THE \( r \)-STIRLING NUMBERS*

Andrei Z. BRODER

Department of Computer Science, Stanford University, Stanford, CA 94305, USA

Received 24 November 1982

The \( r \)-Stirling numbers of the first and second kind count restricted permutations and respectively restricted partitions, the restriction being that the first \( r \) elements must be in distinct cycles and respectively distinct subsets. The combinatorial and algebraic properties of these numbers, which in most cases generalize similar properties of the regular Stirling numbers, are explored starting from the above definition.

1. Introduction

The \( r \)-Stirling numbers represent a certain generalization of the regular Stirling numbers, which, according to Tweedie [24], were so named by Nielsen [16] in honor of James Stirling, who computed them in his "Methodus Differentialis," [22] in 1730. In fact the Stirling numbers of the first kind were known to Thomas Herriot [13]; in the British Museum archive, there is a manuscript [7] of his, dating from around 1600, which contains the expansion of the polynomials \( (\frac{x}{e^x-1})^k \) for \( k \leq 7 \). Good expositions of the properties of Stirling numbers are found for example in [4, Ch. 5], [8, Ch. 4], and [20].

In this paper the (signless) Stirling numbers of the first kind are denoted \( [\text{n}^m] \); they are defined combinatorially as the number of permutations of the set \( \{1, \ldots, n\} \), having \( m \) cycles. The Stirling numbers of the second kind, denoted \( \{\text{n}\}_m \), are equal to the number of partitions of the set \( \{1, \ldots, n\} \) into \( m \) non-empty disjoint sets. The notation \([\ ]\) and \( \{\} \) seems to be well suited to formula manipulations. It was introduced by Knuth in [9, §1.2.6], improving a similar notational idea proposed by I. Marx [18]. The \( r \)-Stirling numbers count certain restricted permutations and respectively restricted partitions and are defined, for all positive \( r \), as follows:

1. The number of permutations of the set \( \{1, \ldots, n\} \) having \( r \) cycles, such that the numbers \( 1, 2, \ldots, r \) are in distinct cycles,

\[
[n\choose m]_r = m \text{ cycles, such that the numbers } 1, 2, \ldots, r \text{ are in distinct cycles,} 
\]

\[
\text{and} 
\]

2. The number of partitions of the set \( \{1, \ldots, n\} \) into \( m \) non-empty disjoint subsets, such that the numbers \( 1, 2, \ldots, r \) are in distinct subsets.

\[
\{n\}_m = \text{non-empty disjoint subsets, such that the numbers } 1, 2, \ldots, r \text{ are in distinct subsets.} 
\]

* This work was supported in part by National Science Foundation grant MCS-77-23738.
There exists a one-to-one correspondence between permutations of \( n \) numbers with \( m \) cycles, and permutations of \( n \) numbers with \( m \) left-to-right minima. (This correspondence is implied in [20, chap. 8] and formalized and generalized in [6].)

To obtain the image of a given permutation with \( m \) cycles put the minimum number within each cycle (called the \textit{cycle leader}) as the first element of the cycle, and list all cycles (including singletons) in decreasing order of their minimum element. After removing parentheses, the result is a permutation with \( m \) left-to-right minima. If the numbers 1, \ldots, \( r \) are in distinct cycles in the given permutation, then they are all cycle leaders and the last \( r \) left-to-right minima in the image permutation are exactly \( r, r-1, \ldots, 1 \). Therefore we have the alternative definition

\[
\left[ \begin{array}{c} n \\ m \end{array} \right]_r = \text{The number of permutations of the numbers } 1, \ldots, n \text{ having } m \text{ left-to-right minima such that the numbers } 1, 2, \ldots, r \text{ are all left-to-right minima (or such that the numbers } 1, 2, \ldots, r \text{ occur in decreasing order).}
\]

Each non-empty subset in a permutation of an ordered set has a minimal element; a partition of the set \( \{1, \ldots, n\} \) into \( m \) non-empty subsets has \( m \) associated minimal elements. This terminology allows the alternative definition

\[
\left\{ \begin{array}{c} n \\ m \end{array} \right\}_r = \text{The number of ways to partition the set } \{1, \ldots, n\} \text{ into } m \text{ * non-empty disjoint subsets, such that the numbers } 1, 2, \ldots, r \text{ are all minimal elements.}
\]

Note that the regular Stirling numbers can be expressed as

\[
\left[ \begin{array}{c} n \\ m \end{array} \right] = \left[ \begin{array}{c} n \\ m \end{array} \right]_0; \quad \left\{ \begin{array}{c} n \\ m \end{array} \right\} = \left\{ \begin{array}{c} n \\ m \end{array} \right\}_0;
\]

and also as

\[
\left[ \begin{array}{c} n \\ m \end{array} \right] = \left[ \begin{array}{c} n \\ m \end{array} \right]_1; \quad \left\{ \begin{array}{c} n \\ m \end{array} \right\} = \left\{ \begin{array}{c} n \\ m \end{array} \right\}_1, \quad n > 0.
\]

Another construction that turns out to be equivalent to the \( r \)-Stirling numbers was recently discovered by Carlitz [2], [3], who began from an entirely different type of generalization, \textit{weighted Stirling numbers}. The simple approach to be developed here leads to further insights about these numbers that appear to be of importance because of their remarkable properties.

