USA

The Design Management Institute (DMI) is an international membership organization that connects design to business, to culture, to customers—and to the changing world. Founded in 1975, DMI brings together educators, researchers, designers, and leaders from every design discipline, every industry, and every corner of the planet to facilitate transformational organizational change and design driven innovation. DMI focuses its mission in three areas: education, design valuation and connection.

The 19th DMI: Academic Design Management Conference: Design Management in an Era of Disruption was hosted by the London College of Fashion and organised by in DMI in collaboration with Loughborough, Westminster and Lancaster Universities.

LEGAL NOTICE: The publisher is not responsible for the use which might be made of the following information.

### **Conference Patron**

Michael Westcott, President, DMI, USA

### **Conference Secretary**

Chris Hancock, Design Management Institute, USA

### **Conference co-Chairs**

Erik Bohemia, Loughborough University, UK

Rachel Cooper, Lancaster University, UK

Jeanne Liedtka, University of Virginia - Darden Business School, USA

Alison Rieple, University of Westminster, UK

### **Scientific Programme Committee**

Erik Roscam Abbing, Zilver Innovation and Delft University of Technology, the Netherlands

Antti Ainamo, Aalto University, Finland

Rita Assoreira Almendra, University of Lisbon Faculty of Architecture, Portugal

Petra Badke-Schaub, Delft University of Technology, Netherlands

Brigitte Borja de Mozota, Paris College of Art, France

Kaja Tooming Buchanan, The Cleveland Institute of Art Ohio, USA

Richard Buchanan, Case Western Reserve University, Cleveland, USA

Ian Campbell, Loughborough University, UK

Henri H.C.M. Christiaans, TU Delft, The Netherlands

Luisa Collina, Politecnico di Milano, Italy

Leon Cruikshank, Lancaster University, UK

Christine de Lille, Delft University of Technology, the Netherlands

Martyn Evans, Lancaster University, UK

Nuša Fain, University of Strathclyde, UK

Selena Griffith, UNSW, Australia

Milan Guenther, eda.c, Paris / Düsseldorf Associate

Professor Birgit Jevnaker, BI Norwegian Business School, Norway

Sabine Junginger, Kolding School of Design, Denmark

Toni-Matti Karjalainen, Aalto University, Finland

Debra Lilley, Loughborough Design School, UK

Anja Maier, Technical University of Denmark, Denmark

Karen Miller, University Cambridge, UK

Val Mitchell, Loughborough Design School, UK

James Moultrie, University of Cambridge, UK

Shin'ya Nagasawa, Waseda University, Tokyo, Japan

Kirsi Niinimäki, Aalto University, Helsinki, Finland

Natalie Nixon, Philadelphia University, USA

Oscar Person, Aalto University, Helsinki, Finland

Marco Pironti, Turin University, Italy

Paola Pisano, Turin University, Italy  
Irina Pitsaki, Northumbria University, UK  
Ashok Ranchhod, University of Southampton, UK  
Anna Rylander, University of Gothenburg, Sweden  
Professor Joanne Roberts, University of Southampton, UK  
Kianne W.L. Simonse, Delft University of Technology, Netherlands  
Matthew Sinclair, Loughborough University, UK  
Dr. Dirk Snelders, TU Delft  
Marja Soila Wadman, University of Gothenburg, Sweden  
Adjunct  
Anne Stenros, Aalto University and KONE Corporation, Finland  
Tung-Jung Sung, National Taiwan University of Science and Technology, Taiwan  
Lisbeth Svengren Holm, University of Borås Sweden  
Pia Tamminen, BIT Research Centre, Aalto University, Finland  
Nina Terrey, ThinkPlace, Australia  
Clemens Thornquist, University of Borås Sweden  
Jose Andrade Vicente, Escola Superior da Gallaecia, Portugal  
Froukje Sleswijk Visser, Zilver Innovation and Delft University of Technology,  
Netherlands  
Beverly Wagner, University of Strathclyde, UK  
Associate  
Fabiane Wolff, UniRitter/Laureate International Universities, Brasil  
Stephen Worrall, E.ON, UK  
Lu Yuan, Eindhoven University of Technology, the Netherlands  
Francesco Zurlo, Politecnico Milano, Italy

## **International Scientific Review Board**

Antti Ainamo, Aalto University, Helsinki, Finland

Rita Assoreira Almendra, Universidade de Lisboa, Lisboa, Portugal

Petra Badke-Schaub, Delft University of Technology, Delft, Netherlands

José Monteiro, Barata, ISEG, Lisbon, Portugal

Sara Beckman, University of California, Berkeley, Berkeley, CA, United States

Pekka Berg, Aalto University, Espoo, Finland

Maurício Bernardes, UFRGS, Porto Alegre, Brazil

Mager Birgit, the University of Applied Sciences Cologne, Köln, Germany

Erik Bohemia, Loughborough University, Loughborough, United Kingdom

Brigitte Borja de Mozota, Paris College of Art, Boulogne, France

## Table of Contents

### **Editorial: Design Management in an Era of Disruption**

Jeanne LIEDTKA, Alison RIEPLE, Rachel COOPER and Erik BOHEMIA .....xxiii

### **— CHAPTER 1 —**

#### **DESIGN IN THE CREATION OF MEANING**

#### *Section 1a: Designers as Cultural Intermediaries in an Era of Flux*

#### **Editorial: Designers as Cultural Intermediaries in an Era of Flux**

Francesco ZURLO and Erik BOHEMIA .....5

#### **Design Strategy Through a Turnerian Lens**

Aysar GHASSAN .....9

#### **Pragmatics, Plasticity, and Permission: a model for creativity in temporary spaces**

Deborah MAXWELL and Alison WILLIAMS .....28

#### **Design and Identities: the case of carsharing**

Adèle MARTIN and Denis DARPY .....49

#### **Multimedia Storytelling – Managing Between Design and Journalism**

Christof BREIDENICH and Marlis PRINZING .....64

#### **What Does Design & Innovation Mean for MSEs? A case study of eight Brazilian furniture firms**

Viviane G.A. NUNES .....93

#### **Semiotics and Global Products Design**

Salvatore ZINGALE, Felipe DOMINGUES and Dijon DE MORAES .....109

#### **Designing the City Identity: Strategic and Product Design for New Experiential Ways of Living, Enabling and Interacting with the Urban Context**

Marina PARENTE .....128

#### **The Impact of Nationality and Gender on Consumer Preferences**

Gloria Anne MOSS and Gabor HORVATH .....143

#### **The Role of Product Design as a Mechanism for Moral Legitimacy**

Sarah J.S. WILNER and Aimee Dinnin HUFF .....168

#### **Positioning Designers into the Craft Revival of Emerging Markets: A Case Study on Chinese Ethnic Brocade Industry**

Wei WANG, Tie JI and Mohsen JAAFARNIA .....187

#### **Pre-emptying and the Myth of the Naïve Mind**

Åsa ÖBERG and Roberto VERGANTI .....205

#### **Participation-based Design Process in Jeju Local Regeneration Project**

SungHee AHN and Stephen L. SMITH .....226

## *Section 1b: Contemporary Brand Design*

### **Editorial: Contemporary Brand Design**

Ashok RANCHHOD.....	251
<b>Exposing the Monster in Media: a study of Ducati's product placement strategies</b>	
Peter ZACKARIASSON.....	254
<b>Dynamic Brands: Shifting from Products to Customers</b>	
Marzia ARICÒ and Kim Wikan BARTH.....	266
<b>Embodied brand meaning through design aesthetics: An Underdog Brand Story</b>	
Ariana AMACKER.....	287
<b>Consumer Engagement in Co-creation of Contemporary Brand Design</b>	
Sara Jane GONZALEZ.....	323
<b>The Impact of Animated Promotional Character Design on Brand Attitude</b>	
Zhiyu ZHAO, Nick HIGGETT and Grahame HUDSON.....	343
<b>Materiality, Design and Brand Management</b>	
Fernando Pinto SANTOS and Marta MORILLO.....	364
<b>Luxury Product Design and Brand Differentiation of Emerging Luxury Brands: a Conceptual Framework Based on Perceived Value</b>	
Zhiqing JIANG and Shin'ya NAGASAWA.....	376
<b>Brand of Products and Brand of Signs: how to manage this relationship in fashion through corporate archives</b>	
Valeria IANNILLI and Federica VACCA.....	397
<b>Designing Channels for Brand Value: Four Meta-Models</b>	
Karla STRAKER, Alexander GARRETT, Mitchell DUNN and Cara WRIGLEY.....	412
<b>Luxury and Ignorance</b>	
Joanne ROBERTS.....	432
<b>Product Design Requirements for Effective Heritage Branding: visual consistency and visual contemporaneity as links to the past, present and beyond</b>	
Young In PARK, Ki Young NAM and Kyung Won CHUNG.....	459
<b>Unravelling the Secret of Successful Brand Extensions: a case study to explore consumer response</b>	
Maaïke MULDER-NIJKAMP and Wouter EGGINK.....	479
<b>Craft Brewery Brands: self-awareness through performance</b>	
Monika HESTAD, Viktor HIORT af ORNÄS and Anders GROENLI.....	505

## *Section 1c: Design Management and Artistic Interventions*

### **Editoria: Design Management and Artistic Interventions: Art, Fashion, Games and Service Design**

Antti AINAMO, Kirsi NIINIMÄKI, Marja SOILA-WADMAN, Lisbeth SVENGREN HOLM and Clemens THORNQUIST.....	534
<b>Mind the Gap! Strategies for bridging artists and organizations in artistic interventions</b>	
Ulla Johansson SKÖLDBERG and Jill WOODILLA.....	538

<b>Innovation Through Dumpster Diving?</b>	
Oriana HASELWANTER .....	562
<b>Creative Control in Sustainable Fashion</b>	
Kirsi NIINIMÄKI and Maarit AAKKO .....	583
<b>Flagship Stores as Fashion Service Design</b>	
Erik HANSEN-HANSEN .....	601
<b>Post-Industrial Design for Consumption: discovery and invention of “tribes”</b>	
Antti AINAMO, Su YUNSHENG and Miikka LEHTONEN .....	625
<b>Sustainable Fashion: a re-conceptualization of the role of fashion design</b>	
Anika KOZLOWSKI, Michal BARDECKI and Cory SEARCY .....	644

— CHAPTER 2 —

TRANSFORMATIONAL DESIGN MANAGEMENT

*Section 2a: User-Centred Design*

<b>Editorial: User-centred Design (UCD): a Disruptive Business Enabler for Sustainable Consumption?</b>	
Debra LILLEY and Val MITCHELL .....	667
<b>Interplay Between UCD and Design Management in Creating an Interactive Platform to Support Low Carbon Economy</b>	
Luca SIMEONE .....	669
<b>Presenting the SCL Model: Adding value to business strategy through UCD principles</b>	
Mariale MORENO, Debra LILLEY and Vicky LOFTHOUSE .....	690
<b>Digital Ethnography: a critical evaluation of the contribution to innovation of the current tools and methods</b>	
Nicolas MINVIELLE, Olivier WATHELET, Mathieu GRIFFOUL and Martin LAUQUIN .....	719
<b>The Drive Towards User-Centred Engineering in Automotive Design</b>	
Scott BRYANT and Cara WRIGLEY .....	740
<b>Value Creation: disruption and empowerment to support creativity in-the-wild</b>	
Laura Healey MALININ, Alison WILLIAMS and Katharine ELEIGH .....	757
<b>Designing an Individualised Eco Information System: a conceptual framework</b>	
Sze Yin KWOK, David HARRISON and Shengfeng QIN .....	774
<b>UCD in the Sustainable Luxury Design Process</b>	
Claudia NEWTON, Kerry KIRWAN, Steven MAGGS and Rebecca CAIN .....	799

*Section 2b: Exploring Collaboration in Product Development*

<b>Editorial: Exploring Collaboration in Product Development: the good, the bad and the ugly</b>	
Nuša FAIN and Beverly WAGNER .....	823

<b>The Right Fidelity: designedly representations that enhance multidisciplinary product development</b>	
Guido STOMPFF and Frido SMULDERS .....	827
<b>Exploring Collaboration in New Product Development</b>	
Nuša FAIN, Beverly WAGNER and Fred LEMKE .....	847
<b>Do Designers and Managers Complement Each Other? The influence of cognitive style on product performance</b>	
Kasia TABEAU, Gerda GEMSER, Erik Jan HULTINK and Nachoem M. WIJNBERG .....	860
<b>Making Design Explicit in Organisational Change: Detour or Latour</b>	
Michael Pierre JOHNSON and Lynn-Sayers McHATTIE .....	880
<b>The Impact of Space on Innovation Teams</b>	
Ulrich WEINBERG, Claudia NICOLAI, Danjela HÜSAM, Dora PANAYOTOVA and Marie KLOOKER.....	901
<b>Discovering the Real Needs of the Client – possibilities of grounded theory in design processes</b>	
Sylke LÜTZENKIRCHEN .....	924
<b>Process, Problem and Theory in the Design Discourse of Brazilian Product Designers</b>	
Júlio Carlos de Souza VAN DER LINDEN and Gabriela DALL'AGNOL.....	943
<b>Collaborative Evaluation of Design Concepts</b>	
Andreas BENKER and Wycliffe RADUMA .....	963
<i>Section 2c: Managing Consumer Involvement in Product Development</i>	
<b>Editorial: Reinventing the customer's role: How customers can create innovation in organization's business models</b>	
Paola PISANO, Alison RIEPLE, Ian CAMPBELL and Matthew SINCLAIR.....	985
<b>In Depth Case Study Exploring Innovative Web-based Methods for 'Design-With' Customers in a Global Watch Manufacturing Firm</b>	
Wei LIU and James MOULTRIE .....	989
<b>Participatory Mechanisms in Crowdfunding</b>	
Michael PAPE and Lorenzo IMBESI .....	1004
<b>Business Model Innovation Through New Customer Roles. Inspirational cues and insights from a design-driven case study analysis</b>	
Cautela CABIRIO, Paola PISANO and Marco PIRONTI.....	1043
<b>Specification of an Additive Manufacturing Consumer Design Toolkit for Consumer Electronics Products</b>	
Matt SINCLAIR, Ian CAMPBELL and Hesam YAVARI .....	1065
<b>Business Model Adaptation to a New Digital Culture</b>	
Paola PISANO, Marco PIRONTI, Alison RIEPLE and Ioannis CHRISTODOULOU .....	1089
<b>Reducing Uncertainty Through Disciplined Experimentation</b>	
Davide SOLA, Gianfranco SCALABRINI and Giovanni SCARSO BORIOLI.....	1105

*Section 2d: Enterprise Eco System Design*

**Editorial: Enterprise Eco System Design**

Kaja TOOMING BUCHANAN .....	1127
<b>Innovating Innovation – deliver meaningful experiences in ecosystems</b>	
Paul GARDIEN, Eva DECKERS and Geert CHRISTIAANSEN .....	1129
<b>IP Management in Response to Changing Conditions1151</b>	
Matthias HILLNER, Nick de LEON and Qian SUN .....	1151
<b>A Semantic Approach of Cultural Interpretation toward Service Innovation</b>	
Soe-Tsyr Daphne YUAN and Hua-Cheng TAI .....	1175

— CHAPTER 3 —  
CONTEXTUALIZED DESIGNING

*Section 3a: Co-creating Shared Value in Service Design*

**Editorial: Co-creating shared value with stakeholders in service design**

Tung-Jung (David) SUNG and Yuan LU .....	1203
<b>Communities as a Retail Store Concept</b>	
Anders HAUG and Pia STORVANG .....	1207
<b>Co-Prototyping Emotional Value</b>	
Satu MIETTINEN, Simo RONTTI and Jaana JEMINEN .....	1228
<b>Impact of Team Communication on Co-design Teamwork in Distributed Intercultural Teams</b>	
Jeff MAN, Yuan LU, Aarnout BROMBACHER and Fangtian YING .....	1247
<b>The Image Co-creation: Store image consistency in creative stores</b>	
Shu-Shiuan HO, Yi-Fang YANG and Tung-Jung SUNG .....	1262
<b>Stakeholder Involvement and Co-Creation in Service Design: Customer experience management in tourism</b>	
Chih-Shiang WU and Tung-Jung SUNG .....	1282
<b>Co-design for Not-for-profit Organization</b>	
Busayawan LAM and Andy DEARDEN .....	1305
<b>Conflicts as Opportunities for New Insights</b>	
Pelin GULTEKIN-ATASOY, Hanneke HOOFT VAN HUYSDUYNEN, Yuan LU, Tilde BEKKER, Aarnout BROMBACHER and Berry EGGEN .....	1323
<b>A Non-Profit Design-Led Innovation Journey</b>	
Erez NUSEM, Cara WRIGLEY and Judy MATTHEWS .....	1343
<b>The Value of Design for Customers in the Service Industry: Contributions and measurements</b>	
Ki Woong NAM and Bruce W. CARNIE .....	1365

*Section 3b: Design in the Creative and Culture Industries*

**Editorial: Design in the Creative and Cultural Industries in an Era of Disruption**

Irini PITSAKI, Alison RIEPLE, Natalie NIXON and Birgit JEVNAKER.....1403

**Three Risk Management Methods That Creative Talents Could Learn From**

**Designers: Empathic observation, group brainstorming, and rapid prototyping**

Jaewoo JOO and Soren PETERSEN .....1409

**Co-creation and the Democratization of Fashion**

Thorsten ROSER, Robert DEFILLIPPI and Juliana GOGA-COOKE .....1421

**Powers of Design: A heuristic inquiry into the Victoria and Albert Museum's residency programme**

Saskia COULSON and Louise VALENTINE .....1442

**Studio Design and the Management of Creative Production**

Jonathan M. GANDER and Alison RIEPLE .....1466

**The Role of Networks in Fashion Designing: The disconnect between designers and manufacturers in London**

Galina GORNOSTAEVA, Alison RIEPLE and David BARNES .....1484

**Design and Identity Formation in Cultural Organisations' Strategic Performance**

Irini PITSAKI, Alison RIEPLE and Natalie NIXON .....1509

**Designing Organizations in the CCI**

Johan KOLSTEEG and Frido SMULDERS .....1526

**Omnipresent Access: User perceptions in new media ecosystems**

Mark LEAL and Jon JELEN .....1542

*Section 3c: Social and Sustainable Design Management ..... 1557*

**Editorial: Social and Sustainable Design Management: A brave new era**

Rita ALMENDRA and José VICENTE .....1559

**Socially Responsible Design or 'Bear Favours'**

Anders HAUG and Jacob BUSCH.....1561

**Achieving Responsible Design Within the Commercial Remit**

Norman STEVENSON, Vicky LOFTHOUSE, Debra LILLEY and Alistair CHEYNE .....1579

**Designing For or Designing With?**

Helena KRAFF and Eva Maria JERNSAND .....1596

**Design Approaches to Creating Social Metrics**

Rebecca LINDSAY .....1612

**Moving Beyond the Consultancy Model: Strengthening Design Approaches for Public Good**

Sarah DRUMMOND and Trevor LAKEY.....1628

**Where the Social and Sustainable is the Territory**

Liam FENNESSY, Soumitri VARADARAJAN and Judith GLOVER.....1643

**Application of Patina for Product Sustainability**

Yeon H. HWANG, Jai KIM, Zoe KANG and Song HWANG .....1658

**Design for development management**

Ledia ANDRAWES and Adela MCMURRAY .....1675

— CHAPTER 4 —  
MANAGEMENT FUTURES

*Section 4a: New Modes of Design Management*

**Editorial: New Modes of Design Management**

Anne STENROS and Pia TAMMINEN ..... 1697

**Construct the Future: new models and visions**

Sara BARQUERO, Luis CALABUIG and Borja GARCIA ..... 1699

**Innovation Consensus: Collective decision making support system for innovation management**

Josep M<sup>a</sup> MONGUET, Alex TREJO, Joan BASSOLAS, Tino MARTÍ and Jenny MARTÍ ..... 1721

**Knowledge integration of and by design**

Per ÅMAN and Hans ANDERSSON ..... 1740

**What are you Managing in Design? Creativity or Innovation or Both?**

Peer M SATHIKH ..... 1763

**Darwinian Design in an Era of Disruption**

John Z LANGRISH ..... 1784

**Community Based Business Design Model**

Pia TAMMINEN ..... 1802

**Designers and Environmentally Sustainable Design in a Business Network: a case study on the development of a passenger ship**

Pekka MURTO and Oscar PERSON ..... 1822

**Design interventions in small- and medium-sized companies: Initial findings from a case study**

Kirsi NIINIMÄKI, Oscar PERSON, Janne PEKKALA and Sanna PELTONEN ..... 1842

**Different Models of Design Management – three examples from the Swedish furniture industry**

Justyna STAROSTKA ..... 1859

**Live Prototyping in Microbrands**

Tod CORLETT ..... 1872

**Design Thinking and Corporate Entrepreneurship: an exploratory study**

Thomas ABRELL and Falk UEBERNICKEL ..... 1886

*Section 4b: Design Management Future Perspectives*

**Editorial: Design Management: Future Perspectives**

Martyn EVANS and Leon CRUICKSHANK ..... 1905

**Towards a dynamic mode of design management and beyond**

Claudia ACKLIN and Alexander FUST ..... 1907

**Design Thinking in Managing (and designing) for Organizational Change**

Liisa NAAR and Marianne STANG VÅLAND ..... 1928

**Design as Change – From Teleology to Guided Evolution?**

Hans ANDERSSON and Per ÅMAN ..... 1947

<b>The Emergent Role of the Social Designer</b>	
Anne-Marie MOORE, Angharad E. BECKETT and Raymond J. HOLT .....	1971
<b>Culture Criminals: Social Media’s Affront to Subculture and Design Management</b>	
Qian SUN and Dave LOWE .....	1988
<b>Transforming organizations – Linking Design Practices to Managing Organizational Capabilities</b>	
Lauri SAVIRANTA and Eero M. ELORANTA .....	2007
<b>Corporate Design Germination Model</b>	
Yasemin SOYLU and Ozlem ER .....	2031

*Section 4c: The Role of Designers in the Shift Towards Product Service Systems*

<b>Editorial: The Role of Designers in the Shift Towards Product Service Systems</b>	
Christine DE LILLE, Erik ROSCAM ABBING, Froukje SLEESWIJK VISSER and Dirk SNELDERS .....	2055
<b>Are you being served? Not onboard! Aviation manufactures moving towards service enabling systems</b>

# Editorial: Design Management in an Era of Disruption

Jeanne LIEDTKA, Alison RIEPLE, Rachel COOPER and Erik BOHEMIA

We are delighted to present the Proceedings of the 19<sup>th</sup> DMI International Design Management Research Conference held in London, United Kingdom.

The theme of the conference was *Design Management in an Era of Disruption*. The management of design has arguably never played such an important role as it does today, as changes to the business and social environment call design to the forefront. The quantity of practitioner writing on the topic of has grown voluminously over the past five years, both in terms of popular management books explicitly focusing on the subject and in articles of note appearing in major publications such as *The Economist*, *Harvard Business Review*, *Business Week*, *The Wall Street Journal*, and *The New York Times*. Yet the attention accorded to the topic within top-tier academic publications has been scant and the rigor of the research lacking. It was the explicit intention on the part of the conference organisers to improve the standard of research in the design management field. It is our belief that the quality of the submissions to this conference reflects this goal and signals a move towards a higher level of academic rigor.

The conference received 507 submissions in total, 474 in the form of paper abstracts and 33 in the form of workshop submissions. After the first round of reviews 15 workshop submissions (50%) were accepted and authors of 286 abstracts were selected to submit the full paper (60%). After the double blind review process 152 papers were accepted (53% of the 286 received papers), 6 (2%) were placed on reserve list and 129 (45%) submissions were rejected.

The abstracts were reviewed by the programme conference committee (50 members) and the full paper submissions (286) were reviewed by 151 members of the scientific review committee.

The conference was organized around 6 meta themes, divided into 19 tracks:

The first theme examined *design in the creation of meaning*, looking first at designers as cultural intermediaries, and their role in constructing cultures and engaging users in an increasingly interconnected world.

Theme 1 also explored contemporary brand design and the strategies, practices and processes by which contemporary brand experiences are created and managed by companies in different product fields, from consumer goods to luxury artefacts. Finally, it looked at design management through the lens of artistic interventions, examining the role of creative and artistic interventions as a strategic tool in complex, chaotic and interactional global environments.

The 2nd theme considered *design management as an agent of transformation*. It first examined user-centred design as a disruptive business enabler for accomplishing sustainable consumption, along with the benefits of adopting a UCD approach to reduce over-consumption of resources and to encourage more sustainable actions. Next it explored collaboration in product development and the challenges new types of collaboration in innovation bring to cross-functional and cross-disciplinary relationships involving designers.

How to manage consumer involvement in product development, given developments in both hardware and software that have facilitated greater opportunities for consumers to increase their involvement in product design and manufacturing that has accelerate movement along the continuum between totally consumer-designed products and totally professionally designed products, was also examined. Finally, theme 2 included papers on the topic of enterprise eco system design, exploring how design offers potential help to companies interested in better managing relationships through improved information systems.

*Contextualised designing* was the focus of the 3rd theme. First, the presence of co-created value in service design, as it has become crucial for business enterprises or communities, and the attendant deep understanding of the different roles and expectations of the various stakeholders that this involves. Design in the creative and cultural industries (CCIs) in an era of disruption was another focus in theme 3, examining the role of design in cultural products that generate experiences and meanings. Finally, social and sustainable design management issues and the differences and commonalities in the management of social and sustainable design approaches, along with the challenges that social and sustainable design practices pose at different levels of intervention - whether they be strategic, tacit or operational - were examined.

Theme 4 looked to the future of design management. Included here were new modes of design management occasioned by the disintermediation of organisational hierarchies and the disruption to

organisational value and supply chains resulting as design management has shifted from coordination to integration. Questions about the future of the DM discipline, and even whether 'management' was the appropriate word, and whether a need existed to adapt in the face of the changing nature of design and management theories were raised. Finally, the role of designers in the shift towards product service systems was examined as designers and companies are challenged to find new ways of serving their customers.

*Design thinking, and its leadership and impact*, in all of its forms, were the focus of theme 5.

The extent to which design can contribute to public policy and the renewal of public services, along with an examination of the ways in which public leaders can acquire the skills of design to reshape and refashion the public policies and services that they are responsible for, was a key focus of this theme. Issues of measurement, how to assess the outcomes produced by a design thinking approach, along with the methodological challenges of identifying and calibrating these, was also included. Finally, the role of design thinking in relation to disruptive business model innovation, occasioned by the emergence of e-business organizations as a new locus for innovation, was explored.

The important topic of *educating design managers for strategic roles* in this new era was the focus of theme 6.

It has been our pleasure as editors of this *Proceedings* and co-chairs of the conference, to assemble this varied and thoughtful collection of papers and workshops. We hope that you find them as interesting and insightful as we do!

# Editorial: Designers as Cultural Intermediaries in an Era of Flux

Francesco ZURLO and Erik BOHEMIA

The themed track includes 13 submissions from 21 authors. The theme of the track was to explore relationships between culture and design. For example, the initial call asked these questions: what challenges and opportunities do designers face when exploring 'local' cultural resources? What processes do designers use to frame 'local' cultural inputs? How do they then translate these insights into new offerings, including 'disruptive' service innovations? What processes do designers use to 'construct' users whether these are 'local' or 'global'? In what ways do these constructs enable or limit designers' thinking? How do designers represent 'culture' within their designs?

The importance of the themed track is related to idea that designers have been described as key cultural intermediaries as a result of their role designing symbolic goods and services. In this role they play an active role in promoting consumption through attaching particular meanings and lifestyles to products and services with which consumers will identify. However, as meanings of the products and services are negotiated rather than determined at the outset, designers need to develop an understanding of how others negotiate these meanings. In addition, due to globalization and increasingly interconnected societies through digital technologies and travel, 'local' cultures are in a flux on an unprecedented scale.

The papers included in this themed track present various take on the track's theme.

Aysar Ghassan's paper *Design Strategy Through a Turnerian Lens* suggests to use the cultural analysis of Victor Turner, anthropologist, (a change of state of the individual through culturally prescribed means), in order to explain how Mars negotiated new meanings for a number of his products (associated with some cases of childhood obesity) with the designed transit from a perception of danger to a desirable healthy condition. The aim is to create a model giving new means to the designer without forgetting, however, ethical implications that the application of the model could produce.

The paper by Zingale, Dominques and De Moraes, *Semiotics and Global Products Design*, brings to the surface an important key in understanding global products semiotics, which uses concepts belonging to the studies in semiotics, such as narratives, encyclopedia and dialogicity. The aim is to collect, visualize, categorize and analyze information – coming from different cultures – in order to foster the development of tools useful for supporting an effective management of global new product development.

The role of design for local sustainable development is at the core of the reflection by Sung Hee Ahn and Stephen L. Smith, in the paper *Participation-based Design Process in Jeju Local Regeneration Project*. Jeju is a South Korea isle which is part of the UNESCO world cultural and naturalistic heritage, a premium touristic destination. The authors realized a project of research-action through several means of participation and involvement, by using creativity and art, in order to stimulate new models of local regeneration, which are sustainable and able to protect the area's capital.

*Designing the City Identity: Strategic and Product Design for New Experiential Ways of Living, Enabling and Interacting with the Urban Context* by Marina Parente, provides a reflection on the “reputation-building” processes of cities and regions, based on a bottom-up involvement of individuals and groups with social networks tools or other "engagement" processes. The comprehensive overview of case studies offers a broad range of opportunities for local actors and institutions.

*Pragmatics, Plasticity, and Permission: A Model for Creativity in Temporary Spaces* by Deborah Maxwell and Alison Williams, explains how space can influence the creative processes of individuals and groups. The paper analyzes a case study, a workshop held within an unconventional space (a Victorian-style building), and how the participants transformed the space in a *milieu*, by making it theirs, and then fostering the creative process. Thereby, the paper proposes a correlation model between space appropriation and creative processes.

*Pre-emptying and the myth of the naïve mind* by Åsa Öberg and Roberto Verganti, deals with a recurring ideal in design world, that is making a real *tabula rasa* (*beginner's mind* in the paper) as a necessary condition for design innovation. The authors, even by empirical tests of some cases and with the support of theories such as Hermeneutics and the U Theory by Otto Scharmer, challenge this myth by proposing, on the other hand, the organizational need – in the frame of the product development processes – to become aware of our own prejudices, and taking them into account, to find and negotiate new possible meanings.

Adèle Martin and Denis Darpys' paper titled *Design and Identities: the Case of Carsharing*, highlights the global issue of sustainable mobility and how is challenging the industry to provide extremely satisfying user experiences, to marry up the natural inclination for ownership with the need to switch towards a service usage model for a reduced carbon footprint. The case of carsharing system Autolib in Paris supports the idea that a superior product-service system design encourages new social rituals and shared habits for a remarkable improvement of urban resiliency.

*Multimedia storytelling – managing between design and journalism*, by Christof Breidenich and Marlis Prinzing examine, within the ongoing dramatic transformation of the media industry, the current practices of multimedia storytelling against the post-modern trend in the traditional media economy of disrupting old forms and contents, towards a revolution in how the industry should be creating information today. Despite shared agreement among professionals upon the role of design for meaningful innovation, it is seldom integrated in production process, to which a systematic and transdisciplinary approach would benefit.

Wei Wang, Tie Ji, and Mohsen Jaafarnias' paper titled *Position designer in the process of local craft revival in the emerging markets: An Empirical Study on Chinese Ethnic Brocade Industry* highlights how, following the economical shift in recent decades, handcrafting is on the rise, thanks also to the democratization of systems, tools and shared services that are lowering the traditional market barriers, and allow access to new forms of funding. Crossing the boundaries between crafts and arts, design can be considered as a key element in the contemporary transformation of manufacturing industry, bridging modern industrial consumption and traditional craft production, with increased socio-cultural acceptance.

In Gloria Anne Moss and Gabor Horvaths' paper titled *The impact of nationality and gender on consumer preferences*, empirical research shows that the overall value that consumers are inclined to attach to product designs widely varies, correlating with many subjective variables that selectively apply. The aesthetic properties of products may heavily impact on perceived utility and, as a result, market value. This paper shows that some behavioural consistency can be found when considering socio-demographic segments like gender and nationality, suggesting their importance in reducing the odds against poor design decisions.

*The Role of Product Design as a Mechanism for Moral Legitimacy* is the paper of Sarah J.S. Wilner and Aimee Dinnin Huff. Meaningful design has the power to influence socio-cultural codes and play an essential role in

redefining the meaning of specific product categories. By acknowledging that meanings are continuously negotiated, this paper investigates how designers may influence consumer perceptions of self and social groups that result in new cultural exchanged meanings. Examination of a specific product category, filled with strong and contested cultural meanings, has evidenced the peculiar role exerted by design for market value, product availability, and popular discourse in mainstream media.

## Design Strategy Through a Turnerian Lens

Aysar GHASSAN\*

Coventry University

*I argue that in 2004, Mars' 'Kingsize Chocolate Bar' became characterised as a culturally constructed cause of obesity in the UK. Mars reacted by redesigning its large bar. In this discussion, cultural theory developed by the anthropologist Victor Turner provides a lens through which to view Mars' design strategy. Turner argues that when protagonists transit from a 'state' of being to a contrasting state, this movement occurs through culturally prescribed means. I argue that Mars' design strategy helped move its large bar from being associated with the undesirable state of 'danger' to the desirable state of 'safety' and that this transition facilitated the continued survival of the redesigned product. Accordingly, Mars' designers are framed as mediating the transition between Turnerian states. Beyond discussion on chocolate, Turner's cultural theory may be used to construct a model to inform design strategy in a wider sense. Accordingly, this paper supports calls to provide future designers (design students) with more instruction on cultural issues as this may increase the commercial success of their creations in professional practice. This move may create contradictions between commercial and ethical imperatives. In concluding, I argue that exploration of associated ethical dilemmas should accompany the delivery of cultural knowledge.*

## Introduction

Research suggests that the choice to purchase artefacts is often not predicated on their ability to function more effectively than their competitors (Norman, 2004). This may help to explain the commercial success of Phillippe Starck's Juicy Salif lemon squeezer, a product which, through depositing pips in the collected lemon juice, has become famous for its inability to perform optimally (Lloyd & Snelders, 2003). Norman (2004) claims that desirable objects trigger deep-rooted, instinctual emotions which draw us to them. As well as 'biologically prewired' (Norman cited in Schofield, 2004, unpagged) determinants, *cultural factors* play an important part in contributing to why consumers find certain objects to be desirable (Parkins, 2004). This discussion explores important cultural factors which inform design strategy. It also discusses how the use of cultural theory may help facilitate the construction of successful design strategy.

Kopytoff (1986, p. 68) argues that artefacts exist as 'culturally constructed entit[ies]' which are 'endowed with culturally specific meanings'. Evidence of the role culture plays in assigning meaning to objects can be found through a brief discussion on the *Slow Movement* (Parkins, 2004). This movement rejects the fast-paced nature of contemporary life as problematic and inauthentic:

*We [...] are often overscheduled, stressed and rushing towards the next task. This rushing is not restricted to our work environment. We rush our food, our family time and even our recreation. (Slowmovement.com, 2014, unpagged)*

The Slow Movement argues for a return to what proponents believe were simpler times, epochs where they argue people were more connected with one another and with the environment around them (Slowmovement.com, 2014). The *slow* lifestyle includes "'mindful" rather than "mindless"' (Parkins, 2004, p. 364, Original Emphases) practices such as walking or cycling instead of making use of a car, and growing fruit and vegetables instead of resorting to supermarkets (Parkins, 2004). In this context, *fastness* and *slowness* are not neutral or objective terms, they aid in the construction of what Parkins (2004, p. 371) claims is a 'discourse of slowness':

*Mindful use of time through 'slow' practices [...] construct 'slow subjects' who invest the everyday with meaning and value as they*

*seek to differentiate themselves from the dominant culture of speed.*  
(Parkins, 2004, p. 371)

It is possible to suggest that artefacts which, in the West, might be termed *slow objects* (for example: slow food and bicycles (Parkins, 2004)) can be categorised as such because of Western individuals' anxieties regarding being, for example, being time-poor and disconnected from nature (Parkins, 2004). Equally, the above objects may not be characterised as *slow objects* in parts of the world which have wholly different economic systems. With Kopytoff's (1986, p. 68) already noted argument that artefacts exist as 'culturally constructed entit[ies]' in mind, it can be suggested that *slow objects* are culturally framed phenomena.

This paper reflects on Kopytoff's (1986, p.68) claim that objects are 'culturally constructed entit[ies]' to investigate the design strategy employed by the confectionary company Mars in the UK in the mid-part of the last decade. It should be noted that the Mars brand is discussed here because it is a popular, household name with a long history—the Mars Bar was the first chocolate snack developed by Forrest Mars in 1932 (Mars, 2014). The notion that the Mars Bar is by no means a niche product adds gravitas to the argument to be made in this paper.

In the Spring of 2004, an influential cross-party committee of UK politicians cited foods which were both 'calorie-packed' and sold in 'super-size portions' as contributing to rising obesity rates (Hickman, 2006, unpagged).

Additionally, this committee urged the government to 'publicly name and shame' companies that chose not to act on these findings (see Hickman, 2006, unpagged). At the time, Mars' large chocolate offering (the Kingsize Mars bar) was an example of a product which had both a large portion size and was rich in calories (see Elliott, 2007). The overconsumption of many foods and drinks can of course contribute to a person's weight gain. However, at this time, certain foodstuffs appeared to be singled out in Western society as particularly virulent causes of obesity. Take, for example, foods and drinks produced by McDonalds. The Spring of 2004 saw a huge amount of attention in the press around *Super Size Me*, a film featuring an individual (Morgan Spurlock) consuming nothing but the largest McDonalds meals for a period of one month (Veltman, 2004). This diet is argued to have had deleterious consequences, transforming Spurlock from a:

*healthy, energetic young man into a wheezing, lethargic blob with a liver well on its way to becoming pâté. (Veltman, 2004, p. 1266)*

Negative attention surrounding portion-sizes and calorific value was also placed on large chocolate bars. The following quote from a leading healthy eating campaigner illustrates this: 'I have always been concerned about super-size confectionery' (Jebb cited in Elliott, 2007, p. 3) Thus, in 2004, the Kingsize Mars Bar belonged to a group of foodstuffs which came to be characterised as *culturally constructed* causes of obesity. This had the potential of polluting the image of this established brand—i.e. it had the potential of placing Mars in a locus of **danger**. This discussion will reflect on the design strategy employed by Mars to counteract this danger. It will then claim that this design strategy helped move Mars' large chocolate snack to a more desirable position of **safety**. The discussion then moves on to introduce relevant cultural theory developed by anthropologist Victor Turner before using Turner's notions as a lens through which to view the transition in the design of Mars' large chocolate offering. This paper then moves on to argue Turner's theories may be useful in informing a wider arena in design strategy before making recommendations for design education. Turner's theories have not been used previously in research in relation to design strategy.

Earlier, it was noted that *slowness* (with respect to the Slow Movement) is a culturally constructed phenomenon and that *slow objects* can be characterised as culturally constructed objects. Similarly, the following discussion will explore culturally constructed elements of obesity as this is important in helping to frame the discourse around Mars' large chocolate snack.

## **Obesity Framed as a Culturally Constructed Disease**

### *Culturally Constructed Elements in the Description of Disease*

The description of illness and disease cannot be completely attributed to the use of supposedly rational and unbiased science. In part, their characterisation is also framed by particular cultural contexts. The role cultures play in constructing knowledge on disease can be illustrated through the way medical experts in the 19<sup>th</sup> Century framed hay fever. This illness was perceived to occur:

*among the educated and upper echelons of society rather than the working classes, occurring in men more than women. (Waite, 1995, p. 196)*

In the 19<sup>th</sup> Century, educated, high status males were considered to be *more civilised* than other members of society (Waite, 1995). The scientific description of hay fever was therefore far from objective and neutral; indeed the scientists of the era gathered evidence which:

*reflected the cultural and ideological views of the time, hay fever was made to fit the model of a 'disease of civilization'. (Waite, 1995, p. 196)*

Both society and medical science have progressed a great deal since the 1800s so it may seem appropriate to suggest that the notion of *diseases of civilisation* no longer apply. Waite (1995, p.196) disagrees, arguing the idea that hay fever is a disease of civilisation is 'still being applied [...] over a hundred years later.' Similarly, discourse on obesity clearly demonstrates how cultural and ideological narratives are woven into various discussions on disease.

### *Culturally constructed elements related to discussion on Obesity*

The UK Public Health Association and Faculty of Public Health (2003, p.1) provide a scientific framework for the description of obesity, describing it as an 'excess of body fat frequently resulting in a significant impairment of health and longevity'. Equally relevant to this paper is the notion that cultural constructions play an important part in how obesity is framed. The ability to accumulate fat is argued to be key to our survival as a species (Cunnane and Crawford, 2003). Accordingly, a body shaped by a layer of fat was viewed by ancient humans to be an ideal one to possess (Eknoyan, 2006). Excessive body fat is a relatively new worry for humans to contend with, as for the vast majority of our history hunger was more of a pressing issue (Eknoyan, 2006). The fact that malnutrition persisted well into the 20<sup>th</sup> Century in the USA, is attested to in Steinbeck's (1939) masterpiece *The Grapes of Wrath*. Indeed, Herbert Clark Hoover's 1928 presidential campaign promising a *chicken in every pot* helped secure his presidency when much of the USA was undernourished (Eknoyan, 2006). Currently, the situation is very different in the USA. Cheaper food (Pollan, 2003; Akst, 2003) and larger portions (Young and Nestle, 2002) have contributed to

increased incidences of obesity. Issues surrounding increasing body mass are not confined to the USA. According to the World Health Organisation (2011, unpagged) the majority of the world's population now reside in 'countries where overweight and obesity kills more people than underweight.' This situation has fuelled alarmism; Boero (2007, p. 41) argues that in health policy, academic literature and in the journalistic press, writers increasingly frame the prevalence of obesity as an 'epidemic'.

As with the aforementioned example of hay fever, ideological views in society play an important part in how obesity is framed. In the 1950s obesity began to be seen as a 'sign of weakness or moral lassitude' in the USA (Boero, 2007, p. 45). The construction of obesity as a moral issue is still prevalent in the West (Boero, 2007; Inthorn and Boyce, 2010). In the UK, rather than constructing obesity as a health issue, television programs frame it as a moral one (Inthorn and Boyce, 2010). The Leader of The Opposition (currently the Prime Minister) David Cameron's, criticism of obese people underscores the notion that in the UK, obesity is also framed as a moral issue on a national scale:

*We talk about people being 'at risk of obesity' instead of talking about people who eat too much and take too little exercise [...] There is a danger of becoming quite literally a de-moralised society, where nobody will tell the truth anymore about what is good and bad, right and wrong. (Cameron cited in Porter, 2008, unpagged)*

In this climate it is conceivable that any brand perceived as contributing to obesity could be stigmatised as an agent promoting both unhealthy *and* immoral behaviour amongst consumers. This may potentially damage the reputation of a household brand. The so-called overweight epidemic appears to be affecting the UK very seriously with a quarter of adults currently characterised as being clinically obese (BBC, 2014), that proportion is predicted to rise to over half of the adult population by 2050 (BBC, 2014). Furthermore, Great Britain tops the scales when it comes to rates of childhood obesity in Europe (The Sydney Morning Herald, 2007-A). In the middle of the last decade, a palpable association with obesity threatened to damage the reputation of the household confectionary brand Mars in the UK. The following discussion will reflect on the design strategy employed by Mars to tackle this potential crisis event.

## **Mars: From Kingsize to Duo**

### *A Perceived Rejection of Gluttony and Selfishness*

As noted, in 2004 influential politicians in the UK requested the government to berate manufacturers of large-portioned, high-calorie foods that did not make positive amendments to their produce (Hickman, 2006). In September, 2004 the Food and Drink Federation (FDF)—of which Mars is a member (Food and Drink Federation, no date)—made 7 pledges that, it claimed, would help individuals consume more moderately (The Guardian, 2004; BBC, 2004). These included ‘clearer labelling, reduced fat, sugar and salt levels, the removal of vending machines from schools’ (BBC, 2004, unpagued). The pledge that concerns the argument to be presented here comes in the form of the FDF’s promise that its members would rethink their position on their large chocolate snacks (Guardian, 2004; BBC, 2004). Creating products designed *for sharing* appeared to be intrinsic to the future strategy of FDF members:

*If, for example, we mark up a product for sharing, and that is backed by a general understanding that perhaps two products in one day is more than moderate, then we are starting to get somewhere. (Patterson cited in BBC, 2004, unpagued)*

At the time, Mars’ large chocolate product came in the form of the *Kingsize Mars Bar*. It weighed 85 grams (3oz) (Elliott, 2007). In 2005 this product was discontinued and, true to FDF’s (Patterson cited in BBC, 2004, unpagued) indication of a rethink, Mars introduced the *Mars Duo*, a product consisting of two chocolate bars placed inside a single wrapper (Elliott, 2007). The Mars Duo was developed as a product for more than one person to consume, the wrapper containing illustrated instructions to help individuals open the packaging in such a way (at the middle rather than at the end of the wrapper) that sharing of the chocolate would be facilitated (Elliott, 2007). The combined weight of the two bars contained within a Mars Duo wrapper *remained the same* as the Kingsize bar which it replaced (Elliott, 2007). Together, these two bars contained *the same* 386 calories as the Kingsize bar (Elliott, 2007).

Arguably, Mars’ decision to create the Mars Duo is linked to how obesity is culturally constructed. The vices of *gluttony* (Prentice and Jebb, 1995; Cafaro, 2005) and *selfishness* (Cafaro, *ibid*) are important notions which contribute to how obesity is framed in society. In the West, both traits are constructed as being unhealthy and immoral practices which harm both the

perpetrator and society at large (Cafaro, *ibid*). In an era where obesity has become a hypersensitive issue, the consumption of a large calorie-laden chocolate snack by a single individual has the potential to be perceived as being both a gluttonous and selfish activity. The act of sharing however is constructed in positive terms as this involves an individual consuming moderately. Indeed, traditionally, ‘the virtue opposed to gluttony was temperance or moderate use’ (Cafaro, *ibid* p. 143, Original Emphasis).

### *Reflecting on Mars’ Design Strategy*

The move from producing Kingsize bars to creating Duo bars necessitated design exercises. The development of chocolate bars is a high profile design activity (Seymourpowell, 2013) and is an example of product design. Also, the development of a new wrapper (including the aforementioned illustrated instructions to facilitate sharing) meant the initiation of graphic and packaging design processes. These design activities are physical embodiments of Mars’ brand strategy and are thus of examples of *storytelling* in design (Brown, 2009). In an era when obesity is perceived in scientific terms as unhealthy and is culturally framed as being immoral, it is sensible to suggest that a brand’s position may be strengthened by attempting to dissociate itself from terms of references connected with obesity. This claim is strengthened by politicians’ calls to publically humiliate companies who choose not to remove themselves from such frames of reference (Hickman, 2006). In creating the Duo, Mars’ design strategy revolved around an attempt to remove palpable connections with gluttony and selfishness. Instead, the design strategy attempted to associate Mars’ large chocolate snack with the positive traits of moderateness and sharing.

To gain a valuable and unique insight into to Mars’ design strategy, this discussion moves on to make use of cultural theory developed by the anthropologist Victor Turner as a lens through which to view it.

## **Cultural Theory Developed by Victor Turner**

The anthropologist Victor Turner was born in 1920 in Glasgow, Scotland (Deflem, 1991). After completing a degree in English Language and Literature, he studied Anthropology at University College London (Deflem, 1991). In 1950, Turner embarked on an ethnographic study of the Ndembu tribes people in the Mwinilunga district of Northern Rhodesia (now Zambia) (Deflem, 1991). It was during this time that Turner began investigating the ritual symbolism he believed underpinned human behaviour (Deflem, 1991).

Turner's work is viewed as being very influential, for it spearheaded an intellectual turn within the social sciences, establishing new processes and setting research agendas through:

*defining or giving fresh currency to terms such as 'social drama', 'cultural performance', 'liminality', 'communitas' and 'reflexivity' (Gonquergood, 1989, p. 84, Original Emphasis)*

Turner (1970) argues that occurrences in society can be described in relation to what he terms **states**. Turnerian states are characterised by the existence of a "relatively fixed or stable condition" (ibid, p. 93) in a wide variety of culturally prescribed phenomena. For example, a state pertains to 'constancies [such] as legal status, profession, office or calling, rank or degree' (ibid, p. 93). Turner also uses the term *state* to describe an individual's position in the journey through life. In this case, a state is:

*the condition of a person as determined by his culturally recognized degree of maturation as when one speaks of 'the married or single state' or the 'state of infancy'. (Ibid, p.93, Original Emphasis)*

On a broader note, the term *state* also signifies the temporal physical or psychological health of a person, a group and even a nation:

*A man may thus be in a state of good or bad health; a society in a state of war or peace or a state of famine or plenty. (Ibid, p. 94)*

For Turner, when a protagonist moves from being associated with one state to another related state, this journey occurs via a set of culturally prescribed rituals (Turner, ibid). For Turner (ibid), such journeys are to be found in all societies. The move from an initial state to a subsequent one carries with it a duty to perform in a certain culturally prescribed manner, for when in the new state a protagonist has:

*rights and obligations of a clearly defined and "structural" type, and is expected to behave in accordance with certain customary norms and ethical standards. (Turner, ibid, p. 94)*

Though immersed in Ndembu cultural performances whilst advancing his hypotheses, it is possible to see how Turner's theories resonate with expectations placed upon protagonists closer to home. For example, once a

person moves from a state of being *single* to one of being *married* he or she is legally forbidden from marrying anyone else.

One reason for individuals to attempt a transition from one state to another state is when they are gripped by a life crisis (see Turner, *ibid*). Amongst the Ndembu tribes-people, critical life states are represented by colours. The colour white is consistent with the following:

*Goodness; health; purity; lacking bad luck; having power; to be without death; to be without tears; authority; life; bringing forth young. (see Turner, ibid, p. 69)*

Consequently, the colour white signifies positive aspects of life amongst members of this tribe (Turner, *ibid*). The colour black is associated with the following positions:

*Badness; evil; lacking luck; being in suffering; misfortune; having disease; witchcraft or sorcery; death. (see Turner, ibid, p. 71)*

Accordingly, the colour black represents—on the whole—negative points of life amongst the Ndembu (Turner, *ibid*). A contrast exists between phenomena attributed to the colour white and those which are signified by black; indeed Turner (1970, p. 74) argues the Ndembu perceive, in the majority of incidences, these colours ‘as the supreme antitheses in their scheme of reality’. It is important to note that the Ndembu have not chosen these colours in an arbitrary fashion. These colours have a culturally constructed significance for they are associated with “‘rivers’” which ‘flow “from Nzambi”, the High God’” of the Ndembu people (Turner, 1970, p. 107, Original Emphases).

Turner (*ibid*) argues that both across the world and throughout history, humans have employed culturally constructed colours to symbolise contrasting aspects of their existence. The Swazi of south-eastern Africa are an example of a People whose rituals revolve around the use of pigments (see Turner, *ibid*). In the *Incwala* period in the Swazi calendar the king is ritualistically stripped of his power. Upon the performance of a series of culturally constructed rituals, the king re-emerges as a powerful figure. The following excerpt illustrates the Swazi’s use of colour in this process:

*symbolic acts are performed which exemplify the ‘darkness’ and ‘waxing and waning’ moon themes, for example the slaughtering of a black ox, the painting of the queen mother with a black mixture.....both the [king and his mother] are in eclipse until the paint*

*is washed off finally with doctored water, and the ritual subject comes once again into 'lightness and normality'. (Turner, ibid, p.109)*

Thus, in both Ndumbu and Swazi cultures, colours with culturally constructed meanings are used to symbolise Turnerian states of being and to facilitate the transition between these states.

It is important to recall Turner's (1970) argument that his states and the journeys between them exist in all societies and that both human and non-human protagonists exist in these states and are party to these transitions.

In this discussion, Mars' large chocolate bar is viewed as a protagonist in Turner's (ibid) terms. In the following section, Turner's (ibid) discussion around *states* is used as a lens through which to view the design strategy employed by Mars in the mid-part of the last decade. At this time, as has been described, Mars large chocolate snack belonged to a group of foodstuffs which can be characterised as *culturally constructed* causes of obesity. This paper will argue that Mars' design strategy helped move its large chocolate product from a Turnerian state of ***danger***, to one of relative ***safety***.

## **Turner's theories as a lens through which to view Mars' Design Strategy**

To recap, In the West, the hypersensitivity over the issue of obesity is fuelled by the idea that it is framed in terms of 'morality, risk, and science' (Boero, 2007, p. 42). Cultural constructions around obesity are intrinsically linked to negativity surrounding the traits of gluttony and selfishness. It is possible to argue that the cultural framing of these traits may have contributed to politicians' calls to 'name and shame' (see Hickman, 2006, unpagged) companies perceived as acting as contributors to the 'epidemic' Boero (2007, p. 41) of obesity. Conceivably, a brand labelled with association with obesity can be argued to be in a state (in Turner's (ibid) terms) of ***danger***. A brand's association with the culturally constructed concepts of moderation and sharing however may mean that it is positioned in a state of relative ***safety***.

It may be commercially advantageous for a brand to attempt a transition from a state of Danger to one of Safety. Here, it is argued that, via undertaking the design strategies described in the previous section, Mars' designers attempted to put the chocolate snack through just such a transformation in state. The diagram below illustrates this transition:

Fig. 1: Mars' Design Strategy Through a Turnerian Lens.

It is important to recall that the weight and calorific value of the two bars contained within a Mars Duo wrapper is *the same* as that of the single Kingsize Mars bar (Elliott, 2007). Through such a frame of reference it could be argued that there is *no difference* between the Duo and the Kingsize bar it replaced. Indeed healthy eating campaigners have argued the introduction of the Duo to be a cynical move on the part of Mars (see Elliott, 2007). However, through a lens provided by the anthropologist Victor Turner (1970) it is possible to argue that the act of undertaking a change of state has been important in enabling Mars to continue to manufacture a large chocolate product. It is important to recall Turner's argument that a change in state carries with it a duty to perform in a certain culturally prescribed manner, for when in the new state a protagonist has:

*rights and obligations of a clearly defined and "structural" type, and is expected to behave in accordance with certain customary norms and ethical standards. (Turner, ibid, p. 94)*

It may well be that, when viewed through a Turnerian lens, the Mars Duo is meeting its obligations for in Mars' recent pledge to discontinue all chocolate items containing over 250 calories by 2014, the Duo was spared the cull because it is purportedly 'designed to be shared' (Reilly, 2012, unpagged).

Viewing Mars' design decisions through a Turnerian lens may impact on how the designers intrinsic to this strategy are to be perceived and helps reframe the role of designers who were integral to executing this strategy. In successfully delivering examples of product and graphic design, these designers have successfully narrated the story of Mars' move from a Turnerian state of Danger to one of relative Safety. In this way, Mars' designers can be viewed as *intermediaries*, negotiating the physical

transition between undesirable and more desirable Turnerian states of being.

## **Possible Wider Implications for Design Strategy and Design Education**

The argument made in this discussion is of value to design educators as it provides a novel method of framing Mars' design strategy. It is however possible that Turner's theories can be used as a lens through which to frame discourse on design strategy beyond the world of chocolate products. It may be possible to perceive a brand (Brand X) that wishes to perform more successfully in a marketplace (or indeed successfully negotiate a move into a new marketplace) as existing in a certain Turnerian state (State A). It would be possible then, via conducting research activities, to conclude that in order to more become commercially successful, an attempt should be made to position Brand X in a more desirable Turnerian state (State B). In this case, the design strategy would necessitate methods of implementing the transition between states through the creation of, for example, relevant products and services. If Turner's lens is applicable in a wider sense in design practice, then (as with the Mars case study) designers (in general) can be argued to take on the role of *intermediaries* between current and more desirable states of being. The diagram below illustrates the role of design for 'Brand X':

*Fig. 2: Design Strategy through a Turnerian lens*

Research suggests that a role of mediation is one that designers may be accustomed to performing. Designers are argued to 'play a pivotal role in articulating production with consumption by attempting to associate goods and services with particular cultural meanings' (du Gay, P., Hall, S. Janes, L. Mackay, H. and Negus, K (1997, p. 5). Consequently, designers play an important role in presenting 'these values to prospective buyers'. As such,

designers are termed 'cultural intermediaries' (du Gay et al, 1997, p. 62). Moreover, in a similar argument to the one illustrated in Fig. 2, Buchanan (2001, p. 14) suggests a product can be framed as a:

*[...] negotiation of the intent of the designer and manufacturer and the expectations of communities of use. The product is, in essence, a mediating middle between two complex interests, and the processes of new product development are explicitly the negotiation between those interests.*

The use of Turnerian states builds on the above arguments by enabling the construction of a framework which provides context and meaning surrounding the articulation of *less desirable* traits associated with product(s) and/or service(s) produced by 'Brand X'. Similarly, this framework also provides context and meaning surrounding the articulation of *more desirable* traits 'Brand X' may wish to associate its product(s) and/or service(s) with. Consequently, the use of Turnerian states provides a model which may facilitate both the construction and implementation of specific design strategy which is focused on effectively narrating Brand X's transition from the *less desirable* to the *more desirable* locus to consumers. If Turner's theories are of value in a wider field of design then in order to make optimal use of them, it follows that designers should be equipped with cultural knowledge to help them:

- 1) Effectively frame culturally constructed issues
- 2) Successfully negotiate a brand's transition from, for example, its current Turnerian state to a more desirable one.

The potential use of Turner's states may have implications on the subject matter forming the diet in design degrees. It can be argued that the purpose of design education is to provide a passport for entry to the community of professional practice (Tovey, 2012). In aiding designers prepare for their professional role as 'cultural intermediaries' (du Gay et al, 1997, p. 62), this discussion supports calls for more emphasis on instruction on cultural knowledge to be included in the design curriculum (Ghassan and Bohemia, 2011; Bohemia and Ghassan, 2012; Bohemia 2012).

## Conclusion

This paper has claimed that in 2004, the Kingsize Mars Bar became characterised as a culturally constructed cause of obesity in the UK. It has also argued that this situation represented a crisis event for this brand of

chocolate. Cultural theory developed by the anthropologist Victor Turner has been used as a lens through which to view the design strategy employed by Mars in confronting this crisis event. This paper has suggested that Mars' design strategy was important in moving this brand's large chocolate product from a Turnerian state of ***danger*** to one of relative ***safety***. In developing this argument, this research has claimed that the role of Mars' designers can be viewed as one of effective mediation between less desirable and more desirable Turnerian states.

Beyond the world of chocolate products, this paper has claimed that Turner's cultural theory can be used to inform design strategy in a wider sense. Turner's theories may enable the construction of a framework which provides context and meaning surrounding the articulation of *less desirable* traits associated with a brand's product(s) and/or service(s). Similarly, this framework also provides context and meaning surrounding the articulation of *more desirable* traits a brand may wish to associate its product(s) and/or service(s) with. Consequently, the use of Turnerian states provides a model which may facilitate both the construction and implementation of specific design strategy which focuses on effectively narrating a brand's transition from the *less desirable* to the *more desirable* locus to consumers. Accordingly, this discussion supports research which suggests that designers can be framed as 'cultural intermediaries' (du Gay et al, 1997, p. 62) and literature which argues for further provision of instruction in cultural knowledge within design education.

The potential inclusion of Turner's theories and the further inclusion of cultural knowledge in design educational practices may however create contradictions between the commercial and ethical imperatives of design. This paper proposes a process of equipping students with cultural knowledge should be accompanied by exploration of associated ethical dilemmas, primarily around the issues of sustainability, corporate responsibility and global citizenship (Ghassan, 2014). Finally, this paper calls for more research into the application of the influential anthropologist Victor Turner's cultural theory in both design practice and design education.

## Pragmatics, Plasticity, and Permission: a model for creativity in temporary spaces

Deborah MAXWELL<sup>\*a</sup> and Alison WILLIAMS<sup>b</sup>

<sup>a</sup> University of Edinburgh, <sup>b</sup> Heriot-Watt University

*This paper considers the case study of a three-day residential knowledge exchange event, exploring the meaning of the event's physical environment for impact on participants' creativity and design thinking. The event's mixed group of academics, design professionals, and entrepreneurs were encouraged to think and respond creatively together on a thematic call (to which they responded in the application process) and were observed within the space. We examine how an unconventional workplace environment (a set of elaborately decorated Victorian hotel meeting rooms) influences a group who do not know each other beforehand, observing how participants appropriate the space, and make changes suitable to their needs. The authors (from polarised but privileged insider viewpoints of author-organiser and author-participant) present this through considering Pragmatics, Plasticity, and Permission and their dynamic interrelationships. These concepts develop into a new three-staged model comprising space-as-is, space-as-anticipated and space-as-used, which describes how the interaction over time of space, its affordances and its users have the potential to expand creativity.*

**Keywords:** Space appropriation; creative potential; knowledge exchange; meaning creation; creativity; temporary spaces

## Introduction

It has long been understood on an experiential level that physical space impacts our creativity. The three Bs of creativity: bus, bed and bath, capture anecdotally our need for spaces to move through, spaces in which to doze and daydream, and spaces near or in water (acknowledging Archimedes). It is only recently that research (McCoy 2000, Barrett & Barrett 2010; Dul & Ceylan 2011; among others) has established that physical space has a mediated impact on the creativity of people using it.

This case study examines a further aspect of this: the extent to which space can be instrumental in the creation of meaning. Meaning in this context is how a specific space stimulated and supported knowledge exchange and design thinking during a temporary innovation event. We explore both the denotative (descriptive), and connotative (affective) aspects of the case study space's meaning (Ching 1979), describing its physical space and affordances, and reflecting on the affective impact they had on the organisers of and participants in the temporary event.

This paper's primary contribution is a new staged model that describes how the interaction over time of space, its affordances and users has the potential to expand creativity. We set out the model's three aspects, and introduce our supporting concept of the dynamic interrelationship between *pragmatics*, *plasticity*, and *permission* (see figure 1).

Our work draws on previous research including Resnick's (2007) and Sawyer's (2003) models of iterative creativity, Russ's (1993) work on affect and creativity, and research into physical space and creativity by McCoy (2000), Barrett & Barrett (2010), Dul & Ceylan (2011) among others. While there are almost as many definitions of creativity as there are researchers working on it, within the context of this case study we adopt Meyer's (1999) common characteristics of novelty and usefulness (summarising the papers in the *Handbook of Creativity*) echoing MacKinnon's (1962) earlier definition of creativity as originality, value and process over time. We also propose that iterative models of group creativity (Resnick 2007; Sawyer 2003) are also relevant to this case study, and note the central role of shared values in Tatsuno's (1990) five-stage group creativity model.

We present our case study methodology, and the context within which it took place. Next we present and discuss our findings, and introduce the model, relating it to the event space's denotative and connotative meanings. As part of the connotative meaning we reflect on the affective experience of the event, and the part played in that experience by the

physical space. We finish by presenting and discussing our findings and conclusions.

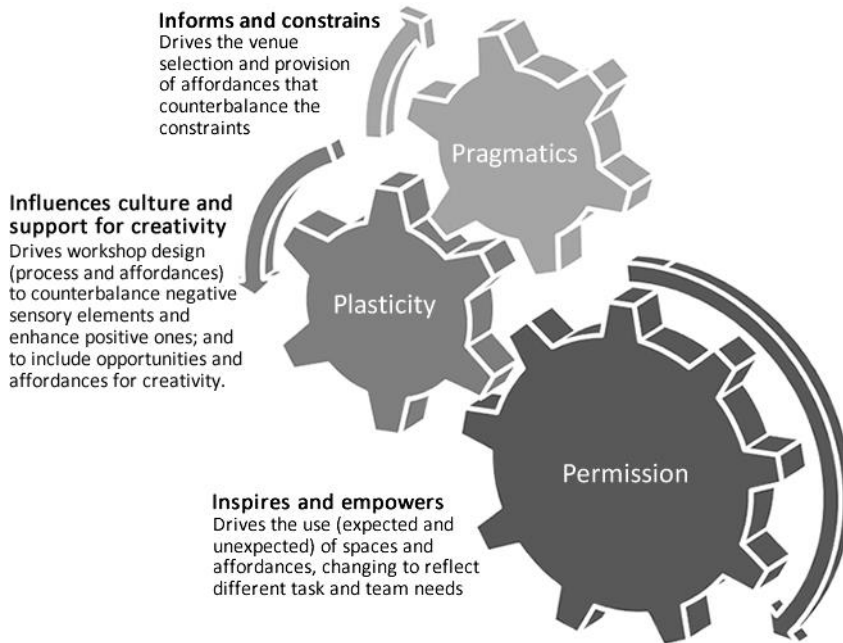

Figure 1 Diagram illustrating the interconnected relationships between Pragmatics, Plasticity, and Permission.

## Methodology

This case study was designed around the central event of a residential workshop. We adopted a selective (rather than descriptive or experimental) case study approach because of its ability to 'focus on particular aspects, or issues, to refine knowledge' (Hakim 1987:62). One of the authors was key to the design and running of the knowledge exchange event, the other was a participant. We therefore refer throughout to author-organiser and author-participant.

The data collection was structured in four stages:

- The space-as-is
- The space-as-arranged by the organisers
- The space-as-appropriated by the participants

- The space-as-experienced by participants and organisers

The *space-as-is* was audited before the event, using a visuospatial grammar to assess how well it would stimulate and support creative thinking. Each author carried out an audit. The *space-as-arranged by the organisers*, set up before the event to add affordances into the space, was recorded through notes, observation and photographs. The data from the *space-as-appropriated by the participants* during the event were collected through observation and photography. Data from the *space-as-experienced by participants and organisers* were collected from two detailed post-event reflections (one by each author) and interviews with and feedback from other participants. The data were analysed and triangulated between the different collection methods of audit, observation, note-taking, photography and reflection.

## **The Case Study & Its Context**

In this section we set out the case study's context and how it unfolded. We present it in three sections: *pragmatics*, *plasticity* and *permission*, relating the case study events to relevant research literature.

The temporary space under discussion in this paper is an intensive residential workshop that took place over three days in Edinburgh, UK, in February 2014, as part of the Design in Action knowledge exchange hub. The workshop was one of an on-going series of events that brings individuals together from different backgrounds, including designers, academics, and business people, and uses design thinking as a catalyst to frame discussions and ideation around key issues pertinent to specific industry sectors. Participants are exposed to alternative ways of approaching problems in high-pressured environments through design tools and methods, whilst also networking and working collaboratively with other participants. The workshop referred to in this paper was focused on the Information and Communications Technologies sector (ICT) and specifically, new technologies within the tourism and cultural heritage sector in Scotland. Twenty participants, including computer science academics and developers, digital publishing start-ups, heritage interpretation and museum consultants, and product and graphic designers took part in the event. Participants, with a few exceptions, had never met each other before the workshop. By intention, workshop participants encompassed a wide range of backgrounds, knowledge, and experience, and consequently a significant undercurrent of the event was around networking and group dynamics.

The workshop programme opened on early evening on Day 1 with ice-breaker activities, dinner and an after-dinner speaker, followed by structured discussions around the key themes of technology, cultural heritage, and tourism. Day 2 included unpacking themes, identifying challenges, generating ideas, and forming teams to work up each idea. At the end of Day 3 each team pitched their idea to a panel of experts (technical, academic, and business) and were encouraged to apply for funding to take their ideas to near to market prototype stage ready for further investment. Aside from directly funding new ideas created during workshops to drive economic growth, it was expected that participants would apply the strategic use of design tools and approaches in their wider workplace and communities, as well as continuing to build on the relationships formed at the event.

The workshop itself was situated in a medium-sized Edinburgh hotel, originally a grand family home. Over the course of the event, participants and organisers moved across four buildings in close proximity (for example, for evening meals). For the purpose of this paper however, we will consider only the central hotel meeting rooms (see figure 2), where participants and organisers spent the bulk of the workshop time, in particular, during creative thinking and ideation activities. Facilitated activities took place in three rooms (Drawing Room, Scott & Bryce Room) whilst two additional spaces were available for catering (Red Room) and break-out (Gallery).

## Pragmatics

In crafting successful research spaces it is important to remember that we always operate under constraints, whether these might include budgetary, research requirements, or logistical restrictions. This is particularly true in temporary environments that have not been designed as work places, far less as creative spaces. In related research, Harrington's ecology of creativity (1990) observes how creative people work with what they have in order to make their environment fit for purpose. His principal example is of a writer, a single mother, who waits until her children are in bed, clears the kitchen table, and writes there. In the case of the example under discussion in this paper, requirements (some of them self-imposed) included: being within budget, close proximity to city centre (Edinburgh), on-site residential accommodation, meeting and breakout rooms, and on-site catering facilities. In addition, the venue decision was influenced by a desire to move away from the usual 'beige' hotel conference suites towards

*Pragmatics, Plasticity, and Permission: a model for creativity in temporary spaces*

a more unique environment that imparted a sense of curiosity and that provided an accessible and relatively inviting outdoor environment (weather permitting). Every decision has pros and cons, and the hotel setting referred to in this paper had its downsides too; primarily the lack of a bar or restaurant on site for use as a gathering space outwith the formal workshop activities.

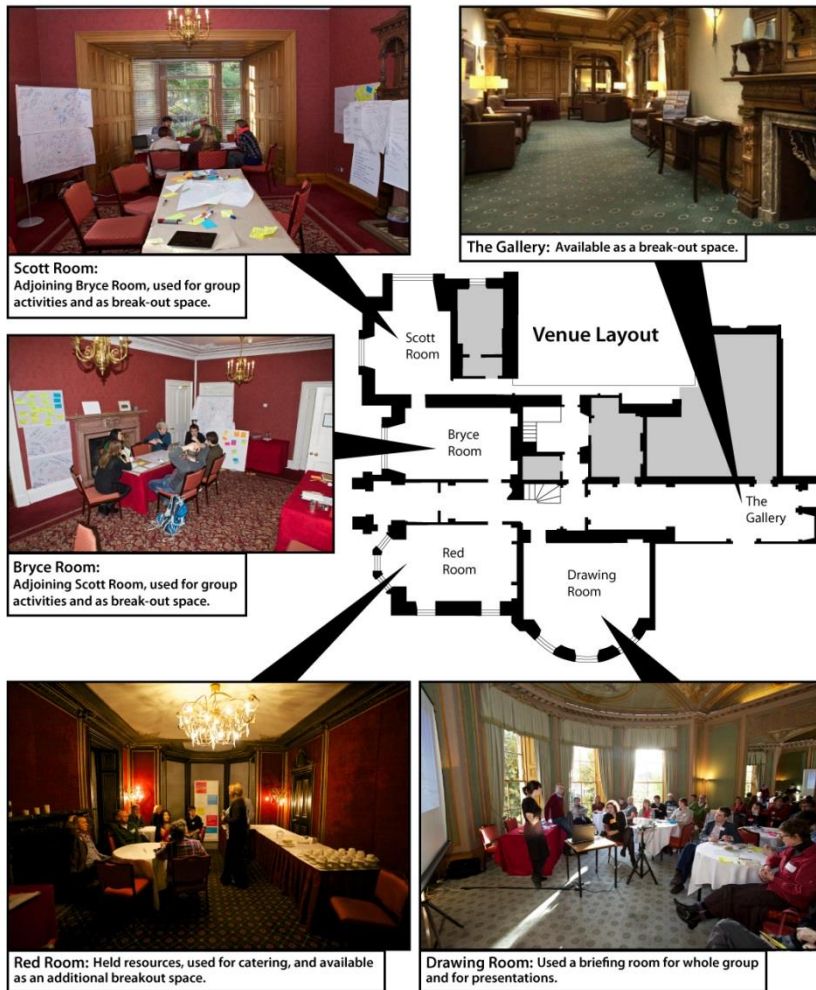

Figure 2 Venue layout indicating the core spaces and their usage in the workshop setting. Photography by Lindsay Perth.

It is worth noting that the choice of venue influenced the orchestration of the workshop activities just as much as the planned workshop activities influenced the venue selection. For instance, the use of multiple rooms in the hotel afforded lots of short movements, which have been shown to promote creative thinking (Beatty & Ball, 2011; Blanchette, Ramocki, O'del & Casey, 2005) but could be construed as problematic in terms of required levels of organising and planning. The rooms and buildings provided the backdrop for what was a complex set of negotiations and configurations around movement and anticipated disruption. To intentionally heighten the sense of movement, participants moved between four additional sites; dinner on the first evening, an afternoon excursion on Day 2 (which included a ten minute outdoor walk each way), dinner on the second evening, and final presentations on Day 3.

Despite a pleasant outdoor environment and large windows, early February in Scotland equates to limited natural light, and the building fabric of dark wood and rich red walls absorbed much of what natural light there was. It is worth in particular referencing Knez' (1995) observation that warm white light promotes higher illumination, more positive mood and better creative task performance. Each room had a slightly different feeling, and variations in light and colour were mirrored by participant noise levels, with the more sombre rooms having correspondingly muted voices. The event photographer noted somewhat exasperatedly that each room had different lighting.

It was clear that the venue as it stood (i.e. on hiring) could only promote creative thinking so far. People's responses to the venue, their interactions with each other and the overall atmosphere, and the dynamic flexibility of this response is critical (Franck 1984). The logistical challenges that participants and organisers faced, and how they worked and responded in-the-moment leads us into the theme of Plasticity.

### *Plasticity*

The physical contains its own cultural patterns:

*artefacts contain behavioural instructions in that they define the reality in which the physical organism is to operate. Often they also contain explicit directions for action – such as norms, regulation, and laws. (Csikszentmihalyi 1975: 61).*

Plasticity of spaces and affordances allows flexibility in how those spaces are used.

*Figure 3. Drawing on the existing fabric of the building as a resource. Photography by Lindsay Perth*

None of the workshop rooms were large enough in their own right to form the sole space of the workshop (20 participants and a support team of between 5-9 people). This seeming limitation afforded movement throughout the rooms in the hotel as best fit the purpose at any one time (see figure 2). In some aspects this was beneficial, as participants used the space fluidly, getting less ‘stuck’ in preferred seats and tables than can be the case in one large room. Early ideation tasks were deliberately choreographed to ensure participants worked in a variety of groupings, tables, and rooms. This anticipated movement, akin to the childhood ‘musical chairs’ game, was received in good humour by participants (“This is fun!” one woman commented when trying to find her next table). Similarly, activities were planned that alternated between standing and sitting, verbal and written, individual and collaborative. Conversely, once participants had self-organised into groups, each team took control of a physical area, generally an entire room, and to some degree this limited interactions between groups.

The nature of the hotel meant that using an adhesive to attach objects to the walls was not permissible, due to fear of damaging paintwork. Strategies for getting round this included using ‘magic whiteboard’ (which uses static to adhere to surfaces), attaching sticky flipchart paper to marble and wooden mantelpieces, and utilising a large, floor-to-ceiling height gilt mirror as a surface for mapping and clustering themes (see figure 3). Completed worksheets, mapping and post-it notes were left on display throughout the workshop, as a resource and as a tangible and visual footprint of the discussions and work completed; a ‘taking over’ or ‘occupation’ of the space.

Whilst the event was carefully planned in terms of activities, it was responsive and subject to change. Adapting the physical to the reality in

which we function is central to research into the impact of physical space on user creativity. In her extended case study, McCoy (2000) observes the *particularisation* of spaces by members of 'breakthrough creativity' teams (i.e. highly creative teams), crafting their workplace to their particular needs. For example, to enable more networking and knowledge exchange, participants were asked to change seats during dinner to talk to new people. Similarly, planned activities were altered following ideation into a more plenary sharing on the basis of participant responses to the main brainstorming session.

Some anticipated and experimental elements had mixed success, for example, the Red Room was set up as a resource space, containing books (on crafting, design, and technology), magazines, printed articles (e.g. Visit Scotland tourist board), lo-fi prototyping tools (e.g. Lego, Plasticine, cardboard), and a printer and a 3D printer. Over the course of the workshop the Red Room was used for catering, but the small cabaret style tables were largely occupied by the organisers and support team. This was not intentional but it served to demarcate the space as organiser territory, so participants did not linger in the room, even to drink coffee. As a result the resources were not well used.

## Permission

The event aimed to create opportunities for productive networking between participants, leading towards viable cross-sector projects. The organisers took the existing spaces, adding affordances to support the physical movement, serendipitous conversations and encounters with information (e.g. the resources area in the Red Room) necessary for such creative behaviours. They deliberately minimised the hotel's constraints, to avoid the possibility that any perception of restriction could remove the participants' agency (Bandura 2000; Jones 2014). They also designed a process to encourage and require this movement and engagement, and they fostered a social context where people could feel such activities were permitted, and could give themselves permission to use the space flexibly.

The workshop provided a 'softening off' of facilitation, from highly structured activities at the outset to more independent autonomous group working by the end of the three days. To enable this, and increase participants' agency and ownership over the process and environment, the organisers introduced elements of Playfulness, invited participants to Populate the Space, and Deferred Control.

*Figure 4. Crafting name badges. Photograph by Lindsay Perth*

- **Playfulness:** The organising team’s intention was to introduce a sense of play through the event, for instance: encouraging participants to make their own name badges using a range of craft materials (see figure 4), which were later available for prototyping purposes. Similarly, on Day 2, teams were issued with a set of cards that included ‘Steal a Team Member (for 30mins)’ and ‘Sugar Boost (get a snack pack)’, which they could redeem as required.
- **Populating the Space:** Participants were invited to bring an object with them to ‘brighten the space’. Despite the organising team not formally introducing this as an activity, several participants brought and shared objects, including a large papier-mâché sculpture, artificial flowers, and artistic images created using computer code. Even on the final day, one participant shared their object, a drawing by their two-year old son. On reflection, a networking activity or equivalent around the objects early in the workshop could have increased the trust levels significantly at a stage when it was most needed (Wheatley & Kellner-Rogers 1996).
- **Deferring control:** Midway through the workshop, teams were assigned their ‘first group task’ (see figure 5), where teams were explicitly given the opportunity to make their own decision about

what to do over the next hour. Two-thirds of the participants elected to go on an organised tour of a local archive, approximately a ten minute walk from the hotel. Whilst some participants found the talk interesting, the walk itself afforded significant intergroup networking and conversation around the ideas from earlier discussion sessions. This activity also served to alter the pace and provide a change of scenery.

From author-participant reflection:

*The walk outside was a life-saver, although ironically we got nowhere at all – went round in circles trying to get out – but the gate was locked, and by the time we got to the main gate and walked into the park a little, it was raining, and we were running out of time.*

Figure 5. Assigning a group task: giving permission to play.

Most participants did not know each other and time was very short, therefore the time-based “form, storm, norm, perform” stages (Tuckman & Jensen 1977) that describe the necessary balance between a team’s task and its socio-emotional needs were compressed. This meant that clashes were more likely to be managed out rather than embraced, and the dissent and diversity that play an important role in creativity (Nemeth & Nemeth-Brown 2003) was lost. In this author-participant’s group, for example, an early and profound disagreement between two members led to the group splitting into two, with a consequent loss of creative potential.

Once groups had been formed, each one gravitated to a particular space, marking it out with materials and feedback cards. Even amongst the groups, and with the provision of similar materials (e.g. magic whiteboard sheets, pens, table top flipcharts) each group developed its own flavour and use of space (see figure 6). In related research, McCoy references the International Workplace Studies Program's (IWSP) finding that 'the physical environment must reflect the team's sense of identify' (in McCoy 2000: 180). She finds that a) teams 'display symbolic artefacts unique to the team as a means of self-expression. Higher levels of creativity are associated with the teams whose range of activities includes [making changes to] their professional domain and artefacts that reflect those professional activities' (2000: 251); and that b) 'team members [...] participate in the design of their environments in order to fit team requirements with the physical environment' (McCoy 2000: 256). Brill et al (1984; 1987) identify people's need to display personal artefacts, and to participate in the process of designing their environment, as factors supporting productivity and motivation. Individualisation, or how people seek to personalise the spaces in which they work and live, is one of three aspects of Barrett & Barrett's (2010) three-part model for informing the design of spaces (the other two are naturalism and stimulation).

The designed process encouraged flexibility between the groups as they formed, but (anecdotally) at least two participants stayed in groups they would rather have left. This raises the question of how to get beyond what Isaacs describes as "politeness [driven by] fear [which] seems to reinforce rule-following behaviour" (Isaacs, 1999, p. 261). For example, this participant-author, having decided not to work with a particular colleague, was driven by avoidance rather than an engagement with an alternative group's focus. The author-organiser also noted participants' 'compliance' with the process. The space's sub-divisions into smaller rooms made inter-group movement (both temporary and permanent) less likely. The 'law of two feet' (Harrison 2008) (i.e. that people can move wherever and whenever they wish) was constrained as the space made such moves more visible to other people.

*Figure 6. Differences in group spaces: a) Some limited physical prototyping did take place at the ‘thinking’ stage, in particular two groups sought out materials, including hacking a thermal receipt printer to provide a live demo for the end of the workshop; b) A discursive group, using very limited physical materials (largely the flipchart to illustrate), c) Technology group - note the 3 laptops and iPad. They also annotated the space with more traditional written notes (magic whiteboard just visible top right hand corner of image). d) This group favoured a paper-based approach to collaboration, and produced documents were largely confined to their working table. (from l-r, t-b).*

There was an observable shift of intrinsic permission-giving over the last day and a half, visible in furniture-moving. Initially only chairs were moved to accommodate different group sizes, but as the groups started to develop their ideas, they appropriated spaces, moved chairs and tables, and added affordances (e.g. boards, equipment) as needed. One group took over the Gallery (see figure 7) and moved the large heavy sofas and chairs to create a working space (inadvertently exposing a box of rodent poison). The hotel staff were extremely tolerant, and beyond a request to keep access to the dining room clear, left the group alone. The Breakthrough Creativity teams observed by McCoy (2000) ignored building regulations and often carried

*Figure 7. Re-appropriating and configuring the Gallery. Photograph by Lindsay Perth*

out changes at the weekend when the building supervisors were away; the basic premise being to ask forgiveness rather than begging permission. McCoy also observed that the least creative team was the one whose manager forbade them to change and improve their environment. Brand (1995) celebrates the possibility of interesting adaptations of space to suit users' purposes or to enrich their relationships with a place. Being able to make such adaptations links into Alexander's central tenet that the physical environment should *feel* right:

*There is a central quality which is the root criterion of life and spirit in a man, a town, a building, or a wilderness. [...] It is the search for those moments and situations when we are most alive (Alexander, 1979: ix – x).*

Without agency, creativity is constrained.

By the last morning, when the pressure to prepare a coherent presentation was overwhelming, all politenesses were gone, and groups appropriated spaces, furniture and affordances ruthlessly from the hotel and from each other, eventually taking over a room which was not part of the original paid package. The necessities of the task had over-ridden social niceties.

Questions arise here about a) people's own social constraints within the process, and b) the degree to which the physical space supports the task. How might participants' own permission-giving be supported to enable them to move beyond politeness into inquiry (Isaacs 1999) and feel that they can walk away from others without causing offence? To what extent does the organisers' arrangement of the space inhibit participants' appropriation of it? Might, for example, a heap of chairs and tables left in the space at the start of the event require space hacking/appropriation from the outset?

## Introduction and Discussion of the Model

We have examined the case study from the standpoint of its pragmatics, its plasticity and its permissions, and how these different aspects interrelate and drive key parts of the ideation process: i.e. its denotative (descriptive) meaning. We now return to the stages outlined at the start of this paper as data collection structure: *space-as-is*, *space-as-anticipated*, and *space-as-used* and examine the extent to which space can be instrumental in the creation of connotative (affective) meaning (figure 8) i.e. how the workshop space stimulated and supported participants in their knowledge exchange and design thinking during the event.

We set out the three stages up a vertical axis of time, plotted against a horizontal axis of creative potential. We observed during the case study workshop that as time went on, so the participants' appropriation of the space increased. The affordances found, used, and appropriated by the participants also increased, as did the degree of agency they displayed (one participant commandeered a thermal receipt printer and dismantled it to create a model for his team's presentation).

We suggest that with the increasing affordances, plasticity and agency (permission) given to and taken by the participants, so the space's potential to stimulate and support users' creativity increases. We further propose that as the space is increasingly personalised and appropriated so its capacity to support creativity is also increased. We reference in particular the research by Barrett & Barrett (2010) and McCoy (2000) presented earlier emphasising the importance of the personalisation or individualisation of spaces by individuals and by teams in their creative ideation process.

The model therefore describes the potentiation of space for creativity, where the three workshop space elements of pragmatics (constraints), plasticity (added affordances) and permission (empowerment or agency) are

brought together with the space as it is, the space as the organisers anticipate the participants will need, and the space that the participants then hack, appropriate and play in.

*Figure 8. Three-Stage Model of space creative potentiation*

We suggest that the greater the degree of participant agency, the greater the take-up of affordances and the use of plasticity, and the greater the potential for creativity.

## Reflections

One of the authors was key to the design and running of the Knowledge Exchange event, the other was a participant.

Author-organiser Reflections:

*Writing this paper has been an interesting and challenging process. Never before have I had to relive a workshop so vividly and acknowledge a particular set of viewpoints, i.e. that of my esteemed participant-co-author. Adopting a shift in perspective has been incredibly enlightening and valuable, and whilst in many instances it reinforced elements that I was already aware of (e.g. need for even*

*more networking activities), in others it illuminated dynamics of which I was not aware (e.g. the significant negative effect of the oppressive sense of light in the space). Being able to independently and collectively reflect on our experiences, both insider perspectives incidentally, has, to me, enriched the writing process and demonstrated the value for such debriefings (even if only informally) for future events.*

*This intentional cyclical research reflection process, that was, 1) conducting an independent audit of the space in parallel with my co-author pre-event, 2) observing and conducting a space audit during the event, 3) independently noting observations and reflections post-event, and 4) in-depth discussions with my co-author; demonstrates our collective awareness of criteria (e.g. sensory properties, possible behaviours, and affordances) that infiltrated the design of the workshop.*

Author-participant Reflections:

*Being a participant rather than my more usual role as organiser/facilitator, and at the same time holding the researcher perspective, has been a fascinating and at times difficult journey. Writing my reflections after the event, and discussions with my co-author, have required me to question deeply my own prejudices, assumptions and responses to space and process. The force and diversity of my affective reactions to the space (including anger and compliance as well as curiosity and enjoyment) took me by surprise and has widened the future scope of my research (e.g. the affective impact of sensory perception). The co-authoring process has modelled best practice: being able to examine uncomfortable emotions and their origination from a position of academic curiosity, founded in trust and respect.*

## Conclusions

This paper has explored the specific context of a set of hotel rooms as a temporary space for knowledge exchange and creative thinking. The space was considered as 1) a bare bones space, 2) orchestrated and augmented with affordances as anticipated by the organisers, and 3) observed as participants used, ignored, and lightly reshaped the space to make it fit for

purpose. The disconnect between intentions and actual use has been discussed, focusing on the movement and fluidity of participants and artefacts throughout the space.

The space-as-is was assessed using a visuospatial *grammar of creative workplaces* (Williams 2013). The grammar sets out in detail those elements of sensory properties, affordances and place that stimulate and support creative behaviour, while at the same time being clear that each individual has his or her unique creative footprint and that what suits one person may not suit another. The grammar thus provides a benchmark of optimal physical space to the organisers of a workshop focussed on creativity and innovative outcomes. The relative merits of whatever workshop space is being considered can be assessed against this benchmark and appropriate decisions taken or not. In the case study, for example, the effect of the combination of the heavy red décor and the lack of natural light in February was not fully appreciated. Had it been, then the organisers would have introduced additional lighting using daylight bulbs. The multiplicity of rooms, however, influenced the workshop's design, supporting its playful nature; yet at the same time, as discussed above, restricted free movement and cross-fertilisation of ideas. Because all creative footprints (Williams 2013) are different, people when given a choice tend to gravitate towards the spaces where they feel most comfortable.

The alternative approach, that spaces are the main determinant of behaviour, risks the charge of physical determinism (Franck 1984), for example when Van der Lugt et al (2006), in contrasting the types of ideas generated in different kinds of rooms in one of their case studies of 'future thinking spaces', say:

*Participants [in the scenario rooms] experience time and time again that the set-up of the different rooms strongly affects the group behaviour. For instance, users of the 'Rules and Regulations' scenario room tend to come up with all sorts of strongly structured solutions to their problem, whereas the 'Community' scenario room evokes more free ways of thinking. (2006: 76)*

Van der Lugt et al do not consider what other variables may have influenced participants' choice of room: their innate preferences in terms of, for example, Kirton's (2003) adaptor-innovator scale are not considered. As set out at the start of this paper, we take the position that the impact of physical space on creativity is mediated through users' perception (Williams

2013; Dul & Ceylan 2011; McCoy 2000) which is in turn impacted by *pragmatics, plasticity, and permission*.

This paper recognises that consideration and evaluation of complex multilayered environments is challenging, and while it is important not to be deterministic about findings and conclusions it is also clear that physical surroundings can play an important role in creativity. Therefore, no sweeping guidelines for best practice are offered here. Rather, our case study highlights the key issues that should be considered when crafting temporary research spaces, namely *Permission, Plasticity, and Pragmatics*. We also introduced a three-stage model comprising *space-as-is, space-as-anticipated* and *space-as-used*, which describes how the interaction over time of space, its affordances and its users have the potential to expand creativity.

We have observed how important it is that the nature of the space-as-is is taken into account at the start of any process. The space should, crucially and obviously, overtly support creativity and innovation through an adequate provision of space(s), in the nature and quality of its sensory properties, and the range of its affordances (existing, planned and spontaneous) for stimulating and supporting creative and collaborative behaviours, i.e. enable agency and Permission. That is to say, that the space-as-is must be flexible enough to sustain the pop-up space-as-arranged and space-as-hacked. In this instance the constraints imposed by the hotel forced the organisers to be innovative about the affordances they provided for example using mirrors for whiteboards and poster displays (Pragmatics).

We conclude that the space should contain the people using it in a way that builds trust quickly and effectively, and the process should encourage the greatest possible degree of permission and agency for the participants so as to optimise the creative potential of the any temporary space.

**Acknowledgments:** *The authors would like to thank all workshop participants for their generous time and willingness to participate fully. The workshop was part of the Design in Action Knowledge Exchange hub AH/J005126/1 funded by the Arts & Humanities Research Council (AHRC).*

## Design and Identities: the case of carsharing

Adèle MARTIN\* and Denis DARPY

Université Paris Dauphine

*Amongst the collaborative consumptions arising nowadays, sharing is one of the most widespread systems. Sharing traditionally owned objects such as cars has certainly affected the consumer-possession relationship. This paper shows the role of design in both identity and brand community building, in the context of carsharing. The carsharing system Autolib in Paris is the research field of this paper. Data from the interviews is analysed through a grounded theory method. Consistent, homogenous and peculiar car design helps a personal appropriation of a shared car by its users. In addition some design elements contribute to brand community development, mostly by creating shared rituals.*

## Introduction

Collaborative consumption has emerged as one of the new economic and social trend of the past decade. This new form of consumption entices individuals to commit to a lifestyle of using but no longer having. Hence, the initial focus is not the creation of a new product but its utility, leaving design to become an illusory tool. The job of the marketing research field is to show companies operating in the collaborative consumption arena that design can be the key to success of a shared product. The links between design and marketing are not always easy to see; yet when these disciplines work in tandem the results can be incredible (Berveland and Farrelly, 2011). It is crucial for marketers to understand the power of design, and for designers the influence they have on consumers. By studying new types of consumption involving a design project this research aims to highlight the role played by design in the level of engagement of consumers towards a shared object. In particular this concept is studied in the case of carsharing. How do consumers relate to a product, which instead of being owned as it traditionally was, is now shared by multiple users? What can be the role of design in consumer's involvement towards shared objects?

Those questions are investigated through the study of a carsharing system involving a design project at its core. After presenting a literature review on consumers and their relation to products, user design and sharing, a study focused on Autolib users (Paris carsharing system) provides results with implications for design and marketing managers.

## Literature review and research question

### *The object and the self*

The question of the relationship between objects and their owner has been of major importance in consumer research since the 1980's. Belk (1988) presented a paper in which he identified possessions as being part of the self. He states that 'we are what we own' and draws on prior literature to understand how consumers use products to construct their identity. The car we own for example speaks a lot about who we are. The representation we make of a man who owns a sporty red car will not be the same as that of a man who has a large family car. The car is part of its owner's identity. It represents, as Belk called it, the *extended self* by opposition to the *core self* (who we are, the body, mind, experiences). To illustrate this concept, Belk studied the loss of objects and the subsequent grieving process, as well as

the different ways to incorporate an object to the self. For example controlling the object or knowing it are ways of integration. The implications of his article are major, and the most preeminent one is perhaps the role played by the extended self in generating a meaning in life.

Ahuvia (2005) furthered Belk's research to stress that the opposition between the core and the extended selves is not clear. He inclined readers to see the self more as a continuum, and stated that 'loved' objects can be a strong part of the self. Ahuvia's ideas drew on Cushman's (1990) theory of the empty self. Cushman (1990) argued that consumers' selves are empty and that they endlessly try to fulfil themselves through consumption. Ahuvia's findings were more positive. To him loved objects have the ability to fill the self. Loved objects are defined by the energy and the time spent on them. Cars are traditionally loved objects: people take care of their car; bring it to the garage, to the carwash... That is the reason why cars are part of their owner's extended self. Having a strong relationship with the environment and the objects that are in it helps individuals build a strong sense of self.

Belk's research on the relationship between user and the object led to a new definition of the consumption product. For Consumer Culture Theory (CCT) researchers (Arnould and Thompson, 2005), the consumption object has become something that 'groups use' to construct 'practices, identities and meanings – to make collective sense of their environments and to orient their members' experiences and lives' (Bettany, 2007). Bettany showed that objects are indeterminate, mutable, as they co-emerge with the user in action. By this she meant that the action of using an object changes the user (his identity) and the product at the same time (it becomes filled with meaning). This definition highlights the role played by goods in the creation of meanings in consumer's lives.

At the same time social psychologists like Tajfel (1974) studied the role of social groups in relation to identity construction. Tajfel found that a part of an individual's identity comes from the feeling of belonging to a group. He named this concept the social identity. According to Tajfel, behaviours could be located on a continuum, between completely interpersonal behaviour on one side to entirely intergroup behaviour on the other. Identity is thus built in part on possessions and in part on the feeling of belonging to a group.

### *The user at the centre of design focus*

Design today has responsibilities beyond visual culture. It focuses also on branding, service design, production, consumption, etc. (Julier, 2007).

Hence, it is important for designers to understand who the consumers in today's society are. Designers make objects that will help individuals build their identity. Buchanan (2001) proposed a definition of design with a central role in the individual's identity construction: 'Design is the human power of conceiving, planning, and making products that serve human beings in the accomplishment of their individual and collective purposes'. Therefore designers help consumers in the construction of their identity both as individuals and as individuals who are part of social groups. Consumers use products to bring meanings to their lives. How can design interact with identities is of crucial importance. Du Gay, Hall, Janes, Mackay and Negus (1997) deconstructed the process of new identity construction around the Sony Walkman®. They showed how designers were able, through radical innovation, to transform cultural practices. As practices evolve, meanings and representations of the cultural world also change for consumers, leaving spaces for new identities to emerge. The Walkman encouraged people to listen to music outside of their homes: in public transports, public parks... These news practices lead to the emergence of new significations in the social space. People started to associate the Walkman to youth, technology, to being in movement. A space for a new identity, the 'urban nomad' was thus created.

Stories like the Walkman participated in a change of scope in the discipline of design. Instead of focusing solely on the product or its technology, designers started to centre their thoughts on the people who will use the product. The discipline of design, in its most recent conception, is interested in the actor of the object (Findeli and Bousbaci, 2005). Designers do not speak of consumers, but of project's carrier or users. There can be no design project without thinking about the user first. The design of a new product is an interrogative activity revolving around the question of how to design user experience. Who will use the product, in what context, when and how? Objects are made to answer the needs of a person, but that need has to be identified first. Dubuisson and Hennion (1996) even referred to designers as 'sociologists of the products' in their book studying the relationship between user, use and the object. Studying this relationship in the context of sharing changes the question a little. It is no more object-use-user; it becomes object-use-users. In this context designers have to think about how can different individuals use the same product.

### *Sharing: a new form of consumption*

One of the main trends shaking up traditional consumption today is the emergence of collaborative consumption. Consumers have started to move away from owning and having to using and sharing (Botsman and Roger, 2010). This is no longer a secondary phenomenon. Firms like Airbnb, Couchsurfing or BlablaCar have millions of users (11 millions for Airbnb, 7 millions for Couchsurfing and BlablaCar). A definition of this phenomenon can be found in Botsman and Rogers' (2010) book on the subject: 'Collaborative consumption occurs when people participate in organized sharing, bartering, trading, renting, swapping, and collectives to get the same pleasures of ownership with reduced personal cost and burden, and lower environmental impact'. The authors divided collaborative consumption into three categories: product services system, redistributive systems and collaborative lifestyles. Product service system is about transforming a good into a service, and this is the category where carsharing activities would fall. John (2012) used the term *sharing economies of consumption* to refer to collaborative consumption, and made a distinction between sharing personal objects with others and accessing a third party good. Because users drive cars owned by a company, carsharing would fall into the second type of these economies.

Not all instances of collaborative consumption are about sharing. Nonetheless they are the ones on which this research focuses, because they are likely to disrupt the established relationship between the owner and his possessions. Belk (2010) defined sharing as 'the act and process of distributing what is ours to others for their use and/or the act and process of receiving or taking something from others for our use'. For Belk sharing is bound to exist more in close circles (like families or close friendships), yet it is more interesting to study this type of consumption when happening between strangers.

Bardhi and Eckhardt (2012) put forth a new concept they called Access-Based Consumption (ABC). This form of consumption is similar to sharing because no transfer of ownership takes place, but differs from it in the lack of sense of ownership inherent to it. The authors focussed on carsharing as a form of access-based consumption. They studied the US company Zipcar, and found no relationship between the users of the service and the cars they used. Their conclusion was that cars in carsharing system could not participate to the identity construction of the users of the service. In other words, they found that these cars did not belong to the extended self of their users. However there was no design involved in the project of Zipcar.

All the cars used in the system are different; they were not made specifically for a carsharing system. The starting point of this research was to consider that the lack of a design project rendered the appropriation impossible by the users.

### *Research question*

The presented literature explores how design and the construction of consumer identities are linked. Designers know that consumers will use their products to build their identity. One of the current challenges for designers and design managers is to learn how to propose not a product for one individual, but a product shared by many consumers within a service scope. Appropriation of a shared product seems difficult (Bardhi and Eckhardt, 2012) yet it is crucial for the sharing company in order to create a long-term relationship between its products and its consumers. How could design enhance the appropriation of a shared object? This research proposes to observe the role that design plays in helping consumers to build their identity within a sharing system (using both the product and the service). This research believes design to be the core element needed to a sharing system so that consumer can create a relationship with the shared product. How can design help to create a solid relationship between a shared product and its consumer?

## **Methodology**

### *The case of Autolib*

This research focuses on carsharing because it is one of the most visual examples of collaborative consumption. It today exists in many large cities in the Western world and keeps growing continuously.

It was important to focus on a carsharing system that involved a design project at its origin, which is why this research studies the French company Autolib in Paris. Autolib proposes a carsharing system like Zipcar, with the difference that all its cars are the same model. It was important to find a carsharing company that proposed homogeneous products. The models used by Autolib are the electric 'Bluecars' designed by Pininfarina. They are not cars that are seen everyday and everywhere; they are specifically associated with this project.

*Figure 1. A Bluecar in Paris. Source: Mariordo (Mario Roberto Durán Ortiz, 2012)*

Autolib is a concept that created new consumption practices in Paris, around a product and a service specifically designed for it. This research looks at the impact of the specific design of this shared object on consumer's identity.

### *Methodology*

The case of Autolib is interesting due to the importance of design at the core of the project. The subject was approached with an abductive method, which consists in constant back and forth movements between the field data and the existing literature. A Grounded Theory approach was followed (Glaser and Strauss, 1967); in its latest conception (Strauss and Corbin, 1990), which consists in producing an explanation of a phenomena based on field data, while referring to the literature to bring order to the findings. The goal of the grounded theory is to observe the relationship between different concepts, to interpret the sense of the actors' actions. The use of this approach seemed appropriate due to the exploratory nature of the research.

Four in-depths-interviews with Autolib users were conducted in Paris. Due to the difficulties in making contact with Autolib users, the respondents were recruited via word of mouth. All interviews were conducted face-to-face in Paris. Out of the four, three were conducted in a café and one at the respondent's home (Marie). Three respondents were men (Oscar, Thomas

and Jean), and all of them were in their mid-twenties. Interviews lasted between forty and seventy minutes. They were semi-structured; to allow new themes to emerge yet controlling that the respondents would not go too far from the research's topics. Interviews were centred on three main themes, to understand the relationships consumers have with the Bluecar, the service infrastructure and other users. The interviews were transcribed and then analysed with content analysis. First the interviews were analysed vertically to allow the researcher to grasp the specificities of each individual in its relationship to the car, the service and other users. Verbatims were sorted into categories and subcategories depending on the theme and subtheme they represented. Then a horizontal analysis was performed to understand the possible differences occurring amongst the respondents on each theme. The results presented below are split into two parts. First the results regarding the role of design in the appropriation of the shared car will be presented. Secondly the contribution of design in the building of a brand community will be addressed.

## Results

### *The Bluecar and the extended self*

This research focuses on the carsharing system Autolib because its products are homogenous. The cars are all the same and the model is called the Bluecar. With more than 2000 Bluecars, the likelihood of taking the same car twice is low. Yet, thanks to the uniformity of the cars users felt as though they were always driving the same car: 'To me it is always the same' (Marie); 'They are quite identical' (Thomas); 'I really feel that it is the same' (Oscar); 'It is always the same car... they have a certain identity inside' (Jean). Because they were always driving the 'same' car, they established a consistency in their use of the car.

The first thing that was remarkable in the interviews was that the four individuals declared to love driving the Bluecar. Jean said: 'I like to drive the Autolib... But otherwise I hate driving normal cars'. Why is driving a Bluecar different? They all referred to the fact that it was an electric car. Marie and Oscar both used terms associated to flying when describing their experience driving the car. The driving was uncommonly smooth because of the absence of noise. At the same time the car appeared to be extremely reactive. All male respondents talked about how happy they were to be the firsts to take off after a green light.

The four Autolib users described the pleasure they took in controlling the car. 'You change completely your relation to the mechanical part of the car' (Oscar). It seemed as though the electric components allowed the car to become secondary and give way to user experience. The experience portrayed was a fun and entertaining one. References to the toy-like aspect of the car, the easy driving as well as the height of the driver's seat were made to reinforce the feeling of control and fun. Belk (1988) identified ways that allow an object to be part of the extended self of an individual. He recognised that *controlling* the object was one of them. Here, the Bluecar's characteristics gave control to the users, helping them enact an appropriation of the car.

Knowing an object is another way to take ownership of it (Belk, 1988). It means paying attention to details, such as the unusual three lights at the back of the car that allowed Thomas to recognise a Bluecar from afar. Jean described the inside of the Bluecar as being different from any other car, which had for consequence to change the body movement he usually associated with traditional cars. He knew that the doorknob for instance must be pulled up to open, whereas in classic cars it is to be pulled towards you. The respondents were quite proud to show that they mastered the Autolib. Thomas expressed that to him 'it is a little game, playing the guy who masters perfectly the Bluecar'.

The relationship users built with the Bluecar did not exist solely thanks to the car's design. The Bluecar belongs to a system, the Autolib system. Therefore the service also had its role to play. It is necessary to understand that mastering the Autolib for Thomas also included using the system in an efficient manner. Autolib was not just a car to them. It was a 'concept', 'an idea', 'a system', 'an infrastructure' that combined a product (the Bluecar) and a quality service system. As Marie expressed 'Nobody is going to say: 'I'm going to get my car'. We all say: 'I'm going to get Autolib''. Therefore it appeared that when studying the appropriation of the Autolib by its users, both the product design and the service design must be taken into account.

Jean spoke about a 'very intelligent service', which combined with the built-in computer contributed to give the image of a 'smart car'. To Marie it was 'the car of the future' due to the built-in computer that allowed you to book your parking place in advance. Autolib was a way of life for Jean and Oscar; it was 'the simple life' (Jean).

It appeared that the Bluecar and the service system that Autolib offers belonged to the extended self of the respondents. This appropriation seemed to be stronger when the users were driving the car. Thomas said

that the Bluecar was 'my car for a limited period of time', Oscar expressed how when he was in the car 'It is mine, it is like if I had a disposable car' and Marie said: 'you see, during the moment I've got it, it belongs to me'. It appeared that there was a real feeling of possession of the car while driving.

The consistency and the particularity of the Bluecar's design (such as the driver's seat height and the silence of the mechanics), combined with the specificities of the services design of Autolib had for consequence to change user practices usually associated to driving. The appropriation of these new habits participated to the construction of a new representation of the driver's identity, revolving around phrases such as 'the smart car', 'the car of the future' and 'the simple life'.

### *Autolib and brand communities*

The research showed that Autolib's Bluecars belonged to the extended self of the individuals who used them. Yet they did not own the car. Autolib is a carsharing system in which they were using the cars, along with thousands of other individuals. Users were, of course, all aware that they were not the sole users of their car. However none of them felt that they were *sharing* it. To them, it was a very 'personal experience'.

Sharing, as Bardhi and Eckhardt (2012) proposed, implies an altruistic dimension that here the respondents did not feel at all. None of them decided to join for ecological or social reasons. Hence it seemed that Autolib users did not considerate themselves as 'sharers'. The identity created by the use of Autolib's Bluecar was not built on sharing, it was rather built on the particular 'way of life' implied by the product and the service system as seen in the previous part.

Although the respondents did not feel the sharing part of using a carsharing system, the experience was nothing like having their own car. The other users, the service system and the Autolib brand were important in their discourses. Users were somehow bound by the fact that they shared the Bluecars. Indeed several clues were found indicating that they constituted the premise of a brand community (Muniz and O'Guinn, 2001).

A brand community, according to these authors is 'a specialized, non-geographically bound community, based on a structured set of social relationships among admirers of a brand. It is specialized because at its centre is a branded good or service. Like other communities, it is marked by a shared consciousness, rituals and traditions, and a sense of moral responsibility' (Muniz and O'Guinn, 2001).

### **Shared consciousness**

Shared consciousness is a feeling of being alike, a feeling that other members of the communities are 'sort of like myself', that members 'sort of know each other' (Muniz and O'Guinn, 2001). For some of the respondents these feelings are expressed clearly. Oscar said 'I have the feeling that all Autolib users use it for the same reasons as I do (...) I have the feeling that all other Autolib users are like me'. Oscar was the most involved in a community around Autolib. To him it was a 'social group'. Thomas said: 'I have a feeling of fraternity, yes, it's like the Bluecar community', before stating that of course he exaggerated, but did feel curious about the other users. There was for all respondents, except maybe Marie, a real pleasure in seeing other Autolib while driving. Jean would like for instance to incorporate a function in the car that could start an interaction when two Bluecars pass each other, 'like something that pops up on the screen, I don't know'.

Marie had been an Autolib user for a longer time than the other respondents. As it turned out, she showed less interest in the other users. She had been amongst the firsts users of Autolib when it started. She had also been amongst the firsts users of Vélib a few years' back (Vélib is the bike sharing service in Paris). More research is needed to understand if Marie's feeling towards other users qualified for what Muniz and O'Guinn called *legitimacy*. Legitimacy is when members of a community differentiate between true members and those who are not. Did Marie feel more legitimate because she was amongst the firsts to drive an Autolib?

### **Shared ritual**

The sharing of rituals amongst Bluecar users is perhaps where design can play its biggest part in the creation of a brand community around Autolib. The researchers asked respondents to describe their actions when taking a Bluecar. Manifest similarities were observed in their discourses. They all looked out for the seats at first, to see if they got a leather seat or a fabric one. They all liked to see their name appear on the board, and they all have registered their favourite radios on the built-in computer. They all appreciated the possibility of booking your parking space beforehand, and they all did so each time they used the car. The creation of shared rituals can be enhanced by service design. It is crucial to think about the different steps through which users should go.

The rituals presented were very 'factual'. Muniz and O'Guinn (2001) advanced that 'These rituals and traditions typically centre on shared

consumption experiences with the brand'. After four interviews, one of the most striking finding was the pleasure of driving users shared. They all expressed real emotion of happiness when talking about driving an Autolib. The seat positioning, the electric battery and the silence induced by it were product design elements that made them feel this particular experience. To them it was like a game, like driving a 'toy' (the actual word came out in two interviews, with Marie and Jean). Driving a Bluecar appeared to be a very entertaining experience that users shared. To Marie and Oscar, it was close to the feeling of flying. Users could not have shared this experience if all Bluecars did not have the same design and if that design wasn't different from more traditional cars.

### **A sense of moral responsibility**

According to Muniz and O'Guinn, having a sense of moral responsibility in a brand community can be expressed in integrating, retaining and assisting members in the proper use of the brand. Marie joined Autolib after having used her mother's membership for a while. It was her mother who offered Marie her own membership, integrating her daughter into the community. Marie also described how at the beginning of Autolib, people did not know how to use the system very well and how they used to help each other's. She stressed that such examples of assistance are not common anymore.

The most prominent instance of moral responsibility occurred not amongst members, but between members, the brand and the product they shared. Unlike other brand communities, Autolib users actually share the same branded products. The sense of ownership towards the Bluecar may be the reason why all respondents expressed their will to take good care of the car they used. It was like their own car: 'I use it like my own car so I take good care of it' (Oscar). Another point is that they were all very satisfied with the service. They felt indebted: 'I feel that I am receiving, I'm benefiting from something (...) more that I give' (Oscar). They wanted to thank Autolib by taking care of the cars. It is the good service design of Autolib that created trust between users and the brand. The results were that users felt moral responsibilities towards the brand.

## **Limits**

This research presents several limits, notably methodological. Even with a grounded methodology, four interviews remain too little to be able to

draw any definitive conclusion on the topic. This research is of exploratory nature and a deeper field study shall be conducted to answer to this limitation. It is also important to note the lack of triangulation of this research. This should be addressed in the future by interviewing design professionals.

## **Conclusion, discussion and future research**

Throughout the research it has been observed that product design and service design combined participated to the construction of consumer's identity. The particular design of the Bluecar created a new, enjoyable driving experience. Product design, joined by a very satisfactory service system, enabled users to feel a real relationship with the shared car. They felt responsibilities towards it, affection, had stories with it, were proud of its history, its infrastructure and were excited about driving it... It appeared that users adopted the Bluecar: thanks to its design a real feeling of appropriation existed. The Bluecar belonged to the extended self of its users: it was their car, always the same to them. When building new product and service scope, designers are creating new gestures for consumers. New habits emerge, new rituals occur and a new relationship between the consumer and the product is generated. More research is needed to deepen the understanding of the relationship between a consumer and a product shared. For instance interviewees in this research talked about how the car was theirs for a limited period of time. It seems that the shared car belonged more strongly to the extended self of the users while they were driving it. When not driving, the car appeared to still belong to the extended self, but less intensely, somewhere on the other side of the continuum (Ahuvia, 2005).

The research also provided results regarding the power of design to create brand communities. New product, new service produce new rituals which, in a sharing system have the ability to link users together. Designers think about ways to give responsibilities to users, by involving them in the good functioning of the system (plugging the car after use, checking for flat tires...). Such involvement from consumers inclines them to take good care of the product they share, which is one of the elements central to the formation of a brand community. Those shared rituals bring the idea that in a sharing system consumer not only share a product but also have an experience in common. One product is use by thousands in the same service scape. The discipline of design in the context of shared products should

move from a user-centred to a users-centred thinking. How to enhance the sharing of experience? This preliminary research has shown that users are curious about other users. Who's using 'their car'? The design process in this context could benefit from integrating users-thinking stages. The question lies in how to render the experience personal to allow for the appropriation of the product, while integrating a community system in which users can interact within one another.

Future research shall deepen the knowledge on the brand community around shared product. In the case of the Bluecar, for instance, more interviews should be conducted among the firsts users of Autolib to see if legitimacy can create hierarchies among users. It would also be interesting to conduct focus groups with several users to observe the sharing of rituals or brand stories between them.

Designers have power. They have the power to give a product meaning for its users. Most famous brand communities are built around a product that has a unique design (e.g. Harley Davidson (Schouten and McAlexander, 1995); Apple (Muniz and O'Guinn, 2001)). Marketers and designers shall benefit from working hand in hand to develop useful designs that consumers can use to create meaning.

# Multimedia Storytelling – Managing Between Design and Journalism

Christof BREIDENICH\* and Marlis PRINZING

Hochschule Macromedia, University of Applied Sciences

*In an era of disruption, multimedia storytelling is key to the challenge facing media, design and journalism, namely, reinvention. Multimedia storytelling is the combination of the strengths of the textual, visual and acoustic approaches. Based on the tensions between the different channels of perception, networked and interactive media offer a broad stage for journalistic storytelling, which is still often neglected. Competencies in design and journalism are merging, creating new user-oriented combinations reflecting the quality of the content and the experience. Consequently, publishers and media institutions must take up the processes and strategies of design management. In our research, we asked about the most useful approaches to multimedia storytelling, and how multimedia projects can be improved through transdisciplinarity. We explored journalistic multimedia stories on several topics (sports, politics, environment, culture, etc.) published in 2013, mainly on German language platforms, and developed a multi-method design: guideline-based interviews with scientific experts and practitioners with experience working on multimedia storytelling projects, and an online questionnaire administered to media users, in order to compare the needs, intentions and challenges. The widespread behaviour among newsrooms is to learn through trial and error, even if they conduct pioneering work.*

**Keywords:** *transdisciplinarity, multimedia storytelling, narrative theory, visual theory, journalism theory, media design, interaction design*

## **Introduction**

Text, video, photos, graphics, sound: Unlike a standard words-on-page article, the multi-chapter series ‘Snow Fall’, published in the New York Times by features reporter John Branch in December 2012, integrated modules to recount a story such that it made multimedia feel natural and useful. This became a benchmark and triggered a wave of journalistic multimedia stories in 2013, amongst others in the German media. As the first benchmark, most project managers have referred to ‘Snow Fall’ ([nyti.ms/1prfUPw](http://nyti.ms/1prfUPw)) as the inspiration for their own pioneering works. In May 2013, the Guardian’s project ‘Firestorm’ ([bit.ly/1bix0J3](http://bit.ly/1bix0J3)) provided another template which has since been named by many as a source of inspiration. This paper provides the first systematic analysis of this phenomenon by addressing the following questions: How might multimedia storytelling contribute to the renewal of journalism through digitalisation? What are the inherent potentials of such an endeavour, and what are the potential barriers? How can research findings be used to successfully implement multimedia stories in journalism? The theoretical approach is derived from the theory of design, the theory of narration, the theory of multimedia storytelling, the theories of roles, functions, cross-mediality and newsroom management, and from research on transdisciplinarity, that is, where projects are jointly developed from the beginning by collaborating specialists who sit at the same table (II).

Our empirical research is rooted in a secondary analysis of the key findings regarding storytelling from several perspectives, and two guideline-based interview polls published in 2013. The first constituted 15 interviews with experts in the fields of multimedia and transdisciplinarity, and the second, 8 interviews with the project managers of journalistic multimedia projects and an online questionnaire of media users about their impressions of multimedia storytelling in general and four selected projects in particular. This concept was framed to explore the statements of the scientific experts and experts in the field, and compare and contrast them with the needs and expectations of the media users.

This study aimed to address systematically the following questions:

- What are the key success factors of multimedia storytelling according to experts from varied disciplines?
- What are the criteria of success of online-published multimedia stories according to the project managers?
- Is a transdisciplinary approach determinative?

- Do the expectations of the project participants coincide with the impressions and needs of the media users?

We took success stories—defined as stories which provide the democratic public discourse and help to shape the responsible citizen, thus implying a journalism that is more than just entertaining. Our study adopts a multi-perspective approach to focus on the scientific disciplines of journalism and design/visualisation. This is also reflected in the fact that the two main authors of this paper work in these two disciplines and developed this study in a transdisciplinary process. The justification for this approach relied on the fact that in such journalistic projects, designers already are standing in the second row. This marks the starting point for follow-up-research: interviews with designers about their objectives might provide further insight. The background of the investigation is the era of media change, with its call for new networked media and new narrative formats, with audiences becoming communities and with the merging of formerly separated channels for reading (texts), viewing (pictures, movies) and listening (sound).

## II. Theoretical approaches

### *II. 1. The design approach*

The matrix of Klaus Krippendorff (Figure 1) shows the evolution and development of design and the understanding of what design means. First, there is the design of products (classic product and graphic design), followed by service design (interactive interfaces, networks) and, finally, the design of projects and discourses. This concept of design deals more with the interaction between users and recipients than with the mere production of artefacts. The Krippendorff matrix leads us to our theoretical approach: journalistic production in multimedia systems should focus on knowledge and interaction with the users.

In reference to the transdisciplinary work on complex multimedia narratives, the universal attitude of design offers an alternative scientific approach. Scientific methods, e.g. in social, media and communication sciences, mostly focus on determinable issues, and the term design is related to human behaviour and unpredictable media use in the field of indeterminate knowledge. Design as an integrative discipline, and designers, as experts on the importance of images, provide valuable support for the understanding of how multimedia stories work in our research project.

... the designer establishes a principle of relevance for knowledge of the arts and sciences, determining how such knowledge may be useful to design thinking in a particular circumstance without immediately reducing design to one or another of these disciplines. (Margolin, Buchanan, 1995, p. 16)

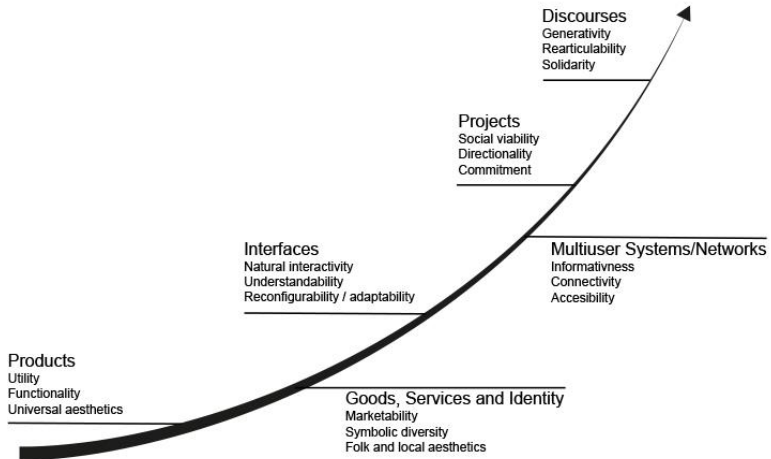

Figure 1. Graphic inspired by Krippendorff, 2006

We distinguish two phases of the design process: problem definition and problem solving.

Since mobile devices are increasingly being used in everyday life, the focus of design is more and more fixed on the experience of the user. In 'The Language of New Media' (Manovich, 2001) Lev Manovich shows how perception and knowledge is based on images or multimedia image-text-tone combinations.

Since mobile devices are increasingly being used in everyday life, the focus of design is becoming increasingly fixed on the experience of the user. In 'The Language of New Media', Lev Manovich (2001) shows that perception and knowledge are based on images or multimedia image-text-tone combinations.

Appropriate to the premise that the end product of design is always geared towards the use of the recipients, journalistic multimedia-based projects can be organised much more effectively by design. It has been proven that images—besides texts—can draw a considerable amount of attention and provide orientation. The effective use of images, from obvious signs (pictograms, logos, icons) to complex information visualisations, is also important for the selected case studies of multimedia-based storytelling. The American film scholar Seymour Chatman differentiates between the substantive components of storytelling (what) and the manner (how) (Figure 2).

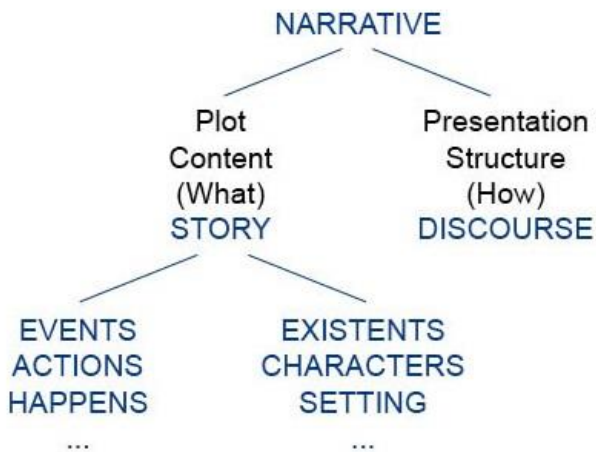

Figure 2. Graphic based on 'Story and discourse' by Seymour Chatman

Applying this scheme to multimedia-based storytelling illustrates the ability to hold attention with the help of visual design. Namely, the visual elements and their rhetorical staging exert a significant influence on the binding of the user and the design. The relationship between design and story and the way of telling it a multidisciplinary one. Journalists and designers (and even editors and engineers) should work together, using a holistic approach, as in the design dialectic square which delivers a four factor framework: design, story, telling and business (Vollmer, 2013).

## ***II. 2. Journalism research***

Storytelling is a cultural technique and a means to convey explicit and implicit knowledge with the help of words, images and sound. Journalism focusses on non-fictional storytelling. At the core of journalistic storytelling is documentation, which requires planning and research. However, there are many commonalities between fictional stories and journalistic stories. Both narratives include a narrative point of view, certain arenas and characters and a plot. Moreover, in every culture, stories are used to entertain, educate and disseminate moral values and facilitate cultural identification. This corresponds to leading journalism functions (Weischenberg, 1990; Burkhardt, 2002) which, in the case of journalism, are included alongside functions like criticism, to inform the public about the actions of the authorities and about social developments, to give both valuable and interesting information, and to transform the public into responsible citizens (Weischenberg, 1983).

Historically, linearity has been one of the narrative qualities that one can find in a journalistic piece or in a musical composition, such as in the structure of a fugue—subject, answer, exposition, discussion and summary. In today's media productions, we find a combination of linear and hyper-linear applications requiring accessible content for individual users. In this sense, multimedia storytelling is a user-centred approach which must integrate the experiences and preferences of the recipient. Thus, it must hold the recipient's attention and contain easily accessible information and a clear orientation (Manovich, 2001). For the successful transfer and acquisition of knowledge, it has been found that multimedia platforms are more successful than simple texts. The combination of linguistic content and visual and acoustic stimuli represents a much more intensive form of mediation (Hageboelling, 2004). Narrative theory offers important findings (<https://projectnarrative.osu.edu/about/what-is-narrative-theory>), as does narrative journalism, in particular about the conceptualisation of how to tell and interpret a story

(<http://www.nieman.harvard.edu/NiemanFoundation/ProgramsAndPublications/NarrativeJournalism.aspx>). This concept concerns the transfer of the techniques of fiction to nonfiction in order to tell true stories which, amongst other things, help to engage an audience in the relevant public discourses within a society via the compelling structure of the story. The analytic frame of narrative theory begins with the assumption that narrative is a basic human strategy for coming to terms with fundamental elements of our experience and the way we want to live. This corresponds to one of the core functions of journalism, namely, helping people make sense of the

world via making sense of stories. Media convergence supports transformation in journalism, giving narratives new meanings, in three dimensions: how a story is told, what is told and who the storyteller is (Renner et al., 2013, p. 7). Currently, online storytelling is more dialogue-oriented than print storytelling. As Herrmann (2013) explains, this is not only a matter of techniques but of other expectations and of the vanishing borderlines between public and private communication. Journalistic storytelling both covers reality and constructs reality. Renner argues (2013) that multimedia might combine journalistic reporting, public discourse and acting protagonists and weave narratives and counter-narratives.

In particular, due to the availability of free publishing online today, online narrative journalism has become popular among writers who are eager to share their personal perspectives on themselves and the world. The availability of social media has increased the importance of public storytelling in Web 2.0 and the importance of professional skills in public communication (Perrin et al., 2012). Sooner or later, we will live in an 'augmented reality' combining virtual and digital data with tangible things, the Internet and social media. Such an environment will not promote isolation; on the contrary, humanity will become increasingly important to make contacts and even to reject non-democratic regimes (Werner, 2012).

The changes to the media landscape include the changing ways of storytelling and reporting. Digital storytelling is becoming increasingly important (Sturm, 2013), whether journalists, newsrooms and media companies are able to implement this change systematically. Research (Kretzschmar, Kinnebrock, 2012; Rothmann, 2013) has shown that 'change management' is often missing. Most companies still focus on print; they use social media, but almost never exploit the potential of cross-media production and multimedia storytelling (Kretzschmar, Kinnebrock, 2012, p. 11). Researchers have issued warning statements as well. Failing to implement new techniques, exploit the potentials of convergence and fulfil the needs of the recipients will lead to disappearance from the market (Picard, 2013). A know-it-all-attitude and a lack of self-reflection cause blindness to the gravity of the situation and to the need for a change of attitude (Russ-Mohl, 2013). However, a wave of development might occur by changing newsroom concepts (Meier, 2007, 2013) towards integrated print–online newsrooms, where issue- and audience-oriented planning and production replace obsolete structures and working routines. In this endeavour, social media and the organisation's website become key drivers of change. Media companies should not only rely on the topicality of the

content but should create flexibility for experiments, new platforms and forms of journalistic presentation (Meier, 2013)—and also give more scope for multimedia storytelling.

### *II. 3. Transdisciplinarity*

Transdisciplinarity describes certain principles of research and science. It is not a method but a kind of procedural approach to an issue. It describes an integrated system of methods from different disciplines (Mittelstrass, 2003). Transdisciplinarity is clearly distinguishable from interdisciplinarity (cooperative connection) and from multidisciplinary (coexistence) (Jantsch, 1972). This corresponds to, and is embedded in, the systems theory of Niklas Luhmann (2001), a sociological abstraction of society as a social system, enclosing all other systems. The media system is a subsidiary system, and journalists have the additional special function of being members of society, whose special task is to critically observe the other systems and themselves. To carry out these observations, journalists take on different roles, from investigative watchdogs to pragmatic advisors, to educationalists, lawyers, promoters or entertainers (Meyen, Riesmeyer, 2009; Weischenberg, 1990).

The transdisciplinary principle, first, answers questions regarding systems knowledge, and thus concerns what has led to a certain situation and how to gain influence over future developments, second, questions regarding goals and what one wants to achieve and, third, questions regarding the possibility of changing specific circumstances in order to achieve these goals (Hirsch Hadorn et al., 2008). Transdisciplinary processes must be professionally moderated and facilitated. All disciplines are subject to an open dialogue, conducted in a transparent manner.

Transdisciplinarity is seen as a useful way of thinking and processing information in order to capture changes. The starting point is to identify existing problems, and then to develop solutions to those problems. This is done at the intersection between society and science, and focuses on the discovery of, transformation of and solution to societal problems, taking the problems as well as the actors as the core reference points (Bergmann et al. 2010, p. 10 f.). Bridging the gap between theory and practice is part of this process, and the results are both scientific insights and practical benefits (Perrin, 2012).

From these theoretical approaches, we develop our guiding research question: How can multimedia storytelling benefit from the key findings provided by design theory, journalism research and the research on transdisciplinarity? Are such findings implemented in the latest editorial

multimedia projects and, if so, to what extent? Finally, how can knowledge about perception (Hasebrook, 1995), multimedia (Manovich, 2001) and narratives be pooled in an integrative theory of storytelling (Hirsch Hadorn, 2008; Perrin, 2012; Renner et al., 2013; Sturm, 2013)?

### **III. Empiricism: Key findings from guided interviews with experts in the field**

We present and compare the results of 15 guideline-based interviews with scientific experts (A) and 8 experts from the field acting as project managers or leading participants in multimedia projects (B), and add the findings from an online survey of media users (C).

#### *A. Guideline-based interviews with experts from science*

We selected experts representing one or more of the fields related to our issue: transdisciplinarity, storytelling, journalism, design, music, multimedia and psychology. Further, it was necessary that these experts have experience in interdisciplinary work.

The interlocuted experts from science:

#### 1. Journalism:

- Multimedia journalist: Mirko Lorenz, journalist and researcher in digital publishing and multimedia;
- Crossmedia journalism researcher: Prof. Dr. Klaus Meier, University of Eichstaedt

#### 2. Transdisciplinarity:

- Prof. Dr. Daniel Perrin, Head of the institute of applied media research, Zuerich University of Applied Sciences, Winterthur, chairmanship of media linguistics (expert for narratives in journalism)
- Prof. Patrick Mueller, head of masters of arts in transdisciplinarity, Zurich University of the Arts;
- Prof. Dr. Wibke Weber, Professor of information design at Stuttgart Media University (HdM), since spring term 2014 Zuerich University of Applied Sciences, Winterthur;
- Prof. Dr. Joachim Hasebrook, Psychologist, Professor of human capital management, Steinbeis Hochschule Berlin;

### 3. Visual Communication:

- Prof. Dr. Stefan Asmus, Head of interaction design and hypermedia, University of Applied Sciences, Duesseldorf;
- Dr. Eunhyong Baek, Lecturer and researcher in design management; Chair Master programm Design Management, School of Design, De Montfort University, Leicester.
- Michelle Christensen, social scientist, designer at the UdK Berlin;
- Prof. Dr. Arne Scheuermann, Head of research in communication design, University of Art, Bern;
- Prof. Dr. Heike Sperling, Professor of digital visual media / visual music, Robert Schumann School of Music and Media, Duesseldorf;
- Ludwig Zeller, researcher in Interaction and speculative design;

### 4. Sound and music:

- Rainer Hirt, sound researcher and designer; audity - Agentur für Audio-Branding und Audio-Interaction
- Georg Spehr, sound director and designer; UdK Berlin, course sound studies.

Each interview lasted between 35 and 60 minutes. Thirteen were conducted by phone, two by mail. The empirical assessments were based on qualitative and quantitative content analyses. In this regard, we were guided by the advice of Roessler (2005) and Mayring (2000).

The interview guidelines were developed on the basis of the research findings on transdisciplinarity and multimediality, in particular concerning design, journalism and transdisciplinarity. The interview included questions about the role of text, images and sound to communicate information and about their role in communicating emotion. The respondents were asked about narrative structures, the conditions of successful multimedia stories and interactivity. They were also asked about how they define multimedia, how they define transdisciplinarity and which conditions they recommend for successful transdisciplinary processes.

#### **Multimediality**

All of the experts defined multimediality through the combination of different media modalities (auditory, visual, etc.), and some also through multi-code modalities (verbal, acoustic, etc.). The shares (multiple codes were possible) were between 44 and 81 per cent. According to them, interactivity does not matter, and digitality rarely matters (only one expert

addressed this). Surprisingly, most of the experts did not find that information transfer in particular works on the text, and emotion transfer on images and sound (e.g. Perrin). Most expressed other factors as more important. Hasebrook argued that if media presentations lead to different encodings in the mind, this is based mainly on the differences between analogue and sequential media. He emphasised the sensuous processing in the brain, rather than channels or modalities. Further, Hasebrook distinguished between 'surface and depth information' and warned of clichés. For instance, the idea that a picture is worth 1,000 words, which is common, is simply misleading, because you think there is a cultural key medium. However, with learning, for example, there is not necessarily a dominant medium; it depends heavily on which personal requirements one has to meet. Most visual media, in particular those concerning moving images, require a high level of spatial perception, but many people lack this. For them, visual information cannot be of great help. Hasebrook also distinguished between a rather spatial and a rather sequential-acoustic information processing in the brain that might also be done side-by-side. If you mix them, you generate attention, but at the same time, you might create mutually disturbing superpositions (interferences) and information that cannot be perceived. Furthermore, the transfer of emotion is far more dependent on context than on the component's text, image(s) or sound. The most successful mediation of both information and emotion should be achieved by creating stable contexts.

Mueller, however, maintained the distinction between digital and analogue, arguing that both are possible with language. The strength of language is that it enables one to make propositional statements. This is a linguistics term. A proposition is what is said in the utterance of a sentence in a particular context regarding certain issues in the world or even certain things. With language, this works much more clearly than with images and sound, but the boundaries are blurred. Experts with core competencies in visual communications often refer to the imprecision of the term 'multimedia' and the difference between the former meaning of the expression and what it means today. For designers, the concept is ahistorical because multimedia productions have existed since the Baroque era in the fields of art and design. Thus, the term is used reluctantly or even avoided (Scheuermann).

The experts were definitely united in the argument that the combination of modalities, if competently done, provides communication benefits (63 per cent). However, twice as many considered the multimedial process to be

more complicated (38 per cent) rather than easier (13 per cent). What matters is how you do it, according to Perrin: ‘For the communicator, the whole matter is dramatically more complex, but also for the recipient, unless the communicator combines the modalities so elegantly that it becomes easy for the recipient, again’. Also frequently noted was that much depends on the attitude of the media user; the elderly are less familiar with interactive interfaces than the young.

### **Transdisciplinarity**

The starting point of a transdisciplinary approach is agreeing on definitions. In the codebook, we operationalised the core points of the definitions given in the literature: starting point (everyday life problem or societal problem), aim (solution, insights), process (cooperation, combination, various disciplines, integration, theory–practise transfer), participants (stakeholders, actors, laypeople, experts, scientists) and profit (scientific insights, practical profit). Those manifestations were identified as basic codes for the conceptual content of the terms; moreover, multivalent coding was allowed.

According to present research references, cooperation is the most coded conceptual content used to define the term ‘transdisciplinarity’, followed by theory–practice transfer and various disciplines. In accordance with the ‘leading definition’ of transdisciplinarity in the literature, most of the experts consider everyday problems or social problems as the starting point for choosing a solution developed in a transdisciplinary manner. This is striking; although it deals with, at least for journalism in democratic societies, vital topics of social and life-world relevance, even the experts who are anchored in teaching or ‘practicing’ in journalism are not yet aware of this problem. This phenomenon is observable in another place. When asked about the supposed effects in three areas, which, again, are essential only for journalism in democracies—the promotion (or impairment) of discourse, democracy education and audience loyalty—in transdisciplinary multimedia approaches, 43 per cent detected a promotional effect on the relationship with the audience, but only about one fifth stated that discourse and democracy could also be promoted through such narratives. More could be done and more should be done, Daniel Perrin maintained, in society and in the newsrooms; media policy, media management and media practice must ensure change.

Unexpectedly, all of the experts, in contrast to the usual definitions in the literature, did not name or know that solution orientation and

integrating power are core characteristics of transdisciplinarity. Indeed, they mentioned cooperation and showed appreciation for it. However, few of them saw cooperation as a conscious or equal process but as being dominated by one discipline or author. Furthermore, few of them recognised the roles of stakeholders and laypersons, or the 'experts of everyday life' (Mueller). The practitioners and researchers are in the foreground of perception. Most of the interviewees expected benefits in finding solutions for both science and practice. Why research in this manner is practised relatively rarely was not clarified. Furthermore, they stated that role models are scarce. One interviewee explained this by stating that one must become accustomed to openness and face discourse. However, one in four had no answer. Sperling stated that vanity is the main problem: 'It lacks the empathy and respect for the thoughts of the others. All are always very self-centred.'

Two thirds recommended practising transdisciplinarity in general, and not only in specific projects. It is striking that there was a gap between the design and video experts, who strongly recommended transdisciplinarity, and the journalism experts, who admitted to being cautious in the use of language. On the other hand, the relevance of journalism was generally expressed. One should think out of the box. Basically, all issues would be appropriate, although only one in ten was satisfied with the preparation of the junior staff for multimedia and transdisciplinarity. Baek found, especially in combination with design and technology, that the transdisciplinary approach in journalism has high potential.

Both sides described the contact between theory and practice cautiously. Meier, for example, said that both sides would be more successful if they worked interactively. Thus, researchers should not simply present scientific results at the end of a linear process which then remain in the drawer: 'You have to go directly into the production processes to change journalism through a research group'. Particularly in times of change, it would benefit the journalistic practice to contact several research disciplines; Weber argued this with a view to the example of visualisation. Every expert supported this statement; most of them found that there is a lot of potential in multimedia storytelling, with almost everyone inserting it in another place. Patrick Mueller, for example, saw future opportunities in 'media convergence storytelling'. That is not at eye level but a willingness to say goodbye to 'conventionalised uses' and to overcome the classic defence mechanisms, and to no longer question one another. It is not just about new knowledge; one must also rediscover forgotten knowledge, as Lorenz said,

using the example of functioning and the effects and patterns of the reception of narrative structures. From the standpoint of the design and music experts, images and sounds are used in a rather additive manner (Spehr). The range of rating ranged from 'benchmark' (especially Snowfall) to 'very weak'.

Last point of this study: Those who had no opinion on the relevance of such approaches to journalism belonged to the group of 'other experts', such as the design and music researchers. One explanation could be that either experiences and role models are missing or that one group preferred not say anything about 'the other group', or that a transdisciplinary approach occurs in one's 'own work and relationship culture' far more naturally, especially as this is not yet widespread among journalists. According to Sperling, from the perspective of a designer, 'we always work in a transdisciplinary way'. Her colleague, Christensen, mentioned a post-disciplinary time that was being reserved in the transdisciplinary approaches, and free from traditional defence and behavioural patterns: 'What transdisciplinarity can bring to research is not just new questions, approaches, methods, and theories—which might provide more comprehensible insights about some of the complex phenomena that are taking place in a globalised, digitalised world, where the artificial is mitigated by multiple perceptions—and it can also provide us with a discussion of new epistemologies'.

In short: The sound and image experts focussed on different varieties of cooperation, whereas the experts in the field of journalism focussed primarily on themselves. The journalism practitioners considered the expertise of others as a decorative add-on service and performance. Despite media crises and changes in the media landscape, they tended to remain unchanging and to squander opportunities. The sound and image experts argued that journalistic flagship projects have high potential for improvement. Transdisciplinarity could especially help them to gain knowledge—in practice and theory—and promises to be a win-win situation for everyone. Therefore, transdisciplinarity must be exercised. Obviously, a journalist, even while working on benchmark projects, prefers to work following the principles of 'trial and error', rather than seeking advice and recommendations from, or cooperation with, scientists. Transdisciplinarity might be the key for change because it provides new insights into research and practice which one cannot discover alone. It seems to us that cases of multimedia storytelling provide the perfect example; journalism in a democracy must be based on the narrative power to regain its relevance.

Transdisciplinarity gives journalism the chance to offer surprising views on common issues, but this process forces researchers and practitioners to be more open-minded.

### *B. Survey: Guideline-based interviews with project managers*

We selected eight multimedia projects, all of which were published online in 2013 in the German mass media and dealt with different subjects: foreign countries (what remained of the Arab Spring), sport (Tour de France), culture (Quarrel/‘Pop auf’m Dorf’), history (Karl Marx Avenue; Willy Brandt), politics (Duisburg before the parliamentary elections; ‘Geheimer Krieg’ of the agents) as well as natural disasters (flood). Another criterion was that the stories had to be distributed throughout the year and published on various platforms. Four stories were uploaded on the platforms of national weekly media (Zeit Online, Spiegel Online), one on a boulevard platform (Berliner Zeitung), one on the platform of a regional paper (Rheinzeitung), one on the website of a public broadcaster (WDR) and one on an online platform created as a cooperation between two media houses: the newspaper Sueddeutsche Zeitung and the public broadcaster NDR. We interviewed the persons responsible for these multimedia projects and, in one case, a freelancer, because he was the project creator and was decisively involved in the project (Jonathan Sachse, Tour de France, Zeit Online). We conducted guideline-oriented interviews via telephone, containing a combination of questions on the project and questions on the use of the different modalities (text, images and sound), to allow for direct comparison with the experts’ statements. The conversation lasted between 20 and 40 minutes, and all interviews were conducted in German.

The projects included in the investigation, the interviewees and the publication date (upload):

The interlocutors were asked both about formal criteria (expenditures of time and costs, participants etc.) and about content (examples, techniques and modalities, intention, teamwork, feedback etc.).

It was impossible to forecast the costs because the projects had not been calculated, and the people involved were on editorial teams or were dedicated volunteers. The number of supporters varied considerably: Rheinzeitung: 2; Berliner Zeitung: 2; WDR: 4; Spiegel Online (topic record-breaking flood): 9; Zeit Online (topic Karl-Marx Avenue): 20; Zeit Online (topic Tour de France): 50. The project duration varied between ten days and eight weeks (Zeit Online projects). Most of the participants were members of the Zeit Online editorial team. Journalists constituted the majority, but other professions, such as programmers, graphic artists and media designers, were consulted. Often, different departments engaged in teamwork. Elder projects resulting from cooperation between Sueddeutsche Zeitung and NDR were significant for their idea of ‘Geheimer Krieg’. All respondents acknowledged that teamwork was the crucial factor. Dobbert mentioned that a constructive atmosphere is important for reaching peculiar results and generating crazy ideas. This is more difficult in larger departments, like at Zeit. Journalists tend to work alone. The necessity to synchronise different departments is complex but undeniable.

The terms for suitable subjects remained vague: they should be ‘interesting’, ‘multi media compatible’, ‘explosive’, ‘news value and high aesthetics’, ‘humans should be the main topic, or [there should be] complex circumstances’, ‘emotional impact’ and ‘the story and the application should entertain’. The selected projects were indeed all multimedia based, but the significance of the modalities of text, images and sound were very different. The percentage of text alternated between 10 and 60 per cent. In contrast, Dobbert stated, ‘We would like to have equal amounts of video, images and

texts'. However, he stood alone with this conscious idea of multimedia. In the majority of the projects, text was the main medium of meaning.

According to the experts' statements, text is used for conveying appropriate information. Manzo said that only text can tell a complex story. Schwarze provided the strongest orientation on text—the core of the reporting on the Arab Spring was text, and other elements were built around this—and Sachse stated that the understanding of the story of the Tour de France could only be entirely realised by reading. Using only the multimedia elements would not lead to an appropriate understanding. In contrast to the other experts, Sachse considered that emotions are better triggered by texts. The beauty of texts are their ability to arouse virtual images better than motion pictures. Most of the experts used images to convey emotions: 'It is important to show people and their emotions', especially in topics around disruption and death. All experts agreed that interactive graphics contribute to a better understanding of information. Storyboards were only used in the political projects, Geheimer Krieg and Duisburg. For Schwarze, dramatic composition can be arranged as follows: introduction, four main chapters, map and comments. In Stueber's opinion, the projects with boulevard or local approaches used templates from the Internet. The projects of WDR and Zeit were tailor-made by commissioning external programmers.

Editorial teams benefit from multimedia projects as part of their daily routine. The high visibility of such projects helps the editorial brand (Manzo). New challenges are important for online media, Domke acknowledged. The goal is 'getting creative, letting off steam, trial and error, implementing things that are fun'. Bensemann stressed the educational effect: 'Media is still divided. It's necessary to learn to think multimedia-based'. All experts mentioned the lack of education and multimedia training to learn special skills. All editorial teams were open-minded about future projects. Sachse would centre the attention in future projects on the user. The attention from internal and external colleagues and the audience on the multimedia projects in 2013 was high. Some of the feedback was as follows: 'well narrated' (Stueber), 'good follow-up' (Menke), 'some argued that they were not interested in cycling, but finally went in it. A very positive result' (Sachse). The detached critical voices from users who disliked the brand were in the minority (Stueber). A few mentioned that the Arab Spring story could be told better without multimedia. Further, part of the praise was kindness. Rheinzeitung received 40 comments 10 minutes after going online. No one could have read this story in this short time. Some were

simply impressed with the huge images and the multimedia itself. Feedback was also given via Twitter. None of the experts evaluated social media feedback systematically. Half of the projects were planned and organised (storyboard, dramaturgy, schedule) afterwards or during the production of the topics. Only in three cases had the project been planned before it started. The project management was either assumed by a specialist in each resort or by one person, mainly an editorial journalist.

There was evidence of a wide gap between the experts and practitioners. Research can yield many findings in the field of new narrative formats. Even journalists working on innovative projects prefer the strategy of trial and error, instead of seeking help and support from research results. It had not occurred to the interviewed experts to consult scientists or publications. Further, there was no conscious involvement of design or any integration of the design steps in the projects. Thus, design plays a minor role in the perception of most journalists. The design and technical functions were handled differently. More than half of the projects were programmed in-house, while the others used a provided template. The journalists criticised that the potential of design was either limited by static templates or had to be programmed by software engineers.

Therefore, the answer to the research question is that the findings and the competencies of external disciplines, which were not immediately involved in the practical steps of the projects, have not been implemented. Hence, the benefits which can be generated from studies like the present one, including design theory, journalism theory and transdisciplinary research, have not been reaped. Consequently, the gap between multimedia storytelling practice and associated disciplines from the fields of graphics, motion, interaction and interface design is huge. Design was not integrated in the examined projects as a matter of course. In most cases, strategic planning and management had been lacking.

### *C. Online survey: How does multi media story telling reach media users?*

The following four multimedia projects were selected for a user-based online survey: Willy Brandt, der Jahrhundertmann; Tour de France; Geheimer Krieg; Pop auf'm Dorf (Figure 3). The aim was to focus on different portfolios (politics, sports, society, history), and preferably different media channels and basic patterns. We avoided selecting projects from one publisher and preferred to choose, e.g. Geheimer Krieg, because of the interactive map, which offered special possibilities.

Figure 3. Screenshots of the four selected multimedia projects

The questionnaire comprised two parts: the first one generally focussed on multimedia storytelling and the expectations and experiences of the users, and the second one concentrated on impressions of the four selected stories.

Fifty-one persons completed the survey. The younger respondents were chosen consciously: 3 out of 4 were between 18 and 25 years of age, and were either students or professors at universities, mainly in the disciplines of design and journalism studies. The motivation behind this selection was to consult an open-minded group of users, who were also experts familiar with the usage of, and conflict between, new media applications. Two out of three already knew about multimedia storytelling and applied them regularly, and one out of three did not know anything about the topic.

Everyone uses different media forms, such as print, broadcast, television, online, but prefer online channels and especially mobile media. Interaction was of average importance, and five respondents indicated that interaction is very important.

The question 'What do you expect from a multimedia story' centred on the expectations of the technique of narration: exciting, dramaturgically well composed, well visualised, credible and authentic. The differences as compared to traditional narrations which the respondents indicated were the individual immersion, the connection with social media, different approaches and multidimensional information. The stories were considered to be easily comprehensible, and nothing was unfamiliar. Some of them mentioned the good navigation and the well-structured elements. They appreciated the combination of the parts and the well-composed duration. The recipients saw the essential difference from traditionally told stories in the possibility of interacting and using more media channels simultaneously. The respondents were also asked about the importance of design in such multimedia storytelling, which they rated as medium to high (Figure 4).

Merging all answers, the users considered multimedia storytelling as enriching; they had no difficulty using the content; and they appreciated the possibilities for interaction and the quality in general. We should mention at this point that the selected stories are benchmarks in the field of multimedia storytelling. Therefore, the success of the multimedia storytelling is the result of the quality and the good combination of content and interactive elements. Briefly stated, in three to four applications, the interviewees felt especially attracted by the design (Figure 5).

Figure 4. What constitutes the difference between this kind of storytelling and traditional media (TV/press)?

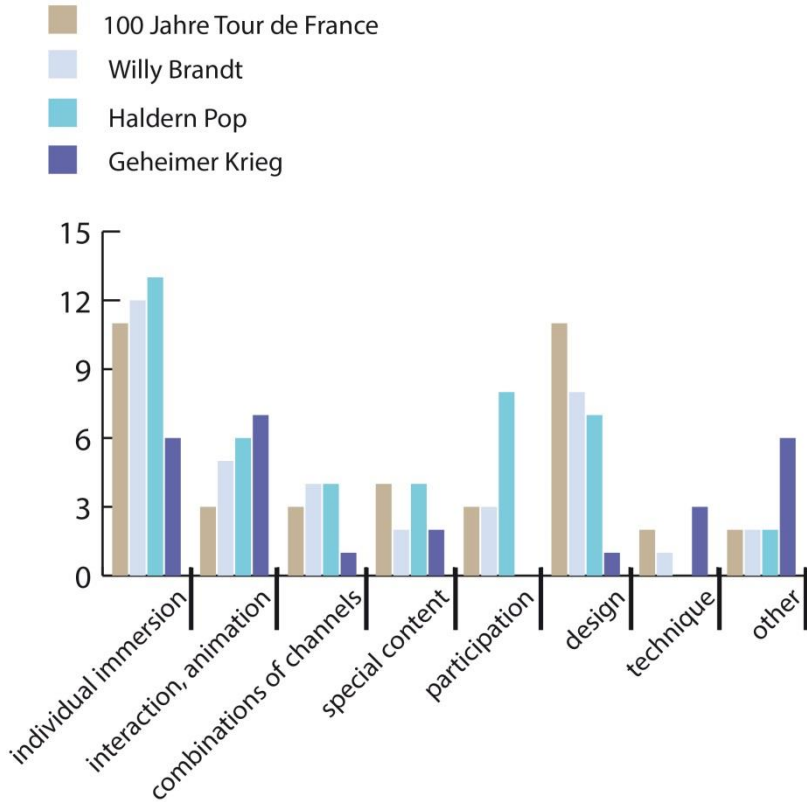

Figure 5, What appealed to you especially?

In comparison, the stories provided the following conclusion: The crucial point was the suitable choice and combination of the channels (text, sound, video and online) at nearly similar levels in the projects, Tour de France, Willy Brandt and Haldern Pop. This was a bit less so in the project Geheimer Krieg, because of an extraordinarily high potential of possibilities for interaction. In this project, the design was not outstanding, while in the other projects, design received a better evaluation.

## Conclusion

There is great potential in multimedia storytelling. Media users seem to be very open to such formats, and are sometimes even enthusiastic about them. Some potential has yet to be explored; apparently, much of the work has been done haphazardly.

There are two gaps: The deeper gap obviously is between the practitioners of journalism and multimedia experts who have research experience; even innovation-oriented newsrooms tend to follow the principle of trial and error instead of deriving benefits from the experiences of others or the findings of science, or the expectations of their audiences. This applies both to the medial implementations and—this has to be emphasised—the design. The study participants underlined the means of presentation, suggesting the growing involvement of design professionals in the development processes of new journalistic formats. Furthermore, they stressed ‘interaction’, as some of the project managers stated that in their next multimedia project, they would direct more attention towards interaction.

The eight applications which we explored reflected different priorities and production scenarios. The story about non-voters in Duisburg was a 90 per cent video narrative; the template for the Halderm Pop project should be used for future WDR stories; and Zeit Online aims to reduce the development efforts by drawing synergies and increasing the rate and the number of similar applications. The Geheimer Krieg project had a special focus on interacting with the user, with maps indicating which facilities are located closest to one’s residence. In the flood project, the before and after images were shown in order to exhibit patterns of behaviour and politics. All projects were pioneering projects that seem to have inspired all parties involved—in the newsrooms and in the audience. However, a more systematic, better approach—a transdisciplinary approach—would benefit all sides, especially the practitioners currently in the newsrooms. As useful as gut feelings are, and as important a practice as expertise is, and as surprisingly positive as the results of experimentation might be, a common, collaborative approach, also contacting researchers regarding such issues—this can be read from the theory as well as from the empirical findings—might reduce errors and omissions and set propelling impulses.

Linking the procedure of the makers with the reactions of the recipients, and comparing this situation with the annotations of part II. 1. The design approach offers the following picture: Even if there is little to no consideration of the design aspect in the production of a multimedia

narrative format, the recipients nevertheless regard design as a factor of innovation (the distinction from traditional media) and as important for creating a general impression. Related to the six levels of the extended design concept (Krippendorff, 2006), design is more than creating products, services or interfaces. If design is applied to the design of a network and complex projects, it is much more astonishing that the design is seldom integrated in the production process. It is the same with the differentiation in the narration model of Chatman (1978), where the narration only is composed partly of its elements (character, settings, actions). There is also a second level (level of structure) which is important in the design of the elements of the first level (level of content). Therefore, design, in its extended definition, is trend-setting for networking and media interaction, and also for the impact of good storytelling.

