Received August 31, 1999; Revised and Accepted October 4 1999

ABSTRACT
The Yeast Intron DataBase (YIDB) contains currently available information about all introns encoded in the nuclear and mitochondrial genomes of the yeast *Saccharomyces cerevisiae*. Introns are divided according to their mechanism of excision: group I and group II introns, pre-mRNA introns, tRNA introns and the HAC1 intron. Information about the host genome, the type of RNA in which they are inserted and their primary structure are provided together with references. For nuclear pre-mRNA introns, transcription frequencies, as determined by microarray experiments, have also been included. This updated database is accessible at: http://www.embl-heidelberg.de/ExternallInfo/seraphin/yidb.html

INTRODUCTION

Introns are sequences present in various types of gene that need to be removed from the primary transcript in order to form a functional RNA. Introns are present in all classes of RNAs (rRNA, tRNA, mRNA, etc.) and have been found in various genomes (eukaryotic, prokaryotic, organelles, viruses, etc.). Introns have to be precisely recognized and eliminated from pre RNA to allow for functional protein or RNA synthesis. In a few cases, introns are involved in the regulation of the expression of their host genes, are alternatively spliced, correspond to mobile genetic elements or code themselves for protein or functional RNA. They constitute therefore a remarkable evolutionary tool.

Introns are classified according to their excision mechanisms. In yeast, five different classes can be distinguished. (i) Group I introns are spliced via two guanosine-initiated transesterification reactions. Some of these introns are autocatalytic. Group I and II introns, pre-mRNA introns, tRNA introns and the HAC1 intron. Information about the host genome, the type of RNA in which they are inserted and their primary structure are provided together with references. For nuclear pre-mRNA introns, transcription frequencies, as determined by microarray experiments, have also been included. This updated database is accessible at: http://www.embl-heidelberg.de/ExternallInfo/seraphin/yidb.html

DATABASE CONTENT AND ORGANIZATION

The Yeast Intron DataBase (YIDB) contains information for the five different types of introns found in the nuclear and mitochondrial genomes of the budding yeast *Saccharomyces cerevisiae*. The data are derived from primary databases (SGD, YPD, MIPS and EMBL) completed with information retrieved from the literature. This information was manually edited to add or remove entries that contained annotation errors and to take into account new experimental evidence.

A summary table shows the overall representation of introns within the *S.cerevisiae* genomes. Information for each type of intron is presented in independent sections as follows.

- **The location, name as well as specific information about intron mobility and polymorphic presence for the 13 group I and II mitochondrial introns.**
- **A list of 254 spliceosomal introns and putative introns present in 249 genes.** Partial sequences of the exon 1, 5’ and 3’ splice sites, and of the branchpoint are provided as well as the intron size. When available, we also provide the transcription frequency of the corresponding genes (i.e., number of transcripts produced per unit of time) determined by microarray experiments (8). A related database containing complementary information about spliceosomal intron can be found at http://www.cse.ucsc.edu/research/compbio/yeast_introns.html (9).
- **A list of the 61 nuclear tRNA genes that contain an intron alongside with their location, cognate amino-acid identity and intron length.**

Links to related entries from the EMBL, MIPS or SGD databases as well as to some relevant references from the PubMed database are provided.

DATABASE AVAILABILITY AND CITATION
Access to the YIDB for academic usage is possible through the World Wide Web at http://www.embl-heidelberg.de/ExternalInfo/seraphin/yidb.html
Users of the database should cite the present publication as reference. Comments, corrections and new entries are welcome.