\section{Basic recurrences}

The \( r \)-Stirling numbers satisfy the same recurrence relation as the regular Stirling numbers, except for the initial conditions.
Theorem 1. The r-Stirling numbers of the first kind obey the 'triangular' recurrence

\[
\begin{align*}
\left[ \begin{array}{c} n \\ m \end{array} \right]_r &= 0, & n < r, \\
\left[ \begin{array}{c} n \\ m \end{array} \right]_r &= \delta_{m,r} & n = r, \\
\left[ \begin{array}{c} n \\ m \end{array} \right]_r &= (n-1) \left[ \begin{array}{c} n-1 \\ m \end{array} \right]_r + \left[ \begin{array}{c} n-1 \\ m-1 \end{array} \right]_r & n > r.
\end{align*}
\tag{7}
\]

Proof. A permutation of the numbers 1, \ldots, n with m left-to-right minima can be formed from a permutation of the numbers 1, \ldots, n-1 with m left-to-right minima by inserting the number n after any number, or from a permutation of the numbers 1, \ldots, n-1 with m-1 left-to-right minima by inserting the number n before all the other numbers. For n > r this process does not change the last r left-to-right minima.

Theorem 2. The r-Stirling numbers of the second kind obey the 'triangular' recurrence

\[
\begin{align*}
\left\{ \begin{array}{c} n \\ m \end{array} \right\}_r &= 0, & n < r, \\
\left\{ \begin{array}{c} n \\ m \end{array} \right\}_r &= \delta_{m,r} & n = r, \\
\left\{ \begin{array}{c} n \\ m \end{array} \right\}_r &= m \left\{ \begin{array}{c} n-1 \\ m \end{array} \right\}_r + \left\{ \begin{array}{c} n-1 \\ m-1 \end{array} \right\}_r & n > r.
\end{align*}
\tag{8}
\]

Proof. A partition of the set \{1, \ldots, n\} into m non-empty subsets can be formed from a partition of the set \{1, \ldots, n-1\} into m non-empty subsets, by adding the number n to any of the m subsets, or from a partition of the set \{1, \ldots, n-1\} into m-1 non-empty subsets, by adding the subset \{n\}. Obviously, for n > r this process does not influence the distribution of the numbers 1, \ldots, r into different subsets.

The following special values can be easily computed:

\[
\begin{align*}
\left[ \begin{array}{c} n \\ n \end{array} \right]_r &= \left\{ \begin{array}{c} n \\ n \end{array} \right\}_r = 1, & n \geq r; \\
\left[ \begin{array}{c} n \\ m \end{array} \right]_r &= \left\{ \begin{array}{c} n \\ m \end{array} \right\}_r = 0, & m > n; \\
\left[ \begin{array}{c} n \\ r \end{array} \right]_r &= (n-1)(n-2) \cdots r = r^{n-r}, & n \geq r; \\
\left\{ \begin{array}{c} n \\ r \end{array} \right\}_r &= r^{n-r}, & n \geq r.
\end{align*}
\tag{9, 10, 11, 12}
The $r$-Stirling numbers form a natural basis for all sets of numbers $\{a_{n,k}\}$ that satisfy the Stirling recurrence except for $a_{n,n}$. That is, the solution of the Stirling recurrence of the first kind

$$a_{n,k} = 0, \quad n < 0,$$

$$a_{n,k} = (n-1)a_{n-1,k} + a_{n-1,k-1}, \quad k \neq n, \ n \geq 0,$$

is

$$a_{n,k} = \sum_r \binom{n}{k} (a_{r,1} - a_{r-1,r-1}).$$

(13)

Similarly, the solution of

$$b_{n,k} = 0, \quad n < 0,$$

$$b_{n,k} = kb_{n-1,k} + b_{n-1,k-1}, \quad k \neq n, \ n \geq 0,$$

is

$$b_{n,k} = \sum_r \binom{n}{k} (b_{r,r} - b_{r-1,r-1}).$$

(15)

For concreteness, the following Tables 1–3 were computed using the recurrences (7) and (8).

The solution of

$$c_{n,k} = 0, \quad n < 0,$$

$$c_{n,k} = (n-1)c_{n-1,k} + c_{n-1,k-1}, \quad k \neq n, \ n \geq 0,$$

is

$$c_{n,k} = \sum_r \binom{n}{k} (c_{r,1} - c_{r-1,r-1}).$$

(16)
3. ‘Cross’ recurrences

The ‘cross’ recurrences relate $r$-Stirling numbers with different $r$.

**Theorem 3.** The $r$-Stirling numbers of the first kind satisfy

$$
\left[ \begin{array}{c} n \\ m \end{array} \right]_r = \frac{1}{r-1} \left( \left[ \begin{array}{c} n \\ m-1 \end{array} \right]_{r-1} - \left[ \begin{array}{c} n \\ m-1 \end{array} \right]_r \right), \quad n \geq r > 1. \quad (17)
$$

**Proof.** An alternative formulation is

$$(r-1) \left[ \begin{array}{c} n \\ m \end{array} \right]_r = \left[ \begin{array}{c} n \\ m-1 \end{array} \right]_{r-1} - \left[ \begin{array}{c} n \\ m-1 \end{array} \right]_r. \quad (17')$$

The right side counts the number of permutations having $m-1$ cycles such that $1, \ldots, r-1$ are cycle leaders but $r$ is not. This is equal to $(r-1)\left[ \begin{array}{c} n \\ m \end{array} \right]$, since such permutations can be obtained in $r-1$ ways from permutations having $m$ cycles, with $1, \ldots, r$ being cycle leaders, by appending the cycle led by $r$ at the end of a cycle having a smaller cycle leader. \(\Box\)