Finally, thus closing the circle: Narration includes the textual, visual, audio and creative presentations of content. The transdisciplinary approach allows for combining the strengths of different perspectives and requires a dialogue between practice and analysis. Our results from the guideline-based interviews with experts and practitioners and the survey regarding multimedia projects show strengths and weaknesses which can be bundled ultimately in the recommendation to become resolutely open to a transdisciplinary approach.

## What Does Design & Innovation Mean for MSEs? A case study of eight Brazilian furniture firms

Viviane G.A. NUNES\*

Federal University of Uberlandia

*Design and innovation themes have been discussed by many authors, with different emphases. Some approaches are systemic and involve the quality of the stakeholder's learning; others relate innovation to a design process or a way of thinking. In MSEs (micro and small enterprises), the improvement of competencies through relationships is crucial to support good design and to achieve successful innovations. Small companies interact in socio-economic networks, which highlights the importance for strategic development within them. However, many small companies are distrustful of the potential cost-benefit for both investing in improvement of competencies and in the employment of professional designers. In contrast, there is an evident need to enhance design awareness among them. The present work aims at discussing these issues in a contextualised Brazilian scenario through the analysis of eight wooden furniture MSEs, their understanding of innovation, and the use of design in their companies.*

**Keywords:** Innovation; Design; Wooden Furniture; Brazilian MSEs

## Introduction

Design and innovation themes have been discussed with different emphases by many authors (Van de Ven, 1985; Swan, Newell, Scarbrough and Hislop, 1999; MacCraw, 2006; Owen, 2007; Manzini and Vezzoli, 2002; Morelli, 2007; Verganti, 2008; Bucolo and Mathews, 2010). Some approaches are systemic and involve the quality of the stakeholder's learning (Hall, 1995; Meroni, 2008); others relate innovation to a design process (Zhuang, Williamson and Carter, 1999), to a way of thinking (Brown, 2008), or to technological or cultural factors.

Some authors (Weick and Roberts, 1993; Carlile, 2002; Kloth and Applegate, 2004; Morelli, 2007) have affirmed that knowledge sharing is crucial for sustainable participation in design and innovation processes, and can be established only if knowledge processing is cooperative. This can occur by improving both individual and company abilities, making them part of an interconnected and diversified system of stakeholders to explore new opportunities, to support well-managed actions and, thus, to obtain better results.

The improvement of competencies through relationships, especially in Micro and Small Enterprises (MSEs), is crucial to the quality of solutions, whether related to products or to services. This improvement can also support the quality of relationships themselves, thus facilitating cooperative behaviour as well as openness towards collaboration. It is therefore valuable that innovative and management strategies include the exchange of knowledge among MSEs, hence contributing to the adoption of more efficient processes through design as well as contextualised solutions that respect and potentiate local cultural aspects.

On the other hand, achievement of effective innovations depends mainly on: a) the continuity of actions performed by a specific group involved in any experience, desirably an inter-organizational group of partners; and b) the quality of knowledge shared among them. Also, maintenance of such innovations will depend again on the quality of these relationships built on a collaborative network approach. Some authors affirm that MSEs already interact in socio-economic networks, which highlights the relevance of a strategic development.

However, most MSEs are distrustful of the potential cost-benefit for both investing in the improvement of competencies and in the employment of professional designers (Bruce, Cooper and Vazquez, 1999). This is strongly confirmed within Brazilian micro and small enterprises, clearly shown by those involved in the experience of this work. Due to their small size and

capacity for managing everyday dynamics, MSEs are generally focused on their own immediate problems. Moreover, the cultural resistance and the trust needed to try novel solutions as well as new ways of interacting represent a huge barrier in changing the companies' performances.

In contrast, there is an evident need to enhance design awareness among them, especially in the microenterprises. In order to evolve and reach a local cultural resource using a sustainable focus as a competitive strategy it is necessary to change the way MSEs face design and innovation issues as well as their management processes.

The present work discusses some of these issues in a contextualised Brazilian scenario through analysing an experience that involved eight wooden furniture MSEs, their comprehension of innovation as well as the adoption of design within their companies. These MSEs took part in a Design Pilot Project named MODU.Lares Project, during an 18 month period, from January 2011 to June 2012. The Pilot provided them with the opportunity to face challenging issues associated with collaborative strategies to improve performances in a highly comprehensive view. The aspects approached during this experience were mainly related to sustainable and economic management topics, which strongly demanded, from the MSEs, a new way of facing social and cultural issues in relation to their businesses and their connection to the broader context.

However, this work does not pretend to present a definitive answer to these issues, especially because, during the experience, the MSEs demonstrated very contrasting behaviours when facing the same situation. Instead, the paper intends to open a debate about the value of culture, knowledge and 'healthy relationships' among different profile organizations - whether they are businesses, institutions or governmental bodies - through a design connection in such a context like Brazil: is it really possible to believe in a socio-cultural and environmental role for design and designers within organizations? Or are business organizations convinced only in the importance of profiting, and therefore avoid any kind of effort to assume their cultural, environmental or social role in their operations?

### *Reflections on Design and Management*

Design management as an important instrument for market competition has been supported by many authors (Gorb, 1990; Walsh, Roy, Bruce and Potter, 1992; Roy, 1994; Bruce, et al., 1999; Mozota, 2003; Best, 2006). Indeed, for Mozota (2003), design management has a double objective: to familiarize managers with design and design with management; and to

develop ways to integrate design into the company environment. In this way, design can support companies, in particular micro and small businesses, in different ways (Bruce, et al., 1999): beyond managing processes and product creation, it focuses on improving customer services and experiences. Also, it contributes to increase the companies' efficiency as well as to define waste reduction strategies (Mozota, 2003; Best, 2006).

Some reasons that lead companies to undertake strategic partnerships can be associated with many aspects, such as:

- improvement of their productive capacities (Swan, et al., 1999);
- reduction of uncertainties in their internal structures and in external environments (Van de Ven, 1986; McCracken, 2005; Todeva and Knoke, 2005);
- acquisition of competitive advantages that enable them to increase profits;
- gaining of future business opportunities that will allow them to command higher market values for their outputs (Todeva and Knoke, 2005; Teixeira, 2005);
- compliance to specific requirements regarding environmental and sustainability changes (Manzini and Vezzoli, 2002; Vezzoli, 2007).

Despite its relevancy as a source of user-centred innovation and competitiveness, design is still little used, especially by small and medium-sized enterprises (Bruce et. al, 1999; Thenint, 2008; Raulik-Murphy, 2010).

In addition, Todeva and Knoke (2005) and Tsai (2009) argue, for example, that the company's engagement in a partnership within an inter-organizational collaborative network depends on the partnership purposes themselves, the characteristics of the organizations and on multiple environmental factors. Since viable solutions to problems of resources and capabilities are not often available within a single company (Das and Teng, 2000), inter-organizational collaborative networks (*ICoNs*) (Nunes, 2013) configure an important instrument to operate, aiming at achieving innovative and more sustainable solutions (Nunes, 2013).

These factors are positioned on different levels, and each one comprises specific issues to address change and performance improvement, such as: a) organizational level (*e.g.*, learning and competence building; adaptation to environmental changes); b) economic level (*e.g.*, market risk reduction, sharing of resources, economies of scale); c) strategic (*e.g.*, cooperation with potential rivals, business diversification); and d) political (*e.g.*, overcoming of

barriers, influence for investment in policies) (Todeva and Knoke, 2005; Tsai, 2009).

The role of design is, therefore, fundamental not only to collaborate with qualified knowledge, thus stimulating the building of scenarios that allow to seek better solutions (Zurlo, 1999; Mozota, 2003; Best, 2006; Rossi Filho, Meroni, Monti and Galisai, 2009). Design can also support the implementation of such solutions, through managing design processes with the aim of reaching successful outcomes (Mozota, 2003; Best, 2006) in all dimensions involved in the collaborative process.

But, although innovation can benefit companies, institutions, individuals and society as a whole, as already argued by Van de Ven (1986), some difficulties in managing its dynamics were confirmed during execution of the Pilot Project. The factors were mainly related to: a) little attention to management; b) resistance in acceptance of new ideas; c) part-whole relationships; and d) institutional leadership, among other aspects.

## **The Brazilian Scenario**

### *The Design Pilot Project Contextualization*

The research intervention took place in the city of Uberlândia (the Triângulo Mineiro and Alto Paranaíba region), Minas Gerais State, Southeastern Brazil. With a population of approximately 640,000 inhabitants (Boente, 2013), Uberlândia is a pole-city for nine neighbouring smaller cities and represents 70% of the regional demands for goods and services. Despite its strategic position and the relevance of the tertiary sector for local economy, the city presents a very fragmented design system among different institutions, whether academic, governmental or business entities (SEPLAN, 2009).

In particular, the wooden furniture sector is formed by about 800 MSEs<sup>1</sup> (Oliveira, et al., 2012) working mainly in craft and made-to-order productions. Almost 85% of these firms are not officially registered and work in precarious facilities with poorly adapted and obsolete machines,

---

<sup>1</sup> Many indications have been used to classify enterprises as micro, small, medium and/or large-sized categories which vary according to the contexts and objectives (Lima, 2001). This work uses references from SEBRAE (2012), *i.e.*: Micro enterprises: <19 employees (I&B sector - industry and business sector) or < 9 employees (C&S sector - commerce and service sector). Annual turnover: ≤U\$160,000; Small enterprises: 20-99 employees (I&B sector) or 10-49 employees (C&S sector). Annual turnover: between U\$160,000 and U\$1,600,000.

employing an unspecialized labour force. The output of this system is composed of products with lower aesthetic or technical quality when compared to other competitors within Brazil, except for the companies that have already established relationships with interior designers and architects. In these cases, furniture projects are usually technically detailed with a high aesthetic quality.

Nonetheless, the majority of these firms (both formal and informal MSEs) lack control over material consumption and waste disposal. There is a recognized unawareness of better practices that could reduce the environmental impacts of the furniture sector in the region. Moreover, from the approximately 120 formal enterprises, only 50% are members of the Local Sector Association (SINDMOB). With few exceptions, the furniture sector is strongly characterized by an inertia to look for organizational, technological or knowledge advances, which reflects its lack of leadership (SENAI, FIEMG, SEBRAE and SINDMOB, 2006).

The furniture MSEs have different development levels and only a few of them present a potential for adopting more sustainable practices due to limited competencies regarding many aspects. Most of these aspects are related to: design (development of products, sustainable design, and design thinking among others), managerial issues (leadership, strategic planning, knowledge, processes and others), and operations (use and development of technologies, production, distribution and marketing) mainly due to their companies' complex facilities, as well as relationships (with clients, suppliers, institutions and others).

After a previous diagnosis, the MSEs that integrated the Pilot Project were selected based on their similar levels of structure and facilities, managing practices and similar targeted markets, in order to facilitate the carrying out of the pilot development. Even though still deficient, these companies demonstrated better conditions to renovate practices on design, production and management issues. Such a perspective also included the possibilities for improving environmental, social and economic performances, including new social and cultural values in their relationships with stakeholders.

Based on a combination of data from a previous diagnosis carried out by SENAI, et al. (2006) and an up-dated diagnosis (carried out by the researcher in 2012) (Nunes, 2013), the Pilot Project reinforced some recommendations (and proposed as part of the Pilot) to the furniture sector, as follows:

- **Management Practices:** an action plan for improving MSEs, starting from the basic concepts of management and their implementation;

- Collaboration: a strategy to improve knowledge by exploring practical knowledge concepts, personal experiences, and to foster the commitment of participants;
- Market Demands: solving the lack of market knowledge (*i.e.*, understanding clients, commercialization methods and marketing investments);
- a Pilot Project as a Strategy to Foster Collaboration: the trial of a cooperative action implementation.

As the MSEs had been operating on individual levels and in isolated ways, collaboration was quite absent among them. Such isolated behaviour resulted in a reduced impact of their decisions at strategic, tactical, or even operational levels. Moreover, this situation limited their capacity to obtain financial subsidies or economic incentives to invest either in research and development or in consultancies which could support not only the improvement of competencies within the companies, but also the increment of technology and manufacturing processes.

With respect to management issues, almost all MSEs were (and still are) managed by people that have been progressively learning how to produce wooden furniture. Their tacit knowledge has been passed from generation to generation, which means that, even in those cases where some evolution of manufacturing practices have occurred, the machinery used and even the production processes are still associated with highly crafted production and thinking, with few exceptions.

As pointed out by Atkinson and Meager (1994) and Bruce, et al. (1999), MSEs are, in general, mainly owner-managed. This condition creates a relation of dependence between company and owner, since the owner has the skills and experience. However, if the entrepreneur is not aware of the potential value of design for their company, or if there is no time to gain skills to work with a designer in a proper way, the adoption of design competencies in these companies may be very hard or might not even occur (Atkinson and Meager, 1994; Bruce, et al., 1999).

According to SEBRAE/MG (2011), there are regular initiatives in Brazil to improve the management of MSEs. However, much still remains to be done to professionalize their management attitudes and much more investment is required to improve their productivity and quality. Sometimes, this is due to the generalization of propositions the consultants offer to these micro and small companies, lack of mentorship or scarcity of resources (time, financial). In some cases the lack of interest by MSEs is related to their poor understanding or recognition of the importance of management within their

businesses. In fact, motivation is a critical aspect that is rarely exploited in consultancies or entrepreneurial courses oriented to MSEs in Brazil.

Moreover, there is an evident need for regionalized policies to stimulate these enterprises to search for higher levels of efficiency, thus creating advantages for their wood furniture production business to overcome their limited technological knowhow and also their managerial specialization achieved so far. Indeed, design policies could motivate furniture MSEs to seek design competencies in order to differentiate and increase the companies' positioning in the market.

As MSEs commonly have economic difficulties in hiring designers as a permanent teamwork resource, partnerships with the university, for example, to provide a design support for these enterprises until they are able to definitively assume professional designers, could be a feasible solution. Actually, at times the reason for not having a full time designer is also related to the entrepreneurs' little awareness of the real value of design to build novel ideas and approaches for innovative solutions, as argued by Brown (2008).

At times, and especially in the case of Uberlândia, the absence of designers in furniture enterprise environments is also related to the lack of interest that interior designers have in the manufacturing process of artefacts developed by them or even for participating in MSE operations, beyond the level of the project. As we see, there was a local pressing necessity for changing the approach to design issues from an isolated aesthetic tool into a strategic key tool for conceiving and manufacturing furniture and, above all, for developing these MSEs in broader terms, including an orientation toward a greater level of sustainability.

### *The Research Aims*

As argued, most micro and small wooden furniture manufacturers in Brazil do not have a strategic systemic vision. In addition, there is also a lack of mechanisms (*e.g.*, R&D; funding or tax incentives) and factors (*e.g.*, socio-economic resources; technical, technological and management competencies, among others) that could guide the construction of these collaborative, interconnected and systemic processes.

Thus, the main objective of this experience, involving eight MSEs of the furniture sector, to address these gaps was:

- To stimulate, through a Design Pilot Project, the openness to, and the further adoption of, new approaches for Design and Management that could contribute to the development of a

sustainable and systemic vision. It also aimed at triggering a behavioural shift that oriented a new scenario of production and consumption and that could contribute to a gradual changing process toward sustainable local development.

This “new Design approach” was associated with both the way of conceiving and producing objects and the way of relating with other organizations in order to achieve more effective results regarding sustainability in all its dimensions (Manzini and Vezzoli, 2002; Hardy, Lawrence and Grant, 2005). Some aspects were intrinsically connected, since the changes in one aspect would necessarily affect, or demand the adjustment of, some other. For example, the adoption of modularized solutions for furniture would contribute to reduce material waste as well as to optimize design and manufacturing lead time (Maxwell and van der Vorst, 2003; Ljungberg, 2005; Vezzoli, 2007; Federlegno-Arredo, Habitec and Trentino-Sviluppo, 2010).

Moreover, the social and cultural aspects of this proposal were confronted with the interaction among involved partners (*i.e.*, companies, institutions, government) in order to make the actual exchange of knowledge possible, thus increasing competencies and capacities for working together and making businesses advance. In addition, as the final products proposed by the Pilot Project were oriented to low income customers of Uberlândia and region, they also intended to fulfil some basic needs of this strata of population, beyond just cost and quality in production, providing solutions that were also sustainable and have a design suited to their requirements (Elkington, 1994; Porter and Krammer, 2006; Morelli, 2007; Parker and Ford, 2009).

Complementarily, two aims can be mentioned: a) the evaluation on what level the Design Pilot Project contributed to stimulate and support the *system-ability* of that context. This was done by using an assessment tool developed by the researcher that included environmental, technological, organizational, economic and socio-cultural aspects; and b) the indication of some actions for the stakeholders (*i.e.*, MSEs, university, support institutions, associations and local government), in order to foster the achievement of the full benefits of a collaborative environment, encouraging regionally based sustainable Design policies and promotion, thus contributing towards local development.

### *Findings of the Experience*

This work highlighted the importance of increasing competencies and sustainability awareness in relation to many aspects for more responsible practices within the context of MSEs. Indeed, this increase depends on a change in the way MSEs deal with problems, and requires knowledge and new behaviour. Due to the difficulties faced in daily practices such as work overload, for example, most of the time MSEs do not engage in processes to search for more knowledge that could contribute to their evolvement, even though this improvement is a basis for it. And, exactly because of this, a collaborative network could contribute to support the MSEs in achieving better operational levels.

However, it is also true that when business partners are not able to deal with internal problems, as mentioned, the difficulties of working together as well as the potential vulnerability of relationships, mutual respect and trust among partners increase, as happened in this experience. Thus, it is critical for MSEs to recognize the need for improving both the individual levels and the company's abilities, making them part of the process by learning and sharing knowledge and information to obtain better results of design and innovation aspects within their companies.

The MSE partners in the collaborative network, built by the MODU.Lares Project, assumed only partially their individual responsibilities for their improvement of competencies. The attention dedicated to organizational aspects (thus clarifying visions about their business and more adapted paths to cover), and to technological and innovation aspects (thus exploring new ways of dealing with manufacturing, even though still using craft systems) still must be reinforced and translated into the strengthening of the MSEs' management levels.

Above all, the increase of such competencies must be associated with the increase of interest in facing the environmental problems that regard each MSE operation. All these aspects, if coordinated with a main collective intent, can support better interaction in inter-organizational collaborative networks, thus contributing effectively to their evolvement and to the development of the broader context as a whole.

A crucial aspect of the experience was related to the leadership of the furniture sector. Any desired change that may affect, individually, the *status quo* of the local business organizations must be associated with their capacity for defining collective goals for the whole sector. To do this, the most challenging aspect is to strengthen the MSEs' participation in the Local Association (SINDMOB) in order to more easily access funding and other

incentives to facilitate investments in research and/or technology, or even for improvement of their facilities.

Only through this, the strengthening of the sector's governance can support the engagement of other collaborative groups to scale up positive impacts. However, this would depend on two main aspects:

- a previous preparation of new partners to respond to aspects such as those discussed in the project (*i.e.*, environmental, technological, economic, socio-cultural and organizational);
- the quality of learning and innovation that individuals are able to share in their relationships among the different stakeholders and contexts.

Nonetheless, by increasing their awareness of such issues not as distant problems identified outside the company but mainly as internal concerns, this would reflect in successful external benefits generated by the individuals' improvements.

Among the outcomes, as many authors have already discussed, the experience confirmed that:

- the owner's way of management within MSEs seriously interferes in the knowledge, skills and awareness of the potential value of design (Bruce, et al., 1999). On many occasions – during meetings, prototyping processes and exhibitions, the single way of expressing an individual entrepreneur's opinion easily changed the course of a collective decision among the group of MSEs;
- the exploration of design benefits occurs only in cases of immediate needs (Cawood, 1997). Among the involved group, these "benefits" were directly related to immediate profits and to the guarantee of marketing success before investing their time and money;
- the lack of financial resources and management, scarcity of skilled labour, and of marketing and sales skills remain internal barriers (Hughes, 2001), as well as lack of information on potential markets, sources of finance and government rules, restrict actions and partnerships. Despite hiring a manager-coordinator for the group, the absence of a long-term vision contributed towards abortion of the experience;
- the little belief in the value, or sureness in the results, of employing creative professionals delays the development of new actions and the trial of novel solutions (Cox, 2005).

## Discussion

Van de Ven (1986) argues that when dealing with design and innovation within MSEs, some restrictions can lead to inertia and early abandonment of ideas: first, there tends to be a short-term problem orientation in individuals and organizations; and second, the portfolio of ideas is little suitable for the situation or it is misunderstood by companies. Actually, the present experience validates that not every partner (MSEs or other organizational typologies) can successfully be engaged in collaborative networks, as well as positively implement innovations, whether technical or behavioural, or related to designing products, processes or services.

Many factors impact the potential for change that can be internal and external, even in the case of the MODU.Lares Project, which was a medium-to-long-term project based on a much focused context and on an updated diagnosis. These internal factors can be related to aspects such as: enthusiasm; leadership; potential and ability for collaborating; awareness of specific internal problems but also of their interdependence with external factors, among others. The external factors can be associated with aspects such as the quality of the collaborative environment, *i.e.*, the relationships established and maintained by such networks; the effective support that organizations obtain to operate in collaboration; the relations with market and consumers, in the case of business organizations; and the relations with social entities, in the case of associative and academic organizations.

In specific terms of technology, infrastructure and production aspects associated with the furniture sector in the region, the majority of local MSEs presented a low technological level. This condition has led them to technical stagnation, reflected in limited productivity and lack of competitiveness in a broader market. Nonetheless, the improvement of the facilities' quality would depend not only on the availability of financial resources, but also on skilled knowledge that would orient the acquisition of new machinery and allow its use.

Besides the technological aspect, design awareness is still quite challenging. While 72% of the MSEs affirmed to using design to develop furniture, it was not perceived as a key factor for competitiveness and success for the company. This highlights the pressing need for diffusion of the design culture within the sector, in order to improve both aesthetic and technical aspects as well as management issues by these MSEs.

A relevant aspect highlighted by the experience was the MSEs' motivation, *i.e.*, their main stimulus was based on economic aspects, despite the systemic relation proposed among all the aspects discussed from the

beginning of the Pilot. For the group of entrepreneurs involved, there was a need to guaranty the success of any investment of time and money, even if a little, before it could occur. In a few instances, only two entrepreneurs (from eight) recognized the experience either as an opportunity for both improving knowledge and creating value for their companies, or an opportunity for increasing their competitiveness in the market. However, their awareness did not contribute to change the whole group's vision and to stimulate commitment.

Despite diverse limitations, the MODU.Lares Project revealed that some partners had feasible conditions to adopt new paths and collaborate toward a new scenario. However, the strong state of passivity of the local furniture sector and other organizations (*i.e.*, support institutions, local government) as well as political constraints also demonstrated that, notwithstanding those feasible conditions, there is a demanding path to follow.

Moreover, the presence of an organization or a manager to efficiently assume the leadership of actions in partnership with the furniture sector by pushing participation among the different organizations and individuals is also crucial, yet challenging. Possibly, this attitude would contribute directly to the continuous execution of actions and to maintenance of a successful collaborative network and development of the furniture sector.

It is decisive for the sector to recognize that innovation is not the enterprise of a single entrepreneur and that co-design is a strategic key to MSEs. Above all, a network-building effort is necessary which focuses on the adoption and the continued execution of a set of new ideas among organizations which, through healthy interactions, become properly engaged with these ideas in order to transform them into good and replicable current practices.

## Semiotics and Global Products Design

Salvatore ZINGALE<sup>\*a</sup>, Felipe DOMINGUES<sup>b</sup> and Dijon DE MORAES<sup>c</sup>

<sup>a</sup> Politecnico di Milano; <sup>b</sup> Politecnico di Milano - Bursar of The National Council for Scientific and Technological Development (CNPq/Brazil); <sup>c</sup> Minas Gerais State University

*This paper aims to make theoretical progress based on previous empirical studies on the semiotics of global products. Once these studies are supported by the theory of semiotics, this article proposes to discuss the possible ways to advance on research methodologies to analyze the relationship between users and their goods. Hence, the concept narratives, encyclopedia and dialogicity emerge as a manner of visualizing, categorizing, analyzing and linking information from/across different cultures. Furthermore, this discussion and advancement contributes to the management area in the sense of providing an epistemological foundation to improve systematic approaches on global products analysis, positioning and adapting, and its design process.*

## Introduction

The relationship between individuals and products can be more complex than merely a material or an economic issue. They can then be understood as complex social phenomena, in which the semiotic aspects are equally relevant. Hence, it is necessary to better understand the possible relationships between physical and cultural signs in order to improve product development and adjustment for international markets.

Because of our dependence on symbols, it is desirable that objects materialize semantic codes to come to fruition in culture-specific contexts. Against this background, semiotics has evolved as a science that can adequately support empirical studies on the semantics of global products, improving the processes of product analysis and differentiation.

Unlike the commonsensical notion of differentiation, adaptation in the global market does not focus on changing the products' physical features, rather on the capability of transferring intangible features to the objects. This is evident in Moraes' (2008) argument that design, as a discipline, has drawn on the social sciences, aiming at anticipating the needs of future users. Thus, design has evolved into a multi- and interdisciplinary domain that is capable of providing timely responses while remaining open to interactions (Moraes, 2010).

In this context, semiotics emerges as an instrument for gaining better understanding of such issues as metaphors and identities of objects of use. Generally speaking, semiotics can be regarded as a scientific basis for designing objects that carry predetermined functions at the primary and secondary levels and are equally subject to being assigned functions at both levels (Domingues, 2011a). Regardless of Eco's (1968) contention that designers are supposed to manipulate variable primary functions and leave open the secondary functions, they are also able to deal with variable secondary functions. Domingues (2011b) provides empirical evidence that supports such a claim and points out the possibility of building on ethnographic technique methods to research and analyze cultural semantic categories that can contribute to the analysis and design of global products.

## Theoretical Context

### *Global Products and Symbolic Meanings*

In general, companies face complex issues when developing global products. As Levitt (1990) argues, ethnic specificities are traces of cultural

heritage, likes, and standards. However, as Levitt also points out, some of such traces slowly open up space for changes while, controversially, others simply evolve globally to make way for the homogenization of ethnic-specific standards at the worldwide level. This does not imply the end, but rather the widening of specificity and, in the face of current communication and technological progress, differences between users should be carefully assessed. In this context, design has been assigned the responsibility of efficiently adapting products (McCracken, 1988). As Levitt (1990) claims, technological modernization opens the way to design-based differentiation and other factors related to the market positioning of products.

The management literature features discussions on competition, differentiation, and positioning of products in the international market. The relationship of design, marketing, and other disciplines involved in product development is complex, and their integration is relevant to developing appropriate products. Scholars have observed that taking multidisciplinary approaches is relevant to understanding how product design provides superior experiences and adds value for the users (Kotler & Rath, 1984). Nevertheless, studies on which factors should be integrated into the design process to add such value remain incipient. Models of development of global products lack specific data on the interactions between users and goods and on their typical use. In our view, this can be obtained by identifying, analyzing and understanding semantic values, as well as advancing the use of ethnographic information, which has been restricted to the alignment of forms, functions, materials, and textures (Boztepe, 2007), rather than focusing on the possibilities of semantic relations between individuals and the objects of use. Such semantic relations are strongly associated with concepts of affordance, material culture, and identity.

As pointed out by Gibson (1986), the focus of the term “affordance” relies on the possibility of an individual performing an action within the scope of his own context. In applying the concept “affordance” within the design domain, certain objects and environments can be considered as being more or less adequate than others in specific functions, and it is their physical features that assure their adequacy to either one or another task (Lidwell, Holden, & Butler, 2010). This implies that designers who develop user-oriented projects design products focusing on their potential meaning (Krippendorff, 2006). As product design involves physical objects, designers should be attentive as to how shared cultural conventions within social groups directly impact on the actual affordances. Therefore, since the objects have cultural and social dimensions, and are also subject of a project

(Bianchi, Montanari, & Zingale, 2010), they can be named as artifacts and products (Bonfantini & Zingale 1999; Deni, 2001).

The purposes that individuals assign to artifacts and products derive from cultural processes, and designers should observe semiological features that are intrinsic to the material production. It is the production of goods and values that generates and reflects a society's cultural identity (Bomfim, 1999). One's identity is expressed in a product through three features: its very existence, origin, and quality (Nyemeyer, 2007).

As Eco (1968) claims, objects of use do not only function, they also communicate. Every use is converted into signs with the existence of a social group; therefore, an object that has a function enables and promotes this existence (Barthes, 1964). The use of objects goes beyond their functions: they can denote and connote specific functions depending on the cultural system (Eco, 1975).

Therefore, the notions of denotation and connotation are crucial within semiotics. Similarly, the terms signifier and signified provide analytical tools to describe two meanings: denotative meaning (level of the signifier) and connotative meaning (level of the signified), as indicated by Hjelm (2002). Such concepts refer to different levels of meaning, which explains why Barthes (1957) introduced the notion of new orders of signification. The first order is denotation, that is, the sign comprises both signified and signifier. The second order is connotation in that the denotative sign is used as a signifier and assigned a new meaning, referred to as myth (Barthes, 1964).

The myth comprises two semiological systems: the language and the system itself, referred to as object language and metalanguage (Barthes, 1957), Figure 1.

*Figure 1 The double integration of the semiological system within the Barthes' myth. Source: Developed by us based on Barthes theory (1957).*

As previously stated, objects of use can be deemed systems of signs, which should be characterized through contextualizing the signifier, culturally building on existing codes (Eco, 1968). This semiotic imposition admits the existence of a signifier within the signs of the objects of use, and this very existence enables the production of meaning or different functions.

Primary functions are clearly different from secondary functions: primary (denoted) functions are the initial functions, whereas secondary (connoted) functions are symbolically derived (Eco, 1975). In denotative terms, the object of use is the precise signifier of its function (Eco, 1968). However, certain forms may go unrecognized as determinants of certain functions (e.g., those of symbolic nature) and demand the awareness of a specific code for them to come to fruition.

The assignment of functions also implies a wider range of all communicative attributions of an object, as the symbolic connotations of an artifact are no less useful than its functional denotations (Eco, 1968). This means that before turning into actions, the functions codified by objects of use are classes of possible functions, or cultural units (Eco, 1975), and because the functions of these objects correspond to cultural units, the codes for their conception are found in cultural features and, hence, lie simultaneously within cultural anthropology and semiotics.

As a synthesis of the arguments on semiotics presented above, Figure 2 represents the theoretical foundation that allowed us to develop the framework that follows.

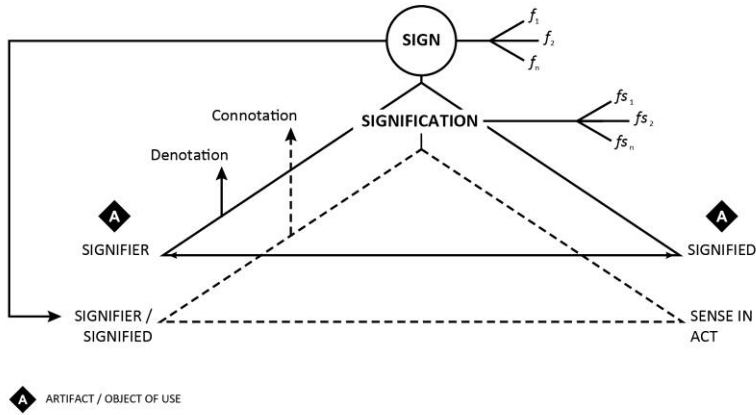

Figure 2 Model of interplay of functional and symbolic meanings.  
 Source: Adapted from Domingues (2011a).

Meaning assignment depends on the existence of an interpreter, that is, an individual that turns the object into a channel for the production of signs. In Figure 2, the left vertex of the first juncture, the denotation vertex, stands for the artifact existing [signifier], but still lacking representativeness. When the object starts representing something, it is assigned a sense [signified]. However, according to semiotics, only in a third moment [sign] is the object assigned the meaning of the first chain, which, for the objects of use, is realized in a use function:  $f_n$ . In the case of an object of use, shown in Figure 2 as an artifact, in the first articulation denotes its forms of use and connotes its possible functions –  $f_n$  – which are preconceived and recognized by the individuals. In other words, the object comes to being already carrying a socially and psychologically construed concept. At the configuration level, it denotes ways of working and connotes its possible functions. In the mythical juncture, however, the objects are assigned symbolic functions –  $fs_n$  – which correspond to institutionalized symbolic values.

Consequently, we believe that social discourses, as previously pointed out, can be regarded as issues strongly related to semiotics. That is, the sense of the artifact cannot be reduced to the mere relation between the signifier (the way object presents itself materially) and a signified (the expected function or performance). Hence, the concepts of “narrative”, “encyclopedia” and “dialogicity” can bring advancements and take an

important role in both the development and the analysis of global products based on the theory of semiotics.

### *Encyclopedia, Dialogicity and Cultural Intertextuality*

Each artifact should be recognized as an actor of a “narrative”, that is, as an element that takes part in a series of actions and behaviors in which artifacts on one side are called to act, and on the other to urge (Barthes, 1957; Deni, 2001; Landowski & Marrone, 2002). In addition, the notion of the encyclopedia provides a model of the semantic representation of an object regarding the historical, social and cultural complexities. In fact, the model of the encyclopedia (Eco, 1984; 2007) is suitable to make evident the multiple ramifications of the sense and knowledge, on different levels: individual, groups, social, cultural – perhaps even regarding general aspects of human beings. The metaphor of the encyclopedia allows the comprehension of the senses of the artifacts related to the cognitive or practical activities (Proni, 2012), and can also be considered as an intertextual network of cultural units interconnected – beliefs, habits, visions etc. This network produces not only connections, but also intercultural and intertextual dialogicity (Tedlock & Mannheim, 1995; Zingale, 2009), and then comparison and conflict (Landowski & Marrone, 2002), influence and infection, which can be considered “memetic” (Dawkins, 1976; Backmore, 1999), and drives inventive and innovative processes (Bonfantini, 1990; Zingale, 2012).

### *Things and Their Intertextuality in Our Environment*

Things are no longer alone, they are always in interaction with something else. That is, the sense of an artifact cannot be defined extracting it from its context. For instance, a word can be properly understood if it is in a sentence, and consequently within a text in which it takes part, but it is not enough. The text takes part in a context (in a situation and circumstance of utterance), and each text is conceived as a node inside of an intertextual network. In analogy, an artifact can be understood as a node inside its context, especially when regarding its role within a cultural context.

The interest of semiotics in artifacts and the material culture can be a starting point in the relational nature of objects. Semiosis itself, the process of identifying and generating sense, is relational. Therefore, semiosis originates when we establish a contact with the environment, inclusive of objects and everything which has a sensory and material nature. It is best to point out that semiosis can occur even in absence of a real language or

system of signification, like in the animal world. Indeed, the sense of an object emerges when we see something connected to something else, and that connection becomes an interest to the observer and therefore worthy of significance. All objects and events assume semiotic value only when they may affect our attention. As long as nothing happens in our minds, the objects are merely “objects”, things that are there, in total and absolute independence.

These “objects” and “things”, since they have a social and cultural dimension, and since they are the subjects of a project (Deni & Proni, 2008; Bianchi, Montanari & Zingale, 2010), we call them artifacts and products. They are in fact natural objects and cultural objects: the latter derive from our intentionality (Bonfantini, 2000). In this sense, objects are also facts and events happening in the world, or that we produce in and for our social life. Their relation nature (more precisely: semiotic-relational nature) is what gives them meaning. To invoke an old philosophical question, the sense does not lie in the being of things, but in their becoming: in their action and interaction. All things, once placed in the environment, tend to change the status of the other things with which they are related.

Therefore, nothing has a life of its own. Even things, such as human and nonhuman animals, have for us social existence, and the existence of every object, natural or manmade, is supported by a network of relationships. Only in this network can they express a sense. It is impossible to imagine the life of things, and even more so life in general, as a single and circumscribed event. Therefore, theoretically, we can set three possible dimensions to think about things regarding their possible contexts.

### *The Meaning of Things along Three Directions*

One should then try to think, at least methodologically, how to make theoretically evident that network of relationships. Only then can we try to obtain a model that allows us to understand how the meaning of objects and artifacts is built and composed in history and society. Thus we appeal to the dimensions of process (diachrony) and system (synchrony), which belong to linguistics (Saussure, 1916). Along with these dimensions, we added a third: the dialogical dimension (Tedlock & Mannheim, 1995; Bonfantini & Ponzio, 2010; Zingale, 2009).

Hence, in Figure 3, we propose a diagram that visually establishes the intersection of those three dimensions:

(1) The line of the diachronic sense: the artifact regarding its previous models within its own history;

- (2) The line of the synchronic sense: the artifact considering other system of artifacts, of the same or different category;
- (3) The line of the dialogic sense: the artifact in relation to its using interactions.

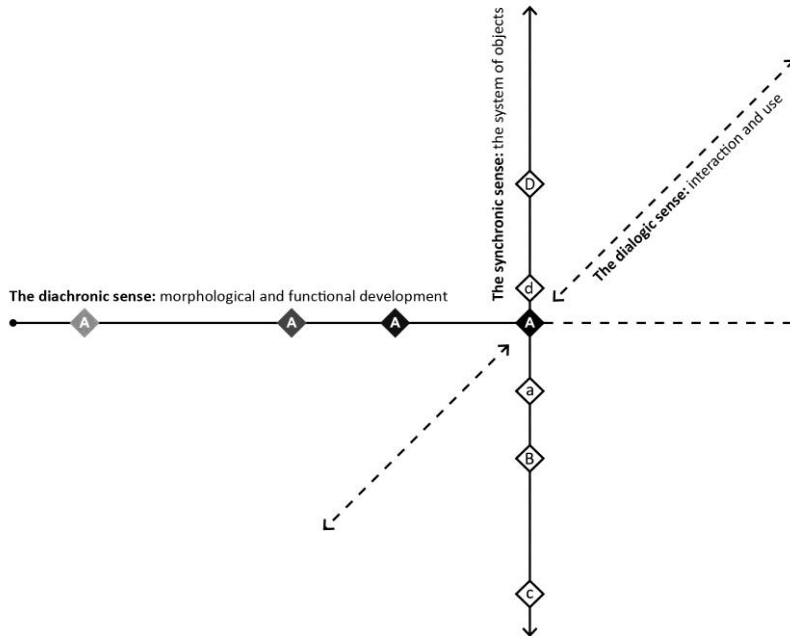

Figure 3 The three dimensions of the sense: diachronic, synchronic and dialogic.

### The Diachronic Sense

The first direction is that of the diachronic. That is, the study and evaluation of cultural objects considered in their origin and temporal development, often in the historical and comparative mode. The diachrony is the process flow of each type of artifact. It is the evolutionary unfolding of the objects. Diachrony puts objects in history: it is therefore the historical meaning of objects (Bonfantini & Renzi, 2010).

For instance: the TV. Once it was an object for collective fruitions, now it is an intimate device for personal vision. Once it occupied the domestic scene, now it is invisible and unnoticeable among other pieces of furniture. What changes is, its different way of “serving the communication”. Its formal metamorphosis goes hand in hand with the change in the use of

social communication. The TV is also monitor and display. Its history begins before the television industry and continues beyond this. On one side it is parent of the movie screen, on the other, its conception takes an important role in devices of vision and control (e.g., dashboards and radar), and with all family of computer monitors, smartphones and tablets.

The diachronic meaning of any cultural artifact can be potentially understood by asking two questions: a) What are the environmental and historical conditions that led to a particular artifact? b) How much and how well does an artifact represent the meaning of its era?

### **The Synchronic Sense**

The second direction is that of synchrony, the study and evaluation of cultural objects considered in a given historical moment, thus abstracted from their development over time. Synchrony, a term proposed by the linguist Ferdinand de Saussure (1916), offers criteria for the collection and study of a set of cultural objects, their simultaneity. In this way, this set is a system of objects in a given epochal dimension. The synchrony looks at the structural dimension of the objects, to their form and compositional syntax and to their sensory nature as determined in the environmental conditions of a given period: the trends of the period, the availability of technology and the social objectives. For instance, there is a different awareness of the ecological threat, or the attention to the body, that today guides the understanding and design of many artifacts, like automobiles and home appliances.

An object that has hardly changed over time is the bicycle. Once a poor transport vehicle, today it is a sign of an ecological vision of social life: an implicit request for a different view on metropolitan mobility.

Therefore, if we want to get the contemporary meaning of the bicycle – or even better, if we want to understand which would be the criteria for design innovation and invention with regard to the bicycle – it should be positioned in the net of its relations with other artifacts or structures where it can be found. There are many projects that seek the innovation of the bike, but do not regard its form or mechanics, but the lightness of the materials and the possibility of being able to bend and fit the bicycle into a backpack or a trolley (cf. [www.sadabike.it](http://www.sadabike.it)). In this case the bicycle is inside an urban system of mobility, such as public transport.

The questions about the meaning of the objects that we find here are mainly: a) Why at a given time a form is considered more appropriate, and therefore more full of meaning than others? b) Which other artifacts or

systems or socio-economic organizations enter into relation with an artifact?

### **The Dialogical Sense**

The third direction concerns the dialogicity sense, the sense that derives from all in question and interpretative actions on artifacts, and from the interaction between observer and object: by what we users are able to ask, and the answers, inferentially, that we are able to grasp. This direction is also the most scientific, because by asking an artifact (e.g., to understand how technological product works) the user puts in place processes of investigation not so dissimilar from those of the archaeologist, historian or anthropologist. This then is the experiential dimension of objects, which are particularly of interest to the processes studied by Interaction Design and usability ergonomic testing.

Before the computer, one of the first popular “dialogic objects” was the radio. Not only because it speaks, but because to make it talk or play we had to act on it. But greater is the complexity of performance, more difficult becomes the dialogue.

The relevance of the dialogical sense can be seen at the increase of importance of the communication items related to an artifact (e.g., manuals, tutorials etc.). These items tell us that each artifact asks the user to identify the interpretant relation that makes its use possible. The user must learn the language of the artifact. Hence, the task of the design is to conceive objects in a manner that makes the inferential language possible.

The line of the dialogical sense is also a social line. The “conversations” with the objects are also conversations around it: the dialogicity is also the aspect which increases the collective and cultural knowledge, the semiotic place in which people share and learn the complexity of the experience in the artifactual world.

The research questions, then, are: a) From which characters of the artifact depend our ability to use it properly and satisfactorily? b) Which are the inferential and interpretive procedures that come into play in understanding the usage schemes of an artifact?

### *Artifacts in Scene, Sense in Act*

Artifacts are predominantly on one or other of the three directions, or on their intersections, in daily use the objects are always in “scene”<sup>2</sup>, a semiotic scene. A delimited and coherent space in which the objects are next to us, around us and at our disposal. The metaphor of the scene tells us that each artifact is always associated with at least one second artifact: no object is alone, it is always a part of a syntax and a composition.

The concept of “scene” does not only regard the way things are set; it also regards the way things acquire, extend and change its sense. The model of the three lines of the sense is designed taking into account the complexity of the action that each line can generate, because the sense of the things lies not in the things, but in the actions they make and actions they allow us to do. In fact, it is necessary to start from Peirce’s idea of pragmatism (CP 5.402) on the meaning of signs and things: the meaning of any cultural act – a sign, but also an artifact – lies in the series of effects and consequences, in *habits*, that such an act produces or is capable to produce in the context of the interpreters. It is for this reason that signs and artifacts produce and nurture the cultural universes. And more specifically: cultural universes.

In fact, the language of the objects is not a system closed in itself, but a system that interacts with our experience of the world (Violi, 1997). Therefore, each semantic universe is continuously influenced by many realities (e.g., historical, environmental, psychological), and certainly influenced by the semiotic reality in its complexity, that is, the set of our knowledge about the world.

Arguing with semiotics based on the model of linguistics, Bakhtin (1929) brings attention to the fact that the sense is accomplished with “live speech”, regardless of the existence of a code or pre-existing system. Hence, Bakhtin makes the distinction between the “neutral meaning” of a word (for us: an artifact) and its “sense in act”. The latter is the overall sense of unity and of any semiotic act, the sense that you can define only in the reality of social interaction, such as the dialogue in a conversational situation as studied by communication pragmatics (Grice, 1975). This means that the sense of an artifact is not defined only by the way in which it manifests (for instance its shape or belonging to a product type), but also by its implicit

---

<sup>2</sup> It should be noted that the metaphor of the scene asks to be developed, keeping in mind that from it derive many other metaphors. Perhaps, for this “etymological” reason, the term scenario appears to be repeatedly used in the theories of design. See Jégou & Manzini (2004); Carroll (1995).

meaning (the Conversational Implicatures, as defined by Grice) and environmental and historical factors. This current sense – or sense in use – thus requires an active understanding. Being designed, instead, the object requires an evaluation of the “dialogical game” in which it may be present and also that the artifact produces and urges.

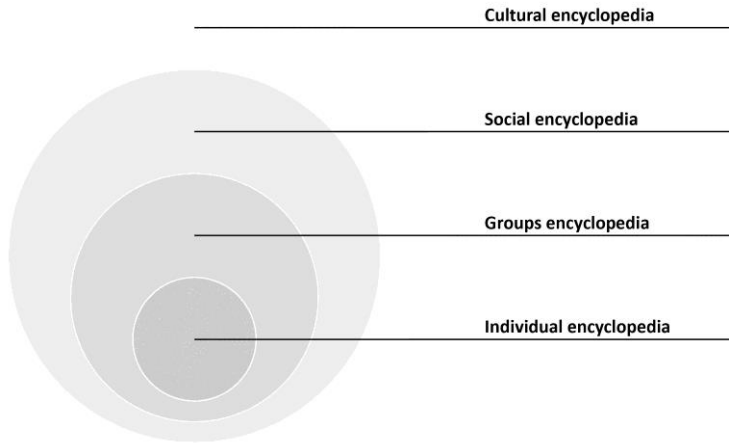

Therefore, the design cannot start from the possible tension between the conventional meaning [conventional signified] and the sense in use. Even the sense in use is the subject of the project, and this understanding of the design is strongly linked to the idea of abduction in the Peirce manuscripts (Bonfantini, 1987; Zingale, 2009, 2012).

To stay with the semantic models, the effort of design with regard to [prefigure] the sense in use – to understand the meaning of artifacts and therefore also the way to conceive – can be guided by the model of encyclopedia developed by Umberto Eco, first developed in 1975 and then in 1984. This model has been designed to overcome the limitations of semantics that separates the inside knowledge of a language (or a system of signification) from those relating to the knowledge of the world. In the model of the encyclopedia, for instance, each "unit of content" (e.g., "oven") is not only the definition (denotation) of the furnace as "an enclosed compartment", usually part of a cooker, for cooking and heating food ([www.oxforddictionaries.com](http://www.oxforddictionaries.com)), nor merely an aspect of the connotation associated with particular uses, such as "kiln" or "furnace". In the model of the encyclopedia, the content "oven" tends to include all the other knowledge that a certain culture has developed around this "enclosed compartment", such as metaphorical ones (a warm place), fairy (Hänsel and Gretel Brothers Grimm), and sadly even those historical (the cremation chamber in a Nazi concentration camp).

As in the library of Borges, an encyclopedia brings an entire heritage of beliefs and knowledge of a cultural community. But it is an irregular archive, often fragmented, incomplete, in continuous change. As a network of semantic interconnections, in which each node refers to other nodes, often unpredictable. But above all, the encyclopedia can have different extensions, for instance: the one that considers the human history of the entire planet; and the one that collects the knowledge of a nation, narrowing the circle of ethnicity, of a social group or even of a family community. Finally, the encyclopedia also has an individual dimension.

To improve the understanding of the concept of encyclopedia, Eco uses the metaphor of the rhizome, taken by Deleuze and Guattari (1976). The graph that we propose here - Figure 4 - is instead a theoretical hypothesis, a

way to represent what might be called an encyclopedic graph, where the knowledge of each individual is embedded in a number of others.

*Figure 4 The different levels of encyclopedia.*

Instead, the rhizomatic structure emerges once we try to give a representation, even if basic and fragmented, of the possible joints and “grafts” among encyclopedic fields at a global level.

Figure 5 The encyclopedia as a complex and global phenomena.

In Figure 5, the circles which represent the encyclopedic universe would be multiplied to an indefinite number. It would be possible to think of an inextricable labyrinth, and perhaps even larger. As Eco writes, no graph is able to represent the model of the encyclopedia in its complexity (Eco, 1975), because this encyclopedia is not attainable in its totality (Eco, 2007). However, Eco also specifies that

*the encyclopaedia is the only way by which we can make it right, not only for the operation of any semiotic system, but also the life of a culture, as a system of interrelated semiotic systems.*<sup>3</sup> (Eco, 2007, p. 56)

Possibly, the model of the encyclopedia is then the only one which can allow the designer to deal with, regarding the necessary methodological caution, the problem of the meaning of artifacts. Or better: the problem of how artifacts propose and, at the same time, produce new meanings within a given anthropological reality.

---

<sup>3</sup> Our translation for: "L'enciclopedia è l'unico mezzo con cui possiamo rendere ragione, non solo del funzionamento di qualsiasi sistema semiotico, ma anche della vita di una cultura come sistema di sistemi semiotici interconnessi" (Eco, 2007, p. 56).

## Final Remarks

Regarding the literature of management and design, the models and arguments previously stated tell us then that design – and the production of goods and artifacts in general, which includes global products – should consider:

1) Thinking of the diachronic dimension, the variation of the senses [denotation level] of an artifact can directly affect its acceptance in different contexts. Especially considering that the development of social and cultural aspects are not synchronized, even within the same contexts. That is, the individuals' response can be more or less effective when experiencing their goods.

2) The synchronic sense, which offers criteria for the study of a set of artifacts in its epochal dimension, can provide a structure of analysis that enhances the manner in which products can be redesigned or adapted to their contemporary context.

3) The dialogicity is understood according to the two acceptations: on the one hand to be seen as an action in relation to the reaction of the other (hence the sense of an artifact lies in the manner in which it is recognized); on the other hand is the dialogism and the awareness that every artifact is to be seen as the answer to interpreting another (e.g. the sense of an artifact can be seized only regarding the intertextual relationship with other artifacts). It is to say, to analyse an artifact, designers should also take into account the other artifacts around it, which makes the design process even more complex.

4) The sense is the result of a collection of stories, but these stories are inevitably dialogic and intertextual. Therefore, the sense of an artifact can vary across cultures, and detected differences can add value to the user's experience in their specific contexts.

5) The sense is a set of dependent and independent variables: variables that depend on an extensive and global knowledge, and variables that depend on specific and local knowledge. Hence, the analysis of global products design, as pointed out by Levitt (1990) and claimed by Boztepe (2007), should be taken in-depth in order to better support processes of conception, positioning and adaptation of goods, especially when dealing with different cultural backgrounds.

6) The consequence that the sense of the artifact is an experienced phenomenon and to be designed should be experienced, is just for the reason that the sense is always a reality defined by the practice of use and the relationship with other artifacts and "discourses". This built a network of

senses which on one side renders the process of artifact analysis almost unfeasible but, on the other can enrich the value of an artifact from the users' point of view. But, as demonstrated by Domingues, Moraes, & Dias (2014), empirical research has been done in this direction.

7) The design practice should then be developed from the ability of the subject-user to interpret the meaning of an artifact, according to what Bakhtin called answering comprehension: an understanding that it is also an appropriate response for the project, but also capable to regenerate the sense of the project itself.

As the theoretical assumptions have been discussed, for further advancements, empirical investigations are strongly desirable in order to test the theoretical arguments in different contexts and realities. The graphic of the three dimensions of the sense - Figure 3 - is not closed in itself. Any enhancement based on the theory of semiotics is welcomed. That is, we believe that broadening knowledge on the dimensions of the senses can improve the methods to analyze global products, which adds value to global products design, its management, and to users' experience.

# Designing the City Identity: Strategic and Product Design for New Experiential Ways of Living, Enabling and Interacting with the Urban Context

Marina PARENTE\*

Politecnico di Milano, Design Department

*The city identity design is a very complex task, but it is indispensable to be recognized in a competitive market and to attract investments, companies and people in economic, cultural and educational sectors. This complexity comes from many factors, including the delicate relationship between identity and reputation, being and being perceived. For this purpose, besides the consolidation of the Place Branding discipline, some investigation methods have been perfected over the last few years. Their aim is to measure the satisfaction index and the reputation of countries and cities. Today, the diffusion of digital technologies and social networks is contributing to increase and spread some actions of bottom-up participation, crowdsourcing, collective creation of urban identity, which can interpret the social changes under way faster. In the age of open-source cities, what is the relationship between top-down identity processes and innovative visions, animating the territories' physical and virtual networks? How can we build a shared, strong image of the city, including and conveying new emerging narrations and innovative proposals of urban use and valorization?*

**Keywords:** *strategic design, experience design, narrative systems*

## **Introduction**

The increasing need of telling and promoting the city identity arises from the new kinds of competition in global markets, proposing the subject of distinctiveness and relationship between places and - tangible and intangible - resources in a renewed manner.

The territories, as the products, try to steer their own development and perception in such a way as to be 'desirable' (Buchanam, 1999), but their success is connected with various 'utility' factors too, that is the fact of proposing itself as a business-friendly environment, providing opportunities and distinctive qualities, and 'usability', that is the possibility to be structured with networks of services and governance systems, such as to render the relationship between environment and its stakeholders easy.

Territory desirability is connected to its identity perception, the implied promise of a system of values of excellence or specialization compared to other places.

This is why cities and territories identity is increasingly becoming a core project and monitoring theme. Their identity is closely related to their competitive positioning (Anholt, 2007), necessary to attract investments and to facilitate processes of economic growth, environment quality and social development.

### *Designing Place Identity*

Place identity is very complicated to trace, because it depends on a multitude of factors:

- **Factors Tending to Change Over Time:** places and towns are developing bodies, where time dimension can be interpreted not only compared to the past and history (and the related system of values), but inside a dynamic and changing present, where the different ways of use can characterize again the sense of the places on the same day too. The theme that disciplines concerning urban studies are asking themselves is not only functional (Landry, 2006; Evans B., McDonald F., & Rudlin D., 2011), but social and relational too, well summarized by the exhibition entitled 'Cities. Architecture and Society' at the 10<sup>th</sup> International Architecture Exhibition, Venice, 2006.
- **Subjective Factors:** towns are the scene of collective memories and the personal approach which everybody has with place perception

and meaning. From this point of view, towns can be interpreted as the repository of personal stories and emotions embedded over time. This kind of approach is supported by emotional geography (Bruno, 2002) and environmental psychology (Landry, 2012).

- External Factors: accidental events (such as acts of nature) or unforeseeable circumstances (such as judicial investigations) can change the place identity suddenly or affect the way it's perceived from outside; or event beyond the control, such as the testimonies of international prominent personalities from the world of culture, economy or social movements of dissent, which can strengthen or obfuscate the identity framework we are trying to point out (Landry, 2006; Anholt, 2007, 2010).

Even only the activity of portraying the place identity, even before strategically targeting it, appears as a complicated matter of choice, an operation that cannot be exhaustive, but selective of a portfolio of identities, mutually compatible and converging on defining a framework of values and territorial specificities.

### *Identity and Reputation*

With regard to the last issue, we notice that the identity question is mingled with the reputation one. In fact, if identity is a representation reasoned, selected, designed and reinforced by tangible evidences and congruent actions, reputation incorporates collective imagination of people that perhaps do not know these places personally, but got an idea of them through what they perceived by media or other narrative forms (from movies to literature or show business testimonials). A bad reputation can arise from a shallow identity design, which stops at the image level, so it is not supported by the real situation and does not keep the promise.

There are many studies which measure the index of satisfaction of the countries and the major cities around the world each year, including the 'Nation Brand Index' and the 'City Brand Index' by Anholt-GfK Roper, or the 'Country Brand Index' by FutureBrand, proof of the growing interest in monitoring the external perception of our own country, taking into account variables measuring factors such as the importance of physical, organizational or social factors. These rankings arise from opinion polls targeting people who do not know directly the countries or cities under investigation, but who express the perceived idea and their expectations about service level, human relationship, investments and job opportunities, vivacity and wealth of the cultural and entertainment experience. So they

are indexes other than the specialist ranking for the different sectors, such as tourism, measuring *a posteriori* actual and quantitative results of a specific sector.

Furthermore, FutureBrand has recently conducted a new survey entitled 'The Made In Report' (issued in February 2014), concerning the relationship between the products coming from different countries and their impact on the overall perception of the Country System. This survey measures the 'value of the country of origin', that is how the successful products can contribute to increase a positive perception of the country of origin and vice versa. This first opinion poll confirms what is easily guessed, that is, for example, that fashion or food products for Italy, as well as the vehicle and precision mechanics sector for Germany, shall be used as successful testimonial for the country of origin. In the first case it shall strengthen the style and good taste idea, in the second one the precision and reliability idea.

Countries and cities are increasingly focused on strengthen their own image in order to intercept - like the companies do - cash flows and investments in different production sectors, tourism or culture, by implementing strategic plans to steer their 'brand identity' and in the same time by keeping the reputation variation, that is 'brand image', under control. These operations are not easy and need an ongoing commitment and coherence of choice.

Anholt would say that 'competitive identity is the art of playing chess by using reality against perception' (2007), a game requiring a great deal of attention, vision and action adequacy. If reputation is what we seem to be and identity is what we actually are (or what we are trying to be), the only way to align these two visions is to practice identity over time with conviction and coherent gestures.

Some towns, such as Barcelona, Bilbao or Turin, have been able to recalibrate their identity, directing it towards new strategic visions of development. They acted over time with an action plan, able to affect not only the perceived image, but also the real structure, by accompanying renewal with top-down initiatives and by facilitating the bottom-up ones.

## **Place Branding and Place Experience**

Zygmunt Bauman (2004) claims that in the liquid modern age even identity is mutable. It is like a dress we use until we need it. But above all he underlines that identity is something that must be invented rather than

discovered; it is like a target, something that may need to be built from scratch or chosen among alternative offers.

If we refer these argumentations to the local identity framework, we see that, to find a specific design methodology, we adjusted branding - brand design and brand management activities – usually used for companies or institutions - to places and cities, considered as complex organizations, which need to be recognizable and able to communicate their own 'personality' to the outside world.

The disciplinary sphere and the methods concerning Place Branding and City Branding, dealing with local marketing and destination management, are gradually consolidating through a specific literature and the verification of the results of the first experiences (Moilanen & Rainisto, 2009; Govers & Go, 2009; Dinnie, 2011; Baker, 2012). However, they point out some criticisms arising from the multi-player dimension (there are a number of territory stakeholders with at times widely divergent targets), as well as from the previously discussed changing factors, in the balance between identity and reputation.

In particular, Govers & Go clearly define the disciplinary scope: 'place brand is a representation of identity, building a favourable internal (with those who deliver the experience) and external (with visitors) image (leading to brand satisfaction and loyalty; name awareness; perceived quality; and other favourable brand associations)' (Govers & Go, 2009, p.17).

They also structure a three-step model of analysis and design of place branding - 'The 3-gap place branding model' (Govers & Go, 2009, p. 41) - based on:

- 'place brand strategy gap', interlinking place identity with projected place image and product offering (in different possible sectors such as tourism, trade, talent, treasury);
- 'place brand performance gap', interlinking projected place image and product offering with the vicarious and perceived place experience;
- 'place brand satisfaction gap', interlinking vicarious and perceived place experience with the visitors' perceived place image.

So the most delicate issue to be solved is the alignment between what has been designed and what is actually perceived, due to the real evidences in the territory as well as the expectations residing even in the user's unconscious.

The comparison with the real experience that each stakeholder may carry out in the territory leads to a constant verification between the brand promises and the brand experience, which, only if confirmed, may have a positive impact on the reputation and the strengthen of the identity.

It is therefore clear that place branding cannot act by its own, but needs to be related to political, economic, urban and social development's strategies, in order to avoid being limited to a superficial graphic 'dress' to be put on territories and cities: in order to be effective, place branding must be a synergetic action requiring long-term strategic actions, constant methods of monitoring and design, as well as the creation of sharing and network between the different players, including inhabitants themselves.

## **Cities and Processes of Bottom-up Change**

In parallel with the consolidation of this relatively new discipline, the diffusion of digital information technologies, especially of social networks, has made more evident - and in some cases has also contributed to increase - the presence of many forms of bottom-up activism, due to the increasingly growing need to modify the current methods of narration and use of the cities.

Associations, on-line platforms, interest groups, young start-ups are proposing not only new methods to communicate, live, visit, tell the city, but also to do business, connect and propose some forms of participatory design, by using the web as a core instrument of action or as an instrument to disseminate information and results, but not always as an exclusive tool. Certainly, the web and the social networks are a powerful real-time amplifier of what is happening in the cities.

The picture of cities that emerges is vibrant, proactive, dynamic, and made of snapshots fixing the instant of a changing journey. The web portrays another identity of the cities, linked to a present time looking at itself critically, in order to design and share some ideas of a very near future. Cities as a cradle of some emerging phenomena: the 'creative cities' phenomenon, not intended just as attraction spots for creativity professionals (Florida, 2005; Landry, 2012), but where social participation contributes to the creation of sense and use of the cities themselves; the smart cities, or better 'senseable cities' (Ratti, 2011) phenomenon, where the web system plays a role of information collector ('sensing') and implementation according to the gathered information ('actuating').

The two different processes – top-down design, usually guided by some opportunities such as major sporting, cultural or religious events (such as the Olympic Games and the European Capitals of Culture) or planned by local authorities; and bottom-up design, made of crowdsourcing, spontaneously suggested by those who want to actively contribute to changes - in the framework of a coordinated project of Place Branding, should contribute and mutually support the choices and goals of a competitive positioning, defined in a early stage.

That can happen if local communities are included within the phases of preliminary approach and design, right from the start, with procedures of comparison, co-design and participatory verification.

## **Collective Narrations of Meanings and Urban Identities: Case Studies**

With reference, especially, to the Italian situation, we are seeing particularly meaningful phenomena. Italy, thanks to its reputation of a country rich of important historical, artistic and scenic attractions, together with an Italian style of taste (fashion and design), and the pleasure of good living (environment, food, human capital), has been living 'on accumulated interest' during these years, by poorly investing in initiatives for the promotion and re-launch of its own image. A heritage, whose value is fading if compared to a competitive context, where other countries are focused on coordinated actions to strength their image. In fact, all ranking systems are registering a slow, but progressive decline of the country system image, which some Italian towns have been trying to remedy for some years, by promoting their own urban image, through more or less successful initiatives of long-term strategic design (such as Turin, Genoa and Milan) or through a new City Brand design (Bologna, Florence, Genoa).

In the current period of economic stagnation and policy uncertainty, the planning and development coordinated initiatives are struggling to materialize, and prefer to act occasionally in an almost uncoordinated manner, with the only aim of obtaining a 'wow' effect, often ephemeral and not-lasting.

In the absence of a policy planning, even more clear in the Southern regions where economies are weaker, and due to the local authorities' evident difficulty to cope with transformation processes and significant investments, surprisingly we are seeing the creation of bottom-up initiatives

trying to integrate new methods of narration, and thence perception and creation of sense, of the places.

This is more evident in the Southern areas, where it is very urgent to relaunch different economies as an alternative to the big corporations, based on tourism and the valorization of the cultural and environmental heritage and the productive sectors related to them.

As mentioned above, the web and social network diffusion makes visible what is happening in real time, and reduces the time needed to know phenomena, amplifies information and facilitates its diffusion. But they are also channels which foster sharing methods, collective participation, co-design and crowdsourcing.

Some case studies have been selected in order to understand what are the filters used to interpret the places identity, what participation methods have been activated in order to undergo physical or perceptive change processes, what innovative and relational tools to renew the experiences of cultural and environmental heritage enjoyment.

In summary, without going into details of each initiative, we shall try to schematize the narrative models and those of meaning creation and the relationships between the different players.

### *Bottom-up Models of Territorial Storytelling*

#### **Repository of collective memories**

- On-line Collaborative Mapping.  
There is a wish to draw new physical and mental city maps, in order to amplify the sensory perception, find out unusual places or track links during the time and social evolution. They are an evolution of the parish maps, used to define the values of the Ecomuseum areas, by integrating the emotional map with the collaborative and temporal dimension of an evolving continuum, and the update, which new technologies allow us to do.  
'MappiNA' (<http://www.mappi-na.it/en/>) and 'Napolirama' (<http://napolirama.it>) are two different ways to express this need of Naples: the first one is an alternative city map providing a geo-localized tale, which portrays the contemporary time, the daily relationship of use of the city, through little known noises, ideas, methods and places; the second one is a family album portraying places and people during all the XX century, pointing out the

evolution of the relationship between spaces and lifestyles over time.

Another important example is 'Nuok' (<http://www.nuok.it>), whose name comes from the pronunciation of a small child of the word 'New York': it's the collective travel journal written by Italians about some towns of the world, which wants to express the children's curiosity about unusual places. It's a collection of stories, perceptions, urban experiences, managed by a group of urban reporters. More than an on-line magazine, it is a storyteller, similar in some ways to the better known Cowbird (<http://cowbird.com>), which is more focused on human experience narration, where places are only the background.

The common elements between these examples are the collaborative dimension, the storytelling and the repository of collective memories.

- Storyteller as a Cultural Mediator.  
The territory oral storytelling is an ancestral form, which is becoming a core element today. With reference to Basilicata - a poorly known region of Southern Italy, except the city of Matera, recently brought to the world's attention by the movie 'The Passion of the Christ' by Mel Gibson (2004) – Gianni Biondillo, writer and architect, was commissioned, in the framework of a series of institutional actions of regional promotion, to make a trip in this territory in order to collect testimonies of the inhabitants and local stakeholders. The above shall be set down in writing, 'Il Diario del Pollino', an eBook, which can be downloaded for free: it is not a novel, nor a guide; it is a travel journal at the discovery of people, stories, excellences, innovations, cultures that we would not have been expected to meet. This experience is interesting, even though it is not a bottom-up initiative, but in a certain sense it is nourished with old exploration practices and authentic testimonies of the territory. The writer becomes a cultural mediator, who not only reveals hidden identities of marginal lands, told by the voices animating these places, but provides his own emotional and affective vision, which is amplified thanks to the web till reaching an unthinkable geographic scope. It is a way to feel, and not only to tell a land.

### **Collective - On-line and On-site - Actions**

- Participation Using Games

*Designing the City Identity: strategic and product design for new experiential ways of living, enabling and interacting with the urban context*

'Critical City' and 'Whaiwhai' are two examples of interaction with the urban environment using games.

The first one uses the on-line web site (<http://criticalcity.org>) to create a play community, which, through some missions in the cities, competes with a points classification, with the only social and recreational aim to interact with urban spaces collaboratively. The missions, carried out in real places and documented and shared only on the web, are demonstration actions of how to regain the urban spaces, imagining different forms and uses, and building a meaningful narrative repository - in the framework of a collective contest - in order to renew them.

Whaiwhai (<http://www.whaiwhai.com/en/>) is a discovery game, aiming at a different touristic use. It is formed by a physical part – a guide book of every city – proposing a path to discover the mystery to be solved, and another part, available on-line on smart-phone, by entering an access code. Through geo-referencing systems and riddles to be solved via text message, the goal is to visit some city spots by following a narrative thread and challenging other users' groups to discover the hidden secret.

In both cases, the game is the instrument to trigger the real participation *in situ*, but the narration role is different: in Critical City you contribute to build it, in Whaiwhai narration shall become a way to know better what is not visible.

- Urban Critique

Wedu - decoro urbano ([www.decorourbano.org](http://www.decorourbano.org)) is a participative instrument reporting the city degradation, a social network aiming to foster the dialogue between citizens and municipality, and it contributes to take care of the city. Active in the Italian territory for about a year, it managed to obtain the accession of several active municipalities, which can in turn report when the problem has been solved. Based on an open-source project, it intercepts the city users' criticisms and moods, and directs them towards positive forms of participation and active citizenship. Among the active municipalities, there are many small towns of Southern Italy, which have intuited the potential of redemption of their reputation and narrative and perception reversal, and showed a real ability to listen and a resolution capacity.

Table 1 Bottom-up Models of Territorial Storytelling

<b>REPOSITORY OF COLLECTIVE MEMORIES</b>	
<p><b>On-line collaborative mapping</b> Network as a participatory archive.</p>	
<p><b>Storyteller as a cultural mediator</b> Storytelling of individual experiences, digital sharing and diffusion of the territory's emotional narratives.</p>	
<b>COLLECTIVE - ON-LINE AND ON-SITE - ACTIONS</b>	
<p><b>Collective storytelling through urban game's actions</b> Exchange-based relation between the real and the virtual, between places and web.</p>	
<p><b>Enjoyment of the territory using narratives as a game</b> Cognitive playful experience of the territory</p>	
<p><b>Urban critique for city care</b> Collaborative dialogues between users and authorities</p>	
<b>CULTURE-LED INITIATIVES</b>	
<p><b>Narrative networks of the territories</b> New sense creation through the connection between different environments.</p>	

### **Culture-led Initiatives**

There are many initiatives proposing new relationship networks between places and meaning systems, and they propose unusual city visions and narrations with a combination of procedures (on-line and on-site): from innovative experiences of urban exploitation (e.g. geo-emotional map of 'Citytellers' - <http://www.cityteller.it> - telling cities through the places of the books the users share; the 'Biciclettering's routes' - an initiative of the Association of Italian Calligraphy —, a urban cycling safari, looking for font of near and distant eras in the city spots), the initiatives proposing multisensorial or participative visit experiences of the cultural heritage (theatrical visit routes, educational experiences, caring activities or guerrilla gardening, accessibility to private sites of creativity, etc.). An exuberant proposal of different narrations that draw inspiration from the different levels of the city's porous identity to create innovative visions and uses. There is a urgent desire to have an impact and create change, pursued first of all by young creative talents, the real engine of urban renewal (Florida, 2005).

### **Souvenir as Touch-points of the New City Experience**

The summary of these initiatives (table 1) provides us the essence of an underground, very visible on the web and less perceptible in reality, excitement of affirmation of new meanings and new stories, a dynamic and authentic narration opposed to the canonical and stereotyped one, where the city seems to be caged. In the absence of a top-down courageous design of a portfolio of territorial identities, updated to contemporary reality, Italian towns are generally seen, exploited and perceived by external visitors according to the most traditional *cliché*. Upon arrival on site, the most innovative and interesting elements of ongoing change in Italian towns are not perceived at all. So they remain common knowledge of the web people, because all the physical elements of the territorial identity narration, including souvenirs, remain bound to the classic vision made of stereotypes.

Since a number of years, through a didactic experimentation carried out in two Italian cities, Milan and Naples, at the Design School of the Politecnico di Milano and the design course of the University Federico II of Naples, we have been checking how, in the framework of affirmation of new bottom-up identity strategies, the system of souvenirs of the territory visit experience could represent an evolutionary step, becoming testimonial of alternative visions of the city (Parente, 2012).

Previously considered as unnecessary objects, souvenirs could be interpreted as the physical link between on-line perception and *in situ* perception, as touch-points of the new city experience.

In this sense, a new generation of city souvenirs could:

- play a role of thickener of the personal experience and the manifold memories embodied by the city, going beyond stereotypes and trying to reveal a more intimate multifaceted nature of places;
- amplify the territory perception, by suggesting special interpretations and visit paths that otherwise would remain invisible;
- contribute to an active and participatory process of identity reinforcement and definition in a way that can involve the different local players, because the first users of the city are the same inhabitants;
- act on internal and external communication, by materializing and making visible some changes under way, in order to ferry the real action of change towards a recognized and shared perception, which starts to influence the crystallized reputations engrained in the collective imagination over time;
- go beyond the ideas of trip and tourism to interact with the new internal and external *city users*, and to meet the growing demand of cultural entertainment;
- be an instrument to renew the tradition, knowledge and local know-how elements.

Imaging new kinds of city souvenirs as devices which can contribute to the collective creation of the 'brand identity' of the place internally and can influence its 'brand image' externally, in other words its reputation.

The concept of device implies not only the instrument dimension, but also the possibility of flanking a more passive mode of sensorial interaction with the product, with an active mode of direct and indirect behaviors and actions, contributing to the territorial identity co-creation.

For design we adopted a three-step method: the first step is focused on city investigation. It is a direct 'on field' investigation using real and digital ethnographic analysis methods, to detect the most significant indicators of the contemporary time and trace the profile of the emerging meanings. The second step concerns the knowledge of the city's tangible and intangible resources, and is an analysis of the territorial capital, able to do a map of the values characterizing the place, and to review the elements dulled for a long

time and not recognized as valuable sources. The third one, focused on the disclosure of the hidden city, is the final design step of implementation of formal, cognitive and relation aspects, which the souvenir must be able to activate in the relationship between city users and the same city.

## Conclusions

All the above dissertation leads us to think to be near to a paradigm change:

- complex processes, such as the identity definition of a territory (strategy), the control of the different stakeholders' actions (performance) and the monitoring of the perception compared to the users' expectations and reputation (satisfaction), seem hard to be realized and controlled without infrastructural significant investments and without approving and sharing the aims;
- the capillarity of technologies and digital channels of communication are rapidly changing the social, political and productive modes, and are opening a new participatory, collaborative and open-source dimension, from the point of view of the meaning definition as well as action definition;
- the top-down design times are asynchronous compared to the speed of the social changes and the emerging needs of the use and enhancement of urban spaces;
- the 'Place Branding' discipline must act together with the economic, infrastructural and policy planning of countries and cities. At present, this coordination seems to be very difficult to achieve in Italy and we need to think about new strategies in order not to go back more than the international rankings.

It is accordingly proposed a shift of perspective, able to enhance and give visibility to the positive processes of self-determination and to the creation of new bottom-up meanings, arising from the active participation in the territory by:

- creating the conditions for an enabling environment for the expression of creative and collaborative communities;
- monitoring the bottom-up activities and building coordination activities through the debate and the creation of shared visions (participatory design);

- facilitating the communication of the aspects of innovation and implementation of the territorial capital value, and considering the vision vivacity a positive factor of the territory vitality;
- flanking the territory main identity with the emerging ones, traced by creative talents;
- setting up relations between the real dimension and the web virtual one, where souvenirs play a new role and are considered as touch-points of the new forms of city experience.

## The Impact of Nationality and Gender on Consumer Preferences

Gloria Anne MOSS<sup>\*a</sup> and Gabor HORVATH<sup>b</sup>

<sup>a</sup> Buckinghamshire New University; <sup>b</sup> University of South Wales

*Design has a vital role to play in the Marketing Mix and can shape a person's overall reaction to a product including its pricing. Designers, for their part, are key cultural intermediaries between the product or services and the consumer but empirical research testing preferences for products, segmented by nationality and gender, shows that the value placed on designs by consumers can vary widely, with personal variables mediating reactions. This paper examines the part played by nationality and gender in negotiating value for the consumer and an understanding of the impact these variables can have on design preferences will help designers and marketers perceive the strength of an interactionist rather than universalist approach to design, permitting an understanding of how others negotiate meanings.*

## Introduction – Importance of Design in the Marketing Mix

Design has the potential to impact the Marketing Mix at each of its four points, whether in respect of Product, Place, Price or Promotion. Self-evidently, it will influence the look of the product and its promotion and can have an influence the price people are willing to pay for non-commodity products, adding a premium of up to 66% on the price people are willing to pay (Hassenzahl, 2007). Its strategic importance is such that it shapes a person's overall reactions to a product (Roy and Wield 1989), replac[ing] nature 'as the dominant presence in human experience' (Buchanan 1995, xii) and serving as 'an important strategic asset, both in the business and academic arenas' (Dell'Era and Verganti, 2010, p.124).

The product design field encompasses the functionality, aesthetics and ergonomics of a physical product that comes into contact with a consumer (Coates, 2003) and consumer reactions to the aesthetic aspects of products are recognized as important determinants of consumer behaviour (Vezyer, 1993; Creusen *et al*, 2010) and key sources of differentiation (Schmitt and Simonson, 1997). These aesthetic aspects consist of those characteristics that create a product's appearance and include materials, proportion, colour, ornamentation, shape, size, and reflectivity (Lawson, 1983). In today's increasingly competitive marketplace, companies need to take into account the aesthetic preferences of consumers when they make decisions about the appearance of their products (Creusen *et al*, 2010, p.1437-8). Design, therefore needs to interact with consumers, leading Buchanan (2001, p.11) to speak of "interaction design", a term he explains as being rooted in how:

*human beings relate to other human beings through the mediating influence of products. And the products are more than physical objects. They are experiences or activities or services, all of which are integrated into a new understanding of what a product is or could be.*

Buchanan goes on to state (p.13) that "interaction design" leads designers and design theorists to seek an understanding of products:

*from the inside—not physically inside, but inside the experience of the human beings that make and use them in situated social and cultural environments... we have an opportunity for new*

*The Impact of Nationality and Gender on Consumer Preferences*  
*understanding through an investigation of what makes a product*  
*useful, usable, and desirable.*

This objective of understanding the experience of human beings links with Bourdieu's notion of 'cultural intermediaries' (1984), one that Nixon (1997) has argued demands a 'differentiated picture' which is:

*sensitive to differences aligned with educational background and training, and which is aware of issues of gender and race.*

Regrettably, as Buchanan himself states, the issue of 'desirability' is thought to remain one of the 'weakest topics of design research today' (*ibid* p.16), reinforcing an earlier observation that 'there has been relatively little investigation of how this variable [aesthetics] affects preferences for products' (Vezyer, 1993). Even into the twenty first century the gap persists, with recent commentators lamenting the fact that 'a deeper knowledge of the area is lacking' (Noble and Kumar, 2010).

This paper seeks to address this gap through empirical work testing the preferences of men and women in five countries.

## **Two Contrasting Approaches to Design**

Broadly speaking, there are two approaches to understanding the process that leads people to perceive aesthetic value in objects. One is the universalist, Kantian approach which holds that the judgement 'this is beautiful' would be universally held insofar as every normal spectator would acknowledge the validity of the statement in relation to a particular object or work of art. As a consequence, this approach seeks to find rules and solutions that will satisfy everyone rather than just a sample of people. By way of example, Maeda's *Laws of Simplicity* (2006) offer ten principles for achieving design simplicity, with the presumption being that simplicity is a goal of universal appeal. Likewise, Nielsen's 113 design guidelines for homepage usability rest in the belief that the applied results will have universal appeal applicable across demographic groups. Two of these guidelines are shown below by way of example:

*(i) Limit font styles and other text formatting, such as sizes, colours, and so forth on the page*

*(ii) Use photos of identifiable people who have a connection to the content as opposed to models or generic stock photos. People are naturally*

*drawn to pictures, so gratuitous graphics can distract users from critical content.*

It can be seen that these guidelines presume a single best way of presenting information which in turn presumes a common aesthetic response on the part of all users. In fact, much design research is dedicated to isolating the visual principles that will universally optimise design. Veryzer (1993), for example, conducted empirical work with twenty four undergraduates with a view to isolating the non-conscious design processing algorithms, the so-called 'internal processing algorithms' (IPAs), that produce positive reactions to design. He concluded that proportion and unity 'may play an important role in many if not most consumer decisions' (p.227). In the same way, and more recently, Creusen *et al* (2010) sought likewise to establish universal rules concerning the effect of complexity and functionality on aesthetic preferences, testing reactions among a sample of 431 subjects. In neither of these studies were the results segmented by variables such as nationality or gender in spite of Veryzer's view that research should examine the role of biological and cultural influences in the development of IPAs. Something similar could be said of studies examining web design aesthetics which are likewise rooted in a universalist paradigm (Schenkman and Jonsson, 2000; Van der Heijden, 2003; Lavie and Tractinsky, 2004).

So we can see that the universalist approach seeks to identify the factors in the attribute that will have universal appeal and this stands in stark contrast to so-called Field theory (Lewin, 1936) or the interactionist approach (Mischel, 1977), the latter of which presumes that individuals will not necessarily view physical and social settings in the same way, producing, as a consequence, different 'life-spaces' and consumption behaviours (Gehrt and Yan, 2004). Both Field theory and the interactionist approach assume that gaining an understanding of people's reactions to the stimulus object ('format preference') relies on an understanding of the interactive impact of the stimulus object ('attributes'), the individual and the situation. So, rather than seek out solutions or laws that will apply to *all* situations, followers of this way of thinking seek out solutions that work in *particular* instances, thereby shaping products around the 'unique and particular needs' of the customer (Hammer, 1995) with purchases offering a vehicle for self-expression (Karande *et al*, 1997).

The interactionist approach to aesthetics has a distinguished history with a notable follower being the Scottish philosopher Hume who held the view that aesthetic value does not in objects but is bestowed on them by the

beholder. According to this way of thinking, the assessment of value is subjective rather than objective, with design optimisation following on from careful definition and targeting of the decision-maker and user. This entails a focus on the demographics of the target group and an understanding of its 'diversity in terms of ethnicity, age, gender, personality and educational background' (Dell'Era *et al*, 2010, p.126). Allied to this and in order to 'promote creativity and problem-solving capabilities', is the recommended reliance placed on diverse teams which it is thought can offer 'a variety of perspectives in a way that homogeneous teams will not' (*ibid*). Very much in this spirit, Dell'Era *et al* argue that designers of different nationalities 'can provide different viewpoints and support companies in the interpretation of product meanings to match the social and cultural needs of people in different countries' (*ibid*, p.125).

The evidence here of interactionist thinking as applied to design is in step with thinking in the management arena where it is widely acknowledged that people are more attracted to and influenced by others who share similar attitudes (Hendrick *et al*, 1970; Reagor and Clore, 1970). A focus in the social arena has been on research examining the positive impact of attitudinal similarity between individuals (Byrne 1971), with positive consequences extending not simply to incidental similarity between a salesperson and customer (e.g. similarity in terms of birthdays) but to also to attitude favourability and positive purchase intentions even when the interaction with the similar other was a brief encounter (Jiang *et al*, 2010).

The interactionist perspective then is one that, unlike the universalist approach which seeks to uncover rules and IPAs that influence all observers, seeks to understand the processes and elements that may influence individual responses. This paper tests the relative merits of these two approaches through empirical work testing the reaction of men and women in five countries to designs presented to them. In doing this, just as Dell'Era *et al* (2010) speak of the importance of heterogeneity in an organisation's designers, singling out nationality as a key variable, this article will focus on nationality, with gender as an additional variable, to test the relative value of a universalist and interactionist framework in understanding the elements that influence 'desirability' and visual aesthetic. Before introducing the empirical work, some background will be provided on the focus given to nationality and gender as key segmentation variables.

## *Nationality*

In an increasingly global marketplace product designers are faced with the challenge to offer usable products and services to an enormous variety of users. With companies seeking to diversify into the global markets, product and service designers need to have insights about the steps needed to ensure a good fit with a global market. This is sometimes just a superficial process such as translation of the language on the interface (Oshlyansky et al., 2004; Jhangiani, 2006) but there is also the deeper question as to how global markets will react at an aesthetic level to products and services.

The likely responses are neatly summarised by Sheth and Parvatiyar (2001) in an article on global marketing:

*Ever since Levitt's (1983) article on globalisation of markets, academics and practitioners have debated whether internet markets are becoming homogeneous and if the international marketing paradigm ought to change from highlighting national differences to exploring international similarities. Proponents of global marketing contend that because market needs are becoming homogeneous, country differences are less relevant to internet marketing planning. Yet others assert that the existence of global markets is 'a myth'. They point to the many contradictory trends around the world suggesting stark differences in national markets and hence the need for adaptation and customisation of international marketing based on individual country differences.*

In terms of individual country differences, Hofstede (1997) suggested that culture is shared with people who live or lived within the same social environment where it was learned with his definition of culture being (1997, p.4) 'the collective programming of the mind which distinguishes the members of one group or category of people from another.' There is recognition of the differences that can divide cultures (Adler and Gunderson, 2008) and a recognition, even by a strong critic of Hofstede's well known analysis of differences in management cultures, McSweeney (2002), that 'Hofstede's dimensions can usefully frame initial discussion about national peculiarities'. Developmental psychologists generally agree that values are established in childhood by the age of ten so these early years are critical in developing attitudes based on nationality.

Despite the endorsement of Hofstede's work on nationality and management styles, and some studies relating his concept to marketing

(Kapferer, 1992; Samli, 1995; Moss and Vintern, 2001; Marcus, 2005; Schuiling and Kapferer, 2004, Jhangiani, 2006), only a tiny body of research has yet described the impact of nationality on design productions with no previous work, to the best of our knowledge focused, on the extent to which preferences may be influenced by nationality. An overview of the small body of work dealing with the possible impact of nationality on design productions appears in the next section.

### **Nationality and design productions**

Most of the work investigating the impact of nationality on design relates to its impact on web design productions. One study, for example, compared the 'look' of websites in Germany, Japan and the US (Cyr and Trevor-Smith, 2004) but used criteria generated by people from industry and the academic community who had previously been asked to suggest characteristics 'that could easily be compared and assessed'. This produced eight criteria (language, layout, symbols, content and structure, navigation, links, multimedia and colours) that may or may not be priorities in terms of understanding the national style of a website. For example, language was rated in relation to three visual criteria (headlines, point form and paragraph) rather than, for example, in relation to the mental constructs informing the words used. Likewise, layout and spatial features were rated in relation to page orientation and banner/menu location rather than in relation to the incidence of straight versus circular lines. The lack of methodological justification for the selection of these criteria unfortunately weakens the methodological validity of this study.

Two further studies comparing websites have been conducted. The validity of the first of these (Cook and Finlayson, 2005) is reduced by further methodological failures, with the study focused on the analysis of no more than two websites, both of which were commercial ones and therefore subject to external, commercial constraints. Moreover, even with an improved sample, their model would be difficult to test since there is no descriptive classification of the visual elements in the websites. For example, their model suggests that low masculinity cultures produce 'pleasing visuals', while high uncertainty cultures produce 'redundant cues such as colour and typography' and it is not clear how the presence or absence of these features could be measured and charted.

The second study (Gunn and Moss, 2006) sought to overcome some of these limitations by using both a larger sample of websites (sixty personal websites produced by students at higher education institutions in the UK

and France) and also a larger number of rating criteria (twenty two) which were rooted in earlier, comparisons of websites by gender. The three main criteria used derived from research on design or website aesthetics:

- criteria concerning navigation issues;
- criteria concerning language, its register and the amount of self-promotion;
- criteria relating to visual elements.

Of the twenty two rating elements used, twelve showed significant differences between the French and UK websites. Seven of these twelve differences related to factors significantly associated in a UK website study (Moss *et al.*, 2006) with female-produced websites (these instances related to fewer subjects, more pages, less expert language, more rounded lines, greater number of typeface colours, more informal typefaces and greater use of certain colours) and a further three factors used to a significantly greater extent in the French than the UK websites and weakly associated with the female-produced websites (use of a welcome message, 2D images and colours in the background). Only two other significant differences between the UK and French websites (use of a crest and reference to one's own achievements) were related to factors which were significantly associated in the UK website study with male-produced websites.

This comparison of UK and French websites highlighted the fact that 83 percent of the features that differed significantly between the UK and French websites related to features that typified the female-produced websites in the UK-only study and this might be thought to illustrate the greater femininity of websites in France compared with those in the UK, reflecting in turn the greater femininity of French as compared with British values (Hofstede, 2001). This view is consistent with Samli's hypothesis (1995) that the masculinity/femininity cultural dimension will influence individuals' values across cultures.

A final study conducted as part of a Masters thesis, compared American and Indian approaches to mobile phone interface design (Jhangiani, 2006). Regrettably, the study focused on a comparison of conceptual elements, for example, the extent to which providing options is favoured by low power distance cultures (*ibid*, p.38), rather than on aesthetic features, restricting observation on the latter point to the observation that 'feminine cultures emphasize the aesthetics of the interface' rather than providing any examples of the manifestations of this observation in design (p.38).

This overview reveals that insufficient research has been conducted on the basis of which an authoritative response can be produced to Sheth and Parvatiyar's questions (2001) regarding the appropriateness for global markets of differentiated or undifferentiated brands. There is some evidence of differences in website designs across national boundaries, but there appears to be no research at all into the impact of nationality on preferences. This latter gap calls for research so that Sheth and Parvatiyar's questions can be definitively answered in respect of preferences segmented by nationality.

### *Gender*

Just as with nationality, opinion on the impact of gender varies (Caterall and Maclaran 2002) with opinions ranging from the post-modern view that gender is an unproductive dichotomy (Firat 1994) to the evolutionary psychological perspective that plays down the influence of sociocultural factors (Jackson, 2001), emphasising instead the role of innate factors (Lupotow, Garovich and Lupetow 1995). According to recent commentators, this second approach is gaining ground in several disciplines and should not be overlooked (Caterall and Maclaran 2002).

In addition to the evidential argument, commentators have emphasised the economic case for focusing on gender. So, Barletta (2006) writes of women control of 83% of consumer spending and Silverstein and Sayre (2009) write of women's massive global spending power, controlling about \$20 trillion in annual consumer spending in 2009. Their conclusion was that, in aggregate:

*Women represent a growth market bigger than China and India combined—more than twice as big, in fact (p.2).*

The substantial size of the female market prompted the authors to conduct a sizeable survey in order to ascertain whether women perceived product sectors to be focused on their own 'specific needs'. Analysis of the views of 12,000 women suggested that women perceived companies as offering 'poorly conceived products and services and outdated marketing narratives that promote female stereotypes' (*ibid*). The gaps were perceived to be particularly acute in the food, beauty, fitness, clothing, health and financial services sectors, with conclusions summarised by the present authors in Table 1 below:

*Table 1: Feedback from women on positive and negative features within different sectors (Silverstein and Sayre, 2009)*

Sector	Factors perceived as positive	Factors perceived as negative
Fitness	Helpers on hand to provide continuous support	Complicated equipment; bright lights; electronic music
Beauty	The availability of newly developed age-reducing products	
Clothing	Some chains offering fun, inexpensive clothing; a 'fit block' is available at Banana Republic which makes buying clothes easy since the same sizing applies to all clothes	Different sizing for different clothes
Health	Products developed to assist with identified problems (e.g. with baby care)	Long waits; higher fees for health insurance
Finance		Lack of respect for female customers; poor advice; one-size fits all forms; red tape

The question addressed by this article concerns the extent to which men and women's preferences differ or cohere, the interactionist and universalist position respectively. In the section that follows we will summarise the findings of existing research comparing male and female design and will then go on to present new evidence from across five nationalities.

### *Male and female design productions and preferences*

#### **Design productions**

Research comparing male and female-produced designs across the fields of graphic, product and web design has uncovered a number of sex differences which parallel those found in drawings and paintings (Moss, 2009). These differences have been shown to be statistically highly significant with a greater tendency for male-produced than female-produced designs to use straight lines, fewer and darker colours and a technical appearance and for female-produced designs to make greater use of rounded shapes, brighter colours and a less technical appearance and greater use of detail (*ibid*; Gunn and Moss, 2006; Stilma and Vos, 2009).

By way of illustration, one set of studies compared the features used in male and female-produced websites. In one of these (Moss *et al.*, 2006a), the aim was to identify the range of features used in male and female-produced websites and this was achieved by rating the personal websites of 30 male and 30 female students against 23 criteria. The study focused on personal websites as a medium where 'people tend to ostensibly be ... their true selves' (Miller and Arnold, 2003), manifesting the 'virtually real self' even if this consisted, in the act of communication, of multiple identities (*ibid.*). The fact that the rating criteria could be objectively rated, and that they emerged either from complex rating exercises or from earlier research, thereby minimised the risk of personal bias (Schroeder and Borgerson, 1998).

As with research reported on earlier comparing websites produced in different countries, the three main criteria used derived from research on design or website aesthetics. They were: criteria concerning navigation issues; criteria concerning language, its register and the amount of self-promotion and criteria relating to visual elements.

Where visual features were concerned, many of these derived from research on the gendering of art and design (Moss, 1995, 1999). The thematic elements included five elements: the formality of photos; the gender of images; the use of inanimate/animate themes; self-propelling/stationary objects; and the institution's crest. Where non-thematic elements are concerned, six features were rated: use of straight/rounded lines; the use of regular or irregular typography; the number and range of colours in the typeface/background; the extent to which design elements appear either three-dimensional/two dimensional; the presence or absence in the layout of a horizontal line; and finally the type of typeface colours used. Overall, a total of 23 elements were rated, all amenable to objective rating and all researcher-neutral in having been derived from earlier research.

A comparison of the male and female-produced web sites produced by thirty male and thirty female students at a UK university highlighted statistically significant differences on 13 (56 per cent) of the 23 elements rated (Moss *et al.*, 2006a). These were spread across the three areas of navigation, language and visual content. Those elements on which there were significant differences related to the number of separate subject areas covered (with men favouring more subjects than women), the character of the language (men favoured formal and expert language, self-promotion and infrequent abbreviations), the thematic features of the images used

(men favoured use of own logo, images of men and formal images, and women images of women and informal images), non-thematic visual elements (men favouring the use of straight lines, and a conventional layout) and the character of the typography (men favoured formal typography and a smaller number of typeface colours).

The most significant differences (at the  $p < 0.001$  level) related to four elements namely: (i) the use of colours (the use of a variety of text colours was more common among the women's websites); (ii) shape (use of a horizontal layout was more common among the men's websites); (iii) images (men used more formal images); and (iv) language (use of self-denigration and informal language were more common among the women, while the use of expert language was more common among the men).

In a second phase of research on male and female-produced websites (Moss *et al*, 2006b), the extent to which these differences were apparent in a comparison of personal web sites produced by 180 male and female students at a UK, French and Polish University is shown in Table 2.

*Table 2: The features which showed significance differences in the way they were utilised in male and female-produced product designs (Moss et al, 2006b)*

Element	Extent of the difference between the male and female use
Rounded or straight sided shapes	$P < 0.001$
Conventional layout with horizontal layout	$P < 0.001$
Range of colours in the typeface	$P < 0.001$
Animate / inanimate images	$P < 0.001$
Gender of images	$P < 0.001$
Formality in the pictures	$P < 0.001$
Regular / irregular typeface	$P < 0.05$
Colours in the typeface	$P < 0.05$
Formality/ informality in the words used	$P < 0.001$
Use of a site map	$P < 0.001$
Use of self-denigration	$P < 0.001$
Use of expert language	$P < 0.001$
Reference to one's own achievements	$P < 0.05$

The websites were rated against 22 features and 13 features emerged as significantly different in the male and female-produced websites. These differences are shown in Table 2.

By way of further illustration, other studies had as their focus a comparison of male and female-produced Product Designs. One recent

study compared the output of sixty Masters-level graduation product design students in Holland, with the designs rated against the twenty three criteria used in the earlier studies (see above) of web design (Stilma and Vos, 2009). The findings showed that fourteen of the twenty three features produced a positive correlation with the differences found in the web design study and five of the features demonstrated significant differences between the male and female-produced products. The significant differences are shown in Table 3.

*Table 3: The features which showed significance differences in the way they were used in male and female-produced product designs (Stilma and Vos, 2009).*

Feature	Level of significance of the differences in use of this feature in the male and female-produced designs	Whether significant in the Moss <i>et al</i> , 2006 study of web designs
Female use of bright rather than darker colours	*P<0.05	Yes
Female use of organic rather than 3-dimensional shapes	*P<0.005	Yes
Female use of greater humour	*P<0.02	Yes
Lesser use by females of moving objects (e.g. cars)	*P<0.005	Yes
The theme of the design focused on the gender of the designer	*P<0.005	Yes

### **Design preferences**

Alongside studies comparing designs produced by men and women there are those testing for the effect of gender in design preferences. Typically, these have asked male and female subjects to rate male and female-produced designs (graphic, product and web design. Where web design is concerned, a number of studies have been conducted with a deficiency being the variability in methodological quality. The first of these (Flanagin and Metzger, 2003) set out to establish the impact of gender on perceptions of site credibility but regrettably the study was based on the evaluation of just two websites with the gender of the sites' designer(s) unfortunately not

revealed. Despite these methodological drawbacks, the study had the merit of distinguishing website *production* and *preference* aesthetics.

A second study (Cyr and Bonanni, 2005) compared the *preferences* of 76 Canadian students for a single Sony website and found that women systematically reported lower preference values than men. The study also found that: (i) more men than women reported the site to be better organised (ii) more men than women had favourable impressions of the way product information was presented (iii) more men than women were satisfied with the navigation design (iv) significantly more women than men questioned the value of animations (v) women were more attracted by the colours on the site, and men by the interactive and 'flashy' aspects of the site.

While this study is welcome in having tackled the topic of web design preference, its value is reduced in having not only restricted itself to a single stimulus website but also in having failed to categorise its features and against a notional visual aesthetic scale. Had the authors tested reactions to a range of web sites from across a visual aesthetic scale, the study would have had greater value. A third study (Zahedi *et al*, 2006), advocated that web sites be produced 'in line with the audience's culture' but although web sites were grouped into four types, no empirical evidence was offered in support of this categorisation.

A fourth study overcame many of these shortcomings (Moss *et al*, 2008) by asking students (38 male and 26 females) to offer preference ratings to three male and three female-produced websites which had been classified, in an earlier study, as displaying design elements that typified the male and female production aesthetic respectively. The preference ratings revealed a highly significant statistical tendency on the part of men and women to ascribe higher overall ratings to web sites created by those of their own gender. Respondents were also asked to provide preference ratings for varied elements in the design and in every case, the female ratings showed a tendency to prefer the female-produced websites; the men, by contrast, while manifesting an overall preference for the male-produced websites, produced detailed preference ratings that prioritised the pictures in the female-produced websites; their detailed preference ratings also showed equanimity as between the shapes in the male and female-produced websites (for these results, see Table 4 below).

*Table 4. Preference test results: the size of the significance levels in terms of each gender preferring websites (or elements of the websites) produced using the production aesthetic of their own gender (Moss et al, 2008).*

	Male preferences	Female preferences
Overall preference for website	0.01	0.01
Language	0.01	0.01
Pictures	Preference for female production aesthetic	0.01
Shapes	No significant preference	0.01
Layout	0.01	0.01
Typography colours	0.01	0.01

This study of design preferences limited itself to reactions to websites, with reactions limited to those of UK respondents. It therefore failed to offer evidence on reactions across different nationalities to a wide range of design stimuli. In order to fill this gap, a new set of experiments were organised as described in the next section.

## **Methodology**

Respondents were students in five countries who had indicated their nationality from birth as being that of one of the five countries. They viewed six pairs of design stimuli shown in a PowerPoint presentation and in each case, indicated their preferences as between the two designs in each pair. Each pair consisted of a single product category with one object in each pair designed by a man and one by a woman. Of the six pairs, two were pairs of related products from the IKEA catalogue (chairs and cushions); one pair consisted of two separate canned drinks and a second pair consisted of fish finger packets, both taken from the catalogue of the design agency that produced the images; the remaining two pairs consisted of images of two Christmas cards, both illustrating an outdoor scene; and the final pair showed two London underground interiors.

Eliciting respondents' reactions from images in a PowerPoint presentation was considered acceptable since all of the product images bar that of the underground stations were either taken from a sales catalogue or were reproduced in the same vertical position in which they would be displayed online or offline (this was the case of the pair of Christmas cards). In this way, the PowerPoint images were a proxy for the situation confronting the consumer offline or online. The photographs of the

underground interiors were, unusually for the product images, not taken from a catalogue but this was justified on the basis that no such catalogue images were available and on the basis that the images were not qualitatively different from the other product images. It should be added that presenting respondents with images displayed in a PowerPoint presentation was the only practical and consistent means of showing clear images of the stimuli to the large numbers of respondents taking part in this study.

Reactions were elicited from 481 men and women in the UK, Germany, France, Hungary and China, with the gender distribution shown in Table 5 below:

*Table 5: Respondent numbers in the five-country preference tests*

	British	German	French	Hungarian	Chinese	Total:
Male	38	68	57	36	26	225
Female	41	60	80	33	42	256
Total	79	128	137	69	68	481

The designs were selected on the basis that they contained features that exemplified the male or female design production aesthetic based on features identified in earlier literature (Moss, 2009; Stilma and Vos, 2009), although the pair of children's chairs were more similar since both used bright colours and a child-like design to appeal to children. The designs consisted of product designs (chairs, cushions), graphic designs (Christmas cards), packaging designs (drinks cans and fish finger packages) as well as interior designs (underground designs) and the quality of the items in each pair was comparable since each pair was targeting the same or similar markets.

For each pair, the respondents were asked to:

- indicate the item in each pair they preferred
- score both items on a scale of 0-10 (where 0= I hate it and 10= I like it very much)

## Results

The results across all the responses show a statistically significant tendency by respondents from five countries, in respect of reaction to five

out of the six pairs of designs, for men and/or women to prefer the design produced by someone of their own gender (see Table 6).

*Table 6. Preference test results across five nationalities with an indication of the statistical extent to which male and female responses differ*

	Significance (difference between choices of male and female respondents)	MALE designed product preferred (M = by male respondents, F= by female respondents)		FEMALE-designed product preferred (M = by male respondents, F= by female respondents)	
Pictures 1 -2 Children's chairs	.536	M <u>55.6%</u>	F 52.7%	M 44.4%	F 47.3%
Pictures 3-4 Cushions	.000	M <u>59.1%</u>	F 30.5%	M 40.9%	F <u>69.5%</u>
Pictures 5-6 Christmas cards	.000	M <u>61.8%</u>	F 35.2%	M 38.2%	F <u>64.8%</u>
Pictures 7-8 Drink cans	.003	M <u>65.8%</u>	F 52.3%	M 34.2%	F 47.7%
Pictures 9-10 Food packaging	.009	M <u>60.0%</u>	F 48.0%	M 40.0%	F <u>52.0%</u>
Pictures 11-12 Underground Stations	.000	M 41.9%	F 23.0%	M 58.1%	F <u>77.0%</u>

These results confirm the finding of 'own-sex' design preference noted in earlier studies (Moss, 1995; 1996; Moss and Colman, 2001; Moss and Gunn, 2008). The case of the pair of children's chairs (Pictures 1 -2) was the only instance which did not illicit significant differences between the responses of male and female respondents. As Table 6 shows, both men and women preferred the product designed by a male designer, although the margin in the case of female respondents was very low (52.7% of female respondents preferred the chair designed by a male designer and 47.3% of them the product designed by a female designer). The similarity of response to the two chairs may be rooted in the fact that both chairs, as seen earlier, were child-like in character, drawing on elements of the female aesthetic with use of bright colours, and so were not as differentiated aesthetically as the other pairs of designs.

The case of cushions (pictures 3-4) elicited reactions that clearly illustrated 'own sex preference' (i.e. a tendency to prefer designs produced

by people of the same gender as the observer) since the majority (69.5%) of female respondents and majority of male respondents (59.1%) preferred the cushions designed by a female and male designer respectively. The difference between the choices of the two genders was highly significant ( $p < 0.001$ ).

The results were similar in responses to the pair of Christmas cards (pictures 5-6) with both genders showing own-sex preference at the high level of  $p < 0.001$ . In percentage terms, 61.8% of male and 64.8% of female respondents preferred the designs produced by someone of their own gender.

The analysis of the responses related to drink can designs (pictures 7-8) showed that both genders preferred the male-designed product although the percentage of male respondents selecting it was significantly ( $p < 0.05$ ) higher (65.8%) than the percentage of female respondents (52.3%).

The results for the food packaging (pictures 9-10) showed own-sex preference at a statistically significant level ( $p < 0.01$ ) with 52% of female respondents and 60% of male respondents selecting the product of female and male designers, respectively.

The case of underground station designs (pictures 11-12) was one in which, although both genders preferred the station design produced by the female designer, the proportion of women selecting it was significantly ( $p < 0.001$ ) higher than the proportion of men.

Taking the results overall, across the respondents from the five countries, it can be seen that in eighty per cent of men's preferences (five out of six pairs) and in sixty seven per cent of women's preferences (four out of six pairs), respondents displayed a preference for the designs produced by those of their own gender.

When segmenting results by nationality, some interesting differences in the extent of 'own-sex preference' emerged (see Table 7).

In the case of British respondents, only two pairs of designs (those showing cushions and those with Christmas cards) elicited statistically significant differences in response by gender. By contrast, in the case of Chinese respondents, there were three cases (cushions, Christmas cards and underground station designs) in which the choices of the men and the women differed significantly. Interestingly, the German and French responses threw up significant differences between men and women's reactions in 4 out of 6 cases (cushions, Christmas cards, drink can designs and underground station designs).

*Table 7. Preference test results by nationalities: significance levels in relation to the extent to which male and female respondents rated their own gender's designs more highly than those of the other gender*

	Overall	British	German	French	Hungarian	Chinese

## **Discussion**

These results exemplify the tendency for design *preferences* by gender to strongly show a favouring of designs produced by people of the same gender as the beholder. These results add weight to the suggestion that design aesthetics can be optimised by following an interactionist rather than a universalistic process. As a consequence, internal processing algorithms (IPAs) should make allowance for differences in aesthetic response across demographic groups. Key variables, according to the research presented here, are gender and nationality.

### *Implications for design and marketing*

Although some argue against a specific "feminine sensibility" (Harris and Nochlin, 1976), some agree with Erikson in speaking of a "profound

difference in the sense of space in the two sexes" (1970, 100) and the evidence explored in this article adds weight to this view. There is also some evidence that the strength of this effect varies by nationality with the strongest effect observed amongst those of French and German nationality. What are the implications of this for design and marketing?

The form of a product relates to consumers' psychological and behavioural responses (Bloch, 1995), and research has demonstrated that a positive aesthetic response to a product will not only lead to enhanced purchasing where the function and price of competing products are equal (*ibid*), but will also correlate with an enhanced estimation of the product's utility (Tractinsky, 1997) and value (Hassenzahl, 2007). The results presented here show that preferences can be segmented by gender and by nationality and the importance ascribed to preferences in the literature highlights the need to factor gender and nationality into design decisions.

### *Implications for strategies and processes*

The findings presented here suggest that design is optimised when there is a match between the gender of the producer and the beholder, an effect of particular importance, with the empirical evidence reported here, in France and Germany. Such a finding suggests that organisations would do well, in order to optimise design, to give consideration to the gender of purchasers and, based on that, look to see a match in terms of the gender of personnel servicing these customers. This is to offer what Baden-Fuller (1995) calls the 'inside-out' and the 'outside-in' strategic perspective.

If a difference in demographics and perceptions emerges between those inside and outside the organisation, then it is possible that a paradigm shift will be required on the part of the organisation's thinking. The radical options involve the recruitment and promotion of staff whose perceptions and aesthetic preferences match those of the target market. A less radical and more evolutionary strategy would encourage greater diversity in people's thinking through a process of training and development. The first option may lead to more permanent change than the second since the effects of training may be temporary rather than long-lasting in nature. However, injecting a demographic into an organisation where that demographic constitutes a relatively small minority can cause difficulties for the demographic concerned, with failures to adequately acknowledge the talents or skills of that demographic. As discussed elsewhere, only an organisation acutely aware of these problems can put in place systems to prevent the worst effects of unconscious bias (Moss, 2009).

The efforts of doing this will be richly rewarded through enhanced customer satisfaction and a customer-focused mindset, in conjunction with an interactionist viewpoint, will be essential tools in the battle to win and retain customers.

### *Research limitations*

The number of design stimuli was limited to six pairs due to the difficulty of obtaining design histories of designed objects across a greater range of graphic, product and public design. A further limitation relates to the fact that, for practical reasons and in common with 75 per cent of British and American psychological research studies, (Coolican, 2004, 35), respondents were limited to members of student bodies. Future research could usefully repeat the research with samples of respondents from other sectors in the same countries.

## The Role of Product Design as a Mechanism for Moral Legitimacy

Sarah J.S. WILNER<sup>\*a</sup> and Aimee Dinnin HUFF<sup>b</sup>

<sup>a</sup> Wilfrid Laurier University; <sup>b</sup> Oregon State University

*The socio-cultural meanings of products have been well documented, but these interpretations are not fixed; technological, environmental and social shifts conspire to disrupt the configurations of extant codes, values and relationships that constitute meaning. These cultural reconfigurations can be signified via the product designs that activate, reflect or accelerate them. Our study investigates product design as an important mechanism in the legitimization of a specific category of stigmatized consumption: sex toys. We examine the devices' changing meanings as they are reflected in North American popular media, conducting a Greimasian semiotic analysis of selected mass media texts from 1990 to present. Tracing the growing legitimation of this morally-charged product category, we provide an analysis of the fundamental tensions that characterize discourse related to sex toys. We find that design-based developments have been an important force in reconciling the binary oppositions that infuse the product category with stigma and tension, and provide evidence that design-related factors are an important means by which such products have gradually moved from culturally-contested to cautiously conventional.*

**Keywords:** design form, aesthetics, semiotic analysis, interdisciplinary, socio-cultural meaning, mass media

## Introduction

The socio-cultural meanings of goods have been well documented in marketing management (cf. Oswald and Mick 2006), design (cf. Crilly, Good, Matravers and Clarkson, 2008; Rosenman and Gero 1998) and material culture (cf. Henare, Holbraad and Wastell 2007) literatures. There is general consensus that meanings flow among cultural categories and consumer goods via cultural intermediaries, including designers, marketers, and consumers (McCracken 1986). However, these meanings are not fixed; contemporary technological, environmental and socio-cultural shifts have conspired to disrupt the extant codes, values and relationships that constitute meanings. Such cultural reconfigurations can be signified via the product designs that activate, reflect or accelerate them (Forty 1986). Thus, from electronic cigarettes to prosthetic limbs, design has leveraged new technologies and shifting cultural values to play an essential and powerful role in redefining the meaning of specific product categories.

It is in this frame that we set out to study product design as an important mechanism in the legitimization of stigmatized consumption practices. Our inquiry focuses on products for which the transformation towards normalization appears to rely upon some form of aestheticization (Schmitt and Simonson 1997; Cova and Svanfeldt 1993). Accordingly, we examine the contribution that design can make in redefining moral consumption by investigating the role of products' design(er)s in redefining practices from deviant to desirable and from culturally-contested to conventional within a single product category: sex toys.

Our initial interest in this phenomenon was triggered by an article in *The Atlantic*, itself a mainstream publication, which profiled a new generation of vibrator design. Describing "well-designed gadgets that take their inspiration from Apple, not Hustler" (Isaacson 2012), the article profiled JimmyJane, a "design-centric brand" of sex toys<sup>4</sup> and its founder, designer Ethan Imboden. In the article, Imboden, who holds an electrical engineering degree from Johns Hopkins and a master's in industrial design from Pratt Institute, describes his impetus to start the company in decidedly unsalacious terms. Indeed, as we delved deeper, we were struck to find that many descriptions of this new sector of sex toys (by both the press as well as the companies' own communications) pains were taken to articulate the design objectives for these goods as prosaically as those of designers of any other category of

---

<sup>4</sup> <http://www.jimmyjane.com/about-us/>

consumer products. For example, JimmyJane's website proclaims, "We've always believed the pleasure's in the details. Not just the aesthetic details (though we love those, too), but also the materials, technologies and engineering that go into creating a truly exceptional product and experience."<sup>5</sup> Similarly, the website of Standard Innovation Corporation, a Canadian-based company whose name reveals a conscious desire to quash extant connotations of its products, emphasizes that the firm strives "to focus on high-quality design and dedication to body and environmentally conscious materials and processes." Intrigued by the seemingly profound transformation of a product category from tawdry to tasteful and the emphasis of design's role in that conversion, we initiated our investigation by examining media- and market-based discourses<sup>6</sup> that have contributed to the popularization and eventual legitimization of sex toys.

Comparing popular culture texts (e.g. movies, television series, women's magazines) with producer perspectives as represented in media interviews, we construct a semiotic square that provides a framework for unpacking the role that design has played within this transitioning product category. Our contribution is a nuanced understanding of the role of designers and their designs in influencing cultural meanings of a product category undergoing transformation and moral reinterpretation. Examining multiple actors, agents and perspectives in the object system of this transforming product category provides an opportunity to more fully unpack and understand design culture's (Julier 2008) influence on consumer culture.

## Literature Review

The study described herein represents the exploratory phase of a larger investigation of products once labelled "unmentionables" (Wilson and West, 1981) but now more likely to be characterized as taboo (Sabri 2012); stigmatized (Sandikci and Ger 2010); or illicit (Goulding et al. 2009) as they are gradually legitimized through a variety of socio-cultural forces (Humphreys 2010). Research on stigmatized consumption has typically focused on the role of resistance or withdrawal from the mainstream, for

---

<sup>5</sup> <http://www.jimmyjane.com/our-products>

<sup>6</sup> We acknowledge that product and consumption meanings are highly contextual and therefore offer the caveat that our investigation is situated in North American texts and discourses. Given that similar products have been developed in the UK (Myla) and Sweden (Lelo), we suspect that in fact the phenomenon we describe reflects Western sensibilities about both sexuality and design.

example, through participation in alternate consumption contexts (e.g. Kozinets 2002; Schouten and McAlexander 1995; Goulding, Shankar, Elliott and Canniford 2009). In these examples, individuals knowingly consume unconventional products or services, thereby tacitly accepting, if not actively seeking, the marginalization that results. In contrast, our study's context—sex toys, and specifically vibrators—involves a product category in “mid-disruption,” as it becomes increasingly normalized and destigmatized, in part through visual association with a popular taste regime (Bean and Arsel, 2013) which emphasizes simple interface and sculptural form (Levy, 2006; Segall, 2012). Arsel and Bean define a popular taste regime as “a discursively constructed normative system that orchestrates the aesthetics of practice in a culture of consumption” (p. 900).

In her groundbreaking history of the vibrator, Maines (1999) traces its history as an innovative technological solution to a phenomenon construed as a common and chronic disease as early as the first century A.D.: female sexual drive, pathologized as “hysteria.” As Maines chronicles in her historical account, hysteria was typically diagnosed by doctors, who then treated it using manual massage. Applying the manual “therapy” was both time and labour intensive, yet treatment of the “affliction” provided a ready and loyal clientele. A breakthrough came in the form of product design. In the late 1800s, two patents were awarded to an American physician named George Taylor for a steam and vibratory massage table he called the “Manipulator” (Maines, 1999). This innovation sparked an industry and by 1900 a “range of vibratory apparatus” was available to physicians. While the first commercial vibrator was designed by and for physicians and provided a medical frame in which to understand the product's application, soon after a range of models for home use was also on the market and provided important disruption to extant codes.

*The social camouflage of the vibrator as a home and professional medical instrument seems to have remained more or less intact until the end of the 1920s, when the true vibrator...gradually disappeared both from doctors' offices and from the respectable household press...When the vibrator reemerged during the 1960s, it was no longer a medical instrument; it had been democratized to consumers to such an extent that by the seventies it was openly marketed as a sex aid (p. Maines, 1999, p. 20).*

Early vibrator designs were limited to the technologies of their time, and were constrained by the mental models that defined their use. Water jets,

steam, electrical currents and a wide range of “percussive devices” were applied to women’s bodies. However, historian Maines notes that pervasive androcentrism endured, and the devices’ use for sexual pleasure or expression was almost entirely elided. Indeed, representation of stimulation for pleasure has long been constrained to pornography, resulting in a perception of indecency that endured despite shifts in women’s power, independence and control of their own sexuality. We argue that only recently—given multiple influences, one of being the emergence of a distinctive popular taste regime led by the aestheticization of other small appliances and electronics—have vibrators acquired more mainstream acceptance and legitimacy.

## Study Design

Our study draws upon Hirschman, Scott and Wells’ (1998) Model of Product Discourse, which acknowledges and assumes the dynamic relationships between practice and text as product meanings are continually formed, modified and re-established over time. We situate our investigation within mass media texts for a number of reasons. First, social and cultural norms are often both discursively created within popular media where expressions of normative consumption, relationships and gender-based narratives abound (Zayer, Sredl, Parmentier and Coleman, 2012; duGay, 1997). Second, examining news accounts and entertainment narratives over time provides an important opportunity to observe shifts in this discourse over time in ways that cross-sectional data would preclude (Humphreys 2010). Third, mass media is by definition created for a broad audience, therefore reflecting meanings and holding appeal for mainstream consumers (Arsel and Thompson 2011; Scaraboto and Fischer 2013). Finally, our data set is archival, consisting of historically accurate discourses and representations, which are not retrospective in nature (Humphreys 2010).

We followed multiple paths to gather representative texts for our study. In addition to searching for articles on the phrase “sex toys” in Business Source Complete database, we selected 36 consumer magazines to examine. We selected magazines whose editorial was focused on lifestyle/entertainment and targeted toward mainstream adults aged 18-50, and searched on the following terms: "sex toys", "vibrators", "adult toys", "massagers", "couples' fun", "sex", "sexual pleasure," "pleasure," "masturbation," as well as the brand names of top manufacturers. We examined any text related to sex toys for all material the publishers made

available online, as our libraries did not subscribe to most of these titles. The resulting articles were logged in a database that included any specific excerpts discussing and describing sexual aids. As with magazines, television programs were examined if they were likely to contain repeated situations or dialogue relating to female sexuality over a period of at least five years. We examined episodes from the series *Sex and The City*; *Weeds*; and *Mad Men*, as well as individual episodes or scenes noted by commentators in news media. For example, we investigated the examples given in articles on *Ms. Magazine's* blog (Vineyard, 2012) the *New York Times* (Howard, 2011), respectively, about the growing acceptance of the product category.

The resulting data set consisted of text from magazine articles and transcriptions of television episodes in which vibrators were featured or discussed. We selected and coded sections of content that explicitly or implicitly related to vibrator use and popularity, either current (at the time the content was produced) or past. As we moved through the stages of open, selective, and theoretical coding, we sought a robust interpretation that adequately and meaningfully captured the nature of the data from our poststructuralist perspective (Humphreys 2010; Thompson 2004). As we coded, we noted that the cultural readings of sex toys are firmly rooted in a number of binary oppositions (Greimas 1983), leading us to construct a semiotic square in order to map the complex semiotic relationships we found within the data. As Floch (1988) explains, mapping these conceptual boundaries can elucidate the conditions within which meaning is produced and interpreted. As such, this form of analysis reveals dynamic systems of signification.

## **Findings**

As noted above, we began by coding and then mapping cultural binaries onto a semiotic square, which is presented in Figure 1. A cultural binary is a pair of opposing concepts used to organize the world. Within the texts we analyzed, the role that sex toys played in women's sexual consumption and expression was characterized in four distinctive ways: hedonistic; filthy; therapeutic; and pure.

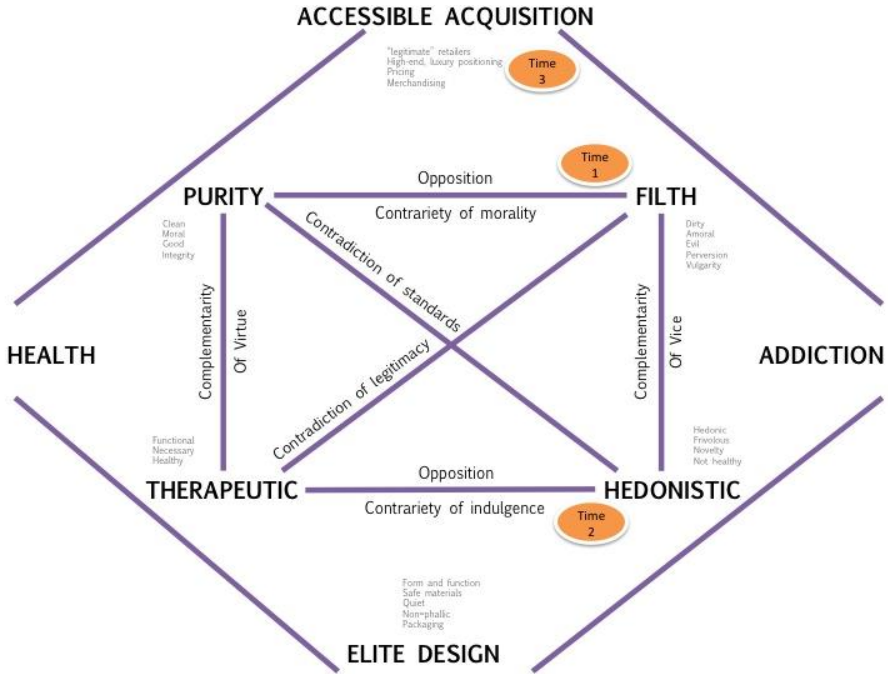

Figure 1 – Semiotic Square

Table 1 provides illustrative instances of each of these conceptual anchors. Importantly, as represented in Figure 1, each of these frames exists in tension with the other interpretations.

The Role of Product Design as a Mechanism for Moral Legitimacy

Table 1 – Data Illustrating Semiotic Concepts

Characterization	Source	Date	Illustrative Text/Scenario	Product/Role of Design
Hedonistic	Sex and The City, Season One: “The Turtle and the Hare” episode	1998	Charlotte, a character generally presented as prudish, is introduced to the idea of a vibrator by close friends. However, she becomes so enamored of her new device that she retreats from the rest of the world, preferring the uncomplicated, consistent pleasure of her sex toy. Her friends, worried that she is addicted, stage an “intervention.” Protesting, “Hey, it’s a vibrator, it’s not like it’s crack,” Charlotte points out that one of her friends introduced her to the idea. “I thought you could handle it,” the friend retorts.	A fuchsia, translucent, bunny-shaped vibrator called “The Rabbit” by producer Vibratex. Its form is portrayed as cute and therefore unintimidating and conceptually accessible. When Charlotte sees the product for the first time, she exclaims, “Look! Oh, it’s so cute! Oh, I thought it would be all scary and weird, but it isn’t, it’s pink! For girls! And look, the little bunny has a little face, like Peter Rabbit!”
Filthy	The L Word, Season Two: “Land Ahoy” episode	2005	At the airport, Dana annoys her friends by insisting that she needs to check her luggage to avoid going through security. Pressured to carry it on, the reason for her reluctance becomes clear when the security guard x-rays her bag and, seeing a phallic shape, calls over a female colleague. “I think we got something here,” he says pointing, “what is, that, some kind of <i>weapon</i> ?” Removing it—and the strap it is in—from the bag, the guard proceeds to examine the toy until Dana’s partner Alice explains its use by pantomime. Having conspicuously confiscating another toy found in the bag for her own use, a female security officer scolds, “you can’t take these on the plane ladies; you should know better than that.”	The toy is hyperbolically-sized and flesh-coloured. A male security guard “examines” it in front of Dana, her friends and curious onlookers. As he bends the rubbery phallus from side to side, muttering “What. The. Hell. Is. This?” the toy replica’s artificial quality is highlighted. The guard’s response to the device is exaggerated for comedic effect, but it also serves to deepen the humiliation experienced by the character.
Therapeutic	Women’s Health Magazine	Nov. 2011	“If you spend time with your battery-operated-boyfriend only when your real guy isn’t around, you’re both missing out: Forty-one percent of women and men have used a vibrator during foreplay, according to researchers from Indiana University’s Center for Sexual Health Promotion, and up to 37 percent of women and men have used one during intercourse. Not only do women who use toys report a host of pleasure perks, but guys say vibes increase sexual desire, erectile and orgasmic function, and intercourse satisfaction, says Debby Herbenick, Ph.D., lead author of the surveys and WH sexuality advisor.”	[#4/5] “When an engineer struggled to figure out how to use a sex toy with his wife, he decided to design his own—and the Ola was born. Unlike other vibrators, this one doesn’t have any preset patterns; instead, you create your own pleasure pulse by stroking or squeezing the pad. The rechargeable and waterproof Ola repeats whatever you request.”

Characterization	Source	Date	Illustrative Text/Scenario	Product/Role of Design
Pure	Chatelaine Magazine	April 2014	“Good news! When it comes to intimacy, we’ve evolved beyond plastic. When having sex, you should still be able to make ethically conscious, ecologically sustainable decisions, and now you can. There are many non-toxic, vegan and sustainable products made to enhance your intimacy and sexual health.”	“When looking to purchase a rechargeable toy you must ensure it’s waterproof, rechargeable, and phthalate-free. Phthalates are chemical compounds used to control the flexibility, transparency, durability and longevity of plastics, but they’ve also raised concern about potentially causing cancer and infertility. We recommend: <a href="#">Jimmyjane</a> , LEL O, and WE-Vibe are leading the pack in innovative—and safe—products.

As Humphreys (2010) has noted, “understanding shifts in discourse over time is crucial for understanding the process of legitimation” (p. 492). We identified two distinct shifts in cultural discourses related to sex toys in our data, and accordingly, have structured the semiotic square in three time periods.

*Time 1: 1990 to 1997*

We bracket our analysis at the turn of the twenty-first century, a period of changing conceptions of women’s power, status and choices sometimes referred to as the beginning of third-wave feminism (Walker, 1992). Popular discourse about sex toys, when voiced, drew heavily on language related to the binary opposition between the node we label *purity*—characterization of sex aids as clean, moral and good—and the more common representation of *filth*—text underscoring perversion, vulgarity, pornography with emphasis on illicit consumption. During this period, discourse relating to sex toys is more clearly organized around polar opposites of purity versus defiled and dangerous (Douglas, 1966). Vibrators are largely relegated to the amoral *filth* end of the moral continuum. The appearance of a vibrator in the feature film *Parenthood* (1989), while slightly earlier than the period’s definitional dates, provides an example of this tendency to frame sex toys as objects of depravity. In the scene, a large extended family is enjoying a traditional dinner when the power goes out and all is dark. The protagonist, Gil Buckman, proceeds to search for a light source. He ducks into the bedroom and emerges with what he believes to be a flashlight. As Gil turns the device on and it begins to noisily vibrate and buzz, power is restored and all eyes focus on the battery-operated, plastic, exceptionally long missile-

shaped vibrator in his hands, and he runs out of the room to dispose of it. His young daughter asks, “Mommy, what was *that*?” to which the mortified mother stammers, “that was ... an electric ear cleaner.” Still not placated, her daughter presses, “it was kinda *big*” to which her grandmother adds, “It sure was!” In this example, adults recognize what the object is, but the vibrator is considered taboo, secret, and its appearance in a family setting is clearly problematic.

### *Time 2: 1998 to 2007*

We see a sharp shift of representation with the creation of the HBO television series, *Sex and the City* (hereafter, SATC), and specifically, episode nine of the first season, titled “The Turtle and The Hare.” As described in Table 1, the episode revolves around a prudish character’s introduction—and subsequent “addiction”—to a pink vibrator called “the Rabbit.” *Sex and the City* is often credited with literally “re-mediating” the presentation of women’s control over their sexual satisfaction (cf. Arthur 2003) for a mass audience. While themes of sexual power, independence and control permeate the entire SATC series, the increase in sales of the Vibratex Rabbit Pearl (the brand featured in the program) after the episode aired, as well as the array of imitators and variations it inspired, offer strong evidence of both the program’s influence and its depiction of the device as a desirable object.

Some scholars have seen the ensuing commercial activity as a predictable, “typical of a contemporary cultural trend towards representing women’s sexual pleasure as fashionable, safe, aesthetically pleasing and feminine (Attwood 2005 p.393) while others have interpreted the representation of vibrators in popular media during this period as fostering fear of its easy substitutability for a male mate and addictive potential (Walther 2010). Under either interpretation, the presence, frequency and framing of vibrators in popular culture texts signals an ever-increasing acknowledgement of the existence and normalcy of women’s sexual desires and equally, the likelihood that they can and will satisfy those desires independently. Thus, vibrator use is increasingly represented as hedonic rather than filthy; it is still a vice, but because of its self-indulgence rather than perversion. Similarly, the opposing pole moves from the conceptualization of virtuous purity to one of natural, healthy and therapeutic desire. In this second time period the tension between categories remains real and important, but differs in terms of intensity, cultural legitimacy and ideological standards.

During this period, not only do the representations of sex toys shift, they become more frequent and occur in increasingly mainstream outlets. For example, in addition to the significant SATC episode, in 2006 “O” magazine, part of Oprah Winfrey’s empire, includes an article on sex toys that proclaims Vibratex’s Rabbit Habit to be “the Rolls-Royce of sex toys” (Kogan 2006) and celebrity Eva Longoria, interviewed by *Self* magazine for her starring role on the immensely popular *Desperate Housewives*, reveals that she bought her first vibrator in 2003 and gives Rabbits to all her friends as gifts (2005). These examples highlight the tension between hedonistic and therapeutic representations of sex toys. Although “O”’s comparison to a luxury vehicle underscores the product’s indulgent qualities, Oprah Winfrey’s brand is firmly rooted in self-improvement. Longoria’s interview includes the confession that she “really wasn’t sexual” until she discovered sex toys. Similarly, mainstream women’s magazine *Chatelaine* avoids the tension by providing readers with a range of possible meanings via a self-diagnostic quiz to find an appropriate device.

Importantly, as with the SATC scene that emphasizes how the form of the Rabbit dispels Charlotte’s intimidation, we note an increasing focus on the aesthetics of each apparatus. *Chatelaine* frames the consumption decision as it would any fashion feature. For example, women whose quiz scores showing their personal style as “pretty, cute and feminine” are advised to maintain their style in the bedroom:

*You’re ready to devote time and effort to exploring your sexual self, so you need a toy that fits your pretty and feminine style—phallic vibes just aren’t for you. Ninety per cent of the time, women will buy a sex toy based on aesthetics, says Andrea Dobbs, retail manager of Womyn’s Wear in Vancouver. If the toy reflects your personal style, you’re going to want to use it more—even show it off! Dobbs recommends shopping for a sex toy the same way you would a pair of shoes or a handbag (Goldberg 2006).*

Advice for “sporty” women is similarly framed:

*You need a toy that fits your sporty, tomboy style – cutesy pink bunnies and over-the-top leopard print just aren’t for you.... The Lava Spot is super cool. It’s like a little smart car...the ergonomic design is sleek and easy to hold – it even looks like a bike handle. [It] is completely waterproof and has a quiet vibration, and the control panel lights up...If you’re concerned about discretion, go incognito*

*The Role of Product Design as a Mechanism for Moral Legitimacy with Water Dancer (§34). This vibe is completely waterproof, small enough to throw in your backpack and perfect for your active lifestyle – the Good For Her website recommends this vibe for camping trips (ibid).*

In the article from *The Atlantic* described above (Isaacson 2012), designer Imboden recalls a visit to a sex toy convention in 2002 and his revulsion for the objects he encountered there: "severed anatomy, goofy animals, and penis-pump flashing-lights kind of stuff" and as Isaacson tells the story, Imboden was inspired:

*'As soon as I saw past the fact that in front of me happened to be two penises fused together at the base, I realized that I was looking at the only category of consumer product that had yet to be touched by design,' Imboden said. 'It's as if the only food that had been available was in the candy aisle, like Dum Dums and Twizzlers, where it's really just about a marketing concept and a quick rush and very little emphasis on nourishment and real enjoyment. The category had been isolated by the taboo that surrounded it. I figured, I can transcend that.'*

Imboden launched his response, JimmyJane in 2004, and its products have been credited for ushering in a new period of consumption, described next.

### *Time 3 – 2008 to 2014 (present)*

The third period represents a period of legitimation through radical redesign, conspicuously communicated attention to form and function, and the increased availability of vibrators through high-end, mainstream retailers. In this period, secondary semantic concepts emerge, depicted by the diamond shape encompassing the core semantic square in Figure 1.

#### **Health vs. Addiction**

The complementary meanings of purity and therapeutic resolve into a new reading of sex toys as normative and therefore "healthy." As the illustrations in Table 1 reveal, contemporary discourse of sex toy consumption has moved into a realm of healthful benefit; note how the excerpt from *Women's Health* magazine draws upon the source credibility of university studies, scientific statistics and frames of "improved function" to imbue the use of sexual devices as part of the virtuous and natural order

of things. The *Chatelaine* text reinforces this interpretation by underscoring the importance of materials in both human and environmental health.

### **Elite Design vs. Accessible Acquisition**

Design has long been an important mechanism for reconciling the apparent contrariety between the therapeutic and hedonistic behaviour (Postrel 2003). The value accorded effective design provides rationale for indulgence; for example, as devices are reengineered to take advantage of technological advances such as usb power, the result is a quieter, more discrete device which is also not at risk of losing its power source, as protagonist and widow Nancy Botwin, of the Showtime series *Weeds* experiences in a scene (Season One, episode Six, “Dead in the Nethers”) in which her vibrator batteries die and she cannot find any in the house to replace them. Similarly, the rhetoric of mindfully-designed objects for which ergonomics and human factors are a prime consideration can be seen as a reflection of the merging of therapy with hedonism. Note the description, excerpted from Standard Innovation Corporation’s website, about its research and development process:

*When inventor Bruce Murison began researching the sexual health business, he discovered an industry of products that were intimidating, poorly designed and cheaply made of potentially toxic materials. He dedicated himself to creating a safe, high-quality, eco-friendly sex product that enhances the experience for both partners. Many years, several products and thousands of designs later, Standard Innovation remains committed to ongoing innovation and to creating bodysafe and environmentally friendly sex products. The research and development process at Standard Innovation is much like that of any other advanced technology company. Every day, our in-house design team explores new technologies, materials and concepts that build on the genius of We-Vibe...our team employs state-of-the-art engineering tools and technologies to ensure each of our products fulfills our promise to create the most innovative and high-quality products on the market. Our process includes digital 3D models, 3D-printed prototypes, simulated human ergonomic software and a university-managed consumer testing and feedback process.<sup>7</sup>*

---

<sup>7</sup> <http://www.standardinnovation.com/about-us/research-development>

Moreover, as the use of sex toys becomes normalized within the discourse of health and normalcy as described above, differentiation—particularly through design—emerges as a meaningful evolution among otherwise commoditized goods (Borja de Mozota 2003; Forty, 1986). As Sudjic (2009) observes, “The pursuit of luxury is more ubiquitous now than at any previous moment in history. In the absence of scarcity, luxury has acquired a role beyond its use as a coded social signal of privileges...department store[s become] museums where everything is for sale” (p. 81). These forces are evident in both the text about and the actual products available on the market in the past decade. Swedish company Lelo offers a collection of sex toys in 20k gold, including a product called Inez which is touted as “the most exclusive vibrator ever created” which arrives in a velvet-lined wooden presentation box and retails for \$15,000 USD. Similarly, JimmyJane sells a limited platinum-plated vibrator for \$545 USD (its 24k gold version, retailing for \$425 USD, is currently sold out) as well as a \$35,000 “Jet Set” experience which includes four hours of flight time on a private jet equipped with sex toys, video entertainment, and champagne. Sociologist Thorsten Veblen’s (1899/1994) theory of conspicuous consumption would interpret these offerings as conferring legitimacy and stimulating desire among the middle class who desire to emulate those “at the head of the social structure in point of reputability.” This is particularly important and notable in the context of the consumption of sexual goods, which have historically been characterized by their status as shrouded secrets. Yet here too, there is evidence of the category’s legitimation. Not only does a range of this new era of vibrator take its visual vocabulary from the genre of sleek, simply and elegant products pioneered by Apple, the usb-powered products are sold with recharging stations that mimic the bedside charging stations that allow iPhones to serve as clock radios.

Finally, while there is no denying that the luxury sex toys, such as those offered by Lelo and JimmyJane, sit at an extreme end of the sex toy market continuum, accessibility of the new design-driven objects remains an issue, with most models retailing for more than \$100 USD. Enter the democratization of design (see Molotch 2003, p. 196) and the accessibility of new retail environments. Where sex toys were once only available at opaque-windowed sex shops located in the marginal districts of cities, the growing legitimacy of the product category has had an equally disruptive effect on the availability of sexual goods. Large and respected manufacturers such as Philips and fast-moving consumer goods producers Reckitt-Benckiser (owner of the Durex brand) and Church & Dwight (maker

of Trojan brand products) have brought their manufacturing prowess and retail relationships to the sex toy category, resulting in product availability in mass merchandisers such as Walmart, 7-11 and convenience store chains as well as main street department stores and specialty shops. For example, in a *New York Times* article entitled, “The Adult Store Goes Mainstream,” Winerip (2009) chronicles the role of retail in providing moral authority and normalcy. Other important avenues for consumption noted in the media include the increasing use and relative privacy of online purchase, as well as the growing ubiquity of direct selling channels—hosted, home-based social parties in which sales representatives demonstrate products and discuss use options.

Emerging from the shadows also means that marketers and others engaged in product development are beginning to add their sensibility to the product mix. High-end products are given names like *Ida*, *Ina* and *Soraya* (Lelo) which forge emotional connections without individual associations. Unlike the “severed anatomy” products encountered by Imboden a decade ago, many of the new products’ sculptural forms are emphatically non-anthropomorphic and devoid of “cute,” childlike animal forms. Similarly, the couples market is an important force in mainstreaming. Once a gag or Valentine’s Day purchase by men, a new generation of vibrators have been explicitly designed for couples’ use, not only reframing their use as acceptable rather than shameful, but also providing a range of meanings over an individual’s life cycle. Thus, mothers are encouraged to buy their teen-aged daughters vibrators so that they can learn about their sexuality and empower themselves *before* becoming sexually active (as advocated by Dr. Laura Berman on an episode of the Oprah Winfrey show) and couples in relationships are encouraged to employ the devices to maintain excitement and closeness. Indeed, in 2009’s feature film *The Ugly Truth*, the protagonist is gifted a pair of *Astrea I Vibrating Briefs* (underwear with a remote control) by a male colleague who to encourage her to sexually experiment with her boyfriend. “What this tells us is we’ve reached a tipping point,” said Debby Herbenick, an author of the studies along with her Indiana University colleague Michael Reece. “Something once regarded as exotic has become commonplace” (Winerip 2009).

## Discussion & Conclusion

Our study examines the emerging moral legitimacy of sex toys, which are a class of objects previously rendered taboo by mainstream consumers due

to associations with vulgarity and perversion. We demonstrate that these cultural meanings largely influenced and were influenced by product design; products in this category were once dominated by distorted forms ranging from the hyperbolized pseudo-anatomical to infantilizing animals, and these forms were manifestations of the taboo, illegitimate nature of the product.

In very recent years, this class of product has undergone a radical redesign. Designers have transformed and indeed begun to legitimize sex toys for the mainstream consumer; through meticulous attention to form and function, vibrators have developed new cultural meanings associated with virtue. Thus, the very recent emergence of elite design in this product category has played a pivotal role in the increasing popularity of vibrators, as evidenced by product sales, product availability, and popular discourse in mainstream media.

As consumer products, vibrators were invented at a time when women's pleasure was defined as pathology. While many gender-based norms have evolved with women's ever-increasing social, political and economic status, market-based discourse related to sexual pleasure has until recently remained largely repressed and relegated to the margins of the mainstream. Yet the new sex toy designers are redefining and destabilizing the market with bold functional and technological innovations (e.g. ostensibly ergonomic designs, tactile materials; quiet and convenient power supply) and, of particular interest, aesthetics that transform the transgressive into tastemakers. There are important managerial implications arising from our study, including prescriptions for managers of illicit or "unmentionable" products. We suggest managers can influence the current cultural meanings of these types of products (i.e., help to de-stigmatize them) by referencing designs of less stigmatized product and product categories. Careful monitoring of popular culture, attention to packaging, and strategic introduction to mainstream retail channels are some ways that managers can destabilize and shift cultural meanings and begin to legitimize products that are, presently, morally contestable.

Our analysis has demonstrated that design can leverage new technologies and shifting cultural codes to play an essential and powerful role in redefining the meaning of specific product categories. While examining contested products situates our study within an "extreme" end of the product spectrum, we selected this context to foreground the very real influence that design can have on market-mediated consumption.

# Positioning Designers into the Craft Revival of Emerging Markets: A Case Study on Chinese Ethnic Brocade Industry

Wei WANG<sup>\*</sup>, Tie Ji and Mohsen JAAFARNIA

Hunan University, School of Design

*Craft revival has made a comeback with the rise of creative and cultural industries both in developed countries and emerging markets. But the difference, against the so-called craft renaissance across Britain in the 1970s, is that today's revival mostly emerged with social responsibility from developing countries in a local-global scale, typically strike its root in a local culture and reform variants for the impact in a larger market. Alongside the blurred boundaries between craft, design and arts in theoretical level, design is more considered as a key element in the contemporary transformation between traditional craft production and modern consumption in social-culture level. So it is important to position designer into such local eco-system based on dynamic and diverse practices. Within literature review and the case study of Gaeml Brocade, this paper address the differences of craft revival in emerging markets, analysis the hierarchy of craftspeople and diversity of markets, and the changing of designers' role following local craft development. The co-creation model between designers and craftspeople has been proved advantageous towards the sustainable development of traditional crafts.*

**Keywords:** Co-creation; Craft revival; Handmade production

<sup>\*</sup> Corresponding author: Wei Wang | e-mail: [wei.wang@mlab.cn](mailto:wei.wang@mlab.cn)

## Introduction

After the economical shift in recent decades from craft production to flexible system and software industry (Cusumano, 1992), craft revival has made a comeback with the rise of creative and handicraft industries, DIY revolution, personal factory and with the application of the kick-starter model. From the development of Arts and Crafts Movement in the nineteenth century, to the so-called craft renaissance that spread across Britain in the 1970s (Peach, 2013), today's craft revival has differences in terms of characteristic and also has a fresh batch of challenges. Firstly, it is based on the changes ushered in by the post-industrial production bringing out massive changes in the socio-economic context, which is revealed by the productive, organizational and technological transition from the large Fordist factory that characterized the twentieth century, to the new post-Fordist production system, including open source, customization, crowd-sourcing and small batch (Imbesi, 2012). Secondly today's revival has to give a combined approach to the cultural heritage and social responsibility teamed with economic developmental needs ranging from underdeveloped regions in a global scale, typically striking its root in a local culture to reforming variants for the impact in a larger market. Thirdly current, margins between craft and design are fading eventually, with craftspeople trained to produce beyond the limited scale of individual work, and designers getting in the way of being able to economically justify production of unique pieces (Kettle, 2005). Within the dynamics of craft practices, professional designers qualified with expertise and industrial insights, play a pivotal role for the craftspeople (Shiner, 2012). Due to historical evolution of craft discipline and the characters of traditional handmade industry, modern design should find its position collaborated with arts and crafts, bridging craft revival to modern industries and diverse markets.

## Revival of local craft in emerging markets

Following a historical review, it present that no matter in developed countries or emerging markets, craft has made significant contributions to the economy in the last few decades. For example in UK, referring o the report of Craft Council (Schwarz el., 2010), the craft sector made a £3 billion contribution to the UK economy, and has a 13% representation of those employed in the UK's creative industries. The total market buying original craft is 11.3 million people, far bigger than that of fine art. In worldwide, according to the Creative Economy Report 2008 (UNCTAD, 2008), arts and

crafts are the only creative industry where developing countries have acquired a leading position in the global market. For this creative sector, developing country exports grew dramatically, from \$7.7 billion in 1996 to \$13.8 billion in 2005, accounting for 60% of total world exports of creative goods. Tourism and the expansion of leisure and art markets appear to have made a significant contribution to the dynamism of arts and crafts and even promises to do better in the coming years of the world market. But in emerging markets, the profession and operation of craft industry is quite different against which in developed countries. In developed countries, the participators, no matter employed or freelance, usually are well-educated creators with craftsmanship, modern design expertise, even have some commercial insights and could use personal social network to promote their works. So Craft Council (UK) use the term **maker** to represent those working with a contemporary aesthetic in craft disciplines, which as a role combines craftspeople, contemporary artist and modern designers (Schwarz et al., 2010). But in emerging markets, the profession would be blurred or somehow disorganized based on regional differences of socio-economic development. Craftspeople play multiple roles in an agricultural society and underdeveloped economy. Typically they have a low level of literacy, low-income and lack the connection with outside markets. They learn the craft from kinship or community, meanwhile considering it as an additional way for living as well as a cultural heritage of local tradition or identity.

Following globalization, craftspeople in emerging markets have more chances to involve into a larger eco-system of mass-production and consumption in different ways. A kind of craft-design collaboration is termed as “outsourcing the hand” (Murray, 2010). Western craft enterprises outsource their production to Asia or Africa, but shift from traditional mass-production factories such in China to varied craft workshop in poorer regions. From a modern western perspective, design entrepreneurs lead the production process as well as collect local acumen from craftspeople for new season’s design, then exhibit and retail them in western context. These ameliorative projects do not just take the economic benefit for craftspeople but are also controversial in reducing the degree of creative involvement from the producers and tread upon the integrity of intellectual rights and fair trade. A radical view from cultural preservationists is that craft would cease to be embedded in the natural rhythm of rural life and in turn become a product of a mechanized process that can be turned off and on with the whistle.

Closely analyzing the reason behind these arguments, one can come across the multiple meanings of craft in local living. From its economic, social and cultural value, Anna Kouhia (2012) addressed a multi-perspectival framework for the meanings of craft, including functional meanings, material meanings, aesthetic meanings, expressive meanings, experiential meanings, multi-sensory meanings, collaborative meanings and narrative meanings. It is obvious that the same craft has different meaning for its local producer, business owner and global customer in their different cultural context. Raymond William (2005) presented a notion of dominant, residual and emergent cultural behaviors. Woranooch Chuenrudeemol el. (2012) added to this by saying that crafts, considered as a form of cultural activity, has its own path of evolution through a period of time, which seems to correspond with the progression of cultural behaviors model (Figure 1). With the impact of global economy in different cultures, the craft from underdeveloped region would be considered as an exotic emergent culture for the western while the craft itself would simply remain a residual culture in local community. So if design involvement cannot revive local creation and reinforce its status in local dominant culture, local crafts would just remain a selling point for outsiders, while losing its inherent meaning for local communities in many centuries and fading in the local eco-system.

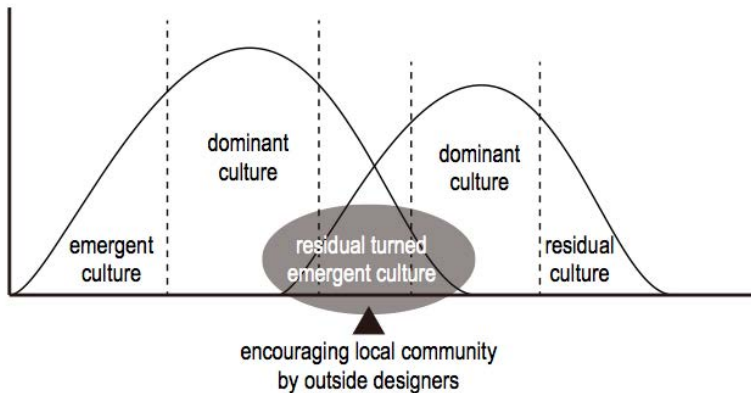

Figure 1 Residual-Turned-Emergent Cultural Evolution by Outside-Designers Stimulant. Source: Chuenrudeemol, W. (2012).

Following this point some NGOs explored a more supportive and constructive way for revival and restoration. For example, Aid to Artisans (Hnatow, 2009) helps local artisan community build its competence for

developing a market-ready product, from design mentoring to technical upgrading, and also exploring flattened distribution channel keeping in tune with the customer needs. It also provides some global training from India to Africa. Because of the diversity of crafts development, local community's knowledge background and markets' risk, it requires more involvement from the modern design expertise. Designers should be considered as the messenger of customized needs, the trigger of a global production ecosystem and the gatekeeper in cultural communication between craftspeople and customer, and also need work with craftspeople together to find a balance between local economic development and cultural sustainability.

Others employed participatory design methods to explore the collaboration between craftspeople and designers. These methods started from Scandinavia. For the last six decades it grew in recent user-centered design (UCD) trend. Sanders et al. (2008) used the notion **co-design** and **co-creation** to describe the collaboration closely between designers and users, and analyzed the changing of the roles in design process. Later some practice-led researchers explored the co-creation possibility in craft revivals, included the GoGlobal project initiated in 2005 (Barker et al., 2009), the cultural-oriented product design with human-centered design methods in Botswana (Moalosi, 2007), the new sustainable mode for the bamboo canopy craft of the Kotwalia community in India (Reubens, 2010), the practice in Bangchaocha's bamboo basketry crafts in Thailand (Chuenrudeemol et al., 2012), and the craft-design collaborations in revitalizing rush-weaving craft in Taiwan (Tung, 2012) etc. Beyond culture probe and ethnographic research, designers collaborated with the local community for social innovation, delivered breakthrough products for different markets, and extended new distribution channels like e-commerce. Contrasted with co-design in modern industries, the collaboration here focuses more on craftspeople than normal users. Because of the multiple roles of craftspeople, including creators, producers and even the first user of these crafts, they have a perceptual understanding of local needs and better creative sense than others. It is preferable to use the term co-creation than co-design because the collaboration between designers and craftspeople are not only limited in design stage but also includes experimenting in new materials, techniques and production, which covered almost all facts of new product development.

## Case study: Gaeml brocade

The case Gaeml brocade (Figure 2) is a typical example in recent Chinese ethnic brocade industry. It is one of ethnic weaving art fashioned by a southwestern Chinese minority community Kam (in Chinese called Dong, comprising 3 million population), and also distributed in Southeast Asia with the ethnographic migration. In the last one thousand years, Gaeml brocade is the main cloth and fabric material for local people. Most Kam women learnt weaving skills from their mothers or grandmothers, produced personal works with homemade looms, and used it as a main cloth and low-cost decorative materials like scarves, robes to baby-straps. Another reason why Gaeml brocade could survive is that the Kam people have their own language but do not have any script or text. They therefore used the Gaeml brocade to record folk beliefs and thereby sustained their own history with meaningful symbols, patterns and layouts, which is narrative and expressive form of art. Gaeml brocade now is one of the national intangible cultural heritage in China, and one of the eight most famous Chinese brocades, exported to oversea.

Figure 2 Traditional Gaeml brocade crafts. Source: photo by Yang Miao.

However Gaeml brocade has been facing crisis in recent years. With the progress of the Chinese economy and the subsequent motivation to join the modern industries, more and more rural youth prefer to work in modern factories and live in the urban areas as migrant workers. Even the youths in their hometown prefer to either start small ventures or startup a micro-enterprise. The remaining others engage themselves farming but not many

*Position designer in the process of local craft revival in the emerging markets*

go for Gaeml brocade. Weaving Gaeml brocade by hands is considered as a low-profit job and now deemed as an out-of-date custom. The lack of skilled Gaeml weavers has become a brutal truth.

In markets, because of the abundance of plenty machine-made clothing and commodities from cities, local customers prefer cheaper mass products rather than traditional handmade works. For example, a handmade scarf needs 15~20 work days by a skillful weaver. It would cost 90~160 euro (the average salary is about 6~8 euro each day in local). But local people find it more affordable to buy a scarf with 5~8 euro made by modern jacquard machine, manufactured from Chinese factories in coastal areas. Another factor about the shift in customers' choice is the impact of the modern media which demonstrate fashion trend on actors wear modern branded clothing. Here the old Gaeml brocade style cannot represent the new lifestyle that young people look forward.

Although some crafts workshop could try to sustain traditional Gaeml brocade with recent tourism growth and government funding support, most Gaeml brocade souvenirs sold in tourist bazaar bear a very similar look and are of low-quality, that reflect the lack of design involvement (Figure 3). Some are even made by outside factories in large volumes, priced at cheap rates and shipped to local bazaar for attracting tourists, which actually hits the original handmade crafts. Only a handful of local artisans could continue the authentic Gaeml brocade creation customized for cultural collectors.

*Figure 3 Early Gaeml brocade souvenirs sold in tourist bazaar. Source: photo by Yang Miao.*

### *The hierarchy of craftspeople and diversity of markets*

Traditional Gaeml brocade is quite time-consuming because of its elaborated jacquard and embroidery technique. So its production is usually organized in separated craft workshops (Figure 4). In each workshop, the average members are about 30~50 people, with a hierarchal unit based on location and kinship. There are typically 3 levels, masters, professionals and part-time participators. Normally one workshop only has 1~2 masters who control all issues. A master could retain his/her leadership status not only by excellent weaving skills, but also with apprenticeship, social status, creative thinking and even by possessing a good market sense. So the role of a master is more like a combination of a chief designer, a product manager and a business developer.