**Theorem 4.** The $r$-Stirling numbers of the second kind satisfy

$$
\left\{ \begin{array}{c} n \\ m \end{array} \right\}_r = \left\{ \begin{array}{c} n \\ m \end{array} \right\}_{r-1} - (r-1)\left\{ \begin{array}{c} n-1 \\ m \end{array} \right\}_{r-1}, \quad n \geq r \geq 1. \quad (18)
$$

**Proof.** The above equation can be written as

$$(r-1)\left\{ \begin{array}{c} n-1 \\ m \end{array} \right\}_{r-1} = \left\{ \begin{array}{c} n \\ m \end{array} \right\}_{r-1} - \left\{ \begin{array}{c} n \\ m \end{array} \right\}_r. \quad (18')$$

The right side of the equation counts the number of partitions of $\{1, \ldots, n\}$ into $m$ non-empty subsets such that $1, \ldots, r-1$ are minimal elements but $r$ is not. But this number is equal to $(r-1)\left\{ \begin{array}{c} n-1 \\ m \end{array} \right\}_{r-1}$ because such partitions can be obtained in $r-1$ ways from partitions of $\{1, \ldots, n\}-\{r\}$ into $m$ non-empty subsets, such that $1, \ldots, r-1$ are minimal, by including $r$ in any of the $r-1$ subsets containing a smaller element. \(\Box\)

4. Orthogonality

The orthogonality relation between Stirling numbers generalizes to similar relations for $r$-Stirling numbers.

**Theorem 5.** The $r$-Stirling numbers satisfy [2, eq. 6.1]

$$
\sum_k \left[ \begin{array}{c} n \\ k \end{array} \right]_r \left\{ \begin{array}{c} k \\ m \end{array} \right\}_r (-1)^k = \left\{ \begin{array}{c} (-1)^n \delta_{m,n} \\ 0 \end{array} \right\}, \quad n \geq r; \quad \text{otherwise.} \quad (19)
$$
Proof. By induction on \( n \). For \( n < r \) the equality is obvious. For \( n = r \)
\[
\sum_k \binom{n}{k} \binom{k}{m} (-1)^k = (-1)^r \binom{r}{m} = (-1)^r \delta_{m, r}.
\]
For \( n > r \), using Theorem 1 and the induction hypothesis
\[
\sum_k \binom{n}{k} \binom{k}{m} (-1)^k = (n - 1) \delta_{n-1, m} (-1)^{n-1} + \sum_k \binom{n - 1}{k - 1} \binom{k}{m} (-1)^k,
\]
and (assuming \( m \geq r \)) by Theorem 2 applied to the right sum, and the induction hypothesis
\[
\sum_k \binom{n}{k} \binom{k}{m} (-1)^k = (n - 1) \delta_{n-1, m} (-1)^{n-1} - m \delta_{n-1, m} (-1)^{n-1}
\]
\[
= \delta_{n, m} (-1)^n.
\]
Hence for each \( r \), the \( r \)-Stirling numbers form two infinite lower triangular matrices satisfying
\[
\|\binom{i}{j} (-1)^i\| \times \|\binom{j}{i}\| = \|\delta_{i, j} (-1)^i\|,
\]
where
\[
\delta_{i, j} = \begin{cases} 1, & i \geq j \\ 0, & i < j \end{cases}
\]
and we also have

Theorem 6.
\[
\sum_k \binom{k}{n} \binom{m}{k} (-1)^k = \begin{cases} (-1)^n \delta_{m, n}, & n \geq r; \\ 0, & \text{otherwise}. \end{cases}
\]

These orthogonality relations generalize as shown in Section 11.

5. Relations with symmetric functions

The Stirling numbers of the first kind \( \binom{n}{n} \), for fixed \( n \), are the elementary symmetric functions of the numbers 1, \ldots, \( n \) (see, e.g., [4] or [5]). The \( r \)-Stirling numbers of the first kind are the elementary symmetric functions of the numbers \( r, \ldots, n \).

Theorem 7. The \( r \)-Stirling numbers of the first kind satisfy
\[
\binom{n}{n-m}_r = \sum_{i_1 < i_2 \cdots < i_m < n} i_1 i_2 \cdots i_m, \quad n, m \geq 0.
\]
The r-Stirling numbers

Proof. Consider a permutation of the numbers 1, \ldots, n having \( n - m \) left-to-right minima. How many such permutations are there that have a given set of minima? Denote the numbers that are not minima by \( i_1, i_2, \ldots, i_m \), where \( i_1 < i_2 < \cdots < i_m \leq n \). A permutation with the prescribed set of left-to-right minima can be constructed as follows: write all the minima in decreasing order; insert \( i_1 \) after any of the \( i_1 - 1 \) minima less than \( i_1 \); insert \( i_2 \) after any of the \( i_2 - 2 \) minima less than \( i_2 \), or after \( i_1 \); etc. Clearly there are \( i_1 - 1 \) ways of inserting \( i_1 \), \( i_2 - 1 \) ways of inserting \( i_2 \), and so on. Hence the total number of permutations with the given minima is \( (i_1 - 1)(i_2 - 1) \cdots (i_m - 1) \). If the numbers 1, \ldots, \( r \) are minima, then \( i_1 > r \). Summing over all possible sets of left-to-right minima we get

\[
\binom{n}{n-m}_r = \sum_{r < i_1 < i_2 < \cdots < i_m \leq n} (i_1 - 1)(i_2 - 1) \cdots (i_m - 1) = \sum_{r \leq i_1 < i_2 < \cdots < i_m \leq n} i_1 i_2 \cdots i_m, \quad n, m \geq 0.
\]

The above theorem can also be proved by induction, but it is more interesting to see the combinatorial meaning of each term in the sum. Its counterpart for r-Stirling numbers of the second kind is

**Theorem 8.** The r-Stirling numbers of the second kind satisfy

\[
\left\{ \begin{array}{cc}
\binom{n+m}{n} \\
\end{array} \right\}_r = \sum_{r \leq i_1 < \cdots < i_m \leq n} i_1 i_2 \cdots i_m, \quad n, m \geq 0.
\] (23)

Proof. Count the number of partitions of the set \( \{1, \ldots, n+m\} \) into \( n \) non-empty subsets, when the \( n \) minimal elements are fixed. Denote the elements that are not minimal by \( x_1, \ldots, x_m \), where \( x_1 < \cdots < x_m \). If we let \( i_j \) be the number of minimal elements less than \( x_j \), then \( i_1 \leq i_2 \leq \cdots \leq i_m \leq n \). Clearly \( x_j \) can belong only to subsets having a minimal element less than it, so that there are \( i_j \) ways to place it. Hence the total number of partitions with a given set of minimal elements is \( i_1 i_2 \cdots i_m \). If the numbers 1, \ldots, \( r \) are all minimal elements, then \( i_1 > r \). Summing up over all possible sets of minimal elements completes the proof. \( \square \)

Therefore the r-Stirling numbers of the second kind \( \left\{ \binom{n+m}{n} \right\}_r \), are the monomial symmetric functions of degree \( m \) of the integers \( r, \ldots, n \).

6. Ordinary generating functions

**Corollary 9.** The r-Stirling numbers of the first kind have the ‘horizontal’ generating function

\[
\sum_k \binom{n}{k}_r z^k = \begin{cases} 
(z'(z + r)(z + r + 1) \cdots (z + n - 1), & n \geq r \geq 0, \\
0, & \text{otherwise},
\end{cases}
\] (24)
Corollary 10. The $r$-Stirling numbers of the second kind have the 'vertical' generating function [2, eq. 3.10]

$$
\sum_k \binom{k}{m} z^k = \begin{cases} 
\frac{z^m}{(1-rz)(1-(r+1)z)\cdots(1-mz)}, & m \geq r \geq 0, \\
0, & \text{otherwise.}
\end{cases} \quad (25)
$$

The above identities follow immediately from equations (22) and (23).

7. Combinatorial identities

Lemma 11.

$$
\left[ \begin{array}{c}
\binom{n}{m} \\
\end{array} \right] = \sum_k \binom{n-r}{k} \binom{n-p-k}{m-p} r^k, \quad r \geq p \geq 0.
$$

\textbf{Proof.} To form a permutation with $m$ cycles such that $1, \ldots, r$ are cycle leaders first choose $k$ numbers to be in the cycles led by $1, \ldots, p$ and construct these cycles; this can be done in $\binom{n-r}{k} \binom{n-p-k}{m-p} r^k$ ways. The remaining $n-p-k$ numbers must form $m-p$ cycles such that $p+1, \ldots, r$ are cycle leaders, which can be done in $\binom{n-p-k}{m-p} r^k$ ways. Using equation (11) and summing for all $k$ completes the proof. $\square$

In particular for $p = r$ we obtain a definition of $r$-Stirling numbers of the first kind in terms of regular Stirling numbers of the first kind [2, eq. 5.3],

$$
\left[ \begin{array}{c}
\binom{n}{m} \\
\end{array} \right] = \sum_k \binom{n-r}{k} \binom{n-r-k}{m-r} r^k = \sum_k \binom{n-r}{k} \binom{k}{m-r} r^{n-r-k}.
$$

This shows that $\left[ \begin{array}{c}
\binom{n+r}{m+r} \\
\end{array} \right]$, for $m, n \geq 0$ is a polynomial of degree $n-m$ in $r$ with leading coefficient $\binom{n}{m}$ and Lemma 11 can be generalized to a polynomial identity in $p$ and $r$:

Theorem 12.

$$
\left[ \begin{array}{c}
\binom{n+r}{m+r} \\
\end{array} \right] = \sum_k \binom{n}{k} \binom{n-k+p}{m+p} (r-p)^k.
$$

For $p = r-1$ we get another 'cross' recurrence

$$
\left[ \begin{array}{c}
\binom{n}{m} \\
\end{array} \right] = \sum_k \binom{n-r}{k} \binom{n-1-k}{m-1} r^k. \quad (29)
$$

Recall that $\binom{n}{m} = \binom{n}{m}_0$ for $n > 0$, so that

$$
\left[ \begin{array}{c}
\binom{n}{m} \\
\end{array} \right] = \sum_k \binom{n-1}{k} \binom{n-1-k}{m-1} k!, \quad n > 0,
$$

(30)
The \( r \)-Stirling numbers

an identity that appears in Comtet [4, eq. 5.6e], and also in Knuth [9, eq. 1.2.6(52a)].

\[ \binom{n}{m}_r = \sum_k \binom{n-r}{k} \binom{n-p-k}{m-p} p^k, \quad r \geq p \geq 0. \] (31)

**Lemma 13.**

\[ \binom{n}{m}_r = \sum_k \binom{n-r}{k} \binom{n-p-k}{m-p} p^k, \quad r \geq p \geq 0. \]

**Proof.** By combinatorial arguments analogous to the proof of Lemma 11.

The counterpart of equation (27) is [2, eq. 3.2]

\[ \binom{n}{m}_r = \sum_k \binom{n-r}{k} \binom{n-p-k}{m-r} r^{n-r-k}, \] (32)

which shows that \( \binom{n+r}{m+r} \) for \( m, n \geq 0 \) is also a polynomial of degree \( n-m \) in \( r \), whose leading coefficient is \( \binom{n}{m} \). As before this implies a generalization of Lemma 13:

**Theorem 14.**

\[ \binom{n}{m} = \sum_k \binom{n-r}{k} \binom{n-1-k}{m-1} (r-1+k) \] (34)

and

\[ \binom{n}{m} = \sum_k \binom{n-1}{k} \binom{n-1-m}{m-1}, \quad n > 0, \] (35)

which is a well known expansion.