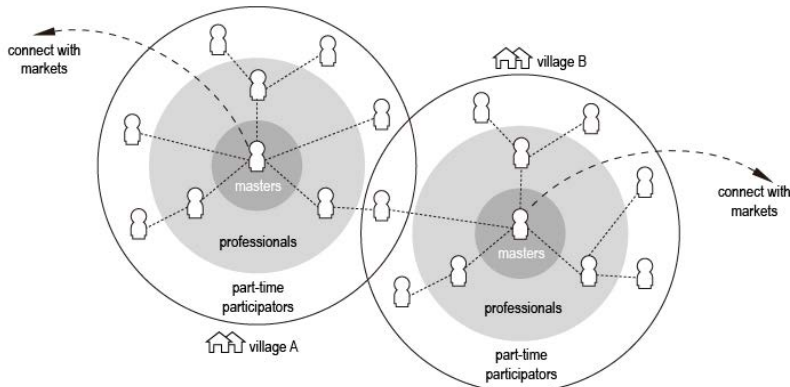

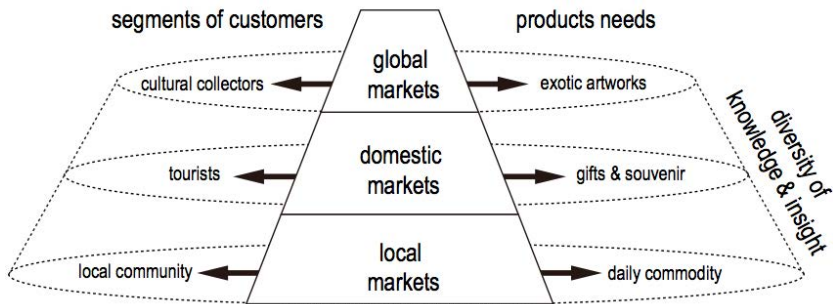

Figure 4 The social network of local craftspeople.

After conducting a survey we found that most masters now seldom weave their works, but spend more time on business and management. Professionals, who are skillful to sustain promised production in both quantity and quality, are the backbone for a workshop. They could keep most classical patterns and layouts in their mind and weave them efficiently even without reference. They could get a reasonable income based on their skill. The significant difference between masters and professionals are not the weaving skill, but the sense of market and product creation. That is why only the master could afford to become a channel with outside markets and decision-maker. The other sub-group, part-time participators, are temporarily based on deals. They participate in the workshop mainly because of neighborhood or kinship. Sometimes they become the pilot user

of product trials. These 3 levels have their different meanings for Gaeml brocade creation. Masters are creative and easy to collaborate. Professionals could improve production technically and keep the quality. Participators could present a wide feedback from both user and producer.

Products from the craft workshops could be usually distributed to different markets (Figure 5). Gaeml brocade, just like other traditional crafts, firstly has its functional and material meaning for local community's daily needs. Even now local youth prefer mass-production substitute in daily usage, other senior people could choose Gaeml brocade commodities owing to their cultural identity, especially in weddings and festivals. But in deliverables, a few masters have the competence to explore new product categories and create new patterns to match local customers' developing needs, which become the bottleneck in local commodities upgrade. Also most masters are either middle-aged or elderly. Their personal style shown in product creation is not so appealing for local youth's taste. So in this market segment, craft workshops need modern design involvement to help Gaeml brocade make a comeback to the local youth's daily life, and also use technical approach to improve product quality, and control production cost.

*Figure 5 The diversity of craft markets.*

Another important market segment is the domestic markets mainly for tourist. Kam people are famous for their complex wooden architecture and traditional musical performance. With the rapid development in recent years, a large number of domestic tourists have been visiting Kam's reserved region, and contributed dramatically to the local economy with their consumption. In this segment, the craft community need a deeper understanding of tourist's needs, and enrich the category of souvenir beyond producing the copies of several old patterns. But most craftspeople lack the sense on what the tourists want to take back home from such a

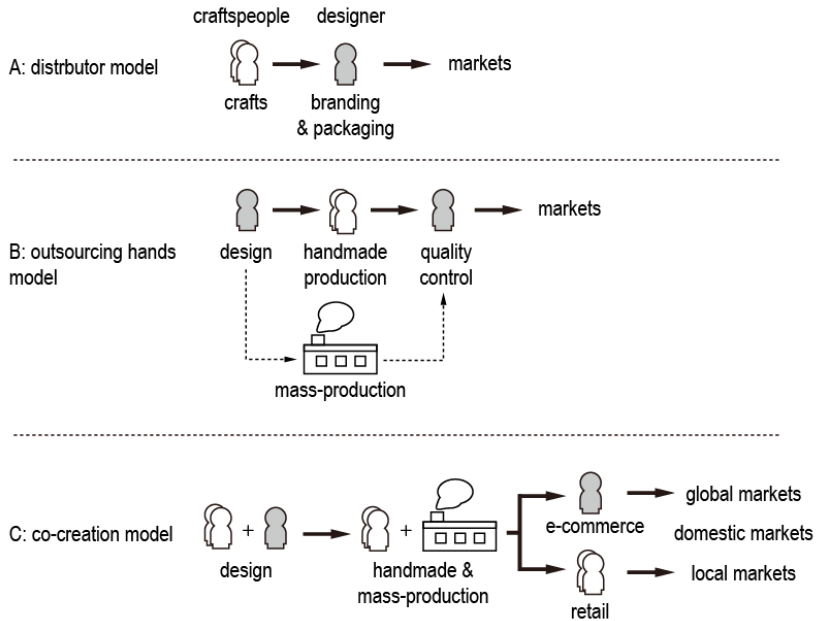

culture rich region? Which style is authentic and iconic in their eyes? How much is a reasonable price for such products? Based on a similar background, designers could have a broader understanding in it, and find shining points from local culture which may have been ignored by aborigines. Designers could contribute more towards packaging and branding with modern design expertise, which increase the additional value of local handmade works.

Additionally another sale channel for traditionally inspired artwork is the global market for cultural collectors which include the rich class in China and overseas. It may be mentioned that this segment mainly depends on the master's personal connection. For example, one of the masters Su Tianmei, officially entitled as the Gaeml brocade skill inheritor, has had more chances to promote her work in some international exhibitions and build a wide network with global collectors. In the recent years, she also claimed to have been asked by some customers for inclusion of modern style or fashion elements in her works besides sticking religiously to the classical patterns. So the 50-years-old master has displayed her eagerness in collaborating with young modern designers to create some fresh ideas to her works, trying out new materials and colors, or tailoring it in new ways. This brings out the relevance needs for modern design involvement in different markets.

### *Designer's potion: from distributor, product manager to co-creator*

Reviewing the design involvement in Gaeml brocade, it is a typical case of craft development in emerging markets. The initiated design involvement began more than 10 years ago. The first generation of local migrants working in the urban factories in the 1990s, came back to their hometowns with a commercial sense and some savings. Some of them invested funds to recover several craft workshops, and planned to produce the Gaeml brocade for markets culturally motivated. But because of low literacy and lack of professional training, they simply followed old patterns and hard to improve style and quality. However, even that, traditional Gaeml brocade with its unique pattern and ethnic style has its selling potential for urban people even for whom the level of its usability is very limited. So these workshop owners employed designers to brand and package original works, and sometimes use designer's social connection to promote the products.

*Position designer in the process of local craft revival in the emerging markets*

*Figure 6 Different models of design involvement in craft revival.*

This kind of craft-design collaboration (Figure 6 A) is called as distributor model where the designer only work on marketing issues after production but do not participate in the craft’s creation part. The collaboration between craftspeople and designers is limited without too much overlapping. Designers do not involve in these traditions and core production. For them, it is just one of traditional crafts which need to be wrapped up for commercial purpose (Figure 7). It is a craftsmen or workshop owner driven model. Its disadvantage is obvious as it quickly faces problems relating to continuous product development and lack of coordination with the market feedback.

*Figure 7 Package and brand design of early Gaeml brocade. Source: photo by Yang Miao.*

Following the growth of domestic cultural and creative industry, Gaeml brocade has displayed both cultural and commercial values in the markets. Another outsourcing hands model emerged later (Figure 6 B). Designer applied the craft's classical elements in his/her creation with their brands, then produce it with local workshops. Craftspeople are considered more as handmade production resources than culture inheritors and creation contributors. It is a designer driven model that he/she more like a product manager controls the whole process from product planning to quality control, and then outsources the work. This model has its success in new brand development and cross-cultural innovation in outside markets, especially tagged with the logo of famous designers and artists (Figure 8). In this model, the craftspeople do not find any space in the designer's creation stage, which usually happens in modern design studios. An interesting phenomenon following this model is that local craftspeople weave Gaeml brocade every day, but they do not use it in their daily life any more. Another challenge is that handmade products are now facing the impact of mass-production factories. More and more products complete its whole production process outside without any link with the local community. Gaeml brocade is losing its narrative, expressive and cultural meanings for local inheritors, as the ethnic element has become a part of the modern designer's personal style. As a historical craft, Gaeml brocade is dying in its original eco-system.

*Figure 8 Modern design creation based on Gaeml brocade. Source: designed by Liu Yi.*

The co-creation model (Sanders, 2008) was introduced recently to foster a deeper collaboration between designers and craftsmen. In the design stage, designers work with the crafts master in the field, and employ ethnographic and participative methods to leverage social innovation with local community. The result of a better merging between modern design expertise and local craft knowledge leads to the creation of varied products for diverse markets from local commodities to souvenir (Figure 6 C). For local market, designer could use user-centered design (UCD) method to analyze local needs and try out the design to test its feasibility and usability with the craftspeople. For domestic and global market, designers could lend their modern sense of functionality into upgrading the souvenirs and, as a cultural intermediary, promote Gaeml brocade in modern ways with a better understanding from local community. The co-creation's advantage in production is a more reasonable integration of low-cost and high-productive mass-production with emotional and elaborated handmade products. A series of product could be made by hand or by applying mass-production alternatively which could be priced differently based on its sales target. Even in one product alone, these two production methods could be mixed (Figure 9). For example, the decorative pattern or lace could be handmade on a mass-produced body. It could reduce the cost that would allow Gaeml brocade to become more affordable, meanwhile keeping its handmade identity. The advantage in sales channels is that craftspeople have their inherent networks in local retail market, and designer could explore new channels like e-commerce and display a complementary collaboration here.

## Discussion

### *The iteration loop between craft-design co-creation*

Analyzing the mechanism of craft-design co-creation, there are different iteration loops in co-creation because of the market diversity and mixed production (Figure 10). Targeted on outside market, the loop would be initiated by designers with modern design sense, using more local handmade production facilitated by craftspeople, and collecting the customer's feedback based on designer's channel. Another loop focused on local market would be initiated by local community needs, using the designer's resource to leverage outside mass-production and get a product feedback from the local retail. As the core engine for running these loops, the craft-design co-creation is not only a mechanism for product creation, but also a platform for knowledge sharing and resources integration between global and local eco-system. The thorough communication between designer and craftspeople is very important, especially in the initial stage to build a new partnership. In our practices, designers should immerse into the rural context from a few weeks to several months, build their

*Position designer in the process of local craft revival in the emerging markets*

connection with masters of craft workshops in daily life. It is better to trial a specific co-creation in field, and involve more local professionals if it's need. Methods employed here should be ethnographic, participatory and practiced. For example, an informal discussion and experiment by focus group in workshop usually could deliver extraordinary ideas. And a face-to-face communication is always better than remote ways.

Figure 10 The iteration loop between craft-design co-creation.

*The balance between cultural preservation and innovation*

Like the development of other traditional crafts, Gaeml brocade industry faces the trade-off between culture preservation and innovation. A radical view is that traditional crafts should be preserved with all its historical appearance and behavior as a cultural heritage without any modern impact. But from Gaeml brocade case, it does not make sense for local community both from the economic requirement and cultural meanings. However design's strong impact without local inclusion could erode the local cultural development. So a designer in co-creation needs positioning his/her creation with an open and supportive attitude towards local culture, and gives a reasonable feedback addressing the local needs both in cultural production and consumption. Even design lead the whole loop in many our practices, this kind of leadership is not dominant, but respecting and encouraging local wisdom.

*The coherence with two production systems*

Handmade production came from craft era with individual uncertainty against machined production. A mixed production system needs more efforts on the operative framework to control the handmade quality and clarify its input/output process with mass-production. The network of local

workshops presents its value here. One of the useful ways is that make an intangible criteria and sample as references in the workshop. The regular training for professionals is also needed. The master should also have an important role to play on quality assurance (QA). During mixed production, the work division between local craftspeople and outside factory should also take into account the logistic cost and maintaining remote communication. So when the design is fixed, designer should work with masters to figure out weekly production schedule and the deliver date, and follow-up the process to reduce the possibility of delay or rework.

### *The challenges in the changing eco-system*

Chinese socio-economic context is changing rapidly. The economic shift and cultural conflict arising out of the Gaeml brocade case is partly an outcome of the discontinuity of the Chinese society. A vivid description of current China can be summed up is a tale of three countries. The first is the top four big cities, Beijing, Shanghai, Guangzhou and Shenzhen, which like any other developed country have a remarkable GDP and a good consumption record. The second is that the majority of the second-tier cities which are at a developing stage. The remaining are underdeveloped rural areas which includes most of crafts' hometown. The fast changing lifestyle influences the trend and taste reflected in the craft's diverse market and also leads to an escalated production cost. During our practices in recent years, local communities developed so fast that we could always find some new things emerged and others disappeared just in several months, and their changing attitude toward life, work and also their crafts. So the co-creation practice should strike its root in local communities, fit into the dynamic changes, and help the craft industry find a more sustainable development roadmap by the experiences and lessons from developed countries.

## **Conclusion**

Craft revival in emerging markets has its unique characteristics placed alongside the developed countries, especially placed it in current global eco-system. Design involvement has proved advantageous towards the sustainable development of traditional crafts. From the empirical study of Gaeml brocade industry, the co-creation model could become a reasonable solution for the craft development in emerging markets. In further practices and research, the co-creation could be improved with the changing of local

*Position designer in the process of local craft revival in the emerging markets*  
social structure, markets and production system. We hope the knowledge and experiences obtained from this study can be applied by other practitioners as a stimulus for further research.

## Pre-emptying and the Myth of the Naïve Mind

Åsa ÖBERG<sup>\*a,b</sup> and Roberto VERGANTI<sup>b</sup>

<sup>a</sup> Mälardalen University; <sup>b</sup> Politecnico di Milano

*One of the mantras of innovation and design in the last years is that innovation requires a "beginner's mind". Innovation is hoped to come from people who are non-experts, unaware of existing solution heuristics and therefore free from pre-conceptions. But, innovation does not always concern the search for new solutions. It can involve a search for new meaning. By meaning we refer to the purpose of a product, the "why" it is used, rather than the "how". Meanings come from individuals and influence how they interpret their personal and business reality; they create myths. Are pre-conceptions detrimental also when searching for new meanings? Should companies therefore look for beginner's minds, or clean the minds of their organization, also when innovating meaning? This article contends that, in the context of innovation of meaning, "the naïve mind" looks like a naïve theoretical construct itself. Our research shows that rather than searching for innovators with a beginner's mind (who hardly exist) and rather than trying to challenge an organization's preconceptions, companies may positively leverage the existence of pre-understanding. By a deliberate act of "pre-emptying", employees can clearly express the meaning they believe in, not to challenge and clean it, but in order to use it as a precious ingredient to be melted and framed into a new interpretation of product meaning. In this paper "pre-emptying" will be discussed in the light of hermeneutics, theory U by Scharmer and four empirical cases of global corporations.*

**Keywords:** Pre-emptying, innovation by meaning, hermeneutics, theory U

## Introduction – The myth of the naïve mind

In a 2013 interview with Fast Company, Tim Brown, the CEO of design firm IDEO discussed some basic principles of their innovation process. “We come with what we might call a beginner's mind”, he noted. Over the years IDEO has built knowledge in multiple fields, but they still approach problems unencumbered by expertise. “We do rely somewhat on the value of having an open mind when we approach a new question”, Brown said (Baer, 2013).

One of the mantras of innovation and design in the last years is that innovation requires a “beginner's mind” (Stefik and Stefik, 2005; Brown, 2009, Bokeno 2009, Kao 2011). In other words, innovation is more likely to come from people who are free from pre-conceptions. This argument has been advocated not only in the field of design innovation, but also in innovation management, for example by theories of open innovation (Dunbar, 1995; Chesborough 2003; Lehrer 2010). The assumption is that outsiders have the advantage of being “as clean as a sheet”, unaware of the solution heuristics that dominate a domain.

This perspective has proven to be effective within the paradigm of innovation as “problem solving” (Sutton 2007). Indeed, when innovation is focused on the search for (technical) solutions to existing problems, then looking at problems without pre-conceptions may enable to search in areas previously unexplored. If the existing solution is “inside a box”, beginners, who do not know where the box is, are more likely to search “outside of the box” (Kelley 2001).

However studies on organizational change remember us that, still, it's company management and its internal resources, who have to take a new proposal in and make it happen. These studies have recognized the importance of internal organizational norms and values. These norms still act as pre-conceptions that eventually affect the deployment of change (Lewin 1947, Levy 1986). Therefore, these studies suggest organizations to make assumptions explicit so that they can be recognized and challenged before moving on into the new. In a way, they share a basic assumption with the studies cited above: that once assumptions are recognized, they should be challenged, so that people enter the innovation journey with a clean mind. Both perspectives therefore indicate that pre-conceptions hinder the innovation process; they create resistance to change; they are negative, rather than positive factors (Kanter 1992).

What happens, however, when innovation is not about a search for new solutions but a search for new meaning? By “meaning” we refer to the reason for “why” people buy and use products and services. A change in

meaning, therefore, is a change in purpose, in what makes sense. It points to a new need or experience – not a new solution to an existing need.

The role of product meaning has recently spurred several explorations. In design, for example, meaning is considered a central element of designers' practice: design, by definition, includes to bring meaning, to "making sense of things" (Heskett, 1985; Krippendorff, 1989). This takes design close to innovation by meaning, also discussed as a "design-driven innovation" (Verganti, 2009) as "meaning making" (Jahnke, 2013) or connected to "interpretive management" (Lester et al, 1998). Another well-developed stream of studies linked to meaning, comes from scholars in organization theories, who have explored how an organization makes sense of their environment (Weick, 1995) or of their identity (Tripsas, 2009), although they do not focus on *product* meaning, and its innovation.

Is the myth of the naïve mind still present when we address the innovation of meanings? Can we be as clean as a sheet when we innovate meanings, and is it valuable to act as beginners? Are pre-conceptions a negative factor and doomed to be challenged?

Our article takes an action research perspective to address the role of pre-conceptions in the process of innovating meaning. We first introduce the theoretical background; then, after having explained the research methodology, we illustrate the journeys of four companies in their search for innovating the meaning of their products. Finally we analyse and discuss the role of pre-conceptions, or rather pre-interpretations, in these journeys.

## **The role of pre-interpretations**

The concept of innovation of meaning looks absent within currently dominant innovation theories. In order to explore the role of pre-conceptions in this realm, we have therefore leveraged frameworks from theories of meaning interpretation and change: specifically, the role of pre-understanding in hermeneutics (Gadamer, 1975 and Ricouer 2010) and of deep change in the theory U of Scharmer (2008). Below we briefly lay out how hermeneutics serve as a valuable lense to discuss meaning, and how the theory U complements this philosophical approach with some practical implications.

### *Hermeneutics – a triple perspective*

Starting from a study of books in religion and law (and the intention of the authors behind) a philosophy of interpreting actors and actions has

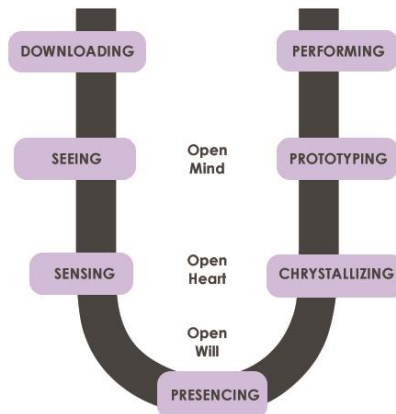

evolved. It is referred to as hermeneutics with the main focus on trying to interpret what you see starting from your own personal perspective (Alvesson & Sköldberg, 2008). The first fundamental part of interpreting concerns the subject, for example a customer, and how she, from her understanding, background and point of view, interprets an object, for example a product. The second level is where the acts of a subject are interpreted by someone else, for example a manager who wants to launch a new product. This is a researcher perspective – to observe someone in action. On a third level, the observer needs to ask herself about her field of departure, for example the meaning that drives her thinking, and deliberately try to take a different standpoint; to re-interpret, and thereby bring alternative understandings and novel proposals.

This third level challenges the myth of the naïve mind; because, hermeneutics acknowledges that no one, when searching for meaning, has a clean beginners mind. As Gadamer express it: ‘what is meaningful passes into one’s own thinking on the subject’ (Gadamer, 1975, p. 375). This approach, therefore, explicitly addresses the point of departure that everyone has (even the most unaware beginner) – and suggests to *deliberately* ask ourselves what this point of departure is and then – leveraging on it.

Another main concept of hermeneutics is that leveraging your own thinking can be eased by bringing other, conflicting views. It can, on one hand be described as an encounter, or a “clash of interpretations” (Ricoeur, 1984), or on the other hand as a blend, or a “fusion of horizons” (Gadamer, 1960/2004). This further challenges the myth of the naïve mind: both Ricoeur and Gadamer indicate that a novel meaning does not come from an empty mind, but, on the contrary, from a mind built on pre-interpretations, a mind with an horizon. It’s the clash between interpretations (the fusion of horizons) that bring novel perspective, not the absence of them. According to Gadamer: ‘A person with no horizon does not see far enough and overvalues what is nearest at hand, whereas to have a horizon means being able to see beyond what is close at hand’ (Gadamer 1975, p. 269; Laverty, 2003, p. 9). Awareness of the finitude of the human condition does not only constitute a limitation to, but is also a basic precondition, of understanding. Therefore, not only the naïve mind looks like a naïve construct, but also, the existence of pre-understanding is a *positive* and necessary asset to drive deep and profound reinterpretations. Without pre-understanding there is nothing to fuse, nothing to clash.

## *The Theory U – beyond the open mind*

Theory U, proposed by learning and leadership scholar Otto C. Scharmer (2008), gives guidance to how companies (or individuals) can strive deeper in their awareness of objects (such as products) and thereafter leverage new unthought-of visions and proposals. Even though not departing from the innovation management field, Scharmer gives valuable direction to the importance of moving beyond rational information processing when in search of change within organizations. His action research perspective combines theories from cognitive psychology, philosophy and organizational learning with joint research initiatives, for example community-engaged projects at the MIT.

*Figure 1 Otto Scharmer's Theory U (adapted from Scharmer, 2008)*

Scharmer's proposal of profound change (within people and in organizations) can be described in the shape of a U (Figure 1). Starting from the top, in the first level, companies take in information, such as a problem, to react and solve it. Some organizations stay at this level of interpreting. They "re-enact" patterns of the past – viewing the world through one's habits of thoughts" to quote Scharmer (ibid, p 39). We could say that they gather, or "download" data, to be used in a certain way to create a solution

without any further reflection. This reactive level goes from clean cut *downloading* of information to efficient *performing*.

When a little more engaged, companies do not just react on things; they actively try to understand problems. By listening, for example to consumers, they manage to take in new, previously unnoticed problems. Here, they “suspend judgement and see reality with fresh eyes” (ibid). It is a more embracing and reflective process than the pure downloading of “data”. It implies a process of going from *seeing* to *prototyping*. The first two levels of downloading and seeing are typical of innovation aimed at solving problems. They exactly mirror what Brown refers to as having an “open mind”.

But Scharmer also shows us two additional levels of awareness. The first is *sensing*, where understanding moves from pure knowledge (explained as the capacity of IQ) to also include empathy (explained as the capacity of EQ – emotional intelligence). Instead of listening with the mind (the brain) this involves an open heart. While sensing belongs to the left side of the U, *crystalizing* is the equivalent on the right. This third level is where vision is becoming outspoken and given a language – so that it can be communicated, to “envision the new from the future that wants to emerge” (ibid). This third step of the U can also be recognized in the work of Schön and his framing-re-framing construct, although this process of learning mainly refers to the past (Argyris and Schön 1995).

The deepest level of awareness is in the bottom of the U. Here, not only the mind and heart are involved but also the will. This understanding goes beyond bringing feelings to the situation but also to freely open up and “dive into” a situation; to show a willingness to “learn new”. It’s the level where we can reach our deepest form of creativity because it comes from deep within our selves. Scharmer calls this level *presencing*, a combination of the words being present and sensing. It includes an action of seeing the most intimate part of oneself – but as part of, and in relation to, the context around us. To reflect on our own future potential in the world we live in, or, as Scharmer puts it: to “connect to the deepest source from which the field of the future begins to arise” (ibid).

Similarly to hermeneutics, Scharmer helps us to further understand why the myth of the naïve mind does not apply to innovation of meaning: the concept of a “beginner’s mind” holds until the second level of Scharmer’s U (i.e. the level of problem solving based on seeing). Here is where an “open mind” is important, as Tim Brown noticed in his interview.

But when one wants to innovate meaning, and therefore has to move deeper in the “U”, an open mind is not enough: one needs also an open

*heart* and an open *will*. To open up these deeper levels, Scharmer leverages the existence of a “self”, the existing and original believes of a person – or with other worlds – an interpreter who comes from the past with her pre-interpretations. Rather than pretending being a beginner – a person has to put in place a clash: between the “Self” (a “Self” with a capital S, that comes from the future she aspires to) and the “self” coming from (the past and) present. It’s the clash between old thinking (the self and its pre-interpretation of something) and future will (the future Self) that generates an innovation of meaning.

Therefore, from a theoretical point of view, both hermeneutics and theory U challenge the myth of the naïve mind. They suggest that no one can be a beginner when searching for new meaning. Instead, acknowledging our pre-interpretation, making it explicit, and fusing it (with the pre-interpretations of others, as in hermeneutics, or with our own interpretations of the future as it emerges, as proposed by Scharmer), is essential. In other words: pre-interpretations have an important, essential value in innovation of meaning.

Both these theories suggest an act of pre-emptying: an act of becoming aware of ones own pre-interpretations, taking them out, discussing them and *building* on them. Our assumption is therefore that the act of pre-emptying might ease the revelation of a deeper knowing - to the birth of new meaning.

However, the mysteries of how to go deep, find these pre-interpretations, discuss them and leverage on them is not easily understood. We have therefore closely studied how companies go through this journey.

## **Being part of it – the method**

Over a period of four years we had a chance to participate into several projects in which teams were aiming to develop new meanings for their products. These projects were also for us precious settings to investigate the role of what we have come to describe as an act of pre-emptying. In this paper we will focus on four global corporations within consumer goods (see Figure 2).

During their journey of innovating their product’s meaning, all four companies invited external experts, or “interpreters” (Verganti, 2009), to enrich their understanding of meanings. Note that these interpreters were not designers, but came with specific competences from other fields than the companies’ expertise. The companies also made several iterations of

internal discussions to carve out potential new meanings of their products. Both these external and internal interactions can be seen as situations in which different interpretations are clashed or different “horizons” are fused. In Figure 2 below, external interactions with interpreters are indicated in green and internal interactions within the organizations are indicated in red.

In approaching these cases, our research perspective would be best described as a combination of action research and hermeneutic turns. As meaning concerns experience, a typical research perspective by observation and distance would limit our understanding. Therefore, instead of this second view perspective, we encourage a third, interactive approach, incorporating also personal interpretation. This means, we combined “data, theory and values” into a “trilateral science” (Galtung, 1977), an “innovation action research” (Kaplan, 1998). In practice, this means we have been active participants by proposing experiments, facilitating meetings, shared our opinions and contributed by bringing theoretical constructs to spur discussions and raise new questions. The paper contains short descriptions of the dynamic journeys of these four companies. We limit, in this case, our reporting to extracting the phenomena of pre-emptying.

In the description we start from the project with the less positive outcome to the project with the most positive outcome. What do we mean by “most positive outcome”? We are not concerned here on whether the firms envisioned a new meaning that was more or less successful on the market. Each project was just the first phase of a long innovation journey; it was a strategic research whose output (the potential new meaning) could then hopefully inform investments in new products and services. Final market success therefore would depend on several factors (e.g., product development performance, market launch strategies, etc.) that are beyond the scope of this study. We do not even assume that a proposal for an innovation of meaning must necessarily be successful on the market. For the worse, the outcome of a research project could even be judged to be wrong or uninteresting, but still the research project would have produced its outcome. Therefore we have been focusing on these specific research projects rather than on the overall innovation journeys. Hence, we considered their outcome to be positive if the team did envision a potential new meaning that went through an *engaged assessment* by the organization with an articulated consensus. In other words, if there was an arena in the organization where the new meaning was taken in, discussed, and decided upon.

## The four innovation journeys and how we analysed them

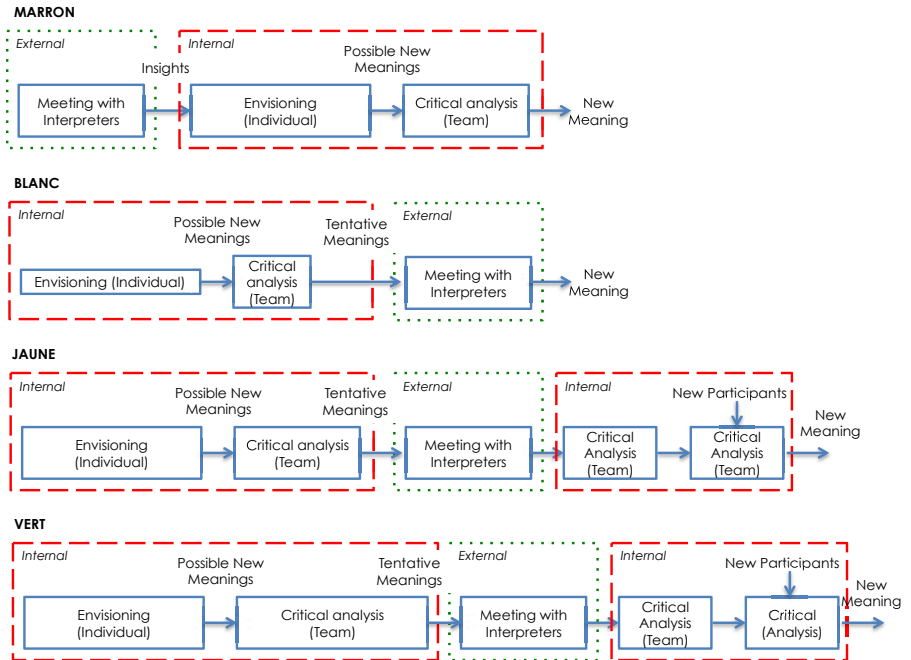

Figure 2 The four innovation journeys of the companies and their strive for finding potential innovations of meaning

### Case Marron: Rethinking core products

*The context:* Marron is a multinational corporation in the industry of consumer electronics. Its meaning innovation project was aimed at radically redefining the company positioning and launch a new range of products. The company had conducted, two years earlier, several creative workshops to generate innovative ideas, with scarce impact.

*The innovation journey:* “We would prefer first to meet outsiders. If we start from generating visions ourselves I’m afraid we would always come up with the same ideas that have been circulating in the last few years”, said the R&D manager of the company. There were two possible paths to start with the project The first implied starting from the outside: to meet external experts in order to collect new information on market trends, and then use

these new insights to generate the new visions. The second path implied instead to start from the inside: an internal workshop in which each member of the project team (consisting of about 20 people from different units) would share their own individual vision about new meanings for the company's products, and then, after the workshop, to critically discuss these new visions with external experts. In between these two options the firm opted for the second one: first collect insights outside, and then generate visions inside (see scheme above). So we started by meeting eight external experts who had a unique experience and perspective on customers' needs and behaviour. We call them "interpreters" (Verganti 2009) (for a detailed study of one of these cases see Altuna et al, 2014) since they may help to interpret how people could give meaning to products. Note these interpreters were not designers but representing different competences. After the meeting with the interpreters, each member of the project team was asked to envision three to five new meanings, leveraging the insights provided by these experts. One month later we organized a workshop, attended only by the internal team, in which these individual visions were shared, with the aim of developing a new meaning for the company. A total of 107 possible new meanings were proposed and our role, as facilitators, was to help the team to find connections among them, and screen them into a few possible scenarios. We proposed a framework, which these contributions should fit into, and also suggested a preliminary clustering.

*The consequences:* The external interpreters brought many insights into the opening meeting. However the project team that attended the meeting asked only a few questions, and the discussion was scarce. Lately, when the team members had to envision possible new meanings, we observed that they hardly considered the insights discussed by the interpreters. When then the team finally met in a workshop to critically discuss the different meanings, the team struggled to make sense of the variety of insights from the interpreters and contributions from the team. When we, as facilitators, proposed a framework and clusters to organize that rich information, the team similarly struggled to make sense of this framework: it looked as imposed from the outside, and could not capture the motivations that lead to the framework.

*Outcome:* the project eventually identified a new meaning. But it was not embodied and intimately absorbed. When team members, at the end of the project, were asked to tell what the new meaning was, they narrated different perspectives. In reality, there was no shared understanding of the new meaning, and the narrations of the team members were still

impregnated by their preconceptions. The new meaning went therefore soon lost into the internal organizational dynamics, and the project did not moved into implementation.

### *Case Blanc: Entering a new market*

*The context:* Blanc is a global corporation in the market of consumer goods. The meaning innovation project was aimed at entering into a totally new business.

*The innovation journey:* In this case the company decided to start first from the internals. They had already conducted some preliminary research and reflections, and wanted to see what new meanings this research could spur, before meeting outsiders. Therefore each member of the team (about 10 people) envisioned 1 new meaning. Then they rapidly discussed their visions into a workshop, giving space for us as researchers and facilitators to propose a framework and clusters to make sense of these visions, thereby generating in the end one tentative new meaning. In a new meeting, this new tentative meaning was discussed with seven external interpreters.

*The consequences:* In this project the meeting with the interpreters was more alive, with several questions and discussion between the outsiders and the team. However, the leader and other members of the team embodied only partially the framework for the new meaning formerly framed by us, the facilitators. In addition, this framework remained unchanged after the conversation with the interpreters. In particular, by focusing on the most conservative ideas, it seemed the company did not take in the more innovative instances.

*Outcome:* the team eventually identified a new meaning. But it was only partially absorbed. Similarly to case Marron, team members had different interpretations of what the new meaning was. Their pre-understandings were not fused. The project eventually moved into implementation, but with a focus on only the most conservative products, promoted by the most influential members of the team. The meaning went back closer to the old one, as the pre-conceptions of individual members were still creeping in.

### *Case Jaune: Addressing a growing market segment*

*The context:* Jaune is a global corporation in the market of consumer goods. The meaning innovation project was aimed at better addressing a growing market segment.

*The innovation journey:* The first part of the process was similar to Case Blanc: first an internal phase (to individually envision new meanings, and

share them to identify a common vision) and then a second external meeting with the seven interpreters. In this early phase however more time, engagement, and deep reflection were invested in about 70 possible new meanings by a larger team (about 15 people). Also, the facilitators had a more passive role, and did not propose any clustering or framework. More important, after the meeting with the interpreters, there were two additional intense working meetings where the company went back to the meaning and discuss it deeply again. In the second of these meetings there were new internal participants, who did not attend the early phases of the process.

*The consequences:* The new meaning took shape progressively along the different phases of the project. The team had proposed a preliminary meaning after the first meeting, but it was only after the meeting with the interpreters that they grasped the potential and radicalness of the new vision. Indeed, the meeting with the interpreters was very productive, and contributed to better focus the new meaning, and to avoid unpromising directions. The contribution of the new participants who came later was also very important. One of them especially, a top manager, challenged the new meaning, as if the project team had moved too far ahead and they had to wait for him to catch-up. Only after he took out his own vision (as the others did before meeting the interpreters) and the others discussed it carefully, he finally felt more comfortable to take in the new vision that had been developed in the project and make it even more robust (he even defended the new meaning during the final presentation to the company President). Finally, and curiously, at the end of the project the team did not only have a clear vision of the new meaning, but also a clear understanding of what the old meaning really was for customers and why it was outdated.

*Outcome:* the team fully absorbed the new meaning, albeit radical, and moved into implementation. They shared a common understanding of the new meaning, which was in sharp contrast with the previous direction. As well, the separate initial pre-understanding of each individual team member was not anymore recognizable in the final meaning. The team managed to create an arena to discuss and assess the new meaning, in which it had the strength to engage even the top executives and other units of the firm that did not participate to the project.

### ***Case Vert: a new shopping experience***

*The context:* Vert is a luxury fashion brand. The purpose of the process of innovation of meaning was to radically change the meaning of the shopping experience of their products in their own worldwide stores.

*The innovation journey:* The process was similar to Case Jaune. The main difference was that at the beginning of the process the team (consisting of 26 internal people) dedicated much more time to critically analyse the individual preliminary proposed meanings of the participants. Although the team envisioned overall 108 possible new meanings, the company realized that the point was not how many visions were proposed, but how much the individual preliminary meanings were seriously examined and really taken in. Therefore, rather than sharing all 108 proposals, each participants discussed in the plenary meeting only the meaning she/he found most promising (i.e. only 26 new possible meanings were critically analysed), but without time constraints: the discussion went on until everyone felt that their proposed meaning was thoroughly listened to, reflected upon and criticized.

*The consequences:* the construction of the meaning followed a similar behaviour than Case Jaune. The team moved however, more rapidly into the search for new meaning and was more engaged, because they had time to discuss collectively each individual meaning. In other words, there was time to transform each individual proposal into a common understanding, that was therefore fused into a shared reinterpretation.

*Outcome:* similarly to case Jaune, the team fully shared a common interpretation of the new meaning, albeit radical, and moved into implementation. Although top management support at the beginning of the project was not strong, the team had the strength to bring on board the top executives and other unit of the firms that did not participate into the project.

## **Discussion**

The four cases provide rich material to explore whether and how the myth of the naïve mind, or rather, a mind with pre-interpretation, contribute to the generation of new meaning of a product.

### ***The importance of pre-emptying***

The first observation confirms the theoretical stance of hermeneutics and Theory U: the myth of the beginners mind does not apply to innovation

of meaning. Project Marron, which explicitly opted for the beginners mind (i.e. asking the team to forget about the past and focus on new information provided by outsiders) did not succeed, and did not move into implementation. Similarly, project Blanc, that did pre-empt, but only partially, achieved only partial results.

One possible explanation for this not positive outcome could be connected to a lack of engagement of the team. Theories of participatory design and co-design, for example, show that a possible barrier for organizations to take in new constructs and ideas is a lack of active participation into the innovation process (Schuler and Namioka 1993, Sanders and Stappers 2008). This however is not the case in this study. In fact, the new meanings were not proposed by external consultants or designers. Rather, they came from a large multidisciplinary internal team that actively participated in the definition of the brief, meetings, homeworks and workshops over a period of four to six months.

What happened in both projects, instead, is that, although a potentially good new meaning was proposed, this was only “on paper”. In reality, the teams did not deeply assimilate the new vision, nor really grasped its uniqueness and implications; they were not intimately convinced. There was no arena for engaged assessment, nor consensus within the team that actively participated. Therefore, when moving into subsequent steps of development and implementation, the new meaning went lost along the way.

Projects Jaune and Vert instead acknowledged that when it comes to meaning, people’s mind is never empty and no one can really pretend to be a beginner. Therefore they dedicated a lot of energy and attention to pre-empt: the deliberate act of becoming aware of our own pre-interpretations, taking them out, discussing them, and letting them go, in order to leave room for new interpretations. This is clearly visible from the dynamic of their journeys. Instead of starting from the outside, they started from the *inside*, from their team visions. In particular: (1) each individual reflected on possible new meanings that they already had in their mind and soul (which enabled them to take-out what they had inside), and (2) these individual visions were taken-in by the other team members, who engaged deeply into discussion (which signalled to each person that her own vision was really considered, and also provided to the entire team precious meat for finding new meaning). The consequence is that eventually the two teams fully absorbed the new meaning and even managed to see the old meaning

of their companies as obsolete. They had therefore the commitment and strength to push the new meaning through implementation.

Hence, a project of innovation of meaning, differently than innovation of solutions, requires an explicit action of pre-emptying, which implies starting from the internal team's ideas about new meanings rather than from external insights.

### *Pre-emptying as a journey*

The second major finding of our analysis is that the action of pre-emptying (i.e. sharing and fusing one's pre-understanding of a scenario) is not a simple act in which a person "takes out" her vision. "Pre-emptying" does not happen in a moment. This is clearly visible in the story of project Blanc, where indeed the company started from the inside, and asked each member to envision a new meaning. But then the act of pre-emptying ended there. The company, did not dedicate enough time to critically discuss these new meanings internally. And we, as the facilitators, drove and pushed the conversation too much, instead of giving the team the time to assimilate and criticise each other's perspective. When the team moved into the following phases of the project (e.g. the meeting with the interpreters), it had still not deeply shared and fused their pre-interpretations.

Project Jaune and Vert instead show that pre-emptying is rather a sophisticated journey consisting of different actions:

- Envisioning: each member envisions one or more possible new meanings.
- Narrating: this new meanings are shared internally with other members of the team.
- Engaged Sensing: the other team members dedicate enough time to listen, critically analyse, understand and embody the vision of each other (vision that, initially, is not totally clear even to the proposer, who therefore needs time to make it significant through the contributions of the others who add new layers of meanings).
- Fusing: the individual visions are enriched, compared, clustered, connected, to generate a new common meaning, where the previous individual contributions are not recognizable anymore as autonomous bits, as in Gadamer's fusion of horizons.

Only when one's vision is melted into the others, then we can say that the process of pre-emptying is completed. Just envisioning and narrating is not enough. Meanings are not like ideas that can be rapidly tossed into a

brainstorming session and then move on. Ideas are “taken out”, meanings also need to be “taken in”. Without the actions of engaged sensing and fusing a pre-understanding will always be silently there and always act as a dead weight that prevents the entire team to move on (as it happened in Project Marron and Blanc). The metaphor of “melting” reminds us that pre-emptying requires much more time and energy than simply putting together individual elements. It is achieved when one’s meaning is not recognizable anymore, and yet it is there, into the compound: one can sense its properties and taste.

The action of engaged sensing, before the fusion, is crucial. The team (and the consultants/leaders/facilitators) have to avoid pushing towards convergence before the individual pre-interpretation are discussed and criticised. Interestingly, and differently from creative problem solving, in this engaged sensing, quantity does not matter: if in brainstorming sessions quantity of ideas is a major target, here instead what matters is how much your vision is discussed and by how many people. An example is case Vert, where, instead of considering all 108 proposals, the company focused just on a smaller number (26) but each discussed by the entire team.

### *Pre-emptying as an on-going journey*

The third major finding of our analysis is that pre-emptying does not happen only at the beginning. The act of pre-emptying instead occurs along the whole process of innovation of meaning.

First, because every time one meets new people along the journey, one receives new critiques to one’s pre-understanding and has new opportunities to melt it further with new horizons. A participant of project Jaune recalls how he became fully aware of his pre-understanding only after the meeting with the interpreters, i.e. half way through the project.

Indeed, we noticed that at the beginning of all projects the companies did not have a clear understanding of what the existing meaning of their products was. They mentioned superficial statements, often in contrast with each other (in a workshop conducted at the beginning of project Vert, the team articulated the existing meaning of their products in more than five different, contrasting, ways). In all cases the deep understanding and embodiment of the old meaning of the company became clear only at the project end. Only when the team embodied the new meaning, simultaneously it embodied the understanding of the real nature of the old one. This is in line with what Scharmer suggests in Theory U: the past and the future co-evolve; you understand the past (your “self”) by learning from

the future (your “Self”). It’s the clash between the future and the past that occurs all along the project, that makes your pre-understanding clearer.

Second, pre-emptying is an ongoing journey because as projects move closer to implementation, the team expands, and new team members are enrolled. If bringing people on board in problem-solving implies to transfer them the “specifications” of a new solutions, when it comes to innovation of meaning one needs to transfer a meaning: and this cannot simply happen through information transfer. First, the newcomer has to pass through a pre-empting action herself. In project Jaune, for example, we have experienced that a top manager joined the project towards the end. Only after he shared his own vision and the others discussed it carefully, he finally felt more comfortable to embrace the new vision that had been developed in the project and melt his own in. This implies that whenever a new person joins the journey, even towards the end, the team should not simply transfer her the project vision (as in an attempt to “convince”), but it should give space and engagement for pre-emptying the newcomer’s vision. This also suggests that meanings cannot easily be outsourced, for other externals to “refine” (Öberg and Verganti 2014).

### *Pre-emptying as a generative ongoing journey*

Finally, pre-emptying does not only serves the purpose of “creating space” into the project participants to take in new meanings. It is not only an act of forgetting the past. Pre-empting is also a generative action: it is the first step to imagine the new, the future. In fact, as earlier described, pre-empting does not start by sharing our vision of the past, but by envisioning a new meaning for the future. It’s an act of designing. In a project we conducted with a Polish company, the chairman envisioned 13 possible meanings during his exercise of pre-emptying. The final meaning of the project does not overlap with any of this, but some of the characteristics of the final products are inspired by these early visions.

In other words, the act of pre-empting is simultaneously an act of “letting go” and of envisioning the new. This makes the idea of the naïve mind even more naïve. The sequence is not: a mind loaded with pre-conception turning into an empty mind and finally into a mind loaded with a new vision. The state of empty mind is never reached: the pre-understanding flows away only when new stuff is put in. It’s by feeding in new horizons that one get rids of the old. As Gadamer says, there should never be a state of empty horizons.

## Conclusions

This article has discussed the role of pre-understanding and pre-interpretation in innovation of meanings. Thanks to the theoretical support of hermeneutics and theory U, and of four empirical cases, the article shows that the concept of the naïve mind does not apply to innovation of meaning. Rather than searching for innovators with a beginner's mind (who hardly exist), organizations may instead acknowledge the existence of pre-interpretation, and deliberately create actions to leverage them. We call this an act of pre-emptying, an act of clearly expressing the meaning a person believes in, thoroughly criticizing it, and fusing it with other pre-understandings to create a new one.

Our study shows that when companies do not “pre-empt”, innovation of meaning seems to struggle: the unspoken old meaning implicitly drives the discussions, the space for new interpretations becomes restricted, people hardly moves away from their pre-conception. Or as Scharmer describes it: “viewing from projecting past patterns and seeing reality as a shadows on the wall projected by our selves” (Scharmer 2008, p. 160). The act of pre-emptying instead eases is an engine to generate new visions.

Our work therefore proposes that, rather than searching outside the box, a valuable way to unlock interpretations is to search “inside” the box.

Whereas hermeneutics and theory U helps us seeing the importance of pre-emptying, none of them give guidance on *how* to do it. Our empirical material provides insights on the dynamics of this act of pre-emptying. First, pre-emptying does not happen in a moment; rather, it is a journey in which different pre-understandings are melted; only when each individual vision has been thoroughly analysed, discussed, and fused with the others, the act of pre-emptying is completed. Second, pre-emptying occurs all along the innovation process. Lastly, pre-emptying does not focus on the past, but on the future: one gets rid of old interpretations only by filling in new horizons; there is never a moment in which an innovator has an empty mind.

In its discussion of challenging the myth of the naïve mind and in exploring the role of pre-emptying, this paper bring two implications for further reflections in future studies.

- From a theoretical standpoint, it would be interesting to discuss the act of pre-empting with the help of other theoretical frameworks than hermeneutics and Theory U. One interesting path of research, for example, is proposed by philosopher Finn Hansen, who contrasts

our feelings as something meta-physical to the more abstract ideas of “wonder” and mysteries (Hansen, 2012).

- From a methodological standpoint, this article highlights the importance of immersing in the context, and action research, when exploring innovation of meaning. As Scharmer emphasizes, it is essential to integrate science (third persons view), social transformation (second person view) and the evolution of the self (first person view) (Scharmer, p 16).

Our research is maybe not there yet, but this construct helps us to describe our methodological approach: we not only observed managers in our research, but we also discussed and immersed ourselves within the organizations. In this way, we are on our way towards a more complete way of looking at science – as a combination of episteme (science), techne (producing, proposing, writing), phronesis (the practical learning in discussions and workshops) as well as the less obvious capabilities of the soul, sophia (theoretical wisdom) and not the least nous, our intuition and awareness.

## Participation-based Design Process in Jeju Local Regeneration Project

SungHee AHN<sup>\*a</sup> and Stephen L. SMITH<sup>b</sup>

<sup>a</sup> Hunan University; <sup>b</sup> Brunel University

*For the purpose of promoting innovation in the public design domain, this paper proposes abandoning the conventional design process in favour of a process based on participation by residents of, and visitors to the region or city concerned. Concurrently, the paper analyses how participation-based public design affects the sustainability of long-term local regeneration. The analysis can give academics and practitioners working in diverse design professions a valuable insight into how innovations can be facilitated rather than fashioned directly by the practitioner's own imagination and hands. The key is collaboration between designer (as a 'design manager') and the participants. This paper proposes a 'participation-based local regeneration design model' (the Model) which can induce intense interactions in the public design process. The Jeju local regeneration project is reported as a practical demonstration of this model. This paper can be classified as a review of an experimental project. The paper accepts a particular definition of 'sustainability: continuing autonomous transformation of the community through the participation process can be regarded as evidence of the sustainability of the local regeneration design model. Further evidence of its sustainability may be found in an increase in links and relationship among community members and between the community and the outer world.*

**Keywords:** Participation-based, Sustainability, Local Regeneration

## **Introduction**

Our aim here is to elaborate an innovative public design model and offer a toolkit which encompasses open invitation to local populations to participate in spontaneous design. The outcomes are ‘all their own work’ nevertheless they would not exist had the process not existed.

The model was developed to facilitate local regeneration consistent with social and cultural sustainability. The model is tentatively named the ‘participation-based local regeneration design model’ (henceforth ‘the Model’). The background of this paper lies in

- culture-led urban design and city regeneration (Knox, 2011; Tallon, 2010; Florida 2002; Evans, 2005; Evans and Shaw, 2004; Hall and Robertson, 2001; Bailey, 2004; Vickery, 2007; Lees, 2003; Lennard, 2009; Fiske, 2005; Robinson, 2009)
- concern for human scale and public space (Jan Gehl, 2010)
- ‘soft’ activity-based project-work (Grasskamp, 1997; Garcia, 2004; Norman, 2003; McCarthy, 2002; Finder, 2005; Smith and Jenks, 2000; Kelley, 1995)
- the creative class (Florida, 2000)
- criticism of top-down urban regeneration (Evans, 2003; Julier, 2005; Miles, 2000; Miles and Kirkham, 2003) and of the ‘hard branding’ of the cities epitomised by the ‘Bilbao Effect’
- public art and design approaches for urban design and regeneration (Carey and Sutton, 2011)
- outright criticism of public art (Phillips, 1988; Hall and Robertson, 2001; Miles, 1997, 1998; Lippard, 1995)
- and support for a new movement in public art (Lacy, 1995; Kwon, 1997; Hunt and Vickery, 2010; Thompson, 2001).

Does the sustainable public design model and toolkit work? Critical to its success is the casting of an invitation which attracts passers-by to participate in the performance ‘Fluid’ and contrasting patterns of involvement including active participants and passive onlookers.

To verify and validate the elasticity and practicality of the Model, this paper concentrates on a test project – the Jeju local regeneration project (henceforth ‘the Jeju Project’). Through the field-testing of the Model, it became clear that designers can indeed be cultural intermediaries with only a basic understanding of the two key elements – the invitation factors and patterns of participation.

## Evaluation Criteria

The evaluation criteria of the field-testing was twofold: the degree of transformation and the degree of sustainability. The primary concern is whether passive spectators will transform into active participants within the period of the test project... and that the project would create an enduring trace, not of any conspicuous design genius on the part of the facilitator, but instead, of the collective genius of local residents. Our suggestion is that ideally-speaking the outcomes of participatory design obscure what traces there may be of the facilitator's presence. The trace of the facilitator is not conspicuous (as in so much public art), but instead 'grey'; even invisible.

The premise behind the Model is that, if any member of a community participates in a project, then, there will some degrees of transformation among community members. The transition from passive spectator to active participant is a profound one and of equal or greater importance than the work produced.

After this initial transformation, the transformation process is likely to continue autonomously among the community members without involvement of the designer. Continuing autonomous transformation is how we can define sustainability here. Other transformations matter intrinsically too: increases in the number and character of relationships and networks among community members and between the community and the outer world.

Based on analysis of *forty-six* prior projects based on *our* Model, *five features of invitation were identified* (Ahn and Lee, 2013):

- sensual invitation
- experience-oriented invitation
- site-specific intervention
- the emotional invitation of story-telling
- and local ownership of the programme
- Four features were identified as critical to participation:
- sensual participation
- active participation
- artistic involvement
- and involvement in exchange involvement

## A Celebrated Prototype: 'Fluid'

The great majority of these features can be appreciated in the performance 'Fluid' initiated by Alan Kaprow (1967). Dozens of passers-by, without any prior notice, spontaneously stacked big blocks of ice to build twenty rectangular nine-foot-high 'ice houses.' - the laborious but play like activity drew a diverse group of spontaneous participants –from a McDonald's manager and an off-duty policeman to neighbouring children - who joined the work in a celebratory fashion. Other onlookers were nonplussed, or even took the 'play' aspect as an affront to their own hard work. For Kaprow the project's importance lay in the unpredictable experience it evoked: 'What remains vivid in my memory is not so much the aesthetics of the event as its social interactions...' (Lacy ,eds., 1995)

Passers-by were attracted by sensual invitation to see the ice block and the performance. Participants could expect a unique experience from the performance – an experience-oriented invitation. The performance intervened in the ordinary life of viewers, awakening the curiosity of persons who happened to be present within the ambit of the event - site-specific intervention. The performance had the potential to be sustained as an 'urban myth' having the emotional appeal of invitation to story-telling. The supposition that new relationships were struck-up among participants – acquaintances, friendships and intimacies suggests how great a difference a short term event might have in a chancy World... events whose effects *multiply* rather than diminish over time and distance.

The participants could feel the performance was their own game - ownership-related invitation.

As for participation: participants could see, touch and feel the ice blocks (sensual participation), participated in the performance (active participation) and as the specific labour and collaboration by the participants were incorporated into the public art performance, they had direct artistic involvement. We are confident that had the result of the performance had been multiple art-works, some participants would have purchased the objects, allowing 'exchange involvement'.

Based on the interactions between invitation factors and participation patterns, a prototype model is originated as seen below.

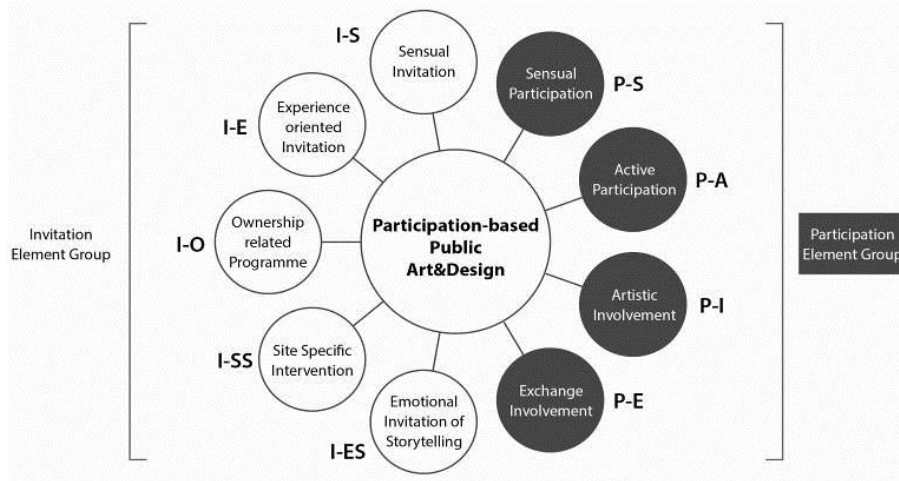

Figure 1 The Model of Invitation Factors and Participation Behaviour Patterns

## Test Project: Jeju Local Regeneration Project

Jeju local regeneration project has continued since its initiation in 2008. A designated UNESCO natural treasure, Jeju is a small island is visited by 600,000 tourists every year (Jeju Local government, 2012). The Jeju Project was initiated to protect the Island’s cultural heritage from external pressure to urbanise.

### Jeju Island

The island, with population of less than 600,000 or 1.3 percent of the total South Korean population is represented by numerous mythologies and legends of approximately 18,000 gods and goddesses, shamanic rituals, medieval feminism represented by a few groups of Haenyo (sea women and female divers) and a very distinct dialect which is still the first language of many elderly residents. This Island was occupied by the Mongolian Empire in the 13<sup>th</sup> century. Mongolian occupation lasted 100 years and Jeju Island was directly governed by the Empire as it was regarded as a key location for the supply of war horses.

### Gasiri

Gasiri, a small village located in the central mountain area of the Island has 1,200 residents (official figures for 2009) and covers 5,600 ha. For hundreds of years, the ancestors of the Gasiri community were involved in

raising war horses for the Koryo Dynasty (918~1392) and the Chosun Dynasty (1392-1910).

*Picture 1 Tamlasunryuckdo ,1702 ©National Museum of Jeju*

For these historical and cultural reasons, the most distinctive characteristic of the Gasiri community is its homogeneity and the spontaneous emphasis which Gasiri residents place on collectivism. The notorious massacre of the 4.3 (the 3<sup>rd</sup> of April) in 1948, when most males in the community were killed by their own government, in conjunction with the community's homogeneity and emphasis on community, makes local people reluctant to engage in open communications even among themselves as well as with outsiders. This is a community characterised by deep-seated and reasonable reticence.

Always known for horse breeding, Gasiri's maintains top-tier stock. Among ten national farms on Jeju, Gasiri hosted the royal horse farm 'Gapmajang' which produced the preeminent war horses of the Chosun Dynasty. In and around Gasiri, there are many features deriving from war horses, including 'Jat Sung' (a farm fence from the medieval period) and 'Maltaewoori' (packhorse drivers).

Picture 2 Horse Farm in Gasiri SungHee Ahn ©2010

In the 15<sup>th</sup> century, King Sejong established ten national horse farms in Jeju to breed the best quality of horses for the royal army. Gasiri is one of ten farms and called ‘Gapmajang.’ Each farm carries a horse-grade designation and Gap (甲) designates the best. The Gasiri farms have carried the best-in- the-whole-county status since that time.

### **Why Gasiri?**

Most public design projects have been tested in big cosmopolitan cities. This raises the question of whether they are viable in different circumstances, and especially conditions of lower population density and in places demonstrating more characteristically rural forms of sociality. The principal reason for trialling the Model in Gasiri is to find a location which will help us see how far the applicability of the Model might reach. The remoteness, homogeneity, population size and ethnographical differences might lead one to expect different responses to the Model. Indeed our wish is that the Model is capable of eliciting a wide range of responses according to local circumstance and its point is *not* to have similar outcomes everywhere. The extent to which the Model accommodates different contexts is one test of its sustainability.

A government subsidised regional regeneration project was being implemented by Korean government in Gasiri. The basic methodology for the project is a joint venture between public and private sectors, with ‘matched funding’ as the main tool for fund-raising. The community’s contribution towards matched funding was an area of land co-owned by community members. The first regional regeneration project was carried

out over a period of 2 years from 2009 to 2011, and a second was started in 2012 to run for five years.

Sub-projects were enacted within the regional regeneration project, taking advantage of government funding, even though the Gasiri Project itself, which was wholly designed and facilitated by the researcher, was not part of the regeneration project.

### **Project Design**

In the design of the Test project, the researcher took into consideration the homogeneity of the Gasiri community and its historical basis. The project, as a whole, can be regarded as an intervention in the everyday life of the community, though 'intervention' carries perhaps stronger connotations than we wish to suggest. The facilitator had no wish to impose alien concepts and imagery upon any social space.

Though sympathetic to the public performance process of 'Fluid' and entirely different from conspicuous hierarchical imposition of conspicuous artefacts the facilitator's approach had many layers and did not progress as a linear sequence of pre-planned stages. This structure had been appropriate for 'Fluid,' because the performance was carried out in a complex, multi-cultural environment under a fixed time-frame and strictly controlled schedule and budget. We acknowledge too that as Lacy(2004) argued, the simple and easy activity in 'Fluid' belied the complexity of the relationship of different stakeholders.

The situation in Gasiri Project was diametric to that characterising major city in Europe or America: above all, the characteristic of community is homogeneous and not multi-cultural, so the burden of controlling relationships is lessened. The industrial context different (long-standing horse-breeding) and a specific, brutal trauma was within living memory.

Reflecting all of those considerations, the Project was designed to be multi-layered and was thus composed of many micro-projects which were implemented concurrently. The multi-layers of the Project were designed to generate enhanced participation levels and degrees among the community members of all ages. Site-specific interventions in Gasiri were quite different from those interventions made by 'Fluid' and other public art performances to be executed in public spaces of metropolitan cities. It took full advantage of the stark contrast between those new facilities and 600 years' history in the village. Through comparison between the two contrasting phenomena, the project invited the residents to much intense discussion concerning this new wave of changes.

### **Invitation Design**

The guiding principle of the invitation was to establish as many opportunities as possible for Gasiri residents to be exposed to all of five 'invitation factors'. There exists a stark contrast between Gasiri Project and 'Fluid.' The invitation to Fluid' had only to follow the artistic instinct of Kaprow. By contrast, invitation to the Gasiri Project was much less constrained; indeed it featured incompleteness and improvisation. With diverse and abundant invitation opportunities, if a resident skipped a sub-project, she or he could participate in other subsequent sub-projects.

Sensual invitation was mostly composed flower-drawing and horse-drawing. This was engaged in by many residents old and young as well as by many Gasiri children and infants. Typically the researcher-designer-design-manager was not regarded as an 'authority' figure and made no attempt to become one. The facilitator became a collaborator, maximising the creative initiative of participating community members. Of course there is novelty here as the residents received new stimuli in the course of drawing, talking and discussing with outsiders as well as with insiders. There was novelty for them in transforming their own drawings into public designs, and in making and installing public design products all around Gasiri.

Experience-oriented invitations were presented through many impromptu interviews and discussion events between residents and visitors. Ownership-related programmes in the Project provided the whole community members with opportunities to create their own art works and public design products. In contrast, residents became viewers (not participants) in concurrent government-controlled regional regeneration project, which had invited many famous artists, designers, musicians, performing artists, entertainers, and other celebrities to the area.

For our work, the emotional appeal to participate in storytelling was essential to the invitation, involving meetings and discussions between outsiders and insiders. The older generation was especially active in relating abundant mythologies, legends and the history of Jeju Island and they did not avoid discussion of the traumatic 4.3 massacre of the male population.

### **Project Development**

One of the readily available symbols for Gasiri is the canola flower which grows wild in and around the village. Every spring, Jeju Island holds a canola flower festival, which is one of the main tourist attractions. At the outset of designing the invitation, residents were therefore invited to casual interviews composed of questions about their individual and shared

memories of the canola flower and a request to draw the flower from memory.

*Picture 3 Flower drawing by Gasiri Children ; Picture 4 Gamajang Road Sign Pole*

These interviews took place conveniently whenever an interviewee turned up in the public space. For a month, 72 residents of the approximate population of 1,200 participated in the process. This activity was designed to be especially inclusive of seniors and senior groups. Drawings were collected and incorporated through a visual material workshop into decorations for the village's workspace building, which is second only to the council building in having regular visits from residents.

There followed a one-day Horse Drawing Competition event, again held in Gasiri. A total of thirty children aged between five and twelve years and some adult volunteers participated in this event. Horses - mainly trained racing horses from the local farm - were brought to this event to enable an element of life-drawing. It should be noted however that both a horse trainer and a horse medical practitioner were present and that when the participants had finished drawing the horses, there was horse riding assisted by the horse farm trainers. Again, by these means, Gasiri was the focus of attention and contemplation, and not the facilitator-designer.

The visual materials from the Horse Drawing Competition were developed into the 'Gapma' (the best war-horse) logos incorporated into sixty designs of tourist information and direction-signs around the village.

The decision-making of what the design process might be was itself accomplished through continuous, iterative and collaborative discussions. A total of sixty-four way-markers were designed and made for a new 20km-long walk along the old fence boundaries of the 'Gapmajang' (the old royal war-horse farm). This route takes about seven hours on foot at a normal

walking speed. The village signs help to promote the newly established route for the visitors. The 'Gapmajang-gil' (war horse road) runs along the border of a national horse farm where war horses were already being raised six-hundred years ago. This walk connects into a path which encompasses the whole of Jeju Island.

Picture 5 Horse drawing of Gasiri Children ; Picture 6 Gamajang Road Sign Pole

The participants expressed delight at encountering logos and other designs which had been incorporated directly from their own drawings. While the imagination of the designer-facilitator is present in the way-markers, it is not especially conspicuous. In this way locals have been able to bring together historical and cultural resources in a successful (meaningful and relevant) attempt at 'community branding'. The hand of the designer was present much more in the process than in the artefacts.

Typical of this process there was continuous collaboration and discussion in the course of designing the logo and in choosing exact locations at which to install each way-marker.

#### **Evaluation: more than a gesture?**

From the outside, 'Gapmajang-gil' (the road running along the war horse farm's fence) can perhaps be read as an optimistic representation of an isolated village in symbolic and economic communication with the outer world (and mediating tourism). However, the intention at Gasiri was to design and facilitate a process-based participatory project to include village residents' voices in communicating with the wider world and communicating between themselves – communication on their terms, not on outsiders' terms. It can be noted that in any case, Gasiri was already

deeply integrated into a very far reaching imperial project of conquest by six centuries ago and its horses are emblematic of this connectivity.

We believe it probable that the participants grew in confidence and activity, becoming more pro-active and more involved in the project because they were working with the village's historical contents that relate specifically to horse and horse-farming culture.

Gasiri opened the 'Jorangmal' (Jeju horse) Museum & Farm in 2012. The Jeju horse is indigenous and recognisable because of its large course-haired head, thick-set powerful body and short legs. This is the first independent museum in South Korea to be built by a village council and run by a village community. Subsequently the Jorangmal Museum & Farm has enlarged on the concept of creating a healing process based on experiencing horse culture in daily life. As the Project was formulated to try to create more active links between the project and participants, the achievement can be seen in the pragmatic public design outcomes in the village as well as in changes in the behaviour and morale of the community members.

### **Participation**

In comparing the strengths and weaknesses of the 'Fluid' and Gasiri Projects, particularly in terms of the manner of the invitation and patterns of participation patterns, the strength of the Gasiri Project is that each sub-project could be executed without an outstanding celebrity lead-designer. The model used in 'Fluid,' made it necessary for a public art and design director to develop plans, raise funds, make numerous links in diverse disciplines and to control the whole process as its main author.

The success of Gasiri Project was essentially dependent upon community participation and they showed much pride in their achievements and ownership of the outcomes. Thus, the project enabled the local community of Gasiri how to draw on pre-existing solidarities and values, through spontaneous participation and horizontal communications among themselves and with the facilitator. At the same time the process did not compromise respect for Gasiri's 'top-down' communication culture which was already established long since. Finally, the project enabled individual artistic expression and reminiscences particular to participants own biographies – which even in villages has an inevitable degree of uniqueness. It now strikes us that the process enabled 'poly-rationality' by engaging 'Hierarchical', 'Enclaved' and even 'Individualistic' thought-styles (Thompson, 2008). Thompson thinks it important that there should be 'high quality discursive space' in order for timely, appropriate, workable and

surprising solutions to emerge to what he calls ‘wicked problems’ (difficulties which affect many persons and are never entirely solved, but tend to evolve as solutions are applied). The new thinking which emerged around the therapeutic value of contact with horses strikes us as one such poly-rational approach to the ‘wicked-problem’ of mental health: worth trying but without claiming to be the ultimate cure.

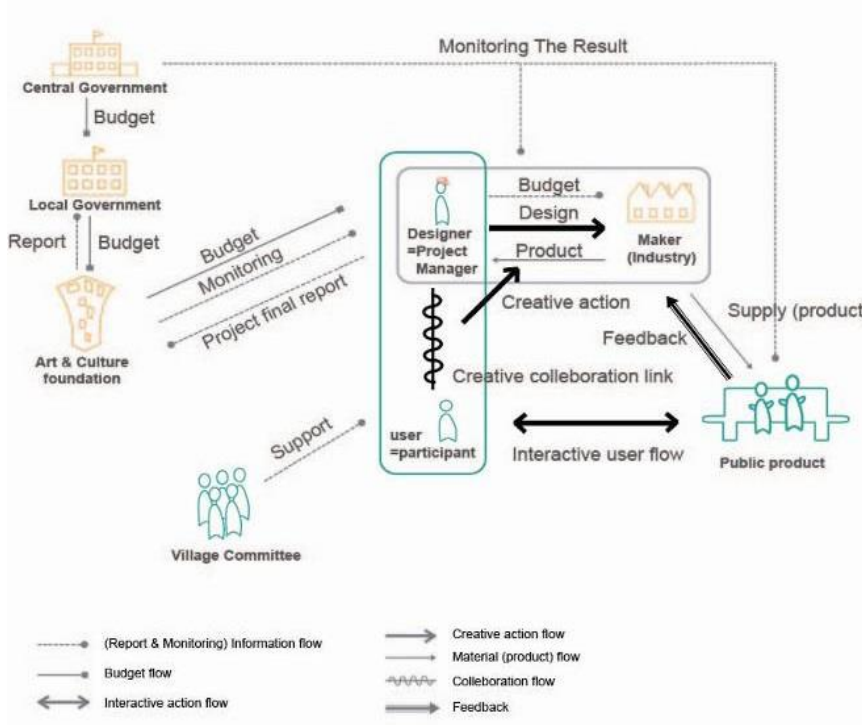

Figure 2 Participation-based Project Innovation Process Flow

### Transformation

A chief administrator at Gasiri stated, “As you see, there is no art gallery or museum in the village. We have never had an art and design project for children. Though the average income of the village is higher than that of big cities, the community is isolated from the diverse culture you can experience in the city.”

She added, “it was a magic time for me, maybe for others too, to see that the drawings made by our children could be directly turned into signage

for guideposts and other public design. It is natural for the children as well as community members to take great pride in the project. Now, it is not unusual for community leaders to use the expressions related to art and design such as 'in the viewpoint of design' or 'artistic value,' each time there is a community meeting for important decision-making. I think Gasiri Project could be a turning point for the community to understand this kind of project can be a tool for community regeneration."

The idea to revive 'Gapmajang-gil' came from Gasiri residents themselves, and it was not suggested by the researcher or by other official sources of authority.

### **Feedback**

In 2012, 'Gapmajang-gil' was newly-opened to outsiders. In the competition run by the Ministry of Land, Transport, and Maritime Affairs, for the best landscape in 2012, Gasiri was chosen as the best landscape in the category of Villages for Agriculture, Forestry and Fishery. Even though the selection criteria for the competition were complicated, it is certain that 'Gapmajang-gil' played a critical role in Gasiri being selected.

Every New Year's Day in Korea, the Chosun Daily, one of the country's major daily newspapers, predicts major trends to come into being, which are selected through interviews with experts from diverse disciplines. On January 1, 2013, the daily newspaper predicted the rise of community participation as a cultural trend, and chose Gasiri Project as a case for the trend in art and design, as part of wider cultural trends. The article also included pictures of Gasiri Project. Our sense of this event is that Gasiri's historic influence as a centre for war-horse breeding, has been re-animated in modest contemporary form via design-facilitation. This is not something that could have been forecast and not something which could have been enshrined in pre-project 'evaluation criteria'. The nature of the process means that clear direction and 'outcomes' cannot be stated at the outset and in this sense its evaluation is (quite properly) less straightforward than many public art projects.

We note with pleasure that on May 3, 2013, Gasiri community held the first Horse Festival, initiated and organised by themselves. The programmes included children's horse drawing and riding events. In fact, the programme for children's horse riding was initiated by a horse trainer in the course of executing in Test Project of this research. (Only with hindsight can we see that the seeds of change were created from the outset of the project.)

As Korea's many villages regarded Gasiri as a benchmark case, it did become exposed to mass media. KBS, the Korea Broadcasting Services, made a one-hour television programme introducing Gasiri. Though it could have been, we do not feel that this exposure has been harmful: community members started to learn their own history through a rehearsal process conducted in preparation for presenting that history to outsiders. The campaign to walk along 'Gapmajang-gil' was initiated as part of this and reminds us that ritual and symbolic acts can evoke emotions, clarify cherished ethics and animate actions (after Durkheim, 1912).

The self-governing committee of the village made a decision to maintain the artist residency programme through fund-raising from non-profit organisations and individual-contributions of the community, even after the end of the sponsorship from the regional regeneration project. The committee chairman announced that art and culture had already functioned as very important resources for Gasiri.

## Conclusion

By tracing the process, the feasibility and validity of the Model was observed and understood. Spectators in a participation-based public design project are the residents of the place where the project is held or processed. Residents share the initiative with designers who work for the project rather than for themselves. It is possible for local residents to interact directly or indirectly with specialists (such as horse-trainers, TV documentary makers and so on) or among themselves, via any process of the project, including planning, making art works, logo designs, installing and building diverse facilities, conservation and though official or informal meetings with officials and policy-makers.

### **Process Patterns and Innovation in Jeju Project**

The participation-based public design project had multiple sub-projects having multiple routes, and so-to-speak innumerable small and safe trial-and-error experiments. In 'Fluid,' there was much less room for trial-and-error because of structural constraints. The performance underpinning the "ice house" construction was constrained by a very tight project schedule and defined budget. Our sense is that though 'Fluid' is remembered, the Gasiri project has been more widespread (though less deliberate and planned) in its effects.

Table 1 Invitation Factors and Participation Behaviour Patterns of Jeju Project by Participation-based Public Design

Design Action (Designer)	Using local motives to evoke sense	Organising interviews and events	Designing co-creation process	Creating links of history and culture	Engaging with local storytelling
Invitation Elements	Sensual Invitation	Experience Oriented Invitation	Ownership Related Program	Site Specific Intervention	Emotional Invitation of Storytelling
Participatory Action (User)	Sensually participate in drawing flowers	Actively participate in the events	Participate in creation process	Co-work and co-owned design	
Participation Elements	Sensual Participation	Active Participation	Artistic Involvement	Exchange Involvement	

In the case of Gasiri, because there were multiple sub-projects (which could be alternative routes for the residents to select) and because the project had time and budget enough to execute multiple sub-projects concurrently, almost every kind of trial-and-error could be allowed. Though less explicit and formal, it was more robust, containing more ‘redundancy’(participation pathways). The table below shows a comparison between the two projects in terms of project layers and process patterns.

Table 2 The relationship between Participation Process Pattern and the Project Layers

Project	Project Layer	Process Pattern
Fluid	A single project	A single route Linear sequence to a specifiable destination Iteration is not allowed

<p>Gasiri</p>	<p>Multiple sub-projects under an 'umbrella project'</p>	<p>Multiple routes                  Multiple sequences are processed concurrently                  Iteration is allowed along all and any sequence (route)                  Choice among multiple sequences (routes) is allowed. There is redundancy                  Change of sequence (route) is allowed                  Multiple and unexpected destinations are allowed</p>
---------------	----------------------------------------------------------	-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

In summary, 'Fluid' is characterised by a *definable single-layered linear sequence*, while the Gasiri Project is characterised by *multi-layered alternative sequences which are not known in advance*. The observation of the two prototypical projects discussed here might enable development of different sub-models. The first sub-model inferred from 'Fluid' might be termed a *single-layered linear sequence model*, while the other sub-model could be called a *multi-layered alternative sequence model*.

## How to Define and Evaluate the Sustainability of the Model?

It is a challenge to assess the sustainability of a design process whose effects defy accurate estimation. What should be included and for what period of time?

The sustainability of the Model can be interpreted as an extension of the *multi-layered alternative sequence model*. If any member of Gasiri community initiated any other participation-based public art and design project, or any other kind of cultural activity project, after the execution of Gasiri Project, the newly initiated project could be seen as a faithful iteration of the initial Gasiri Project.

If this was to trigger other members of the community, and as a result, other fresh rounds, again and again, the Model might secure sustainability without our being able to measure it with complete certainty. How would one treat an individual's recovery from mental distress that occurred subsequent to their contact with horses at the horse museum which might not have developed its therapeutic role had Gasiri residents not experienced the happiness of seeing their designs incorporated into way-markers (and so on)? In a process that is not designed to stop at any definite point, what outcomes (wherever and whenever they occur) can be attributed to it? This issue is illustrated in the extraordinary continuing influence of the decision

many centuries ago to make the island a strategically important war-horse breeding centre.

The ultimate aim of the project is that this sustainability would lead to sustainability of the behaviour pattern of the community in favour of arts and cultural activity. It would be hoped, also, that in the course of this process, the community's ownership of newly-initiated projects and cultural activities would also be secured. The community members who initiate repeated rounds of public art and design project or other kinds of cultural activity are defined as the 'transformation group.' The endless rounds indicate the continuing engagement of community members in initiating and further developing arts and cultural activities. In this context, the Model can be defined as a sustainable model. But in an important sense, the success of the project cannot be calculated with precision.

In the course of executing the test project, it was affirmed that the influence of the initial participants forming the 'transformation group' was at least as strong as the influence of the researcher on community members. Indeed the project could have been deemed to have failed had this not been the case. This is because reliance on the design-facilitator would have inhibited further extension of the Model. In the process, each participant creates many links, gives feedback and influences other potential participants, which are crucial sustainability elements of the Model.

### **Practitioners' Toolkit**

Though the Model has been supported by the test project, appropriate evaluation criteria and performance measurement tools are still to be evolved. A practitioners' toolkit is therefore proposed.

The primary use of the toolkit is in presenting designers specialising in urban or local regeneration with guidance in planning and evaluating a participation-based public design projects. This toolkit can also be utilised as a reference for preliminary evaluation of a proposed project or – with the important caveats entered above - for 'performance measurement' of continuing projects. It is probably needed by governmental bodies who need to be able to account for their funding decisions to the wider population.

In order to simplify decision-making, each element of the toolkit has only five degrees. For example, against the first element ('project objective') [see Table below], as we move closer to the right side ('everyday life'), the project can claim a higher level of validity and we move closer to the left side ('public manifestation'), this indicates, we think, a lower level of validity. The toolkit considers many elements displayed in below.

It is believed that use of the toolkit can foster interaction and collaboration between designers and residents, making the project ‘truly public’ in preparation of how it will be evaluated; not just the work of a single designer or specialist in urban design, local regeneration placed in public view and not just by a single evaluator. It should be possible for publics to use the toolkit for themselves.

Table 3 Participation-based Public Design Toolkit

No.	Project Element	Consideration Element & Degree
1	Objective	Manifestation  Everyday Life
2	Initiative	Designer  Residents
3	Management	Manager  Designer
4	Communication	Top down  Interactive
5	Participation Degree	Inactive  Proactive
6	Participation Partern	Passive  Volunteer
7	Process	Result oriented  Experience oriented
8	Collaboration	Disciplinary  Interdisciplinary
9	Cultural Dynamics	Excluded  Included
10	Scale	Monumental  Human Scale
11	Social Contribution	Implemental  Expressive
12	Aesthetic Value	Conventional  Experimental

The twelve considerations can be gauged qualitatively or less easily, quantitatively. Treated qualitatively, the toolkit is already adequate for the comparative evaluation of competing project proposals and for retrospective evaluation of actual projects. Each element is not to be given any absolute grade (ie. item 12 is not more important than 3, because these are qualitatively different items which, like ‘apples’ and, say ‘pensions’ cannot be added to each other in a meaningful way). For this reason any element for one project should only be judged against the same element in another project (ie. 12 with 12; 3 with 3 – that is ‘apples’ compared with ‘apples’).

Table 4 Using the Participation-based Public Design Toolkit

Level 1	Level 2	Level 3	Level 4	Level 5
low	Middle	Middle	Middle	High
90~100% Single	20~40% vs 80~60%	50% vs 50%	60~80% vs 40~20%	90~100% Single

The evaluation of each project element can be carried out easily and though a more elaborate toolkit could be evolved, even the simplest toolkit can articulate the chief characteristics of any project. It should not be a formidable challenge to develop evaluation methodologies and criteria for a participation-based public design project, though we stress that the further into the future that a project is imagined, or the longer the time elapsed from the outset, the harder it is to attribute its effects.

It is important, however, to analyse carefully all aspects of the information given in the toolkit before applying it to an actual situation. For example, it may not be appropriate to make a decision if the decision is based only on the grades affected by the budget size.

**Acknowledgments:** *Lastly we thank the people of Gasiri, who made the project possible because it was made from their resources and not from ours. This paper is an outcome of theirs.*

# Editorial: Contemporary Brand Design

Ashok RANCHHOD

This track looked for theoretically driven and practically relevant contributions that shed new light on the strategies, practices and processes by which contemporary brand experiences are created and managed by companies in different product fields, from consumer goods to luxury artifacts, from physical products to more service-driven brands. We were particularly interested in the mediating role of design in the creation of strong and sustainable brand recognition.

In this track theme we hoped to identify possible commonalities and differences in the strategies and approaches that brands in different fields apply in their product design and we were not disappointed. Papers submitted ranged from understanding the new conceptual frameworks for understanding brand design to a more holistic approach incorporating product and service design and the way they affect brands. *Branding is relevant to services, where the lack of physicality requires a new analysis based on customer relationship, experience, and trust as to how the interrelated designs help brands succeed (Berry, 2000)*. Pullman and Gross define *experiences* as the “emotional connections [engendered] through engaging, compelling and consistent context” (2004). This means that these experiences have to be designed for brands and experienced by users. On the other hand, there are many digital innovations that affect contemporary brand design such as advergames and digital content design including animation (Philip and Lee, 2005). Brand experience include specific sensations and cognitions created by brand-related stimuli, that can result in attitudes and general evaluations about the brand (Brakus et al., 2009). Brand design is also about understanding the impact of product and packaging design.

## *Summary*

This track considers many of the innovative ways in which contemporary brand design operates in the new digital and globalised world, with papers encompassing a range of different ideas and concepts.

# Exposing the Monster in Media: a study of Ducati's product placement strategies

Peter ZACKARIASSON\*

University of Gothenburg  
School of Business, Economics and Law

*Product placement, and brand placement, is a practice that is increasingly used to expose both products and brands in cultural productions: film, TV, video game etc. The aim of this is to construct associations between a product, or brand, and what is exposed in the cultural production. The effect is thus a transfer of values from the cultural production to the product. Brands are pivotal aspects of any design venture. In order to construct a coherent set of values, and consumer understanding, of a product the brand and physical product need to communicate the same values. Brands thus have a possibility to strengthen design. Using the morphology of the Russian formalist of Vladimir Propp this paper aim to explore the effect of product placements of Ducati motorcycles in films. Through the analysis of 15 film published between 2010-2013 the presence of Ducati motorcycles are related to narrative and characters in order to understand associations constructed in product placement. The results in this paper show that while there is weak relationships between narrative aspects of the films, there are strong relationships between the Ducati motorcycle and the characters in the films. This is most evident in the relationship between the 'helper' character and the Ducati motorcycle as a tool for exploration and adventure.*

**Keywords:** *product placement; brand; design; value; Ducati*

## **Introduction**

Product placement is a practice used by an increasing amount of companies to communicate brands and brand values (Williams et al., 2011); according to a PQ media report product placement business grew 11.7 % in 2012. By exposing a product in different cultural media productions, such as films, TV shows, or video games, a potential consumer are exposed to both design, functionality and brand (Karrh, 1998). The reasoning behind this practice is to assign sign-value (Baudrillard, 1993) to products and brands, which in turn would increase the potential of that product being present as an alternative when consumer are making purchase decisions. Following a Saussurian reasoning of linguistics, product placement is thus part of an ontological battle on sensemaking in order to inscribe brands with value; sign and signifier have little relation to what is signified as products, and brands, are related to different cultural products in the hopes of transferring meaning.

In 2010 the Italian motorcycle manufacturer Ducati was voted first runner-up for an advertising award about product placement in films ([www.brandchannel.com](http://www.brandchannel.com)). Aside from Harley-Davidson, Ducati might be the most distinct and recognizable name in the motorcycle industry; in terms of audio- and visual design. Since 1926, the Italian manufacturer has been a leader in technological advancement, innovation and design, producing both street-legal and race-ready machines for MotoGP. Ducati has during the last 10 years increased the exposure of its brand and product, through product placement, in different culture productions, primarily films and video games. After the hugely acclaimed exposure of a Ducati 996 in the film *Matrix: reloaded* the company seemed to have set the roadmap for future promotion efforts.

The aim of this paper is to analyse Ducati's product placement in cultural production, specifically in films, from 2010 and onward. In doing this it is possible to create an understanding of what symbolic meaning Ducati are striving to inscribe to its brand, and its products; also through what vehicles and in what form this is done. By applying Propps's (1968/2013) formalist analysis of films, and the exposure therein, of the Ducati brand and motorcycles, this knowledge will be possible to create. The contribution of this study will primarily be in a detailed case on brand product placement strategy, secondly to contribute to the on-going knowledge generation and discussion about relations brands, products and design.

## Background

Brands are immaterial artefacts, informational objects, used in order to communicate the value of a company, a product, or a service to a consumer, employee or other actors (Arvidsson, 2006; Kornberger, 2010). As such it can be understood as a sort of virtual real-estate (Schiller, 1999) that occupy the mind of the consumer. This constructed impact by a brand and on a consumer do affect both how the consumer identify herself, and how she perceive the products, or services, related to that brand. As Arvidsson (2006, p. 8) argue, 'brands do not so much stand for products, as much as they provide a part of the context in which products are used.' It can thus be argued that brands has a strong impact on how consumers make sense of consumption, both in how they relate to physical goods and the meaning the consumption of these have. In this sense, understanding the meaning of motorcycles are constructed by the symbolical meaning of the brand.

The impact of a brand can thus be understood through 'power of associations': a brands possibility to inscribe values through associations to other sources of (cultural) values. According to Saussure a sign can be understood as having two sides: signifier – signified, the associations constructed through a brand thus changes depending on what is being signified. A motorcycle, for example, has no meaning – it is but two wheels powered by an engine. The sign motorcycle thus refer to a signifier – a vehicle with two wheels – although what is signified is still under negotiation; the meaning of a motorcycle is not inscribe into the object, but through associations. But, as we shall see later, both the technical and aesthetic design of the motorcycle can support the value of the motorcycle.

A consumer's attention can, to some extents, be produced by means of advertising, design and brand management. Through what is communicated through images, the physical appearance of the goods and what meaning are inscribed into the brand. A brand can be described as having a semiotics meaning, pertains to the meaning or sign value of a product design (Van Rompay et al., 2009) or visual recognition of a product (Karjalainen and Snelders, 2010). The form or design of a product is interpreted by users and communicates important information. In this aspect there is a relationship between the brand and the physical design of a product. Both of these aspects supports the definition of a product.

In the early 1900s a formalist by the name of Vladimir Propp analysed Russian folk tales and developed a framework for understanding the basic elements in these. What Propp (1968/2013) argued were that most folk tales followed the same set or narrative structure, and the characters were

in general the same. The narrative structure followed a sequence of 31 function, described as *the hero's journey*. These functions brings the hero of the narrative from a known setting, through hardship and adventure, and finally back in the original setting. On this journey there are 7 types of characters present: *villain, dispatcher, helper, princess (prize), donor, hero* and *false hero*. Propp's (1968/2013) understanding of folk tales has during later years been used to understand both other literary sources, but also films and video games. In short, it is a useful tool to both construct and understand narratives with.

Viewing brand as narratives, Propp's (1968/2013) model can be used in understanding what role brands have in a narrative. Or, what types of narratives that are created in relations to brands. Precious studies that have studies brands in commercials has argued that these should be understood as "the helper", helping consumers to wash better, drive faster or be happier (Scolari, 2009). This and other studies have moved from studying the product placed in narrative setting without bracketing the product from the narrative. The value of these studies are that the mere presence of a product is but the initial step in understanding the relationship between brands, value and design. Understanding how they are used in enable a deeper understanding of brands in use.

## **Method**

The material for this paper was generated through the analysis of popular films. This media has a long tradition of facilitating product placement and has also had a huge impact as a cultural product on consumer culture. Not having access to official data on films where Ducati has used product placement online resources were used to identify films containing Ducati motorcycles. Using the Internet Movie Car Database (IMCDB) it was possible to identify fifteen films that meet the requirement: distributed 2010-2013, US/European market, English language, and the Ducati motorcycle should be exposed in the film for a somewhat knowledgeable viewer to identify the motorcycle.

Table 1 Films featuring Ducati motorcycles 2010-2013.

Title	Year	Director	Ducati Model
American Pie: Reunion	2012	Jon Hurwitz Hayden Schlossberg	Hypermotard
Beastly	2011	Daniel Barnz	Monster
Fast and Furious 6	2013	Justin Lin	Monster
Haywire	2011	Steven Soderbergh	Monster
I am Number Four	2011	D.J. Caruso	848
Inception	2010	Christopher Nolan	Streetfighter
Kick-Ass 2	2013	Jeff Wadlow	1199
LOL	2012	Lisa Azuelos	Monster
Takers	2010	John Luessenhop	848
The Expendables	2010	Sylvester Stallone	Desmosedici
The Losers	2010	Sylvain White	848
The Next Three Days	2010	Paul Haggis	Monster
TRON	2010	Donald Kushner	900
Wall Street: money Never Sleeps	2010	Oliver Stone	Streetfighter, 1098
Wolverine	2013	James Mangold	Diavel

After the list was constructed all films were viewed and analysed according to Propp’s (1968/2013) framework. The two dimensions of narratives and character has the possibility to guide the understanding on how the Ducati motorcycle and brand are presented in the films.

## Observations

### *Hero’s journey*

Although the Propp’s framework of Hero’s journey was constructed as a framework to understand Russian folktales through categorization it proved a very useful tool for this study. The film in this selection were all ‘Hollywood box office’ constructs with the aim of attracting a wider audience of easy digestible films – popular culture. This transportation of a male hero through the films much followed a path from a secure setting – through disruption – and on to an adventure. Although this structure created a common theme throughout the film the very same structure were not providing a common relationship toward Ducati motorcycles.

An attempt in relating the Ducati motorcycle to the hero’s journey would indicate that the bike is used in transporting a character between the different sections of the narrative. Most evident is this where the bike is

portrait as bringing the characters to adventure, disregarding where in the narrative these are positioned. First, in the opening section of *Fast and Furious 6* the characters called Mia and Han are summoned to join adventure, sitting in a food court in downtown Tokyo. Beside them two bikes, a Harley Davidson and a Ducati Monster. In *I am Number Four* the female character called Number six turn up at the house John Smith (the hero) had to abandon because he was threatened. The relation between Number Six and the Ducati 848 is that of transporting her toward the hero, assisting him (at this point unknown) on his forthcoming challenges with evil.

Second, Ducati motorcycles serve as transportation throughout the narrative. In the film *Beastly* a Ducati monster serve the purpose of transporting the male hero Kyle Kingson on his nightly adventures through the city. Here is also one of the few occasions where the Ducati is referred to in the film, when Rob Kingson, the father, mention that 'I'll get you that motorcycle you've always wanted' in trying to convince the hero going into (social)hiding (being stigmatised through his appearance). It also brings characters to adventure, as in the film *Wolverine*. Here the hero Logan uses a Ducati Diavel to transport himself to the headquarter of the villain, toward battle and struggle.

Third, the end of a narrative, according to Propp (1968/2013) is that of the return of the hero, punishment of the villain, and hero's ascending of the throne. Although this exact sequence might not be heavily present in today's Hollywood box office films there is still the idea of bringing the hero back to his/her original environment, the triumphal return and the punishment of evil. Looking at the resolution of these films the Ducati were also portrayed in this section. Most evident is this in *Kick-Ass 2* where the female character Mindy Macready (or Hit Girl), after given the hero a ride to his house on her Ducati 1199 takes of into the 'sunset'. This section is especially interesting as the character previously has used her Ducati as Hit Girl, an action hero, but the same bike now serve the purpose of Mindy, a 'normal' girl. The Ducati thus facilitate the transfer from a confrontation of evil though 'super powers', to incorporating the bike to transportation of a girl.

A Ducati motorcycle seem to service no single purpose in a narrative. As a vehicle it transport the characters to and from adventure, between different episodes in the narrative. If anything the, the presence of Ducati in the narrative communicate the lack of values. It serves no purpose, besides

transportation. In that sense the presence of Ducati has no effect on the narrative, and the transpiration could have been any vehicle<sup>8</sup>.

### *Characters*

Although the films included in this study have a much richer set of characters than suggested by Propp (1968/2013), the set up seven types serves the purpose of structuring the main characters, important for the narrative. The observations made here are that there are in general only two of these characters that are interesting, the hero and the helper. The hero is the character that the narrative revolves around, the person that are thrown into adventure, overcome difficulties and return victorious back home. The helper is the character that travel with the hero, assisting him/her on the adventures and helping with tasks that the hero can not complete alone. These two characters were the only characters that were driving Ducati motorcycles in these films. There is only one occasion where the villain were driving a Ducati. In Wall Street there is a race between Jake Moore, the hero, and Bretton James, the villain, where Jake is driving a Ducati 1098. The villain is also driving the same Ducati, but modified in design – shape and colour, and lacking the brand name.

In several of the films the hero use Ducati bikes. Sam Flynn, the hero in the film Tron (see image 1), is Driving a Ducati 900. The appearance of Sam is related to the retro model of the 900 model. The bike is thus an extension of the personality of Sam. In Beastly Kyle Kingson, being disfigured by a magical spell use a Ducati Monster when cruising the streets during dark. Dressed completely dark the bike is the extension of his dark persona – a Ducati Monster for a monster. The female hero Mallory Kane in Haywire also uses a Ducati Monster. Although this time the bike is coloured brighter, and Mallory in turn are dressed in matching motorcycle gears. In the film Wolverine the hero Logan is using a Ducati Diavel on one occasion, as mentioned above.

---

<sup>8</sup> Note that including older films would changed these observation slightly. There is an example in the film Matrix Reloaded (2003) where the female character Trinity uses a Ducati 998 to escape the villains on a wild chase through traffic. The bike is here used for a purpose that bring the narrative forward as well as communicating the values of Ducati: speed and agility.

*Image 1 Sam Flynn, the hero, on a Ducati 900 in the film Tron.*

*Source: <http://thebikeshed.cc/wp-content/uploads/2012/01/Tron-3.jpg>.*

There are two interesting films where the border between hero and helper is not as strong as in the rest of the films, *The Expandables* and *American Pie: Reunion*. It is the relation between the main characters in the gang that makes the character driving a Ducati either a hero, or a helper. One analysis of *The Expandables* could be that there are a gang of guns for hire with different persona, all being hero's. Or one could single out the character Barney Ross as the hero, the rest helpers. Although this latter analysis do not do justice to the narrative in the film. Lee Christmas, hero/helper, are here driving a Ducati Desmosedici. The rest of the gang/hero's are driving Harley Davidsons. The Ducati is thus used to single out Lee from the rest of the characters. The same aspect is present in *American Pie*, but this time the character Finch are driving a Ducati Hypermotard. Meeting his high-school friends again Finch turns up on this bike, bragging on all the travels he has done, on the adventurous character he has become.

The hero's that drive Ducati in these films are using this primary as a vehicle for transportation, seemingly. But the bikes are de facto extensions of the different hero's persona, from the cool Sam in *Tron*, to the adventurous Finch, and to the darker hero's Kyle in *Beastly* and Logan in *Wolverine*. All these embody different values and emotions that seem to be

strengthened by the use of a Ducati, notice that the different characters are using different models – each communicating different values.

Where the hero is the character that embody values, the helpers are constructing their meaning through a unity with the bike. As with the observations by Scolari (2009), the helpers in these films seem to find use of Ducati in accomplishing their roles as helpers. Compared to the hero's the helpers relationship to the bike is more of a unity then extension. The bike is no longer an extension of that character, but a non-human helper in the same sense as the human helper. The unity is those who help the hero on his journey.

*Image 2 Number 6, the helper, on a Ducati 848 in the film I am Number Four.*

*Source: [http://s18.postimg.org/tpglc4wrt/Ducati\\_I\\_am\\_Four.jpg](http://s18.postimg.org/tpglc4wrt/Ducati_I_am_Four.jpg).*

Number 6 (see image 2) can be defined as an helper on a bike. Her role in the film is not as the one driving the narrative forward, of being the one who do the hero's journey. She is but the helper, assisting the hero on his journey. This is what defines her as a character. In that aspect the Ducati motorcycle is not an extension of her persona. It is but a tool of her, amongst other tools. The same aspect can be found in Kick-Ass 2 where the helper, Hit Girl, drive a purple Ducati 1199, dressed in a purple jumpsuit, helm and (super hero) cape. The character has a warehouse of tools and weapons to her disposal, the motorcycle can be understood as but one of these tools. Both of these are (magical)helpers on (magical)bikes. This was a special case of helpers defined by Propp (1968/2013). The magical helper

has magical powers. In these films both Number 6 and Hit Girl could be categorised as having (close to) super powers.

The take-away from these observations are that Ducati motorcycles are in these films stronger associated with the characters of the film, then the association with different sections of the narrative. Although bikes are present throughout the different sections of the narrative there is no clear pattern that indicate an coherent relation between narrative and bike. The relation to the character on the other hand are much stronger. Ducati motorcycles are used by both hero's and helpers in the films. Although both types of characters are using these bikes, they differ in how they are used. Hero's use Ducati motorcycles in order to strengthen different aspects of their character: adventurer, dark, monster. The helper on the other hand are defined in a symbiosis with the motorcycle. He/she is thus not defined by the bike, but the helper-bike assist the hero on his/her journey. In the films in this study the helpers are equipped with Ducati motorcycle as part of their magical tools.

## **Reflections**

It is evident that the framework constructed by Propp (1968/2013) provide a structure of narratives and characters in films that makes it possible to relate to Ducati motorcycles; beyond the mere observation that there are brands and products placements in films. Through this analysis it is evident the relation between product and brand, and cultural artefact.

It is recognised that the main reason for brand and product placement is to achieve brand recognition. To be on top of consumers mind in a purchase decision process. Although this study show that exposing brands and products in cultural artefacts also have the potential of communicating the meaning of a brand. This communication strengthen the design of a product as the symbolical meaning can be inscribe into associating the product with the narrative and characters of the film.

Returning to the semiotics of Saussure it is evident through this study that what is signified by Ducati are defined through associations with the characters of these films, mainly with the hero's. The films are thus a possibility to construct sign-value that strengthen design. Although the symbolical meaning of a Ducati motorcycle can be inscribed into the aesthetical design, moving these motorcycles into films there is a possibility to strengthen associations with chosen characteristics. The result is that the

symbolical meaning of Ducati communicate a context, as Arvidsson (2006) argued, in which to understand and use the motorcycle.

We can only guess on the intentions of Ducati, as their official list of films they have collaborated with cannot be accessed. As for the brand this might not be as problematic. Brands are today public commodities, where meaning and value of the brand are co-constructed by the consumers themselves when interacting and using the goods (McAlexander et al., 2002). In that aspect Ducati has been transferred to a public brand where actors in the film industry use these motorcycles in order to associate characters to Ducati. In that aspect the character in the film and the motorcycle both strengthen the symbolical value of each other. Just as motorcycles do not have an inherent symbolical value, neither has a character. It is all about what associations are constructed.

Although this study is limited in its scope it indicates an interesting future area of the relation between brand recognition and design. I believe that there is a strong need to pursue further studies in line with this in order to construct an understanding how design are strengthened through the construction of brands value, in relation to cultural products and other public areas where the meaning of brands are negotiated.

## Conclusion

By applying the framework of Propp (1968/2013) it is evident that Ducati motorcycles are associated with characters in these films. Through this associations the values of the motorcycle are constructed as the hero use these bikes as extensions of their persona. The value constructed through this product placement constructs consumers understanding how to understand the sign-value of Ducati, this in turn strengthen the aesthetic design of the motorcycles.

# Dynamic Brands: Shifting from Products to Customers

Marzia ARICÒ\* and Kim Wikan BARTH

Affiliation

*There are currently limited attempts to analyse the implementation of service design at a strategic level and its impact on the brand. Several studies have covered the relationship between branding and design management but they focus primarily on consumer goods settings (Brodie et al., 2008). In marketing, the natural inclination is to associate branding with goods. Therefore literature on branding tends to focus on the physicality of the product, its visual characteristics, and the meanings it embeds. Nonetheless branding is just as relevant to services, where the lack of physicality requires a new analysis based on customer relationship, experience, and trust (Berry, 2000). A shift of focus from products to services exposes organisations to multiple opportunities to affect customer experience. Choosing to design a strong service proposition around an existing product offering, and to invest in customer experience, produces a consistent increase in customer satisfaction, sales and customer loyalty. This article, based on primary research with the largest general insurance company in Norway, makes a case for service branding as cornerstone to achieving customer orientation. The article presents six success factors to prioritising customer experience in service branding.*

**Keywords:** Service Branding; Service Design; Customer Experience; Customer Satisfaction

## **Introduction**

Brand management literature has long advocated the importance of delivering a consistent and distinctive customer brand experience but surprisingly very little of this approach has been applied to service brands. According to Mosley, the reason behind the late adoption of a fully rounded customer brand experience by service brands is the level of complexity involved, which is both operational and interpersonal (2007, p.124). Service experiences being by their very nature intangible rely mainly on personal interactions between customer and provider, which are highly affected by the number of people involved, depth of knowledge, length and quality of the relationship.

As a result of this complexity, organisations tend to depend heavily on data, hence the rise of investment in customer relationship management (CRM). Literature has now widely proved that such an approach and investment does not produce the expected return in terms of satisfaction, loyalty and sales (Frow *et al.*, 2010; Meyer *et al.*, 2007; Mosley, 2007; Peppard, 2000). Scholars and professional service firms agree on the need for “a shift in emphasis from conventional CRM to a more holistic view of the total customer experience” (Mosley, 2007, p.124). The CRM data-driven approach fails to consider that customer satisfaction is simply the sum of a series of experiences, and from this kind of data it becomes difficult to extract relevant information on how to recognise areas for improvement. Customer experience is indeed a result of a number of touch-points and in order “to understand how to achieve satisfaction, a company must deconstruct it into its component experiences” (Meyer *et al.*, 2007, p.2).

In this working paper we will present how Gjensidige, the largest general insurance company in Norway, has managed to successfully implement a customer orientation business strategy. This is an initial work, a pilot to explore (1) the key elements behind the company’s transition from product to customer centricity, (2) the shift from product to service branding, (3) the role of design in this transition.

The company’s transition strategy towards customer centricity has been informed by the collection of individual touch-point customer satisfaction data, in this paper we present data in the context of inbound and outbound call centres. Individual measurements captured the quality of customer experience as delivered by each individual employee in customer-facing roles in the organisation. The data collected have proven a clear correlation between customer satisfaction, customer loyalty and business growth (Figures 4, 5 and 6). These background data have informed our initial study

on the key success factors for the creation of a successful customer service brand experience, and on the mediating role of design in this transition. Collection of customer satisfaction touch-point data have proven to be a key factor in focusing investment and resources in the most critical touch-points and to create a consistent experience for customers across different channels over time. As a result, an analysis of the company's general customer satisfaction data shows an extremely positive trajectory on the curve from 2008 till today (Figures 1 and 2). The company has proved that opting to invest in customer experience represents a sound long-term competitive advantage.

Based on this background data, our argument will explore the relationship between service branding, service design and customer experience as key elements for the successful implementation of customer orientation as business strategy. We identify three principles and three tactics that together represent the six key success factors to thrive customer experience in service branding: Principles - (1) culture, (2) consistency, (3) measurements. Tactics - (4) systemised cynicism, (5) empowerment, (6) starting with low hanging fruits. This paper is structured as follows: First we briefly describe the theoretical positioning of this paper. Second we present the context of Gjensidige when they started the customer orientation journey, the dynamics that brought them to decide to invest in customer experience, how they designed the vision, and how they decided to implement it. Third, we will describe the mediating role of design in achieving success, through the analysis of the role that the service design firm Livework<sup>9</sup> had in the process. Fourth, we show an analysis of the key success factors that brought the company to embrace customer orientation. Finally, we draw conclusions and identify key areas for future research.

---

<sup>9</sup> Livework Studio is a service design firm headquartered in London, with offices in Oslo, Rotterdam and São Paulo. The company has been involved with Gjensidige since the very beginning of their *Customer Orientation* journey, providing support and knowledge on service design.

## Theoretical positioning

There are many examples of brands that successfully manage the total customer experience, turning this capability to their competitive advantage. These companies usually belong to the fast moving consumer goods sector, as Mosley underlines, Procter & Gamble was one of the first companies to adopt a systematic approach to brand management in the 1930s (2007, p.124). Although the service sector has been playing an increasingly dominant role in developed economies, we struggle to identify examples of

service brands that successfully managed to internalise customer experience as core strategy. Additionally the insurance sector under analysis in this paper requires an additional consideration; although officially belonging to the service sector, insurance is a very product driven industry. Organisations that operate in this sector are constructed with the product at the heart of everything they do. Adopting customer experience as core business strategy means shifting focus from product to customer and therefore requires a whole set of principles, structure, practices and processes that are unknown to most product-led organisations (Oliva *et al.*, 2003). To quote Olivia *et al.*: “not only are new capabilities, metrics and incentives needed, but also the emphasis of the business model changes from transaction to relationship based” (2003, p.161). Therefore choosing customer experience as a competitive advantage requires a transition from products to services, which adds another level of complexity to the argument. The transition required is therefore from CRM to customer experience and from product to service mind-set. Not an easy task for any large organisation and in particular for the company under analysis in this paper which has a 200 year history, 3000+ employees and that operates in the highly regulated, structured and data-driven industry of insurance.

Management literature is almost unanimous in suggesting that the integration of services to the current product offering of any product-focused organisation is beneficial for competitive advantage (Oliva *et al.*, 2003, p.160). As Heskett *et al.* already pointed out almost 20 years ago, services are difficult to imitate, turning them into a sustainable source for competitive advantage. The reason behind this resides in their very nature; services are less visible than products and more labour dependent (1997). Nonetheless, literature on how this integration could be carried out, the consequences for the organisation, its architecture and management and for the business and its growth, is sparse. As Merz *et al.* argue quite clearly, in the past ten years marketing has been evolving toward a service-dominant logic that has service at the heart of the exchange, that is process oriented versus being output oriented and that puts the customer at the centre of value creation as co-creator (2009, p.328). As a result “goods remain important, but are identified as vehicles for service provision” (2009, p.328), putting the perceived value for all the stakeholders involved at the centre. In this context, social interactions among the different stakeholders construct the brand value dynamically, which is seen as a “continuous social process” (2009, p.337). To quote: “any brand is dynamically constructed through social interactions and thus its value is located in the minds of its

customers and the wider group of opinion makers and stakeholders” (2009, p.337).

The natural inclination in marketing literature is to associate branding with products - the tangible aspects of the product itself such as its packaging and logo. When a company undertakes a substantial shift of focus from products to services, the brand is no longer experienced by customers purely on the basis of these tangible aspects, but on the quality of the interactions with the service provider. Building a strong service brand becomes as relevant as building strong product brands, “a strong service brand is essentially a promise of future satisfaction. It is a blend of what the company says the brand is, what others say, and how the company performs the service - all from the customer’s point of view” (Berry, 2000, p.129). It is possible to argue that a service is, from the customer’s perspective, an experience where “Brand related symbols (e.g., name, logo, signage) can evoke memories of past service experiences and expectations of future ones. The brand promise equates to the experience the customer can expect from the service provider” (Ostrom *et al.*, 2010, p.22). To date, several attempts have been made to analyse service branding from customers’ points of view (Brodie *et al.*, 2007) but we believe literature is generally lacking an in-depth exploration of what it means for the organisation in terms of practices and processes.

In this framework, the concept of customer experience becomes key, and we opt to use the definition provided by Meyer *et al.* who define it as “the internal and subjective response customers have to any direct or indirect contact with a company” (2007, p.2). We argue that in this light, consistency and precision become key factors in delivering a successful customer service brand experience. Quality needs to be maintained across all the different touch-points, therefore having specific touch-point data becomes crucial to ensure both consistency and precision, to avoid waste of resources and create a holistic approach.

## **Methodology**

This is an initial study whose investigation was exploratory and based on retrospective new service creation projects. In order to inform the analysis, we made use of semi-structured interviews and a detailed archival assessment of the projects. Five interviews were run with Gjensidige’s Head of Branding and Customer Experience, who has played a central role in the

company's transition since the very beginning. Furthermore three interviews were run with Lavrans Løvlie, founding partner at Livework Studio. Livework, because of its expertise in service design, has been involved in a number of projects with Gjensidige in the last seven years as a trusted partner. The design company has supported them, providing in-depth insights on their customers, and knowledge on service design tools and methodologies. Their involvement was key in proving the fundamental role of design in a product to service transition.

A whole set of documents produced during the development of the projects has also been analysed in detail. Customer satisfaction data collection and analysis has been undertaken by Gjensidige and by a number of external parties, including the National Norwegian Customer Satisfaction Barometer<sup>10</sup>. This material has informed the framework for our observations, which generated an understanding of the key success factors. These elements have emerged clearly as the most mentioned in the interviews and they also represent pivotal moments in the transition. This article simply represents an initial effort to understand Gjensidige's shift of focus from products to customers and its impact on the brand. This is a pilot study, an initial exploration on the topic and case, which encompasses several limitations: 1) data is mostly based on a number of interviews realised with only two interviewees, therefore the outcome might be biased by these two perspectives. 2) the graphs have been produced by the company itself during the last two years, we as authors have not yet got access to the original data. 3) we plan to interview Gjensidige's customers at the next iteration of this study. This will look at using a more extensive methodology taking into consideration all the different stakeholders involved in the case.

This paper covers the first phase of Gjensidige's transformation, which was very much internally focused. This first phase has then informed a second stage that looks at the external perspective focusing on how to communicate this internal transformation to the outside through visual profile and communication strategy. Both the first and second phases are currently subjects of further studies.

---

<sup>10</sup> The Norwegian Customer Barometer (NKB) is a research program conducted by BI Norwegian Business School. The NKB focuses on the relationships between customers and suppliers.

## The Context

In 2008/9 Gjensidige was facing a number of challenges: their market was undergoing a fundamental change, competition was becoming stronger and price was the major factor influencing customers' choice. The company realised the need to differentiate themselves from other companies more strongly in order to survive and grow. It was the year of the birth of a number of comparison sites for insurance policies that quickly became widely used: all their competitors were playing the price-war. Gjensidige decided they didn't want to play that game, it was never in their strategy to be a price leader, and they wanted to secure the quality they were known for by their customers. There was no imminent danger - the company was still performing well, but the CEO, Helge Leiro Baastad, knew the company had to change in order to thrive in the future. In the strategic discussions that followed, Helge and the board drew inspiration from several sources, one of them being the Toyota Way, which is a set of principles and behaviours that define Toyota's DNA. It revolves around two main principles: "Continuous Improvement" and "Respect for People" (Liker, 2004, p.2). The first element looked at quality, the second at employees. The Toyota Way made Helge think about his company's defining element, which in the case of Toyota was quality. In Gjensidige's case it was trust and security. His company had a long history, and it was trusted by its large pool of customers. In 2009 Helge and the board decided that the company's key competitive advantage should be customer orientation. Instead of playing the price-war, Gjensidige chose to invest in customer experience as key competitive advantage. The ambition was to be among the top ten most customer centric companies in Norway regardless of industry: what they started internally to call *Extreme Customer Orientation*.

Helge was an experienced and visionary CEO who knew that in order for Gjensidige to undertake the customer experience journey he had to secure two key elements:

- *The involvement of everyone in the organisation*, making sure that everybody understood and believed in customer orientation as a viable business strategy. Customer experience is often seen belonging to the marketing domain, but this strategy had to be embedded in the organisation's DNA. It had to become each business unit's interest, not only marketing's.
- *The journey must be owned and driven by the organisation, not by consultants*. The reason for this choice was to ensure that the new

strategy and the solutions developed were “baked in” the organisation rather than “bolted on”, in order to achieve a long lasting impact (Gratton, 2012).

The new strategic focus was communicated by the CEO in person to the whole organisation and interlinked with the company’s existing vision statement: *we shall know the customer best and care the most*. The existing vision and new strategic focus were then articulated and operationalized in *The Gjensidige Experience*, that was designed as a framework for the customer orientation of the company. It consists of a set of four principles, each of them supported by a brief description, a number of related actions, and the reason why they’re important (Table 1). The principles are guidelines for Gjensidiges’ customer focus. They ensure clarity for the organisation and act as guiding principles for the company's added value and development, securing precision and consistency in the realisation of Gjensidiges strategic direction – Customer Centricity. The Gjensidige Experience was developed as a framework that was to be adopted by the whole organisation and by all the units under the Brand Gjensidige. Once the Gjensidige Experience was formulated, its key elements became the Gjensidige’s branding guidelines. Here, the service brand is the result of a holistic view that includes products, content, customer care, communication, marketing, third party delivery, direct and indirect touch points.

The CEO wanted the organisational change that the new strategic focus required, to be organisationally driven. He therefore appointed The Marketing Director, Hans G. Hanevold, and the Head of Brand, Kim Wikan Barth, to drive the first phase of change inside the organisation. In order to gain momentum they designed and personally rolled out a change programme across all the different business units. The change programme had several objectives: (1) securing a sufficient momentum and impact, (2) creating awareness and understanding of strategic choice and direction, (3) securing reach, (4) providing the necessary tools to start a number of projects aimed at improving customer experience. The aim was ensuring that the necessary initiatives were undertaken and projects prioritised. The result was a 2 year change programme and 183 projects aimed at simplifying existing processes, changing organisational culture, improving service experience, and improving efficiency.

*Figure 3 The Gjensidige Experience: vision and principles.*

*Table 1 The Gjensidige Experience: structure of the key principles.*

Principle addressing the entire company
What is the essence of what the principle addresses (value creation)
How do we relate to this? <ul style="list-style-type: none"> <li>• Actions and attitudes ☑ The sub-items address the individual</li> </ul>
Why do we do this (desired consequence, effect from a business perspective)

The background data Gjensidige has provided, that represented the starting point of our research, are individual touch-point customer satisfaction data in inbound and outbound call centres, collected between 2010 and 2013. Individual touch-point customer satisfaction data have been collected systematically at every single interaction of customers with employees. Touch-point individual data on customer experience were then interlinked with individual employee performance. This new set of data were integrated in the score cards, and customers’ feedback was actively used during staff training and coaching sessions. As well as this, individual customer satisfaction data were introduced as one of the key parameters for assigning bonuses, next to the traditional ones. Employees embraced this new practice with enthusiasm, as this was a KPI they could have a direct impact upon.

Establishing a CSI survey on touch-point level provided Gjensidige the data to surgically zoom in problems and quickly react to them. Customer satisfaction started increasing dramatically and - unsurprisingly for the company, sales started to grow accordingly. Sales per call grew by almost

50% in three years (Figure 4). These data gave Gjensidige the confirmation that more satisfied customers tend to spend more. Customer experience resulted in having a direct impact on business growth. Betting on customer experience as a point of difference started to pay-off.

Figure 4 Customer satisfaction and sales per call related to the same touch-point. The Touchpoint Customer Satisfaction graph is based on data from 220.000 respondents.

By interlinking the data, a number of new insights started to rise. Comparing the average premium growth and touch-point call centre customer satisfaction scores, it became clear that more satisfied customers tend to invest more in the long term compared to less satisfied ones (Figure 5). Moreover, comparing data on churn and the same touch-point satisfaction, the company had data to prove that satisfied customers are more loyal in the long term (Figure 6).

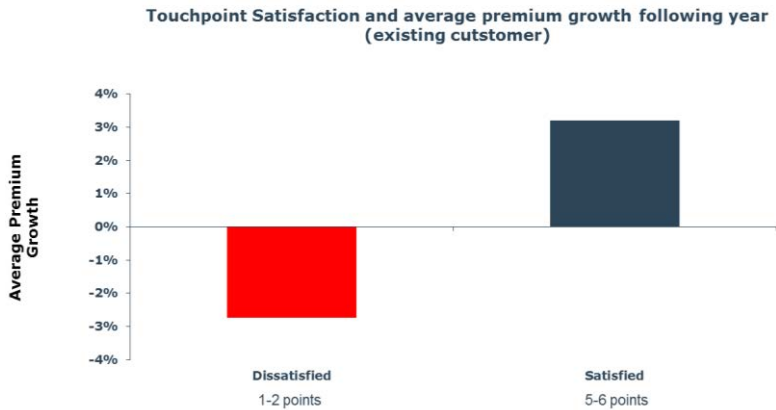

Figure 5 High satisfaction score contributes to growth. Based on 2500 respondents.

Figure 6 High customer satisfaction drives loyalty. Based on 2500 respondents.

These data clearly show that providing superior customer experience is a sound business strategy. More satisfied customers spend more in the short and long term, and are increasingly loyal to the brand. It's important to underline that one of the key aspects behind Gjensidige's success is the introduction of the individual touch-point customer satisfaction index. Being able to gain details about what customers are experiencing, when, and with whom, became fundamental for the strategic improvement of the total customer experience. These background data have represented the starting

point of our analysis on the key success factors that ensured Gjensidige's success and the mediating role of service design in this transition.

## The mediating role of design

Although one of the CEO's prime directives was not to rely on consultants for the overall organisational change from product to customer centricity, Helge knew that in order to provide a better customer experience the company would need the support of somebody that knew the experiential aspects of services thoroughly. They decided to partner with Livework, one of the most widely recognised service design firms, who in the last ten years have worked with a wide range of clients across different industries, investing in gathering a deep understanding of people's drivers, expectations and behaviours in a wide range of contexts. Since then Livework has been working to support Gjensidige where necessary in the design of their customers' experience. Pullman and Gross define *experiences* as the "emotional connections [engendered] through engaging, compelling and consistent context" (2004, p. 553), they further articulate this concept stating that "an experience occurs when a customer has any sensation or knowledge acquisition resulting from some level of interaction with different elements of a context created by a service provider" (2004, p.553). Being able to deliver "experience-centric services" (Voss *et al.*, 2008, p.248) was key to deliver Gjensidige's vision.

Livework closed some of the gaps that Gjensidige was experiencing, providing the following: (1) organisational outside-in perspective, (2) support with pilots, (3) relevant tools and methodologies that are at the core of the service design discipline.

Firstly, the projects the different business units decided to develop were mainly informed by employees' insights on customer experience and traditional customer satisfaction data. This proved to be a too narrow view of customers. Through observation and fieldwork, Livework provided insights on real customers, what they value, what they experience and what they do versus what they say. Gulati argues the importance of an outside-in mindset as follows: "embracing an outside-in perspective - focusing on creatively delivering something of value to customers instead of obsessing over pushing your product portfolio - builds an inherent flexibility into organisations" (Gulati, 2009, p.3). Livework provided a view that complemented the company's perspective by running two hundred face-to-face interviews with Gjensidige's private and commercial customers on

specific project related issues. This approach produced a number of insights on what customers really value, their behaviour and expectations, that didn't emerge from the customer satisfaction data.

Secondly, insurance is a highly traditional and risk adverse sector, where running pilots is not ordinary. Livework introduced the concept of *prototypes* - small-scale qualitative tests of service experiences early in the development process, helping Gjensidige to adopt more cost effective ways of quickly testing ideas with customers before implementing them. Solutions were therefore designed around real customers' needs.

Thirdly, Livework educated the company on how to use a whole set of tools that are fundamental to designing multichannel experiences. From simple persona cards to more sophisticated service blueprints, Gjensidige's employees across different business units got exposed to this new way of working.

Over a period of seven years Livework were involved in 31 projects, providing different degrees of support depending on the projects' requirements. The strategic role of design experts was to inform on real customer needs and providing the tools to tackle problems in creative ways.

An example of the strategic role that service design had in Gjensidige's effort to redesign their customers experience can be found in the work developed for their new branch offices. Here, through a close study of the company's customers, Livework has supported Gjensidige in the creation of a new model for giving financial advice as well as for the re-organisation of the office and staff tools. The key insight that emerged during the interviews was that customers are not always fully informed about their current and future situation. As a result of this insight, the team implemented a practice that put greater emphasis on asking customers the important questions connected to security, insurance and pensions in order to generate more relevant and personal conversations about present and possible future scenarios.

The role of Service Design in this transition emerges to be as the intermediary, not the driver of change. Service Design acted as buffer between the different business units' project intentions, and customers' needs. Livework was involved in defining the projects' needs working directly with the people involved in the project. The value was therefore recognised directly by employees. This observation opens up a new research question on the role of design consultancies in the context of the organisational transition from product to service centricity. In the case of Gjensidige, the company had to build a strong framework and change

culture before being able to involve the design experts. Livework was placed as key partner with specific skills within a clear framework. This ensured the generation of projects that were designed around customers but within the organisational capabilities. This meant that projects could be implemented quickly, providing fast feedback on their success and a clear trajectory for the collaboration - and finally customer experience improvement. This insight is currently the subject of further research.

## Key Success Factors

During our retrospective analysis of the work developed by Gjensidige to improve customer experience, a number of factors emerged as key in the successful implementation of the vision. Ten recurring themes arose from the initial set of interviews as being the most important: (1) Support of top management (2) Visionary CEO (3) Systemised cynicism (4) Everyone needs to be involved (5) Empower managers (6) It's a business strategy (7) Start with low hanging fruits (8) Communicate top-down, operate bottom-up (9) Reporting (10) Measurement. We have extensively challenged and analysed the real meaning and impact of these factors with our interviewees and clustered the initial elements around six fundamental success factors, which can be differentiated in principles and tactics.

### *Principles*

#### **1. Culture**

Mosley argues "one of the most powerful factors in shaping an organisation's culture is the consistent alignment of leadership behaviours with their stated brand beliefs" (2007, p.129). In the case of Gjensidige, the shift in culture represented the fundamental starting point to making the transition from product to customer happen. Customer orientation needed to exit the marketing and branding domain to permeate each business unit under the Gjensidige's brand. Aligning leadership's behaviour around the principles of the new strategy was key to making those principles operational. In order to achieve the required commitment for a long period of time, the core team in charge of rolling out the change programme decided to make top leaders experience customer orientation first hand. During a 2-day management programme, where all the business unit managers had to attend, they were handed a list of randomly selected customers and asked to call them to enquire about their experience with

Gjensidige. The CEO and all the members of the board also undertook the same exercise. Many of the managers didn't have a direct interaction with customers very often, therefore talking with real people was a breakthrough, proving not only the importance of listening to customers, but also that top management was aligned in achieving the new *Customer Orientation* strategy. This example clearly shows that in service branding, customer orientation is as much a cultural exercise as an operational improvement effort.

## **2. Consistency**

As discussed in the introduction to this paper, services are rather complex entities requiring operational and interpersonal capabilities. Within this framework "in attempting to manage the total customer experience, complexity is generally the enemy of consistency" (Mosley, 2007, p.125). The high volume of projects and large number of people across different business units involved required an exceptional degree of coordination. Consistency here is twofold: (1) it relates to the outcome, the service provided, and the customer experience across different touch-points (2) it also relates to leadership, maintaining leadership's alignment over a long period of time. In the first case the reporting system - in both its frequency and structure - ensured a holistic view of the multitude of projects under development and the possibility of aligning them under a common denominator. In addition, the involvement of Livework as a trusted partner across a number of projects, ensured that the service design company had the ability to work across the whole of Gjensidige's organisation, with almost every department from sales to product, actuaries, marketing, online, and retail. Livework was deployed with different degrees of involvement across the organisation, having the possibility to work with a number of different departments and business units meant that they acquired knowledge about the experience delivered by the different business units. Both the accumulated team knowledge and the service design tools helped Gjensidige bridge some of the gaps between different departments.

The latter refers to the challenge of maintaining leadership's interest and effort high over a period of seven years or more. This has been achieved by designing a consistent internal communication strategy, informing employees on a frequent basis on how improvement work is proceeding and the measurable effects on customer satisfaction.

### **3. Measurement**

Deciding how to measure progress since the very beginning was key to assessing the quality of work developed and the determining further work to be done. Deciding to measure customer satisfaction at every single individual touch-point resulted in the ability to zoom in on real problems and solve them quickly. Deciding to systematically measure results and the impact of the different initiatives resulted in the following: (1) Showing clear results communicates the message that the decision to be customer oriented is a primary management goal, to be taken seriously by all employees. The implicit message is: “we measure because we care; your effort is really important for the organisation.” (2) Constantly measuring progresses provides the data to judge whether the projects are producing expected results and confirms that the company is moving in the right direction. (3) Measurements got interlinked to a new set of KPIs. A clear example is individual touch-point customer satisfaction data feeding staff training and coaching sessions. Measurements were instrumental for improvement, which becomes even more important than the results themselves, providing a platform and method for constant enhancement.

### *Tactics*

#### **4. Systemised cynicism**

Customer orientation is seen by many as the soft side of business - something to flavour the customer experience with, but not a strategy in its own right. To Gjensidige, customer orientation was, from the very beginning, strongly tied to the company’s business strategy. Framing it as such was of utmost importance for a successful mobilisation of the whole organisation.

At the core of any business model lays the fundamentals of offer and demand, and in an ever-changing marketplace, the organisations that are most responsive and adaptive to change are the ones who survive and thrive. To Gjensidige, customer orientation as a core element of the business strategy was systematically addressing this, whilst being firmly based on the core goal of all business, namely revenue growth.

#### **5. Empowerment**

When launching *The Gjensidige Experience* the CEO stressed that customer orientation at Gjensidige should have been “A joint effort - a common task - an individual responsibility.” Empowering each business unit

to take the responsibility for the ideation, implementation, and budgeting of the different initiatives, ensured that employees achieved a sense of ownership and pride for their own improvement. Empowerment came with the right support from the organisation to make sure staff had the right tools and methodology in place to succeed. Although the vision was deployed top-down, change happened bottom-up. Here the concept of empowerment is two-fold - it is both structural and individual.

The structure needs to be flexible enough to give employees the opportunity to make customised choices depending on the situation. An example of this can be found in the decision of not to issue call centres with a script of the dialogue they should go through, which is a common practice in this industry. Instead, they provided call centre staff with a set of guidelines. These had two typologies; divisional and situational. Those for the divisional section were strict, as per the insurance industry requirements. The situational ones advised on what the goal of the conversation should be, leaving staff the flexibility to draw on their own experience and creativity in choosing how to approach customers. Opting not to have a scripted dialogue, but simple, clear guidelines and objectives provides a flexible platform for staff to use their own judgement. Therefore empowerment is also individual, showing trust and respect for people's intelligence. Personal judgement becomes key in a process that needs to be driven bottom-up operationally. Additionally, in the context of the insurance industry - highly regulated, with a strong set of legacy systems - this approach ensures staff to become creative in navigating within the restrictions of the industry itself.

## **6. Starting with low hanging fruits**

Being able to showcase results in the short term was key to keeping momentum and enthusiasm around new initiatives. Starting with the easiest problems to fix helps build the confidence to tackle more difficult tasks. An example of low hanging fruit is *customer reassurance*. Gjensidige knew, both from experience and research, that people like to be reassured that they've made the right choice after buying a new product. Therefore they decided to introduce a new practice in call centres both inbound and outbound. Every time staff has contact with an existing customer they should confirm the previous choice (made at a different touch-point), ensuring it was the right choice for them. Realising the positive impact that this has on customers first hand, creates a positive attitude in employees making them strive for more.

## Conclusions

Analysing the recent management literature it becomes clear that brands are no longer seen as static, but as being in a continuous process of evolution depending on the given cultural context, language and meaning (Berthon *et al.*, 2012). Focusing on customer experience enables organisations to evolve together with their customers' needs. As a result "properly executed experiences will encourage loyalty not only through a functional design but also by creating emotional connection through engaging, compelling, and consistent context" (Pullman *et al.*, 2004, p.553). Collecting the right data, at the right time, becomes key in knowing how to respond and being proactive towards an ever evolving context. Deconstructing customer satisfaction in its component experiences is beneficial for turning customer orientation into a successful business strategy. Delivering experiences is undoubtedly a must-have for leading-edge companies that need to be able "to combine functional and emotional benefits in their offerings" (Mascarenhas *et al.*, 2006, p.404).

Design and specifically, service design, plays a fundamental role in developing such experiences and providing relevant customers' insights in order to anticipate potential customers' reactions and expectations. Although this case proves that change needs to be driven internally by the organisation, it also proves that service design has the capacity to act as an instrumental buffer between the staging of the necessary organisational framework, the definition and creation of the organisational attributes, and the final customer experience.

As authors of this paper, we will keep monitoring the company to check whether Gjensidige will be able to keep evolving dynamically around their changing customers' needs. This initial work has opened up a number of research areas that we plan to explore in the future:

- Defining the role of design consultants in the organisational transition between product to service centricity. Although we started laying down some key elements, we believe further research must be undertaken in this area.
- The customer branding experience key success factors must be validated across industries. This could inform a model for the adoption of customer service brand experience more widely across a large variety of sectors.

# Embodied brand meaning through design aesthetics: An Underdog Brand Story

Ariana AMACKER\*

University of Gothenburg

*This paper is an experimental contribution aimed at empirically exploring design as a method of managing the materiality of brand experiences. Little attention has been given to the importance of the sensory-perceptual encounters of the material qualities of brands, that to which the embodied aesthetic knowledge of design attends. The perspective of embodied cognition and John Dewey's notion of art as experience serve as the theoretical and methodological underpinning for a design project of developing a personal brand. I use an artistic research approach to consider how my intersubjective experience of a personal brand, through the material management of my clothing, acquires meaning through both concrete qualities and abstract concepts that operate between me and others. The purpose is offer an (en)active, embodied orientation to design management and to challenge the predominant research assumption that brands meaning can be represented through primarily symbolic relationships. "Underdog" refers to this embodied perspective of design knowledge that is not considered in brand management research but gets filtered through cognitive research frameworks for understanding the symbolic dimension of brands or managerial decision-making.*

**Keywords:** Brand experience, design management, embodied cognition, pragmatist philosophy, aesthetics

## Introduction

Recent research on brands has departed from a functional view of brands as collectively held meanings that can be controlled and managed to a more multidimensional view of brands (Berthon, Holbrook, Hulbert, & Pitt, 2012) and how it is experienced and interpreted from consumers (Allen, Fournier, & Miller, 2008). In this socio-cultural view, brand knowledge is considered more holistically, studied as situated in experiences with brands as symbolic artefacts or of an emergent quality (Diamond et al., 2009). There has been an emphasis on the importance of the emotional and experiential aspects of consumer culture in brands (Brakus, Schmitt, & Zarantonello, 2009; Schmitt, 2009; Thomson, MacInnis, & Whan Park, 2005). “Brand attachment” and “brand experience” has been linked to product aesthetics (Stomppf, 2003) along with the role of consumers to construct and express (or co-create) symbolic meaning of brands (Hatch & Schultz, 2010).

While the discourse around communicating brands in multiple manifestations (visual graphics, products, marketing campaigns, packaging) of consumer experience has expanded, design has also grown as interdisciplinary field of practice (Julier, 2006). In general, design practices are becoming more integrated with development processes in management and marketing, and specifically within brand management, for instance, there has been an explosion of interest in design and co-creation methods (e.g., (Ind, Iglesias, & Schultz, 2013; Ramaswamy, 2009). Hence the literature on design management that focuses on the intersection of design and management is making the argument that design approaches are needed to play a strategic role in configuring brand experience (Hestad, 2013; Montaña, Guzmán, & Moll, 2007). One area of research highlights design as strategic signifying process that helps send a coherent brand message or meaning in all of the mediations or forms of representation (Ravasi & Lojacono, 2005). As well, another stream of design management research has focused on product design and the symbolic implications of expressing brand meaning through a coherent design language(s) including product aesthetics, features, styling, or visual appearance (Karjalainen & Snelders, 2010; Kreuzbauer & Malter, 2005; Page & Herr, 2002). The range of literature linking brand management and design indicate the mixed understandings of design and design’s role in communicating brand meanings or affecting emotional responses to brands (Allen et al., 2008).

These different perceptions of design underscore the difficulty of conceptualizing and articulating design knowledge, particularly using the

theories and methods of management research (Rylander, 2009). Although design practice itself has increasingly become an object of study within management, the research with a focus on understanding how design gives meaning (Ravasi & Stigliani, 2012), the qualitative methods of management research currently used to convey design knowledge and meaning, relies on the positivistic assumption that fully cognitive representations of knowledge are possible. It suggests that design knowledge is reducible to abstract disembodied symbols including language, and thus, can give an essentialist account of design activities. This ultimately poses limitations to the unrepresentable, mutable relationships of design, those that are part of shaping multisensory, discursive, emotional encounters with the world but also what makes it important to designers (Johansson-Sköldberg, Woodilla, & Çetinkaya, 2013).

Design knowledge coming from a different epistemological tradition than management has an assumption that design knowledge implies wholly different theories and methods than qualitative research (Cross, 2006). From a tradition of artistic practice, design knowledge, here referred to as embodied knowledge, is inherent to practice and derived from the senses and direct experiences. One such theory, embodiment theory of knowledge, implicates the bodily basis of human thought and behaviour (cognition) to be ascertained through practice or the body's continued activities in the real world rather than in terms of representational content alone (Gibbs, 2006). In this view, descriptions of how design knowledge works are not a substitute for what is felt because descriptions negate the emotional, subjective experience of embodied knowledge. Thus, experience of meaning is considered to be based in our sensorimotor perception, feelings, and kinaesthetic interaction with the world because bodies in action are tied to our capacities to abstract concepts like concepts of self (Gibbs, 2006; Johnson, 2007). Such a dynamical approach to knowledge is highly situational and applied, indicated to intervene in the research situation, as identified in theories of wicked design problems (Buchanan, 1992), and thereby contributing to the process in which meaning about a phenomenon is shaped.

The implications of this embodied view of design are profound and it is easy to surmise that there is much more to understanding the practical consequences of design knowledge in the development of multisensory and emotional aspects of brand experiences. Solely considering design from a brand management view, or what has traditionally been a marketing perspective drawing from the field of consumer psychology (Allen et al.,

2008), frames design knowledge in descriptive and evaluative forms. As a result, by the embodied, aesthetic dimensions of design knowing get reduced to instrumental means often focused on either the symbolic function of products or strategic decision making. As today more constructivist, sociocultural views of branding suggest that there are ambiguities and tensions in brand meaning and its ongoing construction (e.g., (Kärreman & Rylander, 2008), it might also be appreciated that design is an equally multifaceted, representational practice of constructing and performing meaningful identity relationships.

In response to the perceived limitations of the underpinning philosophical assumptions of management to describe design, which I admittedly generalize because of the ontological dualism between objects and concepts in positivism and interpretivism alike, I turn to classical Pragmatist philosophy that challenges a representational theory of cognition. Likewise, the pragmatic approach methodologically matches the artistic and experimental nature of design because it surpasses the perceived separation of thought and action by bringing about new situations and new concepts (Rylander, 2010). Specifically, John Dewey's (Dewey, 1934/2005) theory of aesthetic experience is relevant to approaching brands as experience and the experiential perspective of design management or "managing as designing" (Boland & Collopy, 2004). This reflects a process-based ontology in which meaning is not able to be captured in the scientific sense, but categories and material existence are learned through their ongoing relationships.

Hatch (Hatch, 2012), in a recent theoretical paper called "The Pragmatics of Branding", makes a similar connection that I am making here between brand experience and Dewey's (1943/2005) aesthetic philosophy. She outlines the role of aesthetics from Dewey's writing to highlight the relationship of "beauty" alongside usefulness in understanding brand meaning. In doing so, she categorizes aesthetic qualities as a further set of criterion for defining a brand's symbolism. This way of intellectualizing Dewey's theory into a conceptual construct for management obscures the more difficult point of how individuals, such as designers, qualitatively assess brand attributes through subjective experience. There is in the interpretive view an inherent essentialism in the abstraction of a brand's meaning from the experience of a brand as though the representation and reality of a brand were distinct.

Consequently, I propose to *operationalize* what Hatch says are “the more radical implications of Dewey’s philosophy” (p.886), and aim to apply pragmatism through design practice.

The contribution of this experimental case, then, is methodological. In trying to experience a brand, it specifically problematizes the notion of *brand experience* in the interpretive view of knowledge that brand knowledge can be reified and made coherent or illuminated through an abstraction of symbolic meaning. The pragmatic point I lay out here, similar to material- oriented approaches in ethnography (Henare, Holbraad, & Wastell, 2007), is that meanings are not ‘carried’ by objects but are identical to them or constituted through them. I focus on how brand experience is situated in our interactions and grasped from sensory qualities and feelings of relationships and is not distinct from the materiality of things themselves. Because the concern is with materiality of experience(s), this case of personal branding exposes a difference between the description or symbolic appearance of brand and the material experience of a brand.

This paper is structured as follows: I introduce the design project of personal branding with the context and rationale for the methodology and design. Then I move on to consider and reflect on my experience of the personal branding project and specifically centre this discussion around themes that emerged as they related to Dewey’s ideas of art and experience and embodied cognition that focus on continuity of inner and outer selves to illustrate how design management connects to brand meaning through material qualities of experience. I conclude with some reflections on the analytic separation made in management research between meaning and things and the implications for brand management if they are taken as one in the same through embodied design knowledge.

## **The Case Study of an Underdog Approach to Branding**

The premise of this project, is that because of the problematic nature of knowledge in how to actually implement a brand experience, an embodied design perspective is appropriate to investigate a designer’s experience of a brand through material encounters in order to ‘think through things’ themselves (e.g., (Henare et al., 2007)). I use an artistic research approach to focus on my experience of design managing a personal brand. I have done so by conducting an empirical project which consisted of investigating the personal branding phenomenon by enacting a material intervention, which

has been to wear the same clothing to project my personal brand over the course of two months. I have also been observing instances of my personal brand negotiation, interviewing colleagues, friends, and family about their experience and knowledge of me both before and after the material intervention. I have collected their thoughts through both informal conversations and an online survey. I am still in the process of collecting data both from others and me. Before the asking people about my material intervention, I have tried to note how they respond to my clothing without revealing it as my brand as such, and then, after telling some people about the project, I have gathered their reactions and suggestions for how to continue with the project.

When confronted with a methodological choice, I decided that an artistic research approach sits well with my background in architecture from which I am familiar with design as an experiential, holistic way of working and learning. This has epistemological significance since it includes a situated, aesthetic approach derived from senses, specifically an awareness of a feelings and embodied experiences in relation to others and the material world. Opposed to the focus on cognitive representations in other research traditions, this embodied approach parallels the classical Pragmatist view of the 'self' as socially constituted and fully embraces empiricism. The pragmatist view opposes the realist attitude of a purely subjective or individualistic experience and by extension the common suggestion that an artist simply imposes his/her self- expression freely onto others. Rather, from a pragmatist stance, artistic practice is intersubjective and revolving around expressive and implicitly social forms of denoting significance to a material reality. Dewey (1934/2005), for example, stresses the point that art is an internal and external process since the artist embodies the attitude of the perceiver when producing a piece of art. Subjectivity is linked to the awareness and ability to generate representations external to the subject that can be observed, analysed and contemplated the same as other forms of representations of knowledge such as data collection. The difference being that design is a holistic approach to knowledge that grounds representational meaning through ordinary experiences and interactions and does not classify aspects of knowledge in order to study the world (Johnson, 2007; Schön, 1983).

### *The unfolding design management of a personal brand*

I began the experiment by asking how can I research brand experience if it is at once highly personal and socially symbolic? The conceptual analysis

of brand experience in the literature (e.g., (Brakus et al., 2009) is contradictory to the subjective and situational understanding of lived experience that authors of experience economy point out (Pine & Gilmore, 1999). I thought that one way exemplify the paradox of trying to define brand experience could be through personal branding. Personal branding reflects the struggle of the marketing approach of commodification of a generic notion and measurable construct of experiences by branding and the implementation issues and subjective meaning of practices as deeply identity driven as a personal brand. Thinking about branding human experiences also made me wonder, in today's ever broadening umbrella of branding, what are the values, experiences, or sacred parts of our identity that are free from market values? And, is this important or relevant anymore?

There is currently a large industry devoted to personal branding (e.g., (Andrusia & Haskins, 1999; Peters, 1997; Roffer, 2002) in a modern work environment defined by individual agency, creativity, flexibility, fast paced development, and uncertainty. It is notable, however, that this explosive phenomenon of personal branding does figure much if at all in academic literature (Shepherd, 2005). Researchers have been placing greater emphasis on identity creation and individual agency in today's networking context (e.g., (Benkler, 2006; Howe, 2008; Leadbeater, 2008; Shirky, 2008; Tapscott & Williams, 2008). There is a more individualized approach to work and for entrepreneurs and a growing class of freelance workers in the knowledge economy, and there is a blurred line between someone's work and someone's identity (Florida, 2004; Shepherd, 2005). In this way, personal branding is maybe not far removed from current cultural practices of alleged "co-creation" of value (Ind et al., 2013). This objective social "me" in current contexts of social production is becoming a new part of marketing and value creation. Knowledge workers contributing their "unique promise of value" are familiar with the refrain to "sell yourself!". It is repeated that persons are now their own CEO's and must differentiate themselves in order to communicate a value statement. Individuals and primarily so-called creative class workers supposedly have more agency in value creation in the current creative, innovative work milieu, but is this rhetoric focused on the appearance or the substance of work?

The personal brand literature suggests, like the corporate branding literature from marketing, that a person can control how others perceive him/her by actively defining what image he/she projects: "It means cutting and polishing your brand so everyone who comes into contact with it forms

the same basic set of words in their mind when they hear your name. It's packaging the things that make you great at what you do, and sending that message out into the world to sparkle" (Peters, 1997 p.7). Trivial as it sounds, this resembles the product branding literature that focuses on symbolic association in product appearance, "it is the designer's job to decode the common values and opinions that exist in the culture and reproduce them into forms that embody the appropriate symbolic meaning" (Opperud, 2004 p.151). This essentialist desire to turn ideas into images has the same marketing rhetoric that dictates that a brand must be clear, focused and consistent. But, can something as complex as an experience, and in this case an experience of someone, her multiple personalities, inconsistencies, nuances, contradictory thoughts be taken up through the rationalization of a clear brand image? Can a person be reduced to sound bites and clichés? Seeing this disparity between research approaches of branding focused on symbolism in relation to perspectives on individual agency in social production, I wanted to empirically test an interpretive research view of branding. By trying to enact (i.e., manage through design) brand relationships (or experiences) rather than trying to cognitively interpret and "construct" them, perhaps there something more to an experiential interpretation of someone's brand.

### **Clothing as site of material experience**

For my personal brand, I thought about where I actually have agency in terms of manifesting some kind of brand experience. My immediate interest was to make or do something that operates as part of my everyday experience and situation. I thought that this could be a way to make the process accessible to others in a common language of design values. By focusing on design in the everyday, I narrow the distance between the assumed agency of design and the consumer in shaping brand meaning to look at what design does to make an experience important.

I started by looking at the personal brand literature and spent time asking myself "where" my qualities of experience or brand presence are, that is, how I locate myself in the material and immaterial. My few online "bios" and profile activities on the web seemed impersonal intellectualized and felt step removed from how I engage with others and how I actually feel about myself as a person. I also sought a design medium that explicitly deals with temporality, because I wanted to try to keep alive the way this case was experienced, how it was made or perceived, as a means to reveal designing as a *matter of experience* not only a matter of materializing a

design product. I concluded that should focus on my physical presence somehow, this being a very pragmatic solution to the problem of demonstrating brand experience in the every day. In one sense, I am being quite literal using experience as design to convey design as experience, the premise being that even if I were to design an object, the design is still located in the experience with the object. In another sense, this design example is elusive. I was curious about how the experience of designing a brand can be seen as something connected to who I am as a person and how I understand the relationship between what I consider a my brand and what others see as my brand.

As I wondered how I could generate certain intensity in my physical presence in some way, my first impulse was that that as brand “design”, the form needs to be distinctive as a brand, like with a logo or some material artefact. After some thought I regarded clothing as a way of expressing a personal brand, the term “clothing” used to refer to the items of cloth worn on the body. Initially clothing as a medium seemed superficial, but then I started to reflect on the challenge of exploring clothing as a brand enactment or an expression of inhabiting my brand. I imagined that assembling clothing could be, in fact, an intimate way to illustrate design as an aesthetic activity, also as one that is difficult to pin down and multidirectional as “managing as designing” suggests. It brings up the difficulty in agreeing upon a design outcome in advance of the process of designing, where the daily act of assembling clothing is recognizable as an ongoing practice of design management and by extension can be framed as an ongoing externalization of personhood. “Personhood” is a term from the embodied cognition literature that refers to first-person bodily experience that constitutes the basis for self-conception and abstract thinking (Gibbs, 2006). This is not a monolithic concept of self, but a link between self and body that is *in process* and constantly forming an identity through interaction with others and the environment (*ibid*). I am constantly negotiating relationships with my clothing and with others as much as through social gesture and response, so this became a site of personal brand experience to direct my attention.

### *Social context for clothing as a personal brand design*

There is very little discussion in branding literature addressing artist’s practices of personal representation in our cultural systems (Schroeder, 2005), but many artists ranging from pop stars like Madonna, Lady Gaga, Bob Dylan, and Bjork to visual artists like Andy Warhol and Banksy have

created strong brands by taking an art-based approach to managing their identity. For my purposes, I became interested in the numerous artists and creative personalities that are known for repeatedly wearing the same clothing (Smith, 2012). They have used clothing as a type of ‘self-portrait’ or participation in culture through art. These range from the artist Joseph Beuys who wore a felt suit uniform, Carrie Donovan fashion editor for Vogue who consistently wore large eyeglasses and pearl necklaces, writer Tom Wolfe who wears only white suits, singer/songwriter Johnny Cash that wore all black, and even Steve Jobs CEO of Apple was notorious for only wearing black turtleneck, blue jeans and New Balance sneakers.

Figure 1 Tom Wolfe in white. Source: <http://www.gq-magazine.co.uk/entertainment/articles/2012-12/03/tom-wolfe-interview-back-to-blood/viewgallery/>

In addition, many well-known modern architects have developed signature brands beyond their buildings through their personal style of dress and accessories. Examples can be traced back to Modernist architects from the turn of the century like American Frank Lloyd Wright who famously wore a cape and a cane, French architect Le Corbusier who had a signature bow tie and round black frame eyeglasses that subsequent architects like the American Philip Johnson also adorned. The continued prevalence of architects with personal brand attire into current day begs the question as to whether they think a particular way of dressing represents, as one blogger amusingly puts it, “a typological solution to the problem of clothing” (Holland, 2010).

Figure 2 Zaha Hadid's signature style, Riverside Museum, Scotland. Source: <http://0.tqn.com/d/gouk/1/0/3/t/-/-/115730131.jpg>

Figure 3 Mike Davis in red. Source: <http://constanzeschweiger.blogspot.se/2012/09/2012-mike-davies.html>

Examples from this tribe include Philip Stirling who reportedly had a uniform of blue shirts, purple socks and Hush Puppies, current architects like Bernard Tschumi who always wears a black suit and red scarf, Frenchman Jean Nouvel who wears all black or all white depending on the season, Englishman Richard Rogers who wears bright coloured shirts and his partner

Mike Davis who dresses in entirely red, Peter Eisenman who has amplified the cliché of the architect's bow tie, Daniel Libeskind dons black cowboy boots, and the Iranian architect Zaha Hadid who is celebrated for wearing bold, sculptural clothing akin to the design of her buildings.

Perhaps in some cases this self-imagery is about enhancing an individualist, creative sensibility, but it appears in most cases for the designer or artist to explore the aesthetics of oneself is a natural extension for the artist to explore multiple materials of self-expression. It is simply a different matter of putting ideas into another form/context. Artists are constantly evolving their art form often along with a highly personal and sometimes eclectic style, and they employ this language of style, performance, artist persona, etc. to catalyse thinking about what the boundaries and construction of art are and how creativity relates to self-identity. They highlight this relationship between appearance and lived experience. This focus of relates the brand management's interest in the ability for objects to carry symbolic meaning, but there is still an open question about what that meaning of self-identity construction is for the designer, how it works in dialog with their art and with others perception of them.

### **Materiality**

Contemplating my material interaction with clothing brought out the immediate, aesthetic relationship that clothing provides for defining who I am in terms of my body, and my identity of my body, in the world. I felt that my clothes have more meaning to me and has more of a manner of expressiveness for a concept of myself than of other representations of "self", such as online profiles. I enjoy the texture and feeling of clothes, and this direct sensory concreteness of clothing feeds into my identity since I wear them on my body as a way that I both appear to myself and present myself to the world. In the Western ontological tradition it is learned to contrast surface to substance, to hold that deep thinking is more consequential than emotional feeling, and to divide the inner self from the superficiality of how one looks (Klingmann, 2007; Woodward, 2005). Thus, research discourse has difficulty deeply interpreting materiality and appearances without relying on semantic processes to provide understanding (ibid). Yet, the supposed superficiality of sensation that humans experience and might not fully understand is what binds communicative meaning of any perceptual experience to a response (Johnson, 2007). This correlation between experience and meaning was

notably offered by communications philosopher Marshall McLuhan over thirty years ago in a comment that, "Everybody experiences far more than he understands. Yet it is experience, rather than understanding, that influences behaviour" (Klingmann, 2007 p.35).

In a conference paper about inhabiting design, Laurene Vaughan (2006) highlights clothing as an artefact that has meaning in that it exists in a lived relationship between user and object. She writes, "Our relationship with clothing is intimate. It is based on touch, we touch it and it touches us. It is a private conversation where each forms the other, an ongoing process of co-creation" (Vaughan, 2006 p.45). Clothing is of the few things that I display that carries degree of self-affirmation since I do not typically have a strong desire for exhibition or ownership of material goods. Nor would I consider myself fashionable or fashion literate, but I do think my clothes constitute a "personal aesthetic" that emerges from my attention to certain relationships I construct when selecting my clothes. In another article titled "Looking Good: Feeling right-Aesthetics of the Self", Sophie Woodward (Woodward, 2005) discusses a case of the material assemblage of clothes by women "as being the site where the self is constituted through both its internal and external relationships" (p.22). I similarly notice that clothing becomes a materialization of my personal aesthetic which is what Woodward says, "emerges as perceptions of what 'goes together' based upon colour, texture, style, cut pattern... what 'goes together' is taken in terms of what 'feels right'. As material culture, clothing is not seen as simply reflecting given aspects of the self but, though its particular material propensities, is co-constitutive of facets such as identity, sexuality and social role" (p.21).

### *The Uniform*

Having decided upon clothing being the design expression for the study, I came to the idea that I would wear a uniform, meaning the same thing every day. Rather than focusing on the symbolism of a uniform I thought uniform could become a site of the experience of turning inward to the actual self, my brand. A uniform sets up a bit of a contradiction because a uniform stands in opposition to creativity. It is characterized as being institutional, monotonous, muted, all the things that one would think of as the contrary to capitalism, choice, and even the enhancement lived experience. It speaks of “the system”. Paradoxically, no longer focusing on the construction of my outfits frees me from the consumption of clothing and the role of a consumer of brands in the market. Maybe the mono-brand becomes my brand. By not changing my clothes, I now give the look of not caring about my appearance, but perhaps the outcome is that others become more aware of my appearance and the fact that I do not change my clothes. After starting the uniform exploration, I discovered an equally contradictory phenomenon of enacting personhood in Japan where people wear entire body Spandex suits called ‘zentai’ (see Figure 4) to interact with others because they seek personal liberation “through complete sublimation of physical self” (Ozawa, 2014). Perhaps for them, as with me, the assumed diminishment of an external framing device such as clothing helps regard the self as more present or clear or maybe it simply a different form of self-expression.