8. Exponential generating functions

**Theorem 15.** The \( r \)-Stirling numbers of the first kind have the following ‘vertical’ exponential generating function

\[ \sum_k \frac{(k+r)}{m+r} \frac{z^k}{k!} = \begin{cases} \frac{1}{m!} \left( \frac{1}{1-z} \right)^m \left( \ln \left( \frac{1}{1-z} \right) \right)^m, & m \geq 0, \\ 0, & \text{otherwise}. \end{cases} \] (36)

**Proof.** The above exponential generating function can be decomposed into the
product of two exponential generating functions, namely
\[
\frac{1}{m!} \ln \left( \frac{1}{1-z} \right)^m = \sum_k \binom{k}{m} \frac{z^k}{k^m},
\]
and
\[
\left( \frac{1}{1-z} \right)' = \sum_k \binom{k+r-1}{k} z^k = \sum_{k \geq 0} \frac{r^k z^k}{k!}.
\]
Their product is
\[
\sum_n \frac{z^n}{n!} \sum_k \binom{n}{k} \frac{k^m}{m^k} = \sum_n \frac{z^n}{n!} \left[ \frac{n+r}{m+r} \right],
\]
by equation (27).

The above theorem implies the double generating function [2, eq. 5.3].
\[
\sum_{k,m} \binom{k+r}{m+r} \frac{z^k}{k!} t^m = \left( \frac{1}{1-z} \right)^{r+t}.
\] (37)

**Theorem 16.** The r-Stirling numbers of the second kind have the following exponential generating function [2, eq. 3.9]
\[
\sum_k \binom{k+r}{m+r} \frac{z^k}{k!} t^m = \left\{ \begin{array}{ll}
\frac{1}{m!} e^{rz} (e^z - 1)^m, & m \geq 0, \\
0, & \text{otherwise}
\end{array} \right. \] (38)

**Proof.** Similar to the proof of Theorem 11, using the expansions
\[
e^{rz} = \sum_k \frac{r^k z^k}{k!},
\]
and
\[
\frac{1}{m} (e^z - 1)^m = \sum_k \binom{k}{m} \frac{z^k}{k!},
\]

The double generating function for r-Stirling numbers of the second kind is
\[
\sum_{k,m} \binom{k+r}{m+r} \frac{z^k}{k!} t^m = \exp(t(e^z - 1) + rz). \] (39)

**9. Identities from ordinary generating functions**

**Theorem 17.** The r-Stirling numbers of the first kind satisfy
\[
\binom{n}{m}_r = \sum_k \binom{p}{p-k} \binom{n}{m+k}_r, \quad r \leq p \leq n. \] (40)
The \textit{r-Stirling numbers}

\textbf{Proof.} From equation (24)

\[ z^{r-p}(z+r) \cdots (z+p-1) = \sum_k \left[ \begin{array}{c} p \\ p-k \end{array} \right] z^{-k}. \]

Express the product

\[ z^{r-p}(z+r) \cdots (z+p-1)z^{p-n}(z+p) \cdots (z+n-1) = \sum_k \left[ \begin{array}{c} n \\ n-k \end{array} \right] z^{-k} \]

as the convolution of the two generating functions and equate the coefficient of \( z^{m-n} \) on both sides. \( \Box \)

\textbf{Theorem 18.} \ The \textit{r-Stirling numbers of the second kind satisfy}

\[ \left\{ \begin{array}{c} n \\ m \end{array} \right\}_r = \sum_k \left\{ \begin{array}{c} p+k \\ p \end{array} \right\} \left\{ \begin{array}{c} n-k \\ m \end{array} \right\}_p, \quad r \leq p < n. \] \hfill (41)

\textbf{Proof.} From (25)

\[ \frac{1}{(1-rz) \cdots (1-pz)(1-(p+1)z) \cdots (1-nz)} = \sum_k \left\{ \begin{array}{c} n+k \\ n \end{array} \right\}_r z^k. \]

Expressing this product as a convolution we obtain

\[ \left\{ \begin{array}{c} n+m \\ n \end{array} \right\}_r = \sum_k \left\{ \begin{array}{c} p+k \\ p \end{array} \right\} \left\{ \begin{array}{c} n+m-k \\ n \end{array} \right\}_p, \]

and the theorem follows by suitable changes of variable. \( \Box \)

\textbf{Theorem 19.} \ The \textit{r-Stirling numbers of the first kind satisfy}

\[ (-1)^r \left[ \begin{array}{c} n \\ m \end{array} \right]_r = \sum_k \left[ \begin{array}{c} n \\ m-r+k \end{array} \right] \left\{ \begin{array}{c} k-1 \\ r-1 \end{array} \right\}_p (-1)^k, \quad n \geq r > p \geq 0. \] \hfill (42)

\textbf{Proof.} From equation (24)

\[ \sum_m \left[ \begin{array}{c} n \\ m \end{array} \right] z^m = z^r(z+r) \cdots (z+n-1) = \frac{z^r(z+p) \cdots (z+n-1)}{(z+p) \cdots (z+r-1)}, \quad n \geq r > p \geq 0. \]

Let \( t = -1/z. \) Then

\[ \frac{z^{r-p}}{(z+p) \cdots (z+r-1)} = \frac{1}{(1-pt) \cdots (1-(r-1)t)} = (-z)^{-r-1} \sum_i \left\{ \begin{array}{c} i \\ r-1 \end{array} \right\}_p (-z)^{-i} \]
by equation (25). Hence
\[
\sum_m \left[ \begin{array}{c} n \\ m \end{array} \right] z^m = \sum_i \left\{ \begin{array}{c} i \\ r-1 \end{array} \right\}_p (-z)^{r-1-i} \sum_j \left[ \begin{array}{c} n \\ j \end{array} \right] z^j = (-1)^{r-1} \sum_m z^m \sum_k \left\{ \begin{array}{c} k \\ r-1 \end{array} \right\}_p \left[ \begin{array}{c} n \\ m-r+1+k \end{array} \right]_p (-1)^k. \]

In particular for \( p = 0 \) we have an alternative expression for the \( r \)-Stirling numbers of the first kind in terms of regular Stirling numbers of both kinds,
\[
(-1)^r \left[ \begin{array}{c} n \\ m \end{array} \right]_r = \sum_k \left[ \begin{array}{c} n \\ m-r+k \end{array} \right]_p \left[ \begin{array}{c} k-1 \\ r-1 \end{array} \right] (-1)^k, \quad n \geqslant r \geqslant 1. \tag{43}
\]
This, combined with (27), gives an identity involving only regular Stirling numbers
\[
\sum_k \left[ \begin{array}{c} n \\ k \end{array} \right]_m \left[ \begin{array}{c} r \\ m+k \end{array} \right](k-r+1) (-1)^k, \quad n \geqslant r \geqslant 1. \tag{44}
\]
The last equation is a polynomial identity in \( r \). For \( r = 1 \), we obtain equation (30) again.

**Theorem 20.** The \( r \)-Stirling numbers of the second kind satisfy
\[
(-1)^r \left[ \begin{array}{c} n \\ m \end{array} \right]_r = \sum_k \left[ \begin{array}{c} r \\ k \end{array} \right] \left[ \begin{array}{c} n-r+k \\ m \end{array} \right]_p (-1)^k, \quad n \geqslant r \geqslant p \geqslant 0. \tag{45}
\]

**Proof.** The ordinary generating function of the \( r \)-Stirling numbers of the second kind can be rewritten as
\[
\frac{z^m}{(1-rz) \cdots (1-mz)} = \frac{z^m (1-pz) \cdots (1-(r-1)z)}{(1-pz) \cdots (1-mz)}.
\]
Putting \( t = -1/z \)
\[
(1-pz) \cdots (1-(r-1)z) = t^p r (t+p) \cdots (t+r-1) = \sum_i \left[ \begin{array}{c} r \\ i \end{array} \right]_p (-z)^{r-i},
\]
do that
\[
\sum_m \left[ \begin{array}{c} n \\ m \end{array} \right]_r z^n = \sum_i \left[ \begin{array}{c} r \\ i \end{array} \right]_p (-z)^{r-i} \sum_j \left[ \begin{array}{c} j \\ m \end{array} \right]_p z^j,
\]
and the result follows by equating the coefficient of \( z^n \) on both sides. \( \square \)

The counterpart of equations (43) and (44) is obtained by making \( p = 0 \) in (45). We get
\[
(-1)^r \left[ \begin{array}{c} n \\ m \end{array} \right]_r = \sum_k \left[ \begin{array}{c} r \\ k \end{array} \right] \left[ \begin{array}{c} n-r+k \\ m \end{array} \right]_p (-1)^k, \quad n \geqslant r, \tag{46}
\]
the alternate expression for \( r \)-Stirling numbers of the second kind in terms of regular Stirling numbers of both kinds. This formula combined with (32), gives an
The r-Stirling numbers

The identity in regular Stirling numbers only:

\[ \sum_k \binom{n}{k} \binom{k}{m-r} x^{n-k} = \sum_k \binom{n+r-k}{m+r} \binom{r}{r-k} (-1)^k, \quad n, r \geq 0, \]  

(47)

which is a polynomial identity in \( r \). For \( r = 1 \), this is equation (35).

**Theorem 21.** The r-Stirling numbers of the first kind have the ‘horizontal’ generating function [2, eq. 5.8]

\[ (x+r)^n = \sum_k \binom{n+r}{k+r} x^k, \quad n \geq 0. \]  

(48)

**Proof.** Replacing in equation (24) \( n \) by \( n+r \) and \( z \) by \( x \), we obtain

\[ \sum_k \binom{n+r}{k+r} x^k = x' (x+r)^n, \]

and the result follows. \( \square \)

Note the equivalent formulation of Theorem 48

\[ (x-r)^n = \sum_k \binom{n+r}{k+r} (-1)^{n-k} x^k, \quad n \geq 0. \]  

(49)

**Theorem 22.** The r-Stirling numbers of the second kind have the ‘horizontal’ generating function [2, eq. 3.4]

\[ (x+r)^n = \sum_k \binom{n+r}{k+r} x^k, \quad n \geq 0. \]  

(50)

**Proof.** Use the identity

\[ e^{(x+r)t} = e^n (1 + (e^t - 1))^x = e^n \sum_{k \geq 0} \frac{(e^t - 1)^k x^k}{k!} \]

and Theorem 12, we obtain

\[ e^{(x+r)t} = \sum_{n \geq 0} \frac{t^n}{n!} \sum_k \binom{n+r}{k+r} x^k. \]  