### *Continuity of Inner/ Outer Experiences*

As this personal brand exploration became an exploration of self, it reminded me of having to create a self-portrait in my past design studio assignments. Such self-portraits were understood to be more than merely an image of myself, but an exploration of what form gives the expression of myself meaning (to me and others). From those introspective projects, I gathered that my brand would not take shape in a highly stylized, object-oriented way, but rather, to draw an analogy to gestalt perception, my interest in design is, and has been, about understanding design as a condition of the context. Reflecting on my past design experiences helps me illustrate how my interests in design have evolved into this current concentration of materializing concepts through performance. My approach to design work has always been restrained, focused on drawing attention to the mundane, the everyday, the hidden, the background. I have had an ongoing interest in the question of “where” the design is in a work and if I can remove the designer in some way. In my architectural work, I used to use the terms the “unbuilt” and “indeterminate” to describe this illusive idea being sought after in my projects, and I was often criticized on my drawings for having too light of a pencil stroke which was perceived as not showing enough conviction in the lines (or maybe what I perceived as divisions) I laid out on paper. Although these imprecise and tentative qualities of my design procedure and identity continue to take on different forms, they become more articulable the more self- reflection I give my creative processes. This being the case, I would still not be able to express the extent of my seeking and experimentation over the course of my life that has led up to this present case study. Each design case reflects my way of thinking in an incremental learning process, and accordingly says something about who I am because they arise from my coupling of my experience and designing in the world. Here is Dewey (1934/2005) on this idea:

*The scope of a work of art is measured by the number and variety of elements coming from past experiences that are organically absorbed into the perception had here and now. They give it its body and its suggestiveness. They often come from sources too obscure to be identified in any conscious memorial way, and thus they create the aura and penumbra in which a work of art swims (p.127-128).*

Thus, this design work can be understood as having many internal tensions which are noted as processes of “development and fulfilment”, to

use Dewey's terms, rather than suggesting a rational logic of coherency or recognition. Where branding normally has a purpose of conveying brand values, I did not have a predetermination of a brand image in this case. My brand design is an act of continual experiential fulfilment and identity negotiation. Design always exists between inside and outside, it is an experience, "which is intervening as well as final—always presents something new" (Dewey, 1934/2005 p.144). The work to develop my brand concept is about how the inner and outer are in conversation with one another. These are two sides of a situated transformation of my understanding of my personal brand: "Pragmatism recognizes that thought can be transformative of our experience precisely because thought is embodied and interfused with feeling" (Johnson, 2007 p.92). Designing is not merely a mental interpretation of an external reality, but an operational *how* of carrying expressions of brand intent in a situation.

As I contemplated what my brand does, I explored how to get new perspectives from friends to think about ways I could develop the process. I do not know if it possible to avoid re-affirming my concept of self, but I thought I would try by seeing what others said about me. When starting out, I initially followed the directions from one personal branding book, *The Brand called You* by Tom Peters (Peters, 1997) where I am to confront myself and ask honest questions about my personality and then have I asked the following questions of myself and then to friends and colleagues: What aspects of my personality do I project, what moral values do I associate with myself, what skills or talents do I have, and how do I describe myself and my personal style. I first answered the questions with adjectives including: playfulness, sensitivity, criticality, openness, having values for creative freedom and thought, the ability to see connections and reflect deeply on issues, and that I see myself as neurotic, humorous, complex, down-to-earth, and shy. Next I asked friends and colleagues to answer the same questions and let them do it via an online survey so their answers could remain anonymous. They answered with the following descriptive words: discipline, accomplishment, ethereal, visionary, shyness, utilitarian, youthful, innocence, funny, emotional, upbeat, and never-ending learner. I also received statements like, "sense of humor about herself and the ability to see the absurd in life," and "a sense of surprise and wonder and curiosity about the world" and "creative and reflective side puts her into places or situations where she doesn't feel comfortable, safe or in balance."

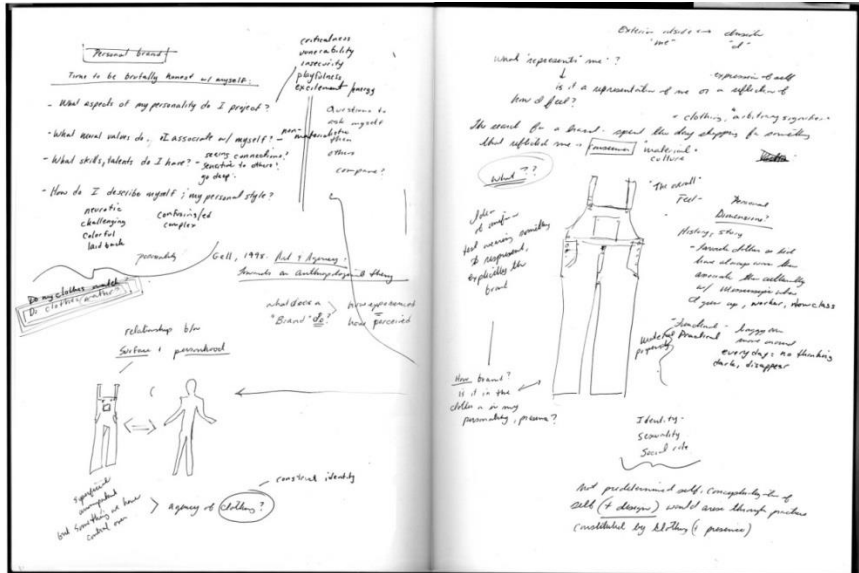

Figure 5 Notes on the case study.

I see their interpretations, which are reflective of my own answers, as part of an unfolding process to keep interpreting my brand. I do not think this is to be interpreted as a coherent, external image of me, but a unity that is in my perceived continuity of self, an identity connected to my body through time and space. It is a natural ongoing navigation between my different selves, between the objective "I" and subjective "me", part of human experience, and in the same way that others perceive themselves or their interaction with me. Thus, the uniform (my brand) is not discontinuous or exceptional in other's experience of me, but part of shaping my experience with them, between me and them.

In classic aesthetic philosophy, the frame of aesthetic judgment or act of contemplation of the *object* of art and the ultimate aesthetic goal is one of "beauty" (Townsend, 1997). This theory makes divisions between content and form, but moreover, between perception and production, which in essence, distinguishes perceiving from knowing. Thus, the struggle with comprehending design knowledge from such traditional philosophies of knowledge, Dewey (1934/2005) says, is that they serve to separate matter and form and thus impose a compartmentalized view of how artistic practices generate holistic expressions or felt meanings of experience: "Aesthetic experience has not been trusted to generate its own concepts for

interpretation of art. These have been superimposed through being carried over, ready-made, from systems of thought framed without reference to art" (p.136).

It is this ontological subject-object divide that shapes the discourse within design management and makes it difficult for design activities to be understood from a pragmatist process-based ontology, or as having a dynamic conversation with a situation (Schön, 1983). Instead, the designer's attempts to represent qualities of experience is usually interpreted by another as producing a designed object. As Dewey (1934/2005) phrases it, "Art is a quality of doing and of what is done. Only outwardly, then, can it be designated by a noun substantive" (p.222). This, linear one-directional model of production of meaning -a thing- is reflected in the way that the meanings of the organization (brand's creators) and the meanings of the consumer (brand's interpreters) have been approached by brand management as discrete. The brand identity, which is in differentiated product features and a concept, is seen to originate from the company and the brand image comes from consumer perceptions and set of belief consumers have about the brand.

For Dewey the material (object) of design that causes contemplative effect, but the object is an effect of internal and external interactions. By example, from my design background, I find that focusing on the experience of designing is not so different from focusing on the object of design, because in practice they are intertwined. When designing buildings, for example, I am actually more focused on the experience of being inside the space than the design of the building itself. Thus, a building is not the *work* of architecture, but rather as Dewey (1934/2005) writes, "the work takes place when a human being cooperates with the product so that the outcome is an experience that is enjoyed because of its liberating and ordered properties" (p.222). The point is that in artistic practice how one engages in the world, that is, how they perceive the relations between body and world, is how one also understands social and symbolic meaning. Things and meaning are not separate, but are in context to how we experience them. Dewey (1934/2005) argues that "art, in its form, unites the very same relation of doing and undergoing" (p.50), the same integrated view of perception and action being presented by embodied cognition theory. One claim from this theory is that perception and action are two aspects of the same neural and physiological processes and that the brain does not simply register representations of the world but is actually adaptive and responsive in representational behaviours (Gibbs, 2006). This being the case, design is a

synthetic knowledge activity of direct encounters, doing and perceiving with the world, and as a representational behaviour, design does not disembodiment meaning, but the acts of production (artistic) and perception (aesthetic) are taken together.

### *The Uniform Part II*

Before deciding on what clothes should constitute the uniform, I resolved to spend a short amount of time shopping for an outfit. My reason for shopping for something new rather than using clothes I already had was for this task of making a choice of clothing. I thought it would be interesting to see what I chose. Furthermore, a new item of clothing also gave me a point in time from my pre-branded self to say, "This is where I'm beginning my brand". Since I am testing the relationship between appearance and experience, I did not want the decision to be overwrought, based on any particular appearance of who I think I am, but I wanted it to be something I just liked, without much up front explanation. I gave myself the stipulation not to overthink the choice, and I succeeded in selecting something after only visiting a few stores in town, being quickly drawn to a pair of black denim overalls on sale at a women's chain store where I live. I immediately liked the hardy fabric and the baggy cut so I tried them on over what I was wearing. There must have been a literal translation of flexibility in this case, because I thought that if they fit over my clothes, their looseness would give me more options for variability if I chose to appropriate them (I later found out that working men sporting overalls in the 19th century actually wore them over another pair of pants). And though I usually prefer to dress in bright colours, I found their colour practical because I thought they could "disappear" by being nondescript and easy to combine with other clothes.

### **Notes on the Overalls**

I did not explicitly evaluate the overalls from their symbolic qualities, though I had a more or less conscious awareness some of their socially communicative aspects. After wearing the overalls, for example, it was pointed out to me they convey the idea of a "builder" which has a figurative match to my architecture background, but I had not thought about that direct translation of my self-biography. I began to wonder how much weight gender and class symbolism overalls have since they have become ubiquitous fashion attire within modern American culture like green military jackets. I learned that overalls, more precisely "bib overalls" which features a pair of pants and a bib area that covers the stomach and chest and held up

by buckle closures at both shoulders, were historically worn by working men in the U.S. in the 1750s. They became then standard dress for painters, farmers and railroad workers when manufacturers started making them out of denim at the turn of the 20<sup>th</sup> century. Around that time they started being worn by children and women and later becoming common attire of women in factories during World War II. By the 1960's, overalls became a fashion item in American culture and today they are both work and casual wear. They have been noted to be part of broader a clothing evolution to more relaxed garments and specifically referential to a current cultural trend of “keeping things simple” with a resurgence in homesteading, D-I-Y, or farm-to-table movements in the U.S. (Rotenberk, 2013).

*Figure 6 The Overalls.*

The overalls actually caught my attention for being an item of clothing that I have always enjoyed wearing since I was a kid. I have had several pairs over the years which have been a favourite of mine, and I can recall a picture of my aunt wearing overalls in her youth hanging on a wall in our house. Besides just being fun to wear, I strongly associate overalls with where I grew up in the southern United States where they are commonly

worn by farmers and working class. These memories with overalls have some underlying associations that I connect to my self-identity, and the aspect that most coincided with this that they are gender neutral, if not masculine, and roughly speak to a “work ethic” or simplicity of lifestyle. I am not highly sexualized through feminine clothing but have always preferred clothes that serve a degree of utility (having many pockets, being loose, durable, etc.) and effortlessness. The overalls fit into this space between my biography and the world, so that I am able to “feel like my ‘self’” in them ((Woodward, 2005).

Having chosen the overalls from a genuine place of self-identification elicits a sympathetic and authentic reaction from friends and colleague versus if I had intentionally chosen a provocative or disruptive outfit. By example, on more than one occasion friends complemented me on the overalls before knowing that they were part of my brand exploration. When I asked them if they thought they suited me, some said yes and that they are “special” and “different” but “they don’t jump out you” and others said that they had not really noticed. I think there should be more of extensive exploration of the perceptions and emotions elicited by the uniform including its associations or the reaction to repeated wear. Not knowing about my project, most people have not commented to me directly. Only one person has mentioned, “Oh, you’re wearing your overalls again.” But for those that I have told, they have stated kindly, “I thought you just ran out of clothes,” or “Now I realize what is going on. I noticed before, but I realized it when we met again. When I told my family they just laughed and said, “Haven’t you done something like this before?” The next round of questions is about my rules for the uniform (see below) and information like, “Can you wear the striped shirt or does that go against the non-colour thing?” There seems to be an interest on their part to check that I am following ‘the rules’ and to help establish or negotiate them, as some have given me suggestions for shoes or other accessories to further the identity. As time goes on the uniform can continue to be a format around which I can gather input into my brand image and enactment. It serves as a stage for wearer-viewer overlap, where I can where I can introduce and discuss the implication of the uniform for a personal brand experience with others.

*Start day, March 3, 2014.* When starting out I set myself some rules for the uniform: 1) I will wear it when I meet people and all social and work-related occasions, 2) I will wear the same undershirt and shoes, 3) I will wear it for a few months (or at least until the final version of this paper is

completed). Thus far, I have held to rules to and 1 and 3, but within the first week I realized it was hard for me not to mix shirts and shoes, so I have allowed myself this margin. This revealed something about me, that I require rules but to an extent, or mostly that I need an element of variation or otherwise I feel constrained. I found the repetition impeding, like eating the same thing every day. I do not mix the undershirts much, but the little amount of change between black, grey, green, and on a couple of occasions, white shirts has an interesting psychological effect. The sense of choice that comes with the ability to vary my clothes, has been for me, a matter of changing my day to day experience. It is not particularly an act of expression or symbolism.

There is a tension the overalls as a representation of myself or how much they are an expression of how I feel about myself. I think the latter is more the case, and the former is the symbolic connection, overall as “signifier”, that arises in a particular social encounter with someone. Someone will perceive the symbolism or cultural currency of overalls and connect that to me as a person. The overalls become a mediator that allows others’ intentions, bound up with their lived experience, to connect back to me. Until they recognize my processes in choosing my materials of expression for this presentation and until they have a sense of me, they may or may not comprehend the ‘self’ or the inner material that I have exposed to the world (Dewey, 1934/2005). Without engaging with my brand, the experience of me through all my attributes and over time, there is a difficulty of describing the meaning of such encounters with my brand, me in a uniform. I do not become “Ariana” wearing overalls, a symbol or meaning for certain qualities to my friends, I am experienced by my qualities when I interact with my friends, and those experiences become internalized by modality-specific, situational perceptions that friends recall in their memory of me (Damasio, 2005). With friends, the uniform is only one aspect of an experience with me among repeated experiences with me. The uniform is an artistic medium for inner exploration and expression of personhood or ‘self’ as much as it is serves a collective system of symbols and cultural meanings. My action of “wearing overalls” is the doing and making in design management, not an outcome of a design. It is a mode of interpersonal communication, a conversation for myself and others that is *consummated*, to use Dewey’s term, as “my brand” because I recognized it to be experienced as such. It has significance for me and others through our relationships that already have emotional meaning. My brand, that is me in overalls, is comprised of various relational meanings, not one complete

narrative. It is not purely cognitive because it is both contradictory (comprising my multiple selves) and ongoing (still being formed) in its material realization.

### **Meaning of Experience**

The pragmatist focus on experience challenges the recent interest in semantic perspective of design that suggests that design objects convey meaning through semantic interpretation (Krippendorff, 1989). In one such area of product design research, the focus on the design aesthetics as signifiers towards an instrumental end to distinguish semantic interpretations of brand qualities or product categories (Kreuzbauer & Malter, 2005). Product aesthetics are easily conflated with products possessing semantic attributes and it seems reasonable to specify the representations or “styling” of a brand should be primarily based how it should look through a visual language or product form (e.g., (Person, Schoormans, Snelders, & Karjalainen, 2008). The intent is to elicit emotional responses from consumers, often under the term “affect” (Nathan Crilly, James Moultrie, & P John Clarkson, 2004) through design attributes by offering perceived symbolic representations of brand meanings. Because semantics, through language, classifies meanings onto things, studying design from this perspective assumes a cognitive (thinking) meaning separate than an affective (acting) meaning and a causal, behavioural relationship of producer-receiver. Brand knowledge, then, is assumed to exist in cognitive forms in the minds of product designers and consumers, so that brand recognition and categorization can match a one to one signifier-signified semiotic thought to exist in discursive symbol systems (Kreuzbauer & Malter, 2005). This approach becomes practically functional because it internalizes an underlying, and perhaps collective, meaning which and works to stabilize or make coherent what are ultimately deterministic and reified brand categories or identities.

Dewey’s claim is that meanings are not mediated through the symbolic dimensions of art alone, but meanings are also caught up in direct emotional response to form, presentation, or materialized experience. Relations are perceived and felt, not just thought, meaning that body-based perceptions of the qualities of a design are what gives a design the so thought “higher-level” symbolic meaning. Johnson (2007) summarizes Dewey’s argument of aesthetic experience in this way,

*Instead of isolating the “aesthetic” as merely one autonomous dimension of experience, or merely one form of judgment, we must*

*realize that aesthetics is about the conditions of experience as such, and art is a culmination of the possibility of meaning in experience (p.212).*

In other words, from the pragmatist standpoint, there cannot be a translation of an experience into the discursive symbol systems of language and selecting qualities of semantic meanings is a reductive view how internal ideas (thoughts, concepts) can represent the outside (world). The inner and outer are the same substance in existence—the outer result is expressive, but it is equally for internal fulfilment. In my case, I was not interested in managing my identity through only symbolic representations (meanings) of ‘self’, but also felt and reacted to different sensory qualities with the items I dressed in. This exemplifies the relationship of doing and undergoing in the way that Dewey (1934/2005) articulates, “The material is not employed as a bridge to some further experience, but as an increase and individualization of present” (p.127).

Consequently, how knowledge is reified in the cognitive constructs of traditional management research, does not support the material, intuitive, multisensory, context-specific interactions with the world that is assumed by Pragmatism and practiced by designers. Design revolves around qualities of experience and the situational encounters with brand “tangibles” (Hestad, 2013) at the individual level. Aesthetic meaning does not rest in general (in a social definition) nor out of context (in the head of perceiver) but is intertwined in experience. Designers, in that respect, experientially consider or qualitatively assess design attributes and relationships through their affective experiences with the world.

Figure 7 Photographs taken every time the uniform is worn.

## Conclusion

This case questions design management's suggestion that design can play a role in managing a coherent brand image (Ravasi & Lojcono, 2005) or visual recognition of a brand (Karjalainen & Snelders, 2010). The predominant approach to design management research on brands aims to understand how a brand is intended in agreed upon semantic terms or expressed values. From a management perspective, it is implied that multisensory brand experiences can be translated into verbal, cognitive representations of meaning: "Brands most certainly carry expressions of intent of the intent of their originators" (Hatch, 2012 p.888). It is important to point out from a design perspective that this notion of formalizing and modelling knowledge in advance through an intended image (or reified view) of knowledge is not necessarily how design materially develops ideas or meanings (through things). In design management where it is currently understood that design and management are both engaged in the production of representations (Orlikowski, 2004), I would add that unlike management, design is not preoccupied with operating in the world through a priori, symbolic terms. In design processes there is a gratification in the artistic behaviour to express, elaborate, or make experiences special in themselves which is not secondary to the symbolic meaning of the experience. Thus, where there is difficulty for design, in management terms, is in sharing the aesthetic perception of felt qualities of design. Management's instrumental concerns and need for rational explanations over the experiences themselves requires a translation from action to thought or vice versa. Thus, the interpretive view of framing brand experiences for management purposes actually keeps the discussion of brands in the conceptual (linguistic) realm and characteristically reduces any kind of complexity or ambiguity of implementation and the context-dependent, relational experience of meaning(s).

In this project of personal branding, it took me a process of self-reflection through my material circumstances to uncover some hidden values that I inhabit and project without necessarily being able to articulate them first. The concreteness of the overalls provided an externalization, a modelling process, by which I have been able to reflect on the concepts of personal branding and "personhood" but also how I find personal meaning in the work itself. I am able to see a connection between my process and outcome of a brand. On one level, I have become alert to the idea that my brand (or personhood) is both reflected by constituted by my decision to wear dark, asexual pants with a utilitarian aesthetic. The clothes, as a

symbolic vehicle, speak to my desire to be practical and for gender mobility, but also my desire to be seen by others in that way. They are at once an application of clothing I find personally evocative but also in the context of others as clothing that surfaces facets of my biography. The materiality provides a way to go into the embodied emotion and feeling of the substance of form.

Moreover on another level, the repetitive wear of the overalls as a uniform serves as a means of enhancing my reality which includes an emotional and psychological component. It gives my behaviour an artistic or special behaviour that is a means of production inseparable from the making special of my material conditions (Dissanayake, 1992). This behavioural enhancement of performing a kind of clothing ritual revealed to me my deeper interest in how aspects of design can arise from the ordinary. Repetition, I am discovering, is one technique that I enjoy as a means to enhance the material and social consequences of my actions where representational meaning does not necessarily come first. In other words, repetition of an activity makes the experience important, and thus aesthetic for me. It has been a way of managing my behaviour that includes a sensual pleasure and intellectual curiosity that I value apart from the symbolic function of the overalls.

*Figure 8 Brand Placement.*

Figure 9 Brand Launch.

Figure 10 Brand Turnover.

This design project helped illustrate how embodied design knowledge constitutes meaning in situation-specific experiences, but it scarcely reveals some of the many contradictions that executing “the intent” entails in practice. The intention of an experience or idea, which is more than an image, may not be understood until it is materially articulated and can be experienced and thus reflected upon. Knowledge of brands reside in individuals’ material experiences, and these in the end are assessed through multiple sensory qualities and felt aspects. These cannot be easily reified into linguistic concepts or reduced to design features as product design literature rehearses (Crilly, Moultrie, & Clarkson, 2009; Hestad, 2013; Kreuzbauer & Malter, 2005; Person et al., 2008). Instead, experience contain multiple and conflicting views. Thus, the management of such design qualities cannot be predetermined or fixed, but must be ongoing with aesthetic, material attitudes. Design utilizes a material perception of form and interaction to also denote, signify, and shape representations through non prescriptive artistic concepts of expressive, emotional content, one that is learned through embodiment.

Finally, this case exposes, in a small way, the conflict of designer caught between the traditionally polarized imperatives of management and art. On one hand, the designer must support reified, commodifiable meanings of brands, and on the other, pursue an artistic notion of exploring non-economic, non-deterministic, felt qualities of experience. The instrumental values of marketing and the compartmentalized perspectives of management research work to separate the intent and consequences of a brand experience. This separation between values and intent is a source of confusion in trying to understand and cognitively represent brand meaning.

In the context of branding, understanding for a designer’s role and approach means that a designer not only provides practical and technical contribution but also a conceptual and compositional one. There is an intrinsic value for the care put into carefully and thoughtfully designing an experience, care in the detail and thought that is not necessarily rational or economically measurable. This is more than an output but a labour of love. Dewey (1934/2005) writes that “craftsmanship to be artistic in the final sense must be ‘loving’, it must care deeply for the subject matter upon which skill is exercised” (p.49). This provides a critique to the current attention being paid to co-creation processes by branding (e.g., (Hatch & Schultz, 2010; Ramaswamy, 2009) which might be missing the point that there can be a kind of artistic authenticity or value for expressing an intent in intersubjective, felt qualities of experiences, not first through a marketing

purpose for profit and predetermined values. Therefore, what might be important is a degree of autonomy associated with art to place more value on the creative process itself rather than on any preconditions for co-creation processes. This rather, is what gives design processes self-fulfilling or intrinsic motivations for people to engage with creative processes beyond economic concerns. Dewey (1934/2005) acknowledges this aspect of consummation of meaning in the social process of creative production:

*Wherever conditions are such as to prevent the act of production from being an experience in which the whole creature is alive and in which he possess his living through enjoyment it will lack something of being esthetic. No matter how useful it is for special and limited ends, it will not be useful in the ultimate degree—that of contributing directly and liberally to an expanding and enriched life (p.27).*

If the intent of a brand can be seen beyond the instrumentality of symbolic meaning to the qualities of engaging in brand experiences, it would be to see that a brand does not just become a symbol of experience, but is in the aesthetic (thinking and felt) qualities of the that experiences the brand provides. Pragmatism and embodied cognition both imply that design does not translate meaning semantically through visual languages, but intertwines values and intent in experience — where there is usually an aesthetic expressiveness of intent in framing such experiences consistent in experience itself. This is the Underdog approach of design. It does not put experience over theory, but holds them together, and it is our experience with things that “*can be conceptual*” (Henare et al., 2007 p.13). This means appreciating the intrinsic value of design knowledge in helping shape experiences, because there is an expressiveness that is not necessarily predetermined by linguistic categories or images of meaning. Furthermore, this logic of embodied knowledge has the intriguing and provocative capacity to actually convey multiple, inconsistent meanings. Individuals perceive things in more than one way in experience and design, as a material practice, draws on the associative perceptions constituted by relationships between people and material world. It would not matter what symbolic meaning brands are perceived to adhere to but suggests rather that they are about engaging people in experiences of ongoing identity fulfilment. There should be seen great potential for brand management through embodied design knowledge because a brand can be dynamically performed, constructed or enacted along numerous continuities and qualities of experience.

# Consumer Engagement in Co-creation of Contemporary Brand Design

Sara Jane GONZALEZ\*

DESMA Future Concept Lab

*In this paper, the literature review and theoretical framework is aim to understand how companies co-create the brand experience with their consumers. An in-depth case study has been developed on recent strategies developed for Nutella, brand of the Italian chocolate's manufacturer Ferrero. The discussion is focus on how consumer's contributions are being considered to create contemporary brand experiences by providing a framework of how companies are using different tools to engage consumer as an alternative approach for reinforce brand recognition. The paper analysis has significant implications for designers, marketers and research professionals because it shows how companies can consider consumers as participants of an integral brand building process. Finally, it point out some follow-ups and future development for this research topic.*

**Keywords:** Brand Co-creation, Brand experience, Brand design, Collaboration.

## Introduction

Consumers are no longer placed at the end of the process where they used to be receptors of the information developed exclusively by companies about brands. Companies have started to recognize in their own customer a source of valuable information and they are enabling platforms and spaces to exchange content with them. For the purposes of this paper, “consumers” refers to buyers of products and services, including, end-consumers, users, businesses, governments, etc.

Some of these contributions are emerging in communities where consumers who feel identify with the brand, voluntarily join their efforts to support it. The Internet has radically altered the proposition that listening to your consumers can help to improve your product and services (Kambil et al., 1999). New media have empowered consumer’s voice, making them feel closer to the brands they consume.

Moreover, design is recognized in terms of branding to create a symbolic interpretation, brand identity or communication strategy, but it is more difficult to understand how design enable the process of communication with consumers, how design could bring closer consumer's inputs and creative process to reinvent brands or what is the role of design in the dynamic data exchange that companies are experimenting. Designed by the company, the consumer brand experience affects how the brand is perceived (brand communication) and how the brand is interpreted (brand interaction), but the brand experience from the consumer perspective is also a motivating reason to start a conversation (positive or negative), in some cases to rethink the brand or to consumers to make their own contributions. Acknowledging the power of consumer’s contributions, some companies started to collaborate with consumers to create and manage their brand experience, giving them a new role as brand co-creators. As the value of the brand has grown and so has the participation of the consumer, have been recognized that the responsibility of design of the brand experience is not only on company’s hands.

Although there are some scholars inquiring into how the brand meaning to the company may differ from what the brand means to its target consumers, there is not much in the literature about how companies collaborate with consumers with the purpose of create a strong brand recognition and what is the role of design in this collaboration process.

The paper has been structure as follows: First, the review of the emergence and definition of brand co-creation concept. Second, the literature relating to the potential for companies willing to co-create and for

consumers willing to participate. Third, a company case analysis of engagement of consumers for brand co-creation and understanding of the role of design in the process. Finally, the contribution of the paper is presented together with future research opportunities.

### *Research Methodology*

An exploratory approach has been applied for reviewing available literature in the topic followed by the analysis of an existing company case in the process of co-creation for brand communication content using netnographic study methodology.

Netnography is a participant-observational method conducted on the Internet (Giannelloni & Vernetto, 2012). This methodology provides information, meanings and describes consumption patterns of online groups (Kozinets, 2002; 2006). Netnography adapts the principles of traditional ethnography to the study of virtual communities (e.g. brand communities, forums, chats, CRM platforms) emerging through computer-mediated communications. According to Kozinets (2002), netnography is the methodology implies the researcher's immersion into the virtual community long enough to familiarize himself with the community's culture—that is its values, norms, language, rituals (Cherif & Miled, 2012).

The netnography was conducted from September 2013 to May 2014. For the purpose of the paper a selection of quotes was made from a previous selection of 125 (from all the content shared during these months on the two unit of analysis), based on the aim of focus of analyze the material connected to the objective of the paper on development of brand co-creation community.

### *Brand Co-creation: theoretical foundations*

The theoretical roots of the brand co-creation concept lie in what Prahalad and Ramaswamy (2004) refer to as joint creation of value by the company and the customer. Similarly, Roser and Samsong (2009), refers to co-creation as an active, creative and social process, based on collaboration between producers and users, that is initiated by the firm to generate value for customers. Further, Ind et al. (2013) suggest that co-creation notion is not purely an organizational opportunity or simply a place where consumers interact, but instead a way of organizations and individuals working together in a process of discovery that delivers benefits for participating individuals (such as fulfilment and socialization) and for the organization

(such as insight, idea generation and development, and marketing platforms).

Co-creation is different from the crowdsourcing of ideas (such as competitions and polls) because it implies an active intellectual participation in a process. For the purpose of this paper, co-creation differs from mass customization, because of the two-way flow between the organization and the participant and because it involves the participant in a process that creates value not only for the individual, but also for others (Ind et al., 2013).

The emergence of co-creation has been possible due the technology advances and development of the network, which have facilitated communication between consumer and companies. Thanks largely to the Internet consumers have been increasingly engaging themselves in an active and explicit dialogue with manufacturers of products and services (Prahalad & Ramaswamy, 2000). The sophisticated information and communication technologies (ICTs), which have developed in parallel with the rise of the Internet, have served as platforms facilitating interaction with and among consumers, and the formation of brand communities (Muniz & O'Guinn, 2001; Muniz & Schau, 2005; 2006). This online connectivity has enabled users to build communities of interest beyond limits imposed by proximity (Muniz & O'Guinn, 2001) and to customize products and share their ideas (von Hippel, 2006).

In an attempt to become close to customers and to understand better their behaviour, organizations have recognized that they can become part of the customer experience (Ind et al., 2013). As described by Prahalad and Ramaswamy (2000) the market has become a forum in which consumers play an active role in creating and competing for value. Companies have started to recognize the importance of a most participative role of consumers. Researchers such as Grönroos (2000), Prahalad & Ramaswamy (2000) and Vargo & Lusch (2004) argue that value is embedded in the co-creation process between the customer and the supplier, and where the customer shifts from being a passive audience to an active player. "The answer, we believe, lies in a premise centered on co-creation of unique value with customers. It begins by recognizing that the role of the consumer in the industrial system has changed from isolated to connected, from unaware to informed, from passive to active" (Prahalad & Ramaswamy, 2004).

Most of the time, co-creation deals with product design or with communication campaigns. Brand co-creation emerges as the space

between organization and consumers conversation. This is a fluid space where brands are discussed and developed and people participate in the movement of ideas (Ind et al., 2013). Consumers and brand communities, or, as Sitz and Amine put it “individuals sharing values, norms and representations emerging from similar consumption practices, from collective reception of advertising messages” (Sitz & Amine, 2007), have to be involved in the brand’s value creation process (Vargo & Lusch, 2008).

*Figure 1 Brand co-creation as interaction between company and consumers*

### ***Brand Co-creation interaction***

Depending on the situation, brand co-creation communities (i.e. group of people participating in a co-creation project) can be organized to last either a few days, or be conducted over the course of several months. The co-creation community could involve as few as a few hundred participants, or it could be scaled up to involve thousands of voices (Riney, 2011).

However, no matter how long or big is the co-creation process there are two types of interaction for develop a co-creation process. Co-creation takes place through *physical* or *online* interaction. First, meet face-to face with consumers to discuss about brands, products and/or services, schedule meetings or events where communication between consumers and firms happen. Second, meet through online communities where interaction between participants occurs by using online platforms (including also corporate websites) and social networks. According to De Valck a “virtual brand community” is a specialized, non-geographically bound, online community, based on social communications and relationships among a brand's consumers (De Valck et al., 2009) A co-creation community is a place both to learn and to share that enables people to realize something of their own potential by exceeding their perceived limits (Agamben, 1993). Cova (2011) has been defined two objectives of the community brand, contribute to social interactions between brand community members and

encourage consumer investment on community: it can be self-exposure or a personal branding. Organizations have the opportunity to be active listeners via social media and brand communities and also to be the instigators of dialogue (Ind et al., 2013).

### *Consumers and company's roles*

The competence that customers bring is a function of the knowledge and skills they possess, their willingness to learn and experiment, and their ability to engage in an active dialogue (Pralhad & Ramaswamy, 2000). Füller suggests that consumer's motivations for participation vary depending on personality and that this creates different expectations towards co-creation. While some people seem to be primarily motivated by extrinsic rewards, other participants are engaged by more intrinsic rewards (Füller, 2010). For co-creation to be sustainable as a practice it needs to engage with people who are intrinsically motivated (Ind et al., 2013). Intrinsic motivation is a vital component of creativity (Amabile, 1997) and drives high-level and long-term interest in co-creation projects (Füller, 2010).

Consumer engagement is has been recognized by different authors as a key point for decision making, Voyles (2007) suggests consumer engagement enhances profitability, Neff (2007) views consumer engagement as a primary driver of sales growth, while Sedley (2008) have seen it, both as a strategic imperative for establishing and sustaining a competitive advantage, and as a valuable predictor of future business performance and recently Brodie et al. (2010) emphasizes how the discourse portrays consumer engagement as a vehicle for creating, building and enhancing consumer relationships.

Beginning a two-way dialogue using the co-creation technique can also result in a variety of positive unintended consequences (Riney, 2011). Co-creation offers a milieu in which people can forge closer links with brands, develop new possibilities (Füller et al., 2008) and build on the ideas of each other (Iba, 2008). As participants begin to build trust and commitment both towards each other and to the organization, they start to feel closer to a brand. As a result, people are willing to provide significant input in response to questions, to contribute their creativity, to engage in discussion, and to generate new ideas (Ind et al., 2013).

The value of this is that external contributors can bring their different skills and expertise to develop ideas together that "combine and combust in exciting and useful ways" (Amabile, 1998). Engaging customers in this way

can yield considerable value, because it goes beyond the gathering of intelligence about customer attitudes—information that can be obtained through more traditional methods such as focus groups and surveys. A key benefit of this approach, as opposed to conducting a conventional market research survey, is the ability to gather stakeholder input rapidly and, depending on the nature of the conversations, redirect the discussions towards topics of interest that emerge from the community (Riney, 2011).

The co-creation process offers a richer, larger and more varied knowledge base, while bringing together different stakeholders. However, it has been recognized for some authors that this in turn requires a participatory leadership style that enables the organization to share and work effectively together with consumers. Organizations can absorb learning from the co-creation space, but only if the knowledge generated with consumers is shared inside the organization (Ind et al., 2013).

### *Consumer engagement for co-creation of brand experience*

A company case have been selected to analyse how companies collaborate with consumers with the purpose of create a strong brand recognition. The emphasis would be in an online platform developed for engage consumer in the creation content and share ideas to strengthen brand recognition and to virtually co-create the brand experience, which allows for an in-depth analysis of what is the role of design in this collaboration process.

#### **Context**

Founded in 1946 the multinational manufacture Ferrero from Italy is a family business recognized by the production of chocolate and other confectionary products. First product of the company was the Pasta Gianduja a cream of hazelnuts and cocoa, which was modified by his creator Pietro Ferrero five years later in Nutella, a softer chocolate cream, today's the most recognized product of the company. Nutella was named in 1964 using the English word "nut" and the Latin suffix "ella". In 1965 the product was introduced to Germany and France, and in 1977 to Australia.

The Brand have been developed a strong brand, including a recognizable jar as packaging and different communications campaigns (e.g. "Nutella® party" in 1992 a fashionable event with Nutella and bread to share with friends or "Nutella® party an Italian Myth" developed in 2004 by the journalist Gigi Padovani). With 640 million Euros in sales in the world, Nutella accounts for 15 percent of global sales by the Ferrero group that has

16.000 employees, 15 plants and 28 companies worldwide, with a turnover of 4.5 billion Euros. In Italy the annual per capita consumption of Nutella is 800 grams per head, while in France is more than a pound per head per year (La Repubblica, 2004).

### *Description of the Co-creation strategy*

Two of the latest brand communication strategies of Nutella in Italy were selected, that best represent the co-creation initiatives of the brand. The objective was twofold: first, to understand how consumer collaborate with companies for the co-creation of the brand experience and second to analyze the role of design in the co-creation process.

### **Nutella® Sei Tu**

On September of 2013, Nutella launched “Nutella® Sei Tu” -Nutella is you- that for some advertisers was the application of a Coca Cola previous successful campaign (The gift bottle), where people can find some packages of the product where their name printed in the label. However, the Nutella strategy included more elements than an advertising campaign. Additionally to the strategy of producing some labels (initially there were 150 names available on stores), it was launched “My Nutella community” an online community with different strategies to reinforce the cult of the brand. First difference, consumers could go on line to create their own labels using the online app “Youtella” in case they wouldn’t find it at the points of sale. Additionally the service “The Name Delivery” was launched to deliver the label created by the consumer to a personal e-mail address or to send the physical product to a specific address. It was the first time the brand connects all the content created by the brand for social networks (including Facebook, Twitter, Pinteres, Instagram and Youtube) in the same platform called “Social Wall”. In addition, more traditional media (TV, Billboards, Radio) were used and some offline strategies where implemented as the “Buongiorno entusiasmo tour” (Good Morning enthusiasm tour) a multi-city event whit activities for the consumers or “Colazione al Buio” (Blind breakfast) a contest to win a breakfast with some VIP guests. At April 30 2014, there were 253.721 delivered via online around the world.

Figure 2 Nutella® Sei tu, Brand co-creation strategy landscape

### Nutella® Stories

For the 50 years of Nutella in February 2014, the company decided to launch a second version for the online community of Nutella lovers called Nutella® Stories. For this occasion consumers were invited to share their touching moments including Nutella using different media (e.g. photos, video, written stories). After participate, consumers receive a Nutella Storybook to their e-mail accounts they can share in social networks (e.g. Facebook, Google+, Pinterest or Twitter) while accessing to stories from their friends and other members of the community.

The content uploaded by the consumer has been visualized in an interactive Nutella's world map, which shows the number of entries worldwide by continents, countries and even local regions. A countdown for a Nutella event was launched to celebrate the product's birthday on May 2014. Consumers can participate with their stories, uploading the contact they received an email with a link for participate in an "instant win" of a weekend for the celebration event or some customized wall clocks.

### Role of design

According to Kapferer (1992, 2004) there are six dimensions of brand identity (physique, personality, culture, relationship, reflection and self-image), divided over two dimensions (externalisation vs. internalisation). The in-depth analysis of brand co-creation landscapes for both strategies (i.e. Nutella® Sei Tu and Nutella® Stories) evidence how the design of each

element has played an important role in communication and weaving all aspects into an effective whole (Table 1).

*Table 1 Role of design of Nutella brand co-creation through brand identity dimensions*

	<b>Dimension</b>	<b>Design Role</b>
Externalisation	Physique -physical features-	-Use of brand identity colours (red, white and black) and icons (jar, labels, slogan). -Name of the strategy related to the brand's name (Youtella, Nutella Stories, etc). -Replacement of brand name on packaging for consumer names (Chiara, Francesca, Paolo).
	Relationship -beliefs and associations-	-Iconic brand and product for Italian market: reinforce the quality and importance of the brand in the country and in the world. - Proximity: strategies to bring the brand to the consumer using deliveries of both, labels and product to all places (home, offices, etc).
	Reflection - view of the brand-	-Happy -Irreplaceable -Fun -Global: communication of number of participants in the community, initiatives.
Internalization	Personality -character and attitude-	-Enthusiastic: Positive language and attitude promoted by brand initiatives. -Active: Design of platforms, events and activities to push a <i>participative role</i> of consumers. -Contemporary: Mix between tradition and modern communication tools, use of technology, platforms and social networks.
	Culture -Set of Values-	-Italian-related: Brand's name replaced with Italian names. -Traditional: Italian consumption tradition gathered through the collection of old pictures and stories. Contrast between old stories and new stories. -International: Use of maps to illustrate the impact of both campaigns in national and international context.
	Self-Image -mirror of the target group-	- Active, full of energy. - Protagonist - Important

Designed elements for both Nutella strategies reinforced the brand identity of the company, the use of new ways of communication (platforms, brand community, social network, apps) connect the consumers with more technological media and devices than traditional advertising (TV Spots, Radio, Billboards, Flyers) and create a new way of interaction between company and brand, where consumers have a more active role. The design of the platforms, events, strategies and brand communication is important also because is increasing the interest of people in the brand. While the people have access to online platforms to share content, they started to feel more connected to the brand, they upload more information and they share more ideas.

### *Interpretation and Data Analysis*

#### **The Nutella community strategy through the Brand Equity Model:**

The Brand Equity Model (Keller, 2012), also known as the Customer-Based Brand Equity (CBBE) Model is based in the idea of to build a strong brand equity, companies must shape how customers think and feel about their product and services. Companies should build the right type of experiences around a brand, so that customers have specific, positive thoughts, feelings, perceptions, opinions and beliefs about it. According to Manktelow on Keller's model "When you have strong brand equity, your customers will buy more from you, they'll recommend you to other people, they're more loyal, and you're less likely to lose them to competitors".

The CBBE model distinguish four steps (Figure 3):

1. Establishing the proper brand identity, that is, establishing breadth and depth of brand awareness.
2. Creating the appropriate brand meaning through strong, favourable, and unique brand associations.
3. Eliciting positive, accessible brand responses.
4. Forging brand relationships with customers that are characterized by intense, active loyalty.

Achieving these four steps, in turn, involves establishing six brand-building blocks –*brand salience* (awareness of the brand, consumer's recognition of the brand) *brand performance* (how well product meets customers' needs), *brand imaginary* (how well brand meets customers' needs on a social and psychological level), *brand judgments* (customers' responses about quality, credibility, consideration and superiority), *brand*

*feelings* (how the brand makes consumers feel) and *brand resonance* (when consumers feel a deep, psychological bond with the brand and the company achieve behavioural loyalty, attitudinal attachment, sense of community and active engagement).

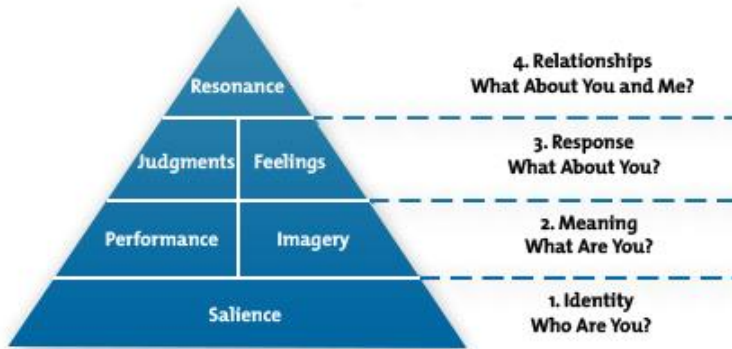

Figure 3 Keller's Customer-Based Brand Equity (CBBE) Model

The Brand Equity Model aims to analyze how the brand co-creation community developed for Nutella have been influence the brand experience and how relates with the different levels to strength brand recognition. The Nutella equity model was elaborated from analysis of communication material (TV commercials, Billboards, Radio spots) and developed for both Nutella® sei tu and Nutella® Stories platforms, including the observation and analysis of the material (pictures, videos) shared by the members of the community and the analysis of the comments on the various websites and social networks linked to both initiatives.

*Step 1- Brand Identity:* Nutella brand initial message for target consumers was focus to describe the product as Hazelnut-Cocoa Spread. At the time of this investigation Nutella is a recognized product in different countries around the world with a strong brand identity, recognized by consumers through the product, esthetical aspect and physique (Kapferer, 1991) including the name, logo and packaging (Nutella Jars) and the slogan "What a world it would be without Nutella".

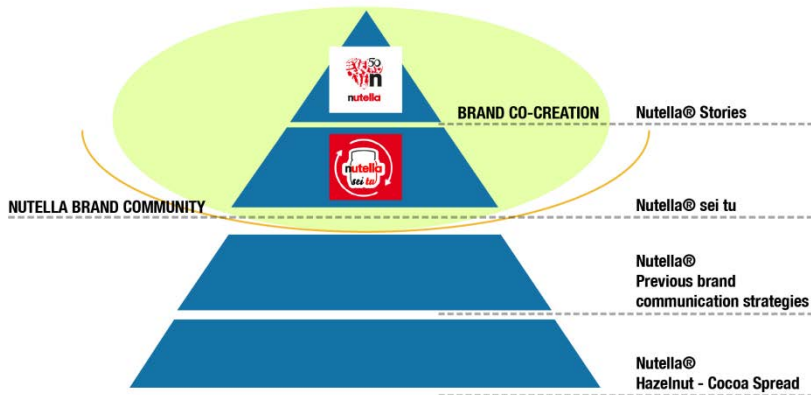

Figure 4 Nutella Brand Co-creation through CBBE Model

*Step 2- Brand Meaning:* At the second level of the model, previous communication strategies developed by the brand have been focus on both, building and strengthen of the brand meaning. The previous brand identity features are the intrinsic characteristics of a brand qualified as “iconic” and “enthusiastic” and associated to passion, happiness, breakfast and taste. Most of the clients purchased Nutella products at supermarkets and the typical usage situation are during morning breakfast at home. The brand may take associations with there past, specially in Italy, where the product was invented 50 years ago and has been consumed by different family’s generations. Associations may involve previous behaviours and experience of friends, family or others.

*Step 3- Brand Responses:* A focus on the last Nutella communication strategies, have been use for understanding of brand responses, analyzing the content shared by consumers in the Nutella brand community developed during last campaigns. Consumer’s personal opinions and evaluations with regard to the brand reflect the positive brand judgments of members in relationship to the brand and the product.

Some others were more focus on the feelings and emotional responses related to the brand e.g. *“I’m almost 39 and I eat the sacred Nutella from when I was a child, I don’t live without Nutella, I’m a “nutelladipendente”... The important thing is not just gluttony, but has always helped me in*

*difficult times of my life in those times of sadness, when things are bad, hard times and depressed... I eat my jar of Nutella and come back as new! It gives me the charge... that energy that is lost when everything goes wrong, for me it is not only the best recipe on the planet, for me it is a source of life. What a world it would be without Nutella... I hope that you will be able to have my custom jar, it will be nice gift ever received..."* Tamara. 10.10.13

Strengthened the use of social network and the Facebook app by consumers during the Nutella® Sei Tu, some consumers focus their opinions on how they feel and what they think about the different initiatives implemented by the brand during that period. *"When I opened the package I could not believe my eyes, wrapped in flaming red satin Nutella jar with my name, I experienced an indescribable feeling my dear beloved Nutella you are unique".* Angelo. 25. 09.2013.... *"I have received the package with Nutella personalized with my name yesterday. It 'was a welcome surprise. Thanks Nutella always in my house"* Maria 27.09. 2013... *"Thank you for this surprise! It really is true what world would be without Nutella! Luckily I don't have to find out!"* Giorgia. 24.09. 2013

*Step 4 - Brand Relationships:* The final step of the model, brand relationships, focuses upon the ultimate relationship that consumer has with the brand (Keller, 2012). Nutella has designed a platform to celebrate the 50 years birthday of the brand, where consumers have participated in the elaboration of different material (photos, video, written stories) where they share what they consider are the most important moments in relationship with the brand.

The material developed by consumers has different purposes. One is to share a retrospective story about how the consumer meets the brand, the first time the product was consumed and how is the relationship from there. There are others entries focus on explain what are the life occasions connected to the brand, including the typical usage situation and some life events (e.g. morning, holidays, picnics, sport competitions, birthday celebrations, weddings, etc) where the brand was part of the memories of the consumer experience. Some consumers share recipes, objects customized with Nutella brand and some designs creating by consumers (kid's drawings, home decorations, wearables, accessories) and some places where they find Nutella brand at home and outside home (supermarkets, restaurants, public spaces). A big collection of pictures of Nutella jars and selfies has been created promoting the consumption of Nutella.

### *The Positive and Negatives effects of the Co-Creation of Nutella brand experience*

The Nutella community's netnography study on the Nutella® Sei Tu and Nutella® Stories campaigns has made it possible to draw negative and positive effect of co-creation of the brand experience.

#### *Positive effects over the brand*

##### **Attitudinal attachment**

Customers must go beyond simply having a positive attitude to view the brand as being something special in a broader context (Keller, 2012). Raies and Gavrard-Perret (2011) perceive the brand attachment as being bidirectional. Gupta and Kim, (2007) additionally see this attachment as a commitment to the community, which can lead to brand loyalty (Algesheimer et al., 2005; Raies & Gavrard-Perret, 2011). The notions of brand community, tribes, sub-culture, attachment or commitment are then not geographically delimited. They transcend the boundaries of national territory (Cherif & Miled, 2012). Content created by consumers in both campaigns succeeded in evidence the attitudinal attachment to the brand. Consumers have state that they "love" the brand, described as a favourite possession and view it as a "little pleasure" that they look forward to. For example: *"It is just love! Nothing else can be said about this incredible, big, fantastic cream! Love is giving a Nutella jar to your girlfriend!"*ciscovich, (IT) Italy, 04.05.14. *"When I was 7, I used to go to the kitchen at midnight when all my family was sleeping. I opened the fridge door and there was a nice and shinny jar. Nutella and I together, mmmm..."* rt.farshad, (IR) Iran, 03.05.14. *"Nutella makes me happy, it makes me smile, it inspire me to share and it is fun to taste it. I love Nutella!!"*ariana.chavez.rocha, (MX) Mexico, 28.04.2014.

##### **Sense of community**

Identification with a brand community may reflect an important social phenomenon whereby consumers feel a kinship or affiliation with other people associates with the brand (Keller, 2012). The community can act as a co-promotion tool (Cova, 2008). The community created around the brand, indicate feeling of happiness about participating and the importance of the growing number of participants involved in the different initiatives proposed with the campaigns. For example: After the company published a video communicating achievement of 5 millions of people in the community some

consumers share positive comments like “*We are five millions!*” Giorgio. 05.01.14. “*I’m one of them, beautiful*” Hajar. 23.12.13.

The community has also shown a networking effect, as the consumers use its own network to broadcast the brand content, using also the tools available in the platform as tagging friends in online post to share and invite other consumers to participate.

### **Intensive communication**

The members are responsible for spreading updates and information about the brand. Indeed, through communities, social networks provide new ways of reaching out and engaging with their members and/or with a brand (Cova, 2008). For example, at May 07 2014, 10 days before the countdown ends, 42.175 stories were share for the Nutella® Stories campaign by the consumers. At May 25 after finishing the countdown, there were 65.180. The traffic registered on the different platforms show how conversation between the company and the consumers has increased during the launch of both initiatives.

### **Active engagement**

The strongest affirmation of brand loyalty occurs when customers are willing to invest time, energy, money or other resources into the brand beyond those expended during purchase or consumption of the brand. In this case, customers themselves become brand ambassadors on behalf of the brand, communicate about the brand and strengthen the brand ties of others (Keller, 2012). Both campaigns have shown how Nutella consumers have decided to join the Nutella community, visit brand-related platforms, participate in open discussions and choose to invest time producing their own material to promote the brand, exchange correspondence with the company and other brand consumers. The activity generated during the launches and duration of both campaigns, have shown an increase of traffic of the platforms and willingness to engage in other activities not related to purchase.

### ***Negative effects over the brand***

No negative effects have been identified related directly with Nutella brand. Some people have focus on share with the community negative comments about the healthiness of the components of the product’s recipe, including details on the ingredients and asking for changes in the recipe for a more “natural” or “healthy” product. “*Try to transform the Nutella in a*

*product as natural as possible and you'll be perfect"* Simone. 22.09.13. *"I would like to read the label "no hydrogenated fats and no palm oil" very harmful to your health!!!"* Anto. 20.10.13. some others have share opinions about price of the product (e.g. *"I was disappointed in the prices of jars of Nutella as it is an advertising promotion was necessary to lower the prices"* Roberto. 06.10.13. The brand did not remove any negative (or positive) comment from the platforms, and people responsible for social networks at Ferrero gave answers to questions and negative comments.

The use of the different platforms (website and social networks) and understanding of the dynamics of the community may be a challenge for consumers, specially when the campaigns are launched and people is not familiar with the mechanisms of participation. For example: For the Nutella® Sei Tu campaign, consumers constantly ask questions via Facebook about how to get the personalized label even when the company explained through the website and the Facebook app.

## **Conclusions**

This study had two main purposes, to understand how brand collaborate with consumers to co-create the brand experience and analyse the role of design during this process.

The analysis of a case study where a brand with a strong identity as Nutella becomes involved in a brand co-creation process have showed first that the company should design a set of strategies and different elements to enable collaboration between consumers and the company. There were necessary technological resources to build platforms, apps, websites, and social networks profiles to create a strong brand community. Both campaigns gave a more participative role to consumers, to upload content, share ideas, invite more members to join the community and interact with the brand, which differs of the passive/receptive role of consumers to more traditional brand communication strategies.

All elements of the strategies from physical to intangible aspects were articulated with the shared objective of involved as many people as possible in the initiatives developed by the company. Design played a relevant role, as all initiatives were reflected in the different aspects of the brand identity (physical, personality, culture, relationship, reflection and self-image).

As a result positive effects on the brand community were generated, included Attitudinal attachment, Sense of community, Intensive communication and Active engagement, which suggest that the brand co-

creation strategies developed by the brand allowed results related to the higher levels (last steps) of the Customer-Based Brand Equity (CBBE) Model.

### *Future development of the research topic*

Brand co-creation is a relatively new topic, which can be explored in the future from different perspectives. One could study how brand co-creation approach affect the internal organization of the company, how designers, marketers and managers change internally in terms of roles, tasks, objectives when they follow a strategy of brand co-creation. It would be also interesting to study once the companies get big amount of data from consumers, how this information is translated in valuable information for produce not only brand content, but also new products and services. It is also important to understand, once the campaigns finished how companies continue to engage consumers in a relationship of “daily co-creation” and maintaining two-way communication without losing consumer interest and willingness to participate, even when there is not an specific event or activity promoted by the company.

As one of the main limits of the empirical study is generalization of results, a future research should be the study of other illustrative examples of brand co-creation with consumers in different settings, in order to validate the positive effects and relevant aspects of design, which have been identified during this study.

# The Impact of Animated Promotional Character Design on Brand Attitude

Zhiyu ZHAO<sup>\*</sup>, Nick HIGGETT and Grahame HUDSON

De Montfort University

*The purpose of this study is to determine the crucial design features, functions and narrative for animated cartoon promotional characters (ACPCs). Previous research has demonstrated that animated characters which companies use to represent their brands can be effective in gaining and holding consumers' attention. They can be treated as a communication tool which can provide value for brands. However, most relevant research was conducted decades ago and focuses on TV advertisements. It has not discussed the effect of ACPCs towards customers' brand attitude and has not examined the design process for promotional characters. In addition, there is little relevant research into digital media advertisements even though online advertising is growing. Research is therefore needed into the development of online animated characters which can effectively and ethically promote brands to customers. This exploratory and descriptive research includes a literature review and in-depth surveys with customers to identify their perceptions to the design components of ACPCs which can influence attitudes towards brands, and to assess whether or not digital media is an effective platform for ACPCs to promote brands.*

**Keywords:** Promotional character, brand recognition, promotion strategy, digital media

---

## Introduction

A brand's promotional character may be real or "a fictional, animated being or animated object that has been created for the promotion of a product, service, or idea" (Phillips, 1996, p. 146). Callcott and Lee (1995) came up with an AMOP framework for defining promotional characters. They reviewed over 700 advertising promotional characters and summarised four main characteristics to describe promotional characters which included: the physical *Appearance* of the characters, the *Medium* they appear in, whether they are advertising *Origin* or non-advertising characters, and whether they are a positive or passive *Promotion* of product. Active characters have actions to speak for a product while passive characters are more symbolic. In order to consider the effect of promotional characters on customers' brand attitude, based on the AMOP framework, the author has classified promotional characters in this research, in the active *Promotion*, advertising *Origin* and animated *Medium* group, which is called animated cartoon promotional characters (ACPCs).

The animation industry world market is positive, developing and sustainable (Chen, 2012; Research and Markets, 2013a). In modern society, thanks to the rapid advancement of technology, computer animation has developed rapidly and it is available to a wider audience. Moreover, cartoon and animation series now are no longer a media only reserved for young children. In the last century, cartoons and animations were aimed at children aged nine and below (Chen, 2012; Research and Markets, 2013). However, more recently animation organisations have been designing animated productions for entertaining both adolescents and adults such as *Corpse Bride* (2005), *Ponyo* (2008), *The Princess and The Frog* (2009) and *Coraline* (2009) which generated internationally big box office returns from adults (Beck, 2009) (See Figure 1, 2, 3, 4). Due to the fact that animated cartoon characters are not limited by boundaries of countries or age, potentially they can quickly create and maintain a positive impression with foreign audiences. Furthermore, animated cartoon characters are no longer just actors in animated entertainment films and programmes. An additional role for them is to promote the animation commercially or even help other industries by acting as a promoter in an advertisement.

Previous research has demonstrated that animated characters which companies use to promote their brands appear to have a good chance of gaining and holding consumers' attention (Baldwin, 1982; Callcott and Lee, 1994). Callcott and Lee (1994) found that consumers noticed and watched advertisements featuring animated promotional characters more than other advertisements. Therefore, many companies employ promotional characters to differentiate their brands and create a personality for the product that connects with consumers on an emotional level (Theresa, 2003). The biggest benefit is the animated promotional characters can be "controlled in ways that human endorsers cannot," (Stafford et al, 2002). However, most of the research in this area was conducted decades ago and focused on TV advertisements in a domestic context (Robinson, 2007). There is little relevant research into digital media advertisements featuring animated characters in an international context (Garretson et al, 2004) even though online advertising is growing (New Media and Market, 2013). The most relevant research is Phillips and Lee (2005), who analysed the Internet's use of promotional characters on 36 corporate websites. Unfortunately, they found that advertisers were not taking full advantage of animated promotional characters usage on the Internet. Research is therefore needed into the development of virtual online characters which can effectively influence customers' purchasing behaviour. The paper describes an initial pilot study for a PhD investigation which looks at the design methodology for ACPCs. The objectives of this paper are not only to conduct a critical literature review but also to propose hypotheses and to provide evidence for the initial study of the PhD research. This paper will question whether ACPCs can affect customers' attitude towards brands and will look at their key design elements.

## **Theoretical Background and Conceptualisation**

### *Employing Animated Cartoon Promotional Characters in Brand Design*

Research in advertising, indicates it would be worthwhile to develop brand cartoon promotional characters for establishing customer loyalty on certain products and services (Lawrence, 2003; Lu, 2009; Macklin, 1994; Palmer and Carpenter, 2006). Employing cartoon promotional characters as a brand strategy has been used for decades to build brand awareness and customer loyalty (Berry, 1973; Fischer, 1991; Lawrence, 2003; Macklin, 1994; Palmer and Carpenter, 2006; Robinson, 2007). Those researchers have investigated this topic from several points of view and levels. They have mainly focused on the relationship between brand recognition and customer loyalty of different age groups (Fischer, 1991; Robinson, 2007), promotional characters and brand attitudes (Mou and Jeng, 2008; Page and Brewster, 2007), visual cues and brand memory (Berry, 1973; Macklin, 1994), animated stories and brand loyalty (Lawrence, 2003; Lu, 2009). Although there are an increasing number of studies which concentrate on the analysis of cartoon promotional characters, some researchers and marketers still question the effectiveness and helpfulness of cartoon characters on marketing promotion (Han, 2011; Weber et al, 2006; Zhang and Lee, 2010). Han (2011) points out that a great number of virtual characters have practically little function, which are unnecessary for promoting brands to customers and they also have some important limitations. Although these characters are cute and popular, a wide range of customers may not be attracted by them. Weber et al. (2006) also argue that the potential customers who are interested in these cartoon promotional characters are probably only children. Nevertheless, the author challenges this opinion; although there are many studies which look at the effect of ACPCs on children and demonstrate the efficient on children's brand identity, the influence of ACPCs on older people can not be ignored. Garretson and Niedrich (2004), for example, believe that cartoon promotional characters can develop adult customers' trust on brand attitude. Furthermore, as has been reviewed earlier, cartoon characters and animation films now are not just exclusive products for children. Numerous adolescents and adults are also interested in cartoon characters. It is reported that almost half of internet users who age 18 to 49 years old watch or download animation or cartoon entertainment films online (Madden, 2007). That is to say, animated characters have the ability to capture

people's attention, which may depend on the design of characters. Similar with cartoon characters, the attraction of ACPCs with customers and subsequently their purchasing behaviour may depend on whether the characters are popular. Thus, the following hypothesis is posited:

**Hypothesis 1: There is a positive relationship between popular ACPCs and brand attitude.**

### *Factors that Influence ACPCs' Popularity*

Previous studies show that personality is a crucial dimension which can communicate emotion to audiences (Andrews, 2005; Han, 2011; LeBel and Cooke, 2008; Lu, 2009; Patterson, 2013). Callcott and Phillips (1996) argue that promotional characters which do not have personality are safer for companies, due to the fact that they do not offend any customers. However, those characters without personality do not help customers memory and recall. ACPCs therefore can only positively affect customers' purchasing behaviour if they can not attract them and the character's personality is key to this. Successful promotional characters such as *The Meerkat Aleksandr Orlov* and *Tony the Tiger* both have a vivid personality (See Figures 5 and 6). *The Meerkat Aleksandr Orlov* is the promotional character of a UK price comparison website *Compare the Market.com* and has 822.100 Likes on their Facebook page up to May 2014. Due to the advertising campaign of the Meerkat character, *Compare the Market.com* became the third largest price comparison website in the UK (Digital Art, 2009). He has a complete back-story for creating and building him as a Russian-born multi-talented meerkat (Patterson, 2013). The design team created an autobiography for the meerkat in order to communicate his human like life and personality to customers. *Tony the Tiger*, the sustainable cartoon character was created in 1950s and has been used for differentiating the breakfast cereal brand Kellogg's Frosties for generations, and is known for uttering the slogan "They are Gr-r-reat!". The design and product team gave *Tony* a human personality (Heintjes, 2012). They also introduced *Tony's* families to make customers perceive him as a real with a lively life. As evidenced by numerous previous studies, characters need to be personified to facilitate the relationship with customers (Lu, 2009; Luo et al, 2006; Miles and Ibrahim, 2013; Phillips, 1996; Zhou, 2005, Zhou, 2010). Due to the human nature, as Guthrie said, "We are people. We know a lot about ourselves. And we often make sense of other things by viewing them as people too " (Guthrie 1995, p.129). No matter if promotional characters

*The Impact of Animated Promotional Characters Design on Brand Attitude*

are animals or non human like characters, personification can be one of the most effective individual factors in creating personality and increasing an ACPCs' popularity. Customers can emotionally respond to promotional characters with a vivid personification and translate this emotion positively to the brands. Popular promotional characters therefore need to have an identified personality. Hence, the hypothesis is presented below:

**Hypothesis 2: Personification will favourably affect ACPCs' popularity.**

Figure 5 Meerkat Team. Source: Comparethemarket.com (2013)

Figure 6 Tony the Tiger. Source: Brandingbricks.com (2012)

Many researchers also state that a customer's loyalty can be cultivated by nostalgia which is developed from a brand's narrative (Callcott and Phillips, 1996; Garretson and Niedrich, 2004; Lee, 2012; Neeley et al, 2000). One of the most useful functions of promotional characters is to rekindle a customer's childhood memory of the brands (Neeley et al, 2000). Customers may trust a brand due to the fact that they knew it when they are young. For example, a retired man said, he liked the Keebler brand because of its character *Keebler Elves* (See Figure 7) which he treated as a comfortable old pair of clothes (Callcott and Phillips, 1996, p.76). Garretson and Niedrich (2004) verify that many organisations have reintroduced their past slogans and promotional characters to make customers recall brands have been part of their lives for years (p.27). Based on these researchers' opinions, the author will also investigate the function of nostalgia on promotional characters and its effect on customers' attitudes. Consistent with previous studies, the following hypothesis is offered:

**Hypothesis 3: Nostalgia will favourably affect ACPCs' popularity.**

*Figure 7 Keebler Elves. Source: Playbuzz.com (2013)*

### *Changes to Advertising with Digital Media*

No matter what the objectives are in promoting brands or advertising products for companies, choosing the appropriate mediums and platforms for showing them to audiences is a fundamental dimension. With the development of advanced technology for digital media, whether to focus mainly on traditional media or digital media platforms has become an issue for companies in order to effectively promote their brands. Based on a Mintel report (2009), an increasing number of potential customers are spending more and more time online. Consequently, companies can now use online media as an advertising channel to connect with a mass market of customers efficiently. However, a majority of researchers claim that traditional media such as TV and radio are still popular and are still the key channels to promote brands (Faughnder, 2014; The Business of Being Social, 2013; Verlee, 2011; White, 2012). Nevertheless, with the recent advances in media technology, digital media platforms may be more attractive than traditional media for teenagers and young adults. Instead of old media, they prefer to use innovative and interactive platforms for entertainment or work. It is reported that fewer young adults use traditional TV sets though they are still interested in watching TV shows. Instead of traditional channels, they prefer to use computers, tablets or smartphones to watch them (Mintel, 2012). Therefore, digital media advertising will be paid greater attention by more and more young people. Moreover, Nairn and Dew (2007) propose that online platforms help to save the time of customers' in making a buying decision. People view a product advertisement online interactively and may then purchase the product in

seconds or minutes. In comparison, they may purchase it in days or weeks if they view the advertisement on TV. In the other words, this new medium can encourage them to engage immediately with the product or brand. Furthermore, unlike traditional media, the Internet connection and digital media make it possible to attract people around the world so digital media advertising is able to obtain more profit in less time (Butterfield, 2012). The author expects therefore that the digital media platform can favourably affect customers' attitude towards brands in combination with ACPCs, and thus proposes the following hypothesis:

**Hypothesis 4: Digital media has the potential to be an important platform for ACPCs promotion.**

## Primary Methodology

This study involved using a questionnaire to identify customers' attitudes towards cartoon characters and ACPC in different age groups. The literature indicates that the sample size should be 10 to 15% of the total population. However, it is not feasible to survey all people in the world (Moore, 2006). Thus, the non-probability (non-random) sampling method was selected for this investigation. Based on Cooper and Schindler (2003), a non-probability sample can be employed when a large population is required. The researcher aimed to collect 200 surveys using Google Documents which is able to collect data world wide. The email to promote the questionnaire included a link to the Google Documents which is a cheaper, and it is a more convenient approach than traditional paper questionnaires. Snowball sampling is a good method of a non-probability sampling procedure which can be used in online social networks (Leroy, 2011). It is an effective platform to gather more respondents of specific groups which is useful to compare the attitudes towards ACPC in different age groups. The questionnaire is available from:

[https://docs.google.com/forms/d/1\\_046J3vC\\_FhlanYeo07YuBGgbcNgl4H2sNf-vXJkr58/viewform](https://docs.google.com/forms/d/1_046J3vC_FhlanYeo07YuBGgbcNgl4H2sNf-vXJkr58/viewform).

In fact, the author has collected 284 surveys which were completed by different age groups as follows:

Table 1 Information on participants' age (Zhao, 2014)

Age of Participants	Number of Participants
Under 12 years	41 participants
13-19 years	54 participants
20-35 years	61 participants
36-50 years	40 participants
51-65 years	47 participants
66 years above	41 participants

210 questionnaires were collected online from Google Documents. Participants were briefed explanations that the author was interested in customers' opinions about the most crucial elements of ACPCs and their media using behaviour. However, in order to find more respondents who are in 51-65, 66 above and under 12 age groups, hard copy questionnaires have been used. The author obtained their parents' consent for the participants who were under 18 years old.

This project used Excel and SPSS to analyse the data. The participants were asked several close-ended questions about brand attitude, promotional characters and media using behaviour. The type of questions included both single-choice questions and multiple-choice questions. Participants were not only asked the questions which involved ACPCs *Personification* and *Nostalgia*, but also relating to *Simple*, *Colourfulness* and *Cuteness*. In addition, a five points Likert scale was developed for questions about the media platform that people normally discover new products, and about how frequently they use various digital media and traditional media platforms.

## Results of Pilot Study

The participants were asked two questions to find out the relationship between purchasing behaviour and ACPCs. One of them was a hypothetical question about purchasing two alternative products which had similar quality and same price but different brand identity. The vast number of participants (95%) chose the product with a good visual brand identity. 47% of them selected the one in which the brand could be recognised by the participants. 30% of them chose the one which looked attractive and 18% of them said they would purchase the one which had advertising campaign. Hence, a brand's visual identity is an important factor for stimulating buying

activity. In order to determine whether the use of ACPCs is an efficient strategy to promote brand visual identity, another question asked about brand association and a brand’s visual identity. Table 2 below illustrates which visual identity may be the most attractive for brand association.

Table 2 Different age people’s attitude towards brand visual identity (Zhao, 2014)

			Which of the following do you always associate with a brand?				Total	
			Logo	Real Spokesperson	ACPC	Product Features		
Age	-12	Count	12	11	36	13	41	
		% within Age	29.3%	26.8%	87.8%	31.7%		
	13-19	Count	23	25	38	9	54	
		% within Age	42.6%	46.3%	70.4%	16.7%		
	20-35	Count	49	25	28	30	61	
		% within Age	80.3%	41.0%	45.9%	49.2%		
	36-50	Count	25	21	15	13	40	
		% within Age	62.5%	52.5%	37.5%	32.5%		
	51-65	Count	20	19	10	21	47	
		% within Age	42.6%	40.4%	21.3%	44.7%		
	66+	Count	12	32	22	1	41	
		% within Age	29.3%	78.0%	53.7%	2.4%		
	<b>Total</b>		Count	141	133	149	87	284

Percentages and totals are based on respondents.

Table 2 shows people from different age groups' attitude towards brand visual identity. Although the ACPC option had the highest percentage (149 out of 284), due to the similar number with other selections logo (141 out of 284) and real spokesperson (133 out of 284), the total count did not display the most effective visual identity strategy. Nevertheless, based on the detailed results which showed different age groups' opinions, the most attractive brand identity for each age group can be seen. 87.8% participants who are under 12 years old were more interested in ACPCs while older people's interests decreased with age. Related to their attitudes on animations, 53.7% of older people who were more than 66 years old also paid more attention to ACPCs than other adult groups. Moreover, it is worth noting that 80.3% of participants aged 20-35 years and 62.5% aged 36-50 years thought that the logo was more associated with a brand. This indicates that it might be effective to employ or combine the graphic version of a brands' ACPC with its logo. To sum up, an ACPC can be an effective strategy for visual identity and can form a positive brand association. As a consequence, the questionnaire results seem to support the author's hypothesis that there is a positive relationship between popular ACPCs and brand attitude.

Table 3 Different age group's attitude towards ACPC (Zhao, 2014).

What kind of ACPC do you like?		Age						Total	
		-12	13-19	20-35	36-50	51-65	66+	Count	%
Cute	Count	28	28	28	22	17	30	153	53.9%
	% within Age	68.3%	51.9%	45.9%	55.0%	36.2%	73.2%		
Simple	Count	20	40	35	27	26	13	161	56.7%
	% within Age	48.8%	74.1%	57.4%	67.5%	55.3%	31.7%		
Native	Count	4	3	3	3	6	24	43	15.1%
	% within Age	9.8%	5.6%	4.9%	7.5%	12.8%	58.5%		
Foreign-er	Count	3	3	11	3	6	0	26	9.2%

	% within Age	7.3 %	5.6 %	18.0 %	7.5 %	12.8 %	0.0 %

	% within Age	9.8 %	5.6 %	11.5 %	2.5 %	10.6 %	24.4 %		
<b>Total</b>	Count	41	54	61	40	47	41	284	100 %

Percentages and totals are based on respondents.

In order to find whether people of different ages have distinctive opinions on ACPCs' features and qualities, the researcher listed various characteristics of ACPCs and asked participants to select (See Table 3). All of these features have been investigated in previous studies and have been confirmed to have a positive effect on branding. However, it seems that there has been no comprehensive survey with customers to ask them what kind of ACPCs they like in terms of design options. These options cover various characteristics of the ACPCs' design which includes appearance, personality, narrative and function. For example, whether an attractive ACPC needs a simple appearance; should it have a native or foreign nationality; and is it similar to customers in personality or appearance.

In terms of overall results five features, *Simple* (56.7%) ranked in the top five ahead of *Nostalgia* (54.6%), *Cute* (53.9%), *Humorous* (51.8%) and *Personification* (48.2%) were far more popular than other characteristics such as foreign appearance (9.2%), however, participants in different ages had their individual preferences. In the teenagers' group, a majority of participants (81.5%) and most (62.5%) middle-aged people who were 36 to 50 years old chose *Personification*. 57.4% of participants who were from 51 to 65-year-old age group considered *Nostalgia* as a core characteristic for successful ACPCs. Notably, a great number of people (90.2%) who were aged 66 above believed *Nostalgia* was the most important characteristic for them. Consequently, H2 and H3 were supported by the results.

With regards to the hypothesis of whether digital media has the potential to be an important platform for ACPCs promotion, 81% of all respondents reported that they use digital media everyday and 61% of participants use television everyday. It was also shown that they did not use other traditional media frequently. Most people also discover new products on digital media (website: 78%, social network: 58%, mobile: 47%) and television (55%). As has been noted in the literature review section, people's media habits had been changing greatly from traditional media to digital media. Therefore, H4 was supported that the digital media platform can be an important channel for ACPCs.

## **Evaluation**

This pilot study has attempted to explore (1) the positive relationship between popular animated cartoon promotional characters (ACPCs) and brand attitude which may influence buying behaviour; (2) factors that influence ACPCs' popularity and (3) the potential of digital media platform

for ACPCs. Based on the primary research, all of the hypotheses seem to be supported. Strong visual identity such as provided by popular ACPCs can definitely affect customers' brand attitude. In addition, drawing on customers' opinions, *Personification* and *Nostalgia* are the most crucial characteristics for the creation of effective ACPCs. As Neeley et al. (2000) claim, reminding customers' of their childhood memory of brands can affect their buying decision over a long period. Customers may buy a brand due to the fact that they know it from when they were young. The study also provides some empirical evidence that digital media has the potential to be an important platform for ACPCs promotion. People's media using behaviour has been changing and taking advantage of this change by using ACPCs in combination with digital media as a promotional platform could be have great potential for companies to promote their products.

### *Contributions and Implications*

This pilot study is part of the researcher's PhD study which aims to create an integrated design method for ACPCs. This initial study will be used to help develop the design framework. The results of this pilot study offers evidence which seems to disagree with some earlier researchers' arguments. Some researchers claim that virtual characters for promoting brands are useless (Han, 2011; Weber et al, 2006; Zhang and Lee, 2010). They believe that a wide range of customers may not be attracted by them and that only children may be interested in these cartoon promotional characters. However, based on this research, many young, middle aged and elderly people are attracted by ACPCs. This result shows the potential of employing ACPCs to positively affect customers' brand attitude and thus potentially purchasing attitude.

The findings of this study also provide empirical evidence for previous hypotheses. A great number of respondents reported that they use digital media everyday and also discover new products through digital media. Relying on a previous study, Liu (2012) proposes that there seems to be some similarities between cartoon characters and network. Both cartoon characters and the Internet have the natures of surreal creativity, fashion and entertainment. Digital media can be a main channel for presenting ACPCs. Furthermore, numerous researchers have proposed that the perceived personification of promotional characters can affect customers' brand attitude (Andrews, 2005; Han, 2011; LeBel and Cooke, 2008; Lu, 2009; Patterson, 2013). This study backs up these propositions which found that most customers prefer ACPCs with personification. Moreover, this study

presents customers' attitude in different age groups towards popular ACPCs who are in different age groups. The findings demonstrate the popularity of ACPCs' within each age group of customers. Although most participants who are 66 years old and above may not be interested in *Personification*, the findings reveal that *Nostalgia* is a very important characteristic in ACPCs for them. An additional finding is that besides *Personification* and *Nostalgia*, there are other important elements can affect the success of ACPCs which are *Cute*, *Simple* and *Humorous*. These features will be investigated in the future research.

## **Limitations and Suggestions**

The limitation of this research is that the sample of 284 subjects was relatively small. In order to understand customers' attitudes better, investigation needs to be extended to more participants. In addition, this study only employed the questionnaires research method in terms of collecting information about customers' buying behaviour. Their actual purchasing behaviour in relation to ACPCs was not recorded as evidence for the research. Thus, in the further study, it would be useful to conduct observations into customers' purchasing behaviour and buying decision in real life.

This research mainly focuses on the impact of *Personification* and *Nostalgia* features on the popularity of ACPCs among customers' attitudes. These two characteristics are perceived important by participants, and obtained the highest ranks in the results. In conclusion, ACPCs with these two features could therefore be popular promoting visual identity for companies which in turn may affect customers' purchasing behaviour. Moreover, this study identified that people in different age groups had diverse opinions on types of visual identity and ACPCs. However, in order to extend the hypotheses which have been proposed, these findings need to be analysed in depth. Future research might also examine the impact of different features of ACPCs on different age customers' buying behaviour in more detail. Hence, an assessment can then be provided in terms of which kind of features of ACPCs would be the most crucial to different age groups.

With regards to the digital media platform for ACPC promotion, this study has determined that digital media can now become a core platform for people to find new products. Future studies will dissect which types of digital media platforms should be the most appropriate channels for promoting ACPC therefore positively affect customers' purchasing decision.

## Materiality, Design and Brand Management

Fernando Pinto SANTOS<sup>\*a</sup> and Marta MORILLO<sup>b</sup>

<sup>a</sup> Aalto University School of Business; <sup>b</sup> Politecnico di Milano

*Despite the fact that in recent years design management has become strategic for companies there's lack of research about the intersection of processes of new production creation and brand management activities. Our research addresses this gap through a longitudinal case study of an International leading furniture manufacturer. We have focused our study in processes of new product creation and explored how design management impacts the managerial understanding about brands. Our study suggests that product design strongly affects how brands are envisaged and managed in the company. These findings challenge the dominant idea of the necessary subordination of design management activities to the higher level of brand management strategy. Our case shows that design management and the design of products also impact brand management activities and this influence should not be disregarded. We believe that a deeper and finer-grained knowledge about this line of inquiry is valuable to advance the understanding on how materiality is intertwined with brand management activities.*

**Keywords:** brand; design; management; materiality; product

## **Introduction**

The evolution of competitive dynamics in an increasing number of industries has directed practitioners' and scholars' attention to design management processes (Ravasi & Stigliani, 2012). Moreover, the rise of branding in contemporary societies has influenced this interest on design and its organizational management (Borja De Mozota, 2003; Julier, 2006). It has been argued that a good integration between design and brand management should exist (Beverland, 2005; Borja de Mozota, 2003; Kreuzbauer & Malter, 2005; Svengren-Holm & Johansson, 2005). According to Beverland (2005) the existing literature about design management and branding generally remains vague, diverse in its recommendations, and dominated by practitioner insights. Exceptions include, for example, Karjalainen and Snelders (2009) study of how companies strategically employ design to create visual recognition for brands; Person, Snelders, Karjalainen and Schoormans (2007) analysis of product styling; Stomppf (2003) article on brand identity and product design and Montaña and Gúzman (2007) model of brand design management.

In their recent comprehensive review of the literature on product design in the domain of business studies, Ravasi and Stigliani (2012) stress the lack of research about how design outcomes can affect organizations, namely members' conceptualization of their organization. Our research addresses this broad gap, focusing in particular in processes of new product creation and brands. Thus, the purpose of our research is to explore how product design processes influence brand management activities. To this end we have developed an in-depth case study of an Italian furniture manufacturer, present in the market for more than eighty years, where the corporate brand is also the brand of the products.

Our study suggests that product design processes strongly affects how brands are envisaged and managed. These results challenge the dominant perspective on many studies about the management of brands and new product creation (e.g. Montaña & Guzmán, 2007) that highlight the subordination of design management processes to the higher level of brand management strategy. Although our findings should necessarily be regarded in the specific setting of our case study we believe that our reflection unveils broader relevant implications.

The structure of this paper is as follows: in the next section we will briefly characterize the evolution of the design management and brand management fields. After explaining the methods employed we present the findings of our study. In the following section we discuss these findings and

relate them with other works. We finish this article with the conclusions and our view about future research.

## Related literature

Design management can be defined, in a simple way, as the managerial activities that optimize design processes (Chiva & Alegre, 2007). Managing design might imply different types of processes and outcomes, namely products, services, communications, environments and interactions (Cooper, Junginger & Lockwood, 2009). The historical evolution of design management can be analyzed in three phases (Cooper et al., 2009). First, around 1960s design management started being regarded in the context of manufacturing, whereas the main concern was the management of issues directly related to the product management processes. Broadening the scope of activity to include concerns with marketing and branding, characterizes the second stage of evolution. Although it continues to exist product centeredness, the concept of service design starts taking shape in this phase. Finally, in the third stage, the setting for the practice and research of design management becomes the organization and society at large. Design management is currently 'changing its course from one of designing as managing to one of managing as designing' (Cooper et al., 2009).

Our research is focused on design management processes related to new product creation with a particular interest in the influence of these processes on branding. Brands have their roots in the 19th century, when they originally served as a guarantee of origin and quality, differentiating otherwise equivalent commodities from one another (Coombe, 1998). Through their legal protection, such marks of liability would allow the producer's 'reputation' to reliably attach to commodities, guiding consumers as they navigated the market. By the 1920s, it was recognized that the trademark could be taken as a surrogate for an absent producer and the trademark became an asset in itself (Schechter, 1927).

Nakassis (2013, p. 117) argues that since the 1980s the brand has become 'a form of value addition that derives profit not from its commodity vehicles but *through* them—more precisely, through the ways brand image (and the premiums it extracts) commodify access to brand imaginaries (as mediated by moments of purchase) through a continual relationality with, or leasing of, the brand'. The author (2013) further states that the purpose of a brand as the identifying part of a product has been left behind and that

nowadays brands stand above the products or services they help identify. Nakassis perspective on contemporary brands resonates with the traditional view of brands as something added to products that has been ever present in the marketing literature (e.g. Kotler & Keller, 2006). Brands are often represented as self-valuable objects separate from products, 'floating signifiers' or 'self-referential signs' (Beebe, 2004, p. 626).

Manning (2010, p. 36) suggests that product and brand form a privileged doublet, expressed in popular marketing mantras such as 'a product is made in a factory: a brand is bought by a consumer'. The author (2010, p. 36) further explains: as 'mantras such as this show, the definition of brand develops over time by a kind of mystical *via negativa*, defining itself not so much by saying what brand is as what it is not: the product.' The opposition brand/product condenses an ontological opposition between immaterial/material, form/ function, distinctive/descriptive, decorative/functional, symbolic/technical and so forth (Manning, 2010). This dichotomic view of brands and products has been widely dominant, although a few authors have been alerting to the risk of downplaying the complex interplay of materiality and immateriality in the contemporary functioning of brands (e.g. Manning, 2010; Moore, 2003; Santos, 2013; Karjalainen and Santos, 2014).

## **Methods**

We have developed an exploratory case study with a qualitative approach (Yin, 2009; Piekkari & Welch, 2011). The paper is based on a longitudinal study at the Italian furniture manufacturer Cassina. The company is a leading firm in international contemporary furniture design, producing chairs, tables, upholstered items, beds and containers. The case was purposively chosen for its informational richness, and due to the opportunity we gained to accede the day-to-day life of the organization and product creation processes. One of the authors is a practitioner researcher within the firm.

The empirical material of the research results from an ethnographic inspired process of research that lasted over 18 months. We consider that this was the appropriate approach according to the exploratory and open-ended nature of the study. The main technique employed was non-participant observation, and the notes gathered constitute the main bulk of the empirical material set. Observation procedures generally addressed the daily life of the organization and included an extensive attention to

processes of new product creation. Semi-structured interviews with the Brand Manager were also developed, as well as informal talks with stakeholders at all levels of the organization. Interview transcripts, field notes and copies of documents compose the empirical material upon this article was developed. The fieldwork took place at the company headquarters.

We regarded the collection of empirical materials as an open process, where we have followed the most promising paths of inquiry within the purpose of our research (Alvesson & Kärreman, 2007; 2011). The process of collection of empirical material and the analysis of the existing theory was highly iterative throughout the research (Alvesson & Sköldbberg, 2009).

### *Research setting*

Cassina is a furniture manufacturing company, producing chairs, tables, upholstered items, beds and containers. The company was founded in 1927 and the corporate brand is also the product's brand. The firm has a strong heritage and this is one of the distinctive features of its brand. This legacy has been characterized by (1) production excellence (both artisanal and industrial tradition and know-how manufacturing process: wood, upholstery, leather); (2) culture: it was at the origins of design, created the iMaestri collection, linked to the modern movement and supported by the 'educated classes'; (3) explorative character: history of talent scouting, provocations and looking for new endeavors. Cassina is part of the Poltrona Frau Group since 2005, an Italian group of furniture manufacturers that also has the brands Cappellini and Pelle Frau. However, the company continues to operate in its own facilities and has its own management, although reporting and following the strategic guidelines of the Group. The product portfolio of Cassina includes world classics from great architects such as Le Corbusier, Gerrit T. Rietveld, Frank Lloyd Wright, Charlotte Perriand or Franco Albini. More recent collaborations were developed with Mario Bellini, Vico Magistretti, Piero Lissoni, Philippe Starck, Jaime Hayon and Gaetano Pesce, among others.

The Division Manager of the company is also the Brand Manager - in fact, this is the formal title in the Poltrona Frau Group organizational structure. Besides managing the overall business of the company, the Brand Manager overviews and directs all that is involved in terms of brand and design management processes. The firm has an open approach to the creation of new products, involving external partners, usually designers but also architects. The entire portfolio is the result of such sort of

collaborations. The design management processes are coordinated at the internal Research and Development (R&D) center, although always followed closely by the Brand Manager.

## **Findings**

In Cassina there is not an internal formal documented process of product creation with clear established phases. Usually the process starts with some sort of characterization of needs identified by the Brand Manager, alone or together with the sales force or other internal stakeholders. The identification of needs emerges through the spotting of opportunities in the market or through processes of reflection about new products, from different and varied reasons: sales performance, customer feedback, will to propose new products to enrich the portfolio, among others. This initial phase of identification and reflection about the possibility of launching new products is always intertwined with analysis of the current portfolio of products. Also, design features, materials and function of the products are present from the outset of initial reflections and internal informal talks. In fact, there's a continuous internal openness to discuss and think about new products and this future oriented proactive thinking is part of the daily life of the company.

Also on-going is the Brand Manager's analysis of the work of designers and architects, as well as trends, in a broad sense, in the marketplaces. New product creation always involves scouting external talents to work with. Once again, there's no documented formal procedure to start a process of new product creation, rather this happens from the organic confluence of different goals, identification of designers, and the need to comply with deadlines in terms of the presentation of new products in fairs like Salon di Mobile. Direct contacts with designers push the process to a new stage where more concrete discussions start to emerge in regard to what to create. Initial talks with external collaborators are led by the Brand Manager, as well as the first exploratory discussions. On a subsequent stage, the external designer actively collaborates with the R&D internal team, responsible for elaborating prototypes and supporting the designer's view. However, the work is always developed as a close collaboration, instead of being solely directed by the designer intentions.

Cassina's Brand Manager is the main steward of the brand and is in charge of driving its management through its own personal understanding of the brand and of the products, as well from its strategic intent while

managing the business. However, internal stakeholders have their own understanding of the brand and actively discuss their views with the Brand Manager and external designers. This is particularly evident in the R&D team, which gathers experienced professionals, some of them working in the company for many years, and quite used to reflect about the brand and new products.

Different stakeholders' understandings about the brand and the product portfolio can be regarded as a boundary space from where discussions are built in processes of new product creation. External designers are guided by their own interpretation of managers' discourses as well as by their interpretation of the company's current product portfolio and product heritage. The talks with the Brand Manager and members of the R&D revolve about the brand but usually in terms of product design.

Product creation processes progress with meetings with designers, Cassina's Brand Manager and the R&D team. In these interactions products are constantly mentioned as a way to discuss, argument, compare, agree and advance the creative process. Meetings with new designers usually require more discussions about the intended view of the brand and how to materialize this view; while discussions with designers that have worked before with Cassina are more fluid and the new product itself is more central in the conversation, although also constantly referred in relation with an idealized view of the brand. No matter the case, materiality is central to the discussions, even when discussing what the brands stands for and how it should be articulated in new products. Examples and metaphors about the brand revolve around Cassina's products and their material features. Also, we have often observed that historical pieces of the product portfolio are used during product creation meetings as a reference to explain either specific design characteristics, or a particular intention for the new product. This practice of bringing an existing product to the current conversation is a way of concretizing a specific brand aspect that is regarded as central to the new product. The brand is described with the products and the products are described as being the brand.

Product creation unrolls as a collective effort and physical prototypes connect practices, understandings and prospective oriented views of the different persons involved, across space and time. From a certain moment on meetings start revolving only around prototypes, where the external designers and Cassina's internal stakeholders advance the process with an hands on approach attitude – discussing and negotiating the right shapes, proportions or level of comfort demanded by the specific concept envisaged

for a particular product. In these meetings the brand continues to be continuously invoked and it becomes evident that previous and current products of the company help define what is intended the brand to stand for.

## **Discussion**

Previous studies in the broad business studies domain have been departing from the assumption that product design should logically be subordinated to the company and brand strategic needs: ‘If design is guided by the brand, it can serve as the cohesive factor for all elements that configure a brand experience and represent an unequivocal source of differentiation’ (Montaña & Gúzman, 2007, p. 829). This mechanistic view of design as operationalizing a higher strategic intent is challenged by our case study findings.

In the Cassina setting, the design of different products of the brand’s portfolio influences how the brand is envisioned and thus, as a consequence, impact the brand and design management practices (see figure 1, below). As referred earlier, Cassina’s physical products are always brought to the design processes of creation of new products. Current and historical products are inseparable of how the brand is regarded since they help define what the brand is.

*Figure 8 - Product design and brand management interplay. Source: Authors*

Cassina’s products, more than being open to embody the brand, strongly influence how the brand is conceptualized and prospectively envisaged. As Olsen (2013, p. 192) proposes: ‘persistency of things makes the past present’. Cassina’s product design has been historically influencing how the brand has been regarded. Views that emphasize physical or conceptual separability of brand and product are in conflict with contemporary aesthetic ideologies among designers, who seek to blur those same

boundaries between form and function (e.g. Dinwoodie, 1997). In the Cassina product design management processes this is particularly evident.

Moore (2003, p. 332) stated that 'commodities are not just typically material and objectual, nor are they accidentally so—they are tangible and material things in their very essence.' The author (2003) argues that it is precisely the products' tangibility and materiality that makes it possible for them to be the vehicles of an added value. Physical products are not fixed and closed, on the contrary they are open to gain agency (Latour, 2005; Law, 2004), become intertwined in networks of relations and be interpreted in different ways across space and time.

## Conclusions and future research

Our research findings, although necessarily pertaining to our specific case study, show that the product design processes may help define the conceptualization about brands. These results suggest the need to challenge the idea that brand strategies should simply drive processes of new production creation, and more generally, design management activities. We propose that the managerial understanding about brands might be significantly influenced by the materiality of products and we consider that this is a relevant perspective beyond the case study and the business setting we have explored. A deeper and finer-grained knowledge about how product design impacts brand management is valuable for the theory and practice of design management activities.

These findings contribute to the emerging broader discussion on the relational materiality of social life (Law, 2004; Latour, 2005) and, in particular, to the recent reflections on a semiotic relational perspective of brands (Manning, 2010; Moore, 2003; Santos, 2013; Karjalainen and Santos, 2014). We expect that our work can stimulate further enquiries related to this stream of research.

Exploring the line of inquiry proposed in this article is also valuable, in our perspective, to advance the managerial understanding on the relation between design and brand management activities. We suggest further exploring the ways design may come to affect brand managers and other stakeholders' conceptualization about the brand and the consequences of this influence.

# Luxury Product Design and Brand Differentiation of Emerging Luxury Brands: a Conceptual Framework Based on Perceived Value

Zhiqing JIANG\* and Shin'ya NAGASAWA

Waseda University

*The boom of international luxury consumption and the change on the function of fashion have been also impacting significantly on the traditional luxury industry. The luxury market may be seen as becoming a relative mass market and more complex than ever before. Except for those famous and historical ones, many new entrants became leading luxury brands. The purpose of this paper is to propose a conceptual framework of luxury product design and brand differentiation of emerging luxury brand on perceived value. In order to further develop and understand the nexus between luxury goods and brand differentiation of emerging luxury brand, this paper (1) defines luxury and emerging luxury brand, (2) reviews the theoretical basis of luxury goods, brand differentiation, perceived value of luxury goods and consumption, (3) frameworks the nexus between luxury product, brand differentiation and consumption, and (4) conducts an exploratory case study on Korloff, a niche and independent French-based emerging luxury brand, to modify the conceptual framework. This paper will be qualitatively and descriptive. An emerging luxury brand is defined as a brand providing luxury goods in or above intermediate level of luxury goods products hierarchy and was also established in or after 1970s.*

## **Introduction**

The luxury goods market has been expanding on a worldwide scale since the early 1990s. After influenced by the Global Financial Crisis in 2008 and 2009 (Bain & Company, 2008), it recovered and regained its outstanding performance with two-digital growth when entering into 2010 (Bain & Company, 2010). The increase of the use of new luxury (Silverstein and Fiske, 2003) and increasing consumption of luxury goods by lower classes of society in most countries (Nueno and Quelch, 1998) are two drivers of international luxury consumption growth. Consumers buy more luxury goods today than before for different reasons, which could include a desire to emulate the lifestyle of the richest or the social class immediately above them (O'Cass and Frost, 2004; Amaldoss and Jain, 2005), the excellence of the products (Kaferer and Bastien, 2009), or needs for uniqueness and self-monitoring (Bian, 2010). Economic growth and emerging young consumers are brand and fashion conscious (Morton, 2002; Bryck, 2003). They prefer brands with an identity based on values through which they can express their individuality to differentiate them from others (Azuma, 2002; Parker et al., 2004) and have a need to bolster their self-image (Knight and Kim, 2007). Accordingly, the luxury market may be seen as becoming a relative mass market, which not only includes members of the wealthiest social class, but also those who belong to more modest classes (Yeoman and McMahon-Beattie, 2006; Nueno and Quelch, 1998), and more complex than ever before.

The boom of international luxury consumption and the change on the function of fashion have been also impacting significantly on the traditional luxury industry. Some long-lasting manufacturers of traditional industry goods became outstanding luxury brands, like Jaeger-LeCoultre, as well as some famous haute-couture houses and accessory manufactures. There are also some designer brands that have been considered as luxury brand such as Emilio Pucci. Except for these famous and historical ones, many new entrants became leading luxury brands, like Giorgio Armani. While the market for luxury goods and services obviously represents a significant business opportunity, a review of the literature relating to the subject reveals a number of issues. However, the main stream of current research is mainly based on the long-lasting luxury houses and lack of the discussion on emerging brands which no matter as the product itself or branding are obviously different.

Among them one important issue is discussion on the luxury perception (for example, Berthon et al., 2009; Dubois et al., 2001; Heine and Phan, 2011; Kapferer, 1997, 1998; Keller, 2009; Nueno and Quelch, 1998; Vigneron and Johnson, 1999, 2004), for a brand must be perceived as different in order to win market share (i.e. customers must have a reason to start buying the brand) (Romaniuk et al., 2007). Undifferentiated new entrants are supposed to be most likely to fail because no customers should be motivated to buy them (Davidson, 1976). A meaningful perceived difference provides buyers with their reason to purchase and be loyal to the brand (Aaker, 2001; Kotler, 1994). Consequently, creating perceived brand difference is critical to emergence of a brand.

The purpose of this paper is to propose a conceptual framework of luxury product design and brand differentiation of emerging luxury brand on perceived value. In order to further develop and understand the nexus between luxury goods and brand differentiation of emerging luxury brand, this paper (1) defines luxury and emerging luxury brand, (2) reviews the theoretical basis of luxury goods, brand differentiation, perceived value of luxury goods and consumption, (3) frameworks the nexus between luxury product, brand differentiation and consumption, and (4) conducts an exploratory case study on Korloff, a niche and independent French-based emerging luxury brand, to modify the conceptual framework. This paper will be qualitatively and descriptive, because qualitative phenomenological research looked to an interactive relationship as giving form to a reality that was perceived, mediated, and interpreted through human beings (Mantz, 2009). Nancarrow, Brace, and Wright (2001) contended that qualitative research was useful for delving into matters —largely unobservable, such as consumer attitudes, values, knowledge, personality and satisfaction (p. 56).

### *Definition and Typology*

The concept of 'luxury' exists since a long time and has been aspired by many for ages. In the popular sense of the word, 'luxury' is something related to indulging in self-pleasure and something which is not a necessity (Ghosh and Varshney, 2013). Sombart (1913, 1922) in his famous book 'luxury and capitalism' introduced two aspects of luxury regarding subjective evaluation of "the necessary", quantitative and qualitative, which can be, and in most cases are combined. Quantitative luxury is synonymous with prodigality, while qualitative luxury is the use of goods of superior quality. He also characterized 'luxury goods' as 'refined goods' derived from the concept of qualitative luxury (p.59). 'Luxury is also a swerve positioned

with respect to a norm, a rule, a law which change from society to society and era to era, thus, luxury is always relative and impossible to define it without situating it in time and space' (Sicard, 2013:25). She summarized three directions of the swerve: upward (direct descendant of court society); laterally (difference instead of superiority) and downward (association with some sort of transgressive behaviour: an obscenity, a misdemeanour and an indecency) (Sicard, 2013:27-31). Berry (1994) categorized luxury goods as sustenance (food and drinks), shelter (accommodation), clothing (apparel with various accessories) and leisure (holiday, etc.). Because of the obvious different features of each category, the emerging luxury brand in this paper mainly indicate the brand that provides refined clothing including not only apparel but accessories like bags, jewelries, etc.

Scholars also discussed the history and nature of luxury (Sombart, 1913/1922; Berry, 1992) and its social function and purchasing motivation (Sombart, 1913/1922; Laveleye, 1889; Veblen, 1898; Leibenstein, 1950). Since last century the debate on luxury extended to modern luxury and ancient luxury, or new luxury and old luxury. Berg (2012) pointed out that in sociological theories new luxuries were created out of the division of labour and the expansion of commerce; old luxuries conveyed excessive displays with large bodies of retainers. Luxury goods are the main body of the debate on luxury over centuries. However, recently 'new luxury goods' have drawn attention of researchers in marketing and management of luxury (for example, Silverstein and Fiske, 2003; Truong et al., 2009; Granot, 2013) and Silverstein and Fiske (2003) defined them into three major types: accessible super-Premium products, old luxury brand extensions, and masstige goods. The concept of new luxury brand was introduced to differentiate those brands that provide new luxury goods away from traditional luxury brands. Consequently, on the contrary to new luxury or accessible luxury, the discussion on 'true luxury' or 'absolute luxury' is rising (Ghosh and Varshney, 2013; Chevalier and Mazzalovo, 2012). 'Absolute luxury' targets the rich (Chevalier and Lu, 2010) and performs the basic function of reinforcing the social stratification first observed by Veblen (Kapferer and Bastien, 2009).

On the other hand, in market place there are some luxury brands like Dolce & Gabbana and Hublot which neither provides the three major types of new luxury like Coach, nor is similar as traditional luxury brand, such as Louis Vuitton. However, there is no clear definition of this kind of luxury brand which cannot be defined either only by its brand contents or established time and no research distinguish the traditional luxury brand,

new luxury brand and emerging luxury brand, although they are also included in some research as luxury brand. Alleres (1990) builds on the dimension of socio-economic class in the context of luxury goods and sees it as a hierarchy consisting of three levels based on the degree of accessibility. This hierarchy is comprised of three levels: products that are extremely high-priced which offer the owner exceptional social prestige; luxury products attainable by the 'professional' socio-economic class in the intermediate luxury level and the accessible luxury level where luxury products that are attainable by the middle socio-economic class who are implicitly perceived as trying to achieve a high social status by their purchase behaviour (Figure. 1). Therefore, in this research emerging luxury brand indicates a brand that provides luxury goods in or above intermediate level. Moreover, the established time is also a key criterion to define an emerging luxury brand. In the literatures on luxury history, 1970s is usually mentioned and considered to be important in world economy and is also a turning point for luxury industry. By the 1970s, in more affluent societies, the material economy and positional economy were running in parallel (Hirsch, 1977). Since then the economy of conspicuous consumption become more apparent. Thus, an emerging luxury brand also refers to a brand providing luxury goods in or above intermediate level of luxury goods products hierarchy and was also established in or after 1970s.

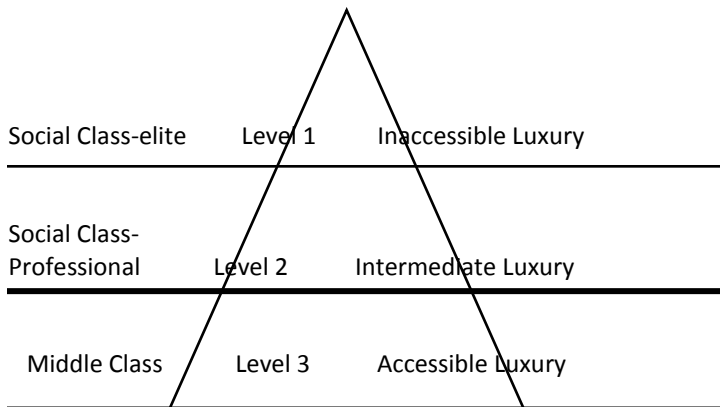

Figure 1 A Hierarchy of Luxury Goods Products (Alleres 1990)

## **Literature review**

As researchers explained the product is not simply a commodity defined through its function, nor does it simply have an added symbolic dimension. Brands are a new axis that connects production and consumption with each other (Kornberger, 2010, p.12) and units of social consumption (Zaltman, 2003: 227). Brands are interfaces: they mediate between production and consumption and stand for industrial production of differences (Baudrillard, 1970/2003) and a hegemonic vehicle for endless diversity (Askegaard, 2006). From the view of Maslow's hierarchy of needs, brands become an extension of the self, present value which is a statement to others as well as an expression of inner, true self (Kornberger, 2010, p.9). The want-satisfying powers of commodities depended on their qualities and on the nature of the wants they served. Products are designed to match needs; brands are created to produce desire (Morgan and Trentman, 2006; Slater, 1997). The product turns out to be nothing but the material extension of the brand (Askegaard, 2006:100), thus, we cannot discuss product without brand. When a product-commodity becomes a brand, its use value is supplemented by a number of further associations (Danesi, 2006: 3, 21).

P1: Perceived brand difference is conceptualized into two types of attributes: product-related attributes and non-product-related attributes.

### *Brand differentiation and perceived value*

Differentiation is regarded as one of the core principles of marketing theory and practice (Romaniuk & Gaillard, 2007) and it makes the brand an imperfect substitute with other brands so that its customer base is more secure. The differentiation has also to be perceived by customers as different (Ries and Trout, 1986) and must be valued (Carpenter et al., 1994). This valued difference does not have to be a material product feature. Rather, it may be symbolic, emotional, or even quite trivial (Romaniuk & Gaillard, 2007). When market researchers and academics examine a brand's differentiation, they typically analyse brand image data deliberately looking for differences in the way consumers perceive brands (Romaniuk & Gaillard, 2007).

On the other hand marketers and researchers introduced perceived value, which is a specific inference-making mechanism based on consumers' intuitions of market efficiency (Chernev & Carpenter, 2001). This concept was recognized as one of the most significant factor in the success of an

organization and as a very important source of competitive advantages for the firm (Sanchez-Fernandez & Iniesta-Bonillo, 2006). This kind of consumer value is extremely important for luxury houses. Researchers (for example Keller, 1986; Berthon et al., 2009; Brakus et al., 2009; Vickers and Renand, 2003; Vigneron and Johnson, 2004; Gofman et al., 2010; Kapferer, 1998, 1999) endeavour to exploring the key factors or dimensions of perceived value of luxury products and brands. The study on key luxury dimensions is an important aspect of managing luxury brands as it serves as a focus for attention and effort (Walley et al., 2013).

### *Models of dimensions of luxury products and brands*

Researchers defined dimensions of luxury products and brands in a semiotic way. An initial review of describing luxury products and brands is listed in Table 1. It indicates that findings of the studies have little in common with each other.

Table 1 Review of brand luxury dimensions.

*Source: Walley, K., Adams, H., Custance, P., Copley, P. and Perry, S. (2013). The key dimensions of luxury from a UK consumers' perspective. Marketing Intelligence & Planning. Vol. 31 No. 7, pp. 823-837; modified by author.*

Luxury is considered something exclusive by most studies, however, there is not much agreement in respect of the terms that the researchers use to describe the dimensions and the typologies ranged from three dimensions to six dimensions. In addition, most of them are derived from the consumption motivation of luxury brands, so personal perception can be found in almost them (Keller, 1986; Berthon et al., 2009; Brakus et al., 2009; Vickers and Renand, 2003; Vigneron and Johnson, 2004; Gofman et al., 2010). Besides, Reyneke et al. (2011) proposed AO framework for luxury wine brands as gift from ontological and aesthetic perspectives while the research of Gofman et al. (2010) took not luxury products but premium as their object. Heine and Phan's (2011) study is the only one that is conducted on the perception of luxury product not including personal perceived value. In this research product-related attributes are only discussed based on Heine and Phan's (2011) dimensions and non-product-related attributes may include the personal and social items.

### *Defining the perceived brand difference construct of emerging luxury brand*

Product-related attributes are classified into 6 dimensions: price, quality, aesthetics, rarity, extraordinariness and symbolic meaning (Heine and Phan's, 2011). There is no doubt that price is one of the most important indicator of conspicuous products, however, some researchers consider that perceived expensiveness contributes to exclusivity (Verhallen and Robben, 1994; Groth and McDaniel, 1993; Vigneron and Johnson, 2004; Gofman et al., 2010) which is also a key factor on uniqueness together with scarcity/rarity (Vigneron and Johnson, 1999, 2004). Moreover, 'extraordinary' is noted as resulting 'only' from a different design or construction, thus, it overlaps the certain contents of either 'rarity' (Heine and Phan's, 2011) or 'exclusivity' (Vigneron and Johnson, 2004; Gofman et al., 2010). Therefore, we added the factor 'exclusivity' into product-related attributes instead of 'extraordinary and price'.

P1a: Quality of luxury goods is related to perceived brand difference of emerging luxury brand.

P1b: Exclusivity of luxury goods is related to perceived brand difference of emerging luxury brand.

Luxury products are by definition not ordinary, but rather a rarity (Kisabaka 2001, p. 96). The Latin etymology of luxury means difference,

departure, deviation (Kapferer and Bastian, 2009; Catry, 2003). When they buy luxury products customers distance themselves from the mass and from one another through the emotional value of acquiring well-crafted and rare objects (Catry, 2003). In the context of luxury consumption, scarce and exclusive brands enhance a unique self and social image (Snyder, 1992; Snyder and Fromkin, 1980) and emerging luxury brand itself represents niche and scarce compared to traditional luxury brand. It is the initial factor that associates consumers with uniqueness (Catry, 2003; Vigneron and Johnson, 2004; Groth and McDaniel, 1993).

P1c: Scarcity/rarity of luxury goods is related to perceived brand difference of emerging luxury brand.

Almost all researches perceive aesthetics as a distinct characteristic of luxury products. In comparison to the other characteristics, aesthetics were mentioned most often by scholars. In 1997 Kapferer stated that luxury defines beauty and is art applied to functional items. Aesthetic product design is one of the most important strategies of manufacturers of luxury products to differentiate themselves from mass market manufacturers (Kapferer 2001, p. 321). Aesthetics is a fundamental dimension of luxury (Holbrook and Hirschman, 1982) and aesthetic objects have a more sensorial attraction (Genette, 1997). Individual pleasure and satisfaction are prime motivating factors in their consumption and even if the product's utilitarian and functional dimensions figure in the perception process; the symbolic, subjective dimension plays the leading role. (Filser and Bourgeon, 1995) (Cited at Lagier and Godey, 2007).

P1d: Aesthetics of luxury goods is related to perceived brand difference of emerging luxury brand.

Consumer use symbols to distinguish products and make choices, since one object can be symbolically more harmonious with consumer goals, feelings and self-definitions than another (Dolich, 1969), but they may also try to integrate the symbolic meaning into their own identity. People regard their possessions as part of identity (Belk, 1983/88). Only those products or brands symbolized as being similar to the self concept will maintain or enhance the self. Consumers will match the perception of luxury product with their own personality or identity unconsciously.

P1e: Symbolic meaning of luxury goods is related to perceived brand difference of emerging luxury brand.

### ***Consumer's need for uniqueness (CNFU) and luxury consumption***

Douglas and Isherwood (1979) explained the consumption is driven by social motives which are shaped by culture. Leibenstein's (1950) famous research differentiated luxury consumption into 'bandwagon' (social taboos), 'snob' (exclusivity or difference) and 'veblen' effect (conspicuous consumption). The bandwagon effect refers to "the extent to which the demand for a commodity is increased due to the fact that others are also consuming the same commodity" (Leibenstein, 1950: 189). In other words, the bandwagon effect reflects the tendency to conform to social norm (Tsai et al., 2013). The snob effect refers to "the extent to which the demand for a commodity is decreased owing to the fact that others are also consuming the same commodity (or that others are increasing their consumption of that commodity)". It reflects the desire to be special and to differentiate oneself from the group (Leibenstein, 1950: 189). The Veblen effect stands for conspicuous consumption, through which consumers openly display wealth to signal social status. Consequently, the Veblen effect occurs when consumer preference for a commodity increases as its monetary value increases. The Veblen effect is related to the snob effect, but the Veblen effect focuses on product expensiveness and the connoted high-status symbol, whereas the snob effect is primarily based on individuality, uniqueness, and exclusivity (Tsai et al., 2013).

P2a: The snob effect on luxury consumption increases as the perceived brand difference increases.

P2b: The bandwagon effect on luxury consumption decreased as perceived brand difference increases.

P2c: The Veblen effect on luxury consumption increased as the perceived brand difference increases.

In the research of consumer behaviour, consumers with a high need for uniqueness tended to adopt new products or brands more quickly than those with a low need for uniqueness (Miremadi et al., 2011). Some psychological literature suggests that people with a high need for uniqueness will seek non-traditional and self-differentiating products (Griffiths and Zimmer, 1998). Individuals with a high need for uniqueness are more apt to adopt new products than individuals with low need for uniqueness (Snyder 1992; Lynn, 1991). Consumer's need for uniqueness

(CNFU) is an important construct when considering consumers' snob luxury preferences. Tian et al (2001) argued that all individuals desire to be unique to some extent, but they also want to belong to social groups. In luxury consumption, when they purchase luxury goods, consumers consider snob effect and bandwagon effect at the same time.

P3: The tipping point of the perceived luxury brand difference is determined by the weight of consumer's need for uniqueness and similarity over which purchase intention will decrease sharply.

## Conceptual framework

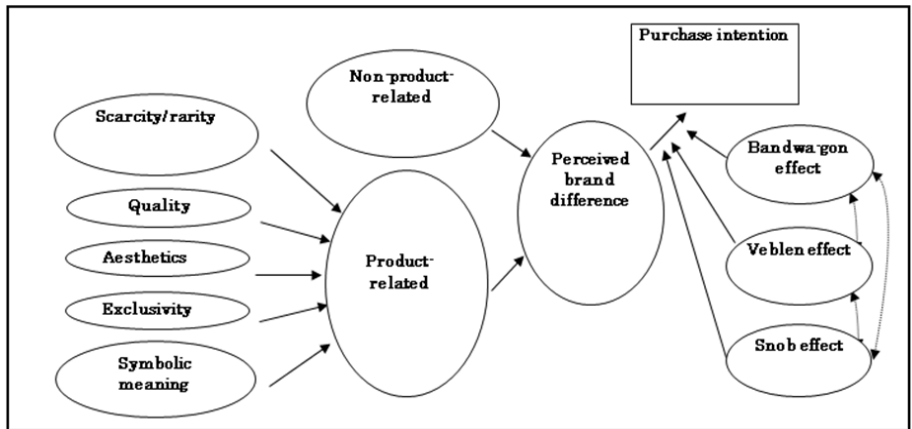

Combining all the five product-related attributes: quality, Exclusivity, scarcity, aesthetics and symbolic meaning with control variables: bandwagon effect, snob effect and Veblen effect, the current study proposes a conceptual framework that integrates different perspectives of perceived brand difference. This framework explains different types of product-related attributes of perceived brand difference of emerging luxury brand and purchase intention. A diagram showing this overall conceptual framework is shown in Figure 2. In this framework the plain lines indicate the primary causal relations and the dashed lines indicate the interaction effects.

Luxury companies ensure scarcity through limiting production, innovating product features, constraining virtual supply and relying on information communicated to customers (Catry 2003). The luxury industry has always been familiar with natural shortage and actual scarcity makes luxury products exclusive. Besides, luxury good's sense of scarcity has, in many cases, been a matter of continuous investment in innovative product features, such as Vuitton's first waterproof canvas handbags; Burberry's hardwearing, water-resistant yet breathable fabric. Techno-rarity is often reserved for top of the lines, promoting brand image and exclusivity. If not motivated by natural components or technological innovation, scarcity may be managed through limited editions. This has been the rule in the artistic world for original works, prints and reproductions. Moreover, luxury firms have tended to rely on the information communicated to customers rather than on physical supply limitations (Catry 2003).

Superior quality is a key attribute of emerging luxury brand. It relies on a series of criteria such as expertise of manufacturing, workmanship, features, service, value and durability, etc. And the aesthetics of luxury products

comply with the taste of the upper class, which represents the cultural relativity of luxury (Kapferer 2001, p. 322). Heine and Phan (2011) state the taste of upper class and aesthetic design contribute to perceived aesthetics. In addition, Lagier and Godey (2007) emphasized the selection and evaluation criteria of luxury products like comparison of object with norms, with social and historical references; its understanding, its interpretation with regard to precise and specific attributes, its display setting, its price, its financial value, and so on (Colbert, 1993).

Brand exclusivity is the positioning of a brand such that it can command a high price relative to similar products (Groth and McDaniel, 1993:11). Finally, the symbolic meaning of luxury products is highly influenced by their brands (Meffert and Lasslop, 2003; cited in Heine and Phan, 2011) and luxury products need to comply with worldwide and the tastes of their target group to symbolize something (Heine and Phan, 2011). Because the symbolism of luxury products refers to a large extend to human values and lifestyles (Kapferer, 2001).

*Figure 2 Integrated conceptual framework of perceive brand difference and purchase intention of emerging luxury brand*

### *Exploratory case on Korloff*

Korloff is a French jewellery brand established in 1978 by a Parisian designer, Daniel Paillasseur, who used to be an art dealer before starting his jewellery business. At the very beginning, he only dealt with precious gemstones until he got the 421-carat rough black diamond, Korloff Noir. The

first Korloff store was opened in 1979 and when entering into 1980s the shop was named after the black diamond 'Korloff'. Korloff began as one boutique is now a global brand in over 70 countries, via more than 50 Korloff PARIS boutiques, and discovered in more than 500 select retailers spanning from Paris to Tokyo. Today, the brand remains an independent and family managed company under the second generation leadership of Olivier Paillasseur who continues in the footsteps of his father. Its product line expanded beyond diamond and jewellery collections into timepieces, high jewelry, writing instruments, fragrances and couture since 1990s. Jewellery and timepieces are their main products which take up about 80% of the sales. Korloff is a typically independent emerging luxury brand with the entry price of the time piece over €2,000 which is almost 4 times of that of Tissort. Thus, Korloff as an independent French luxury house satisfies all the requirements of an emerging luxury brand.

A qualitative research interview seeks to cover both a factual and a meaning level (Kvale, 1996) and the interviewer can pursue in-depth information around the selected topic (McNamara, 1999). Unstructured interview is used in studies that require only textual data and in studies that require both textual and numerical data; and it can be utilized to develop formal guides for semi structured interviews (Bernard, 2006). Consequently, this exploratory case study was conducted in two phases: unstructured interview and semi-structured interview. The unstructured interview was done in October 2013 in Tokyo. We interviewed a Japanese consultant of Korloff who has been servicing Korloff for over 20 years. During this phase, we discussed the key successful factors of Korloff and some general information about its brand identity. Three key words were summarized from the interview to describe how Korloff differentiated itself from other brands and led to its success. One is "innovation" which includes innovations in design, craftsmanship, techniques, etc, which formed today's Korloff style with specific shape and colour. The next one is "PR event". Through a series of PR events in 1990s, an impressive brand image was built up in France which stands for richness and exclusivity. Catry (2003) demonstrated in his rarity research that physical rarity, technology innovation and information-based rarity such as events can increase the rarity of a luxury brand and make consumers feel it more unique. Finally, "Internationalization" is the last key word. According to the interview, 1980s and the early 1990s was the golden time of Korloff brand expansion. The overall revenue grew in an astonishing speed thanks to the global economy prosperity and two digital growth of Japanese economy. However, the

global expansion is a result from the economy growth and brand differentiation strategy. The results support some part of our proposition 1. Thus, in order to gather more information from the managerial view, a semi-structured interview was conducted to the CEO of Korloff in March 2014 so as to modify our proposed conceptual model. We checked relevant product-related attributes that contribute to Korloff's success in brand differentiation (see Table 2).

*Table 2 Product-related attributes that contribute to Korloff's success in brand differentiation*

Attribute	Factor	Description
Scarcity	Technological scarcity* Natural scarcity Limited edition	Korloff cut (patent)* High inlaid technology Innovation in material, technology, design, etc.
Quality	Craftsmanship	High inlaid technology
Aesthetics	Unique design Aesthetic product Symbolic design*	Quite different from other brands in colour, shape Unique design in Lyon style Unique and aesthetic watch and jewellery Square shape in Korloff cut, ring, pendant*
Exclusivity	Price	Entrance price: €2200~ Limited edition: €24,000~
Symbolic meaning	Brand logo, style, design	Symbolic design stand for richness, elite and uniqueness Brand logo appeared in PR events
Note:* highly differentiated <span style="border: 1px solid black; padding: 2px;">New factor</span>		

The results support our conceptual model and show that there is a strong interaction among each attribute as well as the factors. For example, the creation of Korloff cut increases brand scarcity, exclusivity as well as aesthetics. Additionally, one new factor, brand symbolic design, was found

and positively related with symbolic meaning. And in this case, the technological scarcity and symbolic design have a high contribution to Korloff's perceived difference. The scarcity is positively related with Exclusivity especially when the limited edition has a special price. As mentioned above "PR event" is a key factor of Korloff's success and it is the main communication tool of diffusing the information on tradition, ethics (non-product-related attributes) and also expressing its aesthetics, symbolic meaning and exclusivity of Korloff. The product-related attributes are related to non-product-related attributes (story, tradition, etc.) for Aesthetic and symbolic meaning.

Thus, the conceptual framework was modified as below (Figure 3):

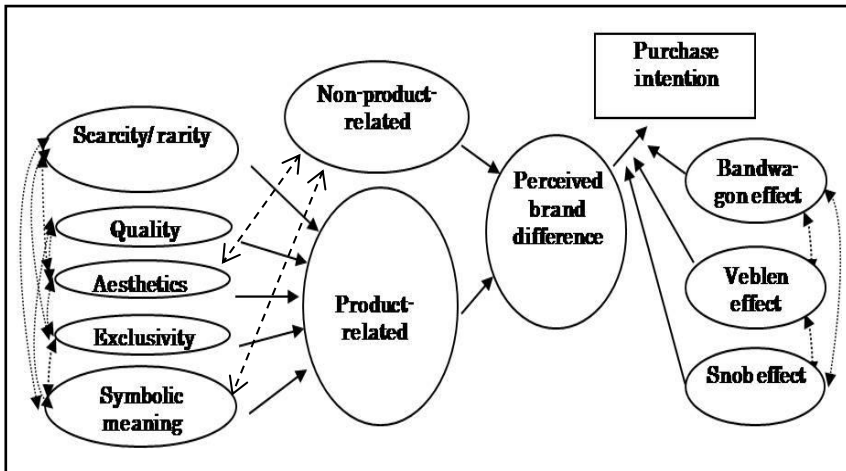

Figure 3 Modified conceptual framework of perceive brand difference and purchase intention of emerging luxury brand

## Conclusion and future direction

Based on extant literature this exploratory study defines emerging luxury brand as a brand providing luxury goods in or above intermediate level of luxury goods products hierarchy and was also established in or after 1970s. Under this definition, this paper also presents a comprehensive conceptual framework that illustrates the nexus between product-related attributes and brand differentiation of emerging luxury brand based on perceived value. The product-related attributes include quality, Exclusivity, scarcity, aesthetics and symbolic meaning with high interaction among one another.

Besides, technological scarcity and symbolic design have a high contribution to perceived brand difference and in the case of Korloff. The product-related attributes are related to non-product-related attributes for Aesthetic and symbolic meaning

However, this research is qualitative and descriptive and mainly based on literature review and interview to Korloff, thus, the accuracy of defining emerging luxury should be discussed on large brand data base. Furthermore, the non-product-related attributes are not studied yet. In the future study it should be done to complete the conceptual mode. Finally, this conceptual model needs checking in a scientific way to clarify the relationship and interaction among each attribute and factors.

## Brand of Products and Brand of Signs: how to manage this relationship in fashion through corporate archives

Valeria IANNILLI\* and Federica VACCA

Design Department, Politecnico di Milano

*In the fashion industry, brand has always been a competitive paramount. It has a real value as a strategic asset with which the company ensures a continuous competitive advantage over competitors and thus the perception of consumers. The construction of the brand recognition scenario represents the ideal place able to offer a view of all the tinged values inspiring the products/lines/categories proposed by a company. Within this scenario, not only the fashion retail system becomes the narrative context of the brand where designing spaces, displays and interactions we connect the distributive strategy to the product/stylistic strategy and the communication strategy; but also the corporate archives are progressively assuming this role and functions, offering peculiar solutions.*

*The paper aims to explore the brand recognition strategy, mediated by design and related to the brand heritage, reading the corporate archive not only as a self commemorative intent and consolidation of the corporate image, but as active resource continuously integrated in the brand identity construction.*

## Brand of Products and Brand of Signs

In the current competitive environment, fashion enterprises implement investments in the intangible resources which can provide innovation of meaning (Buchner, 2003; Celaschi, 2009; Csikszentmihalyi, 1981, 1991; Kotler, 1988; Krippendorff, 1989, 1990, 2006; Verganti, 2002), now necessary to differentiate their products and production processes.

The value chain tends, more and more, to a new shape and dimension within which the success factors can be identified in knowledge management, the ability to anticipate, define and view market trends and the ability to create relational exchange with end users. With the recognition of *knowledge economy* (Rullani, 2004), enterprises enhance the sensorial, communicative, emotional and relational qualities fundamental to the construction of the Brand Image. Within brand policies, the *cultural dimension* of an enterprise is increasingly linked to the amount of value and symbolic assets incorporated into the overall *product offering* of the company. The final product is the result of a multi-dimensional process simultaneously engaging in technological, physical, informational, scientific, social, cultural, and artistic relationships, which determine its nature and specificity.

Therefore, the change resides in those elements that directly affect the processes, relationships and interconnections between the different actors in the economic system. A space in which the concept of *company product* now also includes knowledge, services and experiences as economic value (Iannilli, 2010; Sacerdote, 2006; Valdani, et al., 2001). In particular, new growth and development paths are not identified with the production of new knowledge but rather with the *dissemination* of the one already existing in the increasingly broadening areas of use (Rullani, 2004).

While Kotler (1988) defined brand as ‘a name, term, sign, symbol or design or combination of them, which is intended to identify the goods of one seller or group of sellers and to differentiate them from those of competitors’ (Kotler, 1988, p.463), it is now possible to broaden this definition to include, as a characterizing element, the unique mix of physical attributes and intangible values that constitute the DNA of the company. The brand today is no longer seen only as logo, communication or image projection, but as the set of values that characterizes the company, expressed through a precise *brand strategy* (Aaker, 1991; Kapferer 1992) and a know-how that serves as an invaluable wealth of knowledge to preserve and communicate as *company heritage*. A company’s know-how – interpreted as its heritage– can represent an important channel for product

innovation. As evidenced in the case studies later reported, company archives have become a knowledge asset for the study, understanding and development of new creative and production processes. The stimulation of these dynamics in the Italian scene is of strategic importance for the support of the global competitiveness of its national economic system. The products of made in Italy –arisen from a certain supremacy linked to the design and which have established themselves not so much for radical innovation, but rather for the innovation of the functional, aesthetic and relational qualities– had an international *cultural* impact: furniture, clothes, sports cars have been exhibited in museums around the world and recognized as part of a unitary culture. As a brand of inter-sectorial quality, made in Italy has been a strong distinguishing element for domestic products, regardless of the different product categories, conveying *de facto* a homogeneous system of values to international markets, though rarely in an explicit, coded, and designed way. The maturity of the main Italian industrial sectors, the acceleration of *technological obsolescence* processes, the market saturation, the increasing global competition and the changed socio-political balance are just some of the critical conditions which have heavily affected Western countries in particular. In such conditions, the ability to continuously fuel one's competitive advantage, pursuing sustainable development patterns on a social and economic level, is an on going challenge, in which an important role could be played by the adoption of a more conscious strategy of promotion of the production and material culture developed by made in Italy enterprises.

Companies would thus benefit from the strategic revaluation of company archives as places within which new areas of meaning and relationship between the different users can be ignited. First recognized for their historical, cultural and artistic value (Amari, 1997; Negri, 2003), museums and company archives are now more strategically (Gilodi, 2002; Baia Curioni, 2005) and experientially interpreted. This paper precisely highlights a new interpretation of the company archive as an active force in building *brand recognition* as well as the ideal setting for the transfer and implementation of knowledge.

## **Fashion archives as a living cultural heritage**

Over the past decade many companies in the Italian fashion industry – and more generally industries with high cultural and symbolic value products - have increased the policies aimed at the enhancement of their

brand patrimony through the organization or the optimization of their heritage system. In particular, the cultural spaces of the company, in their various forms and extensions, are gradually assuming the role of important *network* for the activation of social, economic and entertainment relationships, as well as of places necessary for the *visualisation* and *representation* of the values of the enterprise and of the socio-territorial system of which it is part. These values are now identifiable not only in the material product, but also in the concept of *made in Italy* which the company has, at some point, begun not only to recognize, but also to *produce as living cultural heritage*.

The issue of recognition of a brand with a specific territorial context has become a priority for luxury companies in Italy where the strength of the broader national brand contributes to strengthen the brand equity of the companies (Aaker, 1991) and at the same time to build value during the internationalization process. As their prerogative, Italian brands trigger very close relationship strategies between local identity and their own system of values. The concept of *authenticity* (Gilmore & Pine, 2007), and therefore of attributability to a given territorial identity, has become the prerogative for the construction of new consumer experiences. We can see how, to differentiate and make products recognizable among others, it is necessary to raise the degree of emotional involvement between company and consumer, thinking not only about the product but also about the lifestyle scenario. Operating on the meaning of values that the fashion system can generate requires to operate on the construction of *scenarios of meanings* where products are presented exclusively linked to a discussion broader than the aesthetic-formal one, i.e. highly cultural and social.

Italian companies show an increasingly stronger connection to the intangible values related not only to their brand identity but mainly to the manufacturing skills, often hand-craftsmanship, that characterize their brand equity, becoming linguistic elements of brand recognition on an extra-national level. In this sense, the enterprise's heritage becomes a priority resource to be preserved and enhanced and a tool capable of conveying the dialogue with the public through communicative and relational tools in *experiential* contexts underlying the narrative of the enterprise.

If we consider the archives, museums and foundations of major fashion brands, such as Gucci, Salvatore Ferragamo and Gianfranco Ferré, we immediately realize the cultural relevance of these spaces. Established for the preservation and safeguard of the historical memory of the figures and

artefacts that played a central role in the transformation processes of a country's material and social culture (Amari, 1997), they have evolved from *museum spaces* to *spaces of experience* to adapt to completely different economic context and values.

The experience is not intended as an instrumental act, i.e. as channel, medium and expedient, but represents the *reason* for and the *sense* of experiencing. Such experience – globally undertaken in its different dimensions (material, emotional, problematic, cognitive, organizational, relational) – is proposed to be properly lived: *living cultural heritage*.

The territorial context as *image*, as *iconic sign*, welcomes different interpretative paths by the public who *welcomes* and *integrates* narratives, images, and memory as necessary systems to set *new discourses*. While the collected material is part of the social and material history of a specific production or territorial context, the intertwining of symbolic and material stories becomes an inexhaustible source for new design stimuli, within a space which could be called *augmented*.

The concept of experience as *living cultural heritage* occurs through spectacularization and emotional involvement, paving the way for participatory forms of communication which exceed traditional exhibition practices. An attitude deeply rooted in the Italian fashion system, in which the construction of brand scenarios elaborates on the intangible assets of the company, produces spaces in which the emotional experience activates those sensorial-memory processes needed to remember that brand, among others.

## **The new role of fashion archives into company strategies**

As argued so far, the contemporary scene has pushed companies of the fashion system in the paradigms of knowledge (Rullani, 2004) and hypermodernism (Codeluppi, 2009). As argued so far, the contemporary scene has pushed companies of the fashion system in the paradigms of knowledge (Rullani, 2004) and *hypermodernism* (Codeluppi, 2009). If on the one hand the symbolic and intangible value related to production contexts connotes the value system of the goods, on the other hand the offer saturation limits and somehow prevents the consumer from understanding and communicating this new category of goods, which appears more and more *abstract* and *elusive* (Codeluppi, 2012).

As Severino argued in *Heritage Marketing* (2007), we are witnessing a phenomenon of 'temporal reversibility' which contrasts the relentless modernism to trace a dimension of cultural heritage that seeks to investigate the origins and history of a company weaving past with present and trying to outline a system of values based on the authentic redefinition of the identity of that very company. Such process of *neoarchaism* – as defined by Morin (1987), directed toward a return to origins, as a 'manifestation of modernism, of avant-gardism' (Morin, 1987, p.176) – aims to find the meaning of existence and legitimize its authority in a market increasingly contaminated by contrasting and fragmented languages.

In this complex landscape, the past is fuelled by a new contemporary perspective (Fiorani, 2006) and becomes the engine that allows the enterprises of the fashion system to implement a diversification policy, therefore emphasising their brand equity, by informing their own collections and productions with an original, authentic and highly-differentiated cultural content (Vacca, 2013). This cultural heritage is interpreted through a contemporary vision of the market, hybridized through innovative methods and processes and revived with unexpected values and languages, producing a positive feedback in the *post-modern* consumer (Fabris, 2003), now a conscious figure who does not look at objects for their material value but as a product-sign of social and cultural systems (Rullani, 2004).

This new syncretism, that reads the past not as a nostalgic memory but as a tool for the settling and systematization of memory and production knowledge (Vacca, 2013), has generated a growing attention to the preservation and enhancement of the historical archives of companies and their translation in processes of creative and production development. The archive is then seen as a means for the rebuilding and activation of the enterprise's memory which underlines the set of social, cultural, scientific, and production relations, transforming and constantly redefining the concept of archive itself, not as a permanent system but as a dynamic process of enterprise knowledge.

*The question is to know how an object in a space can become a telling trace of an existence, as inversely an intention, a thought, a project can leave the personal argument and become visible outside of himself in his body, in the means it builds for himself. (Merleau-Ponty, 1965, p.329)*

To *archive*, in fact, means to carefully "store" and "preserve" the memory through a wide range of products and documentations that

reconstruct the reality not only of the company but also of the production territory of which it is part, 'as if history were the guarantor of the quality/originality of the product' (Montemaggi, 2007, p. 82). It stands as an objective testimony that - through patents, sketches, technical sheets, prototypes, photographs, and advertising campaigns - is not only a support to the collective memory but can generate economic benefit when this heterogeneity of materials is converted into complementary forms of knowledge enhancement such as museums and documentation centres (Bonfiglio-Dosio, 2003). The product is thus enriched with a wider values system, becoming a sign and witness of histories and lives which become more substantial with the passing of time, testifying for its authenticity and becoming synonymous with uniqueness and quality. The value of the archive is therefore ascribable to a dual dimension: the *objectual* and the *processual*. While it leads to the emphasis of an iconographic dimension of goods and objects which have stood the test of time, with unaltered sign value (*objectual dimension*), it also underlines a new discursive practice which through verbal and linguistic formulations is able to underpin and translate the brand's legacy in a new expressive identity which gains its substance from the past and is presented through new codes to the present (*processual dimension*).

### *The objectual dimension of archives*

Many companies of the fashion system, but also of other productions, looked to historical archives as a possible tool to strengthen their corporate identity and corporate image by "staging" the production process that, from research to conceptualization of the product and from production to communication of the collections, is able to emphasize the intrinsic meanings and the material culture of the companies themselves.

The archive becomes a strategic asset for the exploitation of knowledge, turning into a design tool focused on the visual coding of the referenced cultural roots and the traditional knowledge embedded in the product. The fascination of the brand is emphasized by the uniqueness of the brand's heritage that materializes through iconic products and a "musealization" logic. The spaces of dialogue with the public are company museums clearly aimed at presenting the product as a project but mainly as a process by identifying the set of cultural, historical, and social factors that have characterized the brand identity and can offer an important reinterpretation of the company's distinctive codes. The product becomes a symbol and it is

represented as an art installation or celebratory or exhibition of the company's heritage.

Paradigmatic is the case of **Salvatore Ferragamo** ([www.museoferragamo.it](http://www.museoferragamo.it)) for transforming the corporate heritage linked to the figure of the craftsman and designer Salvatore Ferragamo through the iconic dimension of the shoes he designed and patented in the period between 1920 and 1960. The flagship store in Florence located in Palazzo Spini Feroni, which has been the administrative headquarters of the maison since 1938; it also holds the monographic museum focused on the figure of its founder, 'The Dreams Shoemaker' (Ricci, 2000), which through a series of thematic exhibitions rereads Ferragamo's activity through the technical capabilities and quality designs, emphasizing the iconic dimension of its production and enhancing brand awareness. The direct contact between past and present results in interesting visual analogies that reconstruct a generative path which - through design, patents, the continuous contact with contemporaneity and the artisanal/innovation expertise of Ferragamo footwear - is projected onto contemporary collections through the recoding of the value systems of the products.

In the *objectual dimension*, the ability to overcome the logic of the museum becomes the stage on which to perform the set of territorial and production links and the narrative that emerges, legitimizing the production capacity of the company but also its identity of memory. It is now assessed how the components of narration, storytelling and experience are highly effective design tools. When applied to the environments of culture and of the company's celebratory identity, they become strategic for the interaction with the emotional sphere of the user.

### *The processual dimension of archives*

The company archive is characterized by a vastness and diversity of products that, being often accessible only to insiders, represent the historic core of the company and the materials therein preserved become a cultural heritage that can stimulate design inspiration and give creative and productive continuity to the new collections of products. For this reason, we are increasingly witnessing the acquisition of entire archives by companies who understand the inestimable value of a company's memory and then encode it in completely new creative and production processes. If properly catalogued and interpreted, archival materials can indeed generate design and creative value, understood as a company's ability to transform their

wealth of experience and their historical and iconographic memory into innovative ideas and activate unexplored knowledge itineraries.

Eminent is the example of **Vincenzo Zucchi Spa** ([www.zucchi.it](http://www.zucchi.it); [www.zucchicollection.org](http://www.zucchicollection.org)), one of the most important Italian textile manufactories, which has understood the importance of company's heritage as knowledge tool, employing it in different ways in its production. Operating holding company of the largest Italian group of home textiles, it owns one of the most important collections in the world of blocks for hand printing on fabric, purchased in England in 1988 and then turned into a Museum: *the Zucchi Collection of Antique Handblocks*. This extraordinary collection celebrates the mastery and inventiveness of skilled English, French and Austrian craftsmen who are part of textile history and counts 56,000 hand-printing blocks, which correspond to approximately 12,000 patterns, created between 1785 and 1935, recording the evolution of fashions and styles of the textile industry. *The Zucchi Collection of Antique Handblocks* includes a vast array range of styles and patterns, from the most classical to the early artistic avant-gardes of Art Nouveau and Art Deco, and is divided into six major categories: paisley, floral, ornamental, pictorial, abstract and geometric (Mocchetti, 1991). This archive serves as a value generator for the production of the company which has a home collection designed by Marta Giardini, the *Zucchi Block*: a modern interpretation, through digital printing, of the graphic or figurative designs drawn from the old printing blocks in the Museum. The company also began working on integrating a dedicated consulting service with materials from its archive for designing, drawing and defining patterns with a be-spoke approach aimed at the complete satisfaction of the final customer, oriented not only to textiles but integrating its expertise in other sectors (wallpaper, wood, furniture, etc). The printing block, now universally recognized as the distinctive feature of the company, also becomes a narrative element within the company's commercial spaces to establish a close bond between *the Zucchi Collection of Antique Handblocks* and the product thus emphasizing the corporate perception and company values.

In the *processual dimension*, the archive therefore becomes an active tool that can generate value for the enterprise by widening its know-what in the proposition of new textile collections. They draw from the past but look at the present and contemporaneity, proposing a design approach and creative know-how without resorting to the simple reiteration of styles from the past.

## Possible tracks for making archives a real knowledge asset

As previously stated, company museums and archives are an instrument of both self-celebration and consolidation of the corporate image because they provide the company with the role of 'active cultural entity, as the company's culture becomes the collective culture' (Gilodi, 2002, p.10).

Yet, they are at the same time active resources which, if properly and continuously integrated in the production and design processes, contribute to the construction of the company's identity, strengthening Brand Recognition. While there is a wealth of memory to be preserved, on the other hand the endorsement and presentation of this knowledge continually redefines the identity of the company which is thus able to identify new channels of contact with the end consumer through meaningful semantic elements, directed toward the support of its 'cultural positioning' (Rindova & Ravasi, 2008).

A strategy oriented toward Brand Heritage and mediated by design - understood as a mediator of knowledge, skills and needs (Celaschi, 2008a, 2008b) - is then able to build a strong Brand Recognition through three possible paradigms that make heritage a real asset of knowledge for the enterprise:

- **Heritage into product's iconization**, incorporating the cultural roots in an iconic product that conveys fascination for the brand.
- **Heritage into space's narrative**, transposing the narrative heritage in the retail space as a tool for the linguistic expression of brand identity.
- **Heritage into process's theatricalisation**, presenting the know-how as the characterizing process and nature, highlighting the uniqueness and quality of the product itself.

### *Heritage into product's iconization*

The product becomes an absolute icon incorporating brand identity itself. The implicit and intangible value is generated through a process that removes the object-symbol from its common use, accenting its role as sign and witness of brand heritage. This process of spectacularization focuses on the product and rebuilds around it the distinctive values of the brand, emphasizing its persistence over time. This is the case of **Fendi**: to celebrate the fifteenth birthday of the Baguette ([www.baguette.fendi.com](http://www.baguette.fendi.com)), the maison's iconic accessory, it conceived a traveling event that led to the

opening of pop-up stores in the most innovative concept stores in the world, such as Colette in Paris, Maxfield in Los Angeles, 10 CorsoComo in Milan, Dover Street Market in London and Tokyo, eventually giving rise to a "Baguette Mania."

Another example is **Max Mara** which created "COATS! 60 years of italian fashion" ([www.maxmarafashiongroup.com/it/coats](http://www.maxmarafashiongroup.com/it/coats)), a traveling exhibition designed by architects Migliore and Servetto as a journey in the history of Italian fashion through the coat, Max Mara's iconic garment. The narrative is divided into different thematic areas that intertwine the different historical and cultural eras of the company, connecting them with each other and with their contemporary contexts: the birth of the group (1950s and 1960s), the link with the publishing world (1970s), creativity (1980s), photography (1990s) and industrial production (2000s). All through the eyes of the model 101801, the brand's icon-coat which was made even more contemporary and current by the stylistic interpretations of several world-renowned artists.

### *Heritage into space's narrative*

The space becomes a narrative vehicle through which the brand history is told, reflected in the employed layout, intercepting the new paradigms of contemporaneity. This is the case of the **Pirelli PZero** flagship store in Corso Venezia in Milan ([www.pirellipzero.com/it/flagship-store](http://www.pirellipzero.com/it/flagship-store); [www.fondazionepirelli.org](http://www.fondazionepirelli.org)), where you can breathe the design culture which spans the worlds guarded by Pirelli. An industrial installation that recalls the aesthetics of a factory where rubber acts as leit-motif through the space and creates a visual connection among the company's heritage and the new collections of clothing and objects which employ PZero's know-how. An active and dynamic space that highlights the industrial and technological core of the enterprise. A completely opposite case is the concept / flagship store **NonostanteMarras** in Milan ([www.antoniomarras.it](http://www.antoniomarras.it)), in which the reference to the tradition of hand-made blends with the identification codes of the brand Antonio Marras. An ancient and "charmingly neglected" aesthetic, characterized by peeling walls and meticulously-selected antique furniture. The collection of dresses is placed among numerous objects from vintage markets that are collected and sold in the store. This pervasive space, characterized by installations halfway between art and design, defines the lifestyle of the Marras client and emphasizes the characterizing poetic language of the brand.

### *Heritage into process's theatricalisation*

The bond with the brand's area of origin and the direct connection with the manufacturing processes related to a know-how ingrained in the culture of that territory is the setting from which the narration of brand heritage starts. The values associated with the processes become predominant over the aesthetics of the product itself and are legitimized by the continuous link with industrial and artisanal skills that determine the production identity as a factor differentiating it from similar productions.

This is the case of **Brunello Cuccinelli** ([www.brunellocucinelli.com](http://www.brunellocucinelli.com)) who gave birth to a new entrepreneurial dimension in which the quality of a product is significantly determined by the workers and the love and passion they embed in their work (Cuccinelli, 2012). For this reason, both human skills and the territory must be preserved to continue generating value. This creates the cultural system called "Foro delle Arti": a theatre, an amphitheatre and a philosophers' garden used for concerts and events. All structures were built with the company's profits, reinvested to redevelop the old Umbrian village Solomeo which also houses the "Scuola dei mestieri", founded by the same entrepreneur to embrace the disciplines, like mending and re-looping, which reflect the invaluable know-how characterizing the quality of cashmere and of Cuccinelli products.

Another example of geographical valorisation is also provided by the **Fabbrica Lenta in Bonotto** ([www.bonotto.biz](http://www.bonotto.biz)), a textile mill founded in 1912 in Molvena (Vicenza, Italy) which is now a vertical full-cycled industry, employing about two hundred craftsmen. The mission is to reevaluate the weaving techniques of proto-industrial machinery to rediscover the culture of the manual work, leading the company to produce less products but of very high quality. An avant-garde approach that has been able to merge the industrial component with craftsmanship through a production of textiles "made as art." A eulogy to slowness: the return to the origins and to development of the area guarantees the contemporary translation of a historical memory that can generate culture and identity.

The aspect that emerges from these three trajectories of heritage is a system typically inherent to Italy which sees the link with the territory as the identifying and differentiating factor, understood as material knowledge and as cultural heritage to emphasize and transfer as a positive and qualifying value. The concept of heritage in this context therefore becomes an effective knowledge asset for a fashion enterprise because it is capable of reinforcing the brand equity of the enterprise through greater

competitiveness and becomes the foundation for its recognition and one of the reasons of the company's success.

## Conclusions

The enhancement of the cultural system of the company, meaning the ability to store and reproduce intangible resources over time (Vicari, 1991), then corresponds to the need to create new surfaces of connection with the different stakeholders. Connections that can be interpreted as communicative and relational tools, but also as co-producers of value. When properly exploited, company archives can trigger important processes of hybridization, becoming a design and creative resource for the initiation of new processual values.

If the production of information, knowledge and services is the backbone of the economic activity, especially for enterprises with a strong cultural and symbolic vocation, it can be stated that the heritage space of a company testifies its still-unexplored potential also for what concerns the enhancement of brand identity. For example, it can create strong synergies on the cultural capital, present in the company's archives and museums and in the retail spaces, even in relation to internationalization policies, in which the processes of identification with the brand are not always smooth and immediately assimilated. And this is even truer for the products of the fashion system. The new sales formats and concepts are increasingly dependent on the *continuous innovation* of the commercial offer: events, presentations, *in-store* promotions and new forms of communication in the territory, such as temporary shops that lead to experimenting new and different ways to communicate with different audiences.

In this context the value of the archive understood as *living cultural heritage* can become a real generator of knowledge, which – through appropriate oriented systems of knowledge *dissemination* – appears capable of triggering fundamental innovation processes. The context of company heritage seems to face a double challenge: on the one hand there is the responsibility to preserve, protect, promote, and enhance the testimonies of an immensely valuable past, on the other hand there is a need to view the archive as living cultural heritage, an economic asset to all effects, to employ for economic and educational benefit.

**Author's notes:** *The paper is the result of common research and findings, nevertheless, sections 1, 2 and 5 were edited by*

*Valeria Iannilli, sections 3 and 4 were edited by Federica Vacca. The case studies presented are the result of research studies and projects undertaken in recent years by the research group Fashion in Process, part of the Design Dept. at Politecnico di Milano [www.fashioninprocess.com]. In particular, the case study of Vincenzo Zucchi Spa was investigated and analysed during the research project "FABRICthinking" (February/April 2014) while the case studies of Antonio Marras, Bonotto and Brunello Cucinelli resulted from the PhD thesis of Federica Vacca ["Design on the tread of tradition", unpublished doctoral dissertation (2008), PhD in Design 21 Cycle Ph.D, Design Dept., Politecnico di Milano, Milan, Italy]. ## Designing Channels for Brand Value: Four Meta-Models

Karla STRAKER<sup>\*</sup>, Alexander GARRETT, Mitchell DUNN and Cara WRIGLEY

Queensland University of Technology

*Channels are becoming an increasingly important area for companies to innovate, specifically as they provide direct points of contact with their customers. However, little is known in regards to multi-channel strategies that embody strategic brand values and how customers experience these channels collectively. The purpose of this paper is to investigate how organisations configure multi-channel strategies to communicate their brand value and experience to their customers. Data was collated from sixty companies through a content analysis methodology within the retail sector. Results uncovered commonalities through the identification of four meta-models surrounding common brand values, intended emotive experience, individual channels and the customer segment. These meta-models are titled: High Quality, Trust, Convenience and Community. This research also presents implications of a multi-channel design tool based on findings from this study to help reinforce company brand values and design an overall connected customer experience.*

**Keywords:** Content Analysis, Channel Relationships, Brand Value

## **Introduction**

Businesses are always seeking a competitive advantage. Therefore, it is increasingly common for innovative, forward thinking companies to break the mould of traditional business methods. Channels are becoming an increasingly important area for companies to innovate (Musso, 2010) including channel relationships, as well as, changes in structure and the creation of new channels. However, these channel innovations bring new challenges in regards to experience management. As customers have different motives (such as recreational orientation, convenience orientation, independence orientation, delivery-related risk aversion and product and payment related risk aversion), it is important for retailers to manage the experience across varying channels using common processes and leveraging information given by the customer (Schröder & Zaharia, 2008; Musso, 2010).

Many forward thinking retailers, such as Starbucks and Victoria's Secret, aim to provide an engaging experience across channels (Verhoef, Lemon, Parasuraman, Roggeveen, Tsiros & Schlesinger, 2009). The experience involves both the customer's response to the retailer (cognitive, emotional, social and physical responses), as well as elements controlled (service, retail atmosphere, price) and uncontrolled by the retailer (influence of others, purpose of shopping) (Verhoef et al., 2009). This includes the entire customer purchase and brand experience, which encompasses multiple channel experiences.

Branding literature suggest that strong, positive emotional connections with a brand equates to a loyal customer (Pine & Gilmore, 1998, Mattila, 2001). Since its discovery, designers have sought to design experiences to foster these positive emotional connections. Although not an exact science, this is usually done through understanding users and understanding the customer process pre, during and post interaction with a company (Morrison & Crane, 2007).

The design and management of channels produces ripe opportunity to strengthen brand recognition and create a loyal customer base. It is the proposition of this research that designers are especially equipped with the skillset to capitalise on such opportunities.

Current literature and industry evidence shows that designers are capable of designing products, services and experiences that embody the brand values of a firm. However, present literature does not examine the design process of multi-channel strategies that embody the brand values of a company. This research aims to explore this gap by investigating a range of

companies' channels using a content analysis technique to create a channel analysis framework. An emphasis was placed on the design impact within these organisations and multi-channel strategies. Successful companies were those who were able to provide a brand experience that reinforces the brand value throughout its key channels. A multi-channel design tool is presented to aid companies in the design and management of channels, specifically, the seamless translation of a brand value through a multi-channel strategy.

## **Multi-Channel Customer Experiences**

Hoffman and Bateson (1997, p. 6) suggest, "when a consumer purchases a service, he or she purchases an experience". The main concept that lies at the core of design is user experience, expanding beyond usability and requires treating the user holistically as a feeling, thinking, active person (Jordan, 2000). Desmet and Hekkert (2007) distinguished three components of product experience, as aesthetic pleasure, attribution of meaning and emotional response, which are the feelings and emotions that are elicited. In comparison, multi-channel customer experiences, include the interaction between the customer and the channel, which may include interaction with employees (in store) or via technological platforms (social media). Both design and multi-channel strategies require a holistic understanding of the user to elicit an experience.

The design and management of a company's channel is an opportunity to strengthen brand recognition and enhance customer loyalty through these emotional experiences. A loyal customer can only be developed if a company can build emotional connections, in addition to positive attitudes and behaviours (Shoemaker and Lewis, 1999, Mattila, 2001).

However, as customers engage with many channels at once, thought should be directed to the development of an overall channel experience. Customers often interact with both, physical and digital channels through the engagement with a company. Most notably, online purchases are one of the most rapidly growing forms of shopping, with sales growth rates that outperform buying through traditional retailing channels (Levy & Weitz, 2001). This environment is leading to the rapid market entry of new experience brands, developed through the innovative use of web technology and leading to an increasing variety of customer experiences (Nunes & Cespedes, 2003).

The pre and post experience strategies of these channels are less in the domain of an experience designer, however, designing the customer experience has been the subject of design research. The pre-experience stage focuses on managing brand messages and the product or service's core customer while the post stage focuses on reaffirming brand messages and making the customer return. The experience stage is the most vital and susceptible to the influence of a designer. The goal is to create what Pine and Gilmore (1998) refer to as a "sweet spot" or by Csikszentmihalyi (1997) as "flow" allowing customers to be immersed in the experience. Designers create this though influencing both the physical and relational aspects of the experience (Pullman & Gross, 2004). However, generally a designer has more control over the physical aspects such as colour, space and function, with only limited control over the relational or emotional side. This is commonly due to the intangible and unpredictable nature of these elements.

## **Understanding the True Value of Branding**

Branding no longer revolves around only adding value to an offering, but represents and promotes a lifestyle and culture to the customer (Fan, 2005). This increasing sophistication reflects changes in the business environment, particularly channels and the integration of customer insight, in regards to creating value (Knox & Bickerton, 2003).

Company brand perceptions have the ability to influence their customer's experience (Verhoef et al., 2009), purchase behaviour (Fitzsimons, Chartrand & Fitzsimons, 2008) and a customer's post evaluation of the shopping and purchasing experience (Ofir & Simonson, 2007). When brand perceptions are engaged prior to the purchase process, the customer purchase experience can also be influenced. However, it is also important to consider what influence branding has on the customer purchase process over a period of months and years. Brand loyalty is said to have a key influence on this process, as it indirectly links brand trust and the influence of branding on the purchase process (Chaudhuri & Holbrook, 2001). Brand loyalty represents a measure of attachment that a customer has to the brand, reflecting the likelihood of engagement in the experience, leading to recurring purchase (Ghodeswar, 2008). Keller and Lehmann (2003) propose that the customer mind set is the key driver of brand performance. If the customer is engaged in the experience and brand over recurring engagements, it has the potential to have a significant affect on the

perception of the brand (Verhoef et al., 2009). However, with the growing amount of product, service offerings and channels, companies are faced with the challenge to unify their brand value across multiple channels in a way that is consistent in engaging their customers.

## Current Multi-Channel Strategies

As with brands and company operations, the perspective of channels and their management is shifting towards a more customer centred approach. Traditionally, the focus of channels has been on the functions performed by a company's distribution system. This is the interdependent organisation's (manufacturers, wholesalers, distributors, retailers) process of making an offering available to the customer (Coughlin, Anderson, Stern & El-Ansary, 2001). However, this traditional view of channels is shifting due to emerging perspectives that involve value-adding chains to a larger network of customers. Emphasis is now on channels being the point of conception, promotion and delivery of positive customer and brand experiences (Gundlach, Bolumole, Eltantawy & Frankel, 2006).

Multi-channel strategies and experiences have become a standard approach to reach customers (Verhoef, Neslin & Vroomen, 2007). This approach spans many industry segments such as, retail, travel, banking and technology (Kumar & Venkatesan, 2005). However, this has not always been the case. Traditional multi-channel strategies were developed from market segmentation with companies targeting a certain channel to retail their product or service to a particular market segment. Another company would choose a different channel to appeal to a different customer and so forth (Nunes & Cespedes, 2003). Until recently a customer would stay with one channel (e.g retail store) until the purchase was made. However, today's customer is routinely channel hopping, opting for a multiple-channel experience, which is largely driven by online stores (Nunes & Cespedes, 2003). This has been notably driven by the popularity of online shopping and the transparency of company information, as customers can search for information at one channel, purchase at the next and retrieve the product at another channel (Dholakia, Zhao & Dholakia, 2005; Magnini & Karande, 2011).

Operating multiple channels, digital and physical, allows a company to cater to the differing and evolving purchasing motives of its customers (Schröder & Zaharia, 2008). The key issue for a company is how it can best fulfil its customers needs by offering different channels to engage and

purchase. Furthermore, it is important to know how customers behave and their motives to design a relevant brand and customer experience across these channels (Schröder & Zaharia, 2008). Lee, Chung and Nam (2013) discuss the wide range of designable factors (touchpoints or channels) within the service industry. Which include the need to harmonise physical commodities, virtual interface and service personnel. Other models include the “Design Touchpoint Wheel” (Voss & Zomerdijk, 2007). However, the role of design in the creation of a multi-channel strategy is still emerging as a field of research.

## **The Position of Design in Multi-Channel Strategy**

Traditionally design has been employed by businesses to create an artefact or type of outcome based on marketing research to enhance product development and sales. It is only in recent history that the use of design at an organisational level has been investigated. Coincidentally, design has long expanded from designing products by venturing further into the coordination and managing of experiences, services and even brands in relation to their customers. Examples of this include Wuts, Person, Hultink and Brands (2012), who in the context of video game design created a comprehensive framework for the translation of a brand into digital media. This framework outlines a strategy to translate the values of one brand into one specific media. Furthermore, Karjalainen and Snelders (2010) reinforce brand recognition by exploring case studies involving the translation of brand values into the design of physical products. Examples of brands that do this well include Caterpillar, Volvo and Nokia (Karjalainen & Snelders, 2010), as their products successfully reflect the company’s brand value. These two examples demonstrate the opportunities and position for design in the establishment of brand value through products, as both outline the successes and failures that designers have had in the translation of brand values into products. Designers are equipped with skills such as prototyping, visualisation and the mind set to see problems as opportunities for the invention of new alternatives. Prototyping and visualisation are cornerstones of the design process (Evans, 2011). Evans (2011) outlines that designers use these skills to conceptualise and communicate the future in a variety of ways and at a range of levels to develop, refine and communicate versions of the future. These visions of the future provide organisations with mechanisms to develop an understanding of the potential viability of new products and services.

# Methodology

## Research Design

The aim of this research was to identify how different retail companies design multi-channel strategies to communicate their individual brand value. For this study, a content analysis methodology and investigator triangulation analysis technique was used to decipher channels strategies of sixty companies. These companies were selected from the retail industry and other selection criteria included the number of employees, age, and location. These criterions were deliberately pre-defined to ensure the selection of a broad spectrum of companies of varying channel maturity. The research process was separated into two phases, with four distinct stages (Figure 1).

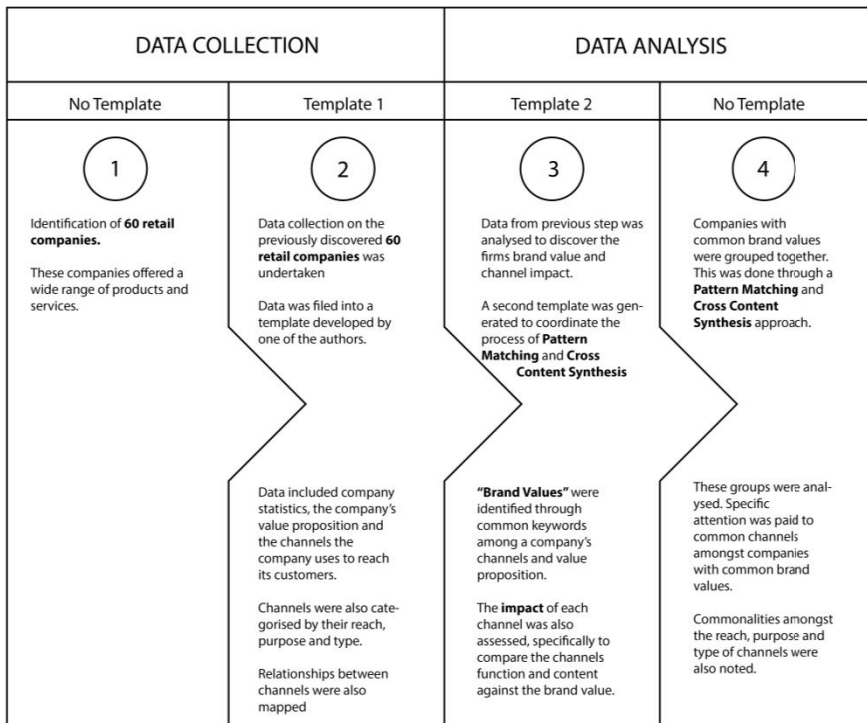

Figure 1 Research Approach

There were two main advantages of using this approach. Firstly, the use of data triangulation allowed for greater accuracy of information despite limited access to official company documents. This was due to investigation of a wide variety of third party sources. The use of this technique was based on Begley's (1996) research on data triangulation. Secondly, the use of multiple investigators, particularly in the analysis of secondary sources proved vital in understanding the common meaning among sources. This was based on Denzin (1978) and Thurmond (2001) belief in the use of multiple investigators for confirmation purposes.

### **Stage One – Data Collection 1**

Stage one involved the identification of sixty retail companies. These companies offered a wide variety of products and services. The identification of these firms came from a pre-existing criterion developed by the research team. Criteria included company size, age, business model, industry and channel use. Key criteria involved the need for companies to have a wide range of physical and digital channels. The size of companies related to the number of employees ranging from under 50 to 10,000+ employees. Age of the company was in reference to when it was established, with the oldest company established in 1884 and the youngest in 2012. All companies were B2C companies and were purposively sampled to provide a range of companies within the retail industry.

### **Stage Two – Data Collection 2**

Stage two involved collecting basic information on the firm (i.e. age, size), their customers, company value proposition and the channels the company uses to get to their customers via third party sources. The research stage also involved labelling each channel by its type, reach and purpose (Figure 2). This information was then mapped onto a predesigned data sheet developed by the research team, which illustrate channel relationships and customer interaction (Figure 3).

Figure 2 An example of a channel within data collection from stage two. The symbols indicate that it is a digital channel, its key purpose is revenue, information and support and has worldwide reach

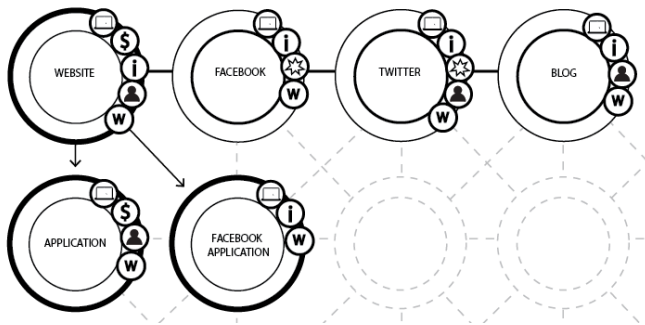

Figure 3 This figure shows the previous channel now in conjunction with other channels this particular business uses. The diagram suggests that the digital elements are the most important elements to this firm and they function to push the user towards their application, the main revenue stream of the company.

### Stage Three: Analysis 1

All sixty companies were assessed in regards to how well (coded as design impact) each channel represented their main brand value to the customer segment (Figure 4). This was approached by investigating each channels emotive purpose and content in relation to its brand value and customer relationship. This was achieved through a cross-content synthesis technique triangulation approach (Begley, 1996; Kolbe & Burnett, 1991) to discover common channel functions to communicate company brand values.

Brand	Brand Values	Channels	Design Impact	Channels	Design Impact
 <b>Company:</b> Mattel <b>Location:</b> California, USA <b>Industry:</b> Consumer Products (Toys)	- Playful, Wonder - Enhancing the lives of children - Caring - New and Old - Trust, Safe  Brand Values diluted by its portfolio of smaller brands, each have their own identity  - Wonder and Playful  - Classic and New Entertainment  - Safe, fun experience		<b>Notes:</b> - Really just a portal to their smaller, owned brands and corporate investor website		<b>Notes:</b> - Direct interaction with customer and users. - Better emotional connection through product launches - Fun and safe environments
			<b>Notes:</b> - Conveys the right information about the brand, but doesn't instill it in the channel Info based, little interaction with traditional customer		<b>Notes:</b> - Little to do with products but brand values comes through. Philanthropy, Caring, Trusting, Happy all ad to the brand
			<b>Notes:</b> - Information heavy - Does not get brand values across well. No toys, wonder, playfulness		<b>Notes:</b> - Brand gets lost in the store - "Toy Store" values are somewhat universal. Still retains many Mattel values

Figure 4 An example of Stage 3: Analysis 1

### Stage Four: Analysis 2

Stage four involved the cross-comparison of all company results from stage 3. This was done by grouping companies with similar brand values. This analysis led to four key themes and the creation of the four meta-models. This grouping allowed the researchers to see not only common channel choices within the themes, but also common trends in the channels type, purpose and reach. Giving insight into how companies use one or two common channels to translate their brand value.

## Results

These four meta-models consist of a common brand value and intended emotive experience. In each meta-model, multiple individual channels are used to convey this to the desired customer segment (seen in figure 5-8).

### High Quality

High quality brands centred their channel strategy on their key offering, in most cases a physical product. Furthermore, each company used their channels to design a high quality environment to support this key product. This usually involved a compelling physical presence through a brand-aligned store, matching partner relationships, accurate and targeted communication strategies and the creation of a sub community surrounding that core product. The emotive experience of exclusivity was portrayed

through the creation of this sub community. Figure 5 outlines the most common individual channels found in companies displaying the band value of high quality and emotive experience of exclusivity.

Figure 5 High Quality Meta-model

Companies with the brand value of high quality focused heavily on two key channels. One consisted of the company's product offering (e.g. electronics, fashion or food items), the other was point of sale through a physical retail store. Along with these two key channels, two supporting channels such as, advertising, pop up stores or partnerships were found.

Bang and Olufsen, Kate Spade, Zara and Nespresso are examples of companies using this meta-model. Bang and Olufsen and Kate Spade created the experience of exclusivity through their retail stores and products by sparsely locating their physical retail stores through leading capital cities with a high price point of their products. Due to this, many customers may feel excluded or limited to the purchasing process highlighting the emotive experience of exclusivity to those who can. Retailer, Zara's exclusivity is created through both company driven and customer driven trends. The retail stores are more accessible and products are available at a lower price point, yet exclusivity is solely created through product availability. As the company produces only a small amount of each item and limits its shelf time.

Nespresso on the other hand, operated on the other end of the spectrum. Their products are high quality within their market, yet still affordable, mass produced and attainable for most consumers. Interestingly, they are able to create exclusivity through high profile advertising and capturing customers into a company/product system. A sub culture has also emerged surrounding the purchasing and consumption of its products. Retail stores, known as *Nespresso Boutiques* invite coffee lovers to experience the 'art of espresso' (Nespresso, 2014). First purchasers

gain exclusive membership into the Nespresso club, which is required to purchase products online and keeps track of all products purchased in store.

Through aligning the three key channels, product, point of sale and a website or firm specific channel, to promote the brand value of high quality, it enables users to have a greater experience of exclusivity.

### *Trust*

Key channels found in the meta-model of trust were the company website, multiple product lines and third part retailers with supporting channels such as expos, theme parks and corporate sponsorships.

The emotive experience of the meta-model trust was developed through the company's rich history, tradition or story, and through consistent product or service performance.

Toy companies, Lego and Mattel as well as established alcohol manufacturer, Jack Daniels used traditional channels such as toy expos, theme parks and associated corporate sponsorship respectively to communicate with their consumers. These channels were chosen and designed to achieve brand recognition, as well as, awareness to previously earned trust. This was particularly important for these product-centred companies, where most of their trade was conducted through third party retailers.

The channels used by these brands had little to do with earning revenue; as there are no "call to action" or direct sale message in these channels. These channels were purely designed to reiterate the product and company's story. The design elements in these channels were generally emotive, had little to do with actually selling the product while heavily pushing a lifestyle surrounding consumption or use. Through aligning the key channels, website, product (linked to third party retailers) and a sponsorship/lifestyle channel, it was found to enable customers to develop their own experience of trust with the brand, through the history, tradition and story.

Figure 6 Trust Meta-model

### Convenience

Convenience brands use one key channel as the main method of interaction, while supporting channels provide cost and time saving methods of engaging customers to funnel them to the key channel. In the retail sector, convenience brands were found to be predominantly digital companies such as Netflix, Trivago and Webjet. These companies often have no physical channels and reached their customers through their website, as well as social media, advertising and customer support. Due to being digital brands, these companies also have fewer channels.

In the meta-model of convenience (Figure 7), channels aimed at providing tailored methods for the customer to interact with the company, as well as directing customers to their website as a point of sale. Through extending the brand through complimentary channels, convenience is provided to the customer, reinforcing the brands value.

Figure 7 Convenience Meta-model

However, the design impact of the brand value convenience was found to misalign to the original emotive experience intended in the key channel, by attempting to service all possible channels of reach rather than focusing on aligning each of their channels to their brand value and emotive experience.

The brand value of convenience is driven by the emotive experience of cutting time and cost savings for the customer and revenue for the company. Customers perceive these brands as convenient due to their affordability and ability to suit their lifestyle. While on an organisational level, it provides brands with a method of connecting and engaging with customer's lifestyles and driving revenue through their core channel.

An example of this is Netflix a company in the music and video industry, which aligns their website to their brand value, as the core channel providing the main product service offering. Although it is important to align this core channel with the company's brand, it is also critical to align supporting channels to effectively funnel users. Trivago an online travel company misaligns their social media across several regional accounts and platforms, due to irregular posting and also very limited interaction with users. This limits the ability for the channels to engage with their users and lead them back to the website. However, in contrast, Webjet, a similar travel company connects with users on several of these social media platforms through engaging regular posts allowing users to stay connected to travel specials as they go about their day. Webjet also utilises email and online chat as an effective method of support, accessible as users are interacting with their website.

Through aligning the three key channels of convenience for digital retailers; website, social media, customer support to promote this brand value, it enables users to have a cost and time saving experience with the brand. There is greater need to aligning these channels in order to portray convenience, as customers should be efficiently funnelled to the source of revenue efficiently.

### *Community*

It was found that the meta-model of community was often perceived as a local brand, despite being global. To achieve this local brand perception, organisations were found to employ channels such as; physical stores or website, social media and blogs, as well as local support (Figure 8).

Community brands included companies operating in both the digital and physical spheres. However, while physical brands are more prevalent, they also provide support through complimentary digital channels. Community brands were found to include Whole Foods Market, Zipcar and the digital company Threadless.

Physical companies often had their key channel as the physical store, connecting with the community through local community foundations and

programs, customer service as well as social media, websites and blogs. The perception of being a local company (even though all are global) is seen, as they are able to connect to smaller communities through support channels.

Digital community companies use their website as their key channel and offer smaller support channels through blogs, forums, competitions and social media. Rather than creating a physical community these companies aim to create digital communities.

Both physical and digital companies reach out and support local communities, providing a personal and local approach. Supporting channels that also aligned with the brand value of community included localised programs, ethical policies, employment opportunities, services and providing unique support based on current needs.

Whole Foods Market, a health and environment focused supermarket, align their local support channels such as foundations and local donations to the brand value of community. This is done through linking to charitable efforts and promoting community and educational involvement, providing unique support to each local community that Whole Foods has a physical store, as well as global support. Further, they encourage local involvement through their digital newsletters and blogs, reinforcing their mission and creating transparency through blogs from owners, executives and users. Essentially, they create a business about people and further align all of their channels to the brand value of community, allowing a consistent message, heightening the customer's experience. Whereas Zipcar, a car sharing company, aligns their website as their core channel. This allows users to stay connected and access the various touch points of the brand, while also being convenient to use. Zipcar also aligns their social media platforms with this brand value, through allowing interaction and also engaging content.

However, Threadless an online community focused clothing retailer, misaligns their social media through not encouraging users to interact with the brand and rather using the platform as a promotional tool. Through not interacting or engaging with customers, rather just linking them to their website, they are in effect "funneling" the potential community to their website community, which has been aligned.

These brands focus on supporting their customers, enabling them to feel as though they are apart of a community.

To provide the experience of support, brands have to engage with customers and provide the crucial human front to the company that customers connect with. As the company connects with customers through

these channels, the brand value of community is formed by localising and engaging support.

Figure 8 Community Meta-model

## Implications

By operating multiple channels, digital and physical, a company can cater to the differing and evolving purchasing motives of its customers (Schröder & Zaharia, 2008). However, it is important to know how customers behave and their motives in order to design a relevant branded customer experience across these channels (Schröder & Zaharia, 2008). Companies should question their multi-channels strategy, asking if the experience across these channels aligns to their brand value. At present, there is little literature investigating how design can be used to satisfy this objective, yet design as a field has been successful in understanding emotions elicited throughout the customer experience.

The findings from this research include four meta-models, outlining trending brand values communicated through multiple channels to create an emotive experience for the customer.

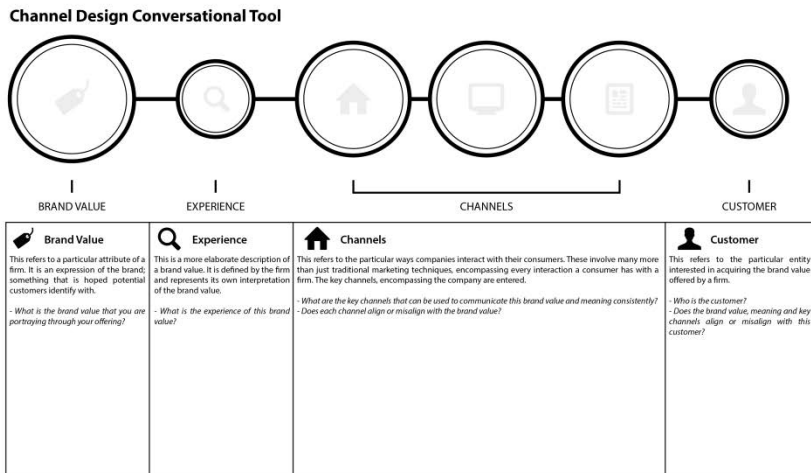

An outcome of this process has generated a multi-channel design tool (Figure 9). It is envisaged that the tool will provide opportunities through visualising the process, allowing channel selection to be considered in relation to the brand value, experience and customer.

Through the use of the tool, companies can test if their brand value is being correctly communicated through existing channels to their intended customer. To use the tool the company must first identify the brand value that they embody or wish to portray through their offering. The experience of this brand value can then be interpreted further through analysing what the brand value means. Referring back to the example of the high quality meta-model the brand value is further defined through the emotive

experience of exclusivity. The key channels used to reach the customer can then be identified. Through designing and assessing each element in the tool, companies can quickly prototype and evaluate alternative multi-channel designs that cannot only reach their customers but connect with them.

It is anticipated that this tool will start the conversation and to help create consistent and seamless translation of a brand value from the company to its customer, across a variety of channels. The advantages of this approach allow firms to play off the strengths of individual channels and to understand the larger customer channel experience.

Figure 9 Multi-Channel Design Tool with Prompts

Furthermore, the authors believe this tool is only the first step and could also be adapted to other business situations. As new channels emerge and multi-channel strategies become more complex the challenge is in maintaining and managing this experience. However, strong, positive emotional connections with a brand experience can equate to a loyal customer. It is the proposition of this research that designers are especially equipped with the skillset to capitalise on such opportunities, by connecting with customers and understanding and providing an emotive experience.

In conclusion, a limitation of this study is the nature of the secondary data sources employed. While this research is able to provide a broad

overview, it is however unable to reveal the underlying company motives for the observed patterns. Intended further research will assess primary data sources to compare such findings.

## **Introduction**

The market for luxury goods and services is expanding rapidly. For instance, the global luxury goods market was valued at more than €200 billion in 2012 and is expected to reach €250 billion by 2015 (Bain & Company, 2013). On the one hand, the demand for luxury goods is growing quickly as incomes rise in the advanced countries and as the middle classes of emerging countries expand. On the other hand, the label of luxury is being attached to an increasing number of goods and services. The extension of the term begs the question of what is actually meant by luxury and exposes its ambiguous nature in the contemporary context. The label 'luxury' evokes vague and often unknown qualities that give a product or service the capacity to command a substantial price premium. Hence, in this paper, I will argue that a core component of luxury is ignorance, or the unknown, and that ignorance has a place in the design, promotion, and consumption of luxury.

Much attention has been devoted to developing understandings of the place of expert knowledge in the production of luxury artefacts (Ricca and Robins, 2012; Tungate, 2009) and knowledge of the management of luxury brands has grown rapidly in the past decade as the increasing number of books in the area attest (e.g. Hoffmann and Coste-Maniere, 2012, 2013; Kapferer and Bastien, 2012; Chevalier and Mazzalovo, 2012; Okonkwo, 2007). In contrast, the role of ignorance has been ignored. Yet, luxury is often marketed through the promotion of mystery and vague and ambiguous references to undefined but somehow exclusive qualities. The place of ignorance in the field of luxury is not confined to marketing and consumption; it is also evident in the experimentation and exploration that is necessary in the design and development of new luxuries.

Following an examination of the contemporary meaning of luxury, drawing on a critical engagement with the work of Berry (1994), this paper will delineate the role of ignorance in the fields of luxury design, promotion, and consumption. This will be achieved through the application of a typology of ignorance, recently advanced in the field of organizational studies (Roberts, 2013), as a lens of analysis. Hence, this paper will provide a conceptual contribution to understanding of the relationship between luxury and ignorance through a systematic examination of the place of ignorance in the design, promotion, and consumption of luxury goods and services. In so doing, a typology of ignorance of relevance to luxury will be

developed which will be of value to producers, promoters, and consumers of luxury. Understanding the place of ignorance in the field of luxury will give those engaged in its design, promotion, and consumption a deeper appreciation of the meaning of luxury, and, particularly, the unknowns that constitute an inherent element in all that is classified as luxury.

## Defining and Knowing Luxury

### *What is luxury?*

In popular discourse, luxury is often associated with expensive elegant and refined products and services of the highest quality. Additionally luxury is related to excessive quantity and viewed as superfluous or unnecessary or an indulgence. In his highly influential book on *The Idea of Luxury*, Christopher J. Berry (1994) provides a detailed exploration of luxury and defines it as the opposite of necessity, in that it is distinct from basic needs, which are non-intentional and universal. Therefore, for Berry luxury is the object of wants and desires. Yet, he goes on to argue that luxuries must be the object of socially recognized desire, and, as such, they are believed capable of giving pleasure rather than merely relieving pain.

What is clear from Berry's (1994) analysis is that luxury cannot be objectively defined because it depends on cultural, social, and individual meanings. Goods which may be regarded as socially non-necessary may be 'needed' by an individual either in a specific instrumental sense or because they are the object of intense desire (i.e. psychologically necessary) or intense identification (e.g. cherished objects). Consequently, not all unnecessary goods or services are luxuries to everyone.

Conspicuous consumption (Veblen, 1899), which is so often associated with luxury goods and services, can be interpreted as the instrumental consumption of luxury with the purpose of signalling status. Hence, some consumption of luxuries may actually be necessary for individuals to maintain their social position. In such cases, the consumption of luxury can be a necessity in which case it is no longer a luxury. For Berry (1994, p. 41), then, '*luxuries are those goods that admit of easy and painless substitution because the desire for them lacks fervency*'. They therefore have a high cross elasticity of demand because they are easily replaced by substitutes. Luxuries also have a high income elasticity of demand, so as incomes rise above an amount required to satisfy basic needs the demand for luxuries grows by a higher proportion than the rise in income.

In contrast to Berry (1994), Armitage and Roberts (2014) offer an alternative definition of luxury goods and services inspired by Marcuse's (1964) critique of the minority of the elite who irresponsibly follow their economic desires or 'false' social needs. Hence, Armitage and Roberts define luxuries 'not as painless substitutes lacking fervent desire but as alienating surrogates saturated with the urgent sense of a life determined by external forces, and consequent lack of control or authenticity and oneness with ourselves.'. Highlighting the complex nature of luxury, Armitage and Roberts go on to note that:

*The irregular meanings of luxury goods and services are now more willingly comprehended as the necessary perception and manifestation of a diverse range of interpersonal yet relative conceptions of human existence across different worlds and spheres from bottled water and high fidelity music to live-in domestic servants and personal financial brokers. We are brought consequently to a many-sided and discursive model of luxury as unnecessary, conducive to enjoyment and ease, costly, difficult to acquire, extravagant, and to the debates this in turn inexorably produces. (Armitage and Roberts, 2014)*

From a business and marketing perspective Chevalier and Mazzalova (2012, p. xviii) argue that a luxury product must meet three criteria. Firstly, it must have a strong artistic content; secondly, it must be the result of craftsmanship; and, third, it must be international. The link between art and craftsmanship and luxury is not new. Works of art and the products of craftsmanship normally require high levels of skill, time and expensive materials. Hence, their consumption has been the preserve of wealthy individuals and institutions. Nevertheless, changing income levels and techniques of production have made these products increasingly available to a wider range of individuals since the late 20<sup>th</sup> century. Chevalier and Mazzalova's (2012) suggestion that for something to be a luxury it must also be international is very much a consequence of globalization in the latter part of the 20<sup>th</sup> century. It is also embedded in a business perspective on luxury which is concerned with market size and expanding geographical reach of brands as a means to produce sustainable profits, especially among the large luxury sector conglomerates like LVMH, Kering, and Richemont.

If luxury is international, it must be recognized as such in various different locations and different cultures. This suggests that there is a homogenizing process. Yet if luxury is socially constructed and we live in a

diverse social world, how can luxury be recognized as such across the globe? The international recognition of items as luxury occurs among a global elite who have more in common with one another than they do with their fellow compatriots. A wider population aspires to join these elite and they satisfy these aspirations by imitating their consumption behaviour.

Luxury has also been classified in terms of its accessibility by Danielle Allèrès' (1990) who identifies three levels of luxury, namely, inaccessible (exclusive unique items), intermediate (expensive replicas of unique items), and, accessible (factory produced and in large production runs). In the contemporary era, we are seeing a democratization of access to luxury, with the proliferation of terms like, new luxury, mass luxury, and masstige. According to Kapfere and Bastien (2012), this is the result of, on the one hand, the efforts of traditional brands to trade up, and, on the other hand, the drive for profits among luxury brands by offering products and services to a wider market. Such changes also reflect the fragmentation of the production process, such that the design of goods and services may involve significant artistic inputs and craftsmanship, but the final products and services can be mass produced without any loss of quality. Moreover, globalization has given rise to highly profitable niche luxury markets that can be reached through the Internet and social media platforms (Anderson, 2008) as well as in the transit lounges through which the wealthy pass en route to their next destination. Regional and national niche luxury markets can now be aggregated into highly profitable global markets in which producers are able to gain economies of scale, yet because their products are distributed across the globe, they remain relatively exclusive.

The meaning of luxury varies through time and space, and across economic, social, and cultural contexts. For instance, in 1900, a telephone would have been a luxury, but today it is a necessity in most parts of the world. Additionally, the possession of an Internet-connected computer may be regarded as a luxury in present day least developed countries, yet this is seen as a necessity in advanced nations. Moreover, the meaning of luxury has become stratified reflecting a hierarchy of luxury. In this short paper, it is not possible to explore luxury from the perspective of all these different times and locations or across all economic, social, and cultural contexts. Consequently, luxury in this paper is viewed from the perspective of an individual in an advanced market.

### *Knowing luxury*

Given the changing nature of luxury, how do we recognize luxury goods and services? How do we *know* luxury? How do we distinguish it from standard or premium goods and services? Does the addition of the label 'luxury' transform a produce into a luxury? Visiting coffee shops like Caffè Nero in the UK you may consume a 'luxury scone' with your coffee – but to what extent is the scone a luxury? Or, is Andrex® Touch of Luxury, the most luxurious product in the Andrex toilet tissue range, really luxury? According to the marketing information, the Shea Butter 'enriched sheets, scented inner core and luxurious dark brown packaging are designed to give you a fabulous feeling.'<sup>11</sup> What this product description captures is an important element of luxury – 'feeling' and this is not merely the feel of the tissue on the skin, it is much more than this. The feelings that luxury brands seek to evoke in their customers are emotional – senses of deserving and the desire to fulfilling dreams (Kapferer and Bastien, 2012). While expensive toilet tissue may be within the reach of many people, the high end products of luxury brand companies are promoted as items that we should aspire to own. While we might not all be able to afford such products we can all appreciate the quality and craftsmanship that goes into their production.

The luxury label is being adopted as a marketing tool for an increasing number of products. Whilst simultaneously, traditional luxury producers are extending their reach into wider market segments. So, how do consumers know luxury? Marketers stimulate false desires in consumers based on the promise of some ephemeral quality labelled 'luxury'. From the perspective of a producer or marketer the label 'luxury' offers an opportunity for product differentiation, and, thereby, the opportunity to increase revenue by securing larger market share through differential pricing.

Because there is a high level of ambiguity and uncertainty in relation to what luxury is, knowing luxury is open to manipulation. Consumers need support in differentiating luxury from premium and standard products and services. Thus, consumers are willing to accepting the opinion of luxury 'experts'. Consumers give way to the authority of the companies and their retail staff – who 'really' know the products and their 'authentic' luxury qualities. Consumers put their trust in brand names and their reputations. It

is for this reason that luxury goods and services normally have a strong narrative that can imparted to potential customers the luxury characteristics including quality, rarity, heritage, timelessness, and, so on. There is no need to provide all the technical details, rather the story itself is what is important, because it speaks to the emotions of consumers and feeds the desire to possess the luxury good or service in order to be part of the story. Hence, luxury can provide a sense of belonging and identity, a sense of history, heritage, and an association to revered qualities that are embedded in the brand narrative. In the individualized society, people look to consumption for their sense of identity but in the advance societies the choice can be paralysing (Bauman, 2001). Hence, stories that link into an historical trajectory provide a promise of security. Buying into luxury is buying into well established and long sought after way of living – a way of living that has a past and a future trajectory.

Knowing luxury through an appreciation of the expertise and craftsmanship that goes into the production process (Ricca and Robins, 2012) is not always accessible to consumers. This type of knowledge requires time to acquire an appreciation of the materials and techniques involved in the production process. In contrast, the presentation of the key features of the luxury in story form gives customers quick access to understanding the product or service. Through a well-constructed narrative, a product can gain all the attributes required to become desirable and a symbol of luxury to many consumers. Such heritage stories are presented to potential customers through a wide range of media from television, newspapers, magazines, and the Internet and social media platforms. In this way, the false desires identified by Marcuse (1964) are stimulated in relation to the need to possess and experience luxury products and services.

Yet, the heritage narratives developed by luxury companies are open to embellishment, and, consequently, do not always represent a 'true' rendition of the history of a product or service. The stories associated with a luxury are open to multiple interpretations, as is the meaning of luxury. In this sense, there are ambiguities associated with luxury and unknowns. It is, therefore, necessary to recognize the role of ignorance in the field of luxury.

## **Ignorance and luxury**

Prior to exploring luxury's relation to ignorance, it is necessary to consider briefly, what the term ignorance means. Drawing on Roberts (2013), a typology of ignorance is outlined below. This typology provides a

lens through which to analyse the relation of luxury to ignorance. As a core component of luxury, in the form of unknown and vague qualities, ignorance has a place in the design, promotion, and consumption of luxury.

### *Ignorance*

Ignorance is usually defined as a lack of knowledge or information (*OED*, 2003: 862). If knowledge is defined as 'justified true belief', ignorance can be viewed as the absence or distortion of justified true belief. One might then argue that ignorance is the absence of empirically valid knowledge. However, as Smithson (1989) notes, the adoption of this approach requires established criteria for absolute knowledge or truth, yet knowledge may be socially constructed, so truth, and the absence of truth, depends on a given perspective or system of belief. Hence, like knowledge, ignorance may be socially constructed.

Related to ignorance is the condition of being ignorant, that is, of lacking knowledge. To be ignorant is also associated with being rude, discourteous, or stupid. A person with no knowledge may be referred to as an ignoramus. Moreover, to ignore refers to a failure or refusal to notice something or someone.

Of course, any attempt to gain an appreciation of ignorance is dependent on knowledge of its existence. Ignorance may take the form of a *known unknown* or an *unknown unknown* (Gross, 2010; Proctor, 2008; Witte et al., 2008). Ignorance, as *known unknowns*, denotes knowledge of what is known about the limits of knowledge; there are certain things that we know that we do not know. Ignorance, as *unknown unknowns*, refers to a total absence of knowledge, such that we are not aware of our ignorance. *Unknown unknowns* are completely beyond anticipation, and, as Gross (2010) notes, the revelation of such ignorance can be a source of surprise. Even so, experience tells us that in the future some unknown unknowns will be revealed. Both known unknowns and unknown unknowns derive from an absence of knowledge.

Other types of ignorance also warrant consideration. Ignorance can, for example, result from ignorance about knowledge, which gives rise to *knowable known unknowns*, *unknown knowns* and *errors*. A *knowable known unknown*, which Congleton (2001) calls rational ignorance, differs from a known unknown in that it is knowable given sufficient motivation and resources to acquire it. *Unknown knowns* refer to things that we do not know that we know (Witte et al., 2008). They include the tacit knowledge that individuals are not always aware that they possess (Polanyi, 1967).

Unknown knows denote ignorance of existing knowledge rather than ignorance itself. Such ignorance does not prevent the use of the unknown knowledge. *Errors* arise from distortion, founded on confusion or inaccuracy, or incompleteness, based on uncertainty or absence (Smithson, 1989). Errors can occur because of the limited cognitive capacity of humans (Simon, 1955).

A further type of ignorance emerges from the refusal to recognize knowledge or its unconscious suppression; this includes *taboos* and *denials* (Witte et al., 2008). A *taboo* is socially constructed ignorance in the form of a social prohibition or a ban on certain knowledge, perhaps because it is viewed as dangerous or polluting. For instance, knowledge of the 1989 student led protests and subsequent massacre in Tiananmen Square are taboo in China. *Denials* represent the ignoring or repressing of knowledge that is too painful to know or that does not fit with one's current understandings of the world. Knowledge that does not correspond with one's existing cognitive frameworks creates a degree of dissonance, which can challenge understanding. Tolerating such cognitive dissonance through denial is a common response and is sometimes referred to as wilful ignorance or wilful blindness (Berry, 2008; Heffernan, 2011). The loss of a loved one can initially evoke such ignorance.

Ignorance also arises from the conscious suppression of knowledge through *secrecy* either by individuals or by organizations (Proctor, 2008). Ignorance arises for individuals and organizations when they are subject to the secrecy of others. Certain types of secrets may be socially sanctioned, such as those arising from the individual's right to privacy. Hence, ignorance can also be identified with *privacy* - the ability of an individual or group of individuals to restrict access to, or information about, themselves. Unlike secrecy, privacy is multilateral in nature and it is enshrined in the laws of many countries and in the United Nation's Universal Declaration of Human Rights. Existing and evolving social and cultural practices together with information and communication technologies also determine patterns of privacy. For instance, the disclosure of private information about celebrities by members of social media sites like *Twitter* and *Facebook* is currently testing the enforcement of privacy laws.

The types of ignorance detailed in this section can exist at various level from the individual to the organization and beyond to society as a whole. In the discussion that follows, attention is focused on ignorance at the level of the organization and the individual.

## Luxury's relation to ignorance

Having examined ignorance it is now possible to consider how ignorance and luxury relate to one another. In particular, ignorance is explored from the perspective of the organization producing and promoting the luxury product or service as well as from the consumers' point of view. In the subsections that follow, the forms of ignorance identified in the previous section are considered from the perspective of the design, promotion, and consumption of luxury. In this way, a typology of ignorance relevant to the luxury sector is constructed (see Appendix 1, Table 1).

A core component of luxury is ignorance, or the unknown. Ignorance in the form of ambiguity and ephemeral qualities has an important place in the promotion of luxury products and services. Moreover, luxury is constructed not only in terms of a physical item or context for a service but also as an idea, as a way of consuming, and, as a way of being. This ontological aspect of luxury, while it is employed in the design and promotion of luxury is not well appreciated by the growing number of consumers of luxury. Hence, many consume luxury in ignorance, happily absorbing and acting on the information disseminated by the luxury companies through their sales force, and websites as well as through their engagement with media, from mainstream television and newspapers to specialist outlets, such as, *The Financial Times'* monthly magazine *How to Spend It* and *The Telegraph's* bi-annual magazine and website *Telegraph Luxury*. While the absorption of such information gives consumers some appreciation of luxury, this appreciation is superficial and derives from codified forms of knowledge. The tacit elements of knowing luxury are more time consuming to acquire as they involve learning in practice. Many consumers remain ignorant of the tacit dimensions of luxury.

### *Creation and Design of Luxury*

Ignorance in the form of *unknown unknowns* is a feature of the process of creativity and innovation (Roberts, 2013). A luxury organization may discover the existence of prior unknown unknowns through, for instance, the recruitment of staff with knowledge sets that are new to the organization, the acquisition of new equipment, R&D, the purchase of business services, interaction with customers and suppliers, and the actions of competitors. Indeed, external actors, like competing luxury organizations, may actively construct unknown unknowns for their rivals by disseminating false information about their intentions or by restricting the circulation of newly acquired knowledge. Recognizing that a luxury organization is

exposed to unknown unknowns can stimulate speculative thinking with the aim of transforming them into known unknowns. Techniques that can be used to expose such ignorance include scenario planning - also known as scenario thinking or scenario analysis, which involves combining the known and the unknown to produce a number of internally consistent scenarios of the future incorporating a wide range of possibilities (Shoemaker, 1995). Similarly, foresight studies and trend forecasting, by anticipating the future, also seek to uncover existing unknowns (Loveridge, 2009; Raymond, 2010).

*Known unknowns* drive creativity in all parts of the luxury organization. Ignorance may not only stimulate the search for new knowledge, but surprisingly the lack of knowledge, *unknown unknowns*, can also be an important element in facilitating the creativity of groups within the organization. This is because the naivety and innocence of the young or those inexperienced in a particular field of expertise can be important forces driving forwards the boundaries of knowledge. The development of new ideas and products often requires creators to 'think outside the box', hence ignorance of the box, in terms of existing knowledge in a particular field, can enhance creativity (Roberts and Armitage, 2008). Luxury companies often engage with artists and search for new talent with the aim of stimulating ideas for new products.

For a luxury organizational *knowable known unknown* refers to ignorance that the organization is not motivated to overcome through the expenditure of the necessary resources. The choice regarding the acquisition of knowledge about knowable known unknowns will depend on the costs and benefits involved and the organization's strategy. Where a knowable known unknown becomes of significance to the organization's activities, an investment will be made in acquiring the appropriate knowledge whether through learning, staff recruitment, R&D or the purchase of knowledge embedded in capital equipment or business service. Such ignorance reflects the knowledge priorities of organizations. Importantly, within organizations, knowledge and ignorance will be unevenly distributed. Consequently, knowable known unknowns can be sustained within, or confined to, parts of the organization through the process of specialization and coordination. In this way, the organization is able to economize on the cognitive resources employed in the creation and design of new luxury goods and services.

*Unknown knowns* denote knowledge that is unrecognized in the luxury organization. For example, they may be embedded in tacit routines (Nelson and Winter, 1982). Ignorance in the form of unknown knowns may also

underpin creativity. The importance of unarticulated knowledge in the form of intuition, for example, is a key element in the act of creation (Koestler, 1976). Thus, acknowledging and valuing unknown knowing in the form of instincts, intuition and insights unsubstantiated by evidence has a role in the management of this type of ignorance about knowledge.

Organizational *error* signifies ignorance arising from the bounded rationality of individual organizational actors and the limitations of managerial attention (Simon, 1955, 1973). Hence, limited cognitive capacity, combined with the nature of human cognition, creates scope for organizational error (Berry, 2008; Harvey et al., 2001). Rapidly and perpetually changing environments stretch the organization's cognitive resources, thereby increasing the capacity for organizational error. Organizational error can often be traced to the actions of individual organizational actors or a failure in organizational systems (Roberts, 2013). For all companies errors can be highly damaging to reputation. For luxury companies, even more so, as their value is so much aligned to intangibles arising from reputation and the perceptions of customers. In the car industry, for instance, errors are giving rise to a growing number of recalls of vehicles, which are damaging in themselves, but they pre-empt more significant damages arising from fatal accidents caused by manufacturing and design errors. Even luxury car manufacturers must recognize errors and recall cars. For instance, in February 2014, Aston Martin recalled 17,590 sports cars due to a problem with the accelerator pedal, which risked the driver being unable to maintain speed or accelerate thereby increasing the risk of a crash (*The Telegraph*, 2014).

*Taboos* can be exploited or taken into account in the design of luxury goods and services. It is, for example, common for hotels to remove the number 13 from the list of floors. In a globalized world, the designers of luxury need to take into account a wide range of taboos that may influence the consumption patterns of the intended consumers of new luxury goods and services.

*Denials* are evident in the creation and design of luxury when there is a refusal to recognize major changes in the business context, which require the adoption of new business models. For instance, many luxury companies have been slow to integrate online shopping and social media into their activities and, as a result, they miss the opportunities to learn about their consumers and to employ such information in the creation and design process. Those companies that have taken up the opportunities are able to take a lead in terms of responding to and adapting to customer needs.

*Secrecy* is vital to luxury organizations in relation to the creation and design of new products and services. Indeed, where products are technologically sophisticated then companies may use trade secrets as well as protecting their knowledge through the Intellectual Property Rights (IPR) system. In this way, companies either keep their competitors ignorant or control the use of their proprietary knowledge. Secrecy and denial are also evident in luxury companies' efforts to maintain ignorance of the production process. For instance, the separation of design from production enables manufacturing to occur through outsourcing to low cost locations, with a final element of the production process occurring in the home country the labelling can reflect the final production stage and therefore implies that products are fully produced in the home market (Thomson, 2007).

Finally, *privacy* can be a vital element of the design of products, especially when they are bespoke. Keeping the confidence of consumers is a vital element in the service accompanying the design, production, and delivery of luxury services. In particular, Ultra High Net Worth individuals (UHNW) treasure their privacy.

### *Promotion of Luxury*

In the luxury sector, the promotion of products and services is more subtle than that found in traditional sectors. Passive advertising is rarely used by luxury companies, which prefer to actively engage their customers. According to Kapferer and Bastien (2012, p. 258-9) luxury communication tends to occur in a number of ways. Firstly, by communicating with existing clients to induct them into the brand family; secondly, through whisper communications, which involves VIP events; third, through song communication, which involve Public Relations (PR), larger events, shop window displays and targeted digital methods; finally, with small amounts of highly impactful advertising.

By focusing on communication methods such as restricted events, PR, sponsorship of cultural and charity events, luxury companies create and maintain a mystery around their products and services. Buying the product allows customers to buy into a luxury brand club. The promoting of luxury can exploit the consumers' exposure to *unknown unknowns* by playing on potential risks, uncertainties and insecurities to which they are exposed.

For luxury companies, *known unknowns* exist in relation to how customers will react to promotional activity. A known incompleteness of knowledge can lead to the outsourcing of exposure to such ignorance through the employment of specialist advertising and marketing firms, or

can direct the development of such skills internally. For the many small family owned luxury companies the outsourcing of promotional activity can reduce exposure to such *known unknowns* and *knowable known unknowns*.

Luxury goods and services have certain qualities that are not necessarily explicitly articulated in promotional activity. This *unknown known* aspect of a luxury may feature in promotional activity because it is open to multiple interpretations and therefore helps to ensure that a product or service is attractive to a wide market. Furthermore, promotional activity often focuses on the aesthetics of the product rather than the technical detail. For instance, the luxury mobile telephone supplied by Savelli is described on the company's website as:

*The jewel of tomorrow. Created specially for women. Imagined by Alessandro Savelli. Bringing together technology and elegance. Revealing something truly new... White diamonds, exquisitely set. Sculpted rose gold, hand-polished to perfection. Ultra-Bombé sapphire crystal, stunning in its clarity.*<sup>12</sup>

Claiming to be exceptional in every detail, the website gives very little technical information about the phone, yet it includes a video of almost 1 minute entitled Jardin Secret, starring the model Julia Restoin Roitfeld. This video focuses on conveying the pleasure, even ecstasy, which a woman can expect to gain from possessing the Savelli mobile phone. No information about the telephone is conveyed. Indeed, the phone is not even visible for much of the video, which concentrates close-up on the visual expressions of the model as she looks into the camera, admires herself in a mirror or closes her eyes and touches her hair as she apparently revels in the sheer bliss of fondling the Savelli phone.<sup>13</sup> Somehow, this phone will give you pleasure and make you happy. But, how?

The promotional activity appeals to the desires of consumers. By providing minimal information but simultaneously suggesting that the produce holds potential for happiness and fulfilment, in a way that allows the customer to fill in the detail of the desired emotions, the promotional techniques of luxury companies maximize their impact. Through the injection of ambiguity into promotional campaigns, the company appeals to a wide range of potential customers who interpret the communication in their own way. The promotion of vague nebulous qualities allows for

---

<sup>12</sup> <http://www.savelli-geneve.com/en/savelli/> (accessed 11/05/2014).

<sup>13</sup> <http://www.savelli-geneve.com/en/savelli/mood/> (accessed 11/05/2014).

multiple interpretations by customers. In this way, the communication strategies of luxury companies involves providing only minimal hard information, the rest is suggestive and designed to stimulate positive emotions.

By playing on the ephemeral and ambiguous aspects of luxury products and services, luxury companies create and employ ignorance as a strategic ploy. Moreover, they exploit the ignorance of customers. While there are many sophisticated consumers of luxury products and services, the rapid growth in the market in both national and international markets results in a growing number of customers who look to the luxury companies and their retail staff as well as media outlets to inform them of the standing of various luxury products and services. Many customers are aware of their own ignorance and are keen to learn from the luxury suppliers. Companies are in a position of authority over such customers and can exploit the ignorance of customers in their promotional activity for their own benefit.

Ignorance in the form of *errors* may be evident in the use of inappropriate promotional activity for luxury goods and services. While often promotion is discreet, some luxury companies do use celebrities to endorse their products. The use of celebrity endorsements can be an error when information, of which the company was ignorant, about the transgressions of the celebrity becomes known. For instance, when the celebrity golfer Tiger Woods' extramarital affairs became known to the public in 2009 his sponsor, the luxury watch company Tag Heuer, suspended the use of his image and later withdrew its sponsorship (*The Telegraph*, 2011).

Promotional activity can exploit the *taboos* that characterize customers' behaviours. In cultures or countries where ostentatious displays of wealth are taboo, promotion may focus on discreet luxury items that are promoted as better value and longer lasting than non-luxury alternatives. For instance, a luxury watch can be passed down through generations. In addition, there are taboos in relation to luxury promotion itself, for instance, in some sectors the display of a price tag would be very much taboo, as would the use of traditional advertising.

The refusal to recognize ineffective or damaging promotional activity is an example of ignorance in the form of a *denial*. Moreover, luxury is often presented as exclusive and promotional methods seek to perpetuate this even though luxury goods and services are widely available to those who can afford them. Yet the promotion of luxury as exclusive seeks to deny the reality that luxury products can be purchased at outlets like the *Chic Outlet*

*Shopping*<sup>®</sup> Villages, which offer a collection of luxury brand outlets in 'village' settings with discounts of up to 60% on their previous seasons' collections.<sup>14</sup> Similarly, the promotion of European luxury through an emphasis on production in Europe can be evidence of companies engaging in *denial* and or *secrecy*. For while some luxury companies are open about the production of their goods in low cost countries, like Hermès which acknowledges its use of low cost labour in Mauritius to hem scarves by hand, others deny the use of low cost labour from the far East. Thomas (2007) documents examples of the production of luxury goods in China and the efforts of luxury companies to conceal this practice. For instance, concealment practices include hiding the 'Made in China' label, or by passing provenance laws by having products 90% completed in China and finished in Europe thus allowing a 'Made in Italy' label to be attached to items largely made in low cost locations. Thomas (2007) also documents the practice of Italian luxury leather goods produced by Chinese owned factories employing illegal Chinese labours in Italian towns such as Prato with its long history of producing leather goods for brands like Gucci and Prada. Clearly, this is not the story that luxury companies wish to promote. Rather they promote the idea of leather goods produced by European crafts people working in small workshops located in Europe. In recent years, luxury companies like Prada have begun to be more open about their global production, indeed, even making an asset of production in a variety of locations (Tokatli, 2014).

In addition to secrecy regarding information about production, secrecy may be used in promotional activity to encourage interest in a new product or service. An element of mystery is important for many luxury goods and services – this requires a degree of holding back information. It is important that customers wait for their luxury good or experience; the waiting increases the desire and anticipation and enhances the exclusive character of the luxury (Kapferer and Bastien, 2012).

Finally, promotion may involve confidential one-to-one communication with clients. For instance, in the provision of information about new financial services to UHNW individuals, privacy is paramount and, in this way, the promotion of such services involves ignorance arising from the need for confidentiality and absolute privacy.

The promotional activities of luxury companies do involve ignorance in all of its various forms. Luxury companies are exposed to ignorance in their

---

<sup>14</sup> <http://www.chicoutletshopping.com/en/company/about-us> (accessed 11/05/2014).

promotional activities and they also purposely exploiting the ignorance of their customers in such activities by restricting information about the true conditions under which some products are produced and by developing narratives that perpetuates the ignorance of customers.

### *Consumption of Luxury*

Luxury consumers may have *unknown unknown* desires that are triggered by the promotional activities of luxury promoters. The exposure of unknown unknowns is unexpected and can create surprise for luxury consumers. The development of new produce and services can satisfy desires that consumers had never contemplated.

Consumers may be aware of their ignorance of certain aspects of luxury, that is, they are aware of *known unknowns*. Rather than seeking to overcome such ignorance, consumers rely on luxury companies to provide evidence of, for instance, the authenticity of luxury goods and services. Heritage stories and indicators of quality are employed by consumers as a means to validate the luxury status of goods and services, and thereby compensate for their ignorance about the luxury goods and services that they consume.

Ignorance in the form of *knowable known unknowns* can be overcome by consumers through, for example, the participation in educational programmes and private study concerning particular luxuries. However, consumers are often time poor and therefore they seek to buy the services of experts rather than specialize themselves. After all, it would be difficult for a consumer to have knowledge about every aspect of every luxury product or service that they consume. Consequently, consumers are happy to remain ignorant of some aspects of luxury. For example, to desire and appreciate a fine timepiece it is not necessary to fully understand the mechanics that ensure accuracy and longevity. Rather, most consumers are happy to put their trust in a reputable luxury brand, safe in the assumed knowledge that the product is of the standard that can be expected of luxury.

Ignorance in the form of *unknown knowns* may underpin a consumer's desire for a luxury good or service. Customers desire something because they feel or believe that it will give them something, for example, pleasure. However, consumers are not always able to articulate how the product will fulfil their expectations. Their feelings may be difficult to express explicitly, nevertheless, they may be based on tacit knowing, including, for instance,

an implicit understanding of what gives them personal happiness or fulfilment.

For consumers ignorance in the form of *errors* may be revealed when they purchase something yet find that it has no value to them after the initial purchase. Such errors can occur because of the false desires experienced by consumers resulting from exposure to the promotional activities of luxury companies.

Ignorance in the form of *taboos* may influence the consumption of luxury in various ways. At a general level, excessive displays of wealth may be taboo and therefore impact on the type of luxuries consumed, perhaps leading to a tendency towards discreet luxury. More specifically, taboos may reveal themselves in preferences for certain colours rather than others, certain styles of dress, and so on. Luxury wines and spirits, for instance, like all alcoholic beverages are taboo in Islamic states, yet this does not prevent their discreet consumption in such countries.

*Denial* reveals itself in the form of wilful ignorance on the part of consumers regarding how luxury goods and services are produced. Consumers' desire for the product allows them to ignore the negative side of luxury goods produced through outsourcing contractors in sweatshops in low cost locations, where health and safety regulation can be far from adequate. Moreover, consumers ignore the dark side of luxuries that require precious metals, minerals, and diamonds (e.g. 'blood diamonds' for jewellery and 'conflict minerals' for mobile telephones).

In recent years, consumers have become more knowledgeable about the ethical and quality issues of outsourcing and are demanding products produced in Europe or USA.<sup>15</sup> There are exceptions, such as Prada, the Milanese fashion house, which according to the FT.com (Sanderson, 2013) reported in its prospectus to its 2011 IPO that it made about 20 per cent of its collections in China and it also uses manufacturing in Turkey and Romania. This choice did not appear to impact negatively on its sales, which increased 29 per cent in 2012 driven by sales to Asian consumers at home and Chinese tourists shopping in Europe (Sanderson, 2013). In the case of Prada, such is the consumers desire to have Miuccia Prada's designs, that they willing ignore the location of production.

---

<sup>15</sup> In addition, the rising number of Chinese consumers, who perceive Chinese or Asian produced goods as inferior (no matter what the reality is) to European products is driving the trend for luxury production to return to the home countries of companies.

*Secrecy* can be an important requirement for the satisfactory consumption of luxury. For instance, anonymous buyers and collectors of art enjoy their purchases in secret locations. Moreover, many UHNW live on private estates hidden from the public eye and enjoy holidays on exclusive island retreats. Secrecy and privacy are intimately connected for many consumers of luxury. While conspicuous consumption is associated with some sections of the luxury market, for other sections consumption involves privacy, for instance, private jets and yachts. Escaping from the public gaze can in itself be a luxury, one that necessitates the ignorance arising from secrecy and privacy.

## Discussion and conclusion

Although the market for luxury is growing rapidly, the nature of luxury remains poorly appreciated. By taking an ignorance perspective on luxury this paper has highlighted important qualities of luxury, in particular, concerning its design, promotion, and consumption. The unknown is a core component of much luxury for most consumers. We are all subject to bounded rationality (Simon, 1955) and we must therefore make choices about what knowledge to acquire and process. Knowing every detail of a range of luxury products is beyond the cognitive capacities of most individuals. Hence, luxury consumers rely on the authority and reputation of luxury companies to inform their purchasing decisions. But as we have seen in this paper, ignorance is not merely confined to consumers. Luxury companies are both exposed to ignorance and they employ ignorance in their promotional activities. Through the deployment of promotional activities that enhance mystery and ambiguity, companies ensure that they appeal to the widest audience. The promotion of luxury employs ignorance to present qualities that are open to multiple interpretations. Consumers are left to fill in the gaps – to identify the potential satisfaction of their own individual desires in the seemingly luxurious exclusive products and services to which they are exposed.

Understanding the role of ignorance in the design, promotion, and consumption of luxury offers valuable insights into the development of luxury brands. Through an application of a typology of ignorance, this paper has begun to uncover the role of ignorance in the design, promotion, and consumption of luxury. The paper offers a conceptual contribution to understanding of the relationship between contemporary luxury and ignorance through a systematic examination of the place of ignorance in the

design, promotion, and consumption of luxury goods and services. The typology of ignorance of relevance to luxury presented in this paper captures the role of the unknown in key areas of luxury production and consumption. As such, it offers valuable insights for producers, promoters, and consumers of luxury.

As this paper has shown, ignorance warrants further consideration among scholars, practitioners, and individuals engaged with luxury. Ignorance is poorly appreciated in the field of business. Nevertheless, there is growing interest in this emerging field (Roberts, 2013). The characteristics of the luxury sector make it a valuable context within which to study the management of unknown, and, particularly in relation to the fields of design, and promotion. In addition, explorations of ignorance and consumption offer value within and beyond the field of business. For practitioners, acknowledging the potential value of ignorance in relation to luxury paves the way for its active management. Knowing what is not known can be as important to organizational performance as knowing what is known. Different types and sources of ignorance require different management approaches that themselves offer scope for diverse outcomes. An awareness of the various types of ignorance provides the first step towards the development of techniques to manage the unknown. For consumers, an awareness of how their own ignorance may be exploited or managed by luxury companies allows them to strengthen their power in the consumer-producer relationship. Recognizing ignorance is, in the Socratic tradition, a form of wisdom – a form of wisdom that is surely of value to all involved in the luxury sector.

# Appendix 1

Table 1. Types of Ignorance of Relevance to Luxury. Source: Developed from Roberts (2013).

Source of Ignorance	Type of ignorance	Design (organizational)	Promotion (organizational)	Consumption (individual)
Absence of knowledge	<b>Unknown unknowns</b>	Ignorance that is beyond anticipation. <i>Such ignorance offers surprise in the design process.</i> Companies may purposely employ staff with different sets of knowledge and a complete lack of knowledge in the field of production can stimulate creativity when it is combined with the knowledge of other members of a creative team.	The promoting of luxury can exploit the consumers' exposure to unknown unknowns. Playing on potential risks, uncertainties and insecurities to which the consumer is exposed.	Consumers may have unknown unknown desires that are triggered by the promotional activities of luxury promoters.
	<b>Known unknowns</b>	A known incompleteness of knowledge, which can lead to the outsourcing of exposure to such ignorance through the employment of design consultancies, or can direct research, development and design efforts.	Known unknowns exist in relation to how customers will react to promotional activity. A known incompleteness of knowledge can lead to the outsourcing of exposure to such ignorance through the employment of specialist advertising and marketing firms, or can direct the development of such skills internally.	Consumers may be aware of their ignorance of certain aspects of luxury. They therefore look to luxury companies to provide evidence of authenticity. Heritage stories and indicators of quality are employed by consumers as a means to validate the luxury status of goods and services, and there by overcome their ignorance.

<p><b>Ignorance about existing knowledge</b></p>	<p><b>Knowable known unknowns</b></p>	<p>Knowledge that is not central to the organization's core competencies. Access to such knowledge can be outsourced to save on the organization's cognitive resources. For instance, many luxury companies outsource business services like advertising and legal service.</p>	<p>Knowledge that is not central to the organization's promotional activity. Where such knowledge is important for promotional activity it may be developed through investment in relevant staff or gained through outsourcing activity. For instance, many organizations outsource business services like advertising and legal service.</p>	<p>There is knowledge that consumers could develop about luxury, e.g. through the participation in educational programmes. However, consumers are often time poor and, therefore, they seek to buy the services of experts rather than specialize themselves.</p>
	<p><b>Unknown knowns</b></p>	<p>Unrecognized tacit knowledge, such as that embedded in routines and practices. We often know more than we can articulate – such knowledge may be evident in intuition, instinct, and business hunches that may only be recognized when they lead to creative design solutions.</p>	<p>Luxury goods and services have certain qualities that are not necessarily explicitly articulated in promotional activity. This element may feature in promotional activity because it is open to multiple interpretations and therefore helps to ensure that a product or service is attractive to a wide market. For instance, the unspoken qualities of the Savelli mobile phone in its promotional video.</p>	<p>A consumer's desires may be underpinned by unknown knowns. Customers desire something because they believe that it will give them pleasure but they don't know how it will do this. Feelings may be difficult to articulate but they are based on some form of knowing, e.g. intuition.</p>

	<b>Errors</b>	Mistakes caused by human error or systems failures. Design errors may result in product failures with major consequences for a luxury company's reputation. For instance, Aston Martin is recalled 17,590 sports cars due to a problem with the accelerator pedal in 2014.	May be evident in the use of inappropriate promotional activity for luxury goods and services. Often promotion is discreet. The use of celebrity endorsements may be an error when information about their transgressions comes to light.	Consumers may purchase something and find that it has no value to them after the initial purchase.
<b>Ignorance from suppressing knowledge</b>	<b>Taboos</b>	Organizational cultures can enforce certain behaviours and knowledge to the detriment of others making some behaviours or knowledge taboo. Some luxury companies have very specific customer service processes which may at times stifle new approaches.	Promotional activity can exploit the taboos to customers. And there may be taboos in relation to luxury promotion, for instance in some sectors the display of a price tag would be very much taboo.	Cannot contemplate the purchase of certain things because of social taboos. In the field of luxury this might be connected to excessive displays of wealth in some countries/cultures.
	<b>Denials</b>	The refusal to recognize major changes in the business context, which require the adoption of new business models. For instance, many luxury companies have been slow to adopt online shopping and social media as a form of promotion, allowing those, like Burberry, that have fully engaged with the possibilities offered by the Internet, to establish a lead in these areas.	The refusal to recognize when a promotional activity is ineffective or indeed, having a negative impact.	Denying the reality behind the production of luxury products. For instance, industrial accidents, sweatshop working conditions, blood diamonds, and environmental damage.

	<p><b>Secrecy</b></p>	<p>Secrecy in the design and development of new products and services is often vital for competitiveness. IPR can be used to suppress the use of design knowledge by competitors. Trade secrets may be an important element in a company's IPR protection strategy. IPR infringement is an important challenge for many luxury companies. Secrecy in the production of products necessary to maintain exclusivity for customers.</p>	<p>Secrecy may be used in promotional activity to encourage interest in a new product or service. An element of mystery is important for many luxury goods and services – this requires a degree of holding back information.</p>	<p>Purchase and consumption of luxury may occur in secret. For instance, anonymous buyers and collectors of art, island retreats, private estates etc.</p>
	<p><b>Privacy</b></p>	<p>In the luxury sector organizations may design products or services in a bespoke manner for specific individual or institutional customers. Confidentiality agreements with employees, customers and suppliers to maintain the aura of exclusivity and craftsmanship, or to protect customers and employees and suppliers.</p>	<p>Promotion may involve confidential communication with clients. For instance, in the provision of information about new financial services to UHNW individuals.</p>	<p>Much luxury consumption involves privacy, for instance, private jets and yachts.</p>

# Product Design Requirements for Effective Heritage Branding: visual consistency and visual contemporaneity as links to the past, present and beyond

Young In PARK, Ki Young NAM\* and Kyung Won CHUNG

KAIST

*The recognition of the value of heritage branding has increased the demand for understanding what is required of product design in heritage branding. This paper presents two significant factors in heritage product design: 1) visual consistency as a link to the past; 2) visual contemporaneity as a link to the present and beyond. The research identifies the effects of these factors on customer's product evaluation. The findings of the research include: 1) higher visual contemporaneity in a heritage product design results in better product evaluations, 2) higher visual consistency in a heritage product design results in better product evaluations when a customer is familiar with the brand and its heritage, 3) combinations of high visual consistency and high visual contemporaneity and a combination of low visual consistency and distinctively high contemporaneity resulted in better product evaluations. Based on the findings, the paper proposes design requirements in terms of visual consistency and visual contemporaneity for brands with a strategic intention to carry out heritage branding successfully by means of design.*

**Keywords:** *Heritage branding; design requirements; visual consistency, visual contemporaneity*

## Introduction

### *Definition of Heritage Branding*

During recent years, more and more brands have appealed to their heritage in the market. Those brands may have noticed that the heritage of a brand plays an important role and adds value in the eyes of consumers (Urde, Greyser, & Balmer, 2007). Existing studies have established that a brand with a heritage stood for authenticity, credibility and trust, and could provide leverage for that brand, particularly in global markets (Aaker, 2004; Wiedmann, 2011; Wuestefeld, Hennigs, Schmidt, & Wiedmann, 2012).

To be a heritage brand is, rather, a strategic choice. A company or product with a heritage is not necessarily a heritage brand and having a heritage does not in itself create value (Hakala et al., 2011). A heritage brand has an organizational belief that its history is important and value-positions itself based upon its heritage over a long period of time, supported by customer-based beliefs (Urde et al., 2007; Hudson, 2010; Rindell, 2013). Therefore, to be a heritage brand requires an intentional and deliberate activation of brand heritage, which scholars refer to as 'heritage branding'.

Heritage branding, however, is different from retro or nostalgic branding. It is seen by many scholars as a distinct concept. Firstly, heritage branding is rooted in a brand's history and cannot be copied while retro branding is a marketing and advertising tactic that any company – even with a new brand – can apply (Hakala et al., 2011). Secondly, heritage brands and retro/nostalgic brands have different attitudes towards the time dimensions. Heritage brands embrace the past, the present and the future and try to keep a brand relevant to the present time, while retro or nostalgic brands have reference only to the time and events in the past, focusing on rehashing the "good old days" (Balmer et al., 2006; Wiedmann et al., 2011, 2012; Rindell, 2013)

### *Heritage Branding and Product Design*

Urde et al. (2007) listed a brand's track record, longevity, core values and use of symbols as brand's heritage quotient (HQ). Hakala, Lätti, and Sandberg (2011) developed this list proposing that brand heritage consists of the consistency and continuity of a company's core values as well as the history, product brands and use of symbols (Fig. 1).

*Product Design Requirements for Effective Heritage Branding: Visual Consistency and Visual Contemporaneity as Links to the Past, Present and Beyond*

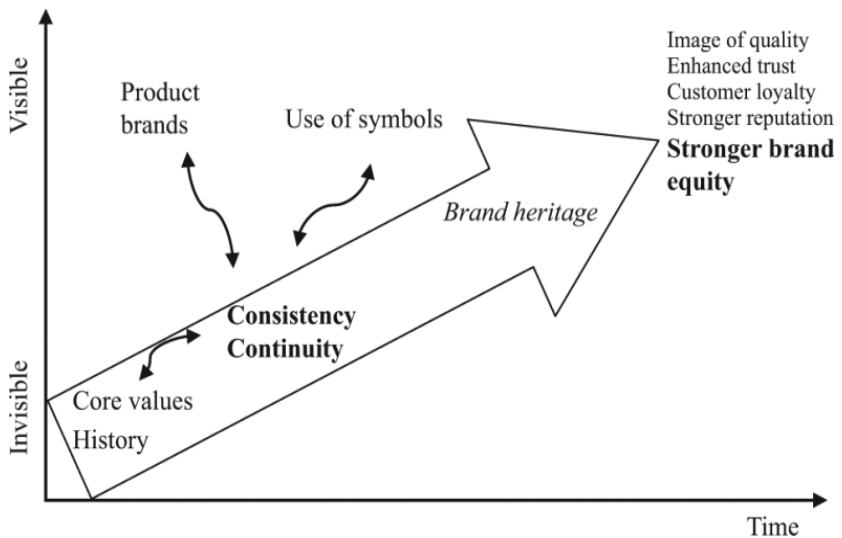

Figure 1 Elements of brand heritage. (Source: Hakala et al., 2011)

Fig. 1 summarizes activating process of brand heritage. Among many interpretations suggested in Fig. 1, this study pays particular attention to the fact that the product brands take a role in visualizing a brand’s core values and history continuously and consistently over time, contributing to an activation of brand heritage. Consequently, design of product brands has a significant role in heritage branding since a product design is a reification of a brand’s core values and an aggregate of layers of a brand’s histories. Urde et al. (2007) support this argument asserting that product design is one of the principal vehicles for activating a brand’s heritage. Being one of key elements that represent and convey to the end customers a brand’s identity, product design is a helm to strategically control heritage branding.

The two axes of the graph in Fig. 1 imply two requirements for pulling a brand to stronger brand equity: a ‘consistent visualization’ of core values and an ability to ‘keep up with time’. In this regard, this research addresses two key ‘linkages’ of the current product, manifested in the design of the product: visual consistency as a link to the past and contemporaneity as a link to the present and beyond. This approach also resonates with the inherent concern of the heritage brand with not only the past but also the present and beyond, as recent studies have addressed. Since very few

studies deal with conditions and drivers of brand heritage, as well as its effects on consumer behaviour (Wiedmann et al., 2011) — and even fewer investigate the effect of design factors in heritage branding — looking at the effects of these two factors of product design on consumers' perception of the product would be a meaningful step for a better understanding of heritage branding.

### *Research Aims and Methodology*

The first aim of the research is to empirically measure how contemporary a heritage product design is visually perceived or which time period it is perceived to belong to and its effect on the evaluations of a heritage product. The second aim of the study is to identify the effects of visual consistency of a heritage product design. The research is intended to be helpful for brands with heritage that want to deploy effective heritage branding by suggesting strategic implications in terms of applications of visual consistency and visual contemporaneity in a heritage product design.

Research methodology includes survey and correlation analysis to investigate the effects of visual consistency and visual contemporaneity on customer's product evaluations. Besides the two factors, brand familiarity was also measured and analyzed since it is proven to be influential on customer's product evaluation in many studies and it is assumed to affect the relationship between visual consistency/contemporaneity and product evaluation. Regression analysis and cluster analysis were additionally conducted to see strength of explanation of the relationship or to find any tendency which cannot be observed from correlation analysis.

### *Automotive Design and Product Brand*

The study uses automobiles as stimuli products. The automotive industry, a giant industry with a long history, is one of the industries that most actively utilizes heritage branding in the market. For this reason, selecting heritage designs with a variety in consistency and contemporaneity would be easier with the automotive industry than any other.

Many of the existing studies on heritage branding refer to the 'brand' as the company since early researchers saw heritage branding from a corporate marketing perspective (Aaker, 2004; Urde et al., 2007). However, the term 'brand' is used in this study to denote a 'product' with regard to the automotive industry. This is because car manufacturers often exercise heritage branding for particular car models (e.g. Fiat Cincequento) and/or

deploy different heritage branding strategies for different models (e.g. Volkswagen Golf vs. New Beetle).

Examples of heritage automobiles which successfully link to the past with visual consistency and to the present with visual contemporaneity are often observed. Richness of examples signals that studying automobile cases would derive rich findings and suggestions with the possibility of applying it to other product categories.

The paper consists of the following sections: (1) discussion of the key concepts, including visual consistency, contemporaneity and product evaluation criteria; (2) pilot study and its findings with implications for the design of the main survey; (3) the main survey results and discussion; and (4) conclusions.

## **Visual Consistency and Visual Contemporaneity in Heritage Product Design**

### *Visual Consistency: Link to the Past*

A number of existing studies on branding strategy have established that consistency and continuity in product design over time are critical for effective communication of a brand (Park, Milberg, & Lawson, 1991; Person, Schoormans, Snelders, & Karjalainen, 2008). In general, visual consistency in product design refers to how visually consistent a product is with the rest of the product range or product portfolio of a company (synchronic). In contrast, visual consistency in heritage design refers to how visually consistent the current product offering is with the visual heritage of the product, i.e., the visual consistency of the current product with the original product and/or its visual elements (diachronic). In heritage brands, consistent use of design and symbols diachronically can bring coherence to a brand's identity by associating it with the past, which makes consumers easily recall and recognize it. Therefore, diachronic visual consistency of the product in heritage branding is a link that connects the current product to its past and visualizes its heritage.

There have been several attempts to distinguish some ways to plant visual consistency in a product design in order to carry a brand's identity. Crilly (2005) and Karjalainen (2007) differentiate explicit and implicit visual references. Explicit visual references are design features that are implemented by designers with the intention of being immediately recognized. On the other hand, implicit cues can be embedded subtly to

refer to a product's characteristics, such as safety or dynamism embedded in Volvo cars (Karjalainen, 2007). Supposing this distinction would also generate meaningful difference in heritage branding, visual consistency was approached in the two different notions of the pilot study: explicit visual consistency and implicit visual consistency.

### *Visual Contemporaneity: Link to the Present and Beyond*

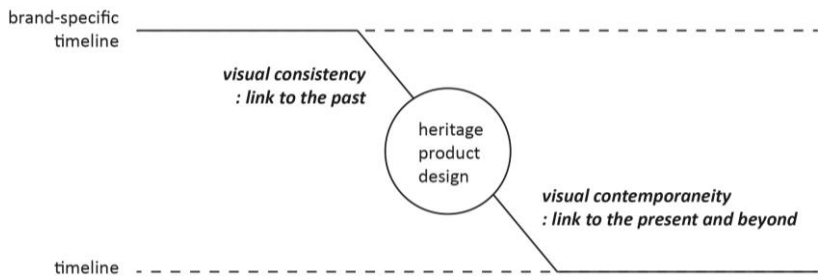

As well as a link to the past, the importance of linking the heritage product design to the present is also recognized by many. Wiedmann et al. (2011), Urde et al. (2007), Aaker (2004) and many other researchers have asserted that heritage brands should have a heritage to help to make a brand relevant to the present and the future. Managers and designers of strong heritage brands today face the challenge of marketing a brand's heritage in a way that brings out its historical reliability but does not make it become outdated for the consumers (Hakala et al., 2011).

The efforts of some of the major heritage brands today to project their current product offerings as not only retaining the 'character' and what the heritage stands for, but for also being thoroughly 'modern' or 'contemporary' testify to this. In the United Kingdom's brochure of Volkswagen's New Beetle and Mini Cooper, which are two representative automobile models of heritage branding, their pursuits of achieving both visual consistency and contemporaneity are presented in parts of their marketing slogans, such as 'even icons have to evolve to remain true to themselves', or, 'Sometimes a huge step forward offers a great view of the past'.

In summary, heritage product design should take into account that making a brand relevant to contemporary life is as important as reminding the customer of the glorious past of the brand. The notion of 'contemporaneity' is proposed in this research to represent the relevance of the current product offering to the contemporary life to act as a link to the present and beyond as a counter-concept to visual consistency. As such, the scale of measurement for visual contemporaneity of heritage products should extend beyond the point of how strictly 'contemporary' a product looks, since the contemporary life reflects and projects visions of the future. Also, the semantic interpretation of visual contemporaneity includes 'modern', 'new' or 'up-to-date', since the term 'contemporaneity' is used in a broader sense than the dictionary definition, 'belonging to or occurring at the same time, age, period.' (Smith, 2006).

## ***Two Linkages in Heritage Product Design***

The two linkages that this research focuses on are presented in Fig. 2. The two timelines are not on one straight line but on different parallel lines because they are implying different contexts: The upper one is brand-specific chronological timeline, while the other one is a timeline of our living world. A link to the past and a link to the present here are not zero-sum concepts to each other. That means that heritage product design can have a strong link to the past and a strong link to the present at the same time.

*Figure 2 Visual Consistency as a link to the past and visual contemporaneity as a link to the present and beyond*

## ***Product Evaluation Criteria***

Since the main focus of the research is to investigate the effect of visual consistency and contemporaneity on product evaluation, it is necessary to determine product evaluation criteria. The product evaluation criteria for the study are chosen after reviews of existing marketing studies. Particularly, existing product evaluation criteria on visual domains were reviewed. The four chosen criteria are: visual attractiveness, perceived quality, perceived value to price of a product and customer's willingness to buy (Dodds, Monroe, & Grewal, 1991; Peracchio & Tybout, 1996).

While perceived quality is evaluated more directly from the visual impression that a customer gets from the product design, perceived value requires a more complex thinking process. Value is an abstract concept highly interrelated and frequently confused with the concepts of quality, benefits and monetary and non-monetary prices. Some researchers statistically proved perceived value to be negatively related to price

(Zeithaml, 1988; Dodds et al., 1991). Therefore, in this study, there is a given boundary between visual attractiveness, perceived quality and perceived value, purchase intention, where customers start to impute quality on the basis of factors besides visual design, such as price, image, practicality or fitness for purpose.

## **Pilot Study**

### *Overview*

Prior to the main study, a pilot study was conducted to test the stimuli composition and formulate effective survey questions for the main study. A total 126 participants (age = 25; 70% women) answered on 7-point Likert scales for brand familiarity, perceived visual consistency, perceived visual contemporaneity, and product evaluation criteria.

### *Survey Design*

Initially, 30 cars currently in production with heritage origins were collected, from which three cars sharing a customer base in South Korea were selected for the study in order to reduce an influence of a customer's demographic profile on evaluations. These were: Mini Cooper, Volkswagen Beetle, and Fiat Cinquecento (500).

The first survey question asks about a participant's familiarity with the car brands. For measuring visual consistency, stimuli consisting of images of the original and the current models of the three heritage automobiles were provided. Both implicit and explicit visual consistency perceived between the original and current designs were accessed separately through two propositions; "The exterior design of the two cars share one or more specific visual features", and "The exterior design of the two cars share similar atmosphere in general". To measure visual contemporaneity of the recent models—out of 20 adjectives gathered from product semantics studies (Karlsson, Aronsson, & Svensson, 2010; Jiao, Zhang, & Helander, 2006)—three adjectives with a temporal sense ('modern, new, up-to-date') were given to be scored on the scale. Lastly, the four product evaluation criteria were scored on the current car designs: 'The exterior design of this car is visually attractive to me', 'I think the quality of this car is good', 'I think this car is valuable regarding the price' and 'I will consider buying this car if I'm buying a car of this price range'. Post-survey qualitative questionnaires were given at the end of the survey to identify any difficulties understanding the concepts or the survey wording.

### ***Results and Implications for Main Study***

The results showed that there was a correlation between visual contemporaneity and product evaluation ( $r = .43, n = 378, p < .05$ ) and between explicit visual consistency and product evaluation ( $r = .32, p < .05$ ). There was no significant correlation between implicit visual consistency and product evaluation.

According to the result, brand familiarity showed a strong correlation with product evaluation ( $r = .47, p < .05$ ) affecting the relationship between visual consistency and product evaluation. This leads to a conclusion that brand familiarity should be controlled to see the true effects of visual consistency on product evaluation. Another way to handle this would be to consider brand familiarity as a third independent variable. In that case, a dynamic that brand familiarity creates in the relationship between the other independent variables (visual consistency and visual contemporaneity), and the dependent variable (product evaluation) should be analysed.

The responses to the post-survey questionnaire revealed some critical issues. Many respondents had difficulties understanding the meaning of implicit visual consistency or distinguishing it from explicit visual consistency. This difficulty was predictable because implicit visual consistency and explicit visual consistency were not two separate concepts, but were rather, interchangeable. The split between the two concepts was originally suggested for designers rather than customers so that the difference can be hard to grasp for the respondents. Thus, the notion of 'visual consistency' in this research has been narrowed down to indicate explicit visual consistency, which is perceived and recognized immediately from the perspective of customers.

The adequacy of the measurement method of visual contemporaneity was also reconsidered. From the answers of the post-survey questionnaires, interpretations of the adjectives appeared to differ among respondents. Some interpreted the meanings of the three adjectives as 'belonging to the future far from the present', while others interpreted them as 'up-to-date to the mainstream standards of the exact present time'. Therefore, instead of scoring on adjectives, a more neutral, comprehensive scale for measuring visual contemporaneity of a product design was designed. In the main study, participants were asked to mark where each car seems to belong on a timeline, which is actually a 7-point Likert scale with extended arrows on both sides. Point one is marked as 'belongs to the past'; point four as 'belongs to the present'; and point seven as 'belongs to the future'. In this

way, participants can easily and intuitively connect the temporal sense of the product on a scale in terms of its visual design.

The other critical problem was that the small variance between the scores for the three heritage automobiles prevented richer findings from emerging. Three automobiles had too-narrow spectra of visual consistency and visual contemporaneity, despite the differences generated from the respondents. This issue is resolved in the main study by increasing the number of stimuli automobiles and their spectra. In addition, automobile models with no heritage were also collected as a comparison group to make it possible to investigate any heritage design-specific phenomenon.

## Main Study

### *Overview*

In the main study, a total of 50 participants answered the survey (age = 29.27; SD = 10.42; 69% women) on 16 cars, both online and offline. All participants were examined not to be extremely interested in automobiles by being filtered with car-information-searching time a week. Survey data were analysed using statistical analysis software, SPSS.

### *Selecting Stimuli*

A total of 16 automobiles were gathered as survey stimuli. They were automobiles categorized as subcompact cars in the American market, a city car and supermini in the British market, and A-segment mini cars and B-segment small cars in the Euro market segment.

As mentioned previously, the 16 automobiles consisted of two different groups: eight cars from the heritage group and the other eight from the non-heritage group. The heritage group consisted of cars whose first generations began to be produced more than 30 years ago, such as Volkswagen Beetle, Fiat Cinquecento, Honda Civic, Mini Cooper, Toyota Corolla, Ford Fiesta, Volkswagen Polo and Suzuki Alto. The selection of the eight heritage cars as visual stimuli for the survey reflected a spectrum of visual consistency; for example, Volkswagen New Beetle and Mini Cooper show comparatively higher visual consistency between their original models and the current models while Honda Civic and Toyota Corolla show lower visual consistency through evolutions over time. In fact, the low consistency of the Civic and Corolla suggest that they may not deploy heritage branding although they have heritage as previously discussed. The non-heritage group consists of cars, which were just launched as brand-new models: Peugeot

208, Audi A1, Opel Adam, Toyota Aygo, Citroen C1, Citroen DS3, Toyota iQ, and Volkswagen Up.

All 16 stimuli images were given with cars that were white or silver in colour without a logo on its front to prevent, as far as possible, colour or brand preference from affecting evaluations. The survey respondents were only provided the automobile models' names, such as 'New Beetle' or 'Adam', not the car manufacturing brands' names, such as 'Volkswagen' or 'Opel'.

### *Measurement and Analysis*

For the heritage group, images of both the original and the most recent model were provided to access perceived visual consistency between them. Respondents were given the sentence, "I feel the exterior designs of the two cars look similar." Participants' familiarity with the history of the car models was measured with the sentences "I've known the car on the left before" and "I know the historical background of this car model". For measuring visual contemporaneity of both the heritage and non-heritage group cars, a timeline described in the previous section was given with a question: "To which period do you think this car design belongs? Mark on the timeline below." Respondents' product evaluations were collected with the same questions as in the pilot.

All respondents' scores on 7-point scales for brand familiarity, visual consistency, visual contemporaneity and the four product evaluation criteria for the eight heritage automobiles as well as the scores for visual contemporaneity and the four product evaluation criteria for the eight non-heritage automobiles were recorded and analysed both separately and together in SPSS.

## **Findings and Discussion**

### *Comparison between Heritage Group and Non-heritage Group*

The result of correlation analysis is shown in Table 1, and the 16 automobiles are positioned on diagrams with an average score of visual contemporaneity as the value of x and an average score of each evaluation criterion as the value of y in order to observe the tendencies intuitively [Figure 3].

Table 1 Pearson correlation coefficient between visual contemporaneity and evaluations

Correlation coefficient		Visual attractiveness	Perceived quality	Value to price	Willingness to buy
Contemporaneity	Heritage	.64**	.60**	.41**	.43**
	Non-heritage	.63**	.42**	.38**	.49**

As shown in Table 1 and Figure 3, there are correlations between visual contemporaneity and all four evaluation scores in both the heritage and non-heritage groups. Meanwhile, no significant distance between the heritage group and the non-heritage group was found in the correlation coefficients between visual contemporaneity and product evaluation criteria. The result means that a car which seems to belong to the right-hand side of the timeline looks visually more attractive, of a better quality, a better value for the money and more desirable to a considerable portion of customers, regardless of whether or not it is a heritage product.

In Fig. 3, the heritage and non-heritage automobiles are distributed irregularly on the x-axis, regardless of group. This is interesting, because it might be assumed that the current models of the heritage group could be perceived as being somewhat less, not more as shown in the analysis result, 'contemporary' because of visual consistency with the original design.

This could be interpreted that the manufacturers of the heritage group cars do actually utilize contemporaneity as an important heritage design device to be up-to-date with contemporary designs, not to be perceived as being outdated as previously discussed (p.6). Also, this means that whether an automobile is a heritage product or a non-heritage product does not affect how contemporary the customers see the automobile as being.

On the other hand, R-square values of the evaluation criteria in Figure 3 show that the variances in visual attractiveness ( $R^2=.75$ ) and perceived quality scores ( $R^2=.86$ ) are more strongly explained by scores of visual contemporaneity than the variance in value to price ( $R^2=.58$ ) and purchase intention ( $R^2=.14$ ) scores are. The reason why there are more outliers in the latter two criteria might be, as discussed above, the perceived ratio of value to price and the willingness to buy are determined by the combined effects of other factors such as price and brand name (Dodd et al, 1991).

*Product Design Requirements for Effective Heritage Branding: Visual Consistency and Visual Contemporaneity as Links to the Past, Present and Beyond*

Figure 3 The 16 automobiles on visual contemporaneity-evaluation coordinates

***Heritage Automobile Group (with Brand Familiarity Controlled)***

Partial correlation analysis was used to explore the relationship between visual consistency and four evaluation factors while controlling for brand familiarity.

Table 2 Pearson correlation coefficient (with brand familiarity controlled)

Correlation coefficient				
	Visual attractiveness	Perceived quality	Value to price	Willingness to buy
Consistency	.23**	.08	-.08	.05
Contemporaneity	.64**	.60*	.41**	.43**

As seen in Table 2, among four evaluation factors, only visual attractiveness has a correlation with visual consistency ( $r=.23$ ,  $p<.05$ ). This result means that higher visual consistency with an original design could result in more visual attractiveness of the design of a new model to the

customers but doesn't affect a customer's perception of quality and value to price or their purchase intention.

There were correlations between visual contemporaneity in the heritage group and all four evaluation criteria. The automobiles with heritage whose designs are more contemporary were visually more attractive to customers and were perceived to have higher quality and value. Customers are also likely to buy heritage automobiles with more contemporary designs.

*Heritage Automobiles Group (According to Brand Familiarity)*

Samples were divided into a high-familiarity and low-familiarity groups according to the mean value of the brand familiarity scores and analyzed separately to demonstrate how brand familiarity affects the result. Then, the relationship between visual consistency and evaluation were investigated using Pearson correlation coefficient analysis in each group.

Table 3 Pearson correlation coefficient

Correlation coefficient		Visual attractive ness	Perceived quality	Value to price	Willingne ss to buy
High- familiarity group	Consistency	.40**	.30**	.06	.23*
	Contemporanei ty	.49**	.41**	.23*	.25*
Low- familiarity group	Consistency	.20**	.03	-.10	.01
	Contemporanei ty	.68**	.67**	.47**	.51*

As illustrated in Table 3, the result shows that correlations were found in the high-familiarity group between visual consistency and three of the four evaluation criteria; visual attractiveness ( $r=.40, p<.05$ ), perceived quality( $r=.30, p<.05$ ) and purchase intention( $r=.23, p<.05$ ). In contrast, the visual consistency in the low-familiarity group has a weak correlation only with visual attractiveness and shows no significant correlation with the other three criteria. This implies that customers who are more familiar with the original design and the historical background of a heritage car considered visually consistent automobiles more attractive, of a better quality and more desirable. Conversely, for customers with less familiarity, visual consistency with an original design scarcely affects the evaluation of an automobile.

With regard to visual contemporaneity, there were positive correlations with four evaluation factors in both groups. Compared to the high-familiarity group, respondents of the low-familiarity group showed stronger correlations between visual contemporaneity and the four evaluation criteria. This means that visual consistency and visual contemporaneity have, more or less, an even effect on the product evaluation in the high-familiarity group, while visual contemporaneity is a more important factor than visual consistency in product evaluation in the low-familiarity group. This implies that heritage products have an extra device – visual consistency in addition to visual contemporaneity – to positively impact customers' product evaluation in the high-familiarity group. However, a low familiarity of the brand and its heritage seems to make a heritage product behave just like a non-heritage product, stripping it of the extra device thus denying the very positive effect for which heritage branding aims: benefitting from visual consistency with their heritage. The findings suggest that promoting awareness of the original design and its heritage to the customer is a critical factor in benefitting from visual consistency in heritage branding.

### *Clustering Heritage Automobiles*

To investigate automobile-specific tendencies which cannot be observed from the previous results, the eight heritage automobiles were positioned on a diagram [Figure 4] with the average scores of visual consistency and visual contemporaneity as x and y coordinates, respectively. The radii of the circles with four different colours represent four evaluation scores (red - visual attractiveness; blue - perceived quality; green - perceived value to price and purple - purchase intention). Further interpretations were made for visual attractiveness and perceived quality of automobiles in Figure 5, since the scores for value-to-price relationship and willingness to pay can be influenced by other factors such as price and fitness for purpose as it is discussed above.

Figure 4 The eight heritage automobiles on visual contemporaneity and visual consistency coordinates and their four evaluation scores

*Figure 5 The eight heritage automobiles clustered by their visual contemporaneity and visual consistency and their evaluation scores for visual attractiveness and perceived quality*

As a result of cluster analysis with visual consistency and visual contemporaneity scores as factors, the eight historical automobiles are divided into three clusters.

- A - Beetle, Mini Cooper
- B - Civic, Corolla
- C - Cinquecento, Polo, Alto, Fiesta

Cluster A automobiles maintain high visual consistency and are in the second order in terms of visual contemporaneity. These cars received the highest scores in visual attractiveness and perceived quality. The automobiles in Cluster B received the highest scores on visual contemporaneity and the lowest average scores on consistency. These cars received scores as high in perceived quality as Cluster A automobiles and got the second-highest scores for visual attractiveness. In Cluster C, scores for visual consistency of the cars vary between 2.31(Fiesta) to 3.78 (Cinquecento). However, they all received comparatively low scores on visual contemporaneity around and below 4 points, which means they seem to belong to the past or the exact present time, at best. They received the lowest scores both on visual attractiveness and perceived quality among the three groups.

The three clusters may signify three different design strategies of automobile brands with heritage. Mini Cooper and New Beetle seem to strategically deploy “heritage branding” as discussed in the beginning of this paper. These automobile brands keep high consistency in and also attain a high level of contemporaneity in their product designs and make them visually attractive to customers. On the other hand, Civic and Corolla deploy different strategies for the same purpose. Although these two car brands have significant heritage, they embrace more radical changes in product design bearing the loss of connection to their past designs, resulting in their belonging to the mainstream trends with a high level of visual contemporaneity. Cluster C neither kept visual consistency to speak of nor made their looks contemporary and they received comparatively inferior evaluations from the respondents. It would be worth investigating each automobile individually in Cluster C due to the variety of visual consistency within the cluster.

## Conclusion

Major findings of the research include:

- It was established from the literature that becoming a 'heritage brand' is rather a brand's strategic choice, requiring active and intentional 'heritage branding'.
- Visual consistency and visual contemporaneity were found to be two significant factors in heritage product design.
- Visual consistency acts as a link to the past and visual contemporaneity acts as a link to the present and beyond in heritage product design.
- Whether it is a heritage product and or non-heritage product did not affect the customer's perception of visual contemporaneity.
- Regardless of the existence of heritage in a product, more contemporary-looking designs received better product evaluation from the customers.
- Higher visual consistency of a heritage product design resulted in a better product evaluation provided that the customer is familiar with the brand and its heritage.
- A low familiarity of the brand and its heritage seems to make a heritage product behave just like a non-heritage product.
- There are various combinations of levels of visual consistency and visual contemporaneity among existing heritage automobile designs. Among those, a combination of a high consistency and a high contemporaneity were positively evaluated by the customers. The combination of a low consistency and a distinctively high contemporaneity was also highly evaluated.

The product design requirements for effective heritage branding could be identified based on the findings of the research.

Firstly, contemporaneity in product design was found to be a quality that helps the product to be evaluated favourably, even in heritage branding. A product design should look contemporary: this creates a visual connection to the present and beyond which is perceived to be more attractive, of a better quality and a better value for the money, and desirable to the customer.

With a good level of visual contemporaneity secured, it is possible to control visual consistency in a product design according to the brand's strategy and value positioning. A heritage product design can opt out of keeping a high level of visual consistency with the original design. It is

possible that a product design with a low visual consistency still remains attractive and is perceived to be of a good quality by maintaining a high visual contemporaneity, although this approach is not considered as 'heritage branding'. On the other hand, a brand can benefit from the effects of heritage branding by keeping a high visual consistency in a product design with its original design. In this case, promoting the awareness of the original design and its heritage among customers is a significant factor in making the perception of the current product more attractive.

### *Limitations and Further Studies*

Visual contemporaneity and visual consistency of a product could be assessed on a more specific level of product design factors, for example, shape, texture or colour for more detailed suggestions of design requirements suggestion. Also, it could be studied more attentively about how people perceive a temporal sense or similarity in a product design with the help of other academic fields, such as cognitive psychology.

As survey and analysis were conducted on a design of a product as a brand in the study, it would be meaningful to further investigate relationships between variables at a corporate level. In this case, measuring methods of the propositions should be reconsidered.

# Unravelling the Secret of Successful Brand Extensions: a case study to explore consumer response

Maaïke MULDER-NIJKAMP\* and Wouter EGGINK

University of Twente

*In this paper we try to disentangle the design of successful brand extensions and test this with two case studies. Earlier research revealed that typicality and novelty are related to the aesthetic preference of products. Despite the fact these two predictors are also each other's suppressors, the equilibrium of both will determine aesthetically preferred products. When dealing with brand extensions we assume this effect is even bigger. We discern two approaches to explain this process. On the one hand the new product category with respect to the known brand can be seen as the novel experience of the design. On the other hand, the consumer can be familiar with the archetypical forms of a product category (typicality) and consider the branded product design as the novel experience. The outcomes show that typicality and novelty are jointly effective in explaining the aesthetic preferences of consumers for some product categories and that the appreciation of novelty for less typical designs is reinforced by the context they are presented in.*

**Keywords:** brand extensions, typicality, novelty, branding, design

## Introduction

The Maya principle as stated by Loewy (1951) has a major impact on the appreciation and acceptance of the design of new products. When a product sparks novelty, people are more attracted to it. On the other hand consumers also need to be familiar with the product category to accept the new product as a credible one. So the product design has to have a certain amount of novelty and typicality to become interesting for the consumer.

Hekkert et al (2003) proved that both features together have a positive effect on aesthetic preferences. For brand extensions this process is even more relevant. The recognizability of the core product is really important, but there also have to be a familiarity with the design characteristics of the brand (Mulder-Nijkamp & Eggink, 2013a). So the brand ensures the typicality and the new product for the brand takes care of the novel aspect. On the other hand this process can also take place the other way around. The consumer can be less familiar with the brand, and more with the core product category. The novelty in this case is than the novel experience of the brand. The reciprocity between these two mechanisms takes place in a split second and also plays an important role in the acceptance of an extension. Based on the above considerations we hypothesized that a successful brand extension incorporates both mechanisms. Therefore the hypothesis of the joint influence of typicality and novelty related to aesthetic preference as discussed by Hekkert will be tested for brand extensions. In a first case study this hypothesis was partially confirmed. In a second case study the effect of the environment is taken into account to test the two different mechanisms of perceiving the brand extensions.

This paper is part of our research into the design of brand extensions, which is aimed at supporting designers in the process of designing successful products.

## Brand recognition

Designing for brand recognition is almost fully embedded in our society as a strategic asset. When the functional characteristics of products are the same as well as the price, the aesthetic expression of the product is used to differentiate from its competitors (Cooper & Press, 2003; Kotler, 2000). Consumer choice of products is based on products with added value which satisfy both emotional and functional needs (Creusen & schoormans, 2005).

Branding is one of the most commonly used methods to increase the aesthetic expression and to create recognisability among consumers

(Kapferer, 2008). According to Zajonc and Bornstein the positive affect also increases with repeated unreinforced exposure and thus familiarity of a stimulus (Bornstein, 1989; Zajonc, 1968). When consumers are more familiar with a certain brand and its visual expression, it is more likely that those consumers remain faithful to the brand. Therefore it is really important to distinguish yourself as a brand from your competitors with a consistent and recognizable portfolio. Through this design consistency, a brand can develop a solid base to create new recognizable products (Karjalainen, 2007; Karjalainen, Heinio, & Rahe, 2010)

Even more important is the incorporation of the core values of a brand (Karjalainen & Snelders, 2010). In order to be recognized by the consumer brands use brand names or logos and specific product design characteristics. When these explicit design characteristics are frequently used in the product portfolio they can therefore be easily recognised. On the other hand the design of a product also acts as a carrier of various symbolic meanings. These meanings are a result of experiencing all the explicit design characteristics together in the complete product. The separate design characteristics will build up to a total image, which will evoke certain associations. These associations are often referring to the brand values of a company and the proper translation of these values into explicit designs is crucial for a company to develop a strong brand (Karjalainen & Snelders, 2010).

## **Brand extensions**

For brand extensions this process is even more complex. The design language of a brand cannot literally be translated for a brand extension, because the products that are to extend the brand are mostly from a complete different category, with specific, commonly used design features. So the extension has to be a good representation of the brand and at the same time has to retain recognition to the product category. For example a bike from Ferrari has to be accepted as a product that is close to the core concept of a bicycle, but also has to share a certain amount of its design language with the Ferrari cars. The focus of our research is to support designers in this complex process to design successful brand extensions.

## Framework

To assist the designer in taking the right decisions when translating a corporate identity into a form language, a Brand Translation Framework was developed (Mulder-Nijkamp & Eggink, 2011; Mulder-Nijkamp & Eggink, 2013a, 2013b). This framework (figure 1) helps the designer to focus on the most important values of the brand, and the way they can be translated into the design and styling of new products in such a way that consumers will recognize the brand and its associated values more easily.

Figure 1. Brand translation Framework

The framework starts with analysing in which way the specific design characteristics of the brand refer to which core values of the brand. The translation of the more tangible features towards the more abstract values can then be done by referring to first and second order associations (Krippendorf, 2005). When analysing the brand by ordering associations, designers will become more aware of the most important values of the brand.

We introduced the framework in an elective master course ‘Graphic language of Products’ of our curriculum Industrial Design Engineering. This course is a 10 week project of 5 ECTS, aimed at defining brand identity and translating those identity into new products, where the students work in couples. The goal of using the framework was to see if young designers can work with the model and to see if the students succeeded in designing more recognizable products. In figure 2 an overview of the framework is shown, filled in by a student couple, analysing the brand Lamborghini. The students made an analysis of the brand according to the three levels of the framework, starting with defining the physical features of the brand on top (level 1). Subsequent the students derived first and second order associations (level 2) from the visuals of the brand and at last they combined

*Unravelling the Secret of Successful Brand Extensions:  
a case study to explore consumer response*

the wordings of the second order associations into groups that together form a certain keyword which refers to the core values of the brand (level 3). It should be noticed that the students are challenged to make their own observation from the product portfolio of the brand and define the three core values that suits the brand the best in their vision. In fact this could be different compared to the values of the brand.

Figure 2. (vice versa) Brand Translation framework for the brand Lamborghini [made by Kyan Kuiper and Haske Rasser]

For two years now, the students are using this version of the framework. From the results it seems that for brand extensions it is quite important that consumers are able to recognize the core product of the extension, besides using characteristic features of the brand. For example, in figure 3 two bicycle designs for the brand Ferrari are shown. It is obvious that the concepts both make use of characteristic features of the brand. However, the designs are completely different. The design of the group at the right (figure 3b) has focused more on using the specific characteristics of the shape of the Ferrari F458 into the design of the bike. They copied the lines of the car quite literal. The design of the group at the left side (figure 3a)

focuses more on the associations with the brand (power, Italian tradition, and a purebred racing pedigree). To retain the Ferrari-feeling they translated the remarkable air intake into the bike concept, as well as the rims of the car. So the students who designed the left bike are using all levels of the brand translation framework instead of the right design which only uses the physical characteristics of the brand. Earlier research showed that a successful brand extension is using all levels of the Brand Translation Framework (Mulder-Nijkamp & Eggink, 2012; Mulder-Nijkamp & Eggink, 2013a).

Figure 3. (a) Design of a Ferrari bike focusing on the values of the brand [Gerrit Witteveen and Richard van Schouwenburg] (b) design of a Ferrari bike focusing only on the characteristics of the F458 [designed by Mark Koenderink & Frank Egberts].

The pitfall of the design of the group at the right side is that they got lost in copying the features of the car into the bike. They forgot to take a step back and get an overview of the complete product and therefore failed to integrate the core values of Ferrari. The other important aspect of their design is that the bike is not very recognizable as a stereotypical bike.

## Typicality and Novelty

Consumers prefer an optimum between innovation and categorization (N. Crilly, J. Moultrie, & P. J. Clarkson, 2004) as explained in the MAYA

principle which was coined by Raymond Loewy (1951). As argued before, especially for brand extensions it is important to pay attention to the recognition process of the consumer.

As stated by Hekkert et al (2003) the aesthetic preference will be determined by the joint influence of typicality and novelty.

*“Typicality and novelty are not to be conceived as opposite poles of one and the same continuum, although a high (negative) correlation will often be found” (Hekkert et al., 2003, p. 112)*

When the design of a product seems to be more novel, consumers are more unsecure about the performances, therefore designers have to create a certain amount of recognition in the product to counteract this effect. But when the design has a strong resemblance with the same category of the core product, the reaction of the consumer can be more disappointed. At the same time the visual similarity of products determines the categorization of the concept. If the design differs a lot from the stereotype-product, the consumer will not recognise the function of the product anymore and can't categorize it.

It seems at first hand that those two principles are linear related to each other. If a product is more typical, it is less novel and vice versa. This seems to be a logical explanation, but on the contrary there are also products that exist of a combination of those two mechanisms.

For example, the lamp in Figure 4 is a new interpretation of a classic baroque lamp. So the form of the lamp refers to associations with the baroque style characteristics which are familiar to consumers and the use of transparent shiny polycarbonate evokes the novel experience of the lamp even as the construction of the foot, which exists of three plains creating a three dimensional form.

*Figure 4. The Bourgie table lamp from Kartell expressing 'typicality' and 'novelty' at once*

We assume that for brand extensions these mechanisms are also really important. In fact there can be two approaches to look at this process. On the one hand the new product category with respect to the brand can be seen as the novel experience of the product. The extension is not common for the usual product portfolio of the brand and therefore refers to the term 'novelty'. The counteracting effect is the implementation of well-known brand characteristics in the extension, which will take care of the 'typicality' effect. The brand familiarity emphasizes the recognition of the brand and its reliability and therefore compensate the effect of the novel experience.

On the other hand the consumer can be more familiar with the archetypal forms of a product category compared to the brand. In other words the product is categorized and recognized like a certain archetypal form (typicality). Meanwhile the consumer considers the extension of the brand as novel experience with respect to the product category.

Take for example the brand extension of a Lamborghini bike. When placing the Lamborghini bike in a bike shop, the novel aspect will be the fact that there is also a bike with a Lamborghini design in the assortment. When we place the same bicycle in a Lamborghini showroom, the novel aspect will be that Lamborghini also designs for another product category.

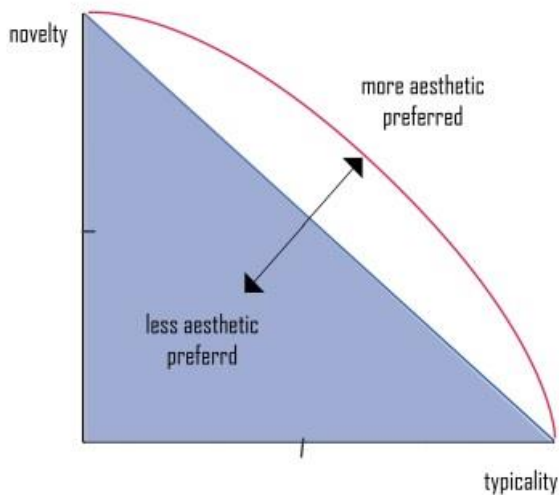

We used the theory of Hekkert et al (2003) to disentangle the design of successful brand extensions. Based on the above considerations our hypothesis implies that the joint influence of typicality and novelty is also positively related to aesthetic preference for designing brand extensions. To test this hypothesis a case study with two different sets of brand extension

designs was executed. In the first instance we'd like to prove that the theory of Hekkert et al. is also applicable on brand extensions. Subsequently we would like to refine the results and take a closer look at the two approaches as described above.

### *Case Study 1*

In study 1 we tested the joint influence of typicality and novelty for brand extensions. The relation between novelty and typicality on the one hand and aesthetic preference on the other hand was investigated in a test with bicycle and helmet designs (concepts of the students of the master course). Conform the joint influence of typicality and novelty we expect that the more aesthetically preferred designs are above the typical negative correlation line (distributed along the red line in Figure 5) and the less aesthetically preferred products are on the line or beneath the line (blue area). Especially the optimum of both mechanism, more to the centre of the graph where the distance between the blue and the red line will be larger, will lead to more aesthetically preferred products.

*Figure 5 Schematic overview of the hypothesis*

Figure 6. Stimuli of study 1 (a) 3 bicycles for Ferrari (A,B,C) and 3 bicycles for Lamborghini (D,E,F) (b) 3 helmets for Lamborghini (A,B,C) and 3 helmets for Mini (D,E,F)

### Method

The two different product categories were rated by 21 respondents. They all had to evaluate 6 bicycle designs and 6 helmets designs (figure 6). The respondents were asked to arrange the designs on typicality, novelty and aesthetic preference by placing them on a line with on the one hand the term “not typical” or “does not look like a archetypical bike” and on the other hand, “typical” or “looks like a archetypical bike”. The selected designs cover a wide range of typicality and novelty. On a big screen, life-size pictures of the six designs were shown (Figure 7).

Figure 7. Set up of test situation

### Results

As was to be expected the ratings for typicality and novelty showed a high negative correlation for both the bicycles and the helmets. The Pearson correlations were respectively  $-.96$  ( $p < .01$ ) and  $-.90$  ( $p < .05$ ).

Both the correlation between the mean typicality and mean preference score (.30) and the mean novelty and mean preference score (-.023) does not reach statistical significance ( $p > 0.05$ ) which is comparable to the study of Hekkert.

As stated by Hekkert et al, looking at the high negative correlations between typicality and novelty, either of these variables may have functioned as a suppressor variable with respect to the relation between the other one and aesthetic preference. When we performed a correlation analysis where the effect of novelty was partialled out, this is true. The suppressor effect is even larger than found by Hekkert et al. The correlation of typicality with the preference of the products is 0.94 (with significance is  $< 0.05$ ) when we controlled for the influence of novelty. The mean originality scores correlates with the mean preference controlling for typicality with  $r = 0.935$  and a significance of  $p < 0.05$ . The same tests applied to the helmets showed another picture. There is no significance between the mean typicality and mean preference when partialing out for novelty and vice versa. The partial typicality/mean preference correlation was .836 and for novelty/mean preference it was .872. Both  $p \geq 0.05$ .

At last a regression analysis was made to determine how much variance in the ratings of the dependent variable "aesthetic preference" can be explained by typicality and novelty. It seems that for the bicycles the influence of the predictors of typicality and novelty showed a significance compared to aesthetic preference ( $p < 0.05$ ). For the helmets there is no significance for this relation ( $p > 0.05$ ). The analysis revealed that typicality as well as novelty explained 89% of the variance in beauty ratings of the bicycle.

The graph in figure 8 shows the ratings of the bicycle designs with on the horizontal axis "typicality" and on the vertical axis "novelty". According to this graph our hypothesis is that the bikes above the line are arranged as more aesthetically pleasing than the bikes on the line. When we compare those results with the aesthetic preference rates (figure 9), it is obviously clear that the designs B, D and A are judged as the most beautiful designs. Bike C scored the lowest, followed by bike F. The standard deviations of the ratings of bike E are very high. Some of the people judged the bike as too extreme, others really liked the novel aspect.

Figure 8. Typicality (looks like an archetypical bike) versus novelty (looks like a novel design of a bike) plot for the 6 bicycle designs.

Figure 9. Mean values for aesthetic preference of the bicycle designs

In figure 10 the results of the helmets are plotted with on the horizontal axis “typicality” and on the vertical axis “novelty”. The graph shows that all results are plotted above the blue line. According to our hypothesis the

helmets C, B and F should rate higher according to aesthetic preference because of the combined influence of the two mechanisms typicality and novelty.

*Figure 10. Typicality (looks like an archetypical helmet) versus novelty (looks like a novel design of a helmet) plot for the 6 helmet designs.*

When we compare the results with the aesthetic preference rates, it shows that helmet B is rated as the far most beautiful helmet conform our hypothesis. The results show also that helmet C is not rated very high, against our expectations. A closer look at the standard deviation explained that there is lot of disagreement about this helmet. Helmet E scored also really low (with the highest standard deviation of all helmets). Helmet A is rated with the lowest 'aesthetic score', with a very small standard deviation.

It is also remarkable to see that the helmets are mainly positioned at the right side of the graph, while the bicycles where spread over the complete graph. There are almost no helmets which are rated as more novel. In the discussion we will discuss these outcomes.

Figure 11. Mean values for aesthetic preference of the helmet designs

### Discussion case study 1

The results show that the hypothesis that was visualized in figure 5 is correct for the product category of the bicycles, however not for the helmets. It seems that the hypothesis can be true, but is dependent on the type of products. As we compare the results of the helmets according to the bicycles, it seems that the helmets are rated as more typical and less novel. This could be explained by the difference in the dominance of the archetypical shape of bicycles versus helmets. After the test the respondents were asked for which product category it was more easy to judge the designs. 17 of the 21 respondents indicated the bicycles as more easy to judge, because the designs varied more and it was easier to determine the extremes. Comparing with the stimuli of Hekkert et al. (Teakettles, Cars and Telephones) it shows that those three product categories are less stereotypical compared to the helmet. this assumption can be explained because a helmet is a product that has to fit around the head and therefore is automatically tended to be less novel. When we take a closer look at the results of the beauty ratings of the helmets this case seems more complex. The differences of the originality of helmet E (figure 12a) varied a lot between the respondents, it has the highest standard deviation. Some of the respondents rated the helmet as old fashioned and discussed the resemblance with retro motor cycle helmets (called 'pothelm' in Dutch) as shown in figure 12b. The same 'problem' even sometimes occurred when respondents were rating the bicycles. Bicycle C was judge as a bike that

looks like an old fashioned specimen from the nineteenth century in contrast to others who judged the bike like really innovative (figure 13).

*Figure 12. (a) the design of helmet for the brand Mini (b) a retro cycle motor helm called 'pothelm' in Dutch*

*Figure 13. (a) the design of a bike for the brand Ferrari (b) Michaux "boneshaker" ca. 1870*

In other words; some of the designs evoke an effect that does not correspond with the designers' intent.

There are also other factors that could influence the outcomes but are not discussed in this paper in detail for example the relatively small amount of respondents, the use of stimuli created by students and the observer characteristics such as the expertise level. Nevertheless, the statistical results of the ratings of the bicycle case study are significant.

### **Conclusion case study 1**

The results show that the hypothesis of figure 5 is correct for the bicycles, however not for the helmets. The more appreciated bikes are placed above the lines. There is an optimum line as visualized in figure 5

where we can predict the outcomes of the more aesthetically preferred designs. Therefore we could say that the aesthetic preference based on the joint influence of typicality and novelty is true for this product category in case of brand extensions. For helmets the hypothesis is not significant, which seems to be due to the more archetypical product category. In order to say more about this effect we need to test more product categories.

Elaborating on the research of Hekkert et al. we can say that to create a successful brand extension, it is important to create a product that has to look like the product of its category (typicality) and on the other hand has to maximize the novelty aspect.

The results also showed that the judgment of novelty in the case of brand-extensions is not without difficulty. To unravel the mechanism behind the appreciation of novelty in brand extensions, we performed a second case study where the influence of the context was taken into account.

### *Case study 2*

There are two mechanisms that can occur when watching a brand extension like a bike from Lamborghini in a specific context.

On the one hand the new product category with respect to the brand can be seen as the novel experience of the product. The familiarity with the brand characteristics of the brand (typicality) has to compensate the effect of the novel experience. On the other hand the consumer can be familiar with the archetypical forms of a product category (typicality) and considers the extension of the brand as a novel experience with respect to the product category. Take for example the brand extension of a Lamborghini bike. When placing the Lamborghini bike in an bike shop, the novel aspect will be the fact that there is also a bike with a Lamborghini design in the assortment. When we place the same bicycle in a Lamborghini showroom, the novel aspect will be the fact that Lamborghini also designs for another product category. When the outcomes of the novelty ratings of the two designs are the same, there is no difference in judging the objects even by placing them in a specific context. We assumed that the more typical bike of Lamborghini in the more typical context (bike shop) will be rated as less novel. All the other bikes will be rated as (more) novel. When the Lamborghini bike in the bike shop is rated as more novel compared to the same bike in the Lamborghini showroom, than we could say that the influence of context will reinforce the effect of the recognition of brand characteristics with a specific context perceiving novelty in a product.

To be more specific, we assume that the bike in context 4 (figure 14b) will be rated more novel than the bike in context 1 (figure 14a), because the novelty in context 1 is provided by the environment, in contrast to the really typical bike shop in context 4. The second assumption is that the bike in context 3 will be rated as more novel than the bike in context 2, because the physical brand characteristics (forms/lines, colours etc.) of the product show more contrast in the design related to the context. According to the integration of the product with the context we assume that bike 4 is more integrated with the context than bike 1 and Bike 2 is more integrated than bike 3.

### **Method**

We asked 59 first year students of our curriculum Industrial Design Engineering to judge two different bike designs in a specific context. They were asked to rate the novelty on a likert scale from 1-7. We made 4 different surveys were the respondents were asked to rate only two different bike designs (1&3, 2&4, 1&2 or 3&4).

*Figure 14. Stimuli of case study 2 (a) two designs of Lamborghini in a Lamborghini showroom (b) two designs of Lamborghini in a bike shop*

In the survey, the respondents were told to rate a brand extension (a product for a specific brand), the exact product and the context were not explained to the respondents. We also asked a second control question were the respondents has to rate (from 1-7) to what extend they thought the bike fitted into the context.

**Results**

The outcomes show that the respondents do not differ a lot between the context pictures 1 & 4. The bike in context 1 is rated just slightly higher ( $M_1=2.0$ ) compared to the bike in context 4 ( $M_4=1.96$ ), but the standard deviation of context 4 is lower ( $SD_1=1.13$ ;  $SD_4=0.73$ ) (figure 15). In contrast, the bike in context 3 is scored as more novel ( $M_3=5.3$ ;  $SD_3=1.06$ ) compared to the bike in context 2 ( $M_2=4.6$ ;  $SD_2=1.32$ ). So we could say that when the product is not really integrated with the context, this has a bigger effect on novelty than placing a more novel product in a context where the product and the context are more integrated (context 2).

Figure 15. plot of mean results for novelty

The outcomes of the second question about integration of the product with the context (consensus) reveals that the bike in context 2 ( $M_2=4.6$ ;  $SD_2=1.55$ ) is more merged with its environment compared to bike in context 3 ( $M_3=2.6$ ;  $SD_3=1.54$ ). The bike in context 4 ( $M_4=5.8$ ;  $SD_4=1.33$ ) is more integrated with the context compared to bike 1 ( $M_1=3.0$ ;  $SD_1=1.64$ ).

**Discussion case study 2**

The outcomes of the integration of the bikes with the context showed that the bike in context 2 is more merged with its environment compared to the bike in context 3. So the effect that people experience the Lamborghini brand as provider for the novelty aspect with the bike in the bike shop as provider for the typicality aspect seems stronger than vice versa (the bike in the Lamborghini showroom as provider for novelty, with the Lamborghini

brand as provider for typicality). The outcomes for novelty reveal the same effect: the “Lamborghini-bike” in context 3 is rated relatively more novel than the “bike-Lamborghini” in context 2.

*Table 1 Outcomes of mean ratings for novelty and integration with context (consensus) arranged for the different surveys*

**Descriptive Statistics**

Mean		context				
	survey	1,00	2,00	3,00	4,00	Total
novelty	1,00	1,8000		5,6000		3,7000
	2,00		4,5714		1,9286	3,2500
	3,00	2,2857	4,5714			3,4286
	4,00			4,6364	2,0000	3,3182
	Total	2,0000	4,5714	5,2581	1,9600	3,4576
consensus	1,00	2,9000		2,5000		2,7000
	2,00		4,5714		5,7857	5,1786
	3,00	3,0714	4,6429			3,8571
	4,00			2,7273	5,7273	4,2273
	Total	2,9706	4,6071	2,5806	5,7600	3,8475

However the results of context 1 and 4 did not match our hypothesis, as the bike in context 1 was not rated as more novel than the bike in context 4. The effect of the typical bike seems to overshadow the novelty aspect, we assume that this is because the bike design is too common.

There are also some other restrictions to this case study. The outcomes of the mean scores of novelty and consensus can also depend on the sequence of showing the pictures. In table 1 the different surveys are shown related with the mean scores of novelty. The outcomes show that the novelty of bike 3 ( $M_3=5.6$ ;  $SD_3=0.94$ ) is almost 1 point lower in survey 4 ( $M_3=4.6$ ;  $SD_3=1.03$ ) compared to survey 1. So the respondents in survey 1 first rated the more typical bike as less novel with context 1, and after that bike 3 was rated as even more novel, in comparison with the respondents of survey 4, who started with bike 3. This means that we also have to test for the inverse of all the combinations.

The other restriction is that this second case study is only tested among first year industrial design students, so the results do not cover a wide range

of people. Although the respondents could be designated as more experienced with respect to adequately perceiving the designs of products.

## General Conclusion

Starting point for the research in this paper were our previous findings, that to create an optimal brand extension, designs need to use all levels of the brand translation framework (Mulder-Nijkamp & Eggink, 2013a, 2013b). In this paper we hypothesized that besides this, a successful brand extension depends on the joint influence of typicality and novelty as also stated by Hekkert et al. The first case study confirmed that to create a successful brand extension, it is important to create a product that has to look like the archetype product of its own category (typicality), and on the other hand has to maximize the novelty aspect. Although it should be mentioned that the number of individuals surveyed was small, the results of the casestudy indicate that the successfulness of brandextensions is also determined by the two mechanisms.

The second case study was partially successful in determining which of the proposed mechanisms defined the appreciation of novelty among the respondents. The “Lamborghini-bike” is rated relatively more novel than the “bike-Lamborghini”, however the reciprocity of both mechanisms was not confirmed. The outcomes did show that the appreciation of novelty for less typical designs is reinforced by the context they are presented in. It seems that the appreciation of novelty of the respondents is strengthened by an environment that does not match the product.

**Acknowledgements:** *The authors would like to acknowledge all participants of the course Graphic Language of Products, all the people who joined case study 1 and 2 and especially Dr. Thomas van Rompay and Prof. Dr. Jörg Henseler for their help and assistance with the analysis of the results.*

## Craft Brewery Brands: self-awareness through performance

Monika HESTAD<sup>\*a</sup>, Viktor HIORT af ORNÄS<sup>b</sup> and Anders GROENLI<sup>c</sup>

<sup>a</sup> Central Saint Martins and Brand Valley; <sup>b</sup> Chalmers University of Technology and Epiphany, <sup>c</sup> Brand Valley

*New principles emerge, with brands, innovation and design being driven by passion and meaning. Companies strive to resonate with consumers, tapping into culture, myths and ideologies, but also move to becoming “citizen artists” who inspire people. Design may play a central role in this, materialising values and interpreting meaning. A product category that is seemingly localised, socially engaged, and value-oriented is craft breweries. These are often small-scale and use traditional approaches to brewing, emphasising craftsmanship and quality, based on an often rebellious but playful nature, challenging the status quo, while having a passion to learn. We aim to understand how to develop brands based on own passion and principles, while being open to influences in society. What is the role of design when establishing a craft beer brand? We conducted a comparative case study using interviews, site visits and extensive desktop research. The results are compared through a framework seeing identity as a self-image that is embodied, performed, interacted and re-negotiated in an ongoing process. Both cases actively use design and engage with their audiences, but do so with different agendas: preserving and perfecting traditions, or playfully creating new brews and scenes.*

**Keywords:** Design, branding, craft brewing, Nøgne Ø, Mikkeller

## 1. Introduction

As the conference title *Design Management in an Era of Disruption* suggests, we live in an era of disruption. In design, branding and innovation management, new principles are emerging that could help us to navigate changing circumstances. These are principles such as the importance of being driven by passion and meaning (Florida, 2002), constantly engaging with change (Neumeier, 2009), and that what you share is what you are (Leadbeater, 2009). Innovative processes open up (Christensen, 2003), and new structures emerge in market-oriented companies which suggest a flattening and reversing of the organisational pyramid, placing customers at the top (Grönroos, 2007). Designers take on roles as facilitators, opening up applications of design thinking outside the design community (Norman & Verganti, 2014; Carlgren, 2013; Johansson-Sköldberg, Woodilla & Çetinkaya, 2013; Kimbell, 2011, 2012; Hobday, Boddington & Grantham, 2011, 2012).

In branding, there is a shift away from mind share branding, which suggests that “the brand must own a simple, focused position in the prospect’s mind” (Holt, 2004, p. 15), towards an approach that is sensitive to the culture and the world of the consumer (Beverland, 2009; Holt, 2002; Holt & Cameron, 2010). Holt suggests that brands need to take an active role and behave as “citizen artists”. Being citizen artists, leading brands go beyond feeding on established culture to also nurture and inspire individuals. He suggests that companies need to identify cultural myths and ideologies that resonate with customers. An ideology is presented as concepts that can be conveyed in various ways, and experienced through layers of cultural expressions (Holt & Cameron, 2010). This view moves away from the idea of a brand as a single message to a layered concept that is manifested in a wide range of activities experienced with all senses and engaged in society.

However, in Holt’s proposed theories the role of products is minimal. Beverland builds on Holt’s concept of citizen artists, but suggests that: “at the end of the day, your brand is only as good as the products or the services behind it” (Beverland, 2009, p. 180). He further introduces the idea that building authentic and culturally sensitive brands also means embracing a tension between coherence and change (Beverland, 2009). As design is an important tool to make brands concrete, alive and meaningful (Abbing, 2010), it could also possibly play an important role in mediating tensions that may arise when developing a brand concept.

While much branding literature that comes from management or marketing has adopted a profit-driven focus (e.g. Kapferer, 2004;

Samuelsen, Peretz & Olsen, 2007), this paper seeks to contribute to a value-centred approach for the customers, the company and society in general. Principles and meanings are central in design discourses, and also have an important role in building brands. Just as vital to the brands are corporate values and beliefs (Aaker & Joachimsthaler, 2000). However, the quest for meaning is often presented as a means to increase company profit, and not an end that is important in itself.

Building value-centred brands that can grow in parallel with societal trends brings a holistic approach to management. This emphasis on values beyond mere financial results suggests that companies will have the opportunity to align brand values with organisational values, thereby performing their brand not only through promotion, but all of the activities they engage in. Aligning corporate strategy with the marketing concept of the company has earlier been seen to be very powerful in companies like IKEA (Porter, 1996). The next stage will be to move away from superficial added values or a brand story to engaging with something as simple yet powerful as building a business based on a passion or principles.

### *1.1 Craft breweries*

Craft brewing is a relatively new sector in Northern Europe, characterised by localised, socially engaged, value-oriented businesses. The attitude in this category can be described as playfulness accompanied by a passion to learn, engaging breweries and their brewmasters as well as devoted fans and followers.

These breweries are mostly small-scale and use traditional approaches to brewing, emphasising craftsmanship and quality. Craft breweries have often been owned independently, with the brewer taking a central role. The craft brewing community started with microbreweries, but an increasing number of companies in the category have now grown beyond the “micro” level. The category is in transition, providing research opportunities concerning startups as well as the mechanisms that come into play when companies grow.

With craft beer, advertising can backfire, or may simply not be possible due to legal restrictions (as in several Nordic countries) or limited budgets. A trend in pubs selling craft beers is to not add any of the companies’ marketing material (pump clips and similar) and to only communicate what the beer is about through the name of the beer and the stories provided by the bar tender. Major players in the category, such as the Scottish beer brand BrewDog, are rapidly expanding despite limited training in marketing

or management (Smith, Moulton, Burge & Turnbull, 2010). A rebellious nature, challenging the status quo, together with the demanding environment in which these brands are created, make craft breweries ideal cases to explore new branding principles and the role of design when establishing a brand.

## 1.2 Aim

The aim of our study is to understand how to develop a brand that is based on one's own passion and principles while being open to influences in society. We seek a way of looking at brands where the company – or the corporate – strategy is aligned with the brand strategy. The focus is on the role of design when establishing these brands. Branding in small and medium-sized enterprises (SMEs) and entrepreneurial marketing are considered under-researched (Boyle, 2003; Merrilees, 2007; Spence & Essoussi, 2010). We would like this paper to contribute to the understanding of how SMEs without large marketing budgets can work to establish their brands. The goal is to compare two craft breweries and answer the question: *What is the role of design when establishing a craft beer brand?*

## 2. Method

We conducted a comparative case study (cf. Yin, 2013) looking at two Scandinavian craft breweries: Nøgne Ø Det kompromissløse bryggeri AS in Grimstad, Norway and Mikkeller ApS in Copenhagen, Denmark. These both have strong narratives and skilfully use design elements to communicate who they are and what they are about. Both companies are involved in staging events and experiences people can participate in. Moreover, they seemingly aim beyond short-term profit, seeking to establish relationships and grow the community. Both are Scandinavian craft breweries, but there are striking contrasts in how they have been set up and organised.

Nøgne Ø was established in 2002 in the small southern Norwegian coastal town of Grimstad. It is currently perceived as one of the major players in the category, and also a success story in terms of brand and finance (Berglihn, 2014). In 2013 Hansa Borg, the largest Norwegian-owned brewery company, bought a majority stake in the company. Nøgne Ø started to build their brand before there was an established culture around craft breweries in Norway, and had to take the lead in establishing this culture. It has invested in brewing facilities and has an expressed goal of developing the best beer (K. Jikiun, personal communication, 13 May 2014). We interviewed the sole remaining of the two founders of the company, the

Head of Marketing and the designer behind the company profile. We also conducted extensive desk research, including blogs, news material and social media activity.

Mikkeller was established in 2006, and is a so-called “gypsy” or “phantom” brewery that does not have its own production facilities, but produces its beer with other breweries. Mikkeller consciously use designers to create a diverse range of expressions. In this case we interviewed the Operations Manager, two of their bar managers, a blogger, as well as bartenders and brewers from the partner breweries. We conducted field research in Mikkeller pubs in Copenhagen (Vesterbro and Nørrebro) and in Stockholm (see Figure 1), attended a collaborative brew project (at The Earl of Essex pub in London), and also conducted extensive desk research, including the brand’s social media activities and external bloggers.

*Figure 1 Participatory observation at Mikkeller Vesterbro: researchers on beer keg-carrying duty. Source: Authors*

In addition, we also visited numerous pubs and off-licence shops that served Mikkeller and Nøgne Ø beers.

To analyse the cases, we first developed the *Becoming a Brand* framework (see Figure 2), which aimed to highlight different perspectives while sacrificing some details to make our model applicable to small-scale organisations. It was grounded in an ambition to reconcile different perspectives on “brands” further described in the following section, and recursively elaborated in the analysis and in exercises with students and

entrepreneurs. The framework was adapted following insights gained during field studies.

We then used the model to compare and contrast the two cases with respect to the physical manifestations of the brands, the activities in which they engage, their collaborations and learning with others, and their self-awareness.

### 3. Analysis

#### 3.1 Four facets of identity

The framework consists of four basic facets and ongoing learning in a changing context.

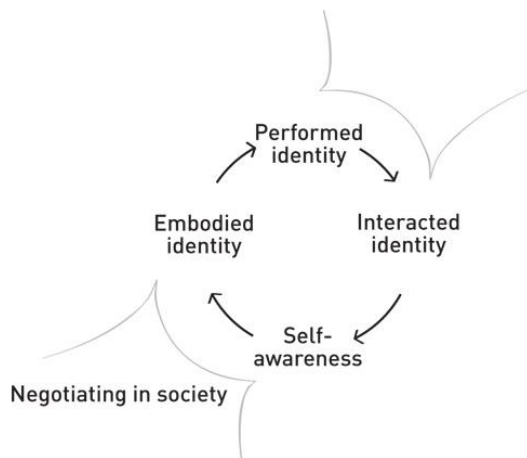

Figure 2 *Becoming a Brand framework. Source: Authors*

#### **Facet one: Self-awareness – Being**

In building a brand, knowing who you are, what your values are and what your vision is have been identified as being of key importance (Olins, 2005; Aaker & Joachimsthaler, 2000). We have named the first facet of our framework *Self-awareness*.

The lack of a record of products, projects and so on leaves space for interpretations. When establishing a new company, establishing exactly what your values, your vision or your philosophy are can therefore prove

daunting and challenging. Two joint entrepreneurs may find that although they share the same vision, their values may conflict. Another challenge is that it can be difficult to separate yourself as a person from the business.

### **Facet two: Embodied identity – Stating**

As brands are intangible and even ambiguous as a concept, design and physical manifestations have been identified as important mediators in communicating what a brand is about (Karjalainen, 2004; Stompff, 2008; Abbing, 2010). It has been claimed that being distinctive through all the senses contributes to customer loyalty (Lindstrøm, 2005).

We have labelled the second facet of the framework *Embodied identity*, referring to tangible/concrete representations of the brand and how these are manifested in the products through shapes, colours, textures or sounds and so forth.

Design plays a role in shaping all of the “touch points” a brand has with the customer (Wheeler, 2006), and the result of all these forms a basis for the company’s creation of awareness around its brand. Similarly, both explicit and implicit design cues can be powerful signatures that trigger the idea of the brand (Karjalainen, 2004), and styling may serve as a strategic tool (Person, Snelders, Karjalainen & Schoormans, 2007).

### **Facet three: Performed identity – Doing**

Identity is not just about values or physical manifestations. Rather than simply broadcasting a message to a passive audience, brands perform and bring alive values and embodiments, creating opportunities for stakeholders to experience events and interact actively with the brand (e.g. Deighton, 1992). In bringing the company’s intent alive, everyone in the organisation needs to be part of the act (Pine & Gilmore, 2011). The third facet of our model is therefore *Performed identity*.

The global advertisement agency Leo Burnett (2013) introduced its “humankind” strategy in 2009, communicating that brands need acts, not ads. This represents a shift from building brand awareness through advertising to focusing on how the company is behaving and which activities it is using to engage with its customers. However, performance in this framework goes beyond the mere “added value” activities, and does not distinguish between products, advertisements, events or other activities that the company is undertaking to perform the brand.

#### **Facet four: Interacted identity – Interacting**

A brand interacts with a wide range of stakeholders (Wheeler, 2006). People (customers, potential customers, business partners and others) engage with the brand and exhibit a range of behaviours. The fourth facet is therefore *Interacted identity*.

These interactions shape the brand to some extent, reflecting a symbolic interactionist perspective on identity: “What the individual is for himself is not something that he invented. It is what his significant others have come to see he should be, what they have come to treat him as being” (Goffman, 1972, p. 327). Interactions become part of changing the company and informing who it is. The actors’ interpretation of activities, the level of engagement and interest give an indication to the company of what the company is and could be about.

Diverse actors imply variety in the meanings created, which may call for values and identity to be explicit in order to provide coherence and structure. These interactions cannot be controlled, but the company can inspire, facilitate and monitor them. Whether or not it conducts active monitoring, a company is likely to get feedback on its products and actions. Over time, experiences of how the company is treated contribute to its heritage, shaping further actions.

#### **Facet five: Negotiating in society – Growing and Evolving**

Neither industries, customers, employees nor society are static, and in a sense, brands constantly change. In our framework, we suggest an ongoing dynamic with respect to the four facets introduced above. The fifth facet is therefore *Negotiating in society*.

We suggest that all activities within an organisation, informal or formal, will be influenced by changes in society. At the same time, companies also shape society.

Depending on the company’s strategy, new activities may be planned to nurture the dialogue. The dynamic is affected or made relevant by changes in society that may be understood through analysing major drivers of change (e.g. political, economic, social, technological, environmental and legal) or through identifying cultural myths and ideologies (Holt, 2004). How the company responds, interacts or facilitates changes in the community will tell the story about who it is, and who it would like to become.

### 3.2. Analysis through the lenses

Analysing Nøgne Ø and Mikkeller through the *Becoming a Brand* framework reveals striking differences in who they are, and how they embody their identities, perform and interact. Table 1 summarises our findings, which we will then elaborate.

Table 1 Understanding Nøgne Ø and Mikkeller through the five facets of the *Becoming a Brand* framework

Facet and key questions	Case 1: Mikkeller	Case 2: Nøgne Ø
1. Self-awareness (Being) a. Who are we? b. What is our passion? c. What are our principles and attitudes? d. How are we changing?	a. “Gypsy” brewers and artists b. Creation, innovation and experimentation c. Engage with other high-level creators d. Constantly changing based on multiple sources of inspiration	a. Uncompromising artisans and missionaries b. High-quality beer c. Teach people to enjoy good beer, “our customers need to be flexible” d. Increasing knowledge about craftsmanship and how to teach people about beer
2. Embodied identity (Stating) a. How are we recognised? b. Which cues give us away?	Name Logo A playful profile, often with a twist, emerging Sometimes the man with the black hat (“Henry”), sometimes the old logo with the founder’s face Playful names “Scandinavian” look and feel in the bars Sometimes “bizarre” and experimental taste combinations	Name Bottles Labels Logo “Pure” beer
3. Performed identity (Doing) a. What are our activities? b. What is unique about how we perform?	Festival (Copenhagen Beer Celebration) Tap takeover Being the “gypsy” brewer – constantly on the move Co-brewing Respond to all	Devoted and passionate about brewing High attention to quality Offer a sophisticated product with high quality Home brewing kit Being personable when

	<p>approaches</p> <p>Opening bars</p> <p>Developing a large number of new and creative recipes</p> <p>Beer festivals</p> <p>Small beer bottles</p>	<p>people approach them</p> <p>Sharing knowledge and being open</p> <p>Contests/competitions</p> <p>Beer festivals</p>
<p>4. Interacted identity (Responding)</p> <p>a. Who is interacting with us?</p> <p>b. How are they interacting with us?</p> <p>c. Which stages of the product life cycle do the external actors engage with?</p>	<p>a. Other breweries, top restaurants, art and design companies, other high-profile Scandinavian companies, hipsters, “female craft beer drinkers”, the curious and innovators</p> <p>b. Co-brewing, bloggers, email interaction with product information</p> <p>c. Product selection (due to the range of products), consumption</p>	<p>a. Passionate and devoted customers</p> <p>b. Own fan club, “Friends of Nøgne Ø”, co-brews (until recently)</p> <p>By accepting Nøgne Ø’s role as “the expert”</p> <p>c. Different opportunities based on the level of engagement: consume product, brew your own product, promote the product, engage in in-house product development, engage in brewing communities, Recently also added “regular” customers, who are less flexible about the peculiarities of craft beer (e.g. yeast sediments and perceived impurities)</p>
<p>5. Negotiating (Growing and Evolving)</p> <p>a. How does the context change? (Political, Economic, Social, Technological, Environmental, Legal)</p> <p>Why are we relevant?</p> <p>b. Which cultural myths and ideologies are relevant in the company’s context?</p>	<p>a. Increased interest in craft brewery brands</p> <p>People seek “quality products” = “quality experiences”, seeking “authentic” and “local”</p> <p>Express yourself through connoisseurship</p> <p>b. Being a rebel?</p>	<p>a. Increased interest in craft brewery brands</p> <p>People seek “quality products” = “quality experiences”, seeking “authentic” and “local”</p> <p>Express yourself through connoisseurship</p> <p>“Nordic” trend</p> <p>DIY trend</p> <p>Craftsmanship.</p> <p>b. David and Goliath?</p>

### **3.2.1 Self-awareness: Being the ideas and dreams**

The awareness of who the company is takes two different paths. While Nøgne Ø seems to have had a clear and strong self-awareness from the very beginning, the Mikkeller brand appears less explicitly defined, yet very self-aware.

In the Nøgne Ø case, the self-awareness has been represented from the outset through the strong personality of the founder, Kjetil Jikiun. Inspired by quality beer and brewing, his mission is to establish a quality beer culture in Norway and to produce the most exquisite beer. The company started with a strong vision of a change it would like to see in society, and a belief in making this change itself. Nøgne Ø has become a missionary on a quest to increase awareness and knowledge about craftsmanship and quality beer.

The Mikkeller brand is layered. The “gypsy” brewer who travels around the world is an important part of who it is (Schøn, 2009). In our research, we identified drives for creativity, curiosity and experimentation, and that Mikkel Borg Bjergsø, Mikkeller’s founder, played a central role in defining what the brand is about. In its attitudes and behaviour, Mikkeller does have a mission, but is in a sense more similar to an artist constantly changing and evolving based on multiple sources of inspiration. This leads to engaging with other high-level actors, such as Michelin-starred restaurants or a design company recognised for its minimalistic design. When explaining what Mikkeller was about and how they perceive working within this brand, two of the employees interviewed for this study separately used the metaphor of a “rock band” (M. Lindberg, personal communication, 9 April 2014; J.G. Alsing, personal communication, 9 and 10 April 2014). There is an interesting contradiction in how it presents itself: the brand should both be “punk and rock’n roll and brutally serious at the same time” (Schøn, 2009). What Mikkeller is and what it is seeking is less explicit and formalised. When we asked for design briefs, documents or similar materials, the response was that all these were inside Mikkel’s head.

### **3.2.2 Embodied identity: Manifestation of who you are**

The Nøgne Ø case is a textbook example of how brands are developed from an explicit self-awareness of values to communicating these ideas to other actors through various cues. Mikkeller, on the other hand, represents a new approach where coherence is sacrificed in order to allow playfulness and content variation.

In the case of Nøgne Ø, the designer Tor Jessen joined the company before the product was launched on the market, giving him an opportunity

to set the brand and design development agenda. He was paid in shares, which also meant he took ownership of what was created. From the very beginning he told the founder that while Jikiun's expertise was crafting beers, his was design.

The name "Nøgne Ø – Det kompromissløse bryggeri" (literally "Barren Island – The Uncompromising Brewery", "Barren Island" being taken from Henrik Ibsen's poem "Terje Vigen", set close to the Nøgne Ø brewery) came after a longer process: "we sought a distinctive name, something that was possible to make a profile of that was the opposite of what was in the beer community" (T. Jessen, personal communication, 25 April 2014).

Like others in the craft beer community, Jessen saw Nøgne Ø's products in the context of fine dining, rather than parties and alcohol consumption. Seeking to communicate this level of sophistication with the beer label, he enjoyed working with the "Ø" (see Figure 3).

Figure 3 Logo and trademark, Nøgne Ø, Det Kompromissløse Bryggeri AS.  
Source: Nøgne Ø, design by Tor Jessen

It was perceived as a strange and Norwegian character, which attracted attention, but also demanded extra effort from international customers. In defining elements representing Nøgne Ø, the bottle also played an important role. Aiming for a unique and pure profile, they decided to go for the 0.5l bottle (see Figure 4).

Initially the founder disliked the logo. In his own words, the design almost made him cry (Jikiun, personal communication, 13 May 2014). Jikiun's attitude later changed, and he came to appreciate that the modern, clean design provided a completely different profile to others in the

category. The comparatively high price of this beer internationally and the emphasis on its high quality also matches the unusual “look and feel” of the design.

Design plays an important role for Nøgne Ø, although in our interview Jikiun felt that the product would always be the most important part of the company for him. However, a good-quality product alone would not be enough to gain recognition.

*Figure 4 Selection of Nøgne Ø beers. From left: Pale Ale, Wit, #100, Brown Ale, Two Captains, Holy Smoke. Source: Nøgne Ø*

Mikkeller’s Operations Manager, Jacob Gram Alsing, stated that “design plays a major role in building this brand” (personal communication, 9–10 April 2014). Using the Mikkeller office in Copenhagen to illustrate his point, he explained that the company’s founder, Mikkel Borg Bjergsø, could not work in an environment where he did not appreciate the aesthetics. The office was decorated in strong colours with purple and pink dominating, and contained Danish-design furniture, such as Verner Panton’s colourful and formful shapes (see Figure 5).

*Figure 5 Mikkeller office in Copenhagen. Source: Authors*

The Mikkeller bars also expressed the brand's distinctiveness. These were not designed following rigid design guidelines, but based on two criteria: Scandinavian design, and the idea that new bars should contain elements from the first bar at Vesterbro in Copenhagen (J. Alsing, personal communication, 9–10 April 2014).

Mikkeller works with a range of designers. With over 600 different labels in various styles, it is no small task to go through them and identify what the Mikkeller brand is about, but a closer look at a selection of bottles revealed a pattern in the embodied identity, conveying who it is and how it is represented (see Figure 6).

The confidence of this small craft brewing company seems to be increasing. The early labels exhibit little coherence, but a few signature elements. A sketch of the founders and the Mikkeller name appear consistently. The colours are initially more conservative and closer to the

*Figure 6 Mikkeller, variety of expressions. Source: Authors*

aesthetic usually found in the beer category, with dark-coloured labels, images of ingredients or other references to the category. An interesting change happens when one of the founders leaves the company, which is also expressed by one of the labels, where the image of this founder is literally carried out and replaced with a man in a black hat – “Henry” (see Figure 7).

“Henry” starts to appear on many of the labels, and increasingly becomes one of the signatures and embedded identities of the Mikkeller brand. He was designed by the Philadelphia-based designer Keith Shore, who initially started to work for Mikkeller as a freelancer. In 2013 Shore became part of the Mikkeller staff, overseeing all the design of its labels, with the title of Art Director. After Shore’s introduction, the labels also become more colourful (see Figure 8).

Figure 7 Left: One of the founders is carried out. Right: Mikkel Borg Bjergsø and “Henry”. Source: Authors, Mikkeller

The Mikkeller brand is also manifested in its sometimes “bizarre” and experimental taste combinations. Seeking to create a different experience than the other players are offering, they can be defined as much by what they are not as by what they are.

### **3.2.3 Performed identity**

In both brands, the organisational structure and attitudes towards brewing play an important part in how they perform their identity and develop the brand.

Nøgne Ø challenges itself with new brewing processes and continuous enhancement of its skills. Engaging in processes that involve a high level of craftsmanship is at the heart of what it does. After succeeding in making a beer that has been recognised worldwide for its quality, Nøgne Ø started to make the Japanese fermented rice drink sake (see Figure 9). This is considered a complicated process, and was seen as important in the organisation maintaining its innovative spirit (T. Young, personal communication, 14 November 2013).

*Figure 9 Sake production at Nøgne Ø. Source: Nøgne Ø*

Nøgne Ø is explicitly value-driven, and has defined a value brief it willingly shares with its employees and others. However, the founder of the company also found that the larger it became, the more challenging it was to perform according to set values, and this has been a constant concern in the day-to-day operations of the business.

When first launching its product, Nøgne Ø appeared different, which was part of its aim. Sharing information about its brewing processes and

teaching people how to brew have been important aspects of performing its identity. Openness and transparency are key values in the company.

Mikkeller's organisation is set up to brew with others, and experimentation through testing new recipes plays an important part of performing the identity. A willingness to offer a different experience to those it is collaborating with was evident in our interview with Thomas Schøn, the Web, Sales and Relations Manager and while observing the brewing process in the London brew pub The Earl of Essex (see Figure 10). When brewing in the USA, it did not opt for an American-style beer, but one that was Belgium-inspired. In the UK it brought in an American-style beer it had recently learned to brew in the USA.

Figure 10 Mikkeller brew day at The Earl of Essex, 8 March 2014. Top left: Beer Geek Breakfast bottle from Mikkeller. Top right: Thomas Schøn and the hops. Bottom left: The Earl of Essex bar. Bottom right: hops. Source: Authors

Mikkeller is a strong example of “performing a brand identity”. The company's employees even used the metaphor of “rock stars”. Mr Bjergsø

served the role of the lead singer, and the development of this brand was dictated by him. At the same time, the staff also expressed freedom in their own defined roles.

Mikkeller also literally puts on a show through the Copenhagen Beer Celebration festival, where a chosen group of brewers and their followers from around the world can attend events and enjoy the latest brews. The company also arranges “tap takeovers” – events at bars where Mikkeller’s staff visit and serve a selected range of products – on a regular basis.

Mikkeller values openness and taking time to engage with people. It also found tensions between being a small organisation and the high level of performance required (J.G. Alsing, personal communication, 9 April 2014).

### **3.2.4 Negotiated identity**

Nøgne Ø and Mikkeller have different ways of negotiating their identities, although both have decided not to be dictated by customer demands and interest.

Nøgne Ø’s attitude to negotiation is noticeable in the name “The Uncompromising Brewery”. When it comes to the product, there can be no compromise. The quality of the beer is also what others outside the Nøgne Ø company saw as key assets of the Nøgne Ø brand. “An exquisite beer” was the common answer from patrons when we asked around in bars about perceptions of Nøgne Ø. Josh Smith from the blog *The Evening Brews* in London described Nøgne Ø beers as “very Scandinavian”, using locally sourced ingredients and Norwegian names, which for him signalled that they were proud of their origin (J. Smith, personal communication, 20 March 2014).

The founder did not see the importance of changing in response to customers’ demands. On the contrary, he expected Nøgne Ø’s customers to be flexible. Those interested and willing to learn about “exquisite” and pure beer would be interested in Nøgne Ø. This interest includes understanding why there are sediments in a bottle of Nøgne Ø ale (see Figure 11), and not complaining that this is an “impurity”, as some novice customers may do.

Shortly after the Nøgne Ø brand was established, the fan club Friends of Nøgne Ø was founded. This network helps to sustain motivation and also a willingness to adhere closely to the ideals in the organisation and be true to its standards.

Figure 11 The ale Nøgne Ø #100, which leaves yeast sediment in the glass. Source: Authors

Mikkeller seems to be particularly well set up to evolve through collaborations, continuously expanding its collaborations with other breweries around the globe, top restaurants, art and design companies and other high-profile Scandinavian companies.

Mikkeller's playful attitude also seems to attract a different audience than traditional ale drinkers. London bartender Jimmy Hatherley described its followers as "local hipsters", "open-minded beer geeks", "female craft beer drinkers" and "innovators" (personal communication, 11 March 2014). He also described Mikkeller as akin to a forward-thinking media and design company.

Mikkeller has gained attention in the media because of its strong stories around the beers (Weiner, 2014). However, it has also experienced the challenge that how they are presented is up to the journalist (Schøn, 2009).

Although Mikkeller's identity seems less explicitly defined, all the people we talked with responded similarly in terms of what Mikkeller was about: being different and being innovative. It is the performance rather than the embodied identity that is driving who Mikkeller is and what it is about.

### 3.2.5 Negotiating in society

There is an increased interest in craft brewing, and it seems like this trend has yet to peak (*The Economist*, 2014). The people we asked who engaged with this culture saw "quality products" as "quality experiences". The customers were seeking a more "authentic" and "local" experience.

Another trend that is important for craft breweries is the increased focus on locally sourced food and quality food experiences.

The two brands were informed and led by similar trends, but there were also individual differences. The opportunity to buy your own home-brewing kit from Nøgne Ø responds to the DIY trend, while the playful and artistic identity of Mikkeller, with a constant new range of products, inspires curiosity.

The culture is still young, and there were indications that these brands, having started from very open, engaging and passionate starting points, are also suffering tensions as they grow. In Nøgne Ø's case, its story has been one of David against the corporate Goliaths, while it now has an incumbent position in the craft beer community in Norway and has been partly taken over by the largest Norwegian brewery corporation (Bakke, 2014). Mikkeller is also suffering from growing pains. Its "rock band" image will not accommodate growing beyond being a small group, and it is now approaching the size of a decent orchestra. These are only a few of the challenges that appear when companies grow.

## **4. Discussion**

Our research aim was twofold. Our main focus was the role of design when establishing a craft beer brand, but furthermore, we wanted to develop our understanding of how SMEs without large marketing budgets can work to establish a brand.

Craft breweries reflect many of the principles mentioned in the Introduction. They are driven by passion, constantly engage with change, and have an open, collaborative profile, actively engaging with multiple actors in society, including restaurants, bloggers, the media and design agencies. They nurture the culture around their craft beers, which may be a central factor in their rapid growth and evolution.

The differences between how these two companies use design elements boil down to one focal point: the interest and value the founders see in design, as well as their engagement with designers early on in the process. Jikiun had an established connection with a childhood friend, Tor Jessen, who was trained in industrial design and took part in setting up Nøgne Ø. He was given a mandate to communicate through a bold, distinctive style. This is in line with what the design literature suggests when building a brand and keeping it coherent. Bjergsø enjoyed different expressions and also identified a range of designers he was curious to work with, meeting Keith

Shore, whose style over time has become part of the embodied identity of Mikkeller. This embodied identity seems to be emerging from the various offerings it is producing. Nevertheless, design is at the core of what the organisation does, and Mikkeller is in some ways closer to the type of organisation seen in high-end fashion brands than a classic brewing company.

The level of cultural engagement goes deep in both cases, but the different stories of these two brands show that no single model fits all. The Nøgne Ø case suggests one message that is communicated through touch points. However, this should not be compared with the concept of “mindshare” branding mentioned in the Introduction to this paper. The brand is driven by a passion for craftsmanship, not added or constructed through advertising. The message becomes that of an exquisite beer and what it takes to be “the uncompromising brewery”. Performance within the organisation becomes what the brand is about.

The Mikkeller case offers valuable lessons, illustrating a brand possibly based on a less explicit starting point, but steeped in experimentation and a willingness to learn, leading to self-awareness. This brand is highly content-driven, and closer to those of music labels than an ordinary brand in the craft brewing category. For companies like this, signifiers such as how they approach us, how they serve beer or design elements still need to be coherent in order to be recognised. Yet the principles also need to be flexible enough to allow the company to tell new stories.

Both of these cases are success stories, although they have chosen to organise their manufacturing and organisations differently. An interesting observation about these two brands and what makes them different is how important the organisational structure is in defining what the brand becomes.

The *Becoming a Brand* framework developed to analyse these cases proved helpful, although the cases also show that a framework should not be used to dictate how to build a brand, but can help to clarify and provide questions as well as answers in an ongoing dialogue.

In building brands, the facets and associated questions in the *Becoming a Brand* framework can be used diagnostically – assessing “what is” – thereby identifying what the company is and providing a holistic understanding. The framework can also be used prospectively, addressing the issue of “what could be”.

While analysis may require attention to be directed to one issue at a time, growth and evolution require a brand to expand within all the

different domains. Building a brand with limited resources requires efficiency. By not seeing branding as detached, but as an integrated part and a goal for all of its activities, companies can maximise their effort and create strong brands that feel authentic as well as relevant.

In this paper, the emphasis has not been on the product or service, but on the embodied and performed identity. When we began this research, we had the idea that products could be part of the embodied identity. However, it became evident, particularly in the Mikkeller case, that the products could also become part of the performed identity. Not solely emphasising on the product or service, but focusing on performance, may shift focus to creating valuable experiences and meaningful activities for all actors engaging with the company and the brand.

However, the cases also revealed challenges. Both companies seemed concerned by tensions that arose in staying true to values while expanding and evolving, and saw challenges in maintaining focus on the reasons for being in business in the first place and not becoming overly preoccupied with finances. Being transparent, engaging and interacting with people who approach them with questions takes time. The short-term financial side of the business suggests focusing on a small amount of what is developed, while the long-term perspective of recruiting new audiences and expanding skills calls for new – ideally, challenging – products.

An intriguing avenue for future research is the fact that these breweries co-produce products. By brewing with others who share the same passion for the beer, they are interlinked, moving questions about brand development from an individual company towards a cluster or network.

## **Concluding remarks**

We were initially intrigued by the craft breweries' attitudes and passion. They seemed to offer a far more innovative, playful and meaningful approach to business than other companies. We therefore hoped to use these two cases to explore the concept of citizen artist brands.