\( \square \)

The equivalent form of Theorem 50 is

\[ (x-r)^n = \sum_k \binom{n+r}{k+r} (-1)^{n-k} x^k, \quad n \geq 0. \]  

(51)

10. Identities from exponential generating functions

The following two theorems are an immediate consequence of the generating functions (36) and (38).
Theorem 23. The r-Stirling numbers of the first kind satisfy
\[
\binom{l+m}{m} \left[ \binom{n+r+s}{l+m+r+s} \right]_{r+s} = \sum_{k} \binom{n}{k} \binom{k+r}{l+r} \binom{n-k+s}{m+s}.
\] (52)

Theorem 24. The r-Stirling numbers of the second kind satisfy [2, eq. 3.11]
\[
\binom{l+m}{m} \left[ \binom{n+r+s}{l+m+r+s} \right]_{r+s} = \sum_{k} \binom{n}{k} \binom{k+r}{l+r} \binom{n-k+s}{m+s}.
\] (53)

These theorems have also a combinatorial interpretation. For Theorem 23 consider permutations of the set \(\{1, \ldots, n+r+s\}\) such that \(1, \ldots, r+s\) are in distinct cycles, each cycle is colored either red or green, the cycles containing \(1, \ldots, r\) are all green, and the cycles containing \(r+1, \ldots, r+s\) are all red. The total number of such permutations with \(l+r\) green cycles and \(m+s\) red cycles is \(\binom{l+m}{m} \binom{n+r+s}{l+m+r+s} \) because each permutation with \(l+m+r+s\) cycles can be colored in \(\binom{l+m}{m} \binom{n+r+s}{l+m+r+s} \) ways. On the other hand, we can first decide which \(k\) elements, besides \(1, \ldots, r\), should be in the \(l+r\) green cycles; the remaining \(n-k+s\) elements must form the \(m+s\) red cycles. Theorem 24 has a similar interpretation.

11. Generalized orthogonality

Theorem 25. The r-Stirling numbers satisfy [2, eq. 6.3]
\[
\sum_{k} \binom{n+r}{k+m} \binom{k+p}{k+r} (-1)^{k} = (-1)^{m} \binom{n}{m} (r-p)^{n-m},
\] (54)
\[
\sum_{k} \binom{k+p}{m+p} \binom{n+r}{k+r} (-1)^{k} = (-1)^{m} \binom{n}{m} (r-p)^{n-m}.
\] (55)

Proof. By (48) and (51)
\[
(x-p+r)^{n} = \sum_{k} \binom{n+r}{k+r} (x-p)^{k} = \sum_{k} \binom{n+r}{k+r} \sum_{i} \binom{k+p}{i+p} (-1)^{k-i}x^{i}
\]
Equation (54) is obtained by comparing the coefficient of \(x^{m}\) on both sides. Similarly, consider the identity (from (50) and (49))
\[
(x-p+r)^{n} = \sum_{k} \binom{n+r}{k+r} (x-p)^{k} = \sum_{k} \binom{n+r}{k+r} \sum_{i} \binom{k+p}{i+p} (-1)^{k-i}x^{i}
\]
and equate the coefficient of \(x^{m}\) on both sides to obtain (55). □
12. The \( r \)-Stirling polynomials

We have seen that the \( r \)-Stirling numbers are polynomials in \( r \). The \( r \)-Stirling polynomials are defined for arbitrary \( x \) as

\[
R_1(n, m, x) = \sum_k \binom{n}{k} \binom{n-k}{m} x^k, \quad \text{integer } m, n \geq 0,
\]

and

\[
R_2(n, m, x) = \sum_k \binom{n}{k} \binom{n-k}{m} x^k, \quad \text{integer } m, n \geq 0.
\]

In particular, by equations (27) and (32), when \( r \) is a positive integer,

\[
R_1(n, m, r) = \left\lfloor \frac{n+r}{m+r} \right\rfloor, \quad \text{and}
\]

\[
R_2(n, m, r) = \left\langle \frac{n+r}{m+r} \right\rangle.
\]

The \( r \)-Stirling polynomials have a combinatorial significance given by the following two theorems.

Theorem 26. The polynomial \( R_1(n, m, x) \) enumerates the permutations of the set \( \{1, \ldots, n+1\} \) having \( m+1 \) left-to-right minima by the number of right-to-left minima different from 1.

**Proof.** Expanding raising powers, we get

\[
R_1(n, m, x) = \sum_k \binom{n}{k} \binom{n-k}{m} x^k = \sum_k \binom{n}{k} \sum_i \binom{k}{i} x^i
\]

Note that all the left-to-right minima except 1 must occur at the left of 1, while all right-to-left minima except 1 must occur at the right of 1. Hence the number of permutations having \( m+1 \) left-to-right minima, \( i+1 \) right-to-left minima, and \( k \) elements at the right of 1 is \( \left\lfloor \frac{n}{m} \right\rfloor \left\lfloor \frac{k}{i} \right\rfloor \).

Theorem 27. The polynomial \( R_2(n, m, x) \) enumerates the partitions of the set \( \{1, \ldots, n+1\} \) into \( m \) non-empty subsets, by the number of elements different from 1, in the set containing 1.

**Proof.** Obvious, from definition (57).

The \( r \)-Stirling polynomials have remarkably simple expressions in operator notation, which generalize the well known formulae for regular Stirling numbers.