The emphasis in branding and design discourses is often on identifying and meeting expectations to create superior products. What we learned from Mikkeller and Nøgne Ø is that being a citizen artist and creating devoted customers is not about adapting to customers, but about engaging in interactions and pushing boundaries to learn, about being skilful, passionate and devoted, thereby inspiring people and enriching the culture one is part of.

*Acknowledgements: The authors would like to thank the sources we interviewed for their willingness to share their insights into this field of research. In particular, we would like to mention Kjetil Jikiun and Tor Jessen at Nøgne Ø, Jacob Gram Alsing and Thomas Schøn at Mikkeller and Jimmy Hatherley at Earl's Brewery.*

# Editoria: Design Management and Artistic Interventions: Art, Fashion, Games and Service Design

Antti AINAMO, Kirsi NIINIMÄKI, Marja SOILA-WADMAN, Lisbeth SVENGREN HOLM and Clemens THORNQUIST

Design is now widely recognized as an effective facilitator for innovation and strategic thinking – especially since the growing legitimacy and diffusion of the term “design thinking” around the change of the millennium. When emphasizing innovation and strategic development, to some extent it seems, however, we believe that this may have been overly at the expense of the aesthetic and artistic part of the design process. Consider, for example, that in contrast to industrial design, fashion design rarely has had any problem to be accepted as a core function in fashion business, also not the artistic side of fashion design. Despite this, fashion design was long neither empirically nor theoretically a focus of design management research, often based on the industrial design process. Only now, a recent interest to enhance the value of art in design has led to a growing interest in a stream of research of fashionista-style and other artistic interventions in design management. Design management research has now begun to discover how creative and artistic interventions as a strategic tool in organizations are effective to handle the complex, chaotic and interactional environments in the global competition. It was with this background that we called for papers where design and artistic interventions, fashion management, and other fields of design, have been investigated in a business context.

Ulla Johansson Sköldberg and Jill Woodilla in their paper “Mind the Gap! Strategies for bridging artists and organizations in artistic interventions” discuss the gap between artistic logic and economic logic, which often can lead to frustrations and frictions when artistic interventions to facilitate innovations are applied to organizations. One issue that is critical to these kinds of “interventions” is what happens once the artists have left. The authors argue that bridging the gap by some kind of intermediary is in the core of the process in order to ensure that the ‘tools gained’ will be used after the artist has left. Their study included three Swedish artist or designer

led facilitating organizations, which used different processes to encourage disruptions for development. While the processes are similar in their intentions and ways of dealing with issues that arose within the organizational target group, they differ in the time and conditions offered to the artists/designers. Establishing a curator to facilitate the process where the status of the artist's perspective would therefore be important if the organization should be beneficial.

Another approach is to be found in the paper "Innovation through Dumpster Diving?" By Oriana Haselwanter. She points at a gap between the theory and practice of artistic interventions. Through looking at dumpster diving activities as means to open up and create change in perspectives among a dozen employees in a large scale engineering company, she bridges this gap by showing how a short term bodily learning process can induce new perspectives or new methods concerning creativity and innovation. Here, dumpster diving, as an artistic intervention, questions the employees' status quo, provoking changes in their behaviour by confronting them with unusual or unorthodox worlds that in turn can lead to alternative ideas and solutions.

In contrast to industrial design, the field of fashion rarely has any problem to argue for the importance of design, also not the artistic side of fashion design. The issues for research in fashion industry has rather highlighted sustainability issues and emphasized the need for more innovation and to re-define fashion as such. It seems therefore that fashion and design management has found a common interest in service design. Even if this has not about sustainability Erik Hansen-Hansen's paper of the development of luxury fashion "Flagship Stores as Fashion Service Design" shows an interesting case for how service design can be applied in the fashion context.

Kirsi Niinimäki, and Maarit Aakko investigate in their paper "Creative Control on Sustainable Fashion" on practice based design and management strategy in the fashion industry. The paper focuses on examining how design thinking applied together with a creative control can create creative power for transition towards sustainable practices in fashion at the same time as it benefits design and manufacturing. The studied cases represent such strategy formulation that is based on experienced understanding of the fashion industry and fashion-related business thinking.

Also Kozlowski, Bardecki, and Searcy focus in their paper "Sustainable Fashion: a Re-conceptualization of the Role of Fashion Design" on the emerging role of design in driving innovative solutions for sustainability. A design-

driven innovation and user-centred approach is in the centre while developing a sustainable fashion system. This paper contributes a conceptually driven argument, how lessons learned from Nike and the Nike+ pss are influencing consumer behaviour and lifestyle change.

The emergence of new markets and design fields, like for instance gaming, shows how new questions about how new design can spawn new kinds of relations between consumers, either on a consumer-to-consumer basis, or mediated through the marketing mediary. In the paper “Post-Industrial Design for Consumption” Ainamo, Su and Lehtonen discuss these kinds of dynamic relation between designers, executives and consumers in the context of on-line consumer tribes. While various kinds of “consumer tribes” have begun to be mapped in marketing literature, open questions have remained as to the extent that designers and executives have discretion in terms of how to be or not to be a member of one or another consumer tribe, in particular when the offering is an on-line one, and whether this discretion is the same or different depending on whether one is a designer or an executive. The authors conclude their paper with implications for design research, marketing research, and forms of social life in postmodern communities.

# Mind the Gap! Strategies for bridging artists and organizations in artistic interventions

Ulla Johansson SKÖLDBERG\* and Jill WOODILLA

Business & Design Lab, University of Gothenburg

*As part of efforts to increase innovation, artistic interventions with similarities to design thinking interventions have become increasingly popular. An important aspect of an artistic intervention is the facilitation or bridging process that links the organization, the artist or designer, and the target group. This process is at the core of the relationship, essential for avoiding frustrations and frictions that easily emerge in the communication processes between the different worlds or logics of the artist (artistic logic) and the target group (economic logic), and for ensuring that the “tools gained” continue to be used in the organization after the artist has left. We present a study of three Swedish facilitating organizations with different processes, SVID ([www.svid.se](http://www.svid.se)), TILLT ([www.tillt.se](http://www.tillt.se)), and SKISS ([www.konstframjandet.se/projekt/skiss](http://www.konstframjandet.se/projekt/skiss)). Our research included interviews with representatives of the different organizations. We discovered that while the processes are similar in their intentions and ways of dealing with issues that arose within the target group, they differ foremost in the time and conditions offered to the artists/designers. We discuss the resources required for the different approaches and reflect on implications for new producers of artistic innovations*

**Keywords:** Artistic intervention; facilitation process; intermediary organization.

## Introduction

Artistic interventions in organizations (AIO), defined as “various activities that bring people, products, and practices from the world of the arts into organizations” (Berthoin Antal, 2012), are becoming an increasingly common occurrence, especially in Europe. The aim of such interventions is that the dominant economic logic of members of the organization should be disrupted by artistic logic. The economic logic of practice, or the norms, values and unwritten laws underlying individual actions, is characterized by an explicit market orientation, with output produced with the primary intention of exchanging the output on a market. The artistic logic of practice, conversely, is marked by the desire to produce *art for art’s sake*, to contribute to the greater good (Bourdieu, 1990; Eikhof & Haunschild, 2007). The disruption, bringing an artist’s open process to idea generation and concept development, is supposed to be good for aiding organizational and individual development, and for innovation work, relating to the fuzzy front end of the innovation process. Our research has shown that for the disruption to be fruitful for the purposes decided in the situation, an intermediary is necessary to facilitate the confrontation of the two logics so one logic does not dominate the other, and creative practices may become part of the repertoire of social practice of organization members.

The term intermediary can apply to both an organization that has facilitation of artistic interventions as its purpose, and to an individual who acts in this function in establishing and conducting the intervention. Here we refer to the organizations as *intermediaries* and the individuals as *facilitators*, although they may use different terms themselves. In this paper we present findings from interviews with facilitators from three Swedish intermediary organizations, complemented with previous knowledge from in-depth research by one of the authors (Johansson Sköldbberg, 2014). Our aim is to describe, compare and contrast the different facilitating processes to demonstrate how disruptions at different levels may be encouraged for development purposes or overcome when they hinder the process.

The paper proceeds in five sections. After placing the study within previously published research, a short methodology section introduces the participants (the individuals and their organizations) and our research process. Quotes from the interviews are used to present our findings and in the discussion that follows we examine strengths and weaknesses in the various structures and processes. Finally, we conclude that an intermediary helps create desired disruptions of the type artists desire, with a minimum of unnecessary ones that can easily happen. We provide practical

suggestions for others who may wish to work with artistic interventions in organizations.

## Literature about artistic interventions

Artistic interventions encompass all activities where artists engage with the world outside the art sphere for purposes that often focus on societal or organizational benefits, but also can focus on mutual development. These engagements frequently, but not necessarily, occur outside the artists' usual venues of studio, museum, gallery, theatre, and the like. Interactions may occur in the public arena or community, or as in our interest, in a public, private, or non-profit organizational context. An artistic intervention is an experience through direct involvement with an artist or artistic process, or through viewing and reflecting on a piece of art. The focus is not on the art form itself, but on the process of engagement and subsequent outcomes at the individual, group, organizational, or societal level. The discourse of artistic interventions draws from the arts, management, and practice.

Artistic interventions as a pure artistic act, but with the aim to influence the broader society maybe labeled “socially engaged art practice” (Kester, 2013; Lacy, 20010; Thompson, 2012) whereas artistic interventions in organizations (AIO) – our concern in this paper – most often focus on what is good for the organization. When studied by management researchers, artistic interventions become part of a broader discourse of Art & Management, frequently based in the metaphorical conceptualization of the ‘art of management’, or how managers or organizational members are engaging with the arts through art-perceiving or art making (cf., Barry, 1996; Hatch, 1998, 1999; Hatch & Yanow, 2008; Vail, 1998). A second related discourse is that of aesthetics of organizations that originated in the 1990s with important early contributions by Strati (1992, 1996, 1999), Linstead & Hopfl (2000), and Guillet de Montoux (2004). In general, these scholars theorized organizing using an aesthetic lens – considering the senses, feelings, touch, smells, sights and sounds -- rather than discussing interventions. Other influential contributions drawing attention to the potential of the arts in business have come from Edgar Schein’s (2001) reflections on the role of the arts in business and Nancy Adler’s (2006, 2011) call for artistic processes to be used in management and leadership. Recently, the journal *Organizational Aesthetics* (<http://digitalcommons.wpi.edu/oa/>) has become a critical center for work focusing in general on art and management (c.f.,

*Mind the Gap! Strategies for bridging artists and organizations in artistic interventions* [www.artofmanagement.org](http://www.artofmanagement.org)) and aesthetics of organizational life, including artistic interventions.

Many current researchers on artistic interventions in organizations place its inception in the in corporate art collections (cf., Jacobson 1994, 1996), or in Xerox PARC, when co-located engineers and new media artists influenced each other's work (Harris, 1999). Darso (2004), provided a comprehensive review of studies of artists working in business settings as catalysts for change, while Schiuma (2011) discussed *Arts-Business Initiatives* that have the potential capacity to boost business performance.

During the 21<sup>st</sup> century, the growth of artistic interventions in organizations has been aided by the presence of intermediary organizations such as Tillt ([www.tillt.se/in-english/](http://www.tillt.se/in-english/)) in Sweden, and Arts & Business in the United Kingdom ([www.artsandbusiness.bitc.org.uk](http://www.artsandbusiness.bitc.org.uk)), although other smaller, organizations exist, primarily in Western Europe, coordinated through Creative Clash ([www.creativeclash.eu](http://www.creativeclash.eu)). The work of these organizations is documented through expert reports, with descriptions of the purpose of interventions, the intermediary organizations established to facilitate the process, and an "evaluation" of results achieved, bearing in mind that the report's unstated mission is to justify the funding and prepare the ground for future applications. While every artistic intervention is unique, taken together, the expert reports provide a general depiction of the process (cf., Berthoin Antal, Inlesia & Almondoz, 2011; Ingelia & Almondoz, 2009; Grzelec & Prata, 2013; Knell, 2004, Barry & Meisiek, 2004; Schiuma, 2009; Stockhill, 2009; Vondracek, 2013). None provide details of an actual intervention; these can be found in researchers' ethnographic accounts (cf., Brattström, 2012; Jahnke, 2013).

Accounts of successful artistic intervention in organizations have been published as case studies in professional journals, highlighting various intervention contexts and benefits for management (e.g., special issues of *Strategic Management Journal*, 2005, 2010). Books written for practitioners by professors from the Harvard Business School, link creativity to jazz 'jamming' (Kao, 1996), and explain artists' processes for the benefit of knowledge workers (Austin & Devin, 2003). Academic journal articles provide more critical examination of the practice and links to organizational development and change or other theoretical concepts (cf., Abbott, Kersten, & Lampe, 2006; Barry & Meisiek, 2010; Beyes & Steyaert, 2011; Berthoin Antal 2012, 2013; Berthoin Antal & Strauss, 2014; Berthoin Antal, Taylor & Ladkin, 2013; Meisiek & Barry, 2014; Styhre & Eriksson, 2008). These publications feature diverse examples of artistic interventions in

organizations, based primarily on qualitative research of interventions established through intermediary organizations.

Commenting on the plethora of approaches to reporting artistic interventions in organizations, Berthoin Antal (2013) notes, “future research will need to engage multiple stakeholders (employees, artists, managers, intermediaries, policy-makers).” We respond to the need to engage intermediaries by in-depth interviews of individuals from three Swedish intermediary organizations involved in facilitating interventions. In embracing the term “artistic intervention”, we acknowledge that the competencies of the artist involved may be from either an artistic discipline such as performance, painting, sculpture and the like, or from a design discipline, such as graphic, product or service, since, as we argue elsewhere (Johansson Sköldberg & Woodilla, 2013), the foundation of design education is in artistic processes.

## **The aim of the paper and research methods**

This paper is written within the framework of a larger study of TILLT performed by Johansson Sköldberg in a participant observation lasting a year and a half. Here we compare TILLT’s facilitation process with that of two other producers of artistic interventions to examine ways they deal with similar situations, that is, how to bridge the gap between artists and the work organizations in which they make the interventions. First we briefly introduce the organizations and key participants.

1. SVID (Swedish Industrial Design Foundation [www.svid.se/en](http://www.svid.se/en)) was founded in 1989 to disseminate knowledge about design as a force for development and as a competitive tool. SVID primarily works with designers who have an artistic foundation in their education, but we knew from previous joint research projects that they use a similar facilitation process. We contacted Marie Loft (ML) for an interview about her role as facilitator in earlier joint projects with Business & Design Lab ([www.bdl.gu.se](http://www.bdl.gu.se)) where we were concerned with the “fuzzy front end” of the innovation process.

2. TILLT ([www.tillt.se/in-english/](http://www.tillt.se/in-english/)) is a non-profit organization based in Gothenburg dedicated to producing artistic interventions with the dual aims of organizational development and increasing the field of work for artists. We interviewed facilitator/process leader Roger Sarjanen (RS), who has been active for more than 10 years and responsible for much of the development of the process, and Marie Mebius-Schröderand and Nina Kjällqvist, who became facilitators at Tillt more recently.

### 3.SKISS

([www.cinergy.info/index.php?option=com\\_content&view=article&id=21&Itemid=14](http://www.cinergy.info/index.php?option=com_content&view=article&id=21&Itemid=14)) is not a separate company but a two-year project. This was our choice for a second comparison to TILLT, since only SVID and TILLT are established organizations for artistic interventions in Sweden. We interviewed the project leader for SKISS, Eva Månsson (EM), and one of the artists, Malin Lobell (ML), who was later employed as assistant project leader.

Interviews with the representatives of each organization were conducted in English in December 2013 and lasted between two and three hours. Apart from a few questions prepared in advance we followed Hopf's (2004) recommendations for focused interviews. We later brought Sarjanen (TILLT) and Loft (SVID) together to allow them to discuss and discover differences and similarities in their ways of handling the process. The interviews were transcribed and indexed for themes that were then used to structure our storyline and generate quotes. Our method was mainly inductive, but with some abductive elements.

We present descriptions of each process in narrative form using quotations from the interviews. For brevity transcripts were edited to remove hesitations while the non-native English speaker searched for the appropriate phrase or used a Swedish word that was then translated and checked by others present.

## **Three ways of handling the facilitation process**

The organizations were chosen because they were intermediaries with facilitation processes. However, both the organizations as such and their facilitation processes differed from each other.

### *SVID: An organization that promotes design*

SVID, the Swedish Industrial Design Foundation, presents itself on its website ([www.SVID.se/en](http://www.SVID.se/en)):

*We work to ensure that design is used in all work on innovation and change. Putting the user at the centre of development means that what is offered is fantastic and attractive. It benefits companies, public services, society and Sweden. But above all it benefits the user.*

SVID's portfolio of services promotes good design through maintaining a roster of designers available to work as consultants, sponsoring broad

research projects, and publishing a peer-reviewed journal. During 2004-2006 SVID completed “design for development” with hundreds of projects within 11 different subprograms run by regional offices with contract employees. The program was evaluated by Johansson Sköldberg who found some of the projects and working methods especially interesting, and suggested further research and documentation, which happened several years later when one of SVID’s regional project managers agreed to work with a doctoral research project concerning the role of designers in early stages of the innovation process (Jahnke, 2013). ML was interviewed for our current study on how she worked with the research project.

### **The research project**

Six different companies that had not previously worked closely with designers participated in the research project. The aim of the project was to find out how the designers influenced the innovation process, specifically in the early stages or “fuzzy front end.” The project was funded by VINNOVA, The Swedish Governmental Agency for Innovation<sup>16</sup>, ([www.vinnova.se/en/](http://www.vinnova.se/en/)) and covered the researcher full-time for four years, and the facilitator’s salary and expenses for half time during a year and a half, although she worked for twice as long for the same pay.

The company received some money from the grant to cover part of the designers’ initial work; afterwards they had to pay all costs for the designers. The companies chosen (by ML) were geographically spread out, new to working with a designer, and had different situations. At the start there were six companies, one dropped out and one was sold, so in the end there were four manufacturing companies - of showers, work-wear, flooring, and a centrifugal milk and cream separator.

### **Facilitation process at SVID**

ML and the researcher selected the designers from those in her network or through referrals from colleagues. For example,

*The workwear company wanted a little bit of academic connection, so I called someone at Borås College of Textiles and asked. It’s a little bit of doing research about who can be good as designer, so I wanted a person who had practical skills of course but also connection with the academic field.*

---

<sup>16</sup> VINNOVA’s mission: “is to promote sustainable growth by improving the conditions for innovations, as well as funding needs-driven research.”

*Mind the Gap! Strategies for bridging artists and organizations in artistic interventions*  
So then we had the matching situation there with the company and the designers. And [Researcher] and I had done the brief or the questions from the companies. What did they want to do? ... And that changed over the time of course, because as always they got into the situation with one question and they came out with a lot of other results. They changed the brief with time too, because they worked a long time. (ML-12/12/13)

After a day-long start-up conference with all companies and designers participating, the company CEOs took turns to host three similar conferences. At other times there were meetings of just designers, or just companies.

The designers started work in the companies, holding workshops for a year and a half.

*That was the most intensive period when they were doing the real designerly work. ... It was a shock for the designers. ... They had read the brief, this is what they want to explore from the company's side. And then the designers came out and started to work with the question. We want to change this and that. And how do we going do that? They had no response. Because it was a totally empty vacuum in all the companies. They didn't have any processes at all. It was more like they were answering the market.*

*We were totally unprepared for that situation. Because we thought that designers could do this. Or we think of them as very creative persons. And they are, in a given situation together with others [designers]. But not creative in confrontation with people. And not good at working with organizational change or organizational processes. .... So it was a long way to build up confidence between us and between designer and the company. [Researcher] and I had met the companies three or four times. And then the designer came in and it was a new situation. The goal was to come closer to each other so that the company and the employees were feeling good about the situation and they felt they could do something and be a part. And they could push their company and themselves forward to bring more meaning into the situation. So we did a lot of workshops around that.*

The facilitator supported the designer:

*I had to support the designer to come into the situation about working very consciously with the people in the workshop group. ... Sometimes it went well and sometimes we lost each other and I had to step in. So I did a lot of symbolically running between the company and the designers to support the designers, to learn something about how they can work with their tools while thinking about how you reach the person here. Because that person doesn't understand when you say, 'What is the **feeling** when you come into a shower like that?' So you have to think about talking about that in another way. (ML-12/12/13)*

Some projects were successful, for example, at the work-wear manufacturer the project influenced their products and created new product segments. They also created a new showroom and meeting room with whole collections displayed on the wall. Others were less successful, like the one where the facilitator and researcher were never able to build up the employees' confidence in working **with** the designer rather than the designer just telling them what to do, so the company withdrew from the project. And others were in-between, where some of the employees were doing good things, and others could not grasp the difference between short-term thinking and long-term thinking. They thought only of what they must do immediately, and not about building for the future.

### **Facilitator's reflections after the projects**

*I have been thinking about something called pre-design that is part of my work that I do before the project starts. If I had done that work in this project, I could have prepared the company in connection to innovation and organizational change better than I did. Because the pre-design process is like preparing the customer for what they are going to do. And to understand what they are doing. ... It is like being a good design buyer. Because if you're not prepared for the situation you waste the time learning in the situation, you don't have the right competence, you don't put the right questions and you don't have the head and the heart in place.*

*The designers have learned a lot. I think they didn't think about it as easy. They were proud of some things that were really good and*

*Mind the Gap! Strategies for bridging artists and organizations in artistic interventions where the company has had good results. You can count it as a good investment for the company they helped. (ML-12/12/13)*

SVID exists to promote design, so they welcomed the opportunity to be involved in this research project. The facilitator was working in circumstances different from her usual routine, but also had support from the researcher. In this situation the introduction of a designer into a company without previous experience of working with a one created concerns similar to when artists were introduced through TILLT's process, as described below. Although ML used the word "designer" in our interviews, we believe it could just as easily have been "artist."

## *2. TILLT: An experienced intermediary organization*

Tillt's roots date back to the early 19<sup>th</sup> century, when it was founded within the democratic political movement, Skådebanan, aiming for "culture for the people" (Johansson Sköldberg, 2014). The organization's strategy has changed considerably during its existence, and in the last 10 years it has turned from being part of a political movement into an independent non-profit company.

### **TILLT Organization**

According to the website [www.tillt.se/in-english/](http://www.tillt.se/in-english/) :

*TILLT is a producer of ARTISTIC INTERVENTIONS in organisations. An artistic intervention is established when an organisation enters into a COLLABORATION with an artist, such as an actor/director/playwright, visual artist/painter/photographer, dancer/ choreographer, writer/poet, composer/musician or a conceptual artist. The aim of such a collaboration is to CROSS-FERTILIZE the competences of the two worlds: the world of the arts and the world of the organisation. The work of TILLT is focused in two directions; on the one side TILLT focuses on processes of human growth and ORGANISATIONAL DEVELOPMENT – artistic competence as a tool to stimulate creativity, innovation, human development, and more. On the other side, TILLT works for increasing the field of work for artists where new art can be born and NEW ARTISTIC METHODS can be developed.*

The current organization, developed under the entrepreneurship of Pia Areblad, has become the world's largest producer of artistic interventions. They have produced hundreds of different interventions, with more than 80

lasting a year or more. In 2013 TILLT had 16 full-time employees under the CEO and Arebald as Strategist and Lecturer. There were two business support positions (business manager and accountant), a marketing specialist, seven people responsible for coordinating projects, and four process leaders.

Almost 70 artists from different disciplines have completed the formal application process and are available to be employed part time (see roster [www.tillt.se/konstnarer-artister](http://www.tillt.se/konstnarer-artister)).

*After recruiting the artists they have to go through a kind of preparation, I made a folder with all the things the artist needs to know, ... such as group dynamics. (RS-6/12/13)*

### **Facilitation Process at TILLT**

The strategist, marketer or another staff member recruited companies who would like an artistic intervention, then a process leader was assigned. Before matching an artist to a particular project:

*The process leader has been out to the company and had a deep talk about what's going on and listens between the lines, and tries to check out what challenges they have, and what problems there are, and why they want to order this kind of project. And so on. And the same with the artists, you have to get a good feeling of what type of person [is needed]. We use only one artist... It's not important if they are a dancer, choreographer, or painter or writer, it's more like the competence artists have so they can rest in the process. They are not afraid if they don't see what's around the corner. (RS-6/12/13)*

The company always pays (up to over \$50,000) for the artist and some administrative costs, and subsidies from a regional government cover marketing and administration. For EU projects, funding from the EU covers part of the company portion. Members of TILLT's staff who coordinate projects have written a series of expert reports covering important aspects of the "back office" process (cf., Grzelec & Prata, 2013; Ingelsia & Almandoz, 2009, Vondracek, 2013).

Next, the all-important steps of anchoring the project and building trust.

*It's so important with trust building. So after the matchmaking this anchor work has been going on as well at the company to inform the board, inform different groups, the unions. ... And to present the artist*

*Mind the Gap! Strategies for bridging artists and organizations in artistic interventions and to have the first meeting with this project group at the workplace. (RS-6/12/13)*

Then the artist works in the company one day a week:

*A phase of two months with the researching, building this project group strong, and getting to know people and the working place for the artist and vice versa. And build trust and starting to do some small workshops and so on.*

*At the end of these two months they have to make a plan for the rest of the project. What are we going to do? How are we going to do it? When are we going to do it? Everyone's voice is important. ... Every idea is good at first. Then you have to sort it out and see what is not subject for this project, and if you have to address these questions to the right persons in the company to take care of. (RS-6/12/13)*

Now the project work begins in earnest:

*After these first two months you have six months, and you never know what's going to happen. And that is the challenge in the whole concept, not coming in with a fixed box about we will do this. It's a challenge to make people understand and feel the good things about, oh I am going to do something! I can give voice to what I think is interesting, and so on. It takes time. I worked with in a project for 18 months and after about 12 months they said, 'Oh, now we understand, we are in a process.' (RS-6/12/13)*

The facilitator keeps an eye on the project through monthly coaching meetings with the artist and more frequent communication when necessary. He steps in when he senses there may be a conflict, often meeting with "the bosses" to make sure they understand the working conditions necessary for the project's success, or to reiterate the need for an "open process" in which everyone participates and all ideas are considered.

Seminars were held at intervals during the projects so all the participants could learn from each other.

*We had three seminars over the project year, and the kick off seminar was when they had been working for maybe a month. When we had all eight projects starting on the same date, and following each other,*

*the seminars were really supporting the process. Then we had rolling starts, so it could be one project starting in January, another in May, and so on. So we had two smaller seminars then. (RS-6/12/13)*

Ending the project

*At the end of the project they have to make a plan for the future. First they made a plan for the project, then they have to make a plan for the future. It's kind of an evaluation of the project. ... It can be coffee and cakes, or a big show, but it's very important to make it clear that this phase including this project is now over. And now you have to carry it by yourself. And now there is no artist coming next week. (RS 6/12/13)*

At TILLT, the facilitator interviewed had many years of experience, and in dealing with the unique circumstances of each intervention, he kept the company's interests foremost in his mind. He knew that the company was paying for the intervention and the CEO would be speaking about the experience with other CEOs as potential buyers of TILLT's services.

### *3. SKISS: A temporary intermediary organization*

SKISS was a government-funded Swedish project within the cultural sector (as opposed to industrial or service sector). It was run by and financed through "Arbetsförmedlingen" (public employment service), a government body that "matches job seekers and employers"<sup>17</sup>. Since it is in the cultural sector where there are usually more job seekers than jobs, Arbetsförmedlingen often tries to create jobs. In this case the hope was that the project would create some permanent jobs after it ended. This policy is common in Scandinavia, the Netherlands and England, but rather alien in the US where private funds play a similar role.

The SKISS project ran between 2005-2008. It was the brainchild of a politician:

*Unhealthiness [employees' poor working conditions] at the working places was rising and that was a big problem. They [politicians] didn't know what to do. And then she [one politician]) had this vision that*

---

<sup>17</sup> "Arbetsförmedlingen is the largest placement service for work in Sweden. Our most important task is to bring together those who have a vacancy to fill with those who are looking for work. By creating meeting places for employers and jobseekers, we contribute to a well-functioning labour market." ([www.arbetsformedlingen.se](http://www.arbetsformedlingen.se))

*Mind the Gap! Strategies for bridging artists and organizations in artistic interventions artists can make a big difference. So she wanted to start a big project, and to hire artists, not just making them work for free but to hire them. (EM-12/04/13)*

In total 56 artistic projects were realized in different workplaces: 30 in Stockholm (20 in first round, 10 in second), and 26 in various regions of the country. Project sites were organizations in the public sector, such as schools, utility companies, elder-care facilities, or public housing management. The size of the organization varied, from 4 or 5 to 2000 people. In most projects the artists were employed half-time for a year and paid by the project, not for the artistic end result. According to one artist:

*You got paid for your work, not the object you're producing. That was important. I think a very important political statement ... that we should be paid for our work and the competence... and it doesn't matter if it's an object or a sculpture or a painting in the end. ... In a way we were working with processes that change minds - changed ways of thinking and reflecting experience the world in a sense. And that's something that you can have in the working places. I mean the artist can come in to that kind of process. (ML-12/4/13)*

The SKISS organization consisted of a steering committee that included an officer from Arbetsförmedlingen and the leader of a research group from Umea University. The full-time project leader, EM, was responsible for conceptual development of the project, budget and obtaining funds from public funding (finance), hiring, training and managing the artists (personnel), communication within the public sphere (public relations), and the development of new projects. She worked alone, with a small amount of administrative help provided by the host organization (Arbetsförmedlingen) and ML, who was also one of the artists. Each project had a contact person who also became part of the SKISS organization.

The project leader was hired in January 2005 and the first group of 20 artists three months later. Artists applied to be included in the project, and were interviewed before hiring.

*We wanted to get a picture of what the artist wanted. Because it was an investigation for the artist. Do I like to work like this and in that case how can I work? And it was a little bit the same for the working places. This was something new for them and they didn't want to say, oh what is artist? He's going to hang a picture on the wall or*

*something? Well we don't know. So it took very many different discussions in this first part. It was also some kind of investigation program [for SKISS]. How can we work with an artist and what does it make to the working place? (EM-12/3/13)*

As a result,

*We were very different kind of artists with different kinds of media, expressions and experience from the field. Some were used to work more with relational aesthetics, others were painters and video artists and sculptures. The oldest one was over 60 years old, the youngest [had just completed] their art education. (ML-12/4/13)*

Before entering the companies the artists completed a two-month training period held at Konstfack, University College of Arts, Crafts and Design, to prepare then “to discuss what is workplace health and why and what we should do.” They had courses in organization theory, visited workplaces, and read and discussed about health. Then the artists themselves chose where they wanted to work. It was their responsibility to find a place that suited them and to convince the organization that their time there would be beneficial.

### **Facilitation process at SKISS**

We view the facilitation process as the way in which the workplace and the artist were coordinated. From this perspective, the artists essentially facilitated themselves and each other. So, for example, the artists needed to find the workplace, introduce themselves, and handle all conflicts that might rise.

The project leader's role

*... was to safeguard the project's budget and funding, to get a good, safe program for the artists. And then try to make good conditions for the artists in the project at the working place - to let the artist choose their own way of working. And try to make it open. I needed clearly to inform the contact persons at the workplace that this was an investigation and the artist had no expectations in the beginning. The artist needed to have a free process to see what will be happening. And then the working place could feel that they had this open process to investigate how they could work in a new way with the artist. (EM-12/4/13)*

*Mind the Gap! Strategies for bridging artists and organizations in artistic interventions*

During the initial training period the artists worked in pairs or small groups and they continued this structure to give each other support during the workplace period.

*The way of thinking or solving problems is my way of looking at the world or the society and I want to be a part of the society. And I think a problem in the art world in one way is that we're almost separate.... In contemporary art you're working with issues that are everyday things in a way. Yeah, and then you should be out in everyday things (ML-12/4/13)*

This background meant that it became customary to focus on the artists and their working conditions. The artist left the company at the end of the contract and returned to her or his own practice. The company workers resumed their everyday work – but no one evaluated the SKISS project to see the workplace was less unhealthy. The project leader took another position and the project was not continued.

## Discussion: points of similarity and difference

As our conversations with the three facilitators showed, the intermediary organizations had different roots, purposes and structures, and although the facilitators had similar overall processes, individual approaches varied. We present these points of similarity and difference in two tables.

*Table 1: Facilitating organization differences*

	SVID	TILLT	SKISS
Purpose of intermediary organization	Foundation with many activities.	Non-profit with government support, single purpose.	One-time project.
Overall purpose of project	Research project.	Cultural, partly commercial project.	Unemployment (artists) project.
Project structure	6 parallel projects, running for 3.5/4.5 years (one day/week).	4-8 parallel projects, each about a year.	56 projects in different organizations, each for half year.
Artist /designer involvement	Initial contract of about 250 consulting hours per artist/designer.	Artist employed equivalent to 20% for one year. Worked in company	Half-time salary provided by the project. Worked in pairs and

		one day a week for about 8 months.	took care of the facilitation process themselves.
Payment/ financing of artist/designer	Research project & company each paid 50% of total cost. Most companies funded additional time.	Company paid artist's salary plus large overhead (never specified and not officially accounted.)	Organizations did not pay anything.
Extent of facilitator involvement	Originally 6 parallel projects expected to run for 1.5 year and be administered on half time basis. Took care of all the administration, including selling, external contacts etc.	Facilitator worked with companies and artists. Others from TILLT's administrative structure were selling the projects.	Administered about 20 parallel projects a year. Not involved in selling or specific activities of projects, rather working as a coach for the artists who acted as own facilitator .

Each intermediary organization had a different experience in developing and running artistic interventions, indicating that different structures are possible, and that projects can run for different lengths of time. As a single purpose, non-profit organization, TILLT needed considerable administrative resources to maintain its viability, while SVID's collaboration in an externally funded doctoral research project provided the facilitator with "on-site" support. SKISS, on the other hand, suggests that artistic interventions can occur with a minimum of administrative support.

Table 2: Facilitator process differences

	SVID	TILLT	SKISS
Recruitment of companies	Facilitator recruited company after discussion with researcher. Recruiting seen as benefit to company since they received a subsidy towards the designers.	Special "seller" (recruiter/marketer) approached company and developed relationship and contract, facilitator then took over.	Project leader recruited artists. Artists recruited the organizations.
Recruitment of artists	Facilitator recruited designers in	Selected from database of interested	Formal recruitment process.

*Mind the Gap! Strategies for bridging artists and organizations in artistic interventions*

	discussion with researchers.	artists. Formal recruitment process for inclusion in database.	
Process support	Facilitator and researcher worked together.	Facilitator dealt with problems as they arose.	Artists supported each other.
Dealing with problems ("people problems")	Facilitator dealt directly with problems and discussed them with researchers. Assigned a new designer when necessary.	Facilitator talked with management as needed to make sure project was understood within company.	Artist dealt directly with problems as they arose - few lasting problems.
How projects ended	Researcher decided. Facilitator & researcher wrote report.	Employees and artists wrote report guided by facilitator.	Artist left company at end of employment period.
Facilitator view of:			
(a) outcomes for Company,	Met the goal set by the project group. Gained tools for future work.	Better communication, better understanding for each other's different roles at the worksite. Outcomes at individual, group, and organization levels.	Respite from daily work during project workshops.
(b) outcomes for artist	Opportunity to reflect on own competencies.	Benefitted in ways related to why they were motivated to become involved in the first place.	Steady salary. Interaction with members of society. Networking with other artists.
(c) own outcomes	Saw how creative methods can be as strong as technical methods. Developed "pre-design" stage.	To see people become engaged and have many ideas and opinions.	Project leader too busy for self-development.

The facilitator process differences were related to the amount of support provided by the project structure and also to individual facilitator's past experience. With the exception of SKISS, where the project leader could not point to a personal outcome, there were positive outcomes for all the

parties involved. In all cases, we note that goals for providing developmental opportunities for the artists were met in addition to company benefits.

Positive outcomes included:

- For SVID, the project lasted a long time; this is needed for implementing artistic interventions in companies. Clear co-financing arrangements existed between the company and other funding sources. Although the amount provided by the company was relatively small, it ensured commitment to the project.
- TILLT has completed 80 projects and the organization is set up to create opportunities and administrative services for artistic interventions. Projects had strong endings including an event, report and company commitment to continue using “tools gained”.
- In SKISS the artists formed peer support groups. The contract provided half-time work for the artists, which was sufficient time for support groups and plus time for artists’ own development.

Negative points included:

- For SVID this was a one-time research project.
- In TILLT the administrative overhead has become too large to be financially viable.
- For SKISS there was insufficient administrative and financial support to continue with projects.

## Overall evaluation

Both work-places and artists need “disruptions” to enable innovation and growth. By bringing artists into the workplace to share their competencies within an open process, organizational and individual development is possible for all those involved. But “gaps” emerge in the meeting of artistic logic and the technical logic of the workplace, and some type of mediation or facilitation process is needed to bridge these gaps before they become overwhelming chasms. Here the unobtrusive skills of an experienced facilitator are necessary, someone who understands both the artist’s perspective (both ML and RS had backgrounds with artistic training), and the managerial view, including access to senior management (SKISS artists participated in university courses covering organization theory and workplace health, in addition to visiting various workplaces).

Just how much and when such facilitation is needed is difficult to ascertain. Our interviews, albeit limited, suggest that facilitators develop their own methods for working in a given situation, and may exceed the number of hours formally assigned to the project. Experienced facilitators spoke of intuitively spotting warning signals and immediately focusing on how they would handle the situation. Future research should focus on such moments. An alternative route, which we have begun to explore (Johansson Sköldberg & Woodilla, 2014), would be to manage artistic interventions in organizations through a curatorial process. Here the artist's perspective would be at least equally important as that of the organization, the artist would be of higher status within their discipline, and the organization would welcome contributing to the cultural environment of society as well as its own development.

Each of the three artistic intervention projects studied here had a different overarching perspective: SVID by the academic perspective, TILLT by the company's perspective, and SKSS by the artists' perspective. Thus, while our comparisons provide insights into the mechanics of facilitating artistic interventions, the total context must be considered when assigning value to different configurations of intermediary organization and facilitating activities.

## **Summary reflections**

As an outcome of our research, we provide the following suggestions for others wishing to implement artistic interventions in organizations.

First, consider the extent of the artistic perspective desired. If the intervention focuses on the artistic perspective introduced into the company (as in the case of SKISS), the outcomes may be more diffuse and take longer to be integrated into company processes, but eventually be extremely beneficial. On the other hand, if management has a definite outcome in mind before the intervention, then a facilitation process similar to that at TILLT would be most beneficial, so that the organization's interest take precedence over the artistic process.

Second, when selecting an intermediary organization to provide the artist (or designer) to work with employees, consider whose values will be foregrounded in the process. A well-established, single purpose organization such as TILLT first assigns the facilitator when then ensures that company values are understood and that the selected artist will work with these values. Alternatively, if the artist him or herself decides that the company

environment would be accepting of an artistic perspective, then artistic values will permeate the project. As a third possibility, participating in a university research project brings additional benefits of a theoretically-informed holistic approach in which the framing research question determines the value of the outcome.

Whichever route is taken, we believe than engaging in artistic interventions of the form described in this paper brings lasting benefits to all parties involved.

## Innovation Through Dumpster Diving?

Oriana HASELWANTER\*

University of Gothenburg

*In an attempt to deal with today's complex and confusing economical demands, more and more corporations are seeking collaborations with artists. They want to use the artists' creative mindsets and working methods to their benefit – stimulate innovative and creative capacity within the company (Guillet de Monthoux, Sjöstrand, 2003), create fiscal value and an increased competitiveness. So-called artistic interventions can come in many forms and a lot of theoretical texts have been published about these ventures. However, a gap between theory and practise exists and it remains questionable if the writings reflect the real world or are primarily theoretical concepts sometimes focused on positive outcomes alone. More case studies are needed in order to describe effects, impact and relevance of artistic interventions in industrial settings because it remains questionable if they can deliver concrete benefits for the companies – or if they even should. This investigative research project is an ambition to minimize this gap through the empirical research that is behind this paper and contributes with an actual case to this field. The paper highlights what happens if artistic interventions are laid out as temporary, independent provocations. In this case, a project group of a large engineering company was confronted with 'dumpster diving' as a type of provocation initiated by an artist. As a main conclusion of this essay I discuss the term 'artistic provocation' – a variation of artistic intervention. Artistic provocations are short-term activities provoking participants by confronting them with unorthodox worlds. Experiencing these worlds with all senses conveys an understanding on different levels. This arguably leads to a more open attitude and positively influences a learning process, which seems to be indispensable regarding long-term creativity and innovation on workplaces.*

**Keywords:** Artistic interventions, creativity, innovation, provocation

## **Introduction**

Due to the rising competitiveness, globalisation and complexity of today's society, corporations are faced with manifold challenges today in order to stay profitable. (Adler, 2006) Hence, companies are more and more willing to explore new paths and territories to find innovative ideas serving a sustainable development of their business. New logics are introduced to traditional business operations. One approach to counteract a slow or stagnating development of non-art or non-culture based firms is trying to infuse art and creativity into the company and expose the employees to unorthodox and provoking working processes.

How inspiration from art can show effects to increase creativity in organisations and companies has been of growing interest during the last decades. (Austin, Devin, 2003; Gagliardi, 1996; Guillet de Monthoux, 2004; Ladkin, Taylor, 2010; Linstead, Höpfl, 2000; Strati, 1999) These approaches – here called artistic interventions – are commonly described as processes bringing together the antithetic worlds of organisations and the arts. For example, the aesthetic dimension of the arts has become a role model for leadership and management (Guillet de Monthoux, Gustafsson, Sjöstrand, 2007; Guillet de Monthoux, Sjöstrand, 2003; Hansen, Ropo, Sauer, 2007; Hatch, Kostera, Kozminski, 2005; Ladkin, 2008), should help to create an understanding of organisational structures (Hatch, 1999; Barrett, 2000) or highlight the sensory experiences of the organisation (Gherardi, Meriläinen, Strati, Valtonen, 2013). These artist-company collaborations should then trigger change on different levels. (Schiuma, 2009; Taylor, Ladkin, 2000; Darsø, 2004) It is expected that these projects influence the innovative competence, the creative ability and the capacity of internal teamwork and external collaboration of the employees. Although these assumptions might be partly valid and look nice on paper, proving concrete effects of artistic ventures within organisations is difficult. For art to work its results cannot be pinned down in advance, claim Barry and Meisiek (2010) and in fact, the field of art represents inspiration, imagination and creativity – in other words soft skills that are hard to measure – while economy represents efficiency, rationality and profit. (Berthoin Antal, 2009) Hence, management often asks for hard evidence of creative approaches in an attempt to prove that their investment in these new working methods produces revenue.

In fact, the lack of research in this field is problematic because not only do we know little, what we think we know is quite biased towards a positive view of the phenomenon (Berthoin Antal, 2011) and moreover artistic

interventions seem to be buzzwords (Carlgren, 2009) when it comes to management strategies.

Thus, it seems relevant to critically evaluate creative approaches in businesses. Can these short-term provocations achieve a change of perspective and increased openness and can they have a positive impact on employee behaviour? By investigating this case of a collaboration between an artist and a big international technology based company in Sweden, some answers to these questions are expected to be found. The presented case describes and analyses what happens between the participants of a 24-hour artistic intervention workshop, which was laid out as a temporary, independent provocation.

At the same time, it is worth mentioning that this research case only describes one single intervention and the long-term effects can only be seen in weeks, months and possibly years to come. Hence, this example serves more as a pre-study of a potentially longer research project.

## **Relevance and contribution**

As mentioned earlier, one reason for this research is to immerse in the gap between theory and practise to find possible mismatches and overlaps. Thereby a presumably clearer and more realistic picture of these approaches can be drawn helping practitioners working with these methods in the actual implementation of these theoretical concepts.

## **Theoretical background**

In order to be able to conceptualize the findings of the empirical study, some key issues need to be approached from a more theoretical perspective in advance.

### *Creativity*

Artistic interventions of all kinds are always said to trigger creativity first and foremost. Creativity is a very complex term to define. Working creatively means (amongst other things) not knowing the outcome or result from the beginning – hence being in an open process – having time to work co-creationally and interdisciplinary and making space for trial and error. Creativity also is possibility thinking – it generates associations. Daring to think that everything is possible favours a constant flow of ideas, of which imagination is an important part. (Englund, 2010) Divergent thinking

(Shalley, Gilson, 2004) and process thinking (Hernes, Maitlis, 2012) are other ways explaining creativity.

Kirton (1989) even claims that the capacity to think creatively is common to all people – the major differences lie in the preferred style of expressing it. Hence, basically everyone is creative (DeFillippi & al., 2007; Gagliardi, 1996; Strati, 1999) because everyone is confronted with ideas (creativity is having good imagination or original ideas, states the Oxford Dictionary) and problem solving on a regular basis. So if creativity is defined as the ability to solve problems, then it could be easily argued that everyone is almost equally creative because everyone solves problems every day.

Styhre and Sundgren (2005) point out four different streams of creativity – (1) creative processes, (2) creative people, (3) creative products and (4) creative environments.

### *Innovation*

Creativity is often followed by discussions about innovation. Especially in this case, innovation is worth mentioning, because the brief of the 24-hour workshop included ideas about open innovation (which will be mentioned later on).

The word innovation comes from Latin 'innovare', meaning 'making something new'. Hence, innovation refers to the creation and application of a new idea to create value in a certain context and its goal is positive change, mostly leading to value creation, increased productivity and therefore increasing wealth in economy. (Dutta, Lanvin, Singh, Green, Berthelon, Bindra, 2009) Around the millennium, the discussion of innovation gained a lot of prestige; it was linked to business strategy and became the hallmark of companies in the forefront of the global economy. (Johansson, Woodilla, 2009)

Nowadays creativity-intense professions like design and art are more and more linked to innovation. (Jahnke, 2009) This means that creativity can be seen as an effective and important tool for innovation. (Englund, 2010) One could say that when creative ideas are translated and applied in the right way, they can become innovations, and further, if a person uses and benefits from this innovation, creativity is said to have been profitable. (Ibid.)

'Open innovation' is defined by Chesbrough (2003) as a paradigm that assumes that firms can and should use external as well as internal ideas, and internal and external paths to market, as the firms look to advance their technology. This means that collaboration between internal business units

or between companies and external parties are essential for open innovation attempts to generate new ideas. (Ibid.) Needless to say, to foster open innovation, companies need to be very open with their own ideas, strategies and developments, which requires a lot of trust between the partners. (Ibid.) It seems obvious that open innovation policies and strategies within companies are risky approaches since the ownership of the intellectual property is always questionable and therefore the ownership discussion and all its legal implications gain high importance. Regardless, open innovation projects are more and more established between various companies – again in search for competitive advantage.

### *Artistic interventions*

Artistic interventions – due to their connection to creativity – are often meant to lead to some kind of innovation – at least from a managerial perspective. Berthoin Antal (2009) states that in recent years artistic interventions have developed as a mean by which it is possible to stimulate innovation. (Adler 2006)

Artistic interventions – sometimes also called arts-based initiatives – are commonly described as processes bringing together the antithetic worlds of organisations and the arts. (Berthoin Antal, 2011) Energy is released in form of new ideas, new visions and deeper understandings for what an organisation is doing on an existential or meta-level when the two contrasting logics (the logic of the artist and the logic of the organisation) clash. (Grzelec, Prata, 2013)

Organisations enter into collaborations with artists in seek for inspiration because arts-based methods, thanks to their 'otherness', are seen as stimuli for new ways of thinking and doing things. (Biehl-Missal, Berthoin Antal, 2011) This is what organisations expect from these kind of collaborative projects in order to trigger the innovative competence, the creative ability and the capacity of internal teamwork and external collaboration of their employees.

Artistic intervention can comprise all kinds of artistic expressions – from theatrical workshops, poetry slams, sculpting, conducting, storytelling, photography, filmmaking and painting to choreographic training and much more. (Biehl-Missal, Berthoin Antal, 2011) All human senses (tactile, visual, audio, taste and smell) – also described as aesthetic values – should get activated and stimulate the participants to see more, hear more and experience more of what is going on within and around them. (Berthoin Antal, 2012) These sensual, intangible, aesthetic values can be described as

soft skills. Soft skills are hard to evaluate in a world dominated by quantitative measurable results and deal with emotions, feelings and intuition. These attributes are essential for artists in their way of working and determine their decision-making processes but they are harder to grasp from a pure managerial perspective.

Taylor and Ladkin (2009) identify four different parts how artistic interventions can work regarding soft skills. They exist on their own or in combinations. (1) Skills transfer: Arts-based methods can facilitate the development of artistic skills in a group. (2) Projective technique: The output of artistic endeavours allows participants to reveal inner thoughts and feelings that may not be accessible through more conventional developmental modes. (3) Illustration of essence: Arts-based methods can enable participants to apprehend the 'essence' of a concept or tacit knowledge in a specific situation in a particular way, revealing depths and connections. (4) Making: The very making of art can foster a deeper experience of personal presence and connection.

Darsø (2004) describes three different levels of artistic interventions: (1) The individual, (2) the group and (3) the organisational level. First and foremost artistic interventions influence the individual. (Schiuma, 2009; Berthoin Antal, 2009, 2014) Concerning the (1) individual level, Darsø (2004) presents a model on how art may influence the participants to reflect on their everyday view of the world and thereby develop a deeper understanding of themselves and how they relate to the circumstances surrounding them. This model consists of the following phases: (1) Downloading – the participants see the world in their traditional way. (2) Seeing – the observational phase. (3) Sensing and pre-sensing – developing a reflective mode. (4) Crystallizing – creating a deeper understanding of who they are and how they relate to the world around them.

On the second level – the (2) group level – the participants of an artistic intervention start to spread and share their learnings within a group in the organisation, which facilitates more and different communication. (Berthoin Antal, 2009, 2014)

The (3) organisational level of a company might be affected when the interventions have an impact on the personal and the group level. Then this could lead to an effect that can be related to increased networking opportunities and visibility which might generate strategic interest from other stakeholders. (Berthoin Antal, 2009)

But it has to be noticed here, that it is problematic to really measure and evaluate the impact of creative initiatives because they are complex in

nature, interact with other influential factors and have outcomes that do not always fall within a clear time frame. (Biehl-Missal, Berthoin Antal, 2011) Many other processes going on in the organisation simultaneously definitely influence the employees and therefore the work of the artist.

## Research methods

As Hatch (2006) suggests, I use a descriptive and symbolic-interpretive perspective for this case. I utilize qualitative data collection methods (Hiatt, 1986) such as participatory observations in cross-disciplinary settings inspired by reflective ethnography (Kostera, 2007).

I took part in a 24-hour workshop and use my observations for my sense-making of what happened during this workshop. To analyse this personal data, I took a qualitative, reflexive and interpretive approach (Alvesson, Sköldbberg, 2008, 2009). Also, as suggested by Johansson and Svengren Holm (2008), a narrative (Czarniawska, Sköldbberg, 2003) and ethno-narrative (Hansen, 2006) approach is useful to create a contextual and aesthetic understanding built upon more than just words. This means that I utilize an on-going sense-making process for my own understanding whereby I constantly structure and stabilize my own reality. (Hernes, Maitlis, 2012; Chia, King, 1998) My approach was abductive (Alvesson, Sköldbberg, 2009) in the meaning that certain experiences from the field led to seek literature in order to understand what is going on. Hence, the theoretical and empirical parts are interacting continuously meaning that I analyse the case during describing it.

## The case

As mentioned in the research methods chapter, I will here describe the case in detail and at the same time add observations and reflections that are all part of the on-going analysis.

### *Background*

The involved company

The presented case is a collaboration between some employees of a big company and an artist. The company is an international technology based corporation found in Sweden. It was established in 1876 and has about 110.000 employees worldwide. The employees of several departments of this company had already been in touch with other creative working

methods prior to this intervention. For example, a two-year long global innovation project focused on design thinking approaches, initiated in cooperation with IDEO, was introduced in 2010. So called 'innovation squads' were set up on three different locations of the company in an attempt to introduce the company to more creative working methods in order to reconsider ways of working to be more responsive, faster paced, and more innovative across the board. (Broner, 2013) The innovation squad located in Sweden consisted of three international innovation specialists / design thinking experts who were hired to carry out design thinking efforts, to implement, guide, audit, facilitate, enable and maintain the project. The results and the impact of this team were hard to evaluate, quite appreciated but did unfortunately not lead to a continuing project.

However, the company wanted to explore other creative approaches to stimulate the innovative competence of their workers. Therefore, they collaborated with an artist during a 24-hour workshop.

### *The artist's agency*

The 24-hour-lab was initiated and organised by an organisation establishing artistic interventions in companies. This agency built their business model around connecting artists and companies and acted as matchmakers in that sense. In this particular case, one agent of this organisation was negotiating with a department leader from the engineering company and finally the collaboration was formulated.

### *24-hour workshop*

For the 24-hour lab, a selected group of employees (around 12 people) from different departments of the company were chosen to take part in this experimental workshop that should challenge the worldview of the participants and bring them to the edge of their comfort zone. The 24-hour-lab should provoke this group of people in various ways to stimulate their creativity, their innovative capacity and change their perspectives. In other words – the employees were supposed to leave the convenience and security of their day jobs for 24 hours and got thrown into a world aside from computer screens, steaming coffee, familiar colleagues, regular 'fika' breaks (Swedish coffee breaks) and workflow meetings to engage in an experimental experience they would not forget for some time to come. This lab should function as a first test-round possibly leading to a greater involvement of the artist in the organisation.

The chosen employees were mostly working with engineering or administrative tasks in the company. The workshop should tackle two days of socially responsible open innovation. Three part-challenges were presented. Challenge 1: Dumpster Diver Afterwork – Creating a full-scale dumpstered afterwork menu. Challenge 2: Dumpster Diver Community – Coming up with a solution that serves a mutual partnership between the company and the Global Dumpster Diver Community. Challenge 3: Social Open Innovation – Finding an integrated method for open innovation adjusted to the company with the guidance of ISO 26.000.

The paper will mostly focus on challenge 1 – the Dumpster Diver Afterwork – analysing the artistic intervention laid out as provocation.

### *Dumpster Diving*

The dumpster diving term originates from the best-known manufacturer of commercial trash bins, Dempster, who use the trade name 'Dumpster' for their bins. (McKean, 2005) Dumpster diving is the activity describing the sitting through commercial or residential waste in mostly urban areas in order to find and re-use waste material – often expired or imperfect but still edible groceries but also other materials such as technological parts, kitchen supplies and other goods. This movement is rather new and a reaction to the large amount of wasted items produced by households, companies or supermarkets today. Dumpster diving mostly happens in the evening or during night since the legal implications for dumpster diving are not totally clear. Dumpster diving is a global movement gaining more and more interest from different groups in society and a combination of social critique, sometimes a political statement, environmental self-responsibility and life philosophy.

### *Opening phase of the workshop*

Starting the 24-hour challenge, the workshop members met on a Thursday afternoon at the office and were confronted with the three challenges to be tackled during the next days in three groups of four. The schedule was tight, the time was short.

Most of the people were unfamiliar with each other although they were colleagues. This fact got evident rather early in the process since most of the participants spoke quite openly and freely without much hesitance during the first getting-to-know phase. The artist in charge motivated everyone to come up with a nickname or alias connected to dumpster diving and everybody's own personality. Pia, Olessia, Mike and John turned into

pineapple, potato, passion fruit juice, melon stone, computer trash or lettuce. Most of the people were quite happy to take part in this game but the question of why these names were relevant was asked very early by one of the most engineer driven participants.

After this introductory phase, the first brainstorming session dealt with questions, thoughts and associations about the Dumpster Diving Afterwork. Although these first ideas and thoughts about the Dumpster Diving Afterwork were not taken any further at this point, it was a good exercise to start a reflective process and a discussion which then continued with general questions about dumpster diving since the group was not introduced to this concept beforehand.

### *Confrontation with dumpster divers*

Two young, bearded, casually looking members of the local Dumpster Diving Community were invited to the workshop to answer as many questions as possible from the group, which were stated on post-it notes. An intriguing observation was that most participants stuck their post-it notes very accurately and in one straight line onto the wall. This could have been a reaction to the first person sticking the notes so perfectly onto the wall so that the others followed her routine but it could also be a sign of the engineer-driven mindsets of most participants where structure and accuracy arguably are very common concepts. However, the different preconceptions about dumpster diving became one of the most thought-provoking discussions of the evening, because a lot of misconceptions and stereotypes were revealed. The session even had to be expanded because a lot of questions wanted to be answered and clichés wanted to be explored. Some people had not even heard of dumpster diving before, whereas others were very much influenced by local media and had never encountered dumpster divers in their lives. A lot of people were surprised by the fact that this sub-culture seemed to be so big in Sweden and that one could even create a company and a successful business model out of it which went very much against their preconceived knowledge and understanding.

Interestingly, the two dumpster divers used a very different language compared to the workshop participants with mostly business, administrative or engineer backgrounds, who were mainly dealing with totally different people and concepts on their workplaces. One of the most surprising statements for one of the participants was a specific attitude of one of the dumpster divers. The participant was concerned about the reason for being a dumpster diver and very amazed by the fact that the two present

dumpster divers apparently did not do this ‘to save the world or make any political statement or protest against the establishment’. For the dumpster divers, dumpster diving was basically a way of living, a mental state and a way to react to ‘society’s failings’ without making too much fuss about it. What they really wanted to achieve was to make people aware of this problem and inspire others to follow their example in order to create a change in the long-run. Even if they partly lived from dumpster diving at the moment, their main goal was to abolish dumpster diving naturally due to the lack of existing leftovers and trashed but still edible food. So basically they wanted to end dumpster diving through dumpster diving – a silent rebellion.

The second discussion of this evening was formed around solutions for mutual collaboration between the company and the dumpster diving community. In the brainstorming of one group, ideas circled around very technical solutions (for example smart phone apps) that mainly benefitted the company – but not really the dumpster diving community. Social aspects were hardly considered. The focus was clearly on finance, legal and tax issues, commercialisation, feasibility, net sales, market impact and implementation, practicability and marketing. This might have been due to the fact that all group members (only men in this case) worked with the technical or managerial side of the company in one or another way. At the same time, this was also an obvious sign that they did not yet leave their usual stream of thinking and their thoughts stayed within their known territory.

### *Dumpster Diving Activity*

After this, it was time for the real excitement – the real-deal, the stop-talking-and-start-doing, the get-outside-and-get-dirty, the stepping-into-the-unknown action. It was time for dumpster diving! The company’s employees got out and scabbled in garbage, took what others left behind, explored the boundaries of legality, carried away heavy bags with found goods, got dirty, crawled into unknown territory, stuck their heads in trash cans, got confronted with reality, climbed onto containers, were uncomfortable, surprised, disgusted, moved, cold, touched, amazed and challenged.

Each of the three groups was guided by at least one semi-professional dumpster diver to the most popular dumpster spots all over the city. Everyone armed themselves with torches, gloves, warm jackets, rubber boots, rubbish bags and tried to be as open-minded as possible. Then everyone was released into the night.

The 'men-only-group' was already quite successful at their first location where they found a hidden shed with trash bins. Although the shed was locked, they could squeeze through a narrow opening to get inside the shed. For two guys of the group this really got to be a task and a challenge they clearly wanted to tackle. The atmosphere became were exciting. It felt like being in a detective story where the forbidden and hidden treasure had to be discovered and the heroes of the story could show off their amazing climbing and rescuing skills. Passing cars and people where observed with a hint of anxiety. Clearly, everyone enjoyed this spectacle in the middle of the night and was amazed by what type and amount of thrown-away but still original packaged goods the two found in the shed. Everyone left this first spot with an ambivalent feeling of excitement and surprise but also a discrepancy of doing the right thing on the edge of legality. The next stops were at a lower excitement level and also not as successful. Even shop owners were asked for expired products and production companies were explored. It was apparent that some group members got really exhilarated, did not want to stop this adventure and even grabbed fruit and vegetables out of full bins holding all kinds of mixed and open groceries. Although it was a really cold night, everyone seemed to be enthusiastic and have fun.

Coming back to the company's premises hold a rather substantial surprise for every group. The big dinner / conference table in the office started to flow over with found food collected at the different spots. Bread, apples, tomatoes, potatoes, peppers, mushrooms, corn, leek, lettuce, oranges, onions, cauliflower, pastries, sweets, cans and bottles of all kinds fought for their space on the table.

### *First reflections*

During breakfast (not dumpstered) on the next morning, first conversations about reflections from the previous evening commenced. Comments about the unbelievable vast amount of still eatable food, discussion about the hypocrisy of food production and supermarket offers, the various existing preconceptions and stereotypes about dumpster diving, the obscure policies in politics and law but also the experience to see things with different eyes when getting in touch with a marginal group in society led to interesting insights for everyone individually. Most 'neo-dumpster-divers' wanted to find out more about how much food was actually wasted on a daily-basis and some wanted to introduce dumpster diving as an exercise for kids to teach them the value of food.

### *Dumpster Diving Afterwork*

A delegation of the group was ordered to set up tables with the dumpstered food very publicly next to the company's canteen later on the same day. This action sparked a lot of interest and discussion not only amongst other employees of the company but also at the canteen. Due to this unexpected development and interest, all the lab participants were asked to mingle around the dumpster table, socialise, engage other employees in provoking conversations and approach anyone passing by. At first, this task was hard to fulfil for some because it took a lot of courage to actually approach people and inform them about this unusual initiative – bearing in mind that they were all colleagues and not used to something like this at all. Some said that they felt a bit ashamed but proud at the same time. But everyone seemed to be pleased that this action gained so much attention.

The preparing of the afterwork menu was organised rather differently in all the groups. Some were struggling to come up with a menu (mostly groups with a bigger percentage of male participants who had less cooking experience) whereas others started to arrange different dishes immediately (engaging in various cooking and food preparing tasks quite naturally). Although the cooking facilities were limited at the premises (only knives, cutting boards, plates and microwave oven were available), the 'dumpster cooks' handled these restrictions very well and even tried to look for cooking equipment in other departments in the building. Everyone seemed really motivated, excited and high-spirited. Maybe a sign that their creative capability was already influenced by the experiences on the previous day.

Although time for last touches on food and decorations on each of the group's table was as short as was the time to come up with a final concept and presentation idea for challenges 2 and 3 they were working on simultaneously, all the groups managed their time well. They prepared inviting tables with different dishes from a variety of tastes. Apples, oranges, pineapple and bananas were transformed into fruit salads. Bread, corn, mushrooms, onions and eggs were used to make experimental types of tacos. Potatoes were cooked and presented in little cups. Mashed biscuits and apples became the ingredients for self-made apple crumble. Even Indian, finger and raw food could be tasted. Besides all of this, a lot of food was still left over and presented for the guest to take with them.

At around 16:30 first curious people started to arrive at the location. The invitation for this afternoon stated that not only special afterwork food would be served but also three new concepts for open innovation ideas for

the firm would be presented. The public was asked to act as a voting committee selecting the best project. Each project consisted of the presented idea and the dumpster menu. Every group used visualisations to present their concepts. In their core, the developed ideas did not vary that much from each other and turned out to be quite realistic – again possibly a sign of the business driven background of the workshopers. But the ideas and innovations included a variety of new and unusual aspects which could have been results of the 24-hour-workshop and the dumpster diving activity. The presentations were elaborate, clear and enthusiastic and definitely something the company's employees were used to do.

Most surprisingly, the guests did not seem to have any kind of reservations against the offered dumpster food at all. People mingled, tasted food from each table, voted for the projects by sticking coloured stickers onto a prepared voting system on the wall, talked and had fun. In this respect, the afterwork was really successful.

## **Findings**

### *Questioning stereotypes*

As a first conclusion or reflection, one could say that this 24-hour-experiment brought out a lot of interesting reactions about the current attitude towards the food consumption in our society today but also highlighted a variety of existing preconceptions and stereotypes towards marginal societal groups. This exercise definitely gave an impulse to rethink certain values and assumptions and was food for thought for the participants. The largely engineer and business driven participants got to question their norms and their reality and started to take social aspects into consideration. Through bodily experiences they started to understand and relate to unknown or ignored social challenges and could use them to open up their minds and lose a part of their rigidity.

### *Group dynamics*

It could be observed that the group dynamic within the teams was influenced significantly by the activity they did together. Of course, typical roles in the groups existed as well. Before the dumpster diving activity, scepticism, critical questioning and strong resistance clearly determined the atmosphere. At the end of the workshop great energy, less distance, a higher level of collegiality and a collective problem-solving attitude could be seen. Especially the collaborative cooking and preparing of the dumpster

food and at the same the team-work on creating ideas and concepts for challenge 2 and 3 led to a strong and positive group-feeling.

### *Innovation and creativity*

The creative capacity of the groups certainly increased during the 24 hours. They came up with solutions for challenges 2 and 3. Most creativity was seen while cooking the dumpstered food since the team members were very restricted in cooking equipment and ingredients but managed to create well-prepared meals. If all this was due to a good atmosphere during the whole workshop or the type of activity they carried out is hard to evaluate and hence questions this venture.

The potential for increased innovation competence could be seen at the final presentations of the groups but can probably only turn into long-term effects when these multi-disciplinary groups keep working together, keep working with creative methods and find a ways how to implement their ideas.

## **Analysis**

On a more conceptual level, the 24-hour-lab revealed that in order to open up, be creative and stimulate innovative and creative capacity, pure artistic interventions do not necessarily need to be the only way to go. However, models found for artistic interventions might also work for artistic interventions as provocations – or artistic provocations such as dumpster diving.

Following Darsø's description of the affected individual level of artistic interventions, many similarities to artistic provocations can be seen. Darsø says that art may influence the participants to reflect on their everyday view of the world and thereby develop a deeper understanding of themselves and how they relate to the circumstances surrounding them. (Darsø, 2004) This certainly happened during and after the dumpster diving activity as described in findings but is not really related to art, artistic methods or processes since the dumpster diving exercise can hardly be seen as such.

However, all phases of Darsø's model can be identified in this project. First 'downloading' – the participants see the world in their traditional way. (Ibid.) The group members were mostly rather sceptical towards dumpster diving and asked a lot of questions in the beginning. They felt safe in their known roles and rather defensive against anything new.

During first confrontations with dumpster diver professionals and dumpster diving, they were a bit hesitant and observant – just as described in ‘seeing’ – the observational phase. (Ibid.) But thanks to a good workshop design and a general curious atmosphere they trusted the process and explored the activity themselves.

This led to ‘sensing and pre-sensing’ – developing a reflective mode. (Ibid.) After the task, most of the participants started to reflect, discuss and critically analyse what they did and how this affected them.

Later discussions brought a lot of personal realisations and a deeper understanding of who they are and how they relate to the world around them as defined in ‘crystallizing’. (Ibid.)

How these insights and learnings could then effect the participant’s behaviour could be observed in increased creativity and better group cooperation.

## **Discussion**

### *Artistic provocation*

Opening up groups for seeing things differently, questioning their routines and attitudes can lead to new and unexpected ideas and reflections possibly resulting in some kind of innovative thoughts. But these processes do not need to have a pure artistic character, result in an artistic artefact or be facilitated by an artist. Group dynamics and other organisational and personal influences are equally as important. Therefore, I want to suggest an arguably new term describing a variation of artistic interventions – the artistic provocation. To elaborate on this concept, the two terms ‘artistic’ and ‘provocation’ need to be described further.

My understanding of a ‘provocation’ in this sense is a short or time restricted activity provoking the employees of a company on different levels – such as experienced and observed during the dumpster diving exercise – by confronting them with unusual contexts, unfamiliar worldviews, unorthodox working methods or extraordinary lifestyles. The very nature of this total otherness, which is hard to grasp or relate to in the beginning since it does not fit in ones perspective of the world, often triggers fear and resistance but also curiosity at the same time. It can stimulate self-reflection and self-questioning which are good starting points for introducing creative work methods for example. The provocations can inspire creative thinking since personal principles and viewpoints might be reassessed or at least questioned.

The 'artistic' aspect in artistic provocations deals more with the aesthetic value of such activities. Experiencing this otherness with all senses can be the main cause to really understand and comprehend new or foreign concepts. This could be observed after the dumpster diving exercise for example, when the workshop participants started to understand and less critically judge the dumpster diving movement and even found positive aspects they wanted to promote and incorporate into their lives. After this experience they saw dumpster diving and even their own attitudes with other eyes. They felt, heard, smelled, saw and tasted how it is to dumpster dive and accordingly were affected by it. They started to create a new understanding not only on a theoretical or abstract level but also on a practical and personal one. They learned to understand a new concept with all their senses. Hence, only through experiencing the group members started to understand and open up. This is why a rough sketch of a model for artistic provocation can be outlined and hopefully developed further.

### *Realising – Experiencing – Reflecting – Changing*

Following and analysing the described 24-hour workshop focusing on dumpster diving as a kind of provocation led to the formulation of a rough model for artistic provocations. (1) Realising. Through the confrontation of an antithetical world the participants of an artistic provocation realise their fears, stereotypes and preconceptions. (2) Experiencing. Through experiencing this antithetical world with all senses they start to understand this new world not only on a theoretical but also a bodily level which seems very important for their understanding and acceptance in order to open up. (3) Reflecting. After this, they start to reflect on their experiences in a deeper and more holistic way. (4) Changing. In the best case, participants then are able to open up and use their insights and learnings for a long-term behaviour change to increase their creativity capacity, influence their innovation competence and inspire their surroundings.

## **Conclusion**

Following an artistic intervention workshop facilitated by an artist in a group of 12 employees of a large engineering company in Sweden, laid out as a 24-hour-lab focusing on dumpster diving as a type of provocation, led to the realisation that not alone art or artistic processes necessarily achieve a change of perspective, an increased openness and positively impact employees' behaviour. Artistic provocations can achieve similar things.

Artistic provocations are short-term activities provoking the participants by confronting them with unusual or unorthodox worlds. Experiencing these different worlds with all senses – aesthetic values – conveys an understanding on different levels. This possibly leads to a more open attitude and positively influences a learning process. Through this individual and bodily learning process the participants are likely to be able to implement new perspectives or new methods concerning creativity and innovation more easily.

Concluding, the 24-hour-lab and especially dumpster diving stimulated and provoked a lot of discussions and self-reflection, positively influenced teamwork and creativity. But if the participants can incorporate their learnings into their daily lives inside and outside the company and translate their experiences into meaningful outcomes for their company remains to be explored.

## Creative Control in Sustainable Fashion

Kirsi NIINIMÄKI\* and Maarit AAKKO

Aalto University, School of Arts, Design and Architecture

*Sustainable fashion has been mostly approached by focusing on decreasing the environmental impact of manufacturing, developing eco-materials and improving ethical issues in manufacturing. However, when aiming for sustainability, even more benefit could be gained if sustainable thinking is integrated in the system level instead of being as an add-on to the original product. This paper presents a case study related to design and strategic thinking in small, entrepreneurial fashion companies, those oriented towards sustainability, in which designers often play a significant role in decision making. The study focuses on examining how design thinking applied together with control can benefit design, manufacturing and business practices, and how it can create creative power for transition towards sustainable practices in fashion. The studied cases represent such strategy formulation that is based on experienced understanding of the fashion industry and fashion-related business thinking. Therefore their strategy formulation can be described as “design-driven” and “practice-based”. This study shows that controlling the fashion system through creative solutions provides an opportunity to increase product quality and consumer satisfaction. Creative and strategic thinking based on design practices and implemented by designers can benefit planning, manufacturing and business practices toward increased sustainability. Such approach can be realized in a profitable way and without compromising the quality of design.*

**Keywords:** Sustainable fashion; design thinking; control; design power

## Introduction

A technological approach has dominated eco-design the last thirty years, mainly focusing on decreasing the environmental impact of manufacturing, developing eco-materials and improving other technical details (Verhulst, Boks, Stranger & Masson 2007). However, Goworek, Hiller, Fisher, Cooper and Woodward (2013) argue that sustainability should be integrated in the system, such as in the garment design process instead of being engineered as an add-on to the original product. Thus, designers should be already included in the planning stage of manufacturing practices, and creative design thinking should guide the entire process (Goworek et al. 2013, p. 389). Based on these ideas, creative thinking and designers' knowledge, i.e. design thinking, could also be utilized in constructing sustainable business models and marketing practice, which engage consumers with more sustainable fashion consumption.

One of the goals of sustainable fashion is to support emotional bonding by designing garments that are aesthetically attractive, gracefully aging, and durable; in other words, to promote slower cycles of fashion. While sustainability-focused fashion, like all other fashion, is still by and large based on the traditional linear system of designing, manufacturing, selling, consuming and discarding, some alternative systems are emerging. In that respect, creative solutions could provide opportunities to challenge the current system and facilitate more sustainable practices.

Fashion designer's knowledge could be integrated already within the company mission, business processes and strategy (Sinha 2000, pp. 37–40). Controlling one's own design, production and business procedures can steer a company towards more sustainable practices (e.g. Aakko 2014) and ensure that production and other processes are actually conducted in ethically and environmentally sound conditions.

This study investigates questions related to control in small, entrepreneurial fashion companies, where the designer is the owner or a principal of the company. In such companies designers are often responsible not only for design, but also for production and business decisions. This study looks at the practice-based strategies by which the companies operate. Moreover, it aims to examine how control over different aspects of the system can benefit design, manufacturing and business practices. In addition, we discuss how tighter control by the designer creates power for transition towards a more sustainable fashion system.

## **Designers in the Fashion System**

### *The Current Fashion System and its Implications*

The current fashion system has its early origin in the two-tiered order of fashion dominated on one hand by made-to-order creations, especially *haute couture*, and mass-produced clothing on the other. Yet, there have always been other levels of couture between these two extremes (Lipovetsky 1987/1994). Similar to the original fashion system, today, the fashion industry also includes different types of production but is significantly dominated by a range of mass-manufactured clothing, especially by “fast fashion” produced by large multinational companies.

Characteristic to the mass manufacturing practices of today are short lead times and efficient, large volume production achieved with the help of low-cost materials and labor often in Asian countries such as China, Bangladesh and India. The fashion industry has notably contributed to environmental problems such as the use of toxic chemicals and generation of high volumes of waste, as well as ethical issues, such as unfair labor practices in the developing countries, including unsafe working conditions, child labor, and unfair wages (Allwood et al. 2006, p. 14; Fletcher 2010, pp. 260–264).

While efficiency and large-scale production may not necessarily cause environmental and ethical problems, the fast fashion business model provides ground for accelerated fashion production, use and disposal, which in turn generate more impact on the environment and play a part in unfair working conditions. Because of their manufacturing practices and business models many fashion companies are able to offer clothing for very affordable prices, which has further created the fast fashion phenomena; this has increased fashion consumption but also decreased the quality of the garments and shortened their lifespan (Fletcher 2010; Niinimäki 2011).

### *Designers’ Role in the Current Fashion Industry*

Since the beginning of the institutionalization of fashion in France in 1868, dressmakers and tailors became couturiers and designers. This was also the beginning of a system where the designer would be the key figure in the production of fashion regardless of the amount he/she participated in the actual designing and manufacturing processes. Similarly today, designer’s role as a creator is central and his/her involvement beyond design varies greatly between different types of companies. While the designer is often emphasized as the unique creator, it should not be forgotten that

fashion is not created only by designers themselves but in collaboration with other fashion professionals and producers. (Kawamura 2005, pp. 57–72.)

It seems self-evident that a fashion designer's job consists of designing garments. Yet, as Pammi Sinha (2000) sums up in her study about the designer's role in the fashion design process, a designer is also a market researcher of visual and qualitative data, an interpreter of meanings and a medium for current moods. Generally a designer also needs to understand what her customer wants, as well as take the social, cultural, economic and political environment into account. (Sinha 2000, p.27.)

In general the design process involves visual research, design development and manufacture. The designers in Sinha's study were all actively involved in the design process up to design development, namely sample making; in some cases manufacturing also influenced parts of the creative phase. According to Sinha, designers' understanding of the consumer needs, the ability to interpret them into desirable design and to communicate this to the sample-makers played a great role in the success of the design. Nevertheless, designers' actual influence on design decisions – about color, fabric, style, conceptual range and manufacturing range – varied greatly in different companies.<sup>1</sup> The designer/owner of a small company employing 3 people interviewed for this study ranked highest in his ability to influence design decisions (Sinha 2000, pp. 27–37).

## **Design and Strategy to Approaching Transition**

### *Transition*

Meadows (2008) argues that the future cannot be predicted but it can be envisioned, and through the reflective process of “systems thinking,” systems can be designed and redesigned according to one's vision. Based on systems thinking and aiming towards the same goals, the transition theory describes how simultaneous processes on multiple levels, involving different social groups/actors, play a role in system innovations. These processes are

---

<sup>1</sup> Sinha (2000) interviewed several designers in five companies across different market levels in the UK fashion industry. Designers of each company were asked to indicate how design decisions (about color, fabric, style, conceptual range and manufacturing range) were made and rank them according to how influential they felt their recommendation were to the company. The maximum score was 25 points. Designer E, who was the owner of his own small business, employing 3 people, ranked highest, with 21 points, for his influence on design decisions; designers A (from a company of 70,000 employees) and C (from a company of 210 employees) ranked the lowest. (Sinha 2000, p.35)

also interlinked and reinforce each other. This multi-level perspective proposes that a transition can have influence on the local, national and even global levels. In other words, the transition theory emphasizes global thinking but local action. Additionally, a transition benefits from co-designing and co-learning processes, which both stress people-centered thinking. (Grin, Rotmans & Schot 2010; Geels 2005.) A transition is not a simple and linear process but an open-ended one, constructed through different kinds of actions, experimentations and co-learning. Therefore, small-scale, niche processes in transition towards sustainable society are as valued as large-scale structural changes in the system. (Doordan 2013.)

Many designers feel that because they work in the industrial system, they have limited possibilities to influence sustainability of design (e.g. longevity of a product).

Keeping costs down is also a dominant concern in the apparel industry (Cooper 2013). This influences the choice between more or less sustainable options. If designers want to have a more influential role in transitioning fashion towards more sustainability they could benefit from turning their attention to systems, processes and dominating business models; designers' creativity could also be used towards changes on the system level.

### *Design Thinking and Design Management for Transition*

Utilizing designer's knowledge could be a way for fashion companies to find new methods for more sustainable practices. As Sinha (2000) points out, incorporating "designerly" thinking into organizational strategy is not purely a question of company size or market constraints but also of organizational culture and management. Operating on a small scale has integral disadvantages; yet it allows a lot of flexibility and space for experimentation. Thus, small scale and certain "risk-taking" can provide opportunities to remain innovative in the current business climate. (Sinha 2000, pp. 40–41.)

Design knowledge and design thinking is more of a process for problem solving rather than an end result. Creative design thinking can help companies challenge their practices and focus on innovative ideas when reassessing processes related to sustainable development, such as societal and environmental issues. (Sherin 2013.)

Therefore, design thinking that looks at problems holistically, can be a useful tool in transition. Design thinking is best described as "productive reasoning", combining both practice-based and theoretical knowledge (March 1976, cited by Cross 2007), thus integrating skills and knowledge,

actions and intellectuality (Trotto et al. 2010). It applies empathy and creativity in the problem-solving processes. Design thinking utilizes a human-centered approach and abductive reasoning, suggesting that something may be more than its initial impression. (Cross 2007.)

Cooper, Junginger and Lockwood (2009) argue that in design management the way of “thinking about design” is concerned with a more system-wide perspective, whereas the traditional “thinking of design” focuses more on a singular product. According to them, thinking *through* design changes the perspective and takes into consideration how the business system operates. This can be seen as a strategic approach to design and design thinking, which can aim for a transition and even systemic changes in the industry. While traditional design management has focused on product design and incremental improvements, “design thinking represents a more radical shift in an organizations overall way of doing business.” (Cooper, Junginger and Lockwood 2009, p. 50.) Through this approach, design thinking can enable transformation by design. It can benefit organizations or even societies by focusing on problems with a wide perspective and applying systems level thinking, not only product development. (Cooper et al. 2009.)

### *Crafting the Strategy*

Whittington, Molloy, Mayer and Smith (2006) propose that formulating a strategy could include a practice-based approach. According to them a strategy formulation could be based on three different work processes: strategy workshops, project management of strategic and organizational initiatives, and the creation of symbolic artefacts to communicate strategic change. Whittington et al. see strategy formulation through the lens of “practice theory”, where practical activities are linked to strategizing and organizing. Opposite to a more formal and traditional strategy construction, they emphasize “the importance of hands-on and crafting skills in getting strategy done” (ibid., p. 615). In addition, Whittington et al. point out that practitioners have skills to “renew formal strategy by injecting craft directly into the process” (ibid.). This approach highlights the importance of practice-based knowledge while formulating the strategy, and therefore could be a fitting approach for design entrepreneurs.

Additionally, Mintzberg (1994) suggests that a strategy could be crafted through emerged processes, which then allows practice and strategy work to be intertwined and simultaneous. Moreover, such approach is centered mostly on practicalities of strategizing and organizing; in communication,

coordination and control, and less on research-based analysis and forecasting. Physical objects and artifacts communicate the strategy. According to Whittington et al. (2006), the process needs creative, artful and adaptive skills. This approach to strategy formulation can be applied in design-driven strategies, in other words, strategies based on design practice, design skills and experienced design knowledge.

## **Research Methods**

For this study three fashion companies were chosen that operate on an entrepreneurial base and small-scale (employing 2–6 people), and where the designer has a central role not only in design but also in business decisions. Additionally, each company has made a conscious effort towards deploying more ethical and ecological production processes.

The data of these case studies was gathered mainly by interviews with the designer-entrepreneurs; additional information was also obtained with a questionnaire (Figure 1.) sent via email and from the companies' websites. The aim of the questionnaire was to investigate what elements these companies are able to control within the core functions of their work: design, production, business management/marketing and sales.

Qualitative and descriptive analysis was used for examining aspects regarding control by focusing on questions: What elements are the companies able to control and how do they do it? What do the companies gain from control? What aspects are they still not able to control? The study also touches questions on company's vision and strategy as they are considered to be related to control in an essential way: control can be a part of the strategy by which one aims to reach for an aspired vision.

## **Studied Cases**

### *Case 1: Anna Ruohonen*

Anna Ruohonen is a Finnish, Paris-based fashion designer and a founder of her eponymous clothing label of women's and men's wear. Ruohonen's fashion house, founded in 1999, is a small-scale business with two showrooms/stores, one in Paris and one in Helsinki<sup>2</sup>.

---

<sup>2</sup> Anna Ruohonen's atelier has currently six full-time employees in Paris, and one full-time and one part-time employee in Helsinki, Finland.

**CONTROL.** How much control does your company exercise over the following elements?

SALES			

☐

Figure 1. Questionnaire on the possibilities to control company's operations.

Everything in Ruuhonen's line is made-to-measure. The customer gets to choose the style and fabric amongst the available choices, and the order is produced according to her measurements taken at the showroom. Almost everything is produced at her atelier; only knitwear is outsourced to a knitwear-studio in Paris.

The label consists of two lines, White Label and Black Classics. The White Label is a seasonal collection, which follows the regular fashion cycle of spring/summer and fall/winter. In contrast, the Black Classics line is a "timeless collection" in which the pieces stay unchanged season after season. The Black Classics collection is on continuous display, and pieces can be ordered throughout the year.

Originally the label operated as most other fashion companies: showing collections to retail store buyers during fashion weeks and producing garments based on the orders the buyers made. However, as Ruuhonen says, this way was very unpredictable. "One season buyers might make big orders, and you sell well and hire more people, but next season the same stores might not buy your collection at all." Also, every season a varying amount of clothing had to be marked down if it was not sold within the current season, and even then some clothing would remain unsold. At the same time, a considerable amount of orders were placed directly by friends and acquaintances; in fact, their support was significant. As the direct orders kept increasing, Ruuhonen realized that this could be an alternative strategy for fashion retail. In 2008 Anna Ruuhonen started her current business concept based merely on direct orders from individual clients.

Producing in-house allows Ruuhonen to have complete control over almost everything regarding her line including design, production, marketing, sales, business management and working conditions. As the company does not produce their own fabrics and trimmings, they are the main elements the company is not able to control. However, Ruuhonen's aim is to use only high-quality European fabrics from natural fibers, such as wool, silk and linen, and they mostly source from mills they have long-term relationships with. Making clothes in-house also ensures fair labor practices in terms of working hours, conditions and wages. According to Ruuhonen, it would be possible to obtain the desired quality by outsourcing production, but since it takes a lot of resources and money to control that everything goes as anticipated, for a small company this system works well.

Quality is an essential element of Anna Ruuhonen's ethos. The quality of garments is ensured through in-house production and thus the ability to control the manufacturing process as much as possible. It allows constant

communication regarding the design and production processes, and enables immediate adjustments. Quality in Ruohonen's line means both material durability and aesthetics that are not bound by trends. "The seasonal trends are not my driving force. My clothing is neither in nor out of fashion," Ruohonen states.

The apparent gain of Ruohonen's system of producing only on demand is that it creates no surplus of unsold garments; this brings both environmental and commercial benefits. As Ruohonen says, "It is hard to predict what customers want. But in our model, we can make what they want. Customers just have to wait a little for that." Additionally, any leftover fabric can be utilized for future orders.

The concept itself also embodies respect towards the clients: all garments are made to measure, which ensures the right fit. As standard sizes rarely fit perfectly, Ruohonen's clients appreciate the possibility of customized garments as well as the individual service.

### *Case 2: Frenn*

Frenn is a Helsinki-based men's wear label founded by Antti Laitinen and Jarkko Kallio in 2013. Frenn designs clothing for the urban working man, with a casual touch. The core of Frenn's clothing is high-quality materials, craftsmanship and tailoring.

The brand's aim is to create comfortable and well-fitted clothing based on long-lasting aesthetics. Through this approach Frenn intends to deepen product satisfaction on consumer's part, thus creating deeper attachment to the garments and therefore lengthen the garments' lifespan. An earlier study has shown (Niinimäki & Koskinen 2011) that deep product satisfaction is a way to extend the use time of garments. On the other hand the most important factors in clothing dissatisfaction are bad fit and low quality (Niinimäki 2014b). The designer Laitinen states that most of the existing mass-manufactured garments have lost the quality of tailoring, which allows Frenn to offer an alternative.

Frenn's garments are manufactured in Estonia<sup>3</sup> and to monitor the conditions of subcontractors and control the quality, they visit the factories periodically. Frenn's fabrics come from EU countries such as Italy, Portugal and Lithuania, and 80% of them have been certified by the Oeko-Tex 100 standard ([www.oeko-tex.com](http://www.oeko-tex.com)), which guarantees that the material is safe for the wearer. According to Frenn, finding high quality fabrics that fulfill

---

<sup>3</sup> Estonia is the closest country with an industrial-scale capacity for garment manufacturing.

such criteria is a big challenge. Delivery of fabrics is another problem; sometimes the ordered materials do not arrive on time or at all. This may cause delays or even stop-overs in manufacturing.

Laitinen and Kallio say that the fashion business has a reputation for being “evil.” Frenn aims to achieve the opposite (as suggested already by the company’s name, which comes from the word “friend”). Through the blueprint of Frenn, Laitinen and Kallio want to make a change in the fashion system (Niinimäki 2014a).

Value base is an important grounding for this company and its practices. As stated on Frenn’s website, “humanity, responsibility and individuality” are important values in which the Frenn company and its products are grounded and which they want to inform to their clients. The brand addresses such values by building close relationships with both their producers and consumers, and by making design decisions based on environmentally and ethically better choices.

### *Case 3: Nurmi*

Nurmi is a small-scale fashion label<sup>4</sup> based in Lahti, Finland that consists of men’s and women’s wear and accessories. The label was founded in 2010 by the designer Anniina Nurmi.

Nurmi’s aim is to provide clothing that is as sustainable as possible. All fabrics in the collection are selected according to ecological and ethical credentials. Information about the fabrics and production are kept transparent. Nurmi’s production is done either locally in Finland or in Estonia. The production is guaranteed ethical as it is based on long-term relationships and either ethical certificates or personal visits to the factory.

One of Nurmi’s main goals is to contribute in steering the fashion industry towards better environmental and ethical practices. Nurmi also gives lectures and courses both on organizational and educational levels and keeps a blog, *Vihreät Vaatteet* ([www.vihreatvaatteet.com](http://www.vihreatvaatteet.com)), through which she shares her knowledge about sustainability in fashion to a wide audience.

The blog actually played a significant role in Nurmi’s decision to start her own sustainable fashion label. Nurmi was one of the pioneers of sustainable fashion in Finland, and thus the blog, created as a hobby, gained popularity and inspired Nurmi to establish her own line. As Nurmi reflects, the company formed organically; after the initial idea of a sustainable fashion

---

<sup>4</sup> Nurmi currently employs two people full-time and one part-time. The label releases two small collections a year.

label, the vision and the strategy have grown gradually together with her experience.

The cornerstones of the Nurmi label are sustainability and transparency. Therefore, all garments are produced according to considerate environmental and ethical credentials. Keeping the production process as transparent as possible conveys credibility about the sustainable methods employed to consumers. Nurmi also aims to design garments that last. In such way, Nurmi's goal is clothing that "doesn't only look good but is also good from within".

The main strategy for carrying out Nurmi's objectives is through controlling all aspects of the design and production processes. The aim is to do it as completely as possible for a label of this size. As Nurmi says,

*Having such goals [sustainability], it is especially important to be able to prove that the production is factually sustainable and responsible. If I could not control the production chain nor know where the materials come from, it would not be possible. It is the utmost important to keep the control in my own hands.*

Although the selection of environmentally friendly and ethically produced fabrics has grown notably over the past five years, finding good quality materials that meet the right ethical and ecological criteria is still difficult. Available supply and minimum order quantities add to that challenge. In certain details, such as zippers or metal buttons, sustainable criteria is still nearly impossible to reach.

Because Nurmi designs and chooses all the materials herself, she is able to control the design process thoroughly. However, since the production is outsourced, achieving high product quality remains a challenge. According to Nurmi, "it is not easy to find local production sites that fulfill my criteria and produce excellent and consistent quality". In any case, local production would be the ideal; the further the factories are, the more complicated it becomes. As Nurmi says,

*Most of my production is local, so it is very easy: I know who they are and I can go there whenever needed. Communication is flexible. But, the further I have to go, the more time I need for making sure everything goes properly.*

## **Results and Discussion**

### *Lessons from the Cases*

All the studied companies state to have complete control over design. At the same time, all designers wish to have more power to influence on the ethical and environmental aspects of fabric manufacturing. Although all the profiled companies have high standards for design and aesthetics, due to the limited availability of suitable and accessible sustainable materials, the quality of fabrics is not always up the desired standard.

Both Frenn and Nurmi note that finding fabrics that fulfill the criteria of desired quality and environmental standards is especially difficult; the selection of such materials is limited and their delivery is unreliable. According to them, organic cotton is easily available but, diversity being an important aspect of sustainability both companies would prefer to use a greater variety of materials. Frenn uses only Oeko-tex 100 certified fabrics, which is a guarantee for the absence of any harmful substances ([www.oeko-tex.com](http://www.oeko-tex.com)), and increases the environmental control over the product in that way.

Anna Ruohonen's main criterion for fabrics is quality and due to her long business history her relationships with fabric mills are established and stable. Nevertheless, Ruohonen also wishes to have more control over fabrics.

As Porter (2004) notes, one of the early barriers to creating a successful business in an emerging industry is the access to raw materials, while the more mature companies have already overcome this challenge. According to the findings of this study, this is also the case with the emerging companies in fashion that focuses on sustainability.

With the help of in-house pattern making and manufacturing, Anna Ruohonen has complete control over manufacturing and product quality. This empowers Ruohonen to create her own retail system that supports slower cycles of fashion. Additionally, Ruohonen exercises control over collection cycles, and she has found success showing collections on her own schedule. Both Frenn and Nurmi, whose manufacturing is outsourced, evaluate having little control over manufacturing and product quality, and wish to be able to control them more. They also state to have less control over collection cycles.

All the studied companies reported having complete control over their business model and business strategy. Being design-driven companies, all of

them have created their own, unique business models and strategies grounded on sustainable methods and their own value base.

Anna Ruohonen is able to manage customer satisfaction in the most tangible way with her strategy of made-to-measure service. Besides providing well-fitted and high-quality products, Frenn addresses customer satisfaction by having the business grounded on social responsibility (and the aim of creating “a more friendly fashion system”). Similar to Frenn, ethical and environmental responsibility is also at the core of the Nurmi label. Additionally, Nurmi manages customers’ intellectual satisfaction by offering information about sustainability in fashion through her blog and her company’s website; this information is open to anyone, not just to customers, as Nurmi wishes to do her part in building a generally more sustainable fashion industry.

According to Porter (2004), a company is able to differentiate itself from others by providing not only products but also services, even if the product is not superior to that of its’ competitors. Such differentiation, for example offering excellent customer service, creates product satisfaction and brand loyalty among customers. This results in lower price sensitivity, in other words, an opportunity to offer good quality at a premium. (Porter 2004.) Along the lines of Porter, Ruohonen has been able to differentiate her brand and build a profitable company through a business model based exclusively on made-to-measure orders. Such a model provides great example of slow fashion and sustainable logic. Having started as experimentation (as Ruohonen operated her business earlier in a more conventional way), the case of Anna Ruohonen shows how change for sustainability, without losing business competence, is possible.

### *Creating Control*

Based on this study the design-driven control in the fashion system can be examined through the following elements: design, fabrics, manufacturing, business model and customer satisfaction.

Controlling design and aesthetics is the starting point for creative control. Since these aspects are at the core of every fashion designer’s work, they are also fairly easy to reach.

Fabric quality is already significantly more complicated to control. Small companies cannot produce their own fabrics but purchase them from an agent or directly from a mill. Therefore, the possibility to control or have an impact on the quality of fabric and the manufacturing conditions are limited.

To get the best and suitable eco-materials might be difficult for small size companies.

Controlling manufacturing is another essential element to ensure the quality of the product and safeguard the environmental and ethical conditions of manufacturing. This is best addressed with in-house manufacturing.

Also a potential aspect for control is the business model. As seen through this study, the design-driven approach in these small, design entrepreneurial companies has given the possibility for unique business models and strategies.

In this context, the most demanding element is control related to consumer satisfaction. However, control over the previously mentioned aspects, the quality of design, fabrics and manufacturing, and alternative business model, can have an impact on consumer satisfaction. According to this study it is best addressed by providing unique design, high quality products, good tailoring and made-to-measure garments.

Additionally, the more control the company has, the more radical approach it can implement in the business. Control may also support a system level transition towards slower cycles of fashion and more sustainable consumption. Therefore, it can be argued that tight control over a system, in this case a small company within the larger fashion system, can create power for transition.

### *Practice Based Strategies for Transition*

The studied cases support Sinha's (2000) suggestion about the benefits of integrating design thinking within the company mission, business processes and strategy. These cases provide successful examples of how small scale, and even certain "risk-taking" can help to remain innovative in the current business environment (Sinha 2000, pp. 37–40). As in Anna Ruohonen's case, having control over many elements of the business has enabled to realize a vision different from the current system and create a unique strategy towards slower fashion cycles.

The studied cases represent a strategy formulation that is based on experienced understanding of the fashion industry and fashion-related business thinking. This is in line with the strategy formulation proposed by Whittington et al. (2006), which suggests grounding it on practice and injecting craft into the strategy formulation process. The studied companies have constructed their strategies through design practices. Design knowledge, rooted in experience, has been used to create control over

company's practices and products, constructing their own local and micro-level system. Each profiled case has utilized such approach for gaining better control over product quality and sustainability. While doing so the goal has been in transition towards a more sustainable fashion system.

As stated earlier, Cooper et al. (2009) argue that thinking through design, i.e. creative strategic thinking, can offer new perspectives in business systems. This approach can facilitate transition, and even systemic changes in the industry. The studied cases are good examples on how fashion practices combined with an environmentally-oriented value base can create better control over the system, and also create power to transform and lead the fashion system towards sustainability. These cases further exemplify how local action can influence global development, as suggested in the transition theory.

## Conclusions

Many designers and manufacturers would like to integrate more sustainable methods in their products, but the possibilities for making more environmentally and ethically sound choices in the fashion system are still limited.

Although pursuit of sustainability is often driven by designer's personal values, faced by the reality of limited opportunities, a common approach in many such businesses is so called "best practices"; fashion companies choose the best existing environmental and social solutions. Even then, some decisions remain compromises. As highlighted in this study, this is especially the case for small- and medium-sized companies: finding suitable sustainable materials that are available in small amounts and controlling manufacturing while aiming to produce long-lasting, high-quality product and achieve customer satisfaction is challenging.

This study showed how design thinking coupled with control has potential for providing better quality, product satisfaction, transparency, fair working conditions without compromising the quality of design. The cases illustrate how sustainable development with the help of designer's control and power, can be reached in a company.

In such a way, creative and design-driven strategic thinking based on design practices does not only enable better control over the system but also creates power to transform and lead the fashion system towards sustainability.

## Flagship Stores as Fashion Service Design

Erik HANSEN-HANSEN\*

The Royal Danish Academy of Fine Arts, Schools of Architecture, Design and Conservation

*When Louis Vuitton in 1997 did establish an in-house architecture department under the leadership of the American architect Eric Carlson, the company was getting ready for a retail revolution to hit in the beginning of the new millennium: constructions of giant mono-brand stores, the so-called flagship stores; spectacular city monuments that merge architecture, luxury fashion, promotion, art, and shopping. Apart from serving the role as ‘place’ (distribution of products) in the 4 or 7 p’s of the classical marketing, the flagship store is a significant brand communicator, ‘a promotional architecture’ (Steiner, 2000) illuminating the image of fashion companies and their associated high status. Some fashion flagship stores even act as tourist attractions in major cities.*

*In this paper the luxury fashion flagship store phenomenon is analyzed through a variety of theoretical perspectives from marketing, design management, retail, fashion, experience economy, to branding. It is argued that a significant meaning production is going on in the contemporary luxury fashion after the tangible good production, and the flagship store phenomenon can serve as a starting point for the development of a distinct Fashion Service Design. The heavy workload in luxury fashion takes place in the stores and this fact could indicate that the theoretical concepts known from Service Design could serve as beneficial tools for the management of luxury fashion businesses. At the end of the text, classical Service Design concepts like ‘front-stage’ and ‘touchpoints’ are applied - although with some modifications - to the luxury fashion flagship store domain.*

**Keywords:** *flagship stores; luxury fashion; experience economy, Fashion Service Design, art as business, aesthetic values, fashion branding.*

## Introduction

In 1999 Louis Vuitton erects the company's first free-standing Japanese flagship store in the city of Nagoya, designed by the then unknown Japanese architect, June Aoki. But it becomes Hermès who sets the agenda for the flagship stores phenomenon in Luxury fashion when the company in 2001 opens a 13-story building in Tokyo's Ginza district.<sup>1</sup>

This flagship store has been under construction since 1998, designed by the world-renowned Italian architect Renzo Piano. It has 6,000 square meters of retail space, offices, two storey art galleries where young artists can display their works, and a permanent exhibition of Hermès' products and history. The building is covered with a glass crystal surface that lights up at night inspired by the traditional Japanese paper lanterns.

The year after, Prada follows in the footsteps of Hermès with its 2.137 square foot flagship store in New York (Wilson, 2006), strategically referred to as a Prada Epicenter rather than just 'a flagship store' in order to emphasize the intellectual associations of the fashion brand. This giant store with the price tag of \$ 40 million is designed by Dutch architect Rem Koolhaas and raised on the basis of a building that previously contained the Soho branch of the Guggenheim Museum. The interior now appears with science fiction design and experimental technologies that is meant to enhance the buying experience; including, for example, fitting rooms with glass doors made of liquid crystal; these doors can be made opaque with the touch of a button. Inside the fitting rooms customers are enabled to see them selves dressed in the garments from different angles on a screen via video cameras. The store also has a gallery and a performance space.

In the following years, the development of luxury fashion flagship stores escalates: In 2002, Louis Vuitton opens its first flagship store in Tokyo's Aoyama district, in 2003 Prada opens a flagship store in San Francisco, Louis

---

<sup>1</sup> The flagship stores phenomenon did exist before the millennium but not to the same level, expenditure and grandness. Moore and Burt (2001, p. 53) identified the period 1990-1995 as 'the most significant in terms of numbers of fashion retailers entering a foreign market for the first time'. But the authors were analysing fashion retailing broadly, not specifically luxury fashion and flagship stores. Further, the book was published in 2001 and the most contemporary source quoted in the text is from 2000, the beginning of the boom in the luxury fashion flagship store expansion.

Vuitton opens a flagship store in Tokyo's Roppongi Hills, and Dior opens a flagship store in Tokyo's Aoyama district.

The flagship store phenomenon reflects the significance of retailing in the development of the luxury fashion business. A central proposition of this text is to recognize the service processes of luxury fashion as being just as important as the production characteristics (refined products). It is argued that a significant meaning production is going on in luxury fashion after the tangible good production, and the flagship phenomenon can serve as a starting point for the development of a distinct Fashion Service Design.

### *Historical context: The restructuring of the luxury fashion*

Around the end of the 1980s the luxury fashion business was restructured, as the former family-owned and domestically based luxury companies became global corporations traded on the international stock exchanges and engaged with business operations in multiple countries (Hansen-Hansen, 2008).

A noticeable development in the restructuring of luxury fashion has been that the international expansion of the companies took physical form through store openings in the leading metropolises of the World, especially the Capital cities. The stores have the roughly same service and price level, regardless of geographical location. This strategy has enabled a uniform communication to consumers all over the globe: that fashion companies are 'cosmopolitan, successful and available to the world's richest and most beautiful people' (Moore and Burt, 2001, p. 53).

The fashion communication has had a strong, almost universal, global appeal. Fashion companies have been able to reach consumers uniformly across national boundaries largely disregarding local and cultural differences. It is often the same image campaigns that can be seen in Tokyo as well as in Paris. Thus, unlike many other types of businesses that went through an international expansion, the luxury fashion companies has been able to operate with one common global marketing strategy: the standardization of marketing, communication methods, channels, product lines and corporate identity leading to economies of scale.

Strong brand values such as exclusivity, aesthetic design, fashion changes (the constant style changes of products), cosmopolitanism, and the emphasis on female beauty has led to international companies able to capture the interest of consumers across national boundaries and income classes.

Although luxury fashion companies are quite small compared to companies in other industries that have the same global recognized brand names, they have managed to create some of the best-known global brands.

In 2013 the fashion and leather goods business group of LVMH, the biggest luxury fashion group in the world, had revenues of € 9.8 billion with only 32,098 employees (LVMH, 2014a, Fashion and Leather Goods p. 28; Human Resource p. 03). It is close to a third of the employees of the Swedish fast fashion company H&M.<sup>2</sup> This despite the fact that the fashion and leather goods division of LVMH includes 12 world-renowned luxury fashion brands.<sup>3</sup> In 2013 the Luxury Division of Kering Group, one of the biggest luxury fashion groups with 9 luxury fashion brands in its portfolio, had a turnover of € 6.5 billion and employed 19.050 people (Kering, 2014, p. 21).<sup>4</sup>

The strong brand positions have caused a massive global consumer interest in the fashion products thereby incentivizing department stores and multi-brand stores to buy wholesale from luxury fashion companies. The pull effect of the famous fashion companies is so great that the stores have to carry these brands, often at the expense of smaller, local brands (Moore and Burt, 2001, p. 50).

The pronounced communication and media presence, enhanced by the fashion media, i.e. fashion magazines and increasingly the internet media and blogs (Engholm and Hansen-Hansen, 2013), including the unmistakable connection between luxury fashion and the staging of female beauty, has made luxury fashion an important field of interest for hundred of millions, if not billions, of female consumers worldwide.

---

<sup>2</sup> In 2013 H&M had 81,099 employees and revenues of roughly € 14 billion (H&M, 2014, p. 58, p. 73). The Spanish Inditex, one of the major fast fashion groups and owner of the brand Zara, had 120.314 employees in 2012 and revenues of € 15.9 billion (Inditex, 2013, p. 3).

<sup>3</sup> The 12 luxury fashion brands under the LVMH Group are Louis Vuitton, Fendi, Donna Karan New York, Céline, Loewe, Givenchy, Kenzo, Thomas Pink, Berluti and Pucci. In addition LVMH also owns related companies in the fields of jewellery and cosmetics.

<sup>4</sup> The 9 luxury fashion brands under the Kering Group are Gucci, Bottega Veneta, Saint Laurent, Alexander McQueen, Balenciaga, Brioni, Christopher Kane, Sergio Rossi, and Stella McCartney.

*Figure 1 Louis Vuitton's flagship store in Paris is strategically located in the tourist district of the Champs-Élysée. With 1800 square meters of space dedicated to shopping, it is Louis Vuitton's biggest store building, and in its own right one of Paris' tourist attractions. There are 7 floors divided into many sections, there are several exhibition rooms showing the historic Louis Vuitton products, a bookshop dedicated to lifestyle, art, travel and fashion, and a gallery of contemporary art at the top floor. The artist Olafur Eliasson designed the elevator as 'a vectored space where the senses become weightless' (Edelmann et al, 2011, p. 157). Source: photo by the author (2012).*

### *From license to Directly Operated Stores (DOS)*

Generally, luxury fashion companies are involved with brand management not garment production. The core competencies are design, communication, distribution and sales (Hansen-Hansen, 2008, p. 198-199). Most luxury fashion companies outsource their production, especially to the Italian textile and manufacturing complex, but there are several brands that produce some of their products in China, for example Burberry, Armani, Celine, and Prada (Thomas, 2007, p. 199-232). Hermès and Louis Vuitton are exceptions, as they produce a large part of their products in-house through their own factories, this is especially the case for their leather goods.

When Burberry Group communicates to potential investors the company describes its 'principal activities' in the following manner: Burberry 'designs and sources luxury apparel and accessories, selling through a diversified network of retail (including digital), wholesale and licensing channels worldwide' (Burberry, 2013, p. 78). Although the design of prototypes and communication as well as control of sourcing are important business activities, it is clearly the retail sales that make up the largest share of the employment activity in the luxury fashion businesses.<sup>5</sup>

Concurrently with the historical restructuring, luxury fashion companies have moved towards vertical integration in the form of increasing control of sales channels. In the 1990's companies such as Dior and Gucci repurchased many of the license rights that had existed around the world, because licensed production was diluting the brand value. It was impossible to maintain global consistency and quality in the products when different manufacturers used the same label on their products (Hansen-Hansen, 2008, p. 186-197).

With license production minimized to specific product categories such as cosmetics and sunglasses, several of the major luxury fashion companies started to alter or optimize the balance of sales channels. Wholesale is typically aimed at concept stores or department stores that control the retail sales to the end-consumer. But luxury fashion companies have increasingly moved towards their own retail, through private ownership of the stores, the so-called Directly Operated Stores (DOS).

The reason for the change to the DOS sales channel is that the fashion companies here can obtain the high profit margins that would otherwise disappear to the department stores as the intermediaries in the wholesale model (ibid). As Bernard Arnault, CEO of LVMH, once put it: 'Luxury goods are the only area in which it is possible to make luxury margins'. Today the leading luxury fashion companies have more retail than wholesale, and in

---

<sup>5</sup> In 2013 two-thirds of the workforce in Prada Group worked in sales (Prada, 2014, p. 161), and out of LVMH's total workforce (not just fashion) in the same year, roughly 61% was employed in sales and administration whereas only 12 % was employed in production (LVMH, 2014a, Human Resource p. 03). The figures for LVHM are for the entire group inclusive of the wine and the spirit divisions. The percentage of sales staff for the fashion division will most likely be much higher. Kering Group's statement of operating infrastructure in 2013 showed that 90 % of its physical buildings in the Luxury Division relate to retail sales (Kering, 2014, p. 175).

the annual reports aimed at investors there are clearly a higher emphasis on store openings than on clothing design.<sup>6</sup>

There are several different types of DOS: Shop-in-shop, shops in shopping complexes, hotels or airports, freestanding stores with direct access to the street and flagship stores.<sup>7</sup> Of the numerous DOS's only a tiny minority are flagship stores.<sup>8</sup> On April 2014, the store locator at Gucci's consumer website showed a total of 21 flagship stores in the world (Gucci.com, 2014). Louis Vuitton's store locator showed 15 flagship stores (Louisvuitton.com, 2014).

The difference between flagship stores and freestanding stores is the size and location. There are free-standing brand shops in many high streets in smaller cities.<sup>9</sup> On the other hand, flagship stores are very large freestanding stores characterized by their location in the most exclusive shopping areas in the leading metropolises of the world; they typically have a shop area of 200 square meters to thousands of square meters. They are

---

<sup>6</sup> For the tax year 2012/13, the retail of Burberry accounted for 71% of revenue, wholesale 24% and licensing 5% (Burberry, 2013, p. 26), up from respectively 58%, 34%, and 8% in the fiscal years 2009/10, and compared to companies like Gucci and Dior, Burberry is a late bloomer in the optimization of channels. At Christian Dior Couture (the fashion department of Dior) the figures were 90%, 8%, and 2% for the tax year ending April 2013 (Christian Dior Couture, 2013, p. 10). In the annual report it is explicitly emphasized that the company strategy is to increase selectivity by a further reduction of license royalties and wholesale (ibid). Louis Vuitton is renown for a pure DOS retail strategy, Hermès has a mixture of DOS and franchise outlets with a few products sold wholesale, e.g. Hermès perfumes (Hermès, 2013, p. 24).

<sup>7</sup> Shop-in-shop refers to a small, dedicated room or area in a department store decorated with the companies own brand design and controlled by the fashion company. A luxury fashion company pays the rent to the department store, while the fashion company directly employs the store personnel. Another version is a shop-in-shop concept, where the shop is run by the department store but in this case it is not a DOS, the channel is wholesale.

<sup>8</sup> Some illustrative examples of the stores network of the contemporary luxury fashion companies: in January 2014 Prada's network consisted of 330 DOS and 24 brand stores under franchise (Prada, 2014, p. 40). Hermès total network of stores at the end of 2012 consisted of 205 DOS, 118 brand shops under franchise, and a non-disclosed number of specialised stores and airport duty-free stores selling watches, perfumes and tableware (Hermès, 2013, p. 21, p. 65). At the end of 2013 the Luxury Fashion Division of Kering group had a total of 1149 DOS of which 474 was Gucci stores, 221 Bottega Veneta stores, 115 Yves Saint Laurent stores, and 339 stores were spread across the group's other luxury fashion brands (Kering, 2014, p. 21, p. 22, p. 25, p. 28, p. 31).

<sup>9</sup> As example, Gucci, Burberry, Bottega Veneta, Hermes and Louis Vuitton all have freestanding shops on the pedestrian street Strøget in Copenhagen; here Louis Vuitton is 100 % owned by the brand, while the others are run on a franchise basis (LVMH, 2014b, p. 66; Hermès, 2013, p. 65; Trading Group 88, 2011).

status symbols in themselves, and they are preferred shopping destinations for consumers who are looking for the widest range of products and the most luxurious atmosphere.

### *Retail stores and experience economy*

A key factor for the growth of these giant stores is the economic performance of the luxury fashion companies. The major luxury fashion companies have increased their share values on the stock exchanges substantially over the past 20 years, this has enabled them to expand their presence with flagship stores on the most prestigious and expensive big city addresses in the world.

It is very expensive to invest in the construction, development and operation of these megastores. Viewed in isolation, running a flagship store can be a loss-making activity for many years. As a consequence it is becoming more difficult to enter the luxury fashion market for new companies today. It requires a substantial amount of capital, to charge a new brand with the global desire needed through advertising campaigns, catwalk shows and directly operated stores on prestigious locations.

It is striking that there is virtually no new luxury fashion company that has enjoyed worldwide success since the mid-1980s unless it has been in specialized niches, such as the shoe and handbag brand Jimmy Choo. Dolce & Gabbana, established in 1985, is the last global major luxury fashion company to enter the scene successfully and this brand should possibly not even be included in the luxury fashion category. Newer brands such as Alexander McQueen and Stella McCartney are part of the Kering group and they are insignificantly small compared to brands like Gucci, Chanel, Prada, and Burberry.

The luxury fashion company's preoccupation with selective retailing is not only due to the demand for high profit margins; it is also a matter of brand control and development in order to stay competitive. Apart from being a channel used to sell products, the flagship stores serve the function of brand communicators, a promotional architecture showcasing the image and status of the fashion labels (Steiner, 2000). Seductive architecture and window decoration is a kind of street advertising.

*Figure 2 Prada flagship store in the Aoyama district of Tokyo. The so-called Prada Epicenter is a 6-story crystal shaped building designed by Swiss architects Herzog & de Meuron, it was opened in 2003. The price amounted to \$80 million, 'making it the largest Italian investment in Japan since the Second World War' (Aconis et al, 2006, p. 76). According to Herzog & de Meuron, the purpose of the building was 'to reshape both the concept and function of shopping, pleasure and communication, to encourage the meshing of consumption and culture' (Chevalier, 2012: 343). Source: photo by the author (2009).*

Further, there is an experiential dimension to the flagship store. Successful luxury fashion companies have realized that consumer value is more than a question of price. The marketing literature describes value as a total experience it includes product quality, attractive store environment, convenience and good service. It has become 'difficult to obtain a competitive advantages on the basis of price, promotion and store location, [therefore] store environment becomes' an important strategy for market differentiation (Chu and Lam, 2001, p. 107).

Environment is a crucial factor when consumers choose between shops, and it also affects their buying behaviour. Behavioural consumer studies indicate that consumers make 80% of their purchase decisions when they are inside the store examining the products (Ebster and Garaus, 2011, p. 2). A well-designed shop environment with a high service level and attractive products can be an effective way to provide customers with a positive shopping experience.

It is hardly a coincidence that the luxury fashion industry's massive retail activity, in particular, the prioritization of the spectacular flagship stores, has occurred in a period when the modern marketing theory has been preoccupied with the so-called experience economy. In 1999, the two American management consultants, Joseph Pine and James Gilmore, published their influential book *The Experience Economy*.

The central claim of the book is that in a world that has moved away from agriculture, industry and service, the selling of experiences is becoming the dominant economic activity. Consumers don't 'purchase goods merely for their functional use', the 'experiences created during purchase and use' is equally important (Pine and Gilmore, 1999, p. 100).

Companies that want to achieve success 'must realize that they make memories, not goods, and create the stage for generating greater economic value' (ibid). A new intensified focus on the experiential dimensions as market force. The Experience Economy as a business principle is so strong in the period that Marxist-inspired critics warn of a new hyper capitalist economic phase. The commoditization of leisure is the fusion of the cultural and the commercial sphere, 'a world in which each person's own life becomes, in effect, a commercial market '(Rifkin, 2000, p. 7), writes the American critic Jeremy Rifkin.

Pine and Gilmore use the theatre metaphor as a management perspective, everything is centred around the production of interesting, relevant and rewarding experiences on offer: the business environment is a

stage, selling is a theatre, the goods and decor are props, sound and lights are effects, and the staff are actors (Pine and Gilmore, 1999, p. 106-107).

*Figure 3 Exterior and interior details from Dior's flagship store at 30, Avenue Montaigne in Paris. It was here that the French designer Christian Dior opened his first haute couture boutique in 1947, funded by the French textile manufacturer Marcel Boussac. In the same year Dior launched an opulent, hourglass shaped and feminine fashion style named New Look. The 1.200 square meter store is styled in aristocratic luxury decor with stucco ceiling and rococo influenced woodcarving. The historical décor is intensified by wall-high black and white photographs depicting 1950s stylized models in haute couture dresses posing in the same kind of interior. The display cases in the store do not exhibit works of art as in a museum but mass-produced 'fashion matter', especially handbags, shoes, sunglasses and jewellery. Source: photos by the author (2007, 2012).*

The luxury fashion flagship stores are excellent examples of the experience economy. The Ready-to-wear garments shown on display dummies in shop windows and inside the stores are not only on display in order to be sold, they also serve as eye catchers and seductive objects of desire. Along with store design, background music, images of beautiful women, and video screens showing catwalk shows, they create an affective experiential space.

Flagship stores are often minimalist in their décor, in order to enhance the aesthetic appeal of the exhibits they display large open space as seen in art galleries. Further there is a deliberate use of a number of social factors: the doormen dressed in black complete with ear buds are reminiscent of bodyguards protecting someone important or a valuable work of art. The female sales assistants appear beautiful and well dressed in the luxury design of the company. In some Prada stores, it is not unusual that visitors will be greeted with a glass of sparkling wine and small chocolate pieces.

The Shopping experience becomes entertainment, a mini version of the opulent and luxurious environments known from the editorial pictures seen in the fashion magazines. The purposes of the shopping experience transcend the merely mundane acquisition of objects. The customer values (in luxury fashion) are no longer, if they ever were, just a matter of tangible characteristics, e.g. the functional or even symbolic aspects of a dress. Instead the meaning and usage of fashion products should be recognized as composites of complex relations in time and space between people, objects, signs, and organizations (Hansen-Hansen, 2008, p. 201). Seen in this light, the commercial experiential space is more than just an exhibition platform for fashion items on sale; it is just as much an experience tool that creates intangible values in and around the fashion brand. The fashion objects for sale are elements in an on-going production process of consumer desire. Experience design entails much more than design and production of mere objects; it is just as much a matter of production of the very relations that consumers are able to experience through the objects (ibid). Image campaigns, flagship stores, and the real world celebrities wearing luxury fashion are parts in a fashion aestheticization process moving through time and space.

### *The new trinity: architecture, fashion and art*

The flagship stores are today aesthetic urban sculptures in their own rights. In addition to being vehicles for the marketing and sales of fashion objects they act as tourist attractions, and they promote and reinforce the

architects as superstars. Luxury fashion companies have been touted as contemporary patrons of architects; the relationship between Rem Koolhaas and Prada recalls Medici and Michael Angelo, a 'marriage of style and power' (Castle, 2000, p. 58-61).

Names of architects and interior designers are now being circulated in the fashion media next to luxury fashion brands and renowned fashion designers: Frank Gehry, Philippe Starck, Rem Koolhaas, Karl Lagerfeld, Jacques Herzog and Pierre de Meuron, Peter Marino, Giorgio Armani, and Marc Jacobs.

Within architecture criticism the flagship store has been condemned as a kind of modern cathedral. The Austrian architect and critic Dietmar M. Steiner laments the commercialization and the contemporary superficial corporate architecture, which he believes has dissolved the finer purpose of architecture.

We are left with 'entertainment architecture' where cultural monuments, galleries and shops are identical, and where everything is in the service consumption. Today museums are just as much engaged in the sale of books, objects, and posters as with exhibitions. In addition the retail temples of fashion look like museums. As a visitor, 'one sinks into a silent humility of cultural devotion', the purchases 'resembles a rite of confession and redemption' (Steiner, 2000, p. 21). The store 'assistants are untouchable ascetic priestesses who graciously return one's credit card as if delivering the Host after the consecration'; the fashion store is 'a chapel of consumerism' (ibid).

Flagship stores may share a kind of monumentalism with the old church cathedrals, but the former represent a theme being in such a stark contrast to the sacred spaces that the comparison is problematic: The (luxury) fashion store celebrates the female beauty and seduction. The temptress as ideal is far removed from the universe of the church. Although beautiful women never were completely absent in the church, the Judeo-Christian tradition is characterized by hostility to female seductive appearance (Faust, 1980, p. 17).

Display dummies in tempting postures, fetishistic paraphernalia like high heels in rows, video screens showing pretty young women on the catwalk, and logo handbags inside display cases – it resembles much more of the glamorous atmosphere of Hollywood movies and fashion magazines.

Unlike other luxuries, luxury fashion has a unique relation to female beautification (Hansen-Hansen, 2012, p. 616-617): to enhance the attraction of the female consumers and thereby also to strengthen their erotic

capital.<sup>10</sup> From the end of the 19th century, luxury fashion as well as the broader fashion business, took over one of the principal activities of traditional art, the depiction and idealization of female beauty (ibid). Like the Christian religion, the modernist art abjured the traditional female seduction and beauty as banal or even alienating (Steiner, 2001). The commercial fashion media, together with the later Hollywood movies, almost monopolized this classical form of aesthetic work. This is probably enhancing the popular fascination and allure of fashion.

Besides the emphasis on glamour and female beauty, it seems to be the cultural value of the art world that the contemporary luxury fashion is trying to connect to rather than the religious value. The flagship stores have not only copied the art exhibition design in the presentation of fashion products. Increasingly they also serve as a dedicated art galleries beside the store function. The 'exhibited creativity of contemporary art' is used to reinforce the luxury fashion, a 'hybridizing art and fashion' (Lipovetsky and Manlow, 2009, p. 156). The art becomes part of the experience economic tools: 'The artifying' of the flagship stores allow consumers 'to feel unexpected and polymorphous pleasures', to discover 'surprising, strange and unusual works of art', and to enjoy 'the aesthetic delights of the store' while they shop 'in an exclusive context associated with the happy few' (ibid, p. 165).

---

<sup>10</sup> The concept of 'erotic capital', as defined by the French sociologist Catherine Hakim, can help to explain the prevailing female consumer interest in fashion. Erotic capital is Hakim's addition to Bourdieu's theory of economic, social, and cultural capital. Erotic capital specifically relates to the opposite sex in all social contexts and it is multifaceted. It concerns areas such as beauty, sex appeal, social charm, social presentation, sexual competence and fertility (Hakim, 2010, p. 500-510). Some of these can be learned, others are innate advantages. Hakim claims that men's demand for sexual activity and erotic entertainment in various forms clearly exceeds women's interest in sex. Feminists have tried to explain this difference with a reference to socially constructed power structures. But according to Hakim, the difference has not disappeared, even as women have achieved economic and social equality with men. There exists an strong asymmetry in the (hetero) sexual economy: sex is widely, cross-culturally and historically recognized as a female resource that is sought after by men, not the other way around (Baumeister and Vohs , 2004). Women do not have an erotic monopoly but generally they have much more erotic capital than men do, and as with the forms of capital that Bourdieu analyzed, erotic capital can be exchanged for other resources.

Figure 4 Life size display dummy of Japanese artist Yayoi Kusama in shop window of the Louis Vuitton flagship store on 5th Avenue New York, August 2012. The decor celebrates the polka dots art clothes and accessories collection, a co-design between Louis Vuitton's then creative director Marc Jacobs and the artist in the autumn of 2012. Source: photo by the author (2012).

The deliberate attempt to connect luxury fashion to the cultural sphere of art can be exemplified through the President of Louis Vuitton Japan, Kyojiri Hata. When the opening of the Louis Vuitton's flagship store in Tokyo's Roppongi Hills in 2003 achieved widespread international media coverage, he declared enthusiastically:

*The Financial Times of London printed an article with a photograph of the store on the first architecture page in its arts section – not the business section. With this, I felt we had successfully achieved a 'fusion of fashion with art' (Hata, 2004, p. 46).*

The relationship between art and luxury fashion is further reflected through the arts sponsorship activities of the fashion companies and through the private art collections of the company heads. Since the early 1990's LVMH has sponsored more than 30 major art exhibitions around the

world (Nayen, 2008). The CEO of Kering Group, Francois Pinault, has one of the world's largest private art collections, in 2006 the British art magazine *Art Review* named Pinault as number one on a list of the art world's most powerful people (*Art Review*, 2006, p. 60-61).

In 2006, LVMH announced its new art foundation Louis Vuitton Foundation for Creation complete with a planned arts and cultural centre being build in the Jardin d' Acclimatation at the Bois de Boulogne of Paris. The building is designed by the world famous architect Frank Gehry and scheduled for completion in the autumn of 2014. Besides the art, the building complex will also house an archive of Louis Vuitton's history. This project is another reflection of the trinity of luxury fashion, art and architecture.

Like architecture and art, fashion also has its own aesthetical manifestations; 'a form of visual art, a creation of images with the visible self as its medium' (Hollander, 1995, p 311). But for many years there has existed a fuzzy relationship between fashion and art on several levels. Art has referenced or commented on fashion just as much as fashion has referenced art.<sup>11</sup> A recent trend in luxury fashion is the direct usage of artists as co-designers, e.g. Yayoi Kusama and Takashi Murakami for Louis Vuitton, or Tracey Emin, who designed the bags for Longchamp in 2004. Through the double signature, this strategy encodes the luxury products with an added cultural dimension, another layer of exclusivity: the designer genius meets the artist genius in the public imagination.

In economic terms art can be perceived as a form of luxury, objects of surplus related to pleasure. Throughout history, powerful patrons have often backed artists, e.g. emperors, kings, merchants, the church and today

---

<sup>11</sup> There are artists who use fashion as their art medium, e.g. Sylvie Fleury, Vanesa Beecroft, or Beverly Semmens. Other artists have been criticizing fashion, e.g. *Art Club 2000*, Cindy Sherman, and Izima Kaoru. Art Museums has exhibited fashion, e.g. Armani at the Guggenheim Museum in New York in 2000, or Helmut Newton's fashion photography at Carlsberg Glyptotek in Copenhagen in 1989. Similarly, some fashion designers are just as much artists as couturiers, their clothing exists mostly in exhibition contexts; this applies for example to Hussein Chalayans sculptural pieces, Viktor & Rolf's conceptual fashion shows, and some of Issey Miyake's creations. Fashion designers have often referred to the arts in their clothing; e.g. Yves Saint Laurent's Mondrian-inspired cocktail dress from the autumn/winter collection in 1965. There are many examples of artists who have worked for the fashion industry, e.g. Sam Taylor-Wood's photo art on the front of Selfridges department store in London in 2000, or the artist Man Ray, who in 1930 photographed the designer Elsa Schiaparelli who herself was inspired by surrealism. As previously emphasized, fashion has to a large extend overtaken art's the traditional preoccupation with the depiction of female beauty.

the state and large corporations, including luxury fashion companies. The same is true for architecture; in some historical periods architects were also considered to be artists.

Architecture, luxury and art share some characteristic. Aesthetics are of significant importance to the three fields. They go way back in history; it was typical art and luxury objects that were placed in tombs (Kapferer and Bastien, 2009, p. 35) and pyramids are examples of extreme funeral architecture. They also share a relationship to aesthetics and power, 'designer jewellery is a luxury and an art, as is the architecture of a mansion or a museum' (ibid). In art and luxury, function is of little importance 'whereas the symbolic value is very high' (ibid), some excessive architecture has similar strong symbolisms, cathedrals or castles for example, but usually there is also a functional values present in architecture.

*Figure 5* Luxury fashion meets feminine beauty, interior design and art. Chanel flagship store and Japanese headquarter in Tokyo's Ginza area. The retail space, located on the first to third floor, is decorated with a number of special ordered artworks; on the first floor there is art by French artists, on the second by American artists, and on the third by Japanese artists. Opened in the end of 2004 and standing 56 meters high with 10 floors and 6.098 square meters of space, it is the largest Chanel building in the world. The 10th floor houses the restaurant Beige Tokyo, operated by Chanel in cooperation with the French chef Alain Ducasse. The architectural space of the building also serves as a kind of visual digital interface to the street environment as the glass facade is lined with 700.000 LEDs creating a large video screen by evening. Source: photos by the author (2005).

Obviously, flagship stores meet many of the basic functions of architecture, but at the same time they are also a form of luxury architecture: Architecture where optimization according to price and function might be of secondary importance compared to the aesthetically conspicuous. Architecture that reinforces the architects as artists and world celebrities.

### *The flagship store and Fashion Service Design*

The substantial corporate activities centred around the luxury fashion stores as well as the high employees workload indicate that the service processes of luxury fashion are just as important as the production characteristics (refined products). A significant meaning production is clearly going on in luxury fashion after the tangible good production, and the flagship phenomenon can serve as a starting point for the development of a distinct Fashion Service Design.

It is possible to apply a classical service design perspective on the experiential fashion retail activity, especially the concepts of back-stage – front-stage is useful. The back-stage is the where the unseen (from the customer's point of view) activities take place; through design, equipment, technology and employees raw materials are transformed into finished products and/or processed information (Teboul, 2006, p. 14). The products or service components that are produced back-stage will later be brought into contact with the customer at the front-stage. The customer with a problem or requirement will be relieved or serviced at the front-stage through a performance; that is through a 'direct interaction with employees, equipment, décor and other customers' (ibid, p. 13).

Teboul's service design metaphors can be transferred to luxury fashion business but his distinction between industry sector and service sector must be altered somehow. For Teboul industry sector types of businesses are characterized by the inverse relationship between the weight of front-stage and back-stage operation (ibid, p. 14). In the industry sector, the front-stage is recognized as being small in comparison to the back-stage whereas in the service sector the front-stage is large and the back-stage is small.

The suggestion in this text is to make an equal balance between front-stage and back-stage (symbolized by the equal size of the two frames in Figure 6). In luxury fashion there must be a significant amount of investment and energy in design, manufacturing of the 'material refined' physical products and promotion. But the front-stage embodied by the (flagship) store experience is equally important. As it has been shown, the store

environment is where the vast majority of employees are engaged in luxury fashion.

Figure 6 is an attempt to visualize luxury fashion inspired by Teboul's theory of Service Design but with a significantly different content inside of the front-stage frame. It should be rather easy to imagine the various touchpoints know from service design in the front-stage, the numerous material and immaterial elements and encounters between the company, the staff, and the customers.

*Figure 7 User co-production of meaning, beauty, and seduction. Fashionable dressed female luxury shopper passing Dior's Directly Operated Store at Sloane Street in London. Source: photo by the author (2010).*

However it is important to recognize that in luxury fashion 'desire' would most likely be the primary customer requirement or 'problem'. Because desire can be considered the core of the luxury phenomenon (Berry, 1994, p. 3) and further, that luxury fashion to a high degree is an industry centred on female beauty relating to sexual desire and ultimately human reproduction (Hansen-Hansen, 2012, p. 618).<sup>12</sup> The flagship store can be

---

<sup>12</sup> The consumption of luxury fashion can obviously go beyond Barry's (1994) definition of luxury as desire; many customers might instead have a 'social need' for luxury fashion in order to enhance their professional career life. However, this usage of luxury fashion does not remove the desire related to physical or erotic beauty. See also the next endnote on 'erotic capital'.

envisioned as a front-stage setting where a performance is taking place between employees and customers and even between customers and customers; through affective and often excessive architecture, décor, lighting effects, images, signs, design, packaging, displays, music, beauty, eroticism, luxury fashion (beauty) objects, sales assistants, and art, customers with a desire are potentially transformed and perhaps even the symbolic meaning of the fashion objects are transformed through the human interactions.

The usual user-centred approaches known from classical service design may not be applicable in luxury fashion, at least not in the same way. User participation or co-design (e.g. Sanders and Stappers, 2008) where the customers are active in product development might not work in luxury fashion, as this business ultimately is based on scarcity, desire, status and seduction.

If there is a user co-creation in luxury fashion it is perhaps taking place in the 'real private life' of the customers, the continual symbolic encoding of desire, hedonism, pleasure, and status through interaction (and exclusion) with other people and objects. This attempt to view luxury fashion in a service design context, should not be seen as fully completed. At this stage it should be considered a tentative experiment with plenty of room for further development and improvement.

## Post-Industrial Design for Consumption: discovery and invention of “tribes”

Antti AINAMO<sup>\*a</sup>, Su YUNSHENG<sup>b</sup> and Miikka LEHTONEN<sup>c</sup>

<sup>a</sup>Aalto University, Umeå School of Business and Economics; <sup>b</sup>TongJi Urban Planning & Design Institute; <sup>c</sup>Aalto University

*While the role of users and consumers in various “consumer tribes” has begun to be mapped in research, open research questions remain. These include whether or how designers or management executives ought to be a member of a consumer tribe that has formed around their product or service. Reporting on our study of consumer tribes in on-line games played on mobile phones, tablets, and PCs, we ask: (1) To what extent does it make sense for an on-line-game designer or executive to be a member of the on-line-game consumer tribe around their game? (2) If membership in the consumer tribe makes sense, what kind of a role or roles ought the designer or executive take? We draw on earlier research in the sociology and anthropology of marketing, on the one hand, and game design, on the other hand. A tribe or its (near-)equivalent can exist in a primordial sense, in an industrial and modern sense, or in a post-modern sense. We analyze three cases of a consumer tribe around a game, the nature of the tribe, and kinds of design and execution: “Minecraft” by Mojang, “Angry Birds” by Rovio Entertainment, and “Clash of Clans” by Supercell. We find that membership in each of the consumer tribes in question makes sense, with roles such as user/consumer, designer, and executive. Yet, roles differ from case and kind of tribe to another, as well as between designer and executive. Each designer or executive successfully takes on no more than two roles at once in her tribe. We call for further research on tribes and communities, especially on consumer tribes in on-line games.*

## Introduction

Currently, there is great interest in tribes in marketing and design theory in “consumer tribes” (Cova, Kozinetz & Shankar 2007; Djelic & Ainamo 2005). According to this stream of research, designers and executives of wearable or mobile devices can be active members of a tribe of users and consumers in ways that contribute to design quality (Kotro & Pantzar 2002). While the role of consumers in various currently relevant consumer tribes has begun to be mapped, open questions remain as to the extent that designers and executives have discretion in terms of how to be or not to be a member of one or another consumer tribe, in particular when the offering is an on-line one.

In this paper, we take as the topic of our research consumer tribes related to on-line games played on mobile phones, tablets, and PCs. We focus on how the underlying games related to these tribes have been designed and executed. Still more specifically, we focus on how or why game designers and games executives may take one or another kind of a role when it comes to a consumer tribe or several thereof. We skew our theoretical lens so as to take the point of view of a game designer or games executive:

1. To what extent does it make sense for an on-line-game designer and executive to be a member of an on-line-game consumer tribe?
2. If membership in a consumer tribe around an on-line games make sense, how the designer or executive ought to be a member; that is, what kind of a role or roles should she take?

We draw on literature from game design and from the sociology and anthropology of marketing. From the sociology and anthropology of marketing, we bring in research findings on sub-cultures, communities and tribes link those to our discussion on tribe formulation and construction in on-line games. We integrate the findings on tribes and on designers’ and executives’ commonalties and identification with a sub-culture or cultural system particular to the “users” or players of one’s game to design research on the ontology of games and how games are used and designed.

We operationalize our approach through an analysis of how users have commonalties with one another and identify with the game in question, and how the tribe dimension in the game in question is designed and executed. To move on to cover contemporary studies on tribes and games and game design and games execution, we provide an overview of the generic research context and specify this context to bear on the context of three games: “Minecraft” by Mojang, “Clash of Clans” by Supercell, and

“Angry Birds” by Rovio Entertainment. In all three cases, tribes have spun or have been spun around the game in a way that makes this a crucial element of the game – yet, in different ways. Finally, we will discuss our three case games from the tribe perspective, and conclude the paper by offering implications for practice and research.

### *How Sub-Cultures, Communities, and Tribes Come About*

In the past, when not based on intuition, design for consumption of more or less any product, whether a physical good or an intangible serviced, concerned describing and analyzing cross-sectional and demographic data about consumers’ places of work and about their favorite place of purchases, and concluding from these starting points for industry what was the kind of design that was needed. Last year’s data about consumption was useful for designing offerings to be launched in a year or two.

Still in the 1990s, research on sub-cultures, communities and tribes of users and consumers still focused on the how rate of change by which these regionally-based cultural systems formed, arranged, rearranged, destroyed over time in particular local cultural systems was accelerating (Lash & Urry 1990). By the turn of the millennium, focus shifted on how the prophecies of a global and post-modern era were beginning to turn into reality (e.g. Miles 2000). Now, those prophecies are beginning to be a reality.

What has by now clearly changed and is different from the context of the past is that globalization, digitalization and cultural change have disrupted the earlier modern-industrial model. Consumers increasingly personalize their lifestyles; they travel, commute, listen to music and play games in ways loosely if at all coupled with where they live or work, or what is their age or gender or education. When the consumers use a digital device such as a mobile phone or a tablet, they leave real-time traces of their consumer lifestyles in a cloud of big data.

Marketing and design research have increased understanding on new kinds of “sub-cultures”, “consumption communities” (Boorstin 1974 in McAlexander, Schouten & Koenig 2002); and “consumer tribes” formed out of such sub-cultures and communities (Cova, Kozinets & Shankar 2007; cf. Djelic & Ainamo 2005; Kotro & Pantzar 2002). A tribe differs from a community in that the former is a fully blown cultural system with an integrated set of commonalities and identification of community members with a geographical space, an occupation, a leisure pursuit, and a consumption patterns such as devotion to a specific brand. In a community, the commonalties or identification relate to only one of these kinds of

dimensions. In a tribe, the commonalties and identification function across multiple dimensions, resulting in tight coupling, high integration, and strong identification.

At the other extreme from a tribe, a sub-culture is weak form of a cultural system that exhibits commonalties and identification in degrees that are weaker than in a community (Figure 1). These three forms of a cultural system are well known as cells of 1A, 2B and 3C of the cultural matrix, with other forms (1B, 1C, 2A, 2C, 3A, and 3B) being less known. Let us first elaborate further on what are sub-cultures, communities, and tribes.

C. Fully blown cultural system			3C Consumer tribe
B. Identification		2B Community	
A. (Pro)active use	1A Sub-culture		
	1. Users toy with, transform product	2. Users evolve a social commonalty	3. Multiple commonalties evolve

Figure 1. User characteristics and developmental “stages”: Sub-culture, community, tribe.

Sub-cultures. Whereas earlier consumers were passive recipients of the marketing efforts of manufacturers of goods, in the 20th century consumers began for the first time in large numbers to toy around with new product and service launches. Consumer use of new technologies over time transformed these technologies and their use in ways that have serious consequences, still today (Pantzar 2003). Outlier and deviant ways of use become meaningful as replicated, became topics of social interaction, and changed behavior associated with lead users, opinion leaders, and sub-cultures. Recent advances in information and communication technologies mean that consumers in ever larger number are active, even proactive, participants in processes of design, so that we may say that choices about how to use and design an offering have become increasingly “democratized”. Lead users are increasingly co-creators, if not creators, of innovation (von Hippel 2005; Djelic & Ainamo 2005).

Communities. A sub-culture of active users becomes a community when it can be said to exhibit marked commonality or identification of users or consumers with a particular and distinct “neighborhood, an occupation, a leisure pursuit, or devotion to a brand” (McAlexander, Schouten & Koenig 2002). When commonalties and identification forge a strong link among

users so that they both as individuals and as a group engage in purchasing behavior, this specific kind of community can be called a “consumption community” (Boorstin 1974 in McAlexander et al. 2002). The advances in ICT, analysis of the big data of patterns of consumption of members of such a community, stored in a cloud, produces detailed images of each user- and consumer-member of such a community.

Tribes. We may consider that a local tribe has been brought about when, within a given geographical space, for example, a community amounts to fully blown cultural system with users thinking and acting in ways where commonalities and identification are marked and distinct across all or most dimensions of the set of an occupation, leisure pursuit, patterns of consumption (Lash & Urry 1990; Geertz 1975). With the recent ICT advances, many a tribe now exists purely in virtual space; that is, it can transgress the constraints of a particular geographical space such as the boundaries of a nation state, and, instead be a global or transnational phenomenon. Many of these tribes escapes the confines of a particular geographical space but still remains fully intact and integrated (Djelic and Ainamo 2005; Cova et al. 2007). Whereas tribes used to be phenomena confined to a particular geographical space (Lash & Urry 1999), this is no longer necessarily the case. More often and more significantly than earlier, use and consumption in our postmodern era are increasingly cosmopolitan.

A cosmopolitan tribes transcends the boundaries of a particular geographical space and ecosystems that traditionally have less external than internal contact. This is not to say that a member of a global tribe could not retain characteristic cultural features in terms of her location, amount of use, skill level, gaming occasions, or off-gaming features in terms of her identity. But tribes, to a greater amount and degree than earlier, have cultural features that cosmopolitan ones. A tribe comes about more and more often first either on the Internet as “social media”, only later to spill over into traditional media (Jing Wang 2005), being less and less a traditional or urban phenomenon a given geographical space “on the street” as in the past (Geertz 1973; Djelic & Ainamo 1999). Even if there is no reason to assume that the three modes would out-rule each other, of the two modes of the street or social media, the virtual mode would increasingly appear to dominate the street-culture and traditional-cultures ones.

## *User and Consumer Tribes, Game Design, and Games Execution*

In the industrial-model or off-line design, such as those related to a wearable off-line computer, designers would “borrow” on the cultural features of a tribe in in another class of offerings such as a snowboard (Kotro & Pantzar 2002). In contrast, game designers tend to build on schemas and scripts within their own class of offerings rather than borrow on the cultural features from another one. According to Douglas & Hargadon (2001):

*game innovations tend to be adopted most rapidly when their newness is domesticated, so to speak, by design features that invited us to treat the new object as if it were merely an extension—albeit an improved one— of a familiar object or device. Early video games like Pong stuck to the simple, rigid schema of a ball game with the ball batted between players or against walls. Later successful video games drew off arcade staples that involved escaping through mazes—an approach drawn loosely from the pinball schema—or raining bullets on would-be protagonists, a schema drawn from that staple of county fairs everywhere, the shooting gallery. The result: a game that imposed rigid rules, drawn from already familiar games which could thus be immediately grasped by users... game designers have encountered difficulty whenever they have attempted to stray into territory where no dominant schemas reign.*

In the design language of those in the consumption community for gaming, a game designer is often herself a “user” – even a “manically obsessed” user who may calls herself a “player” or “gamer”. At best, the designer is “engaged”, even in a state of “flow”, knowledgeable and discerning about what makes a good game and how to use it, as a result of such “immersion” (Douglas & Hargadon 2001). To offset this in-built conservatism, game designers have long had a strategy to somehow “invite users to interact” (Douglas & Hargadon 2001) with the game and, at least indirectly, with them as designers. When this strategy does not work well, at the worst, the designer-user is “addicted” (Ainamo & Tammi 2013).

On the other hand, the recent advances in ICT have had implications in new ways of not only for use and consumption, but also for design and what is in this paper called execution. In on-line games, gaming and other information and communication technologies enable a games executive to

move from assembly to “modular-coding schemes” (Baldwin & Clark 2001) and “customization” (Djelic & Ainamo 2005). Taken alone, market tests with a few highly engaged leaders or as customization to a few test users are both windows often too small to fully reveal the cultural behavior of users. In other words, small numbers lessen opportunities to include appropriate consideration of elements such as demography, lifestyle, and a whole cultural ecosystemic complex of big data that might be able to show how much more than gaming may matter in discovering or designing, exploring or exploiting, a consumer tribe around an offering building of recent advances in ICT (Djelic & Ainamo 2015), such as an on-line mobile game. Within this context, boundary control of what is considered legitimate peripheral participation a tribe has been in design research found to be a useful approach (Haverinen 2012; McGee 2003; Lave & Wenger 1991); that is, the extent that a tribe exists in virtual or real space where the boundaries are open or closed.

With these starting points, in this paper, we inquire into the extent it makes sense that designers and executives in gaming belong to the same tribe as do the realized and intended users of their game. These findings are based on working with informants such as Peter Vesterbacka, marketing director at Rovio Entertainment, with others at Rovio, with Bror Salmelin, Senior Advisors for Innovation Systems at the European Commission, as well as with Samuli Syvähuoko, founder at Remedy and, later, of Gaming Mill.

## **Research Context**

### *Three Games And Their Design, Execution, And Use*

In this paper, we operationalize our emerging framework with two highly successful sets of commonalities of and identification with by users of a game, and its underlying design and execution: “Minecraft” by Mojang and “Clash of Clans” by Supercell. In all three cases tribes are a crucial element in shedding light on contemporary game design as they both have spun various tribes around them.

Another commonality across the three game design and execution is that, given the conservatism of the typical game designers to keep to established and well-known styles and genres of games, games executives have taken measures to off-set the in-built conservatism in gaming communities (that is, communities of both game use and consumption and communities of game design). There are specialized external providers of tracking and analysis of big data the services of which the games executives

of many of the best gaming studios employ. With both intra-game and extra-game knowledge and language of design, service providers' big data and its analysis enable more detailed and precise and knowledge than earlier and elements for visions of user and user lifestyles, preferences, wants, and needs, at the level each individual user, her possible purchases, as well as her associations with various group and communities.

Findings from analysis of big data afford precise and real-time information not only about one user, player or game, but how use and consumption patterns of N users, players and games are associated and appear to interact. Sometimes game designers create and analyze big-data samples of as of yet non-existing sub-cultures (a small niche group, a community, a tribe) to simulate or semi-simulate a cultural element to which some niche group may "latch on to". At other times they "mash up" big data about consumers to invent a tribe that does not really yet exist. Often explicitly they know that they belong to a tribe (see e.g. Minecraft Books 2014; Tribal Battles 2013; Forbes 2011).

From the perspective of a games executive, a good game locates at the "sweet spot" or heart of many lifestyles, many ecosystems, and involves at least one cultural system as source of cultural schemata. Massive success is more probable than otherwise when playing the game carries on also one way or another onto "face-to-face" encounters; that is, social encounters matter in any tribe.

Thus, a game designer and games executives can take on somewhat of a different role. Game designers tend to be an in-born or trained member of a tribe. In contrast, games executives responsible for launching and marketing a game tend to leverage big-data analyses of the possible on-line purchases by each user, the user's possible purchases of add-ons or a premium version of this game. Working together, designers and executives can leverage the above kinds of tribal membership and analyses of the big data to figure out the extents that users can be clustered into a like-minded group or like-minded groups, and how the users' patterns of free use leveraged into realized or potential purchases.

Let us next take a look at a few of the differences across the three cases.

The open tribe around "Minecraft" by Mojang. "Minecraft" is "an indie sandbox game". By "indie", the design language of the gaming community is that the game originates from outside major studios such as Ubisoft and Capcom that have long employed thousands of people.

“Minecraft” started as a one-man project. Markus ‘Notch’ Persson started working on the game alongside his daytime work. After a few years, his daytime work to focus solely on finishing “Minecraft”. Hence, Mojang, his game studio publishing Minecraft, was born.

In essence, “Minecraft” is a game with no clear objectives defined by the game itself. There are no boundaries or tasks. The game is about “building things”. The building materials are various “cubes” (e.g. wood, ore, water). These cubes are “mined” in the game and further refined by the player to produce other materials. The visual identity of the game takes us back to the 8-bit world in the 1980s (Figure 2).

*Figure 2. “Minecraft” by Mojang.*

While these starting ideas may appear bizarre, they may explain the success of the game: these starting ideas are sources of differentiation. “Minecraft” has become a major success both in commercial and cultural terms. Another reason perhaps behind the success of “Minecraft” is its openness and strong connection to “Lego” building blocks, the classic toys, made of plastic material and sold to children by the billions by the Danish manufacturer with the same name as its main product line. With “Legos” building blocks, children can build basically whatever they want. To the point: they can imagine as they build. Similarly, a child or an adult playing with “Minecraft” can even build a copy of “Minecraft” within “Minecraft”.

“Minecraft” has given rise to collectives, celebrities, communities and a veritable “Minecraftian tribe” (Minecraft 2013). People want to showcase their creative skills to others. Here, users are not drawn together in their attempts to beat each other, but instead to witness what imagination can create. Users of “Minecraft” at one point started posting their videos on

YouTube. Soon afterwards one of the “Minecraft” fans was recruited by Mojang to take care of their fan-community management (Goldberg & Larsson (2014).

Incentives for grouping into one or another tribe that have been designed into “Clash of the Clans” by Supercell. Supercell was founded by Ilkka Paananen and Mikko Kodisoja, two Finnish game industry veterans, in the summer of 2010. By 2014, this games studio has released three games for mobile platforms, of which their second title – “Clash of Clans” – has become the most immensely popular globally. “Clash of Clans” has not been only a commercial success, but has given rise to many communities and tribes.

The game itself – a tablet-first strategy game (Figure 3) – places a lot of emphasis on “clans” or sub-tribes. Users are encouraged by the game design to group together in order to defend themselves and attack from other clans. While it is completely possible to play on your own, advantages for joining one or another clan in “Clash of the Clans” have been designed attractive with various incentives. Moreover, various kinds of punishments to the obstinately sole user have been designed as various kinds of disadvantages.

Figure 3. “Clash of the Clans” by Supercell.

Most users join and form clans also for two other purposes: purely social reasons or to outperform competition. In the first case, clans are formed by friends. The game is a medium to chat with other users in one’s clan. (One anecdote tells a story of a man whose car’s tire broke down and he asked help from his friends through Clash of Clans).

In the latter case, users in a clan have a common interest in a “desire for fame and glory”. For competitive purposes, some clans collude into meta-clan communities online so that people can discuss and hone their strategies and tactics with fellow clansmen and -women.

Tribe as a metaphor in “Angry Birds” by Rovio Entertainment. Rovio Entertainment was formed in 2003 by Niklas Hed, who was 29 at the time, with the name of Relude, after he and two friends won a competition at the University of Helsinki to create a multiplayer mobile game on one of the very first Nokia smartphones. The team spent most of its time developing games for EA, Namco and Real Networks, without any distribution or marketing muscle of its own. By the winter of 2006 the company was nearly bankrupt. Niklas was forced to cut his staff, from 50 eventually down to 12.

Then, in March 2009, Jaakko Iisalo, Rovio’s chief designer, sketched hundreds of characters, until finally in March 2009 he sketched a bird—and it looked angry. “There was something about that bird,” says vice president of franchising Ville “Bird Whisperer” Heijari. “We knew we had something.” The team tweaked the game and its characters until they found themselves playing it nonstop. Birds were given different colors, squawks and abilities such as extra density, acceleration and the power to lay explosive eggs in the air before winging off their parabolas from the counterforce of laying eggs. And to justify why its birds were angry, Rovio added egg-grubbing pigs. In “Angry Birds”, a user launches vengeful birds at greedy pigs (Figure 4).

Figure 4. “Angry Birds” by Rovio Entertainment.

Rovio worked with U.K. games publisher Chillingo to polish the animation and work out a plan to keep rolling out new updates, so Rovio could stay in contact with its players. The release of “Angry Birds was initially lost in the December 2009 holiday noise and for its first three months looked like another flop. Then in February 2010 Apple agreed to feature the game on the front page of its app store. To coincide with the

feature, Rovio created an animated YouTube video about its pigs and birds, a free, stripped-down version of the game and 42 new levels. Within three days of Apple featuring Angry Birds, the app jumped from the 600th most-downloaded app to number one.

After USD 42 Million from investors Accel Partners, Felicis Ventures and the founders of Skype, Rovio moved into conquer new markets and transform its plump birds into brand monsters à la Disney—an ambitious strategy for a mobile game that was on the brink of insolvency 18 months ago. After nearly eight years and 51 tries to lay a golden egg, since this breakthrough in 2009 with “Angry Birds” it has been doing everything possible to cook it right.

Even if Rovio would prove out to be a one-hit wonder in terms of games, the studio has been ensuring it is as broad and profitable a wonder as possible. Vesterbacka, with Hewlett-Packard at the time of the 2003 competition, became the studio’s “Mighty Eagle” or marketing director. The game has spread, like bird flu, from Helsinki to mobile phones to the Web and on-line stores such as Amazon. The “Angry Birds” brand is now so well-known it’s hard to imagine this all going away even if the game itself would disappear. In an uncanny metaphor, Peter Vesterbacka has shown to a journalist how children—in loincloths— from Peru’s Yagua Tribe that play Angry Birds somewhere in the Amazon (Forbes 2011).

Rovio’s plans for “world domination” are twofold. Rovio’s “Mickey Mouse strategy”, as Vesterbacka calls it, involves expanding into toys, shirts and cookbooks. The complementary plan is a “Tetris strategy” of expanding across every platform imaginable. What Rovio is not doing (that most gamemakers do) is building a stable of decent games. It’s a risk but less of one than it used to be, given the billions of devices in the hands of consumers. Rather than focus on how to design and execute new games, Rovio has since 2011 been producing a series of short animated films that back into the tale of why its birds are so furious with these pigs in the first place. It has moved into playgrounds and education. In sum, Rovio have “created a clever game app and built it into a cultural phenomenon” (Disney executive in Forbes 2011). The Economist (2014) has argued Rovio Entertainment is Finland’s most valuable brand when it comes to ICT startups, followed by Supercell (and Grand Cru, another gaming studio, in third place, Table 1, next page).

## **Discussion, conclusion and implications**

To what extent does it make sense for an on-line-game designer and executive to be a member of an on-line-game consumer tribe? If the membership does make sense, how to be a member; that is, what kind of a role or roles should she take? In answering these kinds of questions, this paper adds to both design and marketing research. The review of earlier design-research literature in this paper shows that the model of a fully blown cultural system for one’s own tribe can come from a game designer’s own focus of professional interest (Douglas & Hargadon 2004), rather than from a hobbyist pursuit. The case of “Minecraft” in this paper’s empirical section, building on ethnography, shows that a community may from a games-executive point of view be a more highly developed form of organizing use, consumption and design than is a tribe. Findings of earlier design research on a wearable consumer device for measuring impacts on human body of physical exercise imply that designers and executives ought both to be members of a consumer tribe and in ways similar to one another. By virtue of both the designers and executives being members in a tribe of snowboarders, the benefit would be to understand from user and consumer perspectives what is a tribe and how to design and executive the wearable device (Kotro & Pantzar 2002).

Research in marketing has implied that a consumer tribe evolves in developmental stages, from a community that, in turn, forms on the basis of a sub-culture of lead-user innovation. Tribe is in this view the most developed form of organizing of the three modes of organizing – sub-culture, community and tribe – and sub-culture the least developed. Hence, the implication has been that one ought to be a member of a tribe more than a member of a community or a sub-culture.

To answer the first of the two research questions in this paper, we conclude that a game designer and games executive both have discretion to be or not to be a member of a consumer tribe. Our review of literature points to how there are advantages in being a member of a tribe (Kotro & Pantzar 2002) and cloud computing and big-data analysis make it increasingly possible to be a member the consumer tribe for one’s own game.

Table 1. ICT startups around the world, 2014 (Case of Finland: 1. Rovio, 2. Supercell).

On the basis of the empirical section, we find that to take on two or three roles – user, designer, executive (“Minecraft” before reform) – appears to have drawbacks in comparison to taking on one or two roles (“Clash of the Clans”, “Angry Birds”). We find an analytic strategy (“Clash of the Clans”) is made most effective when the executive-analyzer is independent of phenomenon modeled and analyzed. There are advantages to being liberated from the daily detail of tribal affairs, and disadvantages to being enmeshed with these affairs (“Minecraft”; “Angry Birds”).

We take it that “Minecraft” is an example of a taking a game-designer role in treating the above kind of creative tensions, and “Clash of the Clans” is an example of taking a games-executive role in treating these creative tensions. The case of “Minecraft” suggests that a designer and executive like ‘Notch’ Persson in the Mojang indie studio initially appeared not to care about the users from the monetization perspective, but instead focused on designing the game that he himself would like to play. While it is in principle possible to be both game designer and games executive both at the same time, this is in practice probably a feasible solution only in the early phase of a game-design studio, before success would appear to change logics of how to design and execute games. Even Rovio Entertainment (and not only Supercell) shows clear differentiation in roles.

According to this paper, a tribe of consumers may emergently form around a game (“Minecraft”), be synthesized from big data already in the design phase of game (“Clash of the Clans”), or be discovered through analysis of big data about use and consumption (“Rovio”). Over time, the three modes of tribal evolution may encounter each other and co-evolve; over time, some of the new practices from the consumer tribe can travel into game design and execution, affording translating and transformation, and even vice versa (“Minecraft”). The three modes of organizing of use, design and execution are a primordial and tribal mode, an industrial and modern mode, and a post-modern mode. Let us briefly describe each of these three modes, in turn:

A tribe is a primordial form of organizing use, design, and execution. In this first mode, we argue that a genuine tribe of users exists, akin to the traditional anthropological notion of what is a tribe. This mode represents a “primordial” (Djelic & Ainamo 2005) form of creativity and innovation. A user does not change her life style, way of life, or relevant set of cultural meanings according to each cultural offering, but is quite resilient, even rigid, as to the cultural schema that she is most acquainted with.

In any games studio we have analyzed in this paper, there appears to be both a bright side and a dark side to tribes in game use, game design, and games. In the case of “Minecraft”, the result has been what Douglas and Hargadon (2004) call a flow experience for a user. The flow experience has not run amok, requiring ever more large doses of immersion, until all the characteristics of addiction are in place, and a collapse of psyche of the user’s psyche (Ainamo & Tammi 2013). The advantages of a consumer tribe outweigh the disadvantages of potential addiction.

A sub-culture is a modern form of organizing use, design, and execution. The game may be a robust design in that even resilient active use by users will not upset the way the game works (“Clash of the Clans”). As the sub-cultures takes shape, users start off playing for free (“free to play”, F2P) and end up paying for add-on services and premium services. There is no integrated set of cultural meanings. Rather, the consumers are like clogs in a machine, parts of the system more connected by their set of purchases of the game and its format than by any modern notion of advances in technology or in truly autonomous knowledge.. The big data about the users and consumers are treated mechanistically. In this mode, no tribe in the formal sense exists but, rather, a sub-culture connecting users is deliberately synthesized, designed, or created, on the basis of analysis and interpretation of big data in a cloud. Over time, when this kind of synthesis works well, the immersion of users develops into engagement and a flow experience.

A community is a postmodern mode of organizing use, design, and execution. In between the primordial and the postmodern, a creative tension may exist when modes of emergence and design coexist or coevolve (“Angry Birds”). In this third mode, we consider that a community rather than a tribe exists. This is a fluid mode in the sense of being porous, leaking in a semi-controlled way both in and out.

Designer-executive differentiation makes sense in sub-cultures and communities. In the “indie” or independent studio such as Mojang, game design is the driver. There was originally little differentiation between designer and executive roles. In contrast, at Supercell and Rovio, design and execution exhibit a differentiation of roles in between game designers and games executives. Games executives at Supercell make sure that the games that are produced are all estimated to sell well. It is a mainstream studio, very different from Mojang, a studio that is part of the indie scene. In between these two extremes is Rovio Entertainment, both when it comes to design and when it comes to execution, or development, planning, ramp-up, and launch.

Games executives can find advantages into how to target marketing – for tribes, sub-cultures, or communities and sub-tribes –so that the users are normatively compelled, addictively coerced, or for reasons of membership in a fashionable community motivated to spend money in the game. This kind of modularization and recombination of modules appears most deliberately true in the case of Supercell, the mainstream studio. The Supercell games executives ask how to create new games and new “clans” or sub-cultures around them so that users feel more immersed in the game, more engaged with each other, and everybody have a “flow” experience. In “Clash of Clans”, tribe thinking is designed in. Without a clan, a user will find it much more difficult to defend against attacking users as gamers than in a clan: the game design is that users are supposed to form clans in order to progress in the game.

In the case of Mojang, the indie studio, tribe thinking is emergent. Given recent modularization and recombination, there are signs of a transformation of both the consumer tribe and the original design-driven strategy. The tribe around “Minecraft” has not been consciously designed into the game but has evolved organically, side by side with the rising popularity of the game. At Mojang, its indie designers and executives do not opt for a “free to play” (F2P) monetization scheme. Rather, they are taking liberties from such analytics as they create a game, let a tribe evolve, or both. Then again, the dark side the success of “Minecraft” is that, with success, the indie studio will develop more mainstream ways.

In the case of Rovio Entertainment, it is unclear whether the dualistic tribe thinking in terms of “Mickey Mouse” and “Tetris” is tacit and fuzzy purposefully or emergently. Games executives less than at Supercell but more deliberately or consciously than at Mojang aim to create F2P and tribes and analyze big data to categorize users and gamers.

In sum, in this paper, we have shown that there are more than one mode on how users, designers and executives can be members of one or another tribe. We have introduced an approach on how to align findings in marketing research on consumer tribes with findings in design research on being design- or execution-driven, a topic of great interest not only for research but also for contemporary commercial and design practice. We call for further research on how and why consumer tribes related to on-line mobile games shape and are shaped by elements such as passionate hobbyism, a passion to monetize, and occasions of serendipity. We do not expect that these kinds of elements will distribute equally across users, games, designers, executives, and studios. Important research implications

for both design research and marketing research relate to postmodern communities, in particular. What are differences across organically evolving virtual or Internet-based tribes and synthetic sub-cultures after analysis and interpretation of collection, analysis and interpretation of big data in the cloud? To what extents are creative tensions between designers and executives resolved? Given the existence of more than one mode of organizing, in what modes are designers liberated, in what modes is corporate control improved? How to combine such advantages?

# Sustainable Fashion: a re-conceptualization of the role of fashion design

Anika KOZLOWSKI\*, Michal BARDECKI and Cory SEARCY

Ryerson University

*Design thinking is increasingly considered as a valued strategy for innovation and the development of solutions for sustainability. Consequently, the role of the designer as a problem solver has evolved along with the emergence of design management within academic discourse. The adoption of a systems thinking perspective is increasingly recognized as a key strategy for sustainable development. However, fashion designers rarely identify themselves within the role of problem solver nor do they design for sustainability or with a systemic perspective. This paper looks to conceptualize the emerging role of fashion design in driving innovative solutions for sustainability. The paper draws upon ideas and developments from design-driven innovation, user-centred design and corporate sports giant Nike in formulating a re-conception of design. Design-driven innovation pushes for new product meanings and languages while user-centred design focuses on the application of design through a better understanding of the user and their needs. Nike is explored for their innovative development of the Nike+ platform, a service that expands the consumer experience, thereby increasing brand and potentially product value. Products developed in tangent to the Nike+ platform have highlighted the ability to induce behaviour changes in regards to physical activity. This phenomenon warrants investigation as to the applicability to consumption behaviours and patterns within the fashion system. This highlights the importance of the evolving multi-disciplinary role of the fashion designer for a sustainable fashion system*

**Keywords:** sustainable fashion design; Nike; sustainable consumption

## **Introduction**

Fashion design is a complex process that involves a number of trade-offs between aesthetics, cost, time, and consumer preferences. The fashion design process often unfolds in an ad hoc manner. Typically, designers employ an “anything goes” attitude where the key objective is to produce something original and marketable. Considerations beyond aesthetics, such as negative impacts from production or consumption, rarely play a prominent role in the design process. Apparel is typically designed and worn to serve a relatively narrow niche focused on one of comfort, function, or style. Efforts to simultaneously address all three of these functions are uncommon.

Currently, the clothing and textile industry is one of the largest global industries. This is largely due to dramatic changes in recent decades, driven by a desire on the part of the consumer to continually update their wardrobes, thus increasing the scale of fashion production and consumption. Social and experiential dimensions influence consumption patterns while fashion obsolescence is largely driven by aesthetic change that is typically tied to changing social preferences. Lifespans of fashion apparel is affected by the various nature of psycho-social factors that underscore changing social preferences (Fletcher, 2012).

Mass production and consumption of fashion apparel has significant negative environmental and social impacts that have rendered the industry unsustainable (Niinimaki, 2011; Niinimaki & Hassi, 2011; Fletcher & Grose, 2012). Negative environmental impacts are increasing during material cultivation, production processes, use and disposal and are experienced through increased pollution and waste, resource depletion, toxic chemical use and climate change (Hethorn, 2008; Esslinger, 2011; Fletcher & Groese, 2012).

The fashion industry can no longer afford to maintain the status quo of rapid trend-driven products. There is a need to address the environmental and social impacts of the fashion industry in a systematic manner. A number of authors have recognized that this necessitates a focus on the practices within the focal firm and its supply chain (Fletcher, 2008; Hethorn, 2008; Gwilt & Rissanen, 2011), although the literature often approaches these challenges in a piecemeal way. Critically, any effort to reduce the adverse impacts of fashion production and consumption must also explicitly take consumer behaviours into account (Niinimaki, 2011; Niinimaki & Hassi, 2011; Fletcher & Grose, 2012; Armstrong *et al.*, 2014). This issue is often overlooked.

Fashion, like sustainability, is a concept that is well understood yet suffers from multiple constructs, definitions and theories as to its role within modern society. Fashion also appears in many forms such as luxury fashion, couture and fast fashion (Beward, 2003; Brand & Teunissen, 2006). For the purposes of this paper, fashion is referred to as an umbrella term encompassing its various forms where aesthetics and obsolescence dominate over functional use of apparel products. Fashion design therefore functions within the design mandate of aesthetic considerations and appeal of apparel and the associated meanings (Barthes, 1983; Entwistle, 2009). Therefore, environmental and social concerns are largely, at best, a peripheral consideration in fashion design, production and consumption (Fletcher, 2008; Gwilt & Rissanen, 2011; Fletcher & Grose, 2012). Design elements are paramount in how a consumer engages with a product or service. Fashion at large is thus valued not for materiality but the symbolic function of aesthetics, eroticism, knowledge, status or power (Simmel, 2003; Veblen, 1899/2009; Svendsen, 2006; Barthes, 1983; Loschek, 2009). However, digital technology, expansion of communication and globalization have allowed for mass participation of fashion, thereby shifting a greater emphasis to the experience of fashion. Services have become more important as globalization now emphasizes knowledge and experience (Van Halen *et al.*, 2005; Armstrong *et al.*, 2014).

This conceptual paper argues that the fashion design process must be modified to account for environmental and social impacts associated with production and consumption of fashion. The logic in focusing on the design process is that it is at this point that the greatest potential for reducing those impacts exists (Walker, 2006; Niinimaki & Hassi, 2011; Fletcher & Groese, 2012). Design thus plays a critical role in the overall sustainability strategy of any fashion brand. This paper looks to conceptualize the emerging role of fashion design in driving innovative solutions for sustainability. This is accomplished through ideas and developments drawn from design-driven innovation, user-centred design and the initiatives of corporate sports giant Nike in formulizing a re-conception of design. While design-driven innovation seeks new product meanings and languages, user-centred design focuses on the application of design through better understanding users and their needs. Nike is examined for its innovative development of the Nike+ platform, a service that expands the consumer experience—thereby increasing brand and product value. Products developed in tandem with the Nike+ platform highlight the capability of

design to induce behaviour changes in regards to physical activity (well-being, healthy lifestyle).

## **Design**

Design is increasingly seen as a valued strategy for innovation and the development of solutions for sustainability. The role of the designer as a problem solver has evolved and design management has emerged as a focus of academic discourse (Fletcher, 2012; Niinimäki, 2011). The adoption of a systems thinking perspective is increasingly recognized as a key strategy for sustainability. However, fashion designers rarely identify themselves within the role of problem solver nor do they design for sustainability or with a systemic perspective (Fletcher & Grose, 2012). Fletcher and Grose (2012) describe systems thinking as a “way of thinking [that] transcends the binary (i.e. either/or) perspective that frames production and consumption activities as separate and consecutive and the linear view of how resources flow through the supply chain, sometimes described as ‘take, make, waste’” (p.11). A systems thinking perspective is needed in developing a sustainable system, as there are a broad range of social, economic and environmental factors that necessitate consideration. System transformation cannot occur by only focusing on a few isolated parts such as supply chain sustainability but on all parts that make up the system. As designers begin to introduce the concept of a systems thinking into the design process, the function and boundaries of the system must be clearly defined.

Fashion design within the nineteenth and twentieth centuries has largely concentrated on aesthetic values and symbolism of power and status (Breward, 2003; Brand & Teunissen, 2006; Svendsen, 2006). Symbolism of power and status were demonstrated through the ability to create and consume new styles of dress, i.e., fashion, distinguishing a higher social class. Aesthetic values were shaped and associated with symbols of power and status, as social classes with power and status had the means to participate in fashion. Thus the key driver for fashion was maintaining social class differentiation, creating a product-orientated production culture. The semiotic significance of power and status as a signifier for class differentiation dissolved as technological developments with respect to materials and processes transformed the accessibility, function and consumption patterns of fashion clothing.

Within contemporary culture, fashion is one of the most important forms of expression. Fashion by definition, perpetuates renewal, creating

new systems of meanings (Brand & Teunissen, 2006; Breward, 2003). The process of fashion moves through several modes of action and experience encompassing designers, manufacturers, retailers, brands, marketing and consumers. Fashion is context-dependent and not free of artistic and emotional motivations, effects of technology or consumer demand. The cycle of innovation and obsolescence, which characterize fashion trends, are the culmination of impacts from cultural and societal changes. A strong characterization within modern fashion is the value of fashion for its prioritization of temporal notions of aesthetics/style over functional considerations of wear (Breward, 2003; Svendsen, 2006; Entwistle, 2009).

## **Sustainable consumption, meaning and value within the fashion system**

Greater participation in fashion inevitably leads to greater consumption of fashion products. Faurschou (1987) provides an example of a viewpoint on the nature of the relation between fashion and consumption, “fashion is the logic of planned obsolescence—not just the necessity for market survival, but the cycle of desire itself, the endless process through which the body decoded and recoded, in order to define and inhabit the newest territorial spaces of capital’s expansion” (p.82). Fashion consumption is leveraged by the ease and accessibility of fashion products brought about by technological advances.

Consumption is identified as a central challenge to achieving sustainability (United Nations, 2002; EU, 2006). In spite of substantial technological innovations with the capacity to mitigate environmental impacts of products and production, consumption has increased; as a result the environmental impacts in many areas have increased. Sustainable supply-chains alone will not eradicate or amend the deeper issue of fashion consumption. Fashion consumption is now an area of concern, in particular as a result of the expansion in consumption promoted by fast fashion. Mass fashion consumption has been identified as detrimental to the environment. It can be argued over-consumption of fashion products is in direct conflict with the philosophy of fashion. In the pursuit of communicating through fashion as a system of meaning and signs, the profusion of accumulation merely puts more obstacles in the way of relating . If one is communicating, “through objects then proliferation blocks that communication” (Baudrillard, 2003: 5), thereby nullifying the original intention of fashion as a

system of meaning. Thus, over-consumption is not only an impediment to sustainability; it undermines the very philosophical underpinning of fashion.

The excessive consumption associated with fashion has affected concepts of value. Considerations of the predominant value-based paradigm are imperative as value is intimately linked to objects and is a powerful force in terms of influencing consumer behaviour. The study of value is complex as sign value is ephemeral whereas commodity value can be captured. Fashion has managed to distort the association between commodity value and sign value. Consumers no longer have widespread knowledge of apparel construction, labour and resources involved and repair. The loss of intimacy with the production process has led to a loss of value for the process and the associated resources. This has contributed to the decreasing commodity value, thereby altering the meaning and sign value associated with symbolic exchange. The significance of the symbolic exchange within fashion suggests consumption is greater than the tangible acquisition and use of clothing. The experience of fashion clothing is arguably a more significant aspect.

This emphasizes the need to construct new value creation within the context of fashion for sustainability. If value is to change, the relationship between the consumer and a brand must be redefined, as consumers are part of the value chain. This will facilitate reconceptualization of meaning and value in the symbolic exchange of fashion apparel. Krippendorf (2006) largely advocates the need for design to focus on semantics for meaning and value creation for products rather than intended use. A more user or human-centred design philosophy can aid designers in conceptualizing meanings for consideration during the design process (Krippendorf, 2006).

Designers can play a significant role in new value creation through consumer engagement, innovative technologies and business model development. It has been found that consumer behaviour can have a significant influence on the environmental and social impact of clothing (Fletcher, 2008; WBCSD, 2008). However, efforts thus far are unsuccessful in fundamental transformations in consumer behaviours. Adoption of sustainability innovations must fulfil consumer wishes and needs and “fit” into everyday lifestyle to change consumer behaviour (Schultz & Stieb, 2006; Hoffman, 2012).

Reconceptualization of fashion, design, value creation and meaning in building a sustainable fashion system requires systems thinking. Sustainable production and consumption entail more than reducing supply-chain impacts or re-designing products—all facets of a system require change.

However, it is difficult to modify one aspect of a system without changing the rest (Tukker, et al., 2008; Meadows, 2008). “Production, markets and consumption form a regime of an interdependent and co-evolving set of technologies, symbolic meanings, services, consumer practices, rules, interests, financial relations and expectations” (Tukker, et al., 2008:1219). Therefore, in the process towards sustainability, consumers as a part of fashion system, have a decisive part to play. Innovations for a sustainable system often require changes in consumer behaviour, therefore identification of key factors facilitating and obstructing adoption is necessary (Knot & Luiten, 2006; Hoffman, 2012). The following table (Table 1) outlines further implications for designers presented by Vezzoli and Manzini (2009) in conceptualizing a design process for a sustainable system.

*Table 1: Implications for designers in designing for sustainable products, services and systems (Source: Vezzoli and Manzini, 2009).*

- Design as a solution-orientated process as opposed to a product-orientated process (a redefinition of the object of designs action).
- A reorientation of skill and capabilities towards sustainability in both problem-solving and communication.
- Initiate design process with problems for which Product Service Systems may perhaps be the solution as opposed to products.
- Address the design of products for function rather than physical product itself.
- Build on traditional skills to address environmental, social and economic issues.

## **Product Service Systems (PSS)**

It has been argued that within modern or postmodern societies, a multidimensional understanding of the role of consumers and how they consume serves as a platform for developing sustainable changes and strategies (Sto, Throne-Holst, Strandbakken, & Vitterso, 2006; Schultz & Stieb, 2006). One method for fashion brands to better understand the consumer is through interaction, which also allows for the identification of opportunities for value creation. Engaging consumers in the co-creation of value has led to inventing new competencies and business practices. The process also provides essential information on consumer needs and wants. Innovations are also more market-oriented when they can be more closely adapted to consumer wants and needs. Nike has demonstrated many positive outcomes in the form of product-service systems (PSS), innovation, and value creation by continuously interacting with consumers through social media engagement platforms.

A PSS can be defined as an innovation strategy integrating a combination of products and services, jointly capable of fulfilling specific client demands and embracing a service-led competitive advantage (Manzini & Vezzoli, 2003; Mont, 2002; Van Halen, Vezzoli, & Wimmer, 2005). The focus is shifted from designing (and selling) physical products to designing (and selling) a system of product and services. This strategy within sustainable design discourse addresses the potentialities of a sustainable product service system (SPSS) approach in producing synergies among profit, competitiveness, and environmental and social benefits by minimizing environmental and social impacts from production and consumption (Mont, 2002; Manzini & Vezzoli, 2003; Meijkamp, 1998; Armstrong, Niinimäki, Kujala, Karell, & Lang, 2014). A promising strategy offered by SPSS is to delink value creation and resource consumption, thereby stimulating innovation and a systems thinking approach. Shifting from a “product-orientated” to “service-orientated” consumption focus, SPSS aims to enhance cultural change. It has been found that radically innovative products and services, shifting commercial focus from products to services, and related new business models offer opportunities that contribute positively to the sustainability challenges facing businesses.

The rise of social media platforms and social networking has made it easier for companies to engage consumers. Interactive consumers or consumer-led innovation opens channels for communicating thoughts and wants for better products, services or experience. This allows for co-creating value where consumers and non-consumers feel more involved by having the opportunity of speaking freely and having their opinions heard. Developing this idea further is the experience co-creation (ECC). ECC is a process enabling co-creative interactions where individuals can have meaningful and compelling engagement experiences. Nike’s ability to develop social networking through services has prolonged the consumer experience, pushed innovation within the business and increased affinity for the brand.

## **Nike and Nike+**

Nike is a global leader in athletic footwear, apparel, equipment and accessories for a wide variety of sports and fitness activities. Nike designs, markets and distributes all product ranges under the Nike umbrella. More recently, Nike is known for embedding sustainability and innovation as a key driver in achieving long-term business growth. Hannah Jones, Chief

Sustainability Officer & Vice President, Innovation Accelerator, outlines Nike's for a sustainable future:

*We are constantly integrating more sustainable ways of working across our business. But we recognize that many issues facing business and society are greater than one brand can solve alone. To achieve systemic change we must understand risk and embrace innovation as a way to accelerate positive impacts at scale. Collaboration and unconventional partnerships will be critical to our collective ability to design more sustainable business systems. (Nike, 2014: para 7)*

The following section looks at the innovative collaborative development of Nike+, a PSS that has brought Nike to the forefront of the athletic market through consumer engagement. At the moment the Nike+ PSS is not directly linked to sustainable design but demonstrates the innovative capabilities, behaviour change and opportunities to both brand and consumer from this strategy.

In 2006, Nike created the Nike+ (NikePlus) platform, a PSS for interactive engagement with runners. As a joint venture with Apple, Nike+ wirelessly links a runner to various devices, including the Nike Fuelband, GPS watch, iPod, and iPhone, capitalizing on the connection between runners and music. Users must be members of both iTunes and Nike+ online communities. This leverages the power of mobile technology to track, measure, compare, dissect current habits, and share exercise performance globally (Lui, 2013; Nike, 2012).

Through years of studying elite athletes by way of sensors and amassing data on biomechanics, Nike has concluded that athletes cannot improve what they cannot measure. The ability to provide better information provides better motivation. Nike created Nikefuel in 2012, a metric that utilizes an accelerometer to detect three-dimensional motions to measure whole-body movement and energy expenditure. The more active an individual is, the more Nikefuel points they earn, depending on their activity and intensity. The aim is to reach a personalized Nikefuel goal that is set by the user and may be adjusted daily. Wearing the Nikefuel band for most activities and the GPS watch, which is specific to running, captures Nikefuel points. By providing basic data, the Nikefuel and Nike+ system supports users in forming healthier, long-term lifestyle habits (and, possibly, long-term attachments to the devices themselves). The Nikefuel band is an innovative wearable technology, a design that evolved from the Nike+

platform and is an example of a successful PSS. The Nike Fuelband even became a favourite in fashion circles, which began when Serena Williams wore one at Wimbledon in 2012 . Permeation of innovative PSS into mainstream culture is facilitated by technology and wearable technology becoming more fashionable. This highlights the ability for innovative products and services to enter mainstream culture and the potential to influence behaviours beyond a niche market, showing great promise for sustainable behaviour change.

Unlike previously when the purchase of a product signified the end of the consumer relationship, Nike+ focuses on initiating the experience with the consumer with the purchase of a product. Nike is provided with data on why and how products are used and the preferences and behaviours of consumers . Technology has unlocked the ability to better understand the consumer experience by collecting data. Using technology, Nike created a service that has become vital to individuals as a motivation to be active and stay active.

Users have the ability to set goals and exchange information within the Nike+ community. This creates a sense of community, a sense of goals and a motivational nudge. Awareness is a powerful catalyst when users are aware of their own (and others') actions. A better experience brings value to users. Humans are driven by recognition and that is what Nike+ and the Nike+ community provides . This PSS is built on the premise of changing habits. Addressed simultaneously, motivation, intent, ability and opportunity are components likely to change consumer behaviour. Nike found a way to redefine and enhance consumer experiences by opening up opportunities to facilitate behaviour change for fitness and well-being. Simultaneously, Nike established a new way to profit from these innovative products and services along with market growth. Table 2 summarizes the benefits of the Nike+ PSS for both brand and user.

*Table 2: Benefits of Nike+ PSS for Nike and user (Source: Ramaswamy, 2008).*

Benefits Nike	Benefits User
Unique insights for innovation, design and consumer management (learning directly from user behaviour)	Motivation to run
Increased strategic capital	Ease of tracking performance and progress
Lower risks and costs with product/service development and	New experiences of value to stakeholders (consumer/user)

experiment with new offerings quickly  
Reduction in conventional advertising

Low implementation and maintenance costs (digital is a low cost form of media)  
Public evaluation increases brand preference, loyalty and advocacy (build deeper relationships and trust within communities (ex. Nike+ and running).

Data on product use, experience and user lifestyle (activity i.e. running) previously unavailable and direct input on engagement preferences with the PSS.

Lower costs (no need to pay for professional services/run club)  
Social value and recognition (sense of community)  
Functional value (access to data & ability to retrieve useful product, training information & other users insight)

Entertainment value (entertain, educate, & inspiration) in the form of videos, articles and challenges

## Discussion

The problem with contemporary fashion is the negative environmental and social impacts of the industry from production and consumption. The challenge lies in that consumption involves both the fashion brand and consumer. Inviting the role of design in tackling the sustainable consumption challenge, Manzini and Vezzoli (2003) argue that design competencies should move towards those of “strategic design for sustainability”, one example being the SPSS strategy. These systems have the capabilities to reorient current unsustainable trends in production and consumption practices. Essingler (2011) also suggests the key to the role of design in shaping an innovation-driven business model to include sustainability is involving stakeholders, including consumers. Innovations need to move beyond technological developments to include different stakeholders, stimulating new interactions and partnerships as well as new sustainable relationships between consumers and products (Vezzoli, 2007). Innovations for sustainability would benefit from a diverse set of strategies in addition to technological developments.

What Nike has demonstrated is how innovation through the development of PSS by involving the consumer has enhanced the consumer experience, thereby creating new value and facilitating behaviour change for a more active lifestyle. PSS also facilitated technological developments in the form of wearable technology such as the Nike Fuelband and GPS watch to work in conjunction with the Nike+ platform. Looking to Nike, fashion design has the ability to engage the consumer to enhance experience

through innovative SPSS in support of behaviour change for sustainable consumption. Just as activity for health and well-being is a lifestyle, so is sustainability. Nike's vision was to facilitate a healthier lifestyle by encouraging an active lifestyle through sport and not sustainability or sustainable consumption. However, it is this achievement of lifestyle change that is of interest. If Nike, through design and innovation by way of PSS in facilitating change for an active lifestyle, possibility exists for fashion design to facilitate behaviour change for sustainable consumption.

A sustainable lifestyle that incorporates sustainable consumption habits must exist within a system designed for such behaviours. Designers need to interact with consumers to better understand current lifestyles if they are to create opportunities, such as SPSS, to encourage more sustainable behaviours. Successful sustainable innovations require behaviour changes and knowledge about consumers is crucial to design products and services that are easily integrated into users' habits and everyday lifestyle. Franscara (1999) argues that when designing appropriate interfaces and interactive products, considerations to broader issues such as context, situation, moods, emotions, social communication and value systems are imperative. A product can therefore be designed to be recycled but is reliant on the consumer to fulfil this potential. Consumers need to be a part of the process as informed and active participants.

The advantage of the fashion system is the existence of strong digital social media platforms and high levels of engagement with these platforms in the fashion community. Fashion is primarily communicated through visual images and when coupled with technological advancements within digital communication, allows for immediate broadcast and diffusion. This has enabled a strong online community within fashion to permeate and exist. For the fashion industry, the visually-driven app Instagram was a natural union. Instagram has become the go-to social media platform and a critical component of fashion communication.

Fashion itself is a platform for social change thus inherently an ideal aspect within society to develop changes for sustainable consumption and a sustainable system. Therefore harnessing the power of social media platforms and online communication for sustainability strategies is not a major barrier. Fashion design has the ability to either build upon or integrate these existing platforms or develop new platforms to interact and engage the consumer. This now extends design activities to include new dimensions in the development of strategies such as PSS for sustainability. This particular analysis focused on the Nike+ platform as social media is such a

dominant aspect of contemporary society. However, there remains many alternative means of consumer engagement in developing sustainable consumption behaviours and a sustainable fashion system through a re-conceptualization of the role of fashion design. Table 3 summarizes innovative design led solutions for developing sustainability within the fashion system.

*Table 3: Summary of design led solutions for a sustainable fashion system.*

**Design thinking**, where focusing and working with designers and on the design process in developing solutions for a sustainable fashion system.

**Systems thinking** perspective where all aspects of the fashion industry are considered during the design process.

**New value creation** through a more user or human-centered design philosophy, innovative technologies and new business models.

**PSS** an innovation strategy integrating a combination of products and services to jointly fulfil consumer needs. A shift from designing and selling a product to designing and selling a system of products and services.

**Nike+**, a successful PSS where consumers are engaged, creating new value and meaning through new experiences with Nike+. By engaging with the Nike+ platform, consumers experience behaviour change in terms of leading a more fitness/active-orientated lifestyle. Nike, through design and innovation by way of PSS, facilitated behaviour change for a healthier active lifestyle.

## Conclusion

Fashion plays a vital role within contemporary culture as a visual system of meaning and symbolic exchange. Commoditization of fashion as a communication medium coupled with technological development to materials and processes has contributed to increased rates of production and consumption of fashion products. With the growing interplay between sustainability and technology, this paper looked to conceptualize the role of fashion design by examining the innovative PSS, Nike+ and its application as a potential sustainability strategy within fashion. Design is frequently cited as a key factor in developing sustainable systems and driving innovation for sustainability. The consumer and consumption behaviours are also seen as a crucial factor in developing and promoting radical changes for sustainable system innovation.

This paper contributes a conceptually driven argument as to how lessons learned from Nike and the Nike+ PSS are influencing consumer behaviour

and lifestyle change. Fashion as a social system of meaning with a strong digital communication community already in existence is the ideal platform to apply such a strategy. The aim is to harness the power of design and employ systems thinking to further engage the consumer in developing more sustainable consumption behaviours. It is crucial that the design process and the role of design transform for fashion system sustainability. While this paper focused on the Nike+ PSS, this by no means limits the development, use and/or applicability of alternative means of consumer engagement for fashion system sustainability and sustainable consumption. This merely highlights the great opportunities of the consumer engagement and design relationship for developing sustainability.

There are also many implications for designers in developing this emerging role within the sustainable design discourse. Designers and fashion brands bear a greater responsibility in developing upon the traditional design practice to incorporate considerations to economic, environmental and social issues. Designers need to challenge the concept of what fashion can be and how individuals and society as a whole interacts and engages within the fashion system.

This paper highlights areas of potential research in measuring the magnitude and effects of behaviour change from such technological innovations within wearable technology and PSS. There is also potential to investigate the further development of social media platforms within the fashion system in driving sustainability and consumer engagement. How do fashion brands and designers put in place the tools to measure the impact and effects? Also, how will fashion brands implement organizational learning of sustainability for designers to begin incorporating the principles of sustainability within the design process?

# **Editorial: User-centred Design (UCD): a Disruptive Business Enabler for Sustainable Consumption?**

Debra LILLEY and Val MITCHELL

The potential of UCD as a process for enabling sustainability has been demonstrated across a range of sectors including energy (Wilson, Lilley and Bhamra, 2013) and transport (Ross, Mitchell and May, 2012). However, this often requires integration with existing established processes (Haines, Mitchell and Mallaband, 2012). The aim of this track is to explore the potential benefits of adopting a UCD approach to reduce over-consumption of resources and encourage more sustainable actions, and in doing so, gain a greater understanding of the potential influence and impact of UCD in a business context.

A number of the papers in the session illustrate how sustainable consumption and value creation are closely intertwined from both a consumer and business perspective. Newton highlights how consumers who value luxury brands are unwilling to sacrifice quality and functionality for sustainability, yet many of the values of luxury brands such as craftsmanship and durability align with the goals of sustainability. In line with this need to provide value beyond sustainability, Moreno, Lilley and Lofthouse introduce a model and toolkit developed to enable businesses to examine their potential for sustainable consumption whilst identifying opportunities to improve their business model and value proposition. Simeone's paper describes the development of an interactive platform for connecting project stakeholders within a European research project. The benefits of considering economic and organisational considerations alongside user requirements were identified, again demonstrating the benefit of taking a wider perspective on value creation. The process of value creation is also explored in depth by Williams, Malinin and Leigh who focus particularly on the relationships between disruption, perception and empowerment in relation to team creative performance.

The integration of UCD into a business context brings particular challenges including how to best facilitate adoption of UCD methods and processes within existing commercial practices. Kwok, Harrison and Qin,

provide a conceptual framework for designers to enable introduction of eco labeling at the point of sale. Bryant and Wrigley discuss the integration of UCD methods into a technology driven design process within the automotive industry and identify the need for a new organizational role to support integration of user- centered knowledge and processes. Attracting investment in UCD at this level is ultimately dependent on being able to measure its impact. The paper by Minvielle et al. provides an example of a critical and systematic evaluation of a UCD method, in this case, digital ethnography.

Together the papers illustrate the diverse nature of UCD and its role as an enabler for sustainable consumption. The need to provide value to both business and consumers when delivering sustainability is identified across the submissions and tools and methods are proposed to facilitate this. Our thanks go to the authors, reviewers and conference organizers.

# Interplay Between UCD and Design Management in Creating an Interactive Platform to Support Low Carbon Economy

Luca SIMEONE\*

Malmö University & T6 Ecosystems

*TESS (Towards European Societal Sustainability) is a three-year research project receiving funding from the European Commission to study the potential for community-led initiatives to help deliver a low carbon, sustainable future. More specifically, TESS is interested in how existing initiatives (e.g., projects working with renewable energy, car sharing, community farming, ...) can be evaluated and supported in order for them to scale up and have wider societal impact. An interactive platform to connect the project stakeholders (researchers, industry, government, NGOs) is one of the key components of TESS. This paper documents the interplay between user-centred design and design management in creating this platform. In particular, the author organized a series of workshops where theoretical approaches and techniques from both user-centred design and design management have been applied to design an early-stage prototype of the interactive platform. The research question behind this paper is: How can design management complement user-centred approaches in the early stages of the design process? The paper will show how adopting a design management approach helped the participants of the workshops in broadening their perspective. In particular, through a design management lens, participants could reflect upon organizational and economic constraints of the project and thus refine their first prototype of the interactive platform for TESS.*

**Keywords:** user-centred design; design management; personas; low carbon economy; EU-funded projects

## Introduction

This paper reflects upon the outcomes of some design workshops I initiated and facilitated within the scope of TESS (Towards European Societal Sustainability), a three-year EU-funded project in the area of sustainability started in 2013.

TESS targets the following questions: (a) How can innovative, grass-roots green initiatives lead to the transformational changes required to meet stretching carbon targets and wider community objectives? (b) How can the wider emergence and success of such initiatives be supported?

In order to explore these questions, TESS seeks the active participation of a wide range of community-led initiatives (e.g., projects working in the areas: renewable energy, car sharing, community farming, recycling, building cycling tracks, compensation of CO2 emissions...). As highlighted in TESS' first press release:

*“Participant initiatives can expect:*

- *An Internet mapping platform to register and promote their initiative to funders, partners and other communities;*
- *Support with assessing their current and potential environmental and socio-economic impacts;*
- *The opportunity to network with and learn from other socially or technically innovative projects across their country and wider Europe;*
- *The ability to contribute to shaping policies that support community-led sustainability; and*
- *Access to other influencers at local, national and European level including policy makers, researchers and the media.”<sup>34</sup>*

Whilst specifically addressing the community-based initiatives, TESS is also oriented to other stakeholders (Freeman & Reed, 1983; Freeman, 2010), which – in a broader view – affect or are affected by the work of these initiatives: local, national and international policy makers and government bodies, industry, research institutions and general public. For example, TESS takes into consideration that community-based initiatives might need the strategic support of policies and government actions, or might benefit from the interest of industry, or might want to team up with

---

<sup>34</sup> Press release produced in December 2014, by the TESS consortium.

academia on joint projects. The needs and the interests of the grass-roots initiatives oriented towards low carbon economy and their potential to scale up or out and have a greater impact are strictly entangled with the agendas and actions of other societal stakeholders. As Bettencourt and West argued: "To combat the multiple threats facing humanity, a 'grand unified theory of sustainability' with cities and urbanization at its core must be developed. Such an ambitious programme requires major international commitment and dedicated transdisciplinary collaboration across science, economics and technology, including business leaders and practitioners, such as planners and designers" (Bettencourt & West, 2010, p. 912).

A web-based, interactive platform to connect TESS' stakeholders will be a crucial component of the project. This interactive platform will not only contain reports, white papers and webinars produced by the research centers and organizations that are part of the consortium<sup>35</sup>, but also:

- An interactive map of small-scale social innovation initiatives across Europe
- Some collaborative functionalities for the community-based initiatives (and possibly for other stakeholders), where the users can collect, discuss and share their experiences
- An online tool, which the community-based initiatives can use to evaluate their score in terms of carbon reduction

As a member of the consortium, I am in charge of designing this interactive platform<sup>36</sup>. In the spirit suggested by Bettencourt and West, I decided to set up a process where the characteristics of this interactive platform are co-designed together with some representatives of the final users of the platform. Instead of a traditional top-down design process, I applied a collaborative process and invited a large number of stakeholders to design the interactive platform in a participatory way (Simonsen & Robertson, 2013).

---

<sup>35</sup> TESS is coordinated by Germany's Potsdam Institute for Climate Impact Research, with collaborating partners, The James Hutton Institute in Scotland, Universitat Autònoma de Barcelona, Spain, Università degli Studi di Roma La Sapienza, Italy, Oulu University of Applied Sciences, Finland, University Stefan Cel Mare Suceava Romania, T6 Ecosystems s.r.l. in Italy and Climate Futures in Scotland.

<sup>36</sup> Here and in the rest of the paper I use the first person as I led the interaction design activities for TESS. Interaction design activities were a component of a dissemination and communication strategy defined and implemented by other TESS partners, such as Potsdam Institute for Climate Impact Research, T6 Ecosystems, The James Hutton Institute and Climate Futures.

In particular, I organized a series of collaborative workshops where theoretical approaches and techniques from both user-centred design and design management have been applied to build an early-stage prototype of the interactive platform. Activists, policy makers and researchers participated to these workshops and had the chance to apply techniques such as rapid prototyping or wireframing<sup>37</sup> to design their own version of the interactive platform. This process was not specifically tied to a single location, but organized across nomadic workshops that saw the participation of a distributed network of stakeholders coming from at least 18 different countries, from Chile, Colombia, Canada, Korea to several EU countries. The prototypes created in one workshop were presented and discussed in other workshops held somewhere else, thus igniting and sustaining conversational processes across different sites.

This paper presents some reflections on a specific dimension of these workshops: the interplay between methods and techniques coming from user-centred design and design management. The more specific research question behind this paper is: How can design management complement user-centred approaches in the early stages of the design process?

The paper will show how adopting a design management approach helped the participants of the workshops in broadening their take on the project. In particular, through a design management lens, participants could reflect upon organizational and economic constraints of the project and thus refine their first prototype of the interactive platform for TESS.

This paper therefore claims that the interplay between user-centred design and design management can be beneficial for the field, the processes and the practice of interaction design, especially when dealing with complex and ambitious projects facing big economic and societal challenges such as environmental sustainability.

## Theoretical framework

Multiple definitions, theoretical frameworks and methods have been proposed for user-centered design, design management and interaction design. Since a thorough review of all the positions is beyond the scope of this paper and since the distinction between user-centred design and

---

<sup>37</sup> The wireframe is an initial layout that represents the basic elements of a user interface: "The wireframe is a bare-bones depiction (as the name suggest) of all the components of a page and how they fit together" (Garrett, 2002, p. 128).

interaction design is debated between different design communities, I will here only present some of the concepts that have been central in my study.

Kumar and Herger provide an introductory definition of user-centred design: "User Centered Design is a philosophy that puts the user, and their goals, at the center of the design and development process. It strives to develop products that are tightly aligned with the user's needs" (Kumar & Herger, 2013). Authors such as Donald Norman, Bill Moggridge and Bill Buxton are generally credited as important figures in user-centred design (Bainbridge, 2004; Buxton, 2007; Halse, Brandt, Clark, & Binder, 2010; Moggridge, 2007; Norman, 2013).

Nowadays, user-centred design and the very notion of user are crucial components of interaction design projects like TESS.

Löwgren and Stolterman propose this conceptual framing: they define digital artifacts as "artifacts whose core structure and functionality are made possible by the use of information technology" (Löwgren & Stolterman, 2004, p. 7); interaction design is consequently defined as "the process that is arranged within existing resource constraints to create, shape, and decide all use-oriented qualities (structural, functional, ethical, and aesthetic) of a digital artifact" (Löwgren & Stolterman, 2004, p. 5). The notion of use is a key element in both sentences. Löwgren and Stolterman continue by defining as user: "a person who will be using the digital artifact when it is implemented" (Löwgren & Stolterman, 2004, p. 7).

In the specific case of the digital artifact for TESS (its interactive platform), we can identify multiple users: from a member of a bike-sharing initiative in Copenhagen, to a policy maker from the European Commission or to a researcher in a department of environmental sciences, just the name a few examples.

A user-centred perspective would put the needs and desires of these users at the center of the design process.

Design management would look at this same design process from a different angle.

McBride, Chairperson of Design Management at Pratt Institute, sees design management as the "identification and allocation of creative assets within an organization to create strategic, sustainable advantage" (Best, 2006, p. 200). Although this is only one of the many views on design management (see for example: Best, 2006; Cooper, Junginger, & Lockwood, 2011), generally speaking the organizational dimension is a key element of the field. Design management tends to focus on the managerial and

organizational dimensions of design, from how to lead creative teams, to how to ensure the economic and financial viability of a design project, up to how to measure the success of design outcomes, just to name a few of the areas generally covered in literature.

In the specific case of TESS, for example, some design management components would refer to how design is strategically used by the organizations that are part of the consortium, or how the process of developing the interactive platform is managed throughout and beyond the project.

Several authors have explored the interrelations between user-centred design and design management. Svengren Holm analyzes how user-centred design can be a strategic resource for design management (Svengren Holm, 2011). Johansson and Woodilla point out how some studies in user-centred design adopt a “more holistic view” that intersects with organizational studies (Johansson & Woodilla, 2011, p. 467). Dunne elaborates on how user-centred design can be beneficially used in management education (Dunne, 2011). A good number of papers from the 2013 Cambridge Academic Design Management Conference<sup>38</sup> and the 2012 DMI International Conference in Boston<sup>39</sup> reflect upon how user-centred design is an important part of the strategic approach advocated by design thinking and design management. Holmlid argues that design management offers a broader outlook - that also includes a focus on the business and operational dimensions - to organizations that perform user-centred design or interaction design work (Holmlid, Lantz, & Artman, 2008; Holmlid, 2006). Holmlid is also a researcher in service design, which also offers an interesting transversal view on the organizational components of design projects (Meroni & Sangiorgi, 2011). Buchanan – with his interdisciplinary viewpoint across design, information systems development and management - claims that it is nowadays crucial that design education offers students the tools to adopt an organizational perspective and, citing a specific project work carried out with his students, realizes that “there was a missing component that had to be there, that designers had to understand the relationship to organizations” (Buchanan, 2011).

This paper is positioned along this line of thinking and, in particular, aims at offering an original contribution to the design research community by:

<sup>39</sup> <https://www.dmi.org/dmi/html/conference/academic12/academic.htm> accessed March 6, 2014

- (1) Carrying out and documenting empirical work (a design workshop) that shows the potential of combining user-centred design and design management at an early stage of an interaction design project;
- (2) Presenting some reflections upon the interplay of the two approaches and how this interplay is particularly important when dealing with complex projects, such for example the ones addressing economic and societal challenges related to environmental sustainability.

In the next paragraph I will describe a workshop in more detail.

## **A workshop and its outcomes**

In the workshops I have conducted for TESS, I have used both methods coming from user-centered design, such as personas<sup>40</sup> and wireframing, and processes from design management, such as budgeting and diagrams mapping the stakeholders' needs and desires from an organizational standpoint. The economic dimension is described as a core component of operational design management (Borja de Mozota, 2003) or one of the fundamentals of design management (Best, 2010). As for the organizational dimension, methods to describe how organizations use design in their strategic activities or how design can help creating strategic alliances among different organizations have also been presented in literature (see for example: Bamford, Gomes-Casseres, & Robinson, 2003).

I used this mixed approach with the explicit goals of defining the requirements of the interactive platform for TESS and elaborating its user experience design up to a first set of prototypes.

Throughout the course of 5 months (from December 2013 to April 2014), several design workshops have been conducted for TESS, either face-to-face or via Skype. Some of these workshops were reserved to internal partners of the consortium, whilst some other ones were specifically addressed to external stakeholders.

---

<sup>40</sup> Personas are fictitious descriptions of final users and are employed in the design process as a way of representing potential needs and desires of users (Nielsen, 2013).

I present here the outcomes of a specific design workshop held at the Politecnico di Milano in January 2014. I called this workshop ‘Design Management Lab’.

About 20 people, mostly students from the Master’s Programme in Service Design at the Politecnico<sup>41</sup> and professionals from external design companies, teamed up in 4 different groups and worked for two days - 16 hours in total - in order to get to a first proposal for the user experience design of the TESS interactive platform. Each group worked independently and, at the end of the second day, presented their final results to the other groups and to a final jury, composed of some representatives of TESS and a user experience designer from Google.

I chose to describe here this workshop as it was specifically aimed at gathering a group of designers – coming from different background: service design, industrial design, graphic design, interaction design – and at leveraging their expertise to reflect upon the user experience design of the TESS platform.

The Design Management Lab was structured as follows:

#### First day

- Initial briefing about TESS and user-centred design methods (1 hour)
- First design cycle aimed at producing a first set of wireframes for the TESS interactive platform (7 hours)

#### Second day

- Presentation of design management (30 minutes)
- Collective exercise on budget (30 minutes)
- Collective exercise on organizational stakeholders’ mapping (1 hour)
- Second design cycle aimed at re-working and finalizing wireframes for the final presentation (5 hours)
- Final presentation: each group had 15 minutes to show their work to the jury

The structure of the workshop was based on an iterative process with two design cycles. During the first cycle, the participants mostly adopted methods coming from user-centred design. At the end of the first cycle, the participants were exposed to a design management perspective. The

---

<sup>41</sup> [www.polidesign.net/en/servicedesign](http://www.polidesign.net/en/servicedesign) accessed June 30, 2014

insights emerging from this new viewpoint gave the participants the occasion – during the second cycle - to go back to the drawing board, rework and finalize their presentations.

My main interest here is to show how the interplay between the two perspectives – user-centred design and design management – allowed the participants to broaden their take on the project and further develop their reflections on a suitable user experience design for the TESS platform. To show how the participants gained this broader view on the project, in the next paragraphs I present the different design outcomes produced during the first and the second design cycle.

### *The first design cycle: user-centred design*

The first day started with a 1-hour long briefing, where I introduced the TESS project also using a PowerPoint presentation and some videos. I subsequently divided the participants into 4 groups, with approximately 4 or 5 people per group. I then handled a short document synthesizing the briefing to each group. The briefing was structured as follows:

#### **Briefing for design activities for TESS**

**TESS** is a three-year, European-wide research project. It aims to reach an understanding of the potential for community-led initiatives to help deliver a truly sustainable, low-carbon future.

The main research questions are: How can innovative, grass-roots green initiatives lead to the transformational changes required to meet stretching carbon targets and wider community objectives; how can the wider emergence and success of such initiatives be supported?

**TESS** is seeking the active participation of a range of community-led initiatives, whether focused on food, energy, transport, waste or with a wider agenda to build community resilience.

Participating initiatives can expect:

- An internet mapping platform to register and promote their initiative to funders, partners and other communities;
- Support with assessing their current and potential environmental and socio-economic impacts;
- The opportunity to network with and learn from other socially or technically innovative projects across their country and wider Europe;
- The ability to contribute to shaping policies that support

community-led sustainability; and

- Access to other influencers at local, national and European level including policy makers, researchers and the media.

### **TESS: Our goal**

Our goal is to help TESS in designing a website/an interactive platform that hosts useful functionalities for the stakeholders interested in TESS.

We do not need to get to a final graphic layout for the platform, but we have to:

- Outline content and functionalities of the platform
- Design some sketches of the home page and key internal pages

The overall budget for designing and developing the platform is about € 600.000.

At the end of the second day (8 January 2014 at 16.00), we will meet (via Skype) Katja Firus and Antonella Passani (in charge of the Communication and Dissemination activities for TESS), Alessandro Suraci (a visual designer from Google) and present our work.

The activity will be organized in two cycles:

- First cycle (first day): you can employ strategies and techniques from UCD in order to:
  - Define your users (e.g., through a set of personas or other suitable techniques)
  - Define a preliminary version of the information architecture (e.g., through a basic site tree or other suitable techniques)
  - Design a first set of wireframes
- Second cycle (second day): you will refine your design materials after a presentation and some exercises oriented to highlighting a design management approach.

As facilitator, I split my time among the four groups, sitting with them, answering their questions and offering advice.

Most of the participants were already familiar with design methods and had already worked on similar tasks.

Most of the groups (3 out of 4) segmented the process in a sequential way, working collectively on the following tasks:

- They started creating a set of personas
- They sketched out a preliminary diagram representing the information architecture of the interactive platform

- They created a first set of mock-ups

In another group, participants decided to split the tasks, so that whilst some people were taking care of the personas, some other people in parallel were working either on the information architecture or the mock-ups.

Figure 1. First design cycle: A slide showing some personas produced by one of the groups during the workshop.

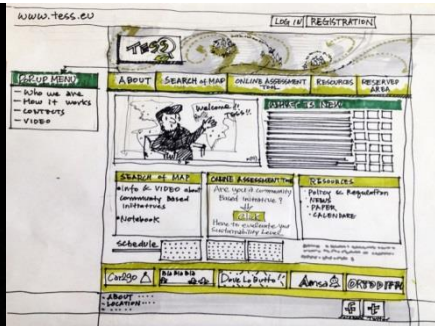

Figure 2. First design cycle: Wireframe representing the home page of the interactive platform, produced by one of the groups during the workshop.

### The second design cycle: user-centred design + design management

The second day started with a brief introduction on design management (about 15 slides, containing some definitions and key themes).

We then collectively worked on two exercises to expose the participants to a design management approach:

- A rudimentary version of the budget
- A stakeholders' analysis: in this exercise, we analyzed the viewpoints of the organizations vs. the individuals usually represented as personas.

Sometimes, the personas depict stereotypical characteristics of single users that might not be aligned with the organizations they are part of. We made a practical case. All the groups created a persona representing the policy makers interested in TESS. All the groups portrayed an enthusiastic policy maker sitting in her office in Brussels, happy to fund TESS and eager to support community-based initiatives in low carbon economy (e.g., see

Figure 1). There might be some truth in these representations, but the dynamics of such a complex organization as the European Commission warn against overly optimistic depictions, and the enthusiastic policy makers may have to navigate across the tense and conflictual landscape of politics. Especially at the high levels of political power, where the interplay with economic power is significant, promoting and supporting governmental actions and policies for sustainability is still a matter of compromises. Within this scenario, the question is how the TESS interactive platform can support policy makers in their daily – probably conflictual – activity within their organizations.

Another important element that emerged from the analysis of stakeholders is that it showed the need to reflect upon the relationships among different users. During the first day, whilst creating the personas, the workshop participants mostly created fictitious representations of single, isolated users. The relationships among different users (or different personas) were not represented. The stakeholders' analysis showed to the participants that a web of relationships connects one organization to other ones and – in a systemic way – the user's actions are entangled into complex dynamics of organizational dependencies.

It is here important to clarify that during the second day I did not present information on TESS that I had not already shared on the first day. Rather, the two design management exercises allowed the students to interpret the same briefing in a different way. The results of the application of this design management perspective were:

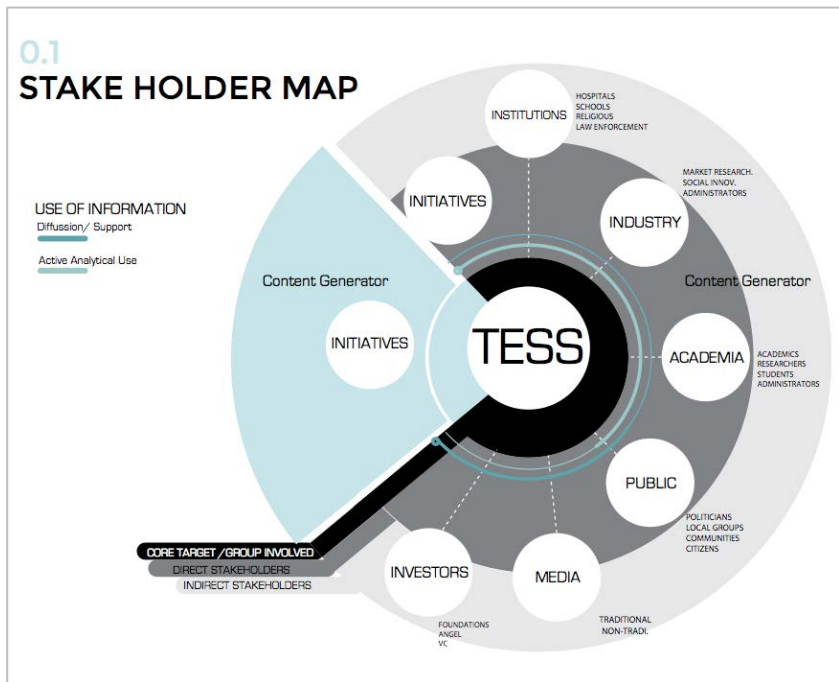

(1) All the groups reworked on the information architecture. Whilst the first day they just piled up ideas for a lot of potentially interesting and useful functionalities for the TESS platform, the second day they realized that the economic resources did not allow developing and maintaining all the proposed functionalities. Consequently, all the groups had to scale down their proposals.

It is here important to clarify that the first day I already gave the participants a rough idea of the budget they could count on, but it is only on the second day - when we worked together on a more analytical budget - that the participants more clearly realized the amount of economic resources that could be allocated for the actual design and development. It came as a surprise to most of the participants that, out of the entire budget, only part of it could go to the actual development of the interactive platform, whilst a significant percentage of it had to cover costs that were not immediately visible (e.g., the impact of taxation over the personnel net

monthly costs, or the project management costs, or the overhead). As already mentioned above, the participants of this workshop were mostly designers and the majority of them did not have previous experience with budgeting.

(2) The stakeholders' analysis also showed a different angle to the participants. The immediate results were:

(a) A group decided to abandon the personas and they worked instead on a quite complex visual representation that did not show individual users, but organizations (initiatives, general public, etc..) and some of the interactions among them.

*Figure 3. Second design cycle: Diagram representing TESS stakeholders.*

(b) Another group realized that the differences between the various segments of the expected users of TESS were so significant to justify the creation of two different interactive websites: one targeted to researchers and policy makers, another one targeted to community-based initiatives and general public.

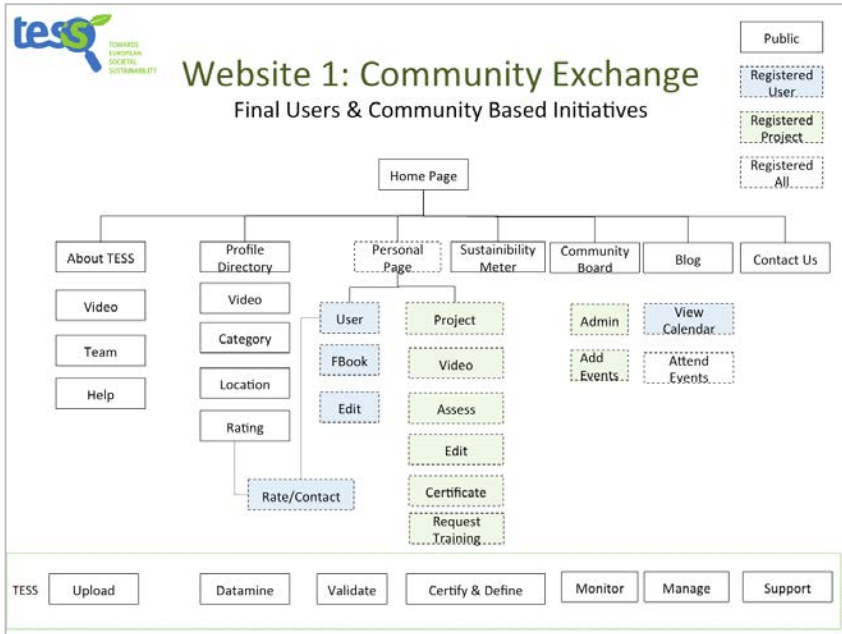

Figure 4. Second design cycle: Site tree representing functionalities of the specific TESS website for community-based initiatives and general public.

(c) Another group re-worked on the format they had previously used to represent personas, labeling it as a ‘quick customer journey’ and adding some more details that could – at least partially – illustrate the more complex scenario emerged from the stakeholders’ analysis.

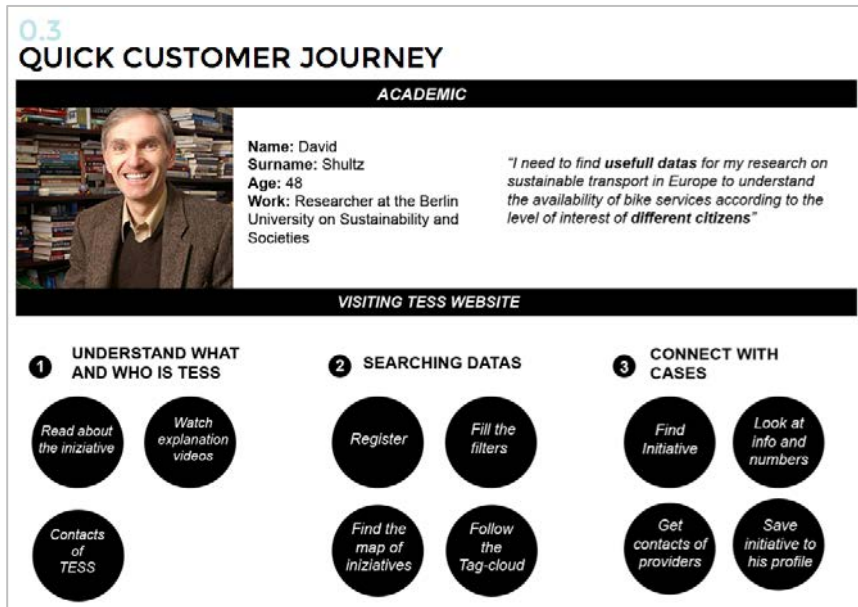

Figure 5. Second design cycle: Quick customer journey for one of the final users of TESS.

At the end of the second day, all the groups presented to the final jury, which appreciated some of the ideas and offered constructive feedback.

## Discussion

Before entering into the discussion, I want to acknowledge some limitations of this study.

Firstly, although the methods used in the Design Management Lab have been also replicated in other workshops, I only describe here the outcomes of a single workshop. As such, the paper is grounded into a single example and is therefore insufficient to draw any definitive conclusion. Although I could see common patterns emerging from several workshops I conducted, a more consistent investigation is needed. At best and as of now, this study only offers some contributions that open up for further explorations.

Secondly, the methods used in my workshops are not paradigmatic and do not represent the only way of doing user-centered design or design

management. I chose the specific methods presented above having in mind an audience for the workshops that was not (always) composed of participants with skills and experience in design. It was also important to choose methods that could be applied and used within the relatively short duration of the workshops (few hours).

In spite of these limitations, I still think that my study can offer some reflections on the research question I presented in the initial section of this paper: How can design management complement user-centred approaches at the early stages of the design process?

First off, I want to clarify here that I am not arguing that either user-centred design, design management or even interaction design should stay on top of the others, but I am rather suggesting that they offer different perspectives on the design process. I am claiming that by adopting different vantage points designers can have a clearer picture of the design situation. When I use the notion of interplay, I want to highlight the processual dimension of this activity of deliberately changing viewpoint. I see the interplay between user-centred design and design management as an iterative process, where, for example, the designer starts with some techniques from user-centred design, then adopts the design management approach, then goes back again to user-centred design and so on, in a process where the two views keep interacting between each others and thus influence the design outcome. In my specific case, this interplay happened at an early stage of TESS, when the project was still quite open and therefore could more easily accommodate inputs coming from different perspectives. It might be the case that this interplay can be also beneficial at later stages, especially when the interactive project is structured across different cycles of design/development and therefore can be refined over time.

The user-centred design techniques that have been employed in the first cycle of my workshop (such as the personas) are oriented to representing users at an individual level. Several scholars expressed their concern about the way users are sometimes represented with these techniques. There are at least three important components of this critique:

1. The representations of users can be naïve or too stereotypical (Chapman & Milham, 2006; Djajadiningrat, Gaver, & Fres, 2000). Nielsen - who has worked and studied personas for a long time - in a recent paper co-authored with Storgaard Nielsen, documents how some Danish firms enact theatrical representations (e.g., through role-play or the use of masks) in

order to enrich personas (Nielsen & Storgaard Nielsen, 2013). These role-play activities enhance the understanding of the final users for both actors and spectators, since they create greater empathy and depict some of the interrelations among the final users.

2. The practice of user-centered design and the representation of users generated by it happen in a socio-political context, where inequalities of power and special interests might be at play. Halse, for example, warns against the idea that the representations of users in user-centred design are neutral, detached and accurate snapshots of reality (Halse, 2008). These representations are created in contexts where dynamics of power and authority might play an important role (e.g., imagine the case of a big multinational corporation headquartered in North-America – like Microsoft - that routinely employs user-centred techniques to create interactive products or services massively distributed at a global scale).
3. These first two points show once again how user-centred design needs to be complemented by an organizational view. Representing the final user as a persona is an important design technique to keep in mind the final audience, but the audience is not composed of users that act as isolated individuals. Users live and act within organizations and organizations live and act within a wider context where they have to interact with other organizations. The sphere of autonomous decisions and behavior of the individual user is strictly entangled with organizational and wider societal dynamics.

It is for these reasons that I advocate for the interplay of user-centred design and design management. Design management allows reflecting upon the organizational, structural, systemic, economic level of the design process. In terms of scale, it is like design management operates at a different level of zoom compared to user-centred design and allows for a broader view. At the same time, user-centred design offers a closer perspective and as such can be more easily operationalized during the design process.

Again, I am not stating here that a specific viewpoint or technique is better than another, but my claim is that all these perspectives should be

taken as complementary ways for deepening the understanding of design activities.

Although during the first day of the workshop I had warned the participants about some of the possible limitations of user-centered design techniques such as personas, it is only on the second day - when they had the chance to apply a design management perspective and techniques and then go back to another design cycle - that they fully saw and experienced these limitations.

## Final remarks

As a concluding remark, I would like to go back to the original claim I stated in the first section of this paper, namely that the interplay between user-centred design and design management can be beneficial for the field, the processes and the practice of interaction design, especially when dealing with complex and ambitious projects facing big economic and societal challenges such as environmental sustainability.

Adopting views and techniques from design management would allow interaction designers (and perhaps also other kinds of designers) to better grasp the complexity of real-world problems as strictly entangled with dynamics of power and authority. I suggest that this approach would better prepare designers to acknowledge the economic and socio-political dimension of their work and – potentially – to operate in a more transformational way when dealing with big societal and environmental challenges.

Binder et al. suggest embracing a design perspective focused on the notion of “design things” (Binder et al., 2011). The original etymology of the word *things* refers to the governing assemblies in ancient Nordic and Germanic societies. Things were collaboratively decided within these assemblies. In Binder et al.’s words, “designing things” means embracing the idea that design should be a venture where a plurality of diverse and conflictual points of view is represented and where this plurality also becomes a socio-political ideal that a designer should struggle for.

In my opinion, the interplay between user-centred design and design management and the way this interplay would equip interaction designers are steps into this socio-political orientation.

## Presenting the SCL Model: Adding value to business strategy through UCD principles

Mariale MORENO<sup>a\*</sup>, Debra LILLEY<sup>b</sup> and Vicky LOFTHOUSE<sup>b</sup>

<sup>a</sup> Nottingham Trent University; <sup>b</sup> Loughborough University

*This paper presents the Sustainable Consumption Leveraging (SCL) Model and its toolkit, which was developed to help businesses examine their potential for enabling sustainable consumption whilst identifying areas of opportunity to improve their business model and value proposition.*

*The paper begins by establishing the contribution of business towards sustainable consumption and sets out user-centred design (UCD) principles as a valuable approach to leverage sustainable consumption. The relationship between UCD principles and sustainable consumption in a business context was studied through qualitative research. The findings of in-depth interviews with experts, a focus group and a document analysis led to the construction of a theoretical framework, which was used to develop the SCL Model and its toolkit.*

*The paper then evaluates the potential for the SCL model and toolkit to leverage more sustainable consumption through a comparison made between four workshops within multinational companies in two different contexts: Mexico and the UK. The paper also presents a discussion of some implications of applying the SCL Model, as well as some corporate culture implications. The paper concludes by drawing out the opportunities represented by integrating UCD principles as an enabler for sustainable consumption.*

**Keywords:** *User-centred design, sustainable consumption, business models, innovation*

## **Introduction**

Increasing economic, social and environmental problems around the world have shown that current models of economic development cannot be sustained. Thus, new patterns of consumption are needed. According to the World Economic Forum (2011), global companies are well placed to leverage more sustainable consumption, as their production lines, supply chains, products and services extend across many continents, and as such the cumulative effect of their actions are wide reaching.

The contribution of business towards sustainable consumption will require setting in place new business models which take into account the complex factors that govern consumer behaviour including: aspirations, habits, needs, lifestyles, and the context in which goods and services are delivered (Seyfang, 2009). To address these complex issues, businesses should modify their business models to develop innovative consumer-focused business propositions. Transforming the business model could help companies to engage more effectively with consumers by empowering them with knowledge about their consumption patterns to modify daily habits that can ultimately trigger behavioural change. (Clinton & Whisnant, 2014).

Innovation is considered as a critical factor in business competition (Owen, 2006). Michaelis (2003) argues that to move towards sustainable consumption businesses will need to innovate in their products, services and business models. However innovation strategies and processes might be different according to each organisation's aims, corporate culture and systems (Nijssen, Hillebrand, A.M. Vermeulen & Kemp, 2006).

In the last decade, the area of design has moved forward to understand its contribution to innovation. The consequence has been the development of new theories of design, innovation, and design management (Verganti, 2011). One clear contribution of these new theories is referred to as 'design thinking.' (Lockwood, 2010a; Brown, 2008; Owen, 2006; Brown & Wyatt, 2010). Design thinking is a way of thinking that parallels other ways of thinking to offer a way of approaching issues, problems and opportunities almost uniquely suited to innovation (Owen, 2006). One of its main characteristics is that it has a human-centered focus (Brown, 2008). Thus, it has been argued by Fletcher, Dewberry & Goggin (2001) that design is an interface between consumers and consumption, and thus it has an important role to play moving towards sustainable consumption. The former is acknowledged through the research presented in this paper, by focusing on user-centred design as an important element of design thinking to improve the innovation process towards sustainable consumption.

### *User-centred design and sustainable consumption*

Design facilitates the ability to understand users and their interactions with the world through different design approaches under the umbrella of user-centred design (UCD), e.g. interaction design, experience design, user interface design, inclusive design, human-centred design, human-computer interaction, and practice-orientated design, amongst others (Moggridge, 2007; Nilstad & Boks, 2008; IDEO, 2009; Saffer, 2006; Abras *et al.*, 2004, Kuijer and de Jong, 2011). Though not all of these approaches are used to contribute towards sustainability, they have recently been seen by design researchers as a valuable approach to bring about a reduction in environmental and social impacts from people's consumption activities (Pettersen, Boks & Tukker, 2013).

User-Centred Design (UCD) is a design process and philosophy in which the designer focuses on users' needs, wants, and limitations through the planning, design and development stages of a product (Usability Professionals Association, 2011). Gould and Lewis (1985) recommend three principles of UCD which are generally accepted to be: an early focus on users and tasks; empirical measurement; and iterative design.

Pettersen *et al* (2013) recalled different approaches for design that address sustainability issues and are linked to theoretical understandings of behaviour and consumption. Two of these approaches that could be related to UCD principles are those that address sustainability issues of consumption through influencing users practices – namely as practice-oriented design, which is grounded on practice theory (Kuijer & De Jong, 2009; 2011; Scott, Bakker & Quist, 2012; Liedtke, Welfens, Rohn & Nordmann, 2012, Haines, Mitchell & Balaband, 2012) and those based on psychological theories whose aim is influencing user behaviour and are better known under the umbrella of 'design for sustainable behaviour' (Lilley, 2009; Lockton, Harisson and Stanton, 2008; Tang & Bhamra, 2012; Zachrisson and Boks, 2012).

To develop their different positions within the research, the former scholars involved users either as informers or co-creators (Sanders & Kwok, 2007). Informers are seen as a subject of study to get information, and co-creators are users, which actively participate in the design process. However no matter how the users are involved, the major advantage of UCD principles is that a deeper understanding of user's practices, habits and behaviours emerge from this iterative design process. The partial or complete involvement of users ensures that the product will be suitable for the intended purpose in the environment in which it will be used (Abras *et*

*Presenting the SCL Model: adding value to business strategy through UCD principles* al., 2004). It also helps to communicate user's expectations to higher management and incorporate these concerns into the design process, as user experiences are taken into account in the early stages of design development (Lofthouse & Lilley, 2006).

In a business perspective, UCD research could deliver different advantages such as developing easy-to-use products/services, better satisfying consumers, decreasing company's expenditure on technical support and training, advertise ease-of-use successes, and ultimately increase market share (Vredenburg, Mao, Smith, & Carey, 2002). In addition, it could help companies to avoid rebound effects of certain products designed for environmental sustainability by actually understanding people's practices and behaviours and what can influence them (Liedtke et al, 2012).

Although UCD principles have been applied in user-centred research to address sustainability issues of consumption, this research has mainly focused on everyday practices such as bathing (Kuijjer & De Jong, 2009; 2011), laundry (Pink, 2005) or food preparation and storage (Tang & Bhamra, 2008; Bhamra, Lilley, Tang, 2011). However, UCD principles have not been explored as a potential aid for businesses to place the user/consumer at the heart of their strategy to enable more sustainable patterns of consumption. Thus, the aim of this paper is to nurture this area of research and discuss the opportunities of UCD principles to act as enablers for sustainable consumption whilst at the same time adding value to the business.

## **A Theoretical Framework**

Considering the potential of UCD principles to leverage sustainable consumption, the research aimed to build a theoretical framework supported by UCD principles that can guide companies to leverage sustainable consumption. To achieve this aim, the researchers explored the relationship between UCD principles and sustainable consumption in a business context through an extensive literature review and an empirical research.

### *Summary of literature review*

The literature review focused on the complexities of consumption and sustainable consumption by studying economic theories (Fine, 1993; Wilk, 2002), anthropology and social theories (Heap and Kent, 2000), cultural

theory (Lury, 1996), systems/infrastructure of provision (Sanne, 2002; Ropke, 1999), system innovation theories (Geels, 2002; 2004) and psychology theories (Ajzen, 1991).

The state of the art review also analysed current theoretical approaches – e.g. product/service life cycles and sustainable product service design proposed by Munasinghe, Dasgupta, Southerton, Bows and Mcmeekin (2009), the Green Marketing Manifesto by Grant (2007), Mindful Consumption by Sheth, Sethia and Srinivas (2011), Collaborative Consumption mainly by Botsman and Rogers (2010) –; and tools – e.g. Consumer Futures 2020 by Forum for the Future (2011), Three Ps of behavioural marketing by Shea (2011); 5 levers of Change by Unilever (2011); Sustainable Consumption Motivators by Hicks & Kuhndt (2011) and the Design tool to achieve sustainable consumption by Hofstetter and Madjar (2003, 2005) - towards influencing sustainable consumption in a business context.

From the literature review, three key concepts that should be embedded within the business model to leverage sustainable consumption were identified. These concepts were: communication, collaboration and innovation, and were further explored through primary data collection to aid the development of the theoretical framework.

### *Empirical research approach*

To build the theoretical framework, the researchers followed a qualitative exploratory research purpose with the aim to investigate the relationship between UCD principles and sustainable consumption in a business context. The following research questions were formulated, which were relevant for the exploratory purpose of this enquiry and were linked to the theory studied through the literature review.

1. Can multinational companies leverage sustainable consumption by focusing on UCD principles?
2. Which are the existing conditions that multinational companies should take into account in order to leverage sustainable consumption?
3. Which user-centred strategies can be applied to leverage sustainable consumption?
4. What are the drivers of multinational companies to leverage sustainable consumption?

To answer these questions and be able to build the proposed theoretical framework, the research needed to generate theory that outlined the

opportunities and challenges that companies face in order to influence sustainable consumption by following UCD principles. As such, the research used grounded theory as a research strategy and as a data analysis technique. This is because grounded theory aims to generate theory from data to develop a theoretical framework (Robson, 2002; Charmaz, 2006), and allows using different data collection methods to identify core elements of a phenomenon to provide an understanding of the underlying principles that explain that phenomenon (Denscombe, 2007).

### *Data collection techniques*

Within this research in-depth interviews and focus groups were chosen as data collection techniques, as they provide a more in-depth insight into the research topic, drawing on information provided by expert informants, which for grounded theory is not shaped by prior concepts or theories (Denscombe, 2007). A document analysis was then conducted with the purpose of verifying and complementing the data obtained from the interviews and focus group.

In-depth semi-structured interviews were conducted with five UCD consultants and five experts (e.g. researchers and consultants) in business and sustainability. Then, a focus group with a UCD consultancy was conducted with six participants including three senior designers, a research analyst, the operation manager and the director of strategy and operations. Finally, a document of a section of questions and answers from the general public posted on an on-line webcast during the Unilever Sustainable Living Plan event on November 15th, 2010; was analysed. The aim of this analysis was to report on where global companies stand regarding the path towards sustainable consumption and to verify and complement the data previously collected.

### *Data analysis and initial findings*

The findings for the three different types of data collection were coded and clustered separately using Charmaz (2006) approach to grounded theory. A within method triangulation was used to compare the findings from the interviews. After, a cross-triangulation of the latter findings with the findings from the focus group and document analysis was applied. The cross-triangulation resulted in:

- Three main conditions, which stated that to leverage sustainable consumption, large companies should have an understanding of the value of integrating sustainability into their core strategy and

recognise the important role of innovation in informing their corporate strategy and operations.

- Three different types of strategies based on UCD, which can help companies to understand UCD principles to leverage sustainable consumption and embed sustainability at a strategic level of the company to develop consumer-focused business models.
- Six business drivers that would help companies to leverage sustainable consumption i.e. gain business benefits through an increase on demand, upcoming legislation, finding relevant issues for the company, and minimising economic and environmental costs through innovation, amongst others.

A correlation between these findings and the three key concepts of communication, collaboration and innovation was seen, constituting the theoretical framework. Figure 1 depicts a summary of these findings and how they relate to the theoretical framework.

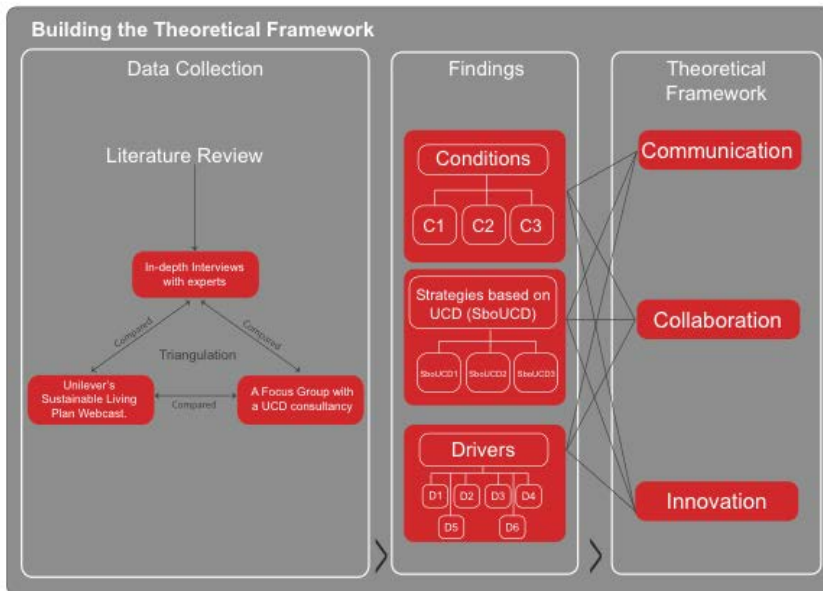

Figure 1 Summary of how the theoretical framework was built

## **Development of the SCL Model**

Based on the theoretical framework described above, the Sustainable Consumption Leveraging (SCL) Model was developed as a mechanism that can enable companies to communicate, collaborate and innovate towards leveraging sustainable consumption. The SCL model is comprised of evaluation criteria, a set of consumer-focused strategies and a Sustainable Consumption Index (SCI) devised from the initial findings previously described.

### *Evaluation Criteria*

The evaluation criteria were divided into four main business areas – Business Model, Consumer, Design and Sustainability – as it was considered that an evaluation of the current business model was necessary to assess further changes in the business proposition. An evaluation of the relationship with, and understanding of, consumers was needed in order to develop more sustainable markets. An evaluation of the capability of a company to apply design thinking was needed in order to see its capabilities to innovate; and an evaluation of the understanding of sustainability was required in order to assess how deeply it is integrated into their strategy and vision. Figure 2 illustrates the four areas with the corresponding criteria to be assessed.

*Figure 2 Evaluation criteria according to four areas of the business*

## Consumer-focused strategies and the Sustainable Consumption Index (SCI)

The model also contains fourteen consumer-focused strategies, which aimed to assist companies in developing ideas that can lead to the creation of a consumer-focused business model to foster sustainable consumption. The strategies were related to the three key concepts of the theoretical framework resulting in five communication consumer-focused strategies, four collaboration consumer-focused strategies and five innovation consumer-focused strategies. All strategies were complemented with prompt questions that could help users to apply each strategy. An example of each set of strategies is depicted in Figure 3.

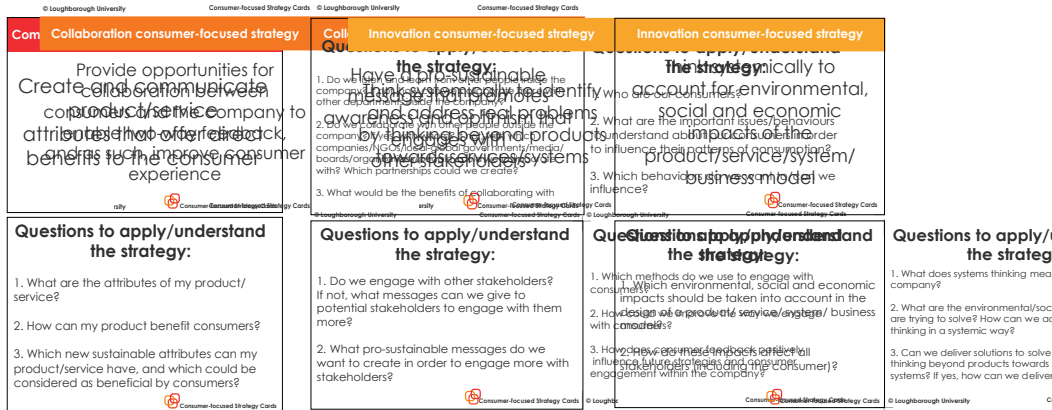

Figure 3 Examples of each type of consumer-focused strategy

The three key concepts of the theoretical framework were also used to develop the Sustainable Consumption Index (SCI) to qualitatively measure the levels of sustainable consumption that a company wishes to motivate and set its targets to, dependent on their objectives and business strategy. The aim of the SCI is to guide companies to evaluate where to set their targets to the level of sustainable consumption they wish to motivate by applying different consumer-focused strategies.

The SCI is inspired by similar models that explain different levels of eco-efficiency related to different types of innovation (Brezet, 1997; United Nations Environmental Programme, 2009). The premise of the SCI is that there is a fundamental relationship between communication, collaboration and innovation. Thus, to motivate more sustainable patterns of

*Presenting the SCL Model: adding value to business strategy through UCD principles*

consumption, different innovative actions and degrees of engagement amongst stakeholders are required in order to enable incremental, disruptive or systemic changes within the business model of a company. The former is grounded in the idea that to achieve higher levels of sustainable consumption a greater level of innovation and involvement of stakeholders is needed (Mont and Plepys, 2008; Nilstad and Boks 2008).

The Green Marketing Manifesto by Grant, (2007) also inspired the SCI. Grant (2007) described three green marketing objectives, 1) to set new standards and communicate, 2) to share responsibility and collaborate, and 3) to support innovation and reshape culture, which are associated to the three main concepts of communication, collaboration and innovation, identified in this research. The SCI is depicted in Figure 4. It shows the levels of sustainable consumption (y axis) as a function of the level of innovation and stakeholder engagement (x axis) in relation to the three different stages identified by Grant (2007).

*Figure 4 Sustainable Consumption Index: Three different stages to motivate sustainable consumption*

The SCI approach argues that certain levels of innovation and stakeholder engagement are always involved in the process of motivating sustainable consumption, as stronger engagement and collaboration with stakeholders, including the consumer, could move a company toward innovation (Lockwood, 2010b). The SCI also argues that global companies will innovate upon other existing products, services or business models, as

breakthrough innovations are based on inventions that serve as a source of many subsequent inventions (Assink, 2006).

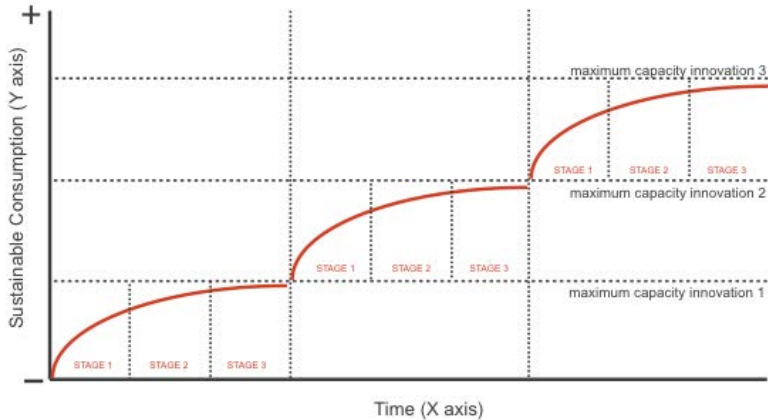

To motivate higher levels of sustainable consumption, disruptive innovation will be needed (Mont and Plepys, 2008). For this context, disruptive innovation is defined as a product, process or concept that significantly transforms the demand and needs of an existing market or industry, by creating new business models or markets with significant societal impacts, as it might transform the way we live, work and learn (Brown, 2003). However, disruptive innovation is a hard concept to grasp and hardly a one-time effort, thus it requires continuous improvement in the overall capability of firms (Cohen and Levinthal, 1990).

To this respect, with the SCI, companies can choose the consumer-focused strategies according to their targets depending on their current innovations, business strategies and resources. For example, a company can set its targets to motivate levels of sustainable consumption within the communication stage by applying only communication consumer-focused strategies. This could be done to incrementally innovate in their communication strategies with consumers or other stakeholders. However, if a company wants to innovate further, it will need to apply a mix of communication, collaboration and innovation consumer focused-strategies to possibly achieve a disruptive innovation that could motivate a higher level of sustainable consumption. Disruptive innovation is a circular development process of continuous feed-back loops (Assink, 2006). Thus, in the SCI, there is no clear boundary between its stages and they may even overlap.

The SCI curve has an ever-decreasing slope (Figure 4) in which an innovation has a maximum capacity of disruptiveness, and improvements towards leveraging sustainable consumption diminish as one progress through the stages. In economics this behaviour is called the law of diminishing returns. Paap and Katz (2004) argue three cases in which innovation reaches its maximum capacity of disruptiveness to the point of saturation, which leads to develop further innovations. These cases are:

- The innovation becomes obsolete, as it no longer satisfies the needs of consumers.
- Incremental improvements responding to emerging needs of consumers are no longer seen as valuable.
- There are changes to the environment due to political, economic, sociological, technological, legal and environmental factors.

In order to avoid stagnation of sustainable consumption, new innovations are needed, resulting in a process where new innovations are required at the end of the life cycle of the preceding ones (Figure 5). Building upon innovations has been studied in the growth of cities where innovation is necessary to maintain a city's viability (Bettancourt, Lobo, Helbing, Kuhnert, & West, 2007).

*Figure 5 Building upon innovations through time to avoid stagnation*

## **Applying the SCL Model through its toolkit**

The SCL toolkit is a resource to assist companies to implement the SCL Model described above. From each element of the SCL Model, each tool of the SCL toolkit emerged, resulting in four evaluative canvases, fourteen consumer-focused strategy cards, and a sustainable consumption index (SCI) template. The SCL Model and toolkit were tested with four global companies through three pilot workshops in Mexico and a main workshop in the UK.

The sampling strategy followed to choose the companies to conduct the workshops with, was based on a convenience sample in which the researches had previously worked with those companies. However, the sample went through a selection process based on the previous findings. The findings revealed certain conditions, which must be present within a company in order to be able to leverage sustainable consumption. These include an understanding of the value of integrating sustainability into their core strategy; and recognising the role of innovation in informing their corporate strategy and operations. As such, three companies in Mexico and

one in the UK that have an understanding of integrating sustainability into their core strategy and who recognize the important role of research and development (R&D) in informing their corporate strategy and operations, were selected. To select these companies, secondary data was used to prove that the companies have a global corporate sustainability and innovation strategy set in place.

The companies, which the workshops were conducted with, were considered as a sample to evaluate the effects of the SCL Model and its toolkit on multinational companies in these regions, but were not considered representative of these countries.

### *Workshops general layout*

Participants that attended the workshops were chosen from different areas and positions inside the company with the condition that they should fit within the four areas of the evaluation criteria of the SCL Model – Business Model, Consumer, Design/R&D and Sustainability -. To do the selection of participants, the researchers worked closely with a person inside the company. An invitation to participate in the study was sent to a list of recommended people, and thus all participants were notified previously that they would be part of this research. This particular recruitment allowed the research to gather different perspectives within the business. In addition, a facilitator was used to moderate discussions and guide participants during the workshop. The workshop consisted of five general activities:

**Activity One – Application of the Evaluative Tool:** The Evaluative Tool aimed to find areas of opportunity to improve upon in the business model and value proposition to consumers. It consisted of three types of self-completion templates including: two self-evaluation canvases, a score canvas and a strengths and weaknesses canvas. For this activity, participants were divided into four groups according to their expertise in relation to the areas of the evaluation criteria of the SCL Model. Each group completed the SCL self-evaluation canvases, which consists of two questionnaires for each area of the evaluation criteria. The questionnaires follow a scale of 1 to 5 to evaluate the current performance and future improvement of the company regarding the criteria for these four areas. Figure 6 depicts an example of these questionnaires showing the one designed for the Business Model Area.

Presenting the SCL Model: adding value to business strategy through UCD principles

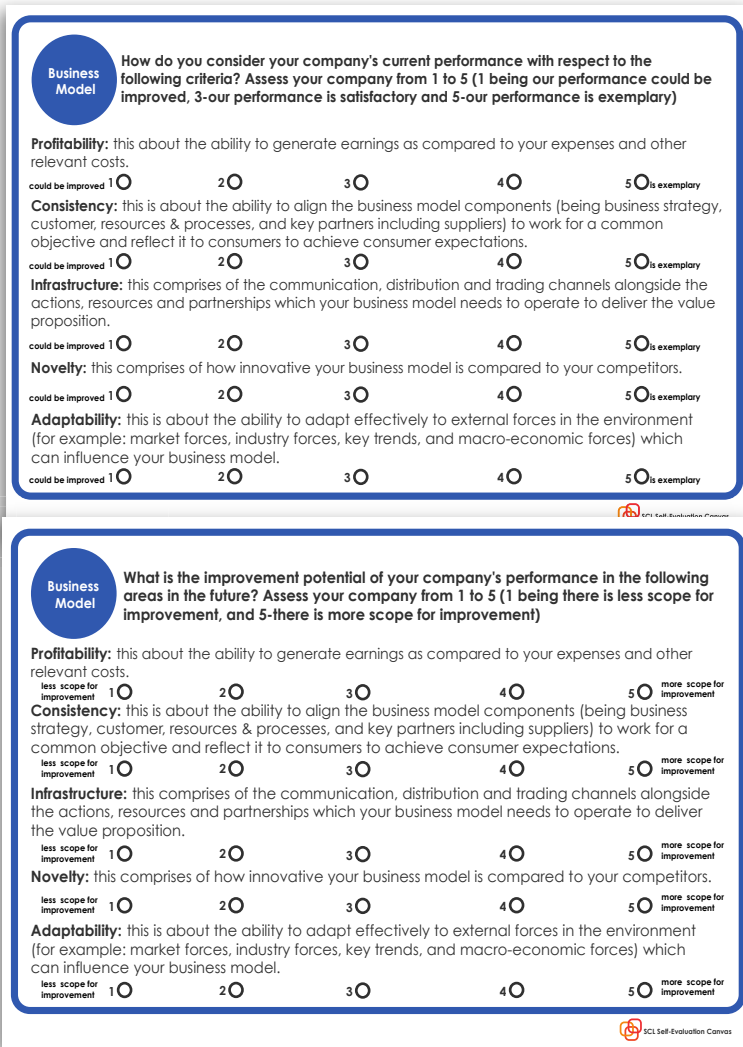

Figure 6 SCL Self-evaluation Canvases – Business Model Area

After completing the self-evaluation canvases, participants transfer their scores to the SCL Score Canvas (Figure 7) with the purpose of understanding and easily comparing the current performance and future scope for improvement for each criterion. When transferring their scores, participants

were encouraged to use post-it notes and the SCL Strengths and Weaknesses Canvas (Figure 7), to identify strengths and weaknesses for each criterion regarding their scores for their current performance and future scope of improvement. Through identifying strengths and weaknesses, a list of areas of opportunity that could be improved was generated.

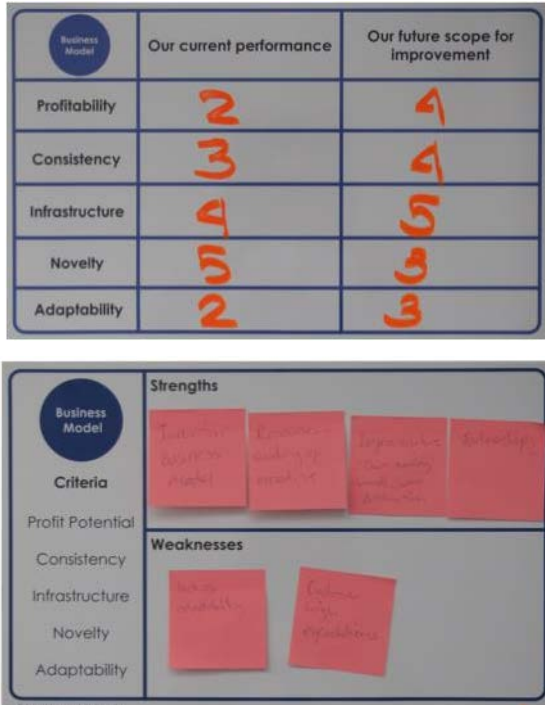

Figure 7 Example of SCL Score Canvas and S&W Canvas used at the workshop

**Activity Two – Identifying overall areas of opportunity:** In this activity, teams gathered together to present their scores and the areas of opportunity identified. The moderator facilitated a discussion between the teams to identify the most important opportunities. To select these opportunities, certain criteria were used. These criteria was set up according to the four areas of the evaluation criteria and was based on internal (e.g. how cost-effective is the business, current in-house sustainability practices with their employees, in-house activities that motivate creativity and innovation, relationship with their consumers) and external (e.g.

*Presenting the SCL Model: adding value to business strategy through UCD principles*

relationship with their supply chain and competitors, external economic, environmental and social factors that could affect their business, perception of their consumers, R&D happening within similar sectors) aspects of the business.

**Activity Three – Choosing the areas of opportunity to work upon:**

Participants were re-organised into new teams by mixing the people from each area of the evaluation criteria. Through facilitation, a filter was applied to identify those areas of opportunity that were deemed most influential for each company. This filter was based on the criteria mentioned above to identify internal and external aspects of the business, which could be utilised to better leverage sustainable consumption. Each new team chose one area of opportunity to brainstorm ideas in response to that opportunity.

**Activity Four – Brainstorm ideas with the Sustainable Consumption Index (SCI) and the consumer-focused strategy cards:** The SCI was introduced as a tool that participants could use to co-relate the consumer-focused strategies to the three key concepts of communication, collaboration, and innovation; to target the level of sustainable consumption they wanted to motivate. The consumer-focused strategy cards were also introduced by explaining that each card had prompt questions that enabled participants to reflect on how and when to apply the strategy and generate ideas within the area of opportunity previously chosen (Figure 8).

*Figure 8 Applying the SCI with the consumer-focused strategy cards to generate ideas that target the chosen area of opportunity*

**Activity Five – Presentation of ideas:** Finally, the sub-groups presented their ideas, which could result in new/improved products, services or business models.

### *Pilot Workshops*

The pilot workshops aimed to identify corporate reactions to the SCL Model and to assess its application with different configurations so improvements could be made. The pilot workshops were carried out with three multinational companies from different sectors including; a pet food manufacturer (C1), a breakfast cereal manufacturer (C2); and a large chain of retailers (C3), with the purpose of making a comparison between them. Because of confidentiality issues, it has not been possible to disclose with which companies the model was tested. For this reason, each company was labelled with a code (e.g. C1, C2 and C3).

The workshops had the same format but were designed in different configurations in relation to the number of participants, the level of seniority of participants, and the areas of specialist knowledge represented by the participants. For example, with C1 and C3 the participants were chosen from different areas and positions inside the company that fit within the four areas of the evaluation criteria. As such the activities described above were conducted with multi-disciplinary teams. This format was chosen because in design thinking, multi-disciplinary collaborative perspectives are considered to lead innovative business solutions (Vianna et al., 2012). Table 1 depicts teams for Activity 1 and Table 2 shows teams for Activities 3 and 4 conducted with C1.

*Table 1 Teams formed for C1 Activity 1*

Participants' Description	Code
<b>Business Team</b>	
Purchasing and Logistics Director	BMC101

Green Team	
R&D Director (BMC102)	
Packaging Manager (DesC101)	
Product Manager (DesC102)	
Environmental and Sanitation Coordinator (SusC103)	

In contrast, for the workshop carried out with C2, participants with a higher position inside the company related to sustainability but with sufficient knowledge about the other three areas of the evaluation criteria were recruited. Thus the activities mentioned above were conducted within a single team.

Targeting the right area and level of participants was considered a limitation, due to the availability of participants in the time given to conduct

the workshop. It was particularly difficult to get participants from higher positions in the company. Despite this, these different configurations of the workshop allowed the researchers to assess the level of influence of different participants in developing strategies to address sustainable consumption.

### *Main Workshop*

The main workshop was conducted with a leading pharmaceutical, health and beauty retailer and manufacturer. To identify this company the code C4 was allocated.

As the research followed an iterative process, reflection on the findings of the pilot workshops, led to the conclusion that a multi-disciplinary team that covered different areas of specialist knowledge, and that have certain power to influence, is needed to implement the SCL Model and its toolkit. As such, the participants chosen to conduct the main workshop with, were part of the sustainability champions programme that C4 implements between its employees to influence more sustainable practices within the company. The levels of participants were senior managers, managers and coordinators.

## **Potential of leveraging sustainable consumption**

The potential of leveraging sustainable consumption was assessed by a comparison between the four workshops of how participants used the SCL Model and toolkit. The findings described an evaluation of ideas generated by participants through using the consumer-focused strategy cards and the sustainable consumption index (SCI). The findings also revealed that the potential of leveraging sustainable consumption would be dependant on the successful application of the SCL Model and on the corporate culture of each company. Thus, some implications on how the workshop was conducted, and some corporate culture implications are also described.

### *Workshops' data analysis and findings*

All workshops were recorded by using up to four Dictaphones to capture what participants in each team were saying. Transcriptions were made to further analyse the data. In addition, three questionnaires were applied to participants: two in the workshops and one three months after the workshops. The questionnaires and the comparison between workshops were analysed through a thematic coding analysis, by following a concept-driven system in which categories and concepts were already

*Presenting the SCL Model: adding value to business strategy through UCD principles*

predetermined (Miles and Huberman, 1994). Different master codes were used and classified as evaluation codes (e.g. EXT – external factors, INT – internal factors POS- positive comment, NEG- negative comment) to study positive and negative comments and external and internal factors that could influence the use of the model and its toolkit; and perception codes (e.g. CFSC – perceptions about the cards, SCLM – perceptions about the model) to analyse the perceptions of participants towards how by using the model and each part of the toolkit could help them to generate ideas to motivate sustainable consumption. Sub-codes were attached to the master codes when needed. To interpret the data, counting and making contrasts and comparisons were used, as this helped the researchers to see what is in the data by looking at the frequency of occurrence of recurrent events (Miles and Huberman, 1994 p.245).

### *Evaluation of ideas generated using the consumer-focused strategy cards and the SCI*

By comparing both pilot and main workshops it was seen that in the pilots, the levels of sustainable consumption that their ideas could motivate did not surpass the communication-collaboration stages of the SCI. For example, the two teams (red and blue, see: table 2) that made up the C1 workshop worked in areas of opportunity that could encourage consumers to adopt more sustainable behaviours.

The blue team worked on: ‘communicate simple sustainability actions to the consumer through their packaging’, and applied the following consumer-focused communication strategy:

- Create and communicate product/service attributes that offer direct benefits to the consumer,

And the following consumer-focused innovation strategy:

- Continual evaluation of a new product/service/campaign/business model through iterative processes, procedures or/and appraisals.

The red team worked on: ‘engage consumers into sustainability actions through programmes and innovation in their products’, and applied the following communication strategy:

- Make pro-sustainable consumption/behaviour rewarding, fun, and interesting to the consumer,

And the following innovation strategy:

- Create experiences that make consumers feel good.

However, although a mix of communication and innovation consumer-focused strategies were used, these teams only thought about communicating the actions towards sustainability that the company is implementing to the consumer:

*“We can evaluate if our services and processes are sustainable before, during and after we manufacture a product...[as such, we can] inform our consumers [about our sustainability actions] so they can be informed about what we are doing to then influence them” (CoC102).*

Thus it was inferred that at this moment the levels of sustainable consumption they could motivate could not surpass the communication stage of the SCI. Despite this, the company acknowledged three months afterwards that the workshop had helped them to set a five-year plan in which they are *“...looking at the corporate efforts/metrics to align (them) as much as possible [with the consumer] to have a robust sustainability strategy in the company” (BMC103).*

Within the workshop conducted with C2, the participants worked on: ‘developing new business models that are more convenient for the consumer, but at the same time to encourage more sustainable services.’

Although the team in C2 used a mix of communication, collaboration and innovation consumer-focused strategies, they did not relate the strategies to the SCI, and thus it was not clear which levels of sustainable consumption they felt they could motivate and to what extent. In addition, after three months, C2 acknowledged that they had not followed up any of the ideas that emerged at the workshop as *“they ha[d] other priorities to attend [to] with certain time frames” (SusC202).*

Within C3, teams worked upon areas of opportunity related to: ‘...know[ing] about consumers’ environmental impacts and consumers’ perception to integrate this knowledge in the innovation process’, and ‘on creating strong partnerships to communicate sustainability to the consumer in order to influence them.’

Even though a mix of communication and innovation consumer-focused strategies, and a mix of collaboration and innovation consumer-focused strategies were used, the discussion amongst these two teams focused on:

*“Communicating to the consumer and other stakeholders what the company will do to innovate to deliver more sustainable products” (DesC301) and on: “Which collaborations are needed to design social and environmental programmes that can engage consumers into more sustainable actions e.g. packaging take back scheme” (CoC302).*

Thus, it could be said that the levels of sustainable consumption could not surpass the communication-collaboration stages of the SCI, as there was no evidence of ideas generated during the workshop that actually focus on innovating in the business model or their products/services. In addition, after three months of conducting the workshop, C3 also acknowledged that *“first the company has to recognize a sustainability strategy, to then create the awareness between the employees to start working on [influencing consumers]”* (CoC301).

In contrast, in the main workshop the ideas generated reached the innovation stage of the SCI. For example, one of the teams chose: ‘to encourage more sustainable living by building on the trust that consumers have for the company’s brand’ and used three communication consumer-focused strategies and one collaboration consumer-focused strategy.

Although, only these four consumer-focused strategies were used to develop an overall idea that could target the area of opportunity identified, the team also used several collaboration and innovation strategies to evaluate their idea by plotting each card on the SCI tool.

*“Does it provide opportunities for collaboration between consumers and the company to enable two-way feedback, and as such improve consumer experience – Yes it does...Our idea is innovative and does it communicate a strong value proposition to the consumer – Yes it does”* (Red team).

Although innovative approaches could be developed through expanding on these ideas, three participants from C4 acknowledged that it would be difficult to achieve this expansion as *“higher management needs to be involved to drive through such significant business changes”* (CoC401).

Despite this, three participants with a degree of influence in corporate-level decision acknowledged *“in the past we had worked bottom-up achieving sustainability improvements in our products... to this, higher management had responded positively”* (DesC401). As such, building a business case *“with some of the ideas that are currently being investigated in the company [could] had a good response of people by saying yes”* (SusBMC401).

In comparison with the companies from the pilot studies in which C1 and C3 acknowledged that they have to work first on embedding a much more integrated sustainability strategy within the business; C4 recognized after three months, that participants followed some of the ideas to *“incorporate [them] into a product sustainability strategy paper”* (SusBMC401). This reveals that they took action to work ‘bottom-up’, and as such they also

shared the outcomes of the workshop with internal colleagues and were planning to present them to internal and external stakeholders.

### *Implications on how the workshops were conducted*

It was found that to better benefit from the workshop; it should be conducted with a multi-disciplinary team. Having this configuration showed that participants had a more collaborative approach to make linkages between what is happening in different teams or areas. In addition, having a multi-disciplinary team allowed discussions that led participants to account for a more holistic perspective. These discussions helped participants to understand their position in relation to what is needed to innovate in their business model and from which perspective.

Participants that are recruited to attend the workshop preferably should be corporate-decision makers, or at least people that have certain degree of influence in corporate level decisions, as the findings revealed that the effectiveness of the model will depend on the buy-in of decision makers or higher management. However the findings also revealed that this could also be achieved through a “bottom-up” approach through which ideas could be tested before being scaled up for senior management.

### *Corporate culture implications*

The comparison between the pilot and the main workshops brought to light that to effectively motivate sustainable consumption, strategic level engagement is vital. Whilst, the secondary data used to prove that the participant companies had set in place a sustainability strategy worldwide, the workshops proved that some of these strategies are difficult to filter down to region specific areas. Three drivers to filter down quicker global sustainable consumption strategies to region specific operations were found from the workshop findings and were compared to the drivers found to built the model. These drivers are:

**Gaining a financial benefit:** the workshops revealed that global companies would be more confident if those strategies could demonstrate an immediate financial benefit.

**Finding relevant issues for the company:** Benefits such as secure resources, controlling of energy use, and avoiding pollution are in the interest of companies, as they have proved beneficial e.g. improving environmental performance in the manufacturing stages. In the four workshops it was recognized that similar benefits could be gained by focusing on “*the sustainability of consumption as most of the environmental*”

*Presenting the SCL Model: adding value to business strategy through UCD principles impacts are in the consumption stages of the life cycle of a product/service” . (C4 workshop)*

**Being motivated through the influence of other stakeholders:** Including legislation and voluntary standard codes. Legislation was found in the workshops as a key driver for companies to filter down innovative strategies towards sustainable consumption. Legislation can vary by country and region. However, global companies situated in countries that have more support from their governments, seem more likely to establish measures to comply with legislation. As such, they might want to influence other regional operations to implement similar measures.

Despite these drivers, sustainable consumption strategies might take longer to disseminate *“due to region specific cultural differences”* (C1) (i.e. population segment, readiness of the market, legislation, availability of technologies, amongst others). Corporations might have to target their strategies to region specifics, which can be resource consuming and, as such, they might not be willing to spend the time and money on doing so. However, it could be argued that multinational companies that have a strong sustainability and innovation corporate culture will filter down all kinds of global sustainable consumption strategies amongst all regions, as they will understand that the sustainability of consumption is a key determinant for future growth and profitability.

## Conclusion

Through this paper a theoretical framework was presented which was then used to develop the SCL Model and its toolkit. The key concepts of the theoretical framework - communication, collaboration and innovation – were considered as part of applying UCD principles in a business context to leverage sustainable consumption. The former was revealed from initial findings which demonstrated that to influence sustainable consumption it would be necessary to communicate and collaborate with people inside and outside a company in order to propose new innovative business models.

Applying the SCL model within multinational companies drew out some opportunities for UCD principles to act as an enabler for sustainable consumption. Opportunities were seen through the workshop whilst ideas were developed through using the consumer-focused strategies and the SCI. Such opportunities were: a) Companies were able to place the consumer at the heart of their business model, which was seen as a way to help them to build brand trust and engagement, and at the same time offer alternatives

that could influence consumers to purchase, use and/or dispose of products differently; b) Companies thought about developing programmes that could engage their stakeholders including their employees to collaborate with the purpose of improving the sustainability of their products, services and business models; c) UCD principles were used to develop new ideas from the bottom-up, which could result on thriving innovation at all levels of the business, enabling structural changes to happen; d) UCD principles were seen as useful to innovate in their value proposition by developing and deploying new business models that could support more sustainable patterns of consumption and at the same time gain financial benefits. These opportunities will need to be seen by decision makers within the company and could be hindered by regional policies, cultural differences of each population segment in which they operate, and corporate culture and values.

The paper presents UCD principles as an enabler for sustainable consumption and draws out some opportunities through applying the SCL Model in a business context. However, there is no means that UCD principles will address the scale of the problem and further changes in the structure where businesses operate are needed.

# Digital Ethnography: a critical evaluation of the contribution to innovation of the current tools and methods

Nicolas MINVIELLE<sup>a\*</sup>, Olivier WATHELET<sup>b</sup>, Mathieu GRIFFOUL<sup>c</sup> and Martin LAUQUIN<sup>c</sup>

<sup>a</sup> Audencia Nantes, <sup>b</sup> Groupe SEB; <sup>c</sup> The Creativists

*Aside of its academic form, ethnography has also become a fairly used method in marketing (Mariampolski 2005), design (Wasson 2000), and more widely, in the products and services creation field (Bauwens & Kloetzer 2013). In the business context in particular, the numeric resources appear as a resources for ethnography in order to work on many points that are specific to companies' businesses, such as temporality, and the articulation between big data and thici data. A preliminary review of the literature reveals some historical shifts since the early stage of the history between ethnography and numeric data. The second part of the paper details two cases study of ethnographic work using digital tools, and immersing in a digital field. Both case studies are commented in order to understand what is the potential of these approaches in innovation processes.*

## **Introduction: as a fact, life is more and more digital, and so is ethnography**

Historically, ethnography is a methodology that aims at studying behaviors in a holistic way, by embracing the point of view of individuals called informants. In order to do this, it relies on the encounter *in situ*, of the ethnographer and its informants. This is done in their natural setting in order to incorporate all the interactions, between behaviors, practices, cultural and symbolic contexts etc.

If ethnography is a research method that is being used in numerous disciplines, it has been founded and is still deeply linked to the academic approach to anthropology. Keeping this in mind; it is deeply attached to cultural and social dimensions of the situations that are studied and to what allows collective living, even in its individual form.

Aside of its academic form, ethnography has also become a fairly used method in marketing (Mariampolski 2005), design (Wasson 2000), and more widely, in the products and services creation field (Bauwens & Kloetzer 2013). Interestingly, many methodological innovations come from this field because of the organizational constraints weighing on the innovation processes.<sup>42</sup>

In its academic setting, the ethnographic approach implies a long and deep immersion in the field. It is from this immersion, and the time spent observing and sharing that a privileged relation is created with the informant. In the business context, there are two main debates. The first one deals with time management (Jordan 2013) and its impact on how the ethnographic studies are done. As an example, in the marketing field, ethnographic practice tends to be reduced to a short visit (1 or 2 hours), in a “real” context. The longer immersions are then being reserved to the most complex subjects (Mariampolski 2001). The second one deals with the ethnography’s capacity to identify the consumers’ lever of decisions. Because it relies on its capacity to listen to its informants, ethnography can sometimes be perceived as ill equipped to understand the consumers’ subconscious mechanisms (as opposed to psychology, or other devices such as eye-tracking) or, on the opposite, it can be perceived as ill equipped to identify macro social trends (as opposed to big data approaches for examples) (Metaxas & Mustafaraj 2013).

---

<sup>42</sup> On this matters, see the EPIC conferences: <http://epiconference.com/>

Combined to the flexibility and evolution of the hypotheses, the ethnographic approaches nevertheless allows revealing hidden rationalities, which cannot be apprehended by classic marketing analysis based on behavioral substrata that are perceived as obvious by the marketing manager.

Since the apparition and development of information based means of communications, ethnology has had to evolve as much in the object that is analyzed as in the tools that are used. In the business context in particular, the numeric resources appear as a resources for ethnography in order to work on the points levers identified above: temporality, and the articulation between big data and thick data.<sup>43</sup>

Ardevol et Cruz distinguish three main steps in this development:

- The cyberspace ethnographies

Linked with the apparition of the Internet, these ethnographies are based on the idea that a “cyberspace” exists in which “virtual communities” may develop. This leads also to the idea that there is a “virtual identity”. The underlying point for ethnography is that there is then a legitimacy to analyze these identities and virtual communities “behind a screen”, and without meeting in the real world.

- The Internet ethnography

This period is correlated with the abandonment of the idea of a “world apart” (Miller & Slater) that would be digitally independent from local cultures and hence separated from the physical work. Terminologies that are being used now start to make a distinction between offline and online rather than “the Virtual world vs. the Physical World”

- The ethnography of the digital

In this period, there is a growing recognition that everything is not about Internet. The amazing development of new tools such as cellphones makes Internet a permeable thing in our life. This leads to a reconsideration of the objects and tools that we use to communicate. Ethnographic approaches hence starts mixing online with offline, at different steps of the ethnographic analysis.

This short historical perspective illustrates three entries by which ethnography has been “modified” by the development of the digital technology. It takes support on the development of Internet and the usages linked to it. Even if Internet is unequal in terms of access (between countries

---

<sup>43</sup> <http://ethnographymatters.net/2013/05/13/big-data-needs-thick-data/>

and social classes), it is nevertheless a world phenomenon, which, in the most connected countries has a penetration rate of 70% or more<sup>44</sup>. At the same time that these societal changes are taken into account, the ethnologists have integrated the digital as a tool to be used during the fieldwork. Even if the panorama is not absolutely clear as of now, we can nevertheless distinguish at least three types of tools that are currently the subject of academic research and business applications:

- Netnography, as defined and popularized by Kozinets (2009)

The method is the “online” translation of “offline” methodology. It is a qualitative and immersive approach in digital spaces. Can also be added to this approach the works on digital and virtual ethnographies that are in fact the continuation on the virtual field of the practices created before the emergence of the digital. Here, we see an adaptation of the modes of communication and interaction with the informants, based on the textual mode of communication.

- Digital Humanities (Schreibman & al 2008).

The objective of digital humanities is to conduct an automatic analysis of large corpus of data obtained by a digitalization already done or done on purpose (such as Google’s project of digitalizing books) (Michel & al. 2011). It combines the network sociology’s approaches and the *text mining* ones.

- The numeric platforms (applications or private blogs)

Developed mainly in the consulting world, but also in the psychological one,<sup>45</sup> (Miller 2012), these tools create distant interactions with informants. Via digital interfaces, informants answer requests ranging from simple questions asked in the informant’s context, provided through platforms requesting videos or richer content. The ethnographer then analysis this material in qualitative or quantitative way according to the study’s needs and format.

These different approaches have in common the fact that they try to reduce the costs of *in situ* by trying to set up an interaction despite the physical distance between the informant and the ethnographer (Gurrierii & Cherrier 2013); but also try to get closer to the moment of the informant’s practice through a « just in time sociology »<sup>46</sup>. To summarize, the netnography studies the spontaneous judgments, solicited or not, in the

<sup>45</sup> For a review of the applications in psychology, <http://www.otago.ac.nz/psychology/otago0474751.pdf> :

<sup>46</sup> For a review of the applications in ethnography: <http://jitso.org/>

exchange frame with the ethnographer, on products, services or the digital expression. Digital humanities break down social movements or trends by following, or anticipating the web practices (Severo & Giraud 2013). And finally, the applications on Smartphone of computers allows collecting judgments or opinions in real time (see the happiness studies on these matters. Palmer & al 2013).

However, because these approaches are new and because they focus on digital as a social phenomenon or as a way to access it, the works that have been published so far are a bit difficult to address: are they digitalized ethnographies or ethnographies on digital? We propose to approach all these practices under the term “digital ethnography”, with the objective to clarify their contribution to the innovation and design practices.

To go one step further, our proposition is to take seriously Ted Richards<sup>47</sup> proposition: the most efficient way to understand the mechanisms that shape the human experience is empathy! To be able to put oneself in someone else's place, is a fascinating but complex thing to do: it implies to abandon for some time one's own conception of things in order to embrace someone else's. Anthropology and ethnography are particularly attached to this problematic (Hollan & Throop 2008), that shapes the relation between the informant and the ethnographer, and serves as a unique way to move closer to the consumers (Winick 1961: 55). It is also a very powerful tool that, by itself, allows to rethink a problematic out of the boundaries established by markets and consumers, or to create these segmentations when, in the case of innovation, no such thing exists (Millier 2014). Based on this, while ethnography in marketing is sometimes limited to a selection of usage items within predefined consumer segmentations, the construction of empathy serves a more radical approach. In this case, it allows reframing the informant's experience based on its emotions, its subjectivity, and more largely, its value (Graeber 2001). It goes the same way for the design ethnography approaches, which reduces ethnography to a question of deviant and tinkered behaviors (Wakkary & Maestri 2008), and does not address the experience and the underlying values.

In this perspective, we propose to discuss the digital stakes of ethnography in regard with its capacity to create empathy in different forms.

## **Objects and tools, mapping the current academic production**

In order to present a review of the literature, we propose a classification based on the object of the ethnographic study versus the tools that are used in order to do it. Both entries subcategorized whether they are digital or analogic. For example, ethnography can be analogic in the object (observing someone drinking wine), but digital in its means (video recording the respondent and posting the video online). It could also be digital in its object and tools (analyzing an online community with digital tools such as Skype or private chat).

We propose some articles that reflect this dichotomy and underline the fact that the situation is still complex since some academic work can appear in more than one box. The “analogic / analogic” box representing the classical approach to ethnography, it is not really developed, the literature being too abundant on the subject. Same thing goes for the analogic object analyzed through digital means. Ethnographers have been using digital tools such as videos or photos for numerous years, and the literature is quite important here too.

In fact, the most interesting research for the scope of this article seems to be on that treats the digital object, with analogic or digital tools. In the case of digital tools, the literature quickly grows with researchers analysing a broad range of objects, such as the relationship with medicine (Aubé, Thoër, 2013), the reason why one posts its holidays’ pictures (Cardon, Beuscart, 2009), or why one exposes oneself on Facebook (Granjon, Denouël, 2010).

The digital tools that are used or tested are also extremely diverse, and range from tweeter conversations (Boyd D. Golder S. Lotan G. 2010), to forums (Aubé, Thoër, 2013), Instagram or Flickr (Cardon, Beuscart, 2009), etc.

In most of these articles, the researchers have a dominant usage in terms of digital tools. As will be argued later, the richness seems to come from the triangulation of different tools in order to produce an adequate number of points of views. As an example, the article from Kara & Graham (2010) present a new digital practice that allows to digitally live a visit of Singapore. The digital tools were complemented by a more classic ethnographic survey in order interview the participants of this experience.

## Benefits and limitations: two case studies

### *Presentation of the case study 1*

#### **Case study 1. A quasi ethnography of smell**

What could be more interesting than analyzing a phenomenon that is *a priori* not really digital - such as the known olfactive cultures- as cultural representations in order to explore Internet’s potential to reveal cultural mechanisms. During a three-year research, we tried to decrypt the cognitive mechanisms that presided to shared forms and olfactory competences in culinary and aesthetic domestic preferences. Quickly, we felt the limitations of an interview-based approach due to the specific aspects of olfactory experience: they are fairly episodic, happen on a long time period and imply a very long follow up of informants for, *in fine*, a limiter number of exchanges. Interviews and experiences followed proved to be very rich, but showed that the daily life’s olfactive experience needed to be rationalized in the form of identity storytelling.

In order to deal with all these limitations, we decided to explore the olfactive verbalization made of Internet culinary discussion forums. More than 2700 exchanges have been extracted in a semi-automatic way (through the use of key words search engines programmed to look for smell

vocabulary, Wathelet 2011). Three types of data were gathered in the course of this project.

First, we collected a large range of olfactory behaviors, even in domain of experiences hard to interview such as sexual life or the management of dirt. Many posts talked about the sensual experience of smelling each other while having sex or using wind or sweat in very intimate games. Even if it seems far from the first object of work (culinary experiences), this helped us get a deeper understanding of how people wrote about their olfactive experiences.

Second we were able to collect a large range of tiny pieces of behavior shedding light on social and cognitive mechanisms through some regularity in the way smell was processed. For instance, we did observe the role of the mother as provider of a legitimate smell for their children, like washing hairs and cleaning clothes of children after a first day of school or coming back from their step-mother. They expressed the need for a legitimate range of smell judged as familiar, linked to a common identity and, connected with other findings, highlighted some cultural trends in the way smell are structured in the course of childhood by mothers and other relatives (Wathelet 2012). Knowledge of that kind was hard to gain through open-interview given the “mundanely aspect” of odors and the difficulty to remember those kind of events in the course of a meeting.

Third, we were able to identify some olfactory skills operating in the course of specific actions, such as cooking. In this case, we described a process we called “sensory pathway”. When cooking, some smell became little anchor structuring the action of cooking and allowing the cook to know to which extent he was in a good or bad way. The cognitive process of creating olfactory cues appeared then to be a central operation, and we were able to describe some of its compound. For instance, cooks tend to pay more attention to smells described as bad, not because of their intrinsic stench but because of their irrelevance at the very stage of the process (like a smell of meat when cooking a cake). In some specific case, specific odours are expected. They are supposed to be the sign of specific change into chemical transformation of food. In forums, lots of talks used this kind of sensory cues to explain some skills said to be non-verbal or embodied, like an hazelnut smell is said to be the reason why a good cook stop to heat butter.

### **Learning from the case study 1**

The netnography brought value to the research in a certain number of ways:

- The number of informants was geographically extended to some targets that would have otherwise been complex to manage (in this case, France, Belgium, Swiss, Canada)
- The semi anonymous aspect of the web allowed the informants to describe smells that related to the personal sphere (sexuality, wife or husband smell etc.). This is a major point of the “digital-digital” approach in the sense that these kind of feedbacks would have been extremely difficult to obtain in a “face to face” setting.
- The possibility to compare experiences that were distant in time in order to describe different paths of sensorial constructions. It also allowed to define shared perceptual structures between the informants (and more precisely, the construction modalities of perceptual indexes)

If this first study proves that many elements of netnography are particularly interesting, the Internet field led to some constraints that had to be negotiated:

- The anonymity is obviously a major limitation when trying to describe who is the informant. In the case of the French food network, it appears to be a very common joke to introduce yourself as an elderly (sometimes supposed to be 100 year olds) given the value of “grand-ma” skills in cuisine.
- This approach offers a generic model, created by individual and distinct units: the different paths of informants are described in sequence but correspond to a multitude of informants. Maybe here can we talk a generalized empathy: one puts himself in the shoes of an abstract informant because there is a reconstruction of numerous scenes in order to build this kind of paths. One ends up here in the posture of the persona: imaginary figures cumulating real experiences. However, it is still possible to get closer to a subjective experience, olfactive in this case, which implies the development of a strong empathy.

To summarize, we produced a specific empathy of the smell phenomenon that is different for two major reasons: it grasped the

dimensions that were expressed through digital means (the smell that I remember by discussing it, the one that is present in the discussion, the one that I talk about, ...) and it allowed an experiential re-composition that completes the empathy created *in situ*. Not better that the *in situ* one, this empathy simply contributes by different means to the general ethnographer's understanding of the experiential value of smelling.

### *Case study 2. A quasi ethnography of cooking traditions in China*

#### **Presentation of the case study 2**

The second case study deals with a two yearlong research done at between Groupe SEB, the world leader in small household appliances, and master in business and design. The objective of the research was to produce a realistic presentation of the tensions existing in China about traditional cooking, and to understand the determiners of the tensions between traditional and modern cooking. Based on the insights that were found in the first phase, Groupe SEB's ethnographer and a group of students were sent to China in order to do a one-week design anthropology. The specificity here was that the remainder of the team left in France would interact with them through digital tools. To summarize, the approach was:

- Digital in its tools and object in the first phase, with an analysis of online communities, and through Internet,
- Digital in its tools (dedicated private blog, Skype for communication, digital cameras for filming etc.) and analogic in its object (physical presence in China, design workshops with informants etc.) in the second phase.

In line with Kozinets, the first step was to define a clear question in order to select what Internet pages or communities should be analyzed.

A first immersion in four important Chinese cooking blogs<sup>48</sup> allowed to select five recipes that generated an important number of comments and that seemed to be perceived as being traditional in Chinese cooking: Jaozi, meatballs, beef noodles, sweet & sour pork, shumai.

Based on this, a number of Internet sites have been selected in order to proceed to the immersion.

---

<sup>48</sup> Douguo.com, Haodou.com, Meishichina.com. The immersion lasted two weeks, with the Chinese students of the Master (five of them) serving as interpreters for the rest of the group

*Table 2 List of sources analyzed*

Networks / forums	Recettesd'une chinoise Recetteschinoises Yummyasi Xinshipu Ttmeishi weibo

For the immersion itself, the team chose two types of actions: observation and interaction. The observation part was a fairly classic approach in the sense that the team was only asked to read all the material available and to highlight comments, discussions etc. that were representative of existing tensions. The interaction part was a bit more complex to handle: when it was felt to be possible the team was asked to interact with the people online. As an example, in the case of the swee&sour pork, 14 comments were posted in order to get a better understand of what the tension was about. These comments only got a limited number of answers (4 in total), underlying the difficulties in developing a relationship with people online, and creating a valuable exchange.

This first phase lasted four months and led to a good understanding of what are the elements of modernity that are questioning the traditional way of cooking. More precisely, the health concerns regarding food, the changing lifestyle (and the fact that it is more and more nomadic), the habits of eating outside, and the impact of youth independence on the oral transmission of recipes have been found as being critical. As an example, still in the sweet & sour pork case, an exchange on [www.meischichina.com](http://www.meischichina.com)

underlines the perceived differences between traditional and modern recipes, and the tension around the use of ketchup in many recipes:

*“I love the taste of sweet and sour, but I’ll never accept ketchup!”*

*“You are very good at cooking, and it’s a pretty dish. But it should be calle ketchup pork. Besides, in the 8<sup>th</sup> step, I do not think it’s half bowl’s water, it’s half pot’s water”*

*“As written this recipe was mediocre at best. I think there is room for improvement, the ketchup would definitely be one of the first things to go!” (3 likes)*

*“It should be called the ketchup pork, not the TRADITIONNAL SWEET AND SOUR PORK !!!”*

To summarize, the online approach allowed the team to quickly identify the critical elements of modernity in order to determine what could be valued later in terms of product or services by the clients.

Based on these elements, five concepts were developed that were representative of the insights gathered in the first phase, and brought to China in order to be presented and incremented in a “design ethnography” approach. The concepts were hand drawn objects, with a storytelling explaining its usage and a typical user experience.

Figure 3: pictures of two of the concepts developed for the design anthropology workshop

The objective here of the design anthropology week was to use all techniques (creative workshops, prototyping, iterative work etc.) in order to challenge the digital ethnography’s findings and insights, in interaction with

Chinese consumers. As a consequence, and in line with design ethnography, the informants became part of the project (Kjaesgaard & Otto 2012). Based on the five concepts' drawings, some were quickly disregarded as not very interesting, and the others led to more testing.

*Figure 4: pictures of the design anthropology workshop*

During this phase, digital tools were used in order to create empathy with all the members of the innovation team that was in France during the week. More specifically, there were four persons in the ethnographic team, the industrial company's team in France (mostly engineers), and in China (who also participated in the fieldwork, but on an elective basis, so never the full team), and the student team (conception and creation).

The design workshops held in China allowed the ethnographic team to evaluate the concepts' prototypes with the Chinese informants. All comments, rebuttals or proposals were shared with the French teams and led to revising the insights behind the prototypes, and not the aesthetical or formal choices of the prototypes. This is an important point in the sense that design anthropology can be misused by challenging the formal concepts instead of challenging the insights they are based upon. The pictures below show how the team prototyped some concepts, and "tried them" in a real setting in order to evaluate their real potential.

*Figure 5: pictures of the design anthropology workshop – prototyping and testing in a live situation*

## **Learning from the case study 2**

The first phase, based on a netnography was fairly rich in terms of insights:

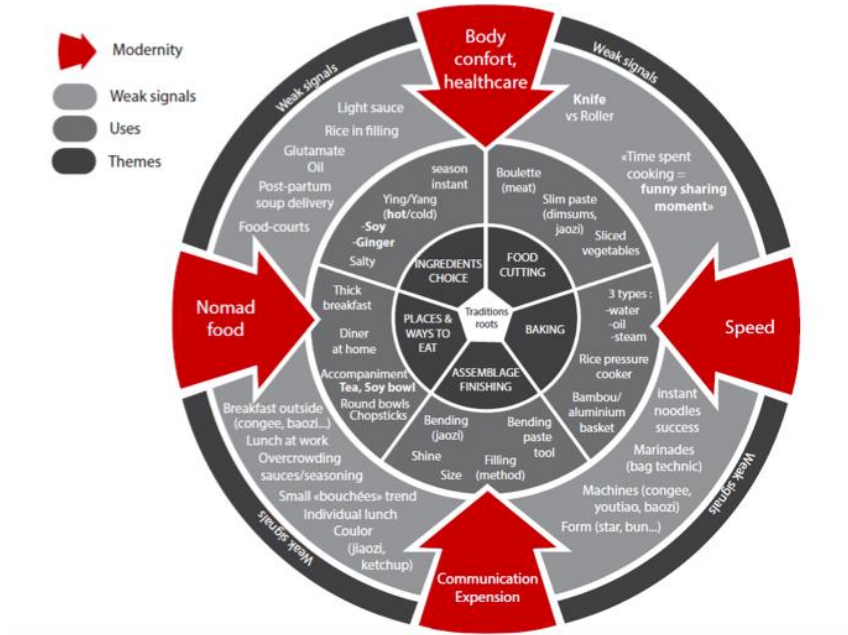

- First of all, it allowed analyzing a distant culture at a lower cost than sending a team directly in China
- Tensions around the subject clearly translated on line and could be understood from the exchanges that happened on line
- Data were accessible by simply reading the pages, without a direct exchange with informants. From this point of view, Internet seems

to be a field where informant's representations are stated without barriers, some people having brutal comments or discussions.

- Interestingly, when the team tried to contact some people online, or to comment, few people answered. This could be linked with the fact that they presented themselves as an ethnographic team and that the time to immerse themselves in the field and be accepted was too short.
- A sort of quantitative filter seems to appear online: a post that receives numerous comments or likes seemed *a priori* to be an interesting one to follow, and it was confirmed during the work.

To summarize, because it was taken from the macro-sociological standpoint, and without precise interviews being held, the netnography did not allow developing an empathy with Chinese informants. The results were much more oriented around the identification of structures, rules or norms. Unfortunately, the experiential or emotional aspects of these rules, structures or norms greatly lacked after the study. This can be clearly seen in the following figure that summarized the netnography, where emotions and experiential aspects are obviously absent. This chart was developed in order to map the findings of the first phase of research, and was used as a summary. If, in itself, it is fairly interesting, it is not a good representation for empathy creating. In fact, out of the five concepts developed based on this chart; three were quickly abandoned when confronted to Chinese people. The authors feel that the main reason was that it is not a very good tool for being empathetic.

Figure 6: a representation of tensions between modernity and tradition in Chinese cooking

The second phase, a design anthropology framework that used blogging and Internet based communication tools also underlined a few critical points:

- It underlined the necessity to do a fieldwork when it comes to leaving the macro-social representations in order to deal with things that are specific to some stakeholders, or that have a situated meaning.
- Some insights found during the netnography have not been perceived as really carrying value once presented on the field.
- The use of the blog has been interesting but difficult. Numerous questions were raised about the kind of material that was expected by everyone (well analyzed one? simple pictures without comments?). This led to some stress in the ethnographic team in the sense that its members wanted to deliver something that was nicely written and presented, hence spending more time on the presentations and postings etc.

The use of the blog was necessary in order to allow the different team to share a vision of the problematic in real time. For the fieldwork, the active collaboration of students allowed to develop new tools, new prototyped concepts through storyboards that were taking into account the insights found. This has only worked because of the “direct” communication that the blog allowed. An interesting point comes from the fact that all the teams’ members underlined that videos and pictures were the best items used. They indeed allowed to share the field’s experience, but also left space for negotiation and creativity.

Also, the publication process of the ethnographic fieldwork becomes a digital ethnography of the ethnographic work in the sense that what is shared and hence has value is the ethnographers’ judgments and the way they publish, day after day, the concepts’ experimentations on the field.

In this case, one can talk of an open empathy, since materials shared in the digital form in almost real time allowed the innovation team to be in the ethnographic team’s boots. It also allowed interpretations and creativity through a critical analysis of concepts during the fieldwork, and through a critical analysis of the ethnographic team’s work according to what he was showing and sharing.

## **Conclusion**

These two case studies highlight a few findings about the potential of digital ethnography. First of all, they underline that no approach is better than the other, but that one needs to triangulate the different tools. Some authors, such as Hime (2005), refer to this as “connective ethnography”. The underlying idea being that the object should be apprehended as a heterogeneous network representing the links between the informants and their connections to real or material objects, or to physical or virtual situations (Jenna Burrell 2009).

The marketing approach to netnography that tries to reduce the time of fieldwork should be dealt with carefully. Indeed, the off and online worlds are connected, but nevertheless have distinct structures. They should be more described as parallel and connected worlds that mirrors. Think for instance about the current big data trends. Neither of these data reflects each aspect of everyday life nor do they capture the whole range of connection defining the behaviors we want to study. It is then feasible to describe how rumor spreads on the social web thanks to automatic analysis of the Internet. But capturing the whole range of judgment leading to the

transformation of shopping behavior needs to proceed thanks to in-depth (or *thick*) analysis of mixed material, based on on-line and off-line materials.

We should proceed with the same caution about numeric platform (blogs, community of customers or dedicated apps), a digital ethnographic approach we are currently studying. Most of them have been developed with the explicit aim of reducing the amount of time needed to gain so called ethnographic insight. By asking informant to document themselves part of their live is also supposed to provide a very wide understanding of specific topic without any interference from the research team<sup>49</sup>. Both assumption remain highly speculative. Our preliminary findings highlight the amount of time needed to create a relevant communication channel with the informants. Having access to intimacy and real life behaviors and emotions implies a lot of energy from the research team as well as the absence of direct communication appear to be a limiting factor to interpretation. Instead of reducing bias like in psychological experimental sciences, the digital medium request lots of engagement from research team to offer in-depth understandings of wishes and uses.

Fortunately, the current approaches tend to push for hybridation of resources, and as a consequences the data analysis processes, rather that replacing the analogic field ethnography by the online field netnography

The fact that these approaches are still not very clear allows for great optimism in terms of academic research. As an example, they pose the question of “just in time sociology”, or the help for decision-making in terms actions that are being done, or finally, the users’ solicitations in innovation processes. Put differently, how could we reintegrate empathy (length in the work, and familiarity), but in ethnographic relations mediatized by the digital tools. We are here in the domain of the construction of a digital empathy that would be adequate according with the subjects at stake: create a sense of understanding of what cannot be captured through face-to-face interview. Maybe an “intimacy empathy” that has been so far privatized?

# The Drive Towards User-Centred Engineering in Automotive Design

Scott BRYANT and Cara WRIGLEY\*

Queensland University of Technology

*Falling sales in Europe and increasing global competition is forcing automotive manufacturers to develop a customer-based approach to differentiate themselves from the similarly technologically-optimised crowd. In spite of this new approach, automotive firms are still firmly entrenched in their reliance upon technology-driven innovation, to design, develop and manufacture their products, placing customer focus on a downstream sales role. However the time-honoured technology-driven approach to vehicle design and manufacture is coming into question, with the increasing importance of accounting for consumer needs pushing automotive engineers to include the user in their designs. The following paper examines the challenges and opportunities for a single global automotive manufacturer that arise in seeking to adopt a user-centred approach to vehicle design amongst technical employees. As part of an embedded case study, engineers from this manufacturer were interviewed in order to gauge the challenges, barriers and opportunities for the adoption of user-centred design tools within the engineering design process. The analysis of these interviews led to the proposal of the need for a new role within automotive manufacturers, the “designer”, to bridge the divide between designers and engineers and allow the engineering process to transition from a technology-driven to a user-centred approach.*

## **Introduction**

In an industry worth more than €500 billion annually, producing more than 80 million vehicles worldwide each year and consisting of over 50 major manufacturers worldwide, the automotive industry represents a lucrative but highly competitive manufacturing industry (ACEA, 2012; Deloitte, 2009a). With sales falling in Europe in 2013 for the sixth consecutive year (Boston & Curtin, 2014), automotive manufacturers are increasingly turning to new strategies to retain their share of sales in a contracting market. Some strategies have focused on the industry approach to manufacturing, namely a technically focused push for a “build-to-order” process rather than the current “build-to-stock” approach in order to reduce overall value-chain costs and to increase efficiency (Parry & Roehrich, 2013, pp. 13). However, others stress a more customer-orientated approach, striving to develop products that meet customer requirements (Oliver Wyman Group, 2007).

The global automotive industry represents the pinnacle of technology-driven innovation, striving to produce marketable, high-tech products in a highly competitive industry. This competition has driven the need for automotive firms to develop a customer-based approach to automotive manufacturing in order to differentiate themselves from their similarly technologically-optimised competitors (Oliver Wyman Group, 2007). With this said, the customer-based approach that is becoming increasingly popular with automotive manufacturers places emphasis on sales and marketing of their products to potential consumers, instead of the development of ongoing relationships with these prospective customers (Deloitte, 2008). However, in spite of this move towards a customer-orientated sales approach, automotive firms are still firmly entrenched in their reliance upon technology-driven innovation to design, develop and manufacture their products (Deloitte, 2009), with a customer focus acting as little more than a way to sell the product to the customer.

In recent times, challenging economic and market conditions have led some automotive manufacturers to question the status quo and seek out new methods for vehicle design and subsequent sale to end-users. More specifically, the time-honoured technology-driven engineering approach to vehicle design and manufacture is coming into question. The rising importance of rapidly changing consumer needs is making it difficult for automotive engineers to focus on the latest and greatest technology integration into their vehicles with little regard for the end-consumer (Accenture, 2010). Understanding that increasing future competitiveness,

and subsequently vehicle sales, is dependent on producing vehicles that are designed and engineered for what the customer (i.e. the user) needs, not just on what is the most technologically advanced, represents the next step forward in the highly competitive global automotive industry. This represents the integration of the user into the total design process, from initial conception through to engineering design and subsequent manufacture.

The aim of this paper is to examine, from an engineering perspective, the challenges and opportunities facing automotive manufacturers seeking to adopt user-centred design as a way to add value to their total vehicle design, development and manufacturing process. Typical user-centred design research explores the implementation of these tools from the perspective of a designer (Cooper, 2004; Bucolo & Matthews, 2010; Dell'Era, Marchesi & Verganti, 2010; Gellatly, Hansen, Highstrom & Weiss, 2010). However, the aim of this research is not to understand how better to enable designers within the automotive industry to effectively implement user-centred design, but rather to assess how to empower engineers with traditional design tools throughout the entire automotive development cycle. This research, conducted as an embedded case study with a global automotive manufacturer in Germany, seeks to test the following hypothesis developed upon reflection of the current state of the industry:

*The acceptance and implementation of design tools such as personas within the context of automotive engineering departments is dependent upon the benefits of the tools perceived by engineering staff in terms of effort vs. reward, in addition to its ability to be adapted to the inertia-bound, heavily regimented and hierarchical structure of large, global firms such as that assessed in the research.*

This paper examines the preliminary stages of the attempt by this global automotive manufacturer to implement the use of a single design-tool (personas). Interviews of key personnel are used to examine (from an engineering standpoint) the challenges faced in the implementation of design tools, such as personas, in the existing automotive development process. Findings from the study provide insight into the issues faced in acceptance of user-centred design tools by technical staff, and propose a number of methods to overcome these impediments.

Whilst this research focuses on an automotive manufacturer in Germany, the challenges and opportunities for user-centred design from an engineering perspective are relevant to other global automotive manufacturers where technology-led innovation and design holds sway.

### *Centring on the user – user-centred design and personas*

The integration of the customer and their needs into the automotive design process represents a new design approach for automotive manufacturing firms. The move from traditional, technology-driven innovation is being facilitated through the use of existing user-orientated approaches. More specifically, it is a combination of the traditional technology push approach, and the complimentary design push approach, focusing on the meaning of the product to the user (Dell’Era, Marchesi & Verganti, 2010). Alternate approaches, such as user-centred design, represent established methods for continually refocusing the design on the end-user, and are starting to be implemented by automotive firms seeking to gain a competitive advantage within the technology-driven industry.

User-centred design can be defined as “...a vision for business growth based around deep customer insights...”, allowing companies to better understand their customers’ values i.e. what customers really need in a product (Bucolo & Matthews, 2011a). More specifically, companies often have a limited understanding of what their customers want, limited to what is immediately observable via interaction with prospective customers which tends towards the solution of short-term needs (Bucolo & Wrigley, 2011). User-centred design provides an opportunity to “develop deeper customer understanding that goes beyond observation”, providing a longer-term understanding of customer needs and requirements in the context of the product design (Bucolo & Wrigley, 2011). The application of user-centred design methodology often uses ‘Personas’ to better understand the users for which the product is being designed.

Personas are typically defined as “fictional, detailed archetypical characters that represent distinct groupings of behaviours, goals and motivations” (Calde, Goodwin & Reimann, 2002) which act as ‘stand-ins’ for real users and help to guide decisions about functionality and design (Calabria, 2004); they are often used when designers are unable to engage directly with end-users, be it due to time, money or other project constraints (Marshall, Cook, Mitchell, Summerskill, Haines, Maguire, Sims, Gyi, & Case, 2013). They are based on knowledge of real users garnered from user-research, and help to identify customer motivations, expectations and goals with regards to the target product segment (e.g. automobile usage). The development of personas as a focus tool used, for example, in vehicular design, personalises target customers in the minds of employees, removing the disconnection in the design process between the customer

and the product developer, allowing for a design to take multiple stakeholder perspectives into consideration in terms of final product design.

Such a user-centred approach to vehicular design has precedence, with a user-experience design team at General Motors seeking to gain a deeper understanding of how their drivers interacted with their in-car infotainment systems, in order to better tailor the design of these systems to the everyday General Motors vehicle user (Gellatly et al., 2010). In spite of the apparent move towards a user-centred approach to automotive project design and development, this project appears similar to many automotive design “success stories”, such as the design of Ford’s successful 2005 Mustang (Tischler, 2004). More specifically, such projects are predominantly design-centric, divorcing themselves from the reality of the multi-disciplinary nature of automotive vehicle development, where designers and engineers are both required to successfully manufacture a vehicle. Whilst this cannot be entirely the case, as such projects go on to develop fully-functional products despite the apparent backgrounding of the developmental engineers, such articles highlight the current absence of the engineer from the design process, at least from the perspective of automotive design.

### *Divorce of interaction – engineers & designs forever apart*

This lack of integration between designers and engineers in development projects is often cited due to the traditionally technology-driven nature of (automotive) engineers who are not accustomed to looking at design from a user-centred perspective (Tütek & Ay, 2011; Bergström, 2007; Persson & Warell, 2003). Such an argument, whilst seemingly logical at first glance, marginalises engineers through such a black and white perspective, turning the design process into an “us versus them” debate between designers and engineers. This marginalisation of such an important facet of the automotive development process appears rather naïve, as although customer-orientated approaches are typically developed within non-technical departments (i.e. by designers), such an approach needs to be adopted by the technical (engineering) staff in order for it to be successfully applied in the physical product. Furthermore, past persona-driven projects, such as that completed by Microsoft (Pruitt & Grudin, 2003) belie the notion that technical staff are divorced from the user-centred design process, with the inclusion of software engineers from the commencement of their persona project (albeit after initial reservations and conflict).

It is proposed that in a similar manner to that of the ‘transitional engineer’ proposed by Wrigley & Bucolo (2012), which builds off of the idea of Norman (2010) for the need for a transitional engineer/developer to bridge the gap between design and business, that there is an inherent need for a transitional engineer to bridge the gap between design and engineering. Whilst the ‘mid level’ opportunity presented by approaching departmental managers and key decision makers with the concept of user-centred design could be addressed by the pre-existing proposition of an intermediary translation team who would “translate the knowledge into practical realisations that the team (business) can then develop and deploy” (Wrigley & Bucolo, 2012), a translation into a business-context is unlikely to work with engineers. This new breed of transitional engineer/developer, a “designer” would function in all three worlds – design, business and engineering – and would facilitate the implementation of user-centred methodologies, such as persona use, within the vehicle design processes of ground level engineers.

## **Case study – engineers, automotive design and personas**

The case study firm, a German automotive manufacturer, is attempting to implement a user-customer centric approach throughout their entire vehicle design, development and manufacturing process. The manufacturer, in spite of its industry leading status at a global level, is mired in a “technology driven” vehicle design process, with the development process led by engineers with little awareness of the users for whom they are designing. The firm’s approach to automotive design is given in Figure 9, and highlights a key barrier to their effective implementation of user-centred design. At first glance appears to have a user-centred focus with the initial design step involving the definition of customer needs and requirements followed by initial customer engagement.

*Figure 9 - Design methodology of automotive case study firm*

However, this approach is dependent on the initial interaction of a multidisciplinary team involving customer-orientated marketing and design employees, and technology-focused engineers, which results in the initial concept definition. Following this stage there is limited interaction between the two groups for the life of the design project. The absence of the user from this technology-driven development process at the firm, and at many others like it, is none more apparent than in their final vehicular products. One fine example is the number of optional extras (vehicle add-ons not included as 'standard') for one vehicle model increased from 14 in 1986 to 92 in 2006, whilst the number of customers purchasing these add-on components remained steady at only 1 in 6 for the same time period (Oliver Wyman Group, 2007). Furthermore, many of the features included as standard in the vehicles were not utilised by users due to their complexity and lack of explanation/intuitiveness (Oliver Wyman Group, 2007).

## **Method - gauging engineers' drive to adopt personas**

The research method undertaken as part of the case study conducted with the automotive manufacturer aimed to assess the challenges, barriers and opportunities for the adoption of a user-centred design approach. This study selected personas as a tool representative of this approach. The selection of personas was a result of their recent development within the firm, along with the use of storytelling and storyboarding, in an attempt to re-centre the vehicle development process around the end-user. These personas attempted to combine measurable customer data, such as driving habits, vehicle usage and driving climate, with less quantitative data such as the psychological needs and social characteristics of potential users. This process was proposed in order to develop a set of target customer representations that could be integrated into the "story" of a vehicle in order to more accurately define the vehicle development requirements.

An action research approach has been applied to understand the how engineers at the company could implement such a user-centred design process. Defined as "the study of how technology is applied in the real world and the practical consequences of technology-enabled action" (Kock, 2013), the action research method moves away from traditional, solely theoretical research, by providing a project solution or service outcome to a specific organisation, in addition to adding to existing academic knowledge on the focus area of the project (Georges & Romme, 2004).

The researcher actively participated in the journey towards the desired organisational change within the participatory automotive manufacturer firm, and the findings outlined in this paper are based upon interviews conducted with engineers at the firm. These interviews took place after the development of initial ‘trial’ personas, and used semi-structured questions to guide the interview. The interviews used the trial personas as examples of the proposed user-centred design methodology, with additional questions specific to the participant’s area of expertise used to better gauge their understanding and opinion of the potential for the implementation of personas within their work and the overall vehicle design process within the firm. Ten 30 to 60 minute interviews were completed, with participants comprising a mix of senior engineers and engineering management.

## **Results – unwillingness to change, or institutional forces at work?**

Interviews with engineers at the case firm suggest that they are quite open to the implementation of design tools such as personas in the automotive development process. However, in spite of individual positivity towards the embodiment of user-centred design thinking in the use of personas in day-to-day development processes, the interviews also revealed significant institutional challenges and barriers that must be addressed if the firm is to transition towards a more user-driven, less technology-led vehicle design process. An analysis of interview transcripts highlighted three key institutional challenges that must be overcome for the successful uptake of the persona design tool by engineers:

- Focus of the engineering design process on “technical requirements”
- Managerial and political decisions in design
- Disconnect between engineers and the customer/user

Breaking down and understanding these institutional barriers is the first step in understanding the subsequent opportunities for the transition to a customer-centric engineering design process at the case firm and many automotive manufacturers like them.

### *Shifting focus from technical requirements*

Emerging as the underlying institutional barrier, ‘technical requirements’ represent the focus of the automotive manufacturer on developing their vehicles to meet a certain list of pre-determined quantitative specifications

(e.g. top speed, acceleration, mileage, torque, horsepower etc.). Whilst such detailed, data driven specifications are vital in completing the necessary calculations for engineering a vehicle, it is argued that the fixation of the engineering design process on technical requirements is inherently institutional. Participant 3, when discussing the development process notes that: *“the department manager is always a part owner of the project, they delegate the work and say: you are now doing this and implement these technical specifications”*. This suggests that the engineers have little say over the choice of a technology-centred design process which stems not from engineers themselves but rather from higher-up and/or elsewhere in the firm. Similarly, Participant 1 elaborates on the design process implemented by the automotive engineers where *“...with the requirements look to the competitor, the competitors, and then you develop your concept, and then you make a list, which concept fits best to your technical requirements...”*, highlighting the dependence of all design decisions on their need to fit the predefined technical requirements.

### *Managing managers and engineering decisions*

The second key institutional challenge was managing managers and engineering decisions, that is the dependence of all development decisions ultimately residing with departmental management. Furthering the need to include, if not focus on, departmental managers in discussions pertaining to the implementation of personas is the understanding of their sheer influence over design process choices and the subsequent tasks undertaken by the engineers under their command. One participant discussing the engineering decision making process reflects: *“we place a lot of time and effort into a design, but only do it the first time, because one of us (from the department) wants it that way. And the person that wants it is not the customer, but the department manager, who says, we have to include these options. And the reason for this, often not even they know, because someone said so”*. Furthermore, this top-down approach to design results in engineers who are often not even engaged in the reasoning behind the work they are completing. Participant 3 elaborates: *“At the moment everything comes from management. They are specifying everything. Of course, someone else (non-manager) maybe thinks a little bit about it, also about the bigger picture, but that is totally voluntary. I would say that everything is already specified in advance for the engineers”*.

### ***Engineers – a lack of user awareness***

This institutionalisation of engineering design as a hierarchically dominated, top-down decision making process has significant flow on effects with the way engineers think about the individuals who will purchase and use the vehicles they are developing. In short, they don't. One participant bemoans the lack of comprehension as for whom the vehicles are being manufactured: *"there is no person behind this, that is tangible, that people can relate to and understand why they want this feature"*. This lack of awareness of the user is prevalent throughout engineering teams, where the engineering *"team leader has no influence over whether the concept is relevant to real customers, because they are only working on small things"* and this stems back to the apparent lack of input the engineers have in the overall design process.

Moreover, it is argued that this institutionalised removal of the engineers from the design decision-making process has in of itself created the issue where the engineers themselves *"don't see, that there is a customer somewhere that wants it"*. This is not to say that the implementation of personas, and through them user-centred design, faces no barriers directly from the engineers. As one engineer put it *"there are many professionals that have been here for ages doing this and they always say: 'I've always done it like this, I can't do it any other way. I always do it like this. Now comes something new, how is this supposed to be better'"*. However, such apparent resistance to change appears to stem directly from the disconnect between the engineers and the users for whom they are designing. It has been suggested that such a barrier could be challenged by highlighting the tangibility of the user-customer: *"If someone now says, I have here a customer profile and I have here my personas and they are like this...then that would be quite interesting, because it is a completely different aspect, the customer is completely different, sort-of. And alone that would help, because developers often forget the customer"*. Such an understanding of the existence and importance of real users by the engineers developing the vehicles, and ensuring this thinking is at the core of engineering design is stressed by Ward, Runcie & Morris (2009) and Bucolo & Matthews (2011) to be of tantamount importance for ensuring automotive manufacturers have the knowledge and flexibility to integrate potentially changing customer requirements, and thus remain competitive in the global automotive market.