Theorem 28.

\[
R_1(n, m, x) = \frac{1}{m!} \frac{d^m}{dx^m} x^n.
\]
Proof. From (48)

\[ m! \ R_2(n, m, x) = \left. \frac{\partial^m}{\partial y^m} (x + y)^n \right|_{y=0} = \frac{\partial^m}{\partial x^m} x^n. \]

Theorem 29.

\[ R_2(n, m, x) = \frac{1}{m!} \Delta^n x^n. \] (59)

Proof. Similar to the proof of Theorem 28. A direct proof is based on combining (8) and (18) to obtain

\[
\frac{n+r}{m+r} = (m+1) \binom{n+r-1}{m+r} + \binom{n+r-1}{m+r-1},
\]

which implies

\[ \Delta R_2(n, m-1, x) = mR_2(n, m, x) \]

and therefore

\[ \Delta^n x^n = \Delta^n R_2(n, 0, x) = m! R_2(n, m, x). \]

Because of these properties the \( r \)-Stirling polynomials, especially the \( r \)-Stirling polynomials of the second kind, were studied in the framework of the calculus of finite differences. Nielsen [17, chap. 12] developed a large number of formulae relating \( R_2(n, m, x) \) to the Bernoulli and Euler polynomials. (Nielsen’s notation is \( R_2^m(x) = m! R_2(n, m, x) \).) Carlitz [3] showed by different means that the \( r \)-Stirling polynomials are related to the Bernoulli polynomials of higher order and also studied the representation of \( R_1(n, n-k, x) \) and of \( R_2(n, n-k, x) \) as polynomials in \( n \). The author [1] obtained several formulas relating \( r \)-Stirling polynomials of the second kind to Abelian sums [21, §1.5], for example

\[
\sum_k \binom{n}{k} (x+k)^p (y+n-k)^{n-k} = \sum_k \binom{n}{k} k! (x+y+n)^{n-k} R_2(k+p, k, x), \quad p \geq 0. \] (60)

13. \( r \)-Stirling numbers of the second kind and \( Q \)-series

Knuth defined the \( Q \)-series as

\[ Q_\sigma(a_1, a_2, \ldots) = \sum_{k \geq 1} \binom{n}{k} k! n^{-k} a_k. \] (61)

For a certain sequence \( a_1, a_2, \ldots \), this function depends only on \( n \). In particular, \( Q_\sigma(1, 1, 1, \ldots) \) is denoted \( Q(n) \).
The r-Sliding numbers

Q-series are relevant to many problems in the analysis of algorithms [12], for instance representation of equivalence relations [15], hashing [11, §6.4], interleaved memory [14], labelled trees counting [19], optimal cacheing [12], permutations in situ [23], and random mappings [10, §3.1]. It can be shown that the Q-series satisfy the recurrence

\[ Q_n(a_1, 2a_2, 3a_3, \ldots) = nQ_n(a_1, a_2 - a_1, a_3 - a_2, \ldots). \]  

(62)

**Theorem 30.**

\[ Q_n\left(\{h\}, 2\binom{h+1}{2}, \ldots\right) = n^h \frac{n^r}{n^r}. \]  

(63)

**Proof.** Note that from (8)

\[ \binom{k+h}{k} - \binom{k+h-1}{k-1} = k \binom{k+h-1}{k}, \]

for all \( k \geq 0 \) if \( h > 0 \). Applying this together with (62) \( h - 1 \) times, we obtain

\[ Q_n\left(\{h\}, 2\binom{h+1}{2}, \ldots\right) = n^{h-1}Q_n\left(\{1\}, 2\binom{2}{2}, \ldots\right) \]

\[ = n^{h-1}Q_n\left(\delta_{1, r}, 2\delta_{2, r}, \ldots\right). \]

One more application of (62) for \( r > 0 \) results in

\[ n^hQ_n\left(\delta_{1, r}, \delta_{2, r}, \ldots\right) = n^h \frac{n^r}{n^r}. \]

and for \( r = 0 \) results in

\[ n^hQ_n(1, 0, 0, \ldots) = n^h. \]

\[ \square \]

**Corollary 31.** Let

\[ f(k) = \sum_r a_r \binom{k+h-1}{k}, \]

where \( a_r \) depends only on \( r \). Then

\[ Q_n(f(1), 2f(2), 3f(3), \ldots) = n^h(Q_n(a_1, a_2, a_3, \ldots) + a_0). \]  

(64)

In [12] Knuth introduced the half integer Stirling numbers \( \{n+1/2\} \). These numbers satisfy the recurrence

\[ \begin{align*}
\binom{n+\frac{1}{2}}{k} &= 0, & n < 0, \\
\binom{n+\frac{1}{2}}{n} &= n, & n \geq 0, \\
\binom{n+\frac{1}{2}}{k} &= k\binom{n-\frac{1}{2}}{k} + \binom{n-\frac{1}{2}}{k-1}, & k \neq n, n \geq 0,
\end{align*} \]  

(65)
which has the form of (15) and therefore has the solution
\[
\{ n + \frac{1}{2} \}_{k} = \sum_{r=1}^{n} \{ n \}_{k}.
\]
(66)

Hence, by Corollary 31.
\[
Q_{n}\left(\left\{ h + \frac{1}{2} \right\}_{1}, 2\left\{ h + \frac{3}{2} \right\}_{2}, \ldots \right) = n^{h}Q_{n}(1, 1, \ldots) = n^{h}Q(n),
\]
(67)

which is in fact the equation used to define the half-integer Stirling numbers in [12].

Acknowledgement

I wish to thank Don Knuth for his continuous support and encouragement and for his thorough reading of the manuscript which resulted in numerous corrections and improvements.