## Findings – the value of user-centred automotive design

As succinctly observed by one interview participant, *“I think something, we have to do something like mind-change”, “but to get this opinion or mind change, is the hard part”*. It is such a “mind change” that needs to be targeted if automotive manufacturers such as the case firm are to reap the benefits of user-centred design and develop a sustainable engineering design process (sustainable in the sense of minimising features unwanted by users and maximising the available functionality). Changing such an institutionalised way of thinking such as the technology-driven vehicle development mentality adopted by the case firm presents a sizeable hurdle to be overcome. However, by reflecting upon the dialogue from interview participants different ‘levels of opportunity’ arise that may be targeted to help transition automotive manufacturers to a user-centred view of vehicle design, namely:

High-level: a company-wide “mind change”;

Mid-level: a “mind change” in departmental managers and key decision makers, and;

Low-level: encouraging the shift towards designing for an actual user-customer rather than just for technical requirements.

Whilst a ‘high-level’, company-wide change in institutionalised behaviour presents the greatest challenge, it is believed that by reducing this challenge down to localised opportunities such as those represented at the ‘mid-level’ and ‘low-level’, user-centred design or *“the right car for the right target people”* can be achieved in engineering-dominated firms such as automotive manufacturers.

### *Integrating personas, technical requirements and managerial engineering design*

Interviewing senior engineers gave insight into how to best present the concepts of personas to the managerial decision makers (and the user focus with which they bring), namely highlighting the overall advantages. Specifically, an often-cited institutional issue at all levels was that of time-pressure where *“we simply don’t have the time, we have more projects, we never have a specific time to dedicate to one project”*. The proposed use of personas is seen as *“helpful if you do it, to get a really transparent view of the customer and then you have good decisions, and therefore you save time”*. Similarly, another participant highlighted their usefulness *“especially*

*for new concepts, where we didn't know what we are doing, I think it would be very very helpful to start more controlled, and to have the customer more in focus".* By engaging key decision making managers with the advantages arising from the use of personas, namely that of improved products and reduced time pressure, the opportunity for a 'mid-level' institutional mind change can be seeded.

Furthermore, this engagement can be fostered from within the senior engineers, with one stating that for personas *"in general the acceptance from the 'method experts' is definitely there"*. These senior engineers are the direct link between the departmental managers and the engineering design teams, and their view that *"these personas are naturally a great application to see that the final customer would really want this, and not just the board (managers) but really the final customer, that there are people outside the company on the street that want it"*, suggests that integration of user-centred design via personas is merely a matter of framing the process in terms acceptable to the respective stakeholders, in this case the departmental managers.

### *Connecting engineers and their users*

Similar to the approach suggested for the 'mid level' opportunity presented by targeting departmental managers, instigating a 'low level' institutional shift towards user-centred engineering design is dependent on the correct framing of the proposed persona process. Whilst engineers are cited as data and technology driven, the researchers argue that this is largely a result of the engineering environment where *"there is so much that they need to do, and they often don't know why they are doing it that way"*, *"there is no person behind this (the design), that is tangible, that people can relate to and understand why they want this feature"*. Engineers are indeed technically minded given their role in the production process, but as one participant said when asked about the usefulness of understanding the user in the overall design:

*"if you know the background of the customer, if you know ok he's somebody who's more keen about understanding the technology or if the vehicle is vibrating, or if he just wants some fat car which is just moving at 180 (km/h)...we don't know...then the discussion usually ends there, because we don't know, nobody can answer for what reason did the customer come to the dealership. So I think it is a very good opportunity to use the tool"*.

Given the apparent amiability of the engineers to the added value brought about via user-centred thinking, connecting engineers and their

users seems to be a matter of finding the right medium for the transfer of information. When propositioned with the concept of personas to centre the user needs in the engineering design process, the following general positive response was received from one German engineer: *“that I have a persona supporting me that tells me why I am doing all of this. And this is, for an engineer also tangible, because the data support this”*.

## What next for automotive engineers?

The proposed concept of “designengineering”, whilst seemingly at odds with the traditional manufacturing separation of engineers and designers, as seen at the case firm, could be crucial in ensuring the acceptance of the general engineering staff. It would allow for a shift in the institutional mentality found at many large automotive manufacturers. As one case firm design engineer recounted:

*“I think the most important thing is the acceptance, because people have to come to us, and tell us, and ask us ‘could you please help us, we are developing this part, could you help us so we know what we have to look into’, and people don’t do that”*.

The implementation of “designengineers” tasked with re-connecting engineers with designers and the underlying vehicle design throughout the vehicle development process (as shown in Figure 10) would ensure that the final product is ultimately one that is desirable to the target customers. By framing each stage of development in the context of the Personas developed along with the vehicle’s story in the initial project definition stage, “designengineers” would allow engineers to better understand the needs of those for whom they are developing the vehicle. This process would also provide departmental managers with a clear idea of the accuracy of the vehicle design at different stages of development, and allow them to more easily base their future decisions on the objectives of the vehicle design, namely the Personas and story for which it is has been designed.

Figure 10 - New proposition for vehicle development process at the case firm

## **Summary**

The core premise of this paper is the current trend of global automotive manufacturers looking to shift their vehicle development processes to a more user-centred approach in order to remain competitive. Whilst user-centred development processes are not new to the automotive manufacturing industry, they are typically used only by designers, with a key segment of the development team, engineers, not included in this process. Such a divide between designers and engineers currently results in a disconnect between engineers and the customer, resulting in the engineering of vehicles that contain components that remain untouched by the user. Compounding this problem is the residence of all decision making authority with the departmental managers, which has come to institutionalise the focus of the engineers solely on technical specifications to the detriment of the end-user.

To overcome this disconnect, the concept of a “designer” was proposed. This role would provide a means to connect the engineer with the customer through the framing of the engineering process decisions on the use of storytelling via Personas. By using Personas, “designers” would provide engineers with a tangible concept of whom they were developing their vehicles, and the story behind why they were using the vehicle. This would allow for engineering decisions to reflect the needs of the user rather than technical specifications disconnected from everyday usage. Similarly, such a process would also provide positive benefits to the key decision makers, the departmental managers. Such a role would provide departmental managers with a clear idea of the accuracy of the vehicle design at different stages of development, and allow them to more easily base their future decisions on the objectives of the vehicle design, namely the Personas and their stories, for which it is has been designed.

In spite of the apparent positivity towards the implementation of Personas by the engineers and departmental managers interviewed at the case firm, much work is to be done to help transition automotive manufacturers to a more user-centred process at all stages of the development process. Following on from the insights presented in this paper, future work will involve evaluating how such “designers” could best be implemented within automotive manufacturers, and ultimately the integration of such a role within an automotive manufacturer, as part of an existing role, or as a new position.

## Value Creation: disruption and empowerment to support creativity in-the-wild

Laura Healey MALININ<sup>a\*</sup>, Alison WILLIAMS<sup>b\*</sup> and Katharine ELEIGH<sup>a</sup>

<sup>a</sup> Colorado State University; <sup>b</sup> Heriot Watt University

*Value creation is the process whereby individuals and teams within organisations co-create consumer benefit. The consumer can be external – a client or customer; or internal – other colleagues and departments within the organisation. We explore this process through the Disruption-Empowerment Model of Value Creation, which describes the instrumental relationships between disruption, perception, and empowerment and their impacts on team creative performance. We suggest that value is both individually and socially constructed from creative processes and contexts, and propose that empowering individuals and groups to be creatively disruptive will ultimately improve team creativity and productivity. We differentiate between value creation of (among others) return of investment (ROI), market share and brand recognition, and the personally affective values of creativity rooted in the creative practitioner's or team's own process and sense of meaning.*

**Keywords:** *creativity, disruption, empowerment, value, flow, groupthink*

## Introduction

In the design industries creativity — the ability to come up with novel and useful ideas, procedures, and products — is a critical component of both design thinking processes and workplace organizational climate. The concept of group creativity has become increasingly popular, for example in business practices based on assumptions that “hive minds” are exponentially more creative than people working alone and in design practices where consumers are increasingly becoming co-producers. However, groups are not always more creative than individuals; they are sometimes subject to periods of *groupthink* or *stasis* that lead to decreased creative productivity. This paper’s primary contribution is a new dynamical systems model of creativity that describes the relationships between a) group creative processes, b) external and internal disruptions to those processes, and c) the socio-physical organisational environment with respect to value creation.

The Disruption-Empowerment Model of Creativity & Performance positions disruption, perception, and empowerment as instrumental elements in both individual and group creativity. Our work draws on previous research in multiple areas, including Wallas’ (1926), Evans & Russell’s (1989) and Resnick’s (2007) models of the creative process, Gibson’s (1977) concept of affordances and Weeks & Fayard’s (2007) work on the complementarity of affordances and habitus (Bourdieu, 1977). We also reference Csikszentmihalyi’s (1975; 1990; 1996) work on *flow* and Janis’ (1972/1982) concept of groupthink.

We first provide a brief survey of creativity processes and background creativity research relevant to the paper’s focus of disruption and empowerment in the creation of value. We define key terms, such as disruption, empowerment, and groupthink. We describe our methodology and the background to the two teams from which we derived our model: staff in a multinational engineering company (MEC) charged with trouble-shooting across 80 plants worldwide; and government employees in a Departmental Innovation Support Team (DIST) enabling colleagues to deliver policy and key performance priorities and targets. We next propose a theory of individual and team creativity that describes two alternative cycles, each set off in response to a disruption in accordance with the degree of empowerment given (or perceived to be given) to the team. We derive the model from, and illustrate it with, examples drawn from our case studies. A key strength of our model is that it is based on observations of

working groups applying creativity-in-the-wild in situations that can be, in both case studies, highly contentious within their respective organisations.

## **Background**

Creativity today is understood to entail a confluence of factors, commonly referred to as the *4Ps* (among others Rhodes, 1961; Kozbelt, Beghetto & Runco, 2010): *people, processes, products* and *press* (the socio-cultural and physical environment of creativity). In this paper we focus on the creative process.

### *Creative Process*

The creative process involves both problem finding and problem solving. A significant portion of the creativity literature examines the problem solving process as a series of mental stages involving ordinary cognitive processes. However the way a creative problem is “found” (discovered and/or defined) can significantly impact the creativity of a corresponding solution (Getzels & Csikszentmihalyi, 1975; Mumford, Baughman, Maher, Costanza, & Supinski, 1997). In their meta-analysis of prior creativity research, Jay and Perkins (1997) found that problem finding includes several sub-processes, including an iterative reassessment and reformulation of the problem statement throughout the creative process. Creative problem finding and problem solving are highly influenced by both environmental conditions and people’s abilities to see opportunities or challenges in a situation (Malinin, 2013). It is commonly understood today that creativity is an iterative process (among others: Armbruster, 1989; Csikszentmihalyi, 1996) and that even the problem finding and problem solving phases may be intertwined — such as when unexpected setbacks (e.g. “breakdowns” or “disruptions”) during problem solving may require a redefinition of the problem itself (Malinin, 2013).

### *Group Creativity*

Creativity researchers generally acknowledge that all creativity involves some form of social interaction — it does not happen unaided in the solitary human mind, but rather emerges through people’s interactions in their socio-cultural environments (Amabile, 1996; Csikszentmihalyi, 1996; Sawyer, 2012). Some researchers assert that groups working together on a single creative problem produce more creative outcomes than individuals simultaneously working individually on the same problem, particularly when

the problem is complex (Fischer & Giaccardi, 2007; Sawyer, 2007). There is contrary evidence to suggest, however, that group processes like brainstorming (a group divergent-thinking process described in Osborn's (1953/1979) model) can also lead to decreased creative ideation within a group compared to the same number of people working alone (Diehl & Stroebe, 1987, 1991; Mullen, Johnson, & Salas, 1991; D. W. Taylor, Berry, & Block, 1958). These contradictory findings suggest that group creative processes are complex and subject to environmental influences (Amabile, 1996; Csikszentmihalyi, 1996). See for example Tatsuno's (1990) group creative process model, based on his observations in Japanese manufacturing plants, that describes how core organisational values are central to creativity. Work on the dynamical systems approach (Arrow, McGrath & Berdahl, 2000; Aragon & Williams, 2011) has largely influenced the now generally accepted perspective that creativity is a socially-situated and socially-constructed phenomenon.

## **Related work**

In this paper we aim to further scholarly discussion about workplace creativity by examining the relationship between value creation, disruption, and empowerment in team creativity-in-the-wild. In particular we extend Csikszentmihalyi's (1996) work on creative flow by considering its role in team creative processes both in terms of creative productivity and groupthink. We also build on Amabile's (1996, 2013) work on creative environments by considering the role of physical context in workplace creativity and productivity. In Table 1 we synthesis the related research underpinning the development of our theory of creative performance introduced later in this paper.

Table 1 Summary of Related Research

Concepts & Definitions	Summary of Related Research	Sources
<b>Creativity-in-the-wild</b> Creative processes are dependent upon people's interactions in their socio-physical contexts, and thus creativity occurs iteratively in-the-wild.	Distributed cognition: Individual cognitive abilities are magnified through interactions in their socio-physical environment	Hutchins 1995
	Flow: total immersion in creative problem-solving is sustained by clear feedback from actions	Csikszentmihalyi 1975; 1990; 1996
	Group immersion (flow) in, for example, creative jazz improvisation and theatre improvisation	Sawyer 2007; Schön 1983
	People use features of their physical environment to engender, sustain, and inhibit different creative processes in order to improve productivity	Malinin 2013
<b>Affordances</b> <i>The relationship between the features of a socio-physical environment with respect to a person's goals, intentions, and abilities; providing opportunities for action in pursuit of those goals</i>	Features of the environment present action opportunities: people see them in terms of <i>functional relevance</i> .	Gibson 1977
<b>Perception</b> <i>Group collective perception of the affordances or constraints of a situation impacts group empowerment and creative performance.</i>	Not all affordances are perceived but creative people are skilled at uncovering hidden affordances; perceived affordances may be false or potential (not yet actionable.)	Malinin 2013
	Perception is impacted by organisational climate  Whether or not people feel in flow	Leigh 2011; Williams 2013;

	depends upon how they subjectively perceive the challenges and experiences in their environment	Nakamura & Csikszentmihalyi 2002
<b>Empowerment</b> <i>Level of perceived empowerment – by self, team, or organisation – impacts people’s abilities to perceive affordances in a creative situation.</i>	Empowerment to perceive affordances depends upon intrinsic factors (e.g. personal skills, abilities, motivation, personality/ mindset) and extrinsic factors (e.g. autonomy, constraints, control, resources) in the socio-physical environment. High creativity correlates with high empowerment (especially over physical environment)	Malinin 2013; Williams 2013  McCoy, 2000; Dul & Ceylan 2011
<b>Disruption</b> <i>A misalignment between expectations of how a creative situation ought to be and outcomes of how the situation is perceived. We posit that disruption is a necessary counter-balance to the possibility of groupthink (Janis, 1972/1982)</i>	Part of the creative process as <i>bisociation</i>  “Tension between continuity and discontinuity (and between compliance and transgression)” (p.35)  Appears as play and experimentation in the creative process (including Einstein’s <i>combinatory play</i> , “a whack on the side of the head” and “provocation”  Dissent and diversity play an important role as a stimulus of creative thought, also liberating people from a tendency to conform  Not listed in indices of creativity handbooks	Koestler 1964  Klausen 2013  Resnick 2007; Van Oech, 1983; de Bono, 1972  Nemeth & Nemeth-Brown  Sternberg, 1999; Kaufman & Sternberg, 2006; 2010; Thomas & Chan, 2013

---

<b>Value creation</b>	When intrinsic and extrinsic values align, teams are more productive and can better handle external disruptions to the creative process	Womack, Jones & Roos, 1990; Wheatley & Kellner-Rogers, 1996
<i>We propose that creativity is the co-creation of value and organizations that empower individuals and groups to be creatively disruptive will ultimately improve team value creation through increased creativity and productivity</i>	Lack of diversity can lead to <i>groupthink</i> and resultant decreased value creation	Foy, 1997; Janis, 1972/1982

## Study Methodology

This research emerged from our desire to find a model that could describe the role of disruption in value creation within organisations. The model we present is developed from studies of creative teams (co-located and distributed) across contrasting sectors, and from observations of creative practice ‘in the wild’. The data are drawn from the authors’ academic research, professional practice in organisational creativity, and theoretical work on the role of the physical environment in creative cognition. We make particular reference to two case studies: a multinational engineering company’s (MEC) trouble-shooting team and a government departmental innovation support team (DIST). The case studies reflect different aspects of disruption: the MEC team are working with external disruptions to the performance of the company, while the DIST team’s disruption is internal, that is, a misalignment between team members, aims and work practices.

### *Multinational Engineering Company (MEC)*

Interviews were conducted with the network leader of a distributed group within MEC. The group comprised 150 people in 90 locations across the three global areas of AsiaPacific, the Americas, and EMEA (Europe, Middle East and Africa). The interviews focused on, among other areas, the creative process followed by the distributed trouble-shooting team in identifying and then tackling, potential problems. This case study examines

how, by scanning for disruption, an internally well-aligned team can identify and solve company-wide problems.

### *Departmental Innovation Support Team (DIST)*

This study was conducted over the course of a year in the office of a Departmental Innovation Support Team (DIST) that “supports the delivery of [Government] policy and key performance priorities and targets”. The team comprises sixty-five people, of whom twenty-nine work in an open-plan office. A further thirty-six employees work remotely from their homes, hot-desking in the team office; with consequent tensions between the two groups. This case study examines how an internally misaligned team can identify and tackle those internal misalignments with a corresponding increase in performance.

The data were collected by electronic survey, and the existing data sets were reanalysed to develop the proposed model. We then tested and refined the model within the context of the two case study groups, and with reference to data sets from our wider research projects pertaining to organisational creativity, agency and the physical environment.

## **Theory: The Disruption-Empowerment Model of Creativity**

Work by Arrow, McGrath and Berdahl (2000) on the complex systems nature of small groups, and Aragon & Williams’s (2011) theory of the dynamical systems nature of distributed creative groups (in which they hypothesise that as in physics where the system stores and transfers energy between two or more modes, so creative idea generation “flourishes across a distributed group [as] *creative resonance*” (p. 1879)) have led us to apply similar principles to the role of disruption in the process of value creation.

In our work on creative groups in organisations we have repeatedly observed the effect that the presence or absence of disruption has on the creativity of the groups at different stages of their creative process (Wallas, 1926; Evans & Russell, 1989 among others). We have observed how a lack, or avoidance, of disruption can push a functioning team into groupthink (Janis, 1972/1982) and hence stasis, where “politeness [driven by] fear seems to reinforce rule-following behaviour” (Isaacs, 1999, p. 261).

We hypothesise firstly that disruption or misalignment can be a creative affordance, affording multiple possibilities for value creation. We posit that the disruption can occur internally within the team itself, where there is a

misalignment between the team's context and its processes. The DIST team's misalignment afforded it the opportunity to realign itself (explored below) with a subsequent significant increase in performance. Value was created within the team itself and enhanced for the team's internal and external clients. We also posit that the disruption can occur externally, where a misalignment is observed by the team, or imposed upon it (explored in the MEC case study). Here the affordance is for a realignment of the problem, resulting in a significant increase in value to the organisation.

We further hypothesise that a team's response to disruption is predicated by the extent to which the team is, or perceives itself to be, empowered to act. When the team perceives itself to be empowered – either by its manager or by itself – then the opportunities afforded by the disruption are perceived and can be acted upon. This leads to flow and increased levels of both creativity and performance: what we call a *creative cycle*. When the team does not perceive itself to be empowered, the affordances are either not seen, or are ignored. This can lead to stasis with decreased levels of creativity and performance: what we call a *degenerative cycle*. An extension of the degenerative cycle is found when a functioning team, instead of continually seeking and welcoming new challenges and disruptions, slips into groupthink (Janis 1972/1982) where performance remains good, but creativity levels decrease. These cycles are illustrated in Figure 1.

Finally we hypothesise that each cycle is driven by affect; that is, by the team's emotional response to the disruption. We draw on the work of De Dreu, Baas & Nijstad (2008) and Rank & Frese (2008) examining the impact of mood and affect on creativity; and on Russ's (1993) definition of affect as "a feeling or emotion as distinct from cognition". We suggest that when the disruption occurs in an environment of trust (Wheatley & Kellner-Rogers, 1996) then people move through empowerment towards flow.

This environment of trust is demonstrated in MEC when a disruption or misalignment occurred between common company practice and the trouble-shooting team's perspective of "We were getting uncomfortable with a particular aspect of the technology". Engineers on the ground were empowered to actually discuss the issue: "[T]hey would say: yes, we know, we've been trying to change this for years" (MEC team leader).

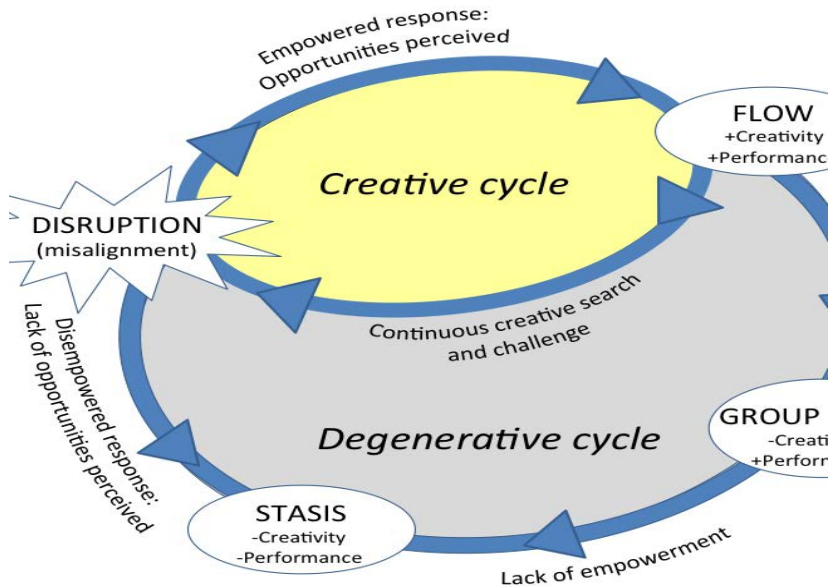

Figure 1: The Disruption-Empowerment Model of Creativity & Performance

The high level of trust and empowerment within the troubleshooting team is reflected in the leader's observations:

*People are really focused on common interest. It's remarkable. I was thinking about it on one of the calls I had this week. I'd never met him before, I didn't even know what part of the company he works in, but [...] we were emailing some thoughts back and forth and we just talked as if we had known each other for 20 years.*

The team leader talks about the strong alignment between creative context and creative process inside the trouble-shooting team:

*And it always happens when somebody inside the company rings up to discuss something, there's never any kind of tension of difficulty about getting going. I suppose it's because you've got this very*

*strong shared attitude – that is what enfolds it all. [...] It's more like a sense of family.*

In this example, the core trouble-shooting team exercised its remit to support the people on the ground with “stuff that’s coming from the sites saying ‘can you help us with it?’ [...] so we might go and help them, or we might say “I know someone who is better in one of these sites, you go and help them””. The trouble-shooting team also takes “a central view”. In the core case study example, “the team of us, the network, management team; we said: We think there’s a particular safety concern inside our technology. We want every plant to address that.”

The internal alignment of the team’s creative context and creative process enables its members to tackle large – and sometimes contentious – company issues:

*We produce the work and tell the sites: You have to do this. [...] We had a very strong pushback from the senior management saying: Why on earth would that be – our systems are already designed to cover all that stuff. [...] And there was a very big argument, and in the end they gradually conceded that we could do it. And this year the team of us who did that won an award and it is reckoned to be the way that it should be done. The optimum way of doing it – a perfect case study.*

In the model’s second, or *degenerative cycle*, we suggest that a disempowered team responds to disruption by seeking and maintaining stasis, unable or unwilling to perceive the affordances and possibilities inherent in the disruption. We draw on the DIST case study as an example of an internal misalignment between the team’s creative process and its creative context. We then present what happened when the cycle’s misalignment was realigned.

The research took the form of two electronic surveys conducted either side of an intervention by the researcher, and workplace changes made by a small Workplace Improvement Project team. The surveys measured the extent to which staff felt that the physical office environment in their office, and in their remote working bases, actively supported agreed performance measures for individual, teams and the department.

The first survey highlighted a tension between the home-based and the office-based workers: when the home-based people came into the main

office their aim was to liaise and network with colleagues, but they found that “the actual office space doesn’t feel like an area where you are supposed to be ‘networking’ in. Although it is its most helpful function [...] you are given the sense that you’re breaking the rules”. Their office-based colleagues, on the other hand felt that “people do not respect other people’s space as they just chat to you even though you are busy doing something”. The Workplace Improvement Project team was then empowered to identify and implement small changes in the physical creative context. These included ways of ensuring that new and existing staff could readily identify their colleagues (revised induction, nameplates on desks, seating plans and “who’s who” photo board), team pods for closer communication, and increased comfort in the office environment through clearing and cleaning, and a tea and coffee-making cupboard organised for all the team.

A second survey, identical to the first one, was carried out nine months later to avoid the Hawthorn effect (in which people being studied improve or modify the aspect of their behavior being observed simply in response to the fact that they are being studied, not in response to the changes that are being studied). In each of the three areas of measurement (individual working, team working and departmental working) the second survey returns showed that staff perceived that their working environment, after the intervention and changes made, had an increased beneficial impact in supporting performance. The percentage of low scores (gives *very little* or *little* support) decreased, and the percentage of high scores (supports *well* or *substantially*) increased. This was particularly noticeable in “Produce high quality work with an 18.6% increase, and “Think innovatively” with a 5.1% increase. In each area of measurement the remote workers, who served as a control group, had unchanged or slightly lower results.

## **Discussion: Value Creation Through Disruption and Empowerment**

As illustrated in the previous section, we propose that disruption is an important element in creativity, and describe it in terms of perceived misalignment. A disruption may be experienced as unease, and on occasion as cognitive dissonance (Festinger, 1957) — or it may be perceived as an unexpected happy surprise. (Isaac Asimov is quoted as saying “the most exciting phrase to hear in science, the one that heralds new discoveries, is not, “Eureka!” (“I found it!”) but rather, “Hmm... that’s funny...”).

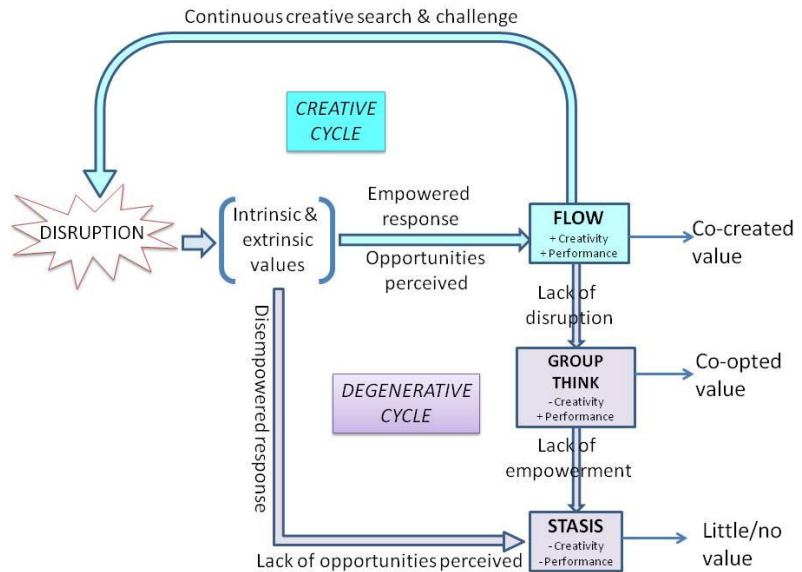

Figure 2: Value Creation Through Disruption and Empowerment

Our findings show that disruption creates a choice point that is instrumental to creativity, but one which may be either unperceived or suppressed. As illustrated in **Figure 2**, how a group responds to disruption significantly impacts the value it may potentially create. A group in flow is empowered to respond creatively, by exploiting disruptions to co-construct value. On the other hand, when the disruption occurs in an environment of disempowerment, people are more likely to move into stasis, resulting in little or no value creation. Finally, a well-functioning and empowered team that avoids disruption risks groupthink (Janis 1972/1982) where value created may be co-opted by one or two members of the group, resulting in decreased creativity.

## Conclusion

We suggest disruption and empowerment are instrumental to value co-creation by organizational teams in flow, (Csikszentmihalyi, 1975; 1990; 1996) the state of high creativity that occurs when individual and group

expectations align with perceptions about the creative context. We posit that disruptions are instrumental to creativity, something Csikszentmihalyi does not consider with his flow theory. Disruptions cause a breakdown in a particular way of thinking about a creative problem when people perceive a mis-alignment. To address the disruption (and return to flow) requires a change in thinking about the creative process (for internal disruptions) or the creative problem (for external disruptions) and ultimately can yield higher levels of creativity and productivity — thus counteracting problems with groupthink. Organizational teams are becoming more diverse as design thinking is employed to address increasingly complex problems while also responding to users who are more educated and discriminating than ever before. We posit that it is all the more important that organisations encourage a climate that embraces creative disruptions and empowerment to improve internal and external value co-creation among employees and other stakeholders.

## Designing an Individualised Eco Information System: a conceptual framework

Sze Yin KWOK<sup>a\*</sup>, David HARRISON<sup>a</sup> and Shengfeng QIN<sup>b</sup>

<sup>a</sup> Brunel University; <sup>b</sup> Northumbria University

*What is the potential of consumer behaviour change if appropriate eco information is provided at the point of purchase? What are the opportunities brought by the latest technologies to information design? What is the role of designer in this context? This paper investigates these questions through a review of literature surrounding the areas of eco information provision, eco-labelling and consumer behaviour, contextual technology and information, User Centred Design (UCD) in business context and in eco-labelling. Building on the findings from literature, this paper proposes a conceptual framework for designers in designing an individualised eco information system. The components and technologies required for such a system are described. The application of the framework is demonstrated with two example scenarios. The conceptual framework was evaluated with a focus group study, which confirms the usefulness of the proposed framework. Implications can be drawn from this paper for designing other information systems for behaviour change.*

## **Introduction**

The sustainability imperative is changing the landscape of business. Competitive advantages are presented to companies that build sustainability into the rhythm of their business (Markley & Davis, 2007; White, 2009), for example, by green marketing and environmental product labelling (Ottman, 2011; Peattie, 2001; Young, Hwang, McDonald, & Oates, 2010). Despite a good deal of survey evidence showing consumer awareness and acceptance regarding eco labelled products has grown substantially, evidence also suggests that consumers have difficulties in perceiving, understanding and trusting the eco information provided at the point of sale (Basu, Chau, & Grote, 2003; Bjørner, Hansen, & Russell, 2004; Cohen & Vandenberg, 2012; Leire & Thidell, 2005; Loureiro & Lotade, 2005; O'Brien & Teisl, 2004; Shams, 1995; Thøgersen, 2002; van Amstel, Driessen, & Glasbergen, 2008).

Consumer information search behaviour is changing in the digital age (Klein & Ford, 2003; Peterson & Merino, 2003). Consumers are having increasing expectations for products which adapt to specific user needs and usage situations. Precise and comprehensible product information has become very important for shopping experience (Alisibai, Chung, & Frankel, 2012).

An individualised eco information system will therefore benefit consumers by providing convenient access to relevant product information, and benefit the businesses by increasing efficiency in reaching target customers.

Considering the importance of understanding user needs and engaging users, this paper aims to propose a conceptual framework which guides future designs of a novel contextual individualised eco information system using a User Centred Design (UCD) approach.

## **Methodology**

Three literature reviews were carried out focusing on:

- The state-of-the-art development of environmental information provision relating to consumer behaviour;
- Theoretical and technological development of contextual information
- The role of User Centred Design (UCD) in business and in eco labelling.

Building on the findings from literature, a conceptual framework was proposed to guide future designs of a novel contextual individualised information system. The framework was further explained using two example application scenarios.

To evaluate the value of the proposed conceptual framework, a focus group study was conducted to collect opinions from designers, who are the target users of the conceptual framework. We conducted two semi-structured focus group interviews in May 2014, totally 10 participants attended the study. All participants are design students at postgraduate level and have a good understanding in UCD and information design. All discussions featured a briefing session and several open-ended questions. Knowledge about eco labelling, individualised information system, stages of contextual technology, the conceptual framework and the two user scenarios were explained to all participants before the discussions began. Data was then analysed using thematic analysis. Focus group is considered to be a flexible tool to uncover opinions, to contextualise perceptions and to test the reality of assumptions. It is particularly useful for exploratory purposes or preliminary analysis. This qualitative method can be used to extend and deepen understanding, but not to validate nor quantify design characteristics (Adams & Cox, 2008; Stewart, Shamdasani, & Rook, 2007; Wilson, Lilley, & Bhamra, 2013).

## **Provision of eco information to consumer**

### *Current Practices in eco information provision*

Alongside other traditional means of environmental regulation, such as permits, mandatory standards, taxes and subsidies, and voluntary agreements, provision of information on the environmental effects of consumption is often put forward as an appealing tool to increase consumer attention toward environmental risks associated with consumption (Bjørner et al., 2004; Cohen & Vandenberg, 2012; Tanneurs & Vezzoli, 2008; Thøgersen, 2002).

Bhamra et al. (2011) identify seven design intervention strategies, amongst which eco information and eco feedback are believed to be two of the most effective strategies in reducing environmental impact associated with individual behaviour (Froehlich, Everitt, & Fogarty, 2009). Kwok et al. (2013) survey existing eco information and eco feedback tools, and identify four major tools that promote sustainable behaviour, namely energy monitor, web-based eco-calculator, mobile app eco-calculator and eco label.

It is found that eco labelling addresses consumer behaviour at the point of purchase most directly.

### *Eco labelling and consumer behaviour*

Eco labelling is defined as a practice providing information to consumers about a product with improved environmental performance and efficiency. An 'eco label' is a label which 'identifies overall, proven environmental preference of a product or service within a specific product/service category based on life cycle considerations' (Global Ecolabelling Network, 2004, 2013). This is an information tool which is 'arguably one of the most prominent measures to facilitate sustainable consumption and production' (Dendler, 2014). The hope is that consumers will then be able to distinguish these products from others, and consumers' choices will give producers of relatively environmental-friendly products a competitive advantage, while discouraging less environmental-friendly products gives companies an incentive to develop more environmentally benign products, in order to promote a market-driven continuous environmental improvement (Basu et al., 2003; Boström & Klintman, 2011; Global Ecolabelling Network, 2013; Thøgersen, 2002).

Since the launch of the first environmental eco labelling programme, the German Blue Angel, in 1978, eco labelling programmes have proliferated. Nowadays there is a large number of eco labelling programmes at national, European and international levels (Basu et al., 2003; Bratt, Hallstedt, Robèrt, Broman, & Oldmark, 2011; Thøgersen, 2000). Over 400 different eco labels or certification schemes exist in 207 countries (Cohen & Vandenberg, 2012; Ottman, 2011, p. 165).

Numerous issues of eco labeling are recognised. From a psychological perspective, the two major problems identified are the ability of the consumer in perceiving and understanding eco labels (Leire & Thidell, 2005; Lynch, 1994; Thøgersen, 2000, 2002; van Amstel et al., 2008), and the lack of trust in them (Boström & Klintman, 2011; Koos, 2011; Nilsson, Tunçer, & Thidell, 2004). These problems are related to other psychological factors such as attitude, motivation, social norm and habit (Biel, Dahlstrand, & Grankvist, 2005; Cohen & Vandenberg, 2012; Leire & Thidell, 2005; Thøgersen, 2002). On the practical side, the two major problems that consumers face are information asymmetry and information overload (Jacoby, 1984a; Koos, 2011; Russell, Krarup, & Clark, 2005). Information asymmetry refers to the case when consumers are handicapped by their deficient knowledge of the quality and pricing of goods in comparison to

producers. Eco labelling is known to be a tool to overcome information asymmetry (Koos, 2011; Russell & Krarup, 2005). Information overload occurs when there is too much information to the extent that the information becomes dysfunctional. In such case, the amounts of information available make it more difficult or more time consuming to reach a decision, or make it less likely that the consumer will attend to some critical information (Jacoby, 1984b).

In summary, there is a generally optimistic view of the future of eco labelling, despite existing schemes' poor performance in diminishing the information gap between company and consumer. Under the right conditions, eco labelling can potentially lead to a substantial reduction in pollution and resource use. It is appropriate to develop eco labelling as part of a portfolio of measures (Baddeley, Cheng, & Wolfe, 2011; Bjørner et al., 2004; Tan, Tan, & Khoo, 2012; Thøgersen, 2002; Vandenbergh, Dietz, & Stern, 2011).

## Technology factors

### *Contextual technology*

Contextual technology is a collective term for various technologies enabling the 'age of context', as illustrated in the book of Scoble and Israel (2014). The book examines the five forces of contextual technology (i.e. mobile, social media, big data, sensors and location-based technologies) and describes how this technology can unlock new ways for companies to connect with customers.

We have divided the processes of context technology into four stages, and related them with some particular relevant enabling technologies, the list is not exhaustive (see Table 1).

While the term 'contextual technology' may be new, the application of contextual technology resembles persuasive technology, and its technology infrastructure is comparable to ubiquitous computing and context-aware system.

*Table 1 Stages in contextual technology in relation to enabling technologies*

Contextual technology	Enabling technologies
Capturing contextual data	Mobile sensing & the Internet of Things Wearable camera & lifelogging Location based technology (e.g. GPS) Data mining
Storing contextual information	Cloud computing Ubiquitous computing Database
Presenting contextual information	Information retrieval & visualisation Mobile device Augmented reality Social media
Sending contextual information	Wireless data transmission

### *Contextual information*

Context is a concept that has been discussed in the field of Information Retrieval and Information Systems for several decades. Numerous models of context and context-aware framework have been proposed (Achilleos, Yang, & Georgalas, 2010; Baldauf, Dustdar, & Rosenberg, 2007; Cheverst, Mitchell, & Davies, 1999; Floch, Hallsteinsen, Lie, & Myrhaug, 2001; Göker, Watt, & Myrhaug, 2004; Henricksen & Indulska, 2006; Ruthven, 2011). These models or frameworks are mainly developed for different technological domains to support the software engineering process.

One useful example is the context model developed by Kofod-Petersen and Aamodt (2003), that illustrates the range of contextual factors around users and mobile devices.

Contextual information has the potential to design very different types of systems. To support better interaction design, Ruthven (2011) has further delineated the concept of contextual information by proposing the five axes along which contextual information may differ:

- Objective (e.g. GPS signals) or subjective (e.g. mood, experience)
- Individual (e.g. individual searcher) or group based (e.g. family);
- Meaningful context (directly affects how a task is performed or how the task results are interpreted) or incidental context (does not significantly affect how a task is carried out or evaluated);

- Extrinsic (e.g. popularity of documents) or Intrinsic (e.g. document type);
- Visible or invisible.

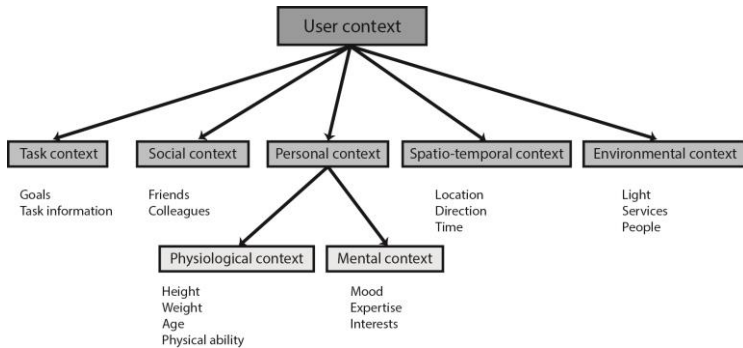

Figure 2 Ambisense model of context (Kofod-Petersen & Aamodt, 2003; Ruthven, 2011)

While the human computer interaction (HCI) community is aware about the availability of a large amount of consumption-related data (Froehlich et al., 2009), there seems to be surprisingly little emphasis on human factors research for behaviour change (Lockton, Nicholson, Cain, & Harrison, 2014; Zimmerman, Forlizzi, & Evenson, 2007). It is time to start thinking about interesting and engaging applications, interfaces, and information designs to make use of this data (Froehlich et al., 2009), but the existing models and frameworks are not pertinent enough to support user experience (UX) designers.

## Design factors

### *User Centred Design (UCD) in business context*

Ergonomic considerations are becoming increasingly important for many businesses. Emphasis are shifted away from pure technological development towards understanding consumer perception and experience (Giacomin, 2012; Hill, 2010; Shaw, Dibeehi, & Walden, 2010).

User Centred Design (UCD), sometimes known as Human Centred Design, focuses on designing products, systems and services that are

physically, perceptually, cognitively and emotionally intuitive and engaging. It can be used as an innovation model and delivers market-pull business strategy which enhances:

- 'Interaction with the customers';
- 'Communication between the customers';
- 'Communication within the business';
- 'Communication of the vision';
- 'Identification and integration of the ethical challenges'
- 'A change of business strategy' (Giacomin, 2012)

The benefits of a user centred design approach to the success of an interactive information system are now widely recognised. The benefits include "increased productivity, reduced user errors, reduced training and human support, improved user acceptance and enhanced company's reputation" (Garrett, 2011; Knoche, Rao, & Huang, 2011; Kontogiannis & Embrey, 1997; Maguire, 2001). The International Organisation for Standardisation (ISO) has published the standard document 'ISO 9241-210:2010 Ergonomics of human-system interaction' to guide human-centred design for interactive systems (British Standards Institution, 2010).

The vast amounts of data in our daily lives can be seen as an enabler of possibilities for the Personal Data Economy. Margolis's (2013) perspective on personal data - one that focuses less on what is technically possible and tantalisingly profitable but concentrates on what people need - is in parallel with the views of UCD approach in the design discipline and HCI community.

### *Opportunities in eco label design*

Regarding the consumer needs for better-designed eco information on product labels, we have identified a number of design opportunities from literature.

In the early stage of the label design process, an important question to be asked is "what is the level of information detail?" There exists a dilemma in deciding the amount of information to be displayed on the label, on one hand research has found that more detailed environmental labels are more credible, on the other hand research indicates the label design should be simple (Hartikainen, Roininen, Katajajuuri, & Pulkkinen, 2013; O'Brien & Teisl, 2004; Vandenbergh et al., 2011). A plausible solution is to offer flexibility in information accessibility by changing its presentation style (Kimura et al., 2010), for example, to encourage active-search condition which utilises the value of detailed information.

To encourage changes in actual behaviour, it is critical to provide actionable information to consumers, beyond conveying static information about the product life cycle (Cohen & Vandenberg, 2012). Examples include providing information that is specific, task-related and based on actual consumer usage, features that allow comparisons among products. Educational function is worth considerations too (Bell, Greene, Fisher, & Baum, 1996; Hartikainen et al., 2013; Thøgersen, 2002).

Credibility and confidence in green claims can be promoted if the source of information is guided by national/ international standards and monitored by third party organisations (Thøgersen, 2002). Using open-source databases may also support the widespread availability of accurate information (Vandenberg et al., 2011).

Before starting a labelling scheme, a selection of the most promising initial products should be identified. Despite the intractable methodological challenges of life-cycle assessment (LCA) (Gaussin et al., 2013; Morris, 1997), it is believed that 'the value of the labels does not come from providing perfect information, but better information than the consumer has at present' (Vandenberg et al., 2011). The design of a labelling system can benefit from using new technologies (Vandenberg et al., 2011). We believe in the future, eco-labelling will no longer be limited to static text/images printed onto packaging, instead it may be possible to have interactive features.

Empirical testing can improve the chances for success before committing to the development stage, as well as provide evidence to further develop the scientific basis for eco labelling design (Cohen & Vandenberg, 2012; Vandenberg et al., 2011).

## **Towards information individualisation: a conceptual framework**

### *Conceptual framework*

Considering insights from the Design for Sustainable Behaviour (DfSB) and HCI research, we believe contextual technology can enable a powerful solution for supporting individual behaviour (Kwok et al., 2013). The conceptual framework proposed in this paper aims to provide a systematic methodology that facilitates the design process of an information individualisation system.

In this system, both product and user act as data carriers (Figure 2). Since contextual technology permits the ubiquitous capture, storage and retrieval of a large amount of contextual data, not only a person can keep a personal profile, history, status, preference and social life ('personal data'), a product can also have a traceable record and a 'life' ('product data') that can be comprehended.

Using enabling technologies, such as mobile computing, the Internet-of-Things and augmented reality, with appropriate information software, persuasive interaction between product and user can be realised. The product data library can be seen as a matrix containing tremendous amounts of product related information. The personal data can be seen as a vector, which extracts a row of values from the matrix after multiplication. The extracted values equal to information individualised to the user's interests. As such, a product can be intelligent enough to approach and appeal to a user in need, and provide tailored assistance.

On a 'product-user interaction' level, the availability of the 'personal data' can enable calculations based on actual user behaviour, so the user can get information that is more accurate and more actionable. On a network level, the 'Internet-of-Things-and-People' can empower a wide range of opportunities for collective decision-making and collective planned action.

The conceptual framework presented in Figure 2 describes the five components required for the proposed system. Using eco labelling as an example application, Table 2 describes suggestions for the information architecture for personal data and product data, as well as gives a list of technology choices to be employed. Different technologies are suitable for different applications; the actual system design thereby varies.

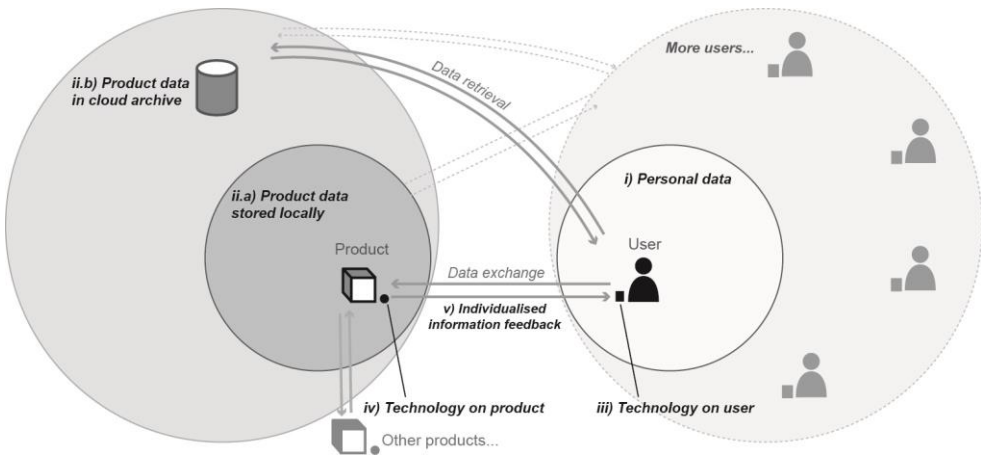

*Dimension 1) Product – user interaction  
Support individual behaviour/ decision making*

*Dimension 2) Internet of Things/ People  
Support collective behaviour/ decision making*

*Figure 2 System concept (above) Product and user interaction. (below) Multiplying the dimension of interaction constructs an Internet of Things and People.*

*Figure 3 Components of individualised information system*

Table 2 Description of components for an individualised eco labelling system

Components	Information/ technology
1) Personal data	<p><b>User profile:</b> age, gender, size...</p> <p><b>History and habit:</b> shopping record, frequency of laundry, frequency of grocery shopping...</p> <p><b>Status:</b> location, time, weather, task to do, budget...</p> <p><b>Preference and need:</b> motivation for environmental behaviour, information presentation preference, personal goal...</p> <p><b>Social:</b> social circle (family, friends...), activities record with social circle...</p>
2) Product data	<p>Can be stored a) locally and b) in cloud archive.</p> <p><b>Archive:</b> database storing all information about products</p> <p><b>Product type:</b> storing information for each product type (e.g. Brand A Fresh Milk 2 Pint)</p> <p><b>Product life:</b> storing record of each individual batch/ piece of product (e.g. a specific bottle of milk produced on a specific date from a specific producer)</p> <p>Information can be categorised in terms of content and format/medium.</p> <p>Content can be divided into four groups:</p> <ul style="list-style-type: none"> <li>i) Life cycle assessment (LCA) (e.g. material, manufacturing, transport, usage, disposal) and corresponding footprint (e.g. carbon footprint, energy efficiency, embedded energy, water footprint)</li> <li>ii) Certificates (e.g. fairtrade, organic, cruelty free)</li> <li>iii) Instructions (e.g. recyclability, care instruction, suggested usage)</li> <li>iv) Other purchasing considerations (e.g. price, colour, size, quantity, material, place of production, material sources)</li> <li>v) Traceable record of actual product (e.g. location of specific product, history of usage, interaction history with other product or user)</li> </ul> <p>Format/ medium can be number, text, chart, infographic, photo, video... or a combination of the above.</p>
3) Technology on user	<p>Choices include ubiquitous computing, GPS, sensors (e.g. camera, accelerometer, proximity, touch, light...etc.), display (e.g. screen, head mounted display, projector), wireless signal transmission (e.g. Bluetooth, Wifi, infrared).</p>
4) Technology on product	<p>Choices include GPS, tags (e.g. QR code, RfID, NFC), digital memory, wireless signal transmission (e.g. Bluetooth, Wifi, infrared), tag sensor and tag writer (e.g. RfID writer).</p>
5) Individualised	<p>Tailored label based on user's preferred content and format.</p>

### Application scenarios

Two application scenarios are described below to illustrate how an individualised eco labelling system works in relation to the proposed conceptual framework. The scenarios were chosen because Scenario 1 shows an example where two users see different individualised labels when looking at the same shirt, and Scenario 2 illustrates an Internet-of-Things example.

#### Scenario 1: Clothing purchasing

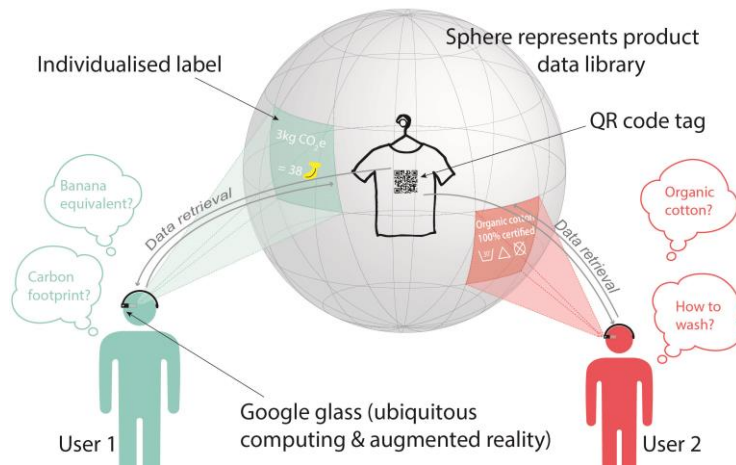

Figure 4 Individualised eco labelling in a clothing purchasing scenario Table 3 Components of an eco-labelling system for the clothing shopping scenario

Components	Information/ technology
1) Personal data	Personal preference of information content and formats. For example, user1 wants to learn about the carbon footprint value of the t-shirt, and wants to see the information displayed in the format of infographic in relation to bananas, a unit which he is familiar with; user2 cares about the material used (whether it is made of organic cotton) and how to wash the t-shirt.
2) Product data	All information about this type of t-shirt (product type) and this specific piece of t-shirt (product life) is stored remotely on a cloud archive, which the QR code links to.
3) Technology on user	Google Glass (ubiquitous computing + augmented reality)

	display), internet connection
4) Technology on product	QR code printed on a tag
5) Individualised information feedback	Two users see different labels according to their needs and preference. User 1 sees the carbon footprint of producing a t-shirt, and the representation of that in terms of 'number of banana' (infographic format). User 2 sees an organic cotton label (certificate information) and clothing care tips (instruction information).

### Scenario 2: Bottled milk shopping

Figure 5 Individualised eco labelling in an Internet-of-Things

Table 4 Components of an eco labelling system for the milk shopping scenario

Components	Information/ technology
1) Personal data	User location, user preference on information content & format. For example, the user's daughter who would drink the milk suffers from allergies, and he needs to check if there is any allergenic substance in her food (social context); this user is concerned about carbon footprint (LCA information) and prefers to read numerical figure (information format).
2) Product data	Milk A & B: general product information (e.g. ingredients, volume), life cycle information (e.g. producers location, transportation history, storage record).

	Fridge: energy efficiency, storage record (what and when is the product stored in the fridge).
3) Technology on user	Tablet computer (mobile computing) with RfID reader embedded, internet and augmented reality function
4) Technology on product	Milk bottles: RfID tags Fridge: timer, RfID sensor and writer These three products form an Internet-of-Things.
5) Individualised information feedback	Although the two bottles of milk look identical, their product data can be different. For example, they may have different carbon footprint values because they are transported differently, and cooled in the fridge for different length of period. The two individualised labels then show different carbon footprint labels based on the user and product location (LCA and location information), and show whether the ingredients are allergy-provoking for the consumer's daughter (social information).

## Framework evaluation: focus group study

Two semi-structured focus group interviews were conducted with a total of 10 design students at postgraduate level. The goal was to collect insights for evaluating and refining the framework.

### *Outcome 1: Designer's opinion on the conceptual framework*

The participants were asked to comment on how useful they think the proposed conceptual framework is in inspiring future designs of individualised eco information system. The feedback was highly positive.

*PA2 The framework is easy to understand.*

*PA1 [The framework] is useful.*

*PB5 The framework is good.*

*PB7 It makes sense as a framework. Certainly there are elements designer can use in designing the system.*

When asked about the potential applications to be designed based on the proposed framework, the participants quickly came up with a variety of ideas. In addition to eco information display, some suggest the designs of information system for health and medical care, such as supporting exercise, diet control and medication. The participants also thought the conceptual

framework can be used in designing smart home solutions, product marking system and educational device. The participants generally believed that the individualised information system is economically viable and it opens up many possibilities for information and product design.

*PB5 I think it is possible economically and [sensors] prices are dropping and dropping.*

*PB7 I think the biggest challenge and also biggest asset of this system is to individualise information feedback and the data exchange. You know that data is so valuable that Google uses that to basically be a multi-billion pound company.*

*PB7 There are possibilities for [information and product] designers... This is like an automatic feedback system that designers can interpret. If it is done properly then it could be a quite powerful tool for designers, or even engineers for that matter, who actually do new product development.*

It was observed that the system concept diagram (Figure 2) was useful in clarifying application ideas that involve the Internet-of-Things-and-People. The participants circled the involved data carriers and their relationships on the printed copies of the diagram when they explained their system concepts.

### *Outcome 2: Role of User Centred Design (UCD) in designing individualised eco information system*

Although it is generally agreed that UCD is important in design and evaluation of information system, its role in designing an individualised eco information system is yet to be fully explored.

In the focus group study, the participants had discussed about the role of UCD in designing an individualised eco information system, and described the potential contributions of UCD in informing, designing and evaluating the system development processes.

All participants strongly acknowledged that UCD methods are useful in informing the design of this kind of system, because designers are good at understanding users and empathising with users' needs.

*PB1 UCD methods such as field study and observation are important for deciding the function of the system, timing to intervene and the information to be displayed.*

*PB2 The stakeholder analysis is used [in marketing and business discipline] to identify groups of end user... [UCD methods] will be useful in understanding the needs of an individual user... This understanding will better benefit the design of the individualised information system.*

*PB7 The strength of designer is about empathising with customers.*

Some pointed out the individualised information system acts like an automatic feedback system which generates a lot of data, and design profession is especially strong at interpreting and visualising data.

*PB4 From the point of view of information architecture, data is already there. But designers are needed to organise and give meanings to them.*

Building this kind of system is complicated; the participants thought the conceptual framework would be useful in supporting communication among various teams, such as designers, engineers, marketing department and behaviour scientists.

*PB1 It is the engineers who are responsible for the technological part and they would not concentrate so much on the user. Designers can put the user needs together and decide what kind of technology to be used.*

*PB6 Designer can be the mediator between teams... such as marketing and psychologist.*

Lastly, all agreed that designers are good at evaluating product/ system, especially before the product/ system is implemented or launched.

## **Discussion and implications**

A common problem with many information systems is that human factors advice and user involvement come very late in the design process, usability and potential benefits of the system are thus reduced (Kontogiannis & Embrey, 1997). Responses from the focus group study indicate the proposed conceptual framework can support designer's involvement in an early stage of the design process of the individualized

information system. The benefits brought by UCD approach are also discussed.

An individualized information system is believed to have a big potential for impact on consumer behaviour, and can be made an effective tool to encourage sustainable consumption. The application scenarios picture how the proposed system concept can change people's perception and understanding towards everyday products, and impact decision-making processes.

In the context of eco labelling, information individualization can potentially benefit the consumers by reducing information overload, reducing information asymmetry and increasing consumer receptiveness. It can also benefit businesses by providing a way to direct highly motivated consumers to navigate niche markets in the long tail.

The conceptual framework also provide design implications for other application areas such as marketing, health care, education and smart home.

We purposefully use the term 'individualisation' to differentiate from 'personalisation', a term commonly used in marketing, design and information system. To the authors' knowledge, there are no clear-cut definitions to set apart these two terms in these contexts. In our opinion, individualised design and personalised design fall in different positions on the spectrum of tailoring. A design can claim to be personalised with minor tailoring to the user's preference, an example is the colourful changeable mobile phone case from the 1990s, while individualised design has a much higher degree of tailoring, an example is a smartphone which possesses tremendous flexibility in its features depending on the apps installed.

*Figure 6 Difference between individualised design and personalised design*

## Conclusion and future works

A review of current literature surrounding the areas of eco information provision, eco labelling and consumer behaviour, challenges related to eco-labelling, contextual technology and information, User Centred Design (UCD) in business context and in eco labelling, highlights a number of knowledge gaps:

- Under the right conditions, eco labelling can have a substantial impact on sustainable consumption;
- There exist numerous consumer issues with eco labelling that can potentially be tackled using UCD approach;
- The emergence of various contextual technologies can enable opportunities for information and label design, change people's relationship with products, and unlock new ways for companies to connect with customers;
- There is a lack of framework to guide designers in designing an individualised eco information system;
- The vast amounts of data generated from our daily lives can be viewed as an enabler of possibilities to the era of disruption. UCD approach is an important key to innovation.

By conceptualising both user and product as data carriers and reducing purchasing environments into components and analytical elements, we are better able to work towards product label design through a UCD approach.

A conceptual framework of a novel individualised eco information system is presented. To the authors' best knowledge, it is the first framework on individualised information system proposed by designer and for designer. We have described the components, data and technologies required, and demonstrated the use of the framework with two application scenarios.

The framework was evaluated with a focus group study. Results indicate that the proposed framework for such a system is useful to guide future design of eco labelling system. Implications can be drawn for designing other information systems for behaviour change.

Space limitations prevented us from discussing other important issues related to pervasive sensors and personal data, for instance, privacy and ethical implications, legal matters, economic and environmental costs of technologies. Besides, this paper has a major limitation that it is mostly theoretical and is supported by little empirical evidence. In the future we

will prototype and test the concepts of the eco information individualisation with a series of empirical studies on consumer behaviour.

## UCD in the Sustainable Luxury Design Process

Claudia NEWTON<sup>\*</sup>, Kerry KIRWAN, Steven MAGGS and Rebecca CAIN

University of Warwick

*The values of luxury brands largely align with sustainable practices. These include timelessness, innovation, durability and craftsmanship; all characteristics that mirror the underlying goals of sustainability. Luxury brands must ensure that their products meet environmental legislation requirements, achieve profitable growth and, importantly, meet customer expectations. The focus on Sustainable Luxury is mounting. However, the present volume of literature dedicated to exploring the concept is low. The purpose of this review is to collate and assess extant research in sustainable luxury. We present an argument for the compatibility between luxury and sustainability through a review of design and engineering literature. So, where does a luxury brand fit in a sustainable future? Findings indicate that consumers are unwilling to sacrifice quality and functionality for sustainable derivatives of products. There is also an attitude-behaviour gap in ethical consumption, where consumers demand ethical products but do not reflect this in their buying behaviour. On the communications side, review findings suggest that consumers are unreceptive to corporate social responsibility (CSR) due to their belief that luxury and CSR are incompatible. The paper concludes by suggesting a means of incorporating consumer feedback into the luxury design process to facilitate design for sustainability in the luxury context.*

## Introduction

The luxury industry is steadily growing despite the global economic downturn. This growth has been apparent since the 1990s (Nueno & Quelch, 1998; Vickers & Renand, 2003) and it is estimated that the global luxury goods market in 2025 is likely to be over 5 times larger compared to 1995 (Bain & Co, 2013). This growth has occurred due to factors such as rising demand for luxury goods and services in emerging markets such as China (Cavender & Rein, 2009), rising standards of living and the democratisation of luxury (Vickers & Renand, 2003). Collectively, this has led to increased attention towards the social and environmental initiatives of luxury companies and the whole sector has been criticised of lagging behind in terms of sustainability through publications such as the Deeper Luxury report commissioned by the World Wildlife Federation (WWF) (Bendell & Kleanthous, 2007).

As well as governmental demands for sustainability stemming from the top-down through legislation, there has been some evidence that consumers are demanding that the products they consume are responsibly sourced, manufactured and sold, and that the workers throughout the supply chain are respectfully treated (McGoldrick & Freestone, 2008). Pressure from non-governmental organisations (NGOs) and activist groups has also forced the luxury industry to consider environmental and ethical issues in their operations due to the fear of damaged reputation and equity (Marie-Cecile Cervellon, 2013). However, despite this, there are still very few NGOs dealing with the luxury sector, minimal labelling or certification measures and limited research being published concerning ethical consumption patterns amongst luxury goods sales (I. A. Davies, Lee, & Ahonkhai, 2012).

To many people, 'sustainable luxury' is a paradox. The etymology of luxury - a derivation of the Latin word *luxus* - means excess (OED, 2013), and tends to be inherently associated with issues such as overconsumption, personal indulgence and social inequality. Conversely, sustainability is associated with ethical and social responsibility, economic growth and the preservation of natural resources. When exploring the principles of both sustainability and luxury, similarities that are fundamental to both overlap, indicating a potential for sustainability and luxury to be compatible (J. Kapferer, 2010).

Figure 1 illustrates the structure and content of this review. The paper begins by analysing extant research in sustainable and luxury purchase behaviour. By understanding key factors impeding each type of

consumption, conclusions can be drawn as to the potential for sustainable consumption in the luxury market. Additionally, the paper discusses the implementation of consumer research in luxury product design processes in order to facilitate design for sustainability in the luxury context.

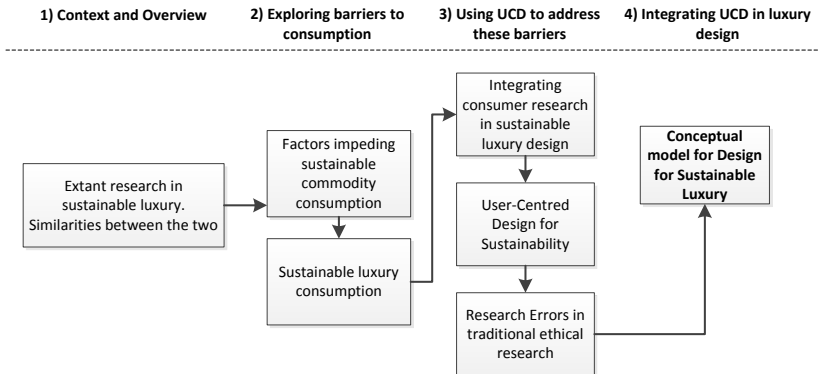

Figure 1: Structure and content of review

## How does Sustainability relate to Luxury?

The word ‘luxury’ is one that is familiar to every individual, but cannot be precisely defined due to its inherent subjectivity (Hudders, Pandelaere, & Vyncke, 2013). The concept has also changed and evolved over time and continues to do so (Yeoman & McMahon-Beattie, 2006). More and more companies with differing business models, customer segments and offerings are marketing themselves as being luxurious, leading to a dilution in the meaning of ‘luxury’ (Csaba, 2008; Ricca & Robins, 2012). Many definitions of luxury have been published from a myriad of different angles, but a common definition is lacking in literature (Janssen, Vanhamme, Lindgreen, & Lefebvre, 2013; Vickers & Renand, 2003). Generally speaking, luxury goods are almost always associated with premium prices that far exceed their functional value (T. B. Jackson, 2004; J.-N. Kapferer & Bastien, 2012; Ward & Chiari, 2008). These prices are justified for a variety of reasons, including: the leveraged status of the brand (T. Jackson & Haid, 2002) and the quality of products on offer (Wiedmann, Hennigs, & Siebels, 2007). Moreover, luxury is also commonly associated with prestige (Vigneron & Johnson, 1999) brought upon by the marketing ability to evoke exclusivity (Phau &

Prendergast, 2000), quality (Biel, 1992), aspiration (Keller, 2009) and a rich heritage (Beverland, 2004).

Similar to defining luxury, sustainability is also an ambiguous term that is difficult to define in a consistent manner (Carrillo-Hermosilla, del Río González, & Könnölä, 2009). Dozens of definitions attempting to do so have been published – many of which are diverse and often conflicted, which indicates the complexity of the concept. Nevertheless, sustainability generally takes into account environmental, social and economic impacts, which are often regarded as the three pillars or triple bottom line of sustainability (Elkington, 1999). Sustainable development is most widely defined and accepted as “development that meets the needs of the present without compromising the ability for future generations to meet their own needs” (Brundtland, 1987). This definition implies that the environmental resources used for economic and technological development should be managed and controlled so that depletion in its entirety does not occur, and that future generations will be able to benefit from the use of these natural resources.

At first glance, the terms ‘sustainability’ and ‘luxury’ can seem paradoxical, but a deeper understanding of the two uncovers similarities fundamental to both concepts. Luxury is, by definition, durable (J. Kapferer, 2010) in both a tangible and intangible sense. Products – largely sculpted by artisans – are limited to the availability of their resources, resulting in careful sourcing of materials and very little waste due to the value of these materials.

Some may struggle to disassociate luxury with issues such as overconsumption, personal indulgence and social inequality. The activity of spending copious amounts of money on materialistic goods can seem immoral when there are issues such as poverty and climate change happening around us. Some researchers have indicated that the collective impact brought upon by the throwaway society, which refers to the consumption and disposal of everyday, mass-produced goods (Cooper, 2005; Robins, 1999), has a much more detrimental environmental impact than that of the luxury sector: a much smaller market in comparison (J. Kapferer, 2010). However, the luxury sector highlights these issues, but it does not cause them. Through prestige prices (Nia & Zaichkowsky, 2000), limited editions (Hudders et al., 2013) and selective distribution (Phau & Prendergast, 2000), luxury brands are able to monitor and control the consumption of their products and services by alluding to an impression of rarity. These factors could be used to actually encourage responsible

consumption through perceived rarity and a guaranteed limitation in demand amongst certain customer groups, thereby protecting natural resources (Janssen et al., 2013; J. Kapferer, 2010). Figure 12 illustrates schematically the common preconceptions derived from the literature when considering luxury, the apparent contradiction between sustainability and the actual similarities between the two.

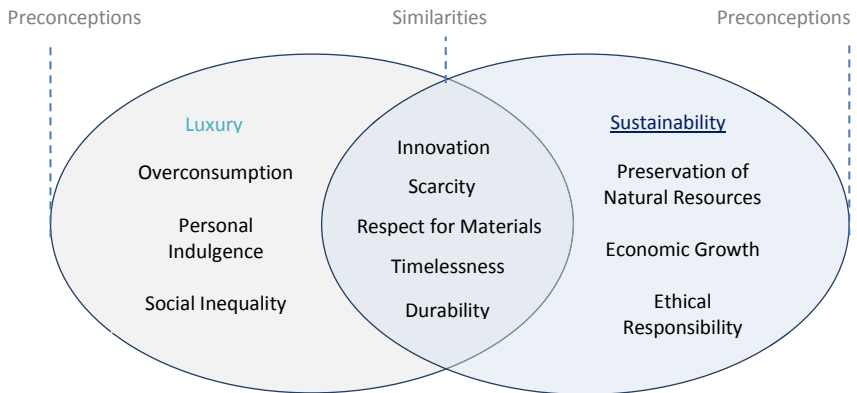

Figure 12: Similarities between luxury and sustainability

The main similarities between luxury and sustainability are therefore:

- A strong emphasis on innovation. Luxury sets the trends in a given industry and radical innovation is often needed for demands such as cleaner technologies and encouraging sustainable behaviour.
- Both sustainable and luxury products are long-lasting and durable. Emotionally-durable design (Chapman, 2005) is an effective strategy for increasing the value of products and ensuring that the user retains the product for a long period of time.
- The notion of scarcity and timelessness is apparent in certain luxury products and sustainability as a whole. The perceived fit between luxury and corporate social responsibility can be strongly conveyed if a company provides a scarcer offering as opposed to an ephemeral one (Janssen et al., 2013).

## Factors Impeding Sustainable Consumption

Researchers have suggested that we are experiencing an “ethics era” (Crane & Matten, 2007; McGoldrick & Freestone, 2008; Smith, 1995) where more and more consumers are taking ethical considerations into their purchasing decisions and adapting their behaviour accordingly (Harrison, Newholm, & Shaw, 2005; Mason, 2000). Ethical consumer behaviour can be defined as ‘decision making purchases and other consumption experiences that are affected by the consumer’s ethical concerns’ (Cooper-Martin & Holbrook, 1993). Examples of ethical issues can include human rights, labour conditions, animal well-being and the environment (Doane, 2001). Ethical consumption can manifest itself as consumption of products because of their positive attributes (e.g. buying Fair Trade products) or boycotting products because of their negative attributes (e.g. avoiding products produced by child labour) (De Pelsmacker, Driesen, & Rayp, 2005).

In 2010, sales of ethical goods and services (namely in the food, finance, travel and household sectors in the UK) rose by almost 9% from £43 billion to £46.8 billion in comparison to £13.5 billion in 1999. Although ethical consumerism seems to be on the rise in the UK, ethical expenditure is still relatively low when compared to overall spending (Co-operative-Bank, 2011). Additionally, research has found that around 30% of UK consumers report that they are very concerned about purchasing ethically due to an environmental attitude and it is important for companies to demonstrate their commitment to social responsibility (Ipsos-Mori, 2009) but only 3% reflect this in their purchase decisions (Defra, 2006). Clearly, individuals are struggling to translate their environmental concerns into their purchases – this behaviour is known as the ‘attitude-behaviour gap’ (Papaoikonomou, Ryan, & Ginieis, 2011; Sheeran, 2002).

It is important to understand the factors that lead to this attitude-behaviour gap in order to develop ways in which more sustainable offerings can be successful on the market. As illustrated by Figure 11, after an understanding of these factors impeding each type of consumption is achieved, a way of addressing these factors is discussed.

### *Barriers to Sustainable Consumption*

Research aiming to identify the barriers to ethical consumption has been conducted, but has so far produced conflicting findings. For instance, some studies suggest that sensitivity towards ethical products increases with age (Hines & Ames, 2000) and affluence (Barnett, Cafaro, & Newholm, 2005), and to be greater in female consumers and those at lower educational

levels. Conversely, some studies have found no such correlations (Bray, Johns, & Kilburn, 2011; Doran, 2009).

In a study, Bray et al. (2011) suggested potential explanations for the attitude-behaviour gap (presented below with supporting references), and thus barriers to sustainable consumption:

1. Price sensitivity - participants felt that ethical derivatives of products were too expensive (Öberseder, Schlegelmilch, & Gruber, 2011; Richardson, Irwin, & Sherwin, 2005; Young, Hwang, McDonald, & Oates, 2010).
2. Personal experience - participants were more likely to consider changing their purchasing habits when a negative news story forced them to think about a certain ethical issue or when they were personally affected (Öberseder et al., 2011).
3. Ethical obligation – many participants reinforced that they would like to make a difference – especially when the price differential was small – but they also felt that it was ‘too difficult’ to engage in ethical consumption regularly (Young et al., 2010).
4. Lack of information – participants stated that they did not have enough information about ethical issues to inform their purchase decisions on this agenda (Wheale & Hinton, 2007; Young et al., 2010).
5. Quality perception – the perceived quality of ethical goods was identified as being a clear influencing factor in consumers’ decision-making processes during consumption. It was clear that consumers were not willing to tolerate a loss in quality for ethical products. Some consumers also frequently believe that there is a trade-off decision to be made between sustainability and functional performance (Luchs, Brower, & Chitturi, 2012).
6. Inertia in purchasing behaviour - brand loyalty ultimately kept participants from straying from a brand in search for ethical derivatives. Additionally, consumers tend to be ‘locked-in’ to their current habits and over-estimate the inconveniences of sustainable consumption (Richardson et al., 2005).
7. Cynicism - some participants felt that sustainability marketing and communications were not genuine and that ethical claims were a strategy to take advantage of consumer goodwill and to charge higher prices. Most participants believed that the extra

premium paid towards certain products did not reach the end beneficiary (Richardson et al., 2005).

8. Guilt - some participants retrospectively felt guilty when they decided not to purchase an ethical alternative of a product. Further supported by Young et al. (2010).

### *Sustainable Luxury Consumption*

Academic studies exploring sustainable luxury have focussed on the propensity for consumers to consider ethics in their luxury consumption choices (Achabou & Dekhili, 2013; I. Davies, Doherty, & Knox, 2010; Joy, Sherry, Venkatesh, Wang, & Chan, 2012), the appropriate means of sustainability communications in the luxury industry (Janssen et al., 2013; Steinhart, Ayalon, & Puterman, 2013) and the cultural differences in the perception of sustainable luxury (Marie-Cécile Cervellon & Shamma, 2013). The total number of academic studies in this research area is limited currently up to 2014, but it is gradually increasing.

I. A. Davies et al. (2012) conducted 199 structured interviews with UK consumers and found that ethics was not a priority when buying luxury goods versus commodity goods. It was postulated that the market for ethical luxury goods would be minimal in the present climate of conducting the study (2010) due to several reasons:

1. Quality-price differential - the most prominent finding was the perception that ethical luxury products were too expensive.
2. Lack of information - the majority of respondents felt that there was a lot more information available for ethical commodity products compared to ethical luxury products which were largely unheard of to them.
3. Regularity of purchase - respondents felt like they could put more effort into finding out about the ethical credentials of a commodity product they purchased on a regular basis (such as coffee).
4. Lack of availability - there was a clear perception that ethical-luxury goods are rarely available on the market.
5. Commodities make a difference, luxuries do not – respondents felt that they could make a difference towards less economically developed countries by purchasing commodity products such as fair trade coffee, but not with ethical luxury goods.

Attributes such as product quality and brand reputation remain to be of higher priority than the environmental commitment of a brand – which is coincidentally not a decisive factor for purchasing a luxury product. Furthermore, the presence of recycled materials in luxury clothing products was perceived unfavourably amongst luxury consumers because recycled materials are not readily associated with quality and prestige (Achabou & Dekhili, 2013). However, consumers were willing to accept the use of recycled materials in packaging. Consumers therefore look for a distinctly different set of benefits when buying luxury products compared to commodity purchases and ethics does not seem to be part of this. Luchs et al. (2012) found that focusing resources on achieving superior product aesthetic design for sustainable products resulted in a positive effect on confidence and increased the likelihood of consumption. Sustainability in luxury design could therefore be compatible as luxury designers already possess the capability for superior aesthetic design.

Furthermore, it is crucial for luxury brands to understand the factors they can leverage within their communications to achieve responsible business practices without the negative consequences of promoting sustainable luxury. These include issues such as a disbelief that luxury companies are genuine in their motives for promoting ethics (Torelli, Monga, & Kaikati, 2012) and a perceived degradation of quality.

The challenge then, is to transform an industry that is quickly associated with inherently unsustainable characteristics to one that is sustainable but maintains its values and desirability amongst consumers. It seems that any animosity towards sustainable commodity or luxury products is largely down to perceptions of low quality, higher prices and distrust when in reality this may not be the case.

It is clear that the barriers impeding both sustainable commodity and luxury consumption are extremely similar. These are:

- Quality-price differential: Regardless of whether a product is a commodity or a luxury, consumers perceive these products as being of lower quality and more expensive.
- Lack of information about sustainable products.
- Lack of availability.
- Cynicism and distrust in brands claiming to be ethical.
- Inertia in purchasing behaviour due to factors such as brand loyalty and consumer lock-in.

As illustrated in Figure 11, the following section aims to discuss how these barriers are addressed within standard product design for

sustainability. By doing so, the potential for using these strategies in sustainable luxury design can be considered.

## **Integrating Consumer Research in Sustainable Luxury Design**

Luxury designers and managers traditionally dictate what luxury is, and what consumers should want from a product or service. A luxury brand may listen to its consumers, but may not necessarily incorporate their desires into a final product if it does not align with the long-term vision of the brand in question. Of course, resources are invested into trend forecasting, but many luxury companies still rely on intuition and the creativity of their designers when developing new products. In contrast, companies such as Proctor and Gamble invest heavily in developing methodologies for consumer insight research in order to ensure that the products they produce are exactly those that their consumers want (J.-N. Kapferer & Bastien, 2012).

In contrast, sustainable product design often needs consumer insight research to attract customers to greener product offerings and to understand the attitude-behaviour gap apparent in sustainable consumerism. Research exploring the uptake of green products has suggested that focusing on market needs during product design and development will result in a greater chance of customer approval. Green products must also collectively incorporate environmental attributes as well as meeting market requirements accordingly with competing products (Berchicci & Bodewes, 2005). Moreover, the 'ethics era' seems much more limited in application than the literature sometimes suggests (I. A. Davies et al., 2012).

To alleviate this, exploring and analysing why values towards more sustainable offerings have a weaker influence on purchase decisions is paramount for understanding and attempting to influence consumer behaviour towards achieving sustainable consumption patterns (Young et al., 2010). Additionally, exploring how consumers interact with products and the hidden factors underlying purchase decisions should be useful in understanding environmentally and socially significant consumption (Bhamra, Lilley, & Tang, 2011).

Even consumers that already place an importance on sustainability have demonstrated that products must still meet a minimum threshold of functional performance in order to be considered for consumption (Luchs et

al., 2012). This reinforces both the importance and potential that the identification of this minimum threshold of performance of consumers could have in successful sustainable product design.

### *User-Centred Design for Sustainability*

As previously discussed, consumer adoption of low carbon products has been slow (Roy, Caird, & Potter, 2007). One reason as to why this may be is because many low carbon products on the market have been designed with little thought into user requirements, i.e. they have failed to take a user-centred approach to the design process. One such approach would usually take into account aspects such as appealing aesthetics and ergonomic requirements, but it has been argued that many design processes towards low-carbon products are only regarded as functional and technical entities, when multi-sensory features actually play an enormous role in whether an individual is likely to purchase a product or not.

The challenge of sustainability can be tackled using design opportunities. This can be from merely improving existing products to influencing the behaviours of consumers that can ultimately lead to a change in lifestyle towards more sustainable consumption habits. It is argued that in order for radical – rather than incremental – change to occur: a user-led approach to design for tackling the sustainability challenge is required (Richardson et al., 2005). However, there are some research errors that need to be taken into consideration when taking this approach in ethical consumption research.

### **Research Errors in Ethical Consumption Studies**

A consumer led approach commonly uses research methods such as surveys, interviews and focus groups. An issue with conducting qualitative research on sustainability and in particular, consumer ethics, is that some individuals may be inclined to respond with the most socially desirable answer, which causes a fundamental flaw in experimental design (Öberseder et al., 2011; Ulrich & Sarasin, 1995). The traditional survey based methods – as favoured in most ethical consumption research – therefore fails to take into consideration the complexity inherent in decision making and actual buying behaviour (Carrington, Neville, & Whitwell, 2014).

Additionally, many studies investigating ethical consumption in general also tend to use surveys that require respondents to simply rank certain ethical issues. The problem with this type of survey design is that these questions do not require consumers to trade-off ethical attributes against traditional attributes of products, nor do they allow analysts to determine

the degree to which consumers would sacrifice to make these trade-offs (i.e. the level of priority placed on a certain product attribute). Therefore, results obtained from these type of survey questions often overstate the importance of ethical attributes and issues simply because they are apparent answers that would generally be socially accepted (Auger, Burke, Devinney, & Louviere, 2003; Auger, Devinney, Louviere, & Burke, 2008).

Future research should look to reducing the effects of this bias. Exploring actual buying behaviour would be helpful, including the analysis of the trade-offs that individuals make during purchase decisions in order to gain a well-rounded and in-depth understanding of consumer purchase intentions.

Fuchs, Prandelli, Schreier, and Dahl (2013) explored whether the use of a user-centred design strategy in luxury fashion companies would generate negative perceptions as to the status and quality of products. Results indicate that for high status luxury products, consumers demand company-designed items more so than user-designed ones as it was perceived that user design fails to achieve the high standards of quality required in luxury products.

However, the adoption of a user-centred design strategy can lead to various benefits including the ability to develop new products that better meet the needs of consumers that may not have otherwise been met (Hoyer, Chandy, Dorotic, Krafft, & Singh, 2010).

We argue that a balance between systematically uncovering baseline needs of consumers while also allowing for creative freedom for designers could be needed for achieving successful sustainable luxury products.

### *A Conceptual Model for Design for Sustainable Luxury*

By reviewing extant literature on sustainable consumption, we have extracted that design for sustainability often necessitates the capture of customer perceptions and requirements in order to mitigate the risk of product failure. We believe that in order to achieve successful sustainable luxury products, a systematic process of capturing customer insights as a direct driver to product design is required but rather as a safety net to steer designers and product developers in the right direction. By doing so, the process of luxury design becomes more rigorous but not constrained, as it can allow designers to work towards baseline functional needs in terms of sustainability requirements but also allow them freedom in creativity.

The research errors – such as social desirability bias - commonly found in ethical consumption research also needs to be addressed. An understanding of customer purchase decisions is crucial to understanding sustainable

consumption. However, the attitude-behaviour gap (where individuals say they are demanding ethical products but do not reflect this in their purchasing behaviour) must be avoided.

To address this, the 'hidden needs' of customers should be identified. Hidden needs are defined as "requirements that customers or users have but which they have not yet directly recognised" (Goffin & Lemke, 2010). More often than not, individuals are largely unaware of these needs and are therefore unable to articulate them. This is therefore a research challenge, which can be addressed using the methods described next.

Hidden Needs Analysis is a set of tools and techniques that go deeper than traditional market research methods (such as surveys and focus groups). Some of these techniques include repertory grid technique, contextual interviews and lead user groups. For analysis, a method of conjoint analysis can be used for assessing how a product or service that addresses hidden needs is perceived (Goffin & Lemke, 2004). As articulation is difficult, and sub-conscious perceptions are identified, there is a reduced chance of social desirability response bias skewing results and impacting on validity. Thus, the methods used in hidden needs analysis may be able to uncover practical insights for developing successful sustainable products.

Figure 3 illustrates a conceptual model showing the process of integrating customer research and sustainability requirements in a luxury design context, while also taking into consideration the findings obtained from current research exploring sustainable luxury. The product criteria that could have the greatest influence on customer satisfaction can be identified, and then placed as a priority when making key design decisions. An understanding of these priorities could then help designers and engineers to pinpoint where best to optimise sustainability without negatively affecting customer satisfaction. For instance, consumer research could uncover that customer satisfaction worsens when leather seats are not integrated into the design of a car. Designers and engineers can then use this information and meet sustainability drivers by either focusing resources on ensuring that the leather used in their products are ethically sourced, or – if this impacts on quality or proves to be cost-ineffective – they can focus their sustainability resources elsewhere on a feature that is not highly prioritised by consumers, whilst still meeting their overall sustainability requirements. This highlights the potential for adopting a user-centred design approach in order to uncover ways in which customer satisfaction can be achieved while also ensuring that sustainability targets are met.

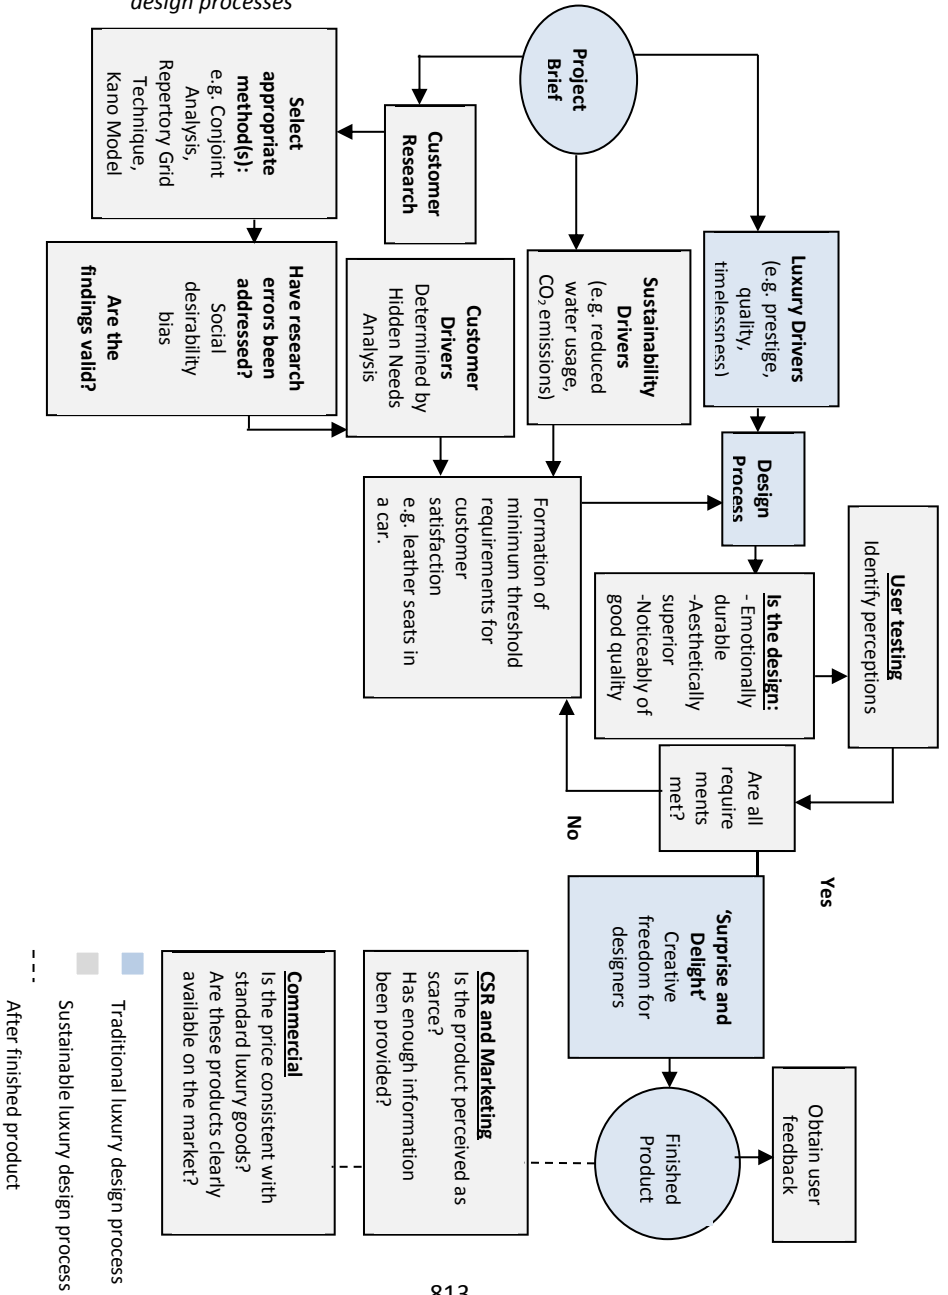

As a key problem identified in literature is that consumers are not willing to sacrifice functionality or quality for sustainable products, conducting consumer insight research will lead to a better understanding of product requirements. By doing so, this understanding of customer needs will aid in decision making when designing products or marketing communications.

It is important to note that in order to ensure that creativity in design is unhindered; customer data should indirectly feed into the overall design process and is used only as a guide to ensure that the product is more likely to be successful when introduced to the market.

Therefore, as the barriers impeding sustainable luxury consumption are very similar to those affecting sustainable commodity consumption, a user-centred design strategy can be used to mitigate the risk of product failure. This is because:

- Understanding why values towards more sustainable offerings have a weaker influence on purchase decisions can help to achieve more sustainable consumption patterns.
- Products must still meet a minimum threshold of functional performance in order to be considered for consumption. Consumer research can identify these requirements and incorporate them into the product design process.
- A user led approach to design for tackling the sustainability challenge is more likely to lead to radical – rather than incremental – innovations, which is needed for both sustainable and luxury design.

Figure 3: A conceptual model for integrating customer research in sustainable luxury design processes

## Conclusions

This paper highlighted that although the similarities between sustainability and luxury are not apparent at first glance, there are characteristics fundamental to both, such as innovation, timelessness and durability. The aim of sustainable luxury is to create awareness about the possibilities that luxury companies could have by integrating sustainability principles into their practices. Similarly to their products, luxury companies have an opportunity to set a trend in sustainable luxury in order to make greener products desirable to the public. While it is more difficult to integrate sustainability within an industry that is and has been inherently unsustainable, the principles and practices of sustainable development are already present in the underlying principles of luxury.

After assessing extant research in ethical consumption and sustainable luxury, we found that there is a general interest in sustainable products but not at the expense of functionality or quality. A sustainable product – particularly one sold at a premium – cannot overlook key attributes important to customers when creating ethical derivatives. Trade-offs and priorities of consumers have to be identified in order to ensure that customer satisfaction is maintained. Additionally, many studies aiming to explore the propensity for consumers to consider ethics in their purchase decisions adopt surveys as their main experimental method. This type of research method is subjected to the effects of social desirability response bias, where respondents select the most socially appropriate and obvious answer that often does not reflect their true buying behaviour. A more rigorous experimental methodology is required to counter the effects of this bias and uncover more valid information.

We believe that to tackle the attitude-behaviour gap apparent in ethical consumption and to achieve successful sustainable luxury products, emphasis should be placed on understanding consumer purchase decisions in order to mitigate the risk of product failure. Combining the desirability inherent in luxury products and systematically identifying baseline needs of consumers regarding sustainability could provide a safety net for sustainable luxury product design – ensuring that the end result is a product that is desirable and also sustainable.

# **Editorial: Exploring Collaboration in Product Development: the good, the bad and the ugly**

Nuša FAIN and Beverly WAGNER

Innovation is a key driver of competitive and economic growth, but nurturing it is a challenging task because it involves multiple and constantly changing actors, linkages and dynamics. Furthermore, although collaboration and cooperation have come to dominate successful innovation, businesses often run into information and coordination problems at the different stages. This means understanding collaboration, coordination and cross-functional integration processes is essential for effective innovation performance. As design is an integral part of such collaborations in innovation, contributions within this track address the challenges that new types of collaboration in innovation bring to designers. Examples include cross-functional and cross-disciplinary collaboration with other disciplines and functions, voice of the designer, working in dispersed design teams, engaging key stakeholders in the design process, measuring performance and product excellence as a result of cross-functional involvement.

Initially 29 abstracts were submitted to this track, followed by a submission of 19 full papers of which 8 will be presented at the conference.

In the opening paper Fain, Wagner, and Lemke discuss the relevant literature on collaboration in product development and propose a framework for exploring collaboration proneness in development processes. The framework provides a valuable insight into managing collaboration in practice and provides an evaluation tool for managers to determine internal team competences and gaps to be addressed. Furthermore, it enables companies to assess potential NPD partners outside company boundaries. A test on an industrial case demonstrates the applicability in practice of this theoretically derived framework.

In the second paper, Benker and Raduma explore the possibilities and constraints of applying the quality function deployment (QFD) method during the early phases of a product development process in order to facilitate collaborative design concept evaluation. They investigate the potential of utilizing the QFD method throughout an iterative design process without introducing too much complexity to the agile development process by

participatory action research. Two separate experiments are discussed that test the applicability of QFD to facilitate in the evaluation of different design concepts. This study highlights how the QFD method allows for communicating design concepts across different functions and facilitates design concept evaluation during early product development. The study concludes with suggestions how the method can be further developed to better manage design concept evaluation in the future.

The third paper in the track examines how designers' and managers' cognitive styles influence the outcome of innovation processes. Tabeau, Gemser, Hultink and Wijnberg collected comprehensive data on 83 projects in an online survey. Their results indicate that conformist managers enhance financial product performance, while creative designers contribute to success by developing products that are both unique and of high quality. Moreover, designers' and managers' cognitive styles complement each other, indicating that for higher levels of product performance, creative designers should not conform to rules whereas conformist managers should avoid being creative. However, the results also indicate that product performance is enhanced when designers and managers are both attentive to details, indicating that these professionals supplement each other's abilities as well.

The track continues with a paper by Johnson and McHattie using a case-study method to produce an account of design work within a strategic design intervention with an SME. Drawing on Latourian principles in actor-network theory, observations and accounts of intervention are grounded use of tools, artefacts and activities deployed. This allows analysis exploring traceable influences that design artefacts have on the work being performed and reflective space for designers to assess their performative agency. The paper proposes consideration of the constraints and opportunities that design management encounter concerning matters of concern for organisational change; and in so doing, how this can inform design practice.

Moreover, Lützenkirchen explores collaboration between designers and clients by focusing on three areas of collaboration – communication, design management and motivation for change. On the basis of narrative interviews, the research study finds two opposite perspectives of interest to designers and clients in all three explored areas. The paper thus addresses the need for awareness of these, advising careful analysis and description of the needs and expectations, as well as the characteristic performances and reactions of both designers and clients/entrepreneurs. This may open up new ways to bridge the gap between partly incompatible demands.

Van Der Linden and Dall'agnol take a different approach in the next paper and explore the question "how do designers work?", by addressing the dichotomy between academically proposed tools and actual practice. They interview product designers in Brazil and propose the following: they found different approaches for design processes related to designers' field of activity and experience. Some, mainly companies' internal designers, use formal and quasi-structured processes, but most adopt a flexible and intuitive approach. Also problem definition approaches vary among designers, where specifically marketing and user research, brainstorming and product analysis are some of the approaches defining a design problem. Finally, they observed that none of them adopts an explicit and formalized theoretical approach.

The last two papers explore influences of representations and design space to design processes and designers' work.

Stomppff and Smulders explore the fidelity of products: the degree to which representation of an intended product actually corresponds to the eventual real world product. In a long term participatory study, they observed that some of the studied representations serve as boundary objects: objects that have a capability for teams and organizations to transfer, translate and transform knowledge across difficult epistemological barriers. However, they also found that the fidelity of these representations varied considerably. Expressing the intended product is not merely a translation of a preconceived idea into an appealing visual object, but that might indeed even be said to influence the social process. The contribution of this paper lies in the categorization of the representations into four groups, where a representation is situationally dependent; situation being formed by the boundaries and aim of the social interactions. They present the categories and a framework to explain the findings in relation to the team process.

The final paper by Weinberg, Nicolai, Husam, Panayotova and Klooker discusses the impact of space on innovation teams as an outcome of the interaction of team members with their environment. It presents a pilot study that uses qualitative interviews with facilitators of design processes and non-participatory observations of innovation teams in design workshops. While they set up and interact with their team spaces to discover factors influencing the way teams worked within their space, the results indicate that conducting innovation workshops outside the usual corporate environment is perceived as self-made than perfectly designed. Further promoting factors include: access to raw material for prototyping, the spatial division between different teams, the possibility of using walls as well as flexible furniture as presentation surfaces. The opportunity to create the own team space proves

*Exploring Collaboration in Product Development: the good, the bad and the ugly*

highly beneficial for innovation teams. However, evidence was found that throughout the process more advanced design thinkers showed a higher iterative interaction with their environment.

# The Right Fidelity: designedly representations that enhance multidisciplinary product development

## Introduction

Boundary objects are objects that have a capability in teams and organizations to transfer, translate and transform knowledge across difficult barriers such as between specialists, between departments or between disciplinary functions (Star & Griesemer 1989; Carlile 2002, 2004). Consider, for example, a plan board: even when people do not see each other, or communicate, they can still instil what they have to do and when and interact. The term boundary object proved to be particularly valuable in the context of New Product Development (NPD) (Leonard-Barton 1991; Cook & Brown 1999; Bechky 2003; Bucciarelli 1994; Carlile 2002, 2004; Levina & Vaast 2005). These boundary objects for NPD can be sketches; engineering drawings; models; abstract notions; timelines; charts; spreadsheets and so on.

Lately, there has been much interest in the notion of 'boundary objects'. But despite the scholarly interest, there are many questions unanswered for boundary objects. What objects may become boundary objects, why and when? How can these objects be improved for their boundary spanning capabilities? How can boundary objects explicitly be developed and managed? This leaves practitioners inside NPD teams and managers empty handed when it comes to developing effective boundary objects.

A specific kind of objects we are interested in are representations of the product and/or service a NPD team is developing. These enable specialists to learn about what they develop together. In a six year lasting participatory study of NPD teams in-the-wild these representations were omnipresent, ranging from textual documents like requirements and business cases, up to integrated prototypes. The difference between these representations is the fidelity: the degree to which a representation corresponds to the eventual real product. These representations proved to be of particular importance to facilitate collaboration in those teams (see Figure 1). In this paper we explore these representations, in order to understand and predict what kind of representations become boundary objects and in what context.

*Figure 1 An emotional discussion alongside sketches of a user interface. The project leader on the left discovered by means of the sketches that there was disagreement on the functionality of the product. It shows how objects are critical for multidisciplinary collaborative knowledge work.*

## **Theory: boundary objects**

In development of complex products, specialists create something none of them can conceive beforehand, as these products require too much knowledge to be developed by one person (Schrage 1995). However, collaboration is not simple, as each specialist has his own practice, constituted by their occupational and educational background, including jargon, tools, models, and the like. In short, specialists have different object worlds (Bucciarelli 1994). These specialists have problems to understand each other's practices and boundaries can be observed (Dougherty 1992; Carlile 2002): imaginary/felt demarcations between specialists, departments or disciplinary functional units. Boundaries are known to stifle innovation (e.g., Dougherty 1992) and also to incite innovation (e.g., Fiol 1995). Spanning boundaries is crucial for organizations that develop complex products and/or services. Not only to enhance its innovative capabilities, but also to reduce costly errors and iterations as a result of poor cross-disciplinary collaboration. Several mechanisms are known and studied to span these boundaries, such as (assigned) roles like boundary spanners; or specific tools such as 'wikis'. It is found that some objects used in teams also have boundary spanning capabilities.

Boundary objects (Star & Griesemer 1989) refer to a wide range of artefacts, observable by many actors that are robust enough to maintain a common identity across the diverse practices, yet are plastic enough to adapt to distinctive practices. Although the name suggests that boundary objects are at the edges of practices, Star & Griesemer (1989) described them differently. Boundary objects 'sit amidst' all practices, that is are part of the practices of many specialists. For example, a project planning is shared among all specialists and is part of all their individual practices. Thus, boundary objects should be conceived as nodes in a network, where practices become joint.

Carlile (2002, 2004) developed extensive theories to explain why some objects enable boundary spanning. He found that knowledge inside NPD teams is structurally different for specialists and that it is embedded in practices and cannot be articulated. Carlile identified four categories of boundary objects: repositories, standardized forms and/or methods; objects/models and maps. The importance of Carlile's writings is that he showed that there is a relation between the kind of boundary and the kind of boundary object. Repositories (as specification databases) and standardized forms are good for transferring and translating knowledge across boundaries, but have limited value when e.g. contradictory aims exist and knowledge has to be transformed. Put differently: when something new has to be invented.

Ewenstein & Whyte (2009) studied visual representations in architecture, like drawings and sketches. They highlight that these representations are characterized by a 'lack' or incompleteness that precipitates unfolding. In time, the objects change, the meanings shift and layers of information are added. The drawings serve as boundary objects, but are in flux, continuously adapted and never complete. These drawings have an 'unfolding ontology' (Knorr Cetina 2001) and are essentially mutable. This insight opposes the view that boundary objects are relatively stable, a view that is implicit in many publications on the subject.

What is lacking in literature are insights in the expressive form of these boundary objects themselves. For example: it is observed that sketches are boundary spanning (Ewenstein & Whyte 2009; Henderson 1999), yet what sketches? Are it 'back-of-the-napkin' kind of sketches, or well crafted and precise sketches? Do they need to convey beauty and elegance, or has a clumsy sketch also boundary spanning capabilities? In this paper the focus is on representations of the final product and/or service in NPD. The research

question we explore is: what representations have boundary spanning capabilities, how, why and when.

## Method

This paper deploys the data and analysis of a large PhD study conducted in 2006 - 2012 in the Netherlands. Aim of the large study was to understand what designers contribute to multidisciplinary teams and organizations. This paper deploys the same data and shifts the empirical lens from designers to representations used in the design process, in order to reflect on the boundary spanning capabilities inherent in some of these representations.

### *Method and context*

The large study (Stompff 2012) was instigated to contribute to the theory development on design, namely designing in multidisciplinary teams. There is a large body of literature on design, but design *teams* in the wild are rarely discussed. The other way round, there is an even larger body of literature on innovation, but designers are remarkably absent (Hobday, Boddington & Grantham 2011). A large, multinational, high tech company served as the context, developing printers, software and services. These are developed by a R&D organization of 2000+ employees that is based in nine different countries around the world. A topic was chosen that well represents multi-disciplinary NPD teamwork: Operator Recoverable Errors (ORE). ORE concerns enabling users of printers to solve errors, such as paper jams. In the company at hand, ORE is known to be a notoriously complex topic that impacts the work of many developers including mechanical-, software-, and electrical engineers; product- and interaction designers and quality assurance specialists.

The study was set up according to a Deweyan inquiry, a method based on Dewey's pragmatist logic (1938). The method is aimed to deal with a doubtful situation, being a design situation that is not readily understood and thus, stalling progress. The study consisted of roughly two stages. First an analytic stage to instil insights from observations in the everyday practice, to understand the constituents and the relations. This theory building stage leads to new or revised theory and associated hypothesis. Data gathering for the first stage lasted two years, and included 29 interviews; 30 hours of filmed team meetings; and many photos and scans of objects, sketches, models and so on. In addition, observations by the participating designer were recorded in a journal. Analysis was done by

means of five distinctive studies (triangulation of methods) and together with seven co-researchers that varied across studies (triangulation of evaluators).

The second stage consists of a range of guided experiments in the same practice, to validate or falsify the propositions. The second stage consisted of three guided experiments, that were done in-the-wild in the company at hand. The data from these stages consists of participatory observations recorded in a journal, plus photos and sketches of objects, sketches, the environment and the like.

One set of findings from the large study are subject of this paper and concern the role of representations in discussions and reflections on activities of specialists within and across their practices (Stompff 2012; Stompff & Smulders 2013). These representations seemed to provide a platform that served as common 'language' for the specialists to relate their activities to those of others and by that facilitate cross boundary discussions.

### *Representations as boundary objects*

A range of distinctive representations was observed, including simple sketches up to beautifully crafted and expressive representations as models. Several of the experiments in the second stage of the study were geared for developing and using these representations, to span boundaries inside the organization at hand. Some of these boundaries that were included in the experiments are known to be problematic in the company at hand, such as between R&D and marketing. The experiments done during the studies showed some mixed results: there were successful and less successful ones. Consequently, the question arose what kind of representations span boundaries and in what situations.

Informed by the methodical principle underlying grounded theory (Glaser & Straus 1967) we moved back and forth between analyzing and collecting data. While keeping focus on the research question at hand, we worked inductively in order to instil ideas for a framework until 'theoretical saturation' was obtained (Glaser & Straus 1967). The framework we looked for needed to form a combination of sets of representations and design situations. We categorized the representations and subsequently reflected on their contribution to the social processes in the design situation. A striking observation was that the fidelity of the representations seemed to be highly relevant for the situation and process a NPD team was in.

## Findings

The continuous refinement of our findings enabled to obtain a fine-grained perspective on representations and design situations. Below we present and describe four categories of representations, with a varying fidelity.

### *Category 1: When every detail counts*

The first category concerns representations whereby every detail seems to be of importance for the specialists involved. Consider for example, an integrated prototype or integrated CAD models that represented the work of a group of specialists (see Figure 2). Things that could not be seen were explained in depth in meetings by the specialists, e.g., such as software code. The photo of the integrated prototype shows that the team did experiments with the prototype collectively, interacting heavily with the prototype. They took much care that all steps for the experiments were done correctly. They closely scrutinized whatever happened. Discussions, proposals, experiments and reflections were cross disciplinary.

Interestingly, the interactions with the object itself seemed of particular value. Or more precise: not only the experiments they performed on the prototype provided additional information, also the experiences they had while interacting was important. The team members took parts in their hands to feel the robustness, sat on their knees to access a specific situation, listened to the sound of a motor gearing up and so on. The sensory experiences showed to be relevant. They felt that something inside was stuck; understood that a motor ran too hot due to the smell of ozone; or heard how something broke down. Consequently, the fidelity of the representations needed to be as high as possible. Any abstraction was considered a nuisance or was mistrusted. Only a detailed prototype allows to experience real time what the situation is at hand. If no prototype is available, a CAD model that depicts as best as possible the current situation is used instead. Put differently, these representations were not solely *abstract* boundary objects that represent something; also the *interactions* with the object proved to be meaningful and enabled boundary spanning.

Figure 2 On the left (1) a team meeting is depicted while experimenting with an integrated prototype. On the right (2) a team meeting is shown when a review was held behind a CAD station. In both situations, interactions and (sensory) experiences were important for boundary spanning.

Looking at the situation in which the detailed object fulfilled its boundary spanning contributions we see the following. In these meetings specialists were discussing problems that were not understood well; work was reviewed that was new to others; or situations were discussed whereby the team members disagreed whether or not it was a problem, or whether or not a proposal would solve a problem. Often ambiguity prevailed and team members had different explanations and interpretations of what they observed before them. They tried to make sense of the doubtful situation they found themselves in. The many questions, discussions and interactions with the object were focused on how to interpret the situation at hand and this lasted until the actors agreed upon what brought them there. Put differently, the situations concern a social process of problem setting and making sense of the situation at hand. Sensemaking is devising plausible explanations of the situation a team faces, retrospectively (Weick 1995). Once the problem was set, the detailed representations seemed to lose their value as a boundary object in the discourse and objects of other fidelity entered the situation as the next category illustrates.

### *Category 2: A 'little sketch will do'*

The second category opposes the first group in almost any conceivable way. This concerns crude sketches or maps, drawn on paper or on the whiteboard. A similar kind of representation was for instance a 'carton prototype' that a mechanical engineer made every now and then. He made those within few hours, showing, e.g., a cover or sub-frame. He

subsequently invited others to have a look, which sparked animated discussion and new ideas. The models were like 3D sketches and clearly served as a boundary object. The sketches include some words or arrows or circles to highlight something specific and typically have a very low fidelity.

In Figure 3 one such an example is presented, including what it evolved into in time. They are so rudimentary that these have hardly any meaning for those not involved in the meeting where these sketches were created, but make much sense for those that were part of the social activity. As an interviewee explained: "a little sketch will do". For example, the sketched map depicted in Figure 3 has some vertical boxes on the left side that have no words in it, whereas the boxes on the right have. These boxes with no text were already discussed and sketched before, so in this sketch just a hint suffices for the team members to grasp what is depicted. Also information is added, later in the meeting, adding another layer of meaning to the already existing sketch. The vertical curly lines were added to group some of the boxes together, which was done later in time.

These kinds of representations are swiftly created in multidisciplinary team meeting when collaboration is ongoing. Two or more specialists need to develop something together, e.g. to solve some problem that has impact on both their work. They have to find means to express to other disciplines what ideas they have and what enables the development and reflection on these ideas. While doing so, they develop a way to express their collective work in a sketchy way and meanwhile develop a common vocabulary and discourse. It is the essence of designing: to put forward an idea by means of a sketch and to reflect on it (Schön 1983). Thereby the sketches are changed, thrown away, drawn again and in time elaborated, just like a designer who is sketching, but then in a multi disciplinary setting. To show that, in Figure 3 also the final 'map' is depicted that evolved from these crude sketches, few months later. It is not hard to recognize the initial sketches in this map, although it is much more detailed and layered. The map enabled the team at hand to show and reflect on the relations between their activities.

Figure 3 On top (1) a sketch is shown of a map that was used in a multidisciplinary team meeting. It provided the means to swiftly sketch ideas for solving a problem, cross disciplinary. The developed language proved to be fruitful, as the team stuck to these kind of maps, eventually developing it into a large map (2) that depicted the relations between physical 'zones' inside the product; software code for specific error scenarios and the activities of a user.

The map developed and matured over time, however remained 'open-ended' until the end of the meeting. The in-between sketches and digitally drawn versions of the map had 'white spots' that still needed to be filled in; areas that were still subject of debate. Put differently, the map was an essentially mutable object that is ongoing adapted to new insights and had to be co-created. It was a boundary object par excellence, sitting amidst

*The Right Fidelity: designedly representations that enhance multidisciplinary NPD practices, but not a static object as the object is coming into being while progressing. The sketches, with their low fidelity, have an 'unfolding ontology' (Knorr Cetina 2001): the object is never fully accomplished but rather "continually 'explode' and 'mutate' into something else, and that are as much defined by what they are not (but will, at some point have become) than by what they are"(ibid.:p.182).*

As becomes clear from the situational descriptions above, these sketchy boundary objects proved their value mainly while the various disciplines were actively involved in a multi disciplinary design process with the aim to identify solutions to the problem at hand.

### *Category 3: The essence of an idea*

The third category resembles the previous one, as it concerns representations that have a low fidelity and can be quite abstract. Consider e.g., hand drawn and computer drawn sketches that are deliberately 'iconified', or 3D models that depict a similar abstraction (see Figure 4). However, these representations lack the open-ended nature of the previous category. Rather they represent the essence of an outcome of a team decision, after considerable discussion. So, despite the abstraction and low fidelity, the aim of these representations is different to the crude sketches of Category 2: they represent the 'essential idea' a team agreed on - and nothing else!

*Figure 4 Three examples of representations that were created to summarize the essence of an idea the team agree on. The one on the left (1) is hand drawn and later 'beautified', whereby unnecessary details were erased. In the middle a highly 'iconified' picture is shown, and on the right (3) a photo is shown that was used to explain what was decided on the position of a user interface.*

The representation shows the frame for subsequent design and engineering activities, a frame that often needs to be approved by others. The representations depict rightfully what everybody agrees on - across

practices, and are sufficiently to the point so that everybody 'gets the picture'. In a way these representations are a visual summary of what happened in the meeting. At the same time, these representations leave open ample space for individual specialists to develop their lines of actions within their own disciplinary practice. Even though at team level a sketch is the closure of a multidisciplinary discussion, for individuals it leaves open ample space to manoeuvre.

Despite the apparent lack of details and the low fidelity, actually every detail is meaningful. Much information is deliberately omitted, and thus the remaining details have relevance. For example, in Figure 4 also an 'iconified' drawing is shown. Behind the man there is a clock drawn. There is hardly any information in the drawing, so time is considered very relevant. These kinds of representations not only summarize, but also attempt to prevent misinterpretations. These representations serve as boundary objects over time, establishing a jointly constructed frame for future activities. These sketches therefore come about in a social process that was termed 'future framing' (Smulders & Brehmer 2011), a design process in which the actors aim to develop a satisfactory frame representing the future outcome of their combined work as well as the solution space for their upcoming individual design and engineering activities.

These representations were also used to communicate with others, e.g. management stakeholders. By presenting the core of an idea and nothing else, it is clear what had been chosen and what is still open. They have vigour and charm that ensures commitment and invites to participate as so much is left open for the imagination. We observed that these representations incite open dialogues and ample space to explore new aspects. As such, somewhat paradoxically the representations of this category concern both the end of something in a meeting and the beginning of something new in separate tracks.

#### *Category 4: Even better than the real thing*

The last category concerns extremely well crafted representations and models that are aesthetical and pleasing. Consider e.g. photographic renderings of a product; real life models; almost art like kind of scale models; small movies or animations and so on (see Figure 5). The representations recall so-called concept cars that are presented at car shows, to show possible future models, also referred to as projecta's (Buijs 2012). Not only what is represented is made with great care, also how it is shown is deliberately chosen, providing a kind of future reality how the

*The Right Fidelity: designedly representations that enhance multidisciplinary NPD*

object should be seen. For example the lineup of products in Figure 5 is geared to highlight that the products will share the same user interface, which was considered a USP for the firm involved. The representations have an extremely high fidelity as these are often better than the real thing they refer to, namely the future product.

*Figure 5 Three examples of highly stylized representations of a possible future products. On the left (1) an idea is demonstrated to have one user interface across a range of products. In the middle (2) a proposal for a new package design is shown, to leverage the brand. On the right, a proposal for a new design language is demonstrated. When these representations were made, none of these product they refer to were planned.*

Just as the previous category, these visuals and models point towards the future but here represent a very detailed end of a design and development process. These representations serve another goal. Rather than summarizing what has been decided, this is aimed at getting commitment from others, such as getting resources and budget. This category of representations is compelling, clarifying, elegant, coherent, aesthetical, thought provoking. In short: seductive, if not persuasive. All means are employed to ensure that others are convinced something is a good idea. It is not about explaining an idea, it is about ensuring the idea is framed in a particular and preferred way. As such, these representations are basically 'selling' ideas to actors outside the team in social processes aimed at persuading actors from other disciplines or with other roles.

## **Summarizing the findings**

Four categories of representations are discerned that each have contributions as boundary objects in a social dynamic setting of actors, inside and outside teams. Thereby the fidelity of these objects varies across these settings. Consequently, we instilled that the 'right' fidelity of a

representation is situational dependent where the situation is formed by the involved boundaries and aim of the social interactions. In Table 1 an overview of our findings is presented.

Category 1	Category 2	Category 3	Category 4
When every detail counts	A little sketch will do	The essence of an idea	Even better than the real thing
High fidelity	Low fidelity	Very low fidelity	High fidelity
No abstraction allowed	Sketchy	Iconic	Carefully crafted and expressive
Preoccupation with failure	Preoccupation w. problem solving	Preoccupation with converging	Preoccupation with commitment
Sensemaking	Designing	Future framing	Gaining commitment

*Table 1 Comparing four categories of representations of the intended product that serve as boundary object*

The category 1 representations like integrated prototypes are used inside the team when the team experiences doubt and/or uncertainty around an unexpected situation. Or that someone presents e.g., a newly devised or adapted module that needs to be reviewed by all in context with other parts and modules. Such events initiate processes in which teams resort to those representations that best show their collective work at that moment in time and that hardly show any abstraction from that. While assessing the situation, the specialists have a preoccupation with failure, looking for clues that hint at problems or may provide explanations why something doesn't work. They set the problem at hand. Of interest is that the representations pre-eminently refer to *past activities*. For example, a prototype is representing what all team members did in the past and represents those past design decisions that brought them in the situation they are in. The social cognitive process aptly can be named a sensemaking process: the "retrospective development of plausible images that rationalize what we are doing" (Weick et al. 2005).

By contrast, category 2 representations like 'back of the napkin' sketches are used when a problem is well understood and the team engage in solving it. The low fidelity of the representations is needed because the team needs to invent, explore and adapt solutions swiftly; reflect on these and -if necessary - dismiss them. The representations need to be understood by all

and are often abstract and refer to both past activities (such as existing parts) and future activities (such as new parts that need to be developed). Representations serve as boundary objects among the disciplines and permanently are in flux and adapted to the latest insights and ideas. Layers of information are added. This category of representations is closely related to the findings of Ewenstein & Whyte (2009) and Knorr Cetina (2001) on the unfolding ontology of epistemic objects. These representations are deployed when team is in the process of developing a solution for a problem, i.e., when the team is designing.

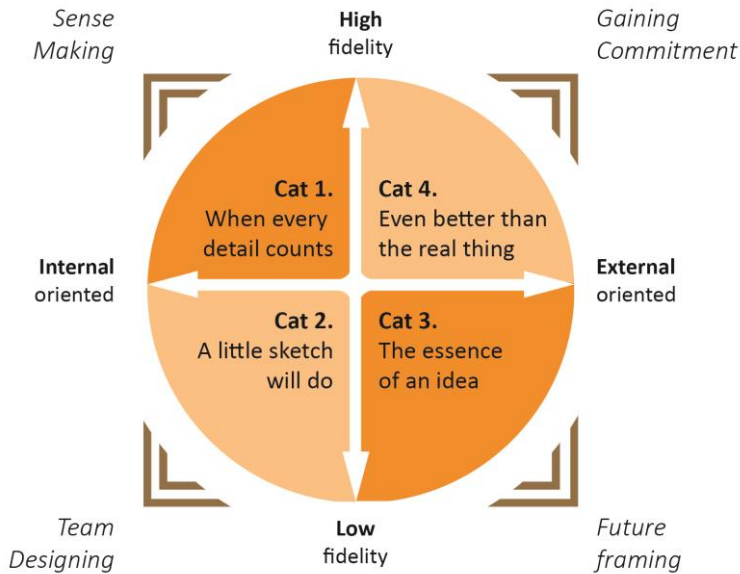

Category 3 representations fit very well in a process in which the robustness of possible lines of action is tested. These representations on the intended product summarize and capture the core of the idea, and consequently provide an agreed on frame for future activities. The process of summarizing is somewhat different from the design process, as the focus shifts from developing solutions to expressing 'what we agreed on what we will create'. Of interest is that these representations capture the essence and nothing more; they have what Weick named the 'charm of the skeleton' (Weick 2004: p.43). The 'skeleton' of a good idea has a vigour and a charm that is persuasive so that individuals can commit themselves; leaves open sufficient space for individuals to explore solutions and is sufficiently constrained so that everybody knows the generic line of thought. This class of representations embodies a frame for future activities without explicitly spelling out what individuals need to do. We see this social process as 'future framing' (Smulders & Brehmer 2011), rationalizing current and future activities.

Category 4 representations seem to have much overlap with the previous category, as these expressive representations also provide a future frame and are the outcome of a design process. However, the aim for these representations are fairly different. The persuasive representations are geared for gaining commitment of others, who are not part of the team. Consider for example management stakeholders who provide budget and resources and sales & marketing actors. Or consider potential future clients. Even though an idea is just premature, it is shown as if it is fully developed so that others commit themselves. A language is used that is easily grasped by all involved. It is harder to explain and reflect on the added value of for example a project description of 100 pages, compared to an expressive picture that 'says it all'.

## Conclusions and implications

The research question we explored in this paper is: what representations have boundary spanning capabilities, how and when? The focus we had was on representations of the intended product. Our findings show that the concept of 'boundary objects' is fruitful to study and explain knowledge work, at least in NPD. What we added to the existing body of literature is that the fidelity of representations that serve as boundary objects inside teams has a relation with the social process a team is in.

We observed that the many representations used throughout multi disciplinary product development have varying fidelity. We categorized these and in Figure 6, a convenient organizing framework is presented. The vertical axis depicts the fidelity of the representation being the degree to which a representation corresponds to the eventual final product. The horizontal axis depicts whether a representation pre-eminently is used inside the team, e.g., to span boundaries between specialists. Or that it is used pre-eminently outside the team, e.g., to span boundaries with stakeholders or other teams. We projected the four categories onto this map, showing (1) that the fidelity of these representations that serve as boundary objects can vary considerably. And (2) that this variation can be observed for representations that are used inside the team and outside the team. Consequently, there is no silver bullet, no representation category that serves boundary spanning independent of its context.

*Figure 6 An organizing framework. An explanation is provided in the text. The vertical axis concerns the fidelity of a representation. The horizontal axis depicts whether a representation is pre-eminently used inside the team, or outside. The four categories are shown, with a relation to observed team processes.*

The process a team is in is an indicator for what kind of representations are useful to the team members. Consequently the 'right' fidelity is an appropriate fidelity for the social process a team is in:

- If teams are in doubt, experience ambiguity, need to review parts and/or modules they hardly know yet: they need to make sense of the situation. The team engages in problem setting and the best representations get as close as possible to the eventual product, providing much detail and that enable team members to interact with it.
- If teams are solving problems, i.e., designing; representations need to have a low fidelity and are highly abstract. Key is that the specialists must be able to make swift cross disciplinary proposals that are ongoing improved, changed, and reflected on. These representations unfold in time.

- If teams 'know' where they are heading, they need to converge and explain each other and others what they will do in the future. We name that future framing: construct a guiding frame for all subsequent activities. Representations need to capture the core of ideas and nothing more. They are robust enough to maintain a common identity, yet are plastic enough to adapt to distinctive specialisms
- If teams need to gain commitment of others, representations are needed that are compelling, self explaining, seductive; if not persuasive.

Expressing the intended product is not merely a translation of a preconceived idea in an appealing visual, but co-shapes what the outcome will be. Also, the message conveyed cannot be seen apart from the way it is expressed. Thus, there is a 'right fidelity' considering the goals and the process a team is in. The implication of these findings for practitioners in NPD teams, such as managers, designers, engineers and so on, is first of all to get awareness for the impact of representations for team processes. And second, awareness of the impact of the fidelity on these processes. If a problem needs to be solved cross disciplinary, flashy renderings of the intended product will not help at all. The other way round, sketches used for problem solving make much sense to the involved team members, may look as incomprehensible, awkward and unprofessional to outsiders. Using an erroneous category for a specific process will not lead to boundary spanning.

## Exploring Collaboration in New Product Development

Nuša FAIN<sup>\*a</sup>, Beverly WAGNER<sup>a</sup> and Fred LEMKE<sup>b</sup>

<sup>a</sup> University of Strathclyde; <sup>b</sup> University of Newcastle

*This paper discusses the relevant literature on collaboration in product development and proposes a framework for exploring collaboration proneness in development processes. The framework proposes valuable insight into managing collaboration in practice, as it provides an evaluation tool for managers to determine their internal team competences and gaps to be addressed. Furthermore, it enables companies to assess potential NPD partners outside company boundaries. A test on an industrial case demonstrates the applicability of the theoretically derived framework to practice.*

**Keywords:** *new product development, cross-functional collaboration, case study*

## Introduction

Innovation is a key driver of competitiveness and economic growth, but nurturing it is a challenging task because it involves multiple and constantly changing actors, linkages between different departments, and dynamics, in terms of collaboration, communication and decision-making. Although academic literature emphasises collaboration and cross-functional integration as determinants of successful innovation, businesses often run into information and coordination problems at the different stages of innovation and product development processes. This means understanding collaboration, coordination and cross-functional integration is essential for effective innovation performance. Academic literature has identified collaboration as one of the key aspects of New Product Development (NPD) effectiveness (e.g., Evanschitzky, Eisend, Calantone, & Jiang, 2012; Gupta, Raj, & Wilemon, 1986; Jassawalla & Sashittal, 1998). Frameworks have been proposed that identify mechanisms relevant for achieving effective collaboration within companies (e.g., M. Song, Kawakami, & Stringfellow, 2010; X. M. Song, Thieme, & Xie, 1998). Furthermore, enablers and barriers of collaboration have been explored. Companies, however, still struggle in achieving internal cross-functional collaboration, and as a result, NPD activities are sub-optimised. This further leads into inadequate collaboration beyond NPD within the company.

This paper takes a holistic approach and identifies factors and dimensions that affect cross-functional collaboration in product development, along with the factors and dimensions that are affected by such collaboration. The assessment contributes to the innovation field through the development of a framework for the analysis of collaboration in product development that can be used in future research and practice, irrespective of context. This paper will begin with a systematic literature review that leads to the outline of a collaboration proneness assessment framework. An extensive pilot study will demonstrate how the framework performs in an actual organisational context and will highlight the vital lessons learned. A fresh outlook for managers and theory builders will be presented in the concluding section.

## Literature review and conceptual framework

Although cross-functional integration has been identified as an important driver of NPD success, it is striking to note that the views of scholars are fragmented in this regard. A literature meta-analysis of peer-

reviewed innovation journals identified more than 50 articles, when searching for the following keywords in title, abstract, and keywords section: cross-functional collaboration, integration, product development. In this analysis, we identified four emerging themes: (1) determining the cross-functional integration gap, (2) determining needed levels of functional involvement in different NPD stages, (3) Influence of integrative mechanisms on integration and NPD performance, and (4) information/knowledge management and integration in NPD. To provide background for the development of the collaboration proneness framework, these themes are further explored below.

### *Determining the Cross-functional Integration Gap – the antecedent*

Early work within the field of cross-functional integration is solely based on the framework proposition that Gupta et al. (1986) put forward. Their framework introduces the cross-functional integration gap and the factors that contribute to it. The propositions that guide the framework are: (1) the degree of integration between R&D and marketing can be assessed by measuring the difference in ideal and achieved levels of integration, (2) the ideal level of R&D-marketing integration is the level that is perceived by R&D and marketing personnel as the one at which the highest possible NPD success can be achieved, (3) the achieved level of R&D-marketing integration is the level of current cross-functional integration as perceived by R&D-marketing personnel (Gupta et al., 1986; M. Song & Thieme, 2006), and (4) the difference between the ideal and achieved levels of integration is referred to as the cross-functional integration gap, and is suggested to directly influence NPD success (Gupta et al., 1986).

Although later studies developed scales to measure and assess the cross-functional gap, little has been done on expanding Gupta et al. (1986) original framework, consisting of the four constructs influencing the cross-functional gap. It is apparent from the reviewed literature that industry competitiveness, firm characteristics and organisational structure and culture influence cross-functional collaboration in early stages of NPD.

Sherman et al (2005), for example, place importance on integration of information from past projects as a contributor to NPD performance, and consequently overall competitiveness. They claim that effective recording of information from past projects and efficient retrieval of that information, coupled with effective cross-functional integration result in improved efficiency in the early and later stages of NPD. Furthermore, firm

characteristics engage with NPD performance as well. Internal integration as a single factor has a negative influence on time performance, but when interacting with vision its effects are positive, meaning that a cross-functional process is not enough for better time performance (Tessarolo, 2007). Top-management support is critical for achieving effectiveness. It will influence individual behaviour within the team through the creation of social cohesion; however, cultural aspects also need consideration. For example, US and UK goal incongruity is attributed to motivational factors, whereas in Japan and Hong Kong to facilitative factors (Xie, Song, and Stringfellow, 2003). This means that effective integration is also linked to culture and change management and for the processes to be effective, these need to be considered prior to project development.

### *Determining Needed Levels of Functional Involvement in Different NPD Stages – the structure*

More recent studies can be divided into two separate streams, following the example of Ernst, Hoyer, and Rübssaamen (2010): behavioural and attitudinal. The former deals with information sharing between the studied functions in NPD, whereas the latter is focusing more on the level of cooperation between functions in the sense of common goals, shared resources and common vision. In this paper both aspects of integration, are combined, as both, information sharing and collaboration are understood to be important parts of successful NPD (L. P. Cooper, 2003). Furthermore, the process-oriented perspective has been widely researched, as cross-functional integration has been extensively studied within different NPD stages (e.g., X. M. Song et al., 1998). There is, however, no consensus on what exactly the NPD stages are. X. M. Song et al. (1998), for example, presume that the core of any manufacturing company usually consists of three major functions, namely R&D, manufacturing and marketing and therefore, the focus is on defining and investigating NPD stages. They identify market opportunity analysis, planning, development, pretesting and launch as the main NPD stages (X. M. Song et al., 1998). By contrast, the NPD literature (e.g. Cooper 2003) focuses on scoping, building a business case, development, validation and launch with important intermediate gate reviews. Every study defines the stages in unique ways, which hampers benchmarking the outcomes.

NPD success is more likely when the companies employ function-specific and stage-specific patterns of cross-functional integration (Song, Thieme

and Xie, 1998), which means that both customer and departmental requirements need to be considered when engaging with NPD projects.

Integration in teams has a positive relationship to NPD performance. Social cohesion, superordinate identity, market-oriented reward system, formalization of planning, and encouragement by management are positively associated with integration (Nakata and Im, 2010). Senior management policies can enhance the level of involvement between different NPD functions and can improve the likelihood of NPD success. The effects, however, depend on national culture, for example, team leader autonomy, team rewards and job rotation are effective in US, but not Japan (M. Song et al., 2010). Formalizing integrative mechanisms in terms of policy practices and structures facilitates inter-functional communication and knowledge diffusion. Established stages of the process further enable clear understanding of roles and responsibilities, making it clear to the team where their expertise is paramount for success (Cooper, 2003).

### *Influence of Integrative Mechanisms on Integration and NPD Performance – the process*

Recent literature suggests environmental uncertainty as one of the major factors contributing to the need for integration. Interestingly, it actually does not play a major role in fostering cross-functional integration in NPD. Thus, the focus of research should shift from investigating external influence factors towards a better understanding of the links and their effects internally (Calantone & Rubera, 2012). The centre of research attention is therefore shifting towards understanding what factors influence the cross-functional collaboration internally and how they can be manifested to aid better NPD performance. The initial propositions with regard to the so-called 'integrative mechanisms' have been put forward by Gupta et al. (1986), but have not been expanded since. The literature suggests several important mechanisms for integrating marketing and R&D (Lu and Chang, 2002; Maltz and Kohli, 2000; Song and Thieme, 2006; Garrett et al., 2006). Depending on the criteria used, these mechanisms are often classified differently (Griffin and Hauser, 1996; Cordon-Pozo et al., 2006). The most widely used mechanisms are formalization, centralization and organizational climate, along with joint reward systems and social cohesion (e.g., Nakata and Im, 2010). Although widely researched, there is still no agreement on the direction these influences have on firstly, cross-functional integration and secondly, NPD performance. Parry and Song (1993), for example, have discovered that formalization may aid R&D-marketing

integration by reducing role conflicts. But it may also impede integration by restricting the flow of information. Especially in SMEs effective organizational structures and management development activities tend to be more informal (Grey and Mabey, 2005). Formality of policies, strategies and structures is commonly associated with large firms. Other authors proposed formalization as a mechanism with positive effect on integration because it facilitates inter-functional information transfer, improves the awareness of that information by team members, reduces and prevents conflicts between the functions, reduces ambiguity throughout the NPD process and improves cooperation between departments (Ruekert and Walker, 1987; Cordon-Pozo et al., 2006). Similarly, centralisation and organisational climate have had mixed findings in different studies (e.g., Fain et al 2011; Song and Thieme, 2006) and have, moreover, not been investigated beyond cross-functional collaborations. As Nakata and Im (2010) recently point out, the effects of such integrative mechanisms on building fully successful NPD teams is still under-researched.

In line with the antecedents and structure, several practices can be employed to enable effectiveness in the process, such as lessons learned, project management, clear information storage facilities and effective teamwork.

Cross-functional integration can be enhanced by actions of senior management and diminished by goal incongruity (Parry et al 2010). Different project management practices can help support alignment of goals and processes, such as detailed plans, active participation of the team in developing plans and autonomy to respond to unanticipated issues (Thieme, Song, & Shin, 2003). Furthermore, activities, such as formal audits and memos contribute to effective retention and application of knowledge developed in prior NPD projects. This facilitates knowledge retention and learning from past projects. Activities that promote interpretation of knowledge in the firm's strategic context help uncovering new applications of existing knowledge and directly increase NPD performance (Marsh & Stock, 2006), confirming links between situational, structural and outcome dimensions in NPD.

### *Information/Knowledge Management and Integration in NPD – the outcomes*

By implementing virtual teams into the NPD, organizations get a greater spectrum of expertise. This process can involve experts beyond the boundaries of their organizations and even geographical area and

consequently, the NPD effectiveness level can be influenced. With organizing and distributing human resources in the virtual environment, all team members are able to contribute their abilities as much as possible. By the same token, the organisation can acquire, develop and deploy knowledge as a resource in a dynamic way. Superior performance is often the result when organisations use their capabilities in these new ways (Tseng and Abdalla 2006). Due to fast development of Information and Communications Technologies (ICTs) and other NPD aiding technologies, the question of knowledge management and information sharing has become of great interest within the field of cross-functional cooperation in NPD. Song and Song (2010), for example, study the moderation role of ICTs in NPD and cross-functional integration. They find that ICTs can be used to reduce the negative impact of physical separation and cultural differences and therefore, play a strong moderating role in R&D-marketing integration. Furthermore, ICTs can help in acquiring information from past projects and as Sherman et al. (2005) conclude contribute to NPD performance. They find that effective recording of information and its efficient retrieval contribute to stronger integration of functions and consequently, to greater NPD success.

The integration of the above constructs into an effective NPD project result in the following outcomes: product profitability, enhanced NPD performance and higher levels of team integration. This consequently means that cross-functional teams positively impact organizational performance through their innovativeness, particularly in cost-leadership organizations (Engelen and Brettel, 2012).

Cross-functional integration substantially impacts product profitability through a mix of direct and mediated effects (McNally, Akdeniz, & Calantone, 2011). Trade-offs are made between time, quality and expense and although speed to market and product quality enhance product profitability, they also partially mediate the impact of fuzzy front end expenses on product profitability (Brettel, Heinemann, Engelen, & Neubauer, 2011).

The framework presented in figure 1 summarizes the discussed literature and identifies four key dimensions that impact cross-functional collaboration, namely antecedents, structure, process/enablers and outcomes.

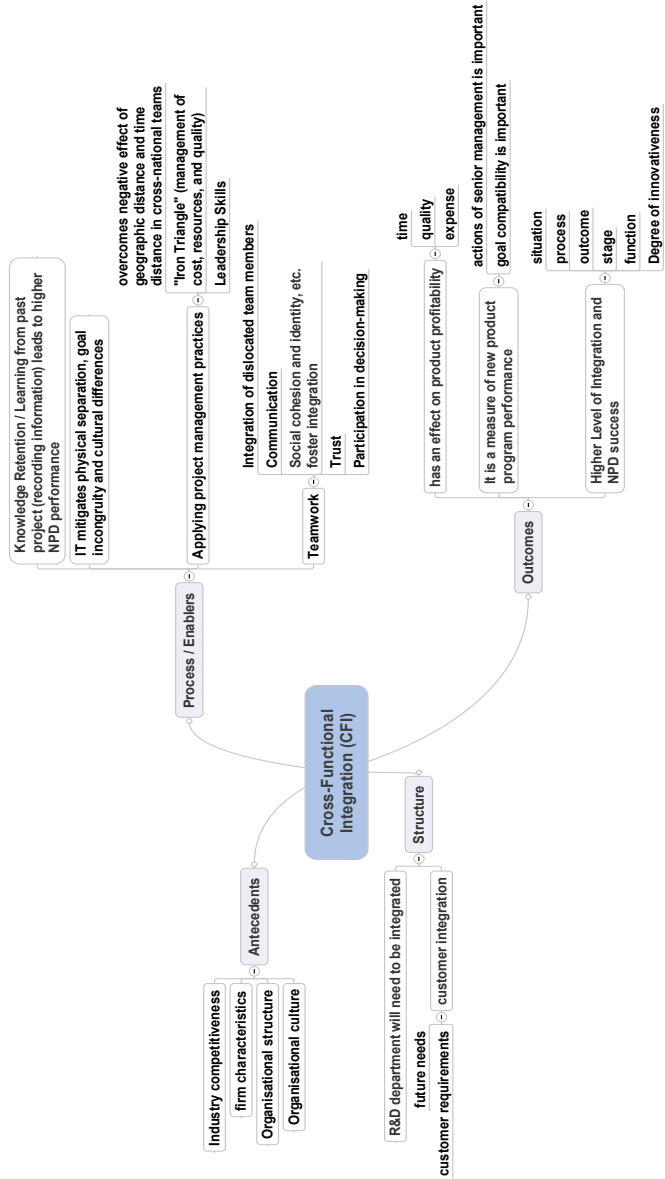

Figure 1: Conceptual framework for cooperation proneness

## Context and methodology

Based on the above framework a research protocol was derived to test its validity on an industrial case. The company involved, is a heavy-manufacturing organisation, focusing on development of bespoke high-tech products for a variety of industries and customers. The approach taken for the purposes of this case study was qualitative, integrating semi-structured interviews with content analysis of secondary sources for data triangulation.

The interview guide was derived from the key literature themes and was based on semi-structured questions focusing on industry characteristics, company structure and culture, team processes and NPD enablers, along with an assessment of relevant outcomes within the company (Griffin 1997; Kahn 2006; Kester 2011). Ten interviews were conducted with key stakeholders within the case company, including the project manager, marketing manager, production design and development manager, chief engineer, general sales manager and technology director. The interviews ranged from 30 minutes to 2 hours and resulted in around 100 pages of transcripts.

Company reports and operating procedures complemented preliminary interview data. The combination of such techniques enabled examining current state within the company, matching the empirical data to the proposed framework and its alignment with the company needs.

## Findings and discussion

The key theme discussed with the interviewees within the company was the effectiveness of cross-functional integration in their product development processes. It was determined at the outset of the conversations, that cross-functional integration is based on informal rules and regulations, mostly on team participant's good will. As outlined by the project manager *"It is quite a dynamic thing... Basically you bring people when you need them."* Cooperation and information exchange is not strong enough under such a loose structure. As one of the interviewees said, *"Manufacturing won't know what to manufacture. Sales and marketing, what happens to them? Do people have a forward view of where they want to go with their products?"* Ensuring engagement of all relevant stakeholders throughout the whole NPD procedure is seen as critical in best practice literature (Page 1993; Griffin 1997), but is currently not given high enough priority in the company. As outlined in the proposed framework, this consequently means that there may be a disconnection between the

four key constructs (antecedents, structure, process/enablers and outcomes) for effective cross-functional integration.

Interestingly enough, the industry characteristics may have a major role in this potential disconnect, as described by one of the interviewees *"It should be in mind that a lot of our competitors haven't changed any of their technology either within the period of the last 25 -30 years. They are not changing because they are not required to change."* Keeping the technology stagnant ultimately means that the need for cross-functional integration might be low in this sector. The literature identifies industry competitiveness as a relevant antecedent of cross-functional integration in NPD. Consequently, this case demonstrates the significance of the industry context as a principle influencing factor for NPD in this organisation. This is further supported by the marketing manager's claim that *"Everything we do just now I think is common sense; it's been through experience and learning what's been involved. But we don't have any pre-defined tool set that we can apply."*

There seems to be no drive for change from the industry and customer side. Thus, the need for a clear formal structure and process is not seen as a priority in the company. This is supported by the claim: *"It is a mature market. The first one who takes that big giant step is very brave indeed..."* and further strengthened by the notion that most of the NPD activities are undertaken in a relatively informal way. Large manufacturers in mature markets often face the inability to match resources, strategy, technology, etc. with new products (cf. Dougherty & Hardy, 1996), which may explain why the NPD process of our case company has not become business-as-usual. The NPD activities including idea generation, development, and review points are predominately driven by individual projects and are not standard practice. Idea generation, for example, has been limited to a single workshop, resulting in prioritizing ideas: *"There was an idea generation workshop that took place with representatives of most of the business units, and supply chain as well. There were like 300 ideas identified, which were then ranked in order of priorities and impacts."* This company approach diverts from best practice literature: the NPD process should be structured around customer needs to guide successful product ideas (R. G. Cooper & Kleinschmidt, 1987; Maidique & Zirger, 1984) [Griffin 1997] and a balance of 'newness' among projects helps manufacturers to remain competitive in the long-term [Edgett 2011; Griffin and Page1996]. On the other hand, although the processes employed are rather informal, the support of the senior management mediates the effectiveness of the outcomes. As the project

manager stresses “*we had a commitment from the managing director of that business unit to support the particular designer assignment. It tends to be that projects driven by customers’ needs have slightly higher priority*”.

## **Implications and conclusions**

The framework of cross-functional proneness outlined on the basis of a structured literature review presented four key constructs relevant for effective cooperation: antecedents, structure, process, and outcomes. The influence of these constructs has been tested within an industrial environment to firstly examine their relevance for practice and theoretical implications arising from this. The framework proposes valuable insight into managing collaboration in practice, as it provides an evaluation tool for managers to determine their internal team competences and gaps to be addressed. Furthermore, it enables companies to assess potential NPD partners outside company boundaries.

The case has shown that all four constructs contribute to cross-functional integration. It is interesting to note that respondents recognise the impact of antecedents on NPD performance (e.g., organizational structure, etc.) and these seem to drive the NPD procedure and influence remaining constructs. However, the stagnant competition in the heavy-manufacturing industry (i.e., another antecedent) is overriding the organisational need and management efforts to fully integrate functions across the organization. It appears that manufacturers are satisfied with their relative NPD performances, explaining inertia within this particular sector. Effective leadership serves as the key enabler to formalize structure and consequently influence the innovative nature of project outcomes. Through such actions they are balancing their NPD performance, enhancing their internal collaboration proneness. Future research will have to look at other industry settings to help formalise theory development in this area. With regards to our case company, it would be interesting to see what happens when one manufacturer begins to utilise its full collaborative potential to drive NPD to the next level.

# Do Designers and Managers Complement Each Other? The influence of cognitive style on product performance

Kasia TABEAU<sup>\*a</sup>, Gerda GEMSER<sup>b</sup>, Erik Jan HULTINK<sup>a</sup> and Nachoem M. WIJNBERG<sup>c</sup>

<sup>a</sup>Delft University of Technology; <sup>b</sup>RMIT University; <sup>c</sup>University of Amsterdam

*Prior research suggests that designers may complement managers in achieving successful innovation outcomes because of their different ways to approach problems and opportunities. Designers have, for example, been ascribed characteristics such as being explorative, future oriented and intuitive, while managers have been described in terms of a preference for exploitation, driven by the past and being rational. There is, however, not much empirical research that examines whether designers and managers indeed think differently and how this affects innovation outcomes. We attempt to fill this gap in the literature by examining how designers' and managers' cognitive styles (in terms of creativity, conformity, and attention to details) influence outcomes of innovation projects. Our results indicate that conformist managers enhance financial product performance, while creative designers contribute to higher levels of success by developing products that are both unique and of high quality. Moreover, designers' and managers' cognitive styles complement each other, indicating that for higher levels of product performance creative designers should not conform to rules and conformist managers should not be creative. However, our results also indicate that product performance is enhanced when designers and managers are both attentive to details, indicating that these professionals supplement each others' abilities as well.*

**Keywords:** Designers, managers, cognitive style, co-worker fit, product advantage, financial product performance.

## **Introduction**

To gain and sustain competitive advantage, more and more organizations rely on innovation (Song, Im, Bij, and Song, 2011). Successful innovation requires the generation of new ideas and the implementation of these ideas into new products, services or processes (Amabile and Fisher, 2009). Designers can effectively assist companies in the development and successful implementation of innovation (Abecassis-Moedas and Benghozi, 2012; Dell'era and Verganti, 2009, 2010; Perks, Cooper, and Jones, 2005). The effectiveness of designers in innovation has, in part, been attributed to designers' unique orientation towards the work at hand, and the mental attitude with which problems are approached and situations responded to. Indeed, "design thinking" has gained considerable attention in the management literature, since designers seem to contribute to innovation in ways managers cannot (Hassi and Laakso, 2011; Micheli, Jaina, Goffin, Lemke, and Verganti, 2012). Designers are described as being explorative, ambiguity tolerant, positive, future oriented and intuitive (Hassi and Laakso, 2011). Beverland and Farrelly (2011) suggest that designers view the environment as mutable, change as radical and exiting, knowledge as intuitive and the future as the driver of the present. This mentality is different from that of individuals working in business functions who tend to view the environment as fixed and view change as incremental, knowledge as measurable and the past as basis of their decisions for the present (Beverland and Farrelly, 2011).

Even though prior research suggests that designers and managers have different mentalities, there is not much empirical evidence that designers and managers indeed differ in mentality and the effect this has on innovation outcomes. This research sets out to explore this topic, and focuses at how these professionals' cognitive styles (in terms of creativity, conformity and attention to details) influence financial product performance. Cognitive style is a person's "preferred way of gathering, processing, and evaluating information" (Hayes and Allinson, 1998, p. 850), reflecting how individuals approach problems, process information and learn (Miron-Spektor, Erez, and Naveh, 2011). When interpreting design thinking as a mentality that indicates how individuals approach problems and respond to situations, cognitive styles are a good representation of this mentality.

The purpose of this study is to explore (i) how managers' cognitive styles influence financial product performance, (ii) how designers' cognitive styles

influence financial product performance and (iii) how the two actors complement each other in achieving these innovation outcomes. We test our hypotheses by using a dataset of 83 innovation projects in which new products and services were developed in cooperation with an external designer. The dataset contains the responses from both the external designer and NPD manager that were involved in the project (n=166, 83 designers and 83 managers). The results from our PLS structural equation model show that for higher levels of financial product performance, designers should be creative (and not conformist) and managers should conform to rules (and not be creative), indicating that the two professionals complement each other. However, our results also show that both designers' and managers' attention to details is important for higher levels of performance, showing that they supplement each other's abilities as well.

This paper is structured as follows. First, we discuss the theoretical background and present our hypotheses. We then present the method and discuss our results. In the final section we give conclusions, the limitations of our study and directions for future research.

## **Theoretical background and hypotheses**

### *Cognitive styles*

Cognitive style refers to the process of problem solving rather than the content of the activity (Hayes and Allinson, 1994; Miron-Spektor et al., 2011) and describes how people "perceive, think, solve problems, learn and relate to others" (Hayes and Allinson, 1994, p. 53). Prior research has described individuals' cognitive style in terms of two extremes, such as intuition and analysis (Allinson and Hayes, 1996) or adaption and innovation (Kirton, 1976). This aggregation of the dimensions of cognitive style into one continuum with two poles, however, has been criticized since such a division can mask the effects of the underlying attributes on performance (e.g. Payne, 1987). In response to this criticism, Miron, Erez, and Naveh (2004) developed and tested a three factor structure of cognitive style. The authors examine cognitive style in terms of creativity, conformity, and attention to details. Creativity refers to individuals' ability to identify problems, reframe them and come up with many solutions (Miron-Spektor et al., 2011; Miron et al., 2004). Individuals who conform to rules seek consensus and generate ideas which will be likely to be accepted by their group (Miron-Spektor et al., 2011; Miron et al., 2004). Finally, those that are attentive to details are efficient, reliable, systematic and precise.

We hypothesize that the cognitive style of managers responsible for new product development (NPD) projects will directly influence the financial performance outcomes of these projects. Managers are involved in the organization of innovation projects by controlling, among other things, the budget and planning (Bonner, Ruekert, and Walker Jr, 2002), and by determining product pricing to ensure profitability (Beverland, 2005; Beverland and Farrelly, 2011). Therefore, we expect that managers' cognitive style influences the extent to which the product is effectively and efficiently implemented. We assess that managers' creativity will have a negative influence on financial product performance. Creative individuals tend to follow an unstructured and unorthodox process when developing solutions to complex problems (Amabile and Fisher, 2009; Cummings and Oldham, 1997). Moreover, they tend to navigate away from what is already known (Amabile and Fisher, 2009; Cummings and Oldham, 1997) and prefer to develop radical solutions (Miron-Spektor et al., 2011) which may be difficult to integrate within the organization (Bear, 2012). These characteristics often result in inefficiency (Kirton and De Ciantis, 1986), which in turn will negatively affect financial product performance. We assess that managers' conformity to rules and group norms will have a positive influence on financial product performance. Managers who conform to rules and norms will be focussed on solutions which will be accepted by their organization, creating support for these solutions and ensuring these solutions fit with organizational resources (Kaplan, Brooks-Shesler, King, and Zaccaro, 2009). Moreover, conformists are likely to abide to project planning and budget since they consider rules and regulations important (Miron-Spektor et al., 2011; Miron et al., 2004), aiding how efficient the project is implemented and stimulating financial product performance. Finally, we assess that managers' tendency to pay attention to details will have a positive influence on financial product performance. Managers who are attentive to details are thorough, efficient and enjoy improving rather than changing the status quo (Miron-Spektor et al., 2011; Miron et al., 2004). These characteristics aid in bringing an innovation to the market quickly, which will positively influence the financial performance of the innovation.

Therefore:

H1A. Managers' creativity has a negative influence on financial product performance.

H1B. Managers' conformity has a positive influence on financial product performance.

H1C. Managers' attention to details has a positive influence on financial product performance

Designers are usually not directly responsible for business aspects that have a direct effect on financial product performance such as price setting, budget and planning. This is particularly true for external designers. Rather, designers will influence, above all, the qualities and features of the outcome itself (Beverland, 2005; Beverland and Farrelly, 2011). Therefore, we propose that designers' cognitive styles do not directly influence financial product performance but do contribute to successful innovation through the development of product advantage. Product advantage is the extent to which an innovation is unique, superior at meeting customers' needs and has a better quality than competing products (McNally, Cavusgil, and Calantone, 2010). Designers' creativity will have a positive influence on product advantage since creativity enhances innovativeness (Miron-Spektor et al., 2011). As described above, creative individuals enjoy developing radical solutions (Miron-Spektor et al., 2011) and they tend to navigate away from what is familiar (Amabile and Fisher, 2009; Cummings and Oldham, 1997), enhancing the development of uniqueness in the solution. Designers' conformity to rules and group norms will on the other hand result in less innovative outcomes. Conformists are strong at developing products that are likely to be accepted by their group (Kaplan et al., 2009; Miron-Spektor et al., 2011; Miron et al., 2004). This suggests that conformist designers may be more incremental in their ideas, proposing ideas that meet current customer needs, rather than trying to develop future customer needs. Designers' conformity might thus result in developing products that resemble what is already on the market, reducing product advantage. Designers' attention to details will have a positive influence on product advantage since attention to details enhances reliability (Miron-Spektor et al., 2011; Miron et al., 2004). Those individuals that are attentive to details are thorough, they focus at small details of the task (Miron-Spektor et al., 2011; Miron et al., 2004) and as such can ensure that the quality of the final solution is better than that of competing products. Therefore, we propose:

H2A. Designers' creativity has a positive influence on product advantage.

H2B. Designers' conformity has a negative influence on product advantage.

H2C. Designers' attention to details has a positive influence on product advantage.

### *Person – environment fit*

Person – environment fit theory explains how the fit between individuals and their environment influences their performance (Kristof-Brown, Zimmerman, and Johnson, 2005). For example, the more individuals fit the requirements of a job they have to perform, the higher their satisfaction and performance in this function (Chilton, Hardgrave, and Armstrong, 2005). The environment of the individual may include, for example, the organization someone works in, the team someone is part of or direct co-workers (Kristof-Brown et al., 2005). In this research, we focus on the fit between co-workers. Examples include subordinates and supervisors, mentors and protégées and salespeople and their managers (Kristof-Brown et al., 2005). In this research, we focus on the dyadic relation between designers and managers, where managers represent the environment in which the designers have to perform. Depending on the type of dyadic relation, there are two types of fit that can play a role in performance outcomes: *complementary fit* and *supplementary fit* (Kristof-Brown et al., 2005). Complementary fit refers to the situation where co-workers have an offsetting pattern of characteristics, and reflects a situation in which one person has what the other needs (Kristof-Brown et al., 2005). Complementary fits plays a large role in performance when the exchange of resources or services between individuals is key (Kammeyer-Mueller, Schilpzand, and Rubenstein, 2012). Supplementary fit is reflected by a situation in which co-workers share similar characteristics, ensuring the harmonious relation between these two actors (Kammeyer-Mueller et al., 2012; Kristof-Brown et al., 2005).

We expect that complementary fit between the designer and manager will play a large role in achieving good product performance outcomes since designers and managers each will have different capabilities and skills due to training and experience (e.g. Abecassis-Moedas and Benghozi, 2012; Dell'era and Verganti, 2009, 2010; Perks et al., 2005). In the case of innovation projects in which external designers are hired, designers may actually be selected based on their complementary knowledge and skills. In line with complementary fit principles, we expect that higher levels of product advantage will be achieved when designers and managers complement each other in their creativity: i.e. when one actor is highly creative and the other

is not. When both actors are creative, the project may focus at developing new solutions, a strength of creative individuals (Miron-Spektor et al., 2011; Miron et al., 2004), but fail to implement those solutions. Conformity to rules and group norms will ensure efficiency but will also result in 'me-too' products that do not provide superior product advantage. When both the designer and manager conform to rules, they will not challenge each other (Nemeth and Goncalo, 2005) and will not challenge what the customers want anymore, which will negatively influence product advantage. Therefore, we also expect that the designers and managers should complement each other for higher levels of performance: i.e. one actor should conform to rules, while the other should not. While attention to detail is important for higher levels of product quality, we expect that when both the designer and manager have high levels of attention to detail, the project will revolve around improving characteristics of competing offerings rather than developing unique offerings (Miron-Spektor et al., 2011). Therefore, we again expect that when designers and managers complement each other, product advantage will be positively influenced. Thus, we propose:

H3A. The extent to which designers and managers complement each other in terms of creativity has a positive influence on product advantage.

H3B. The extent to which designers and managers complement each other in terms of conformity has a positive influence on product advantage.

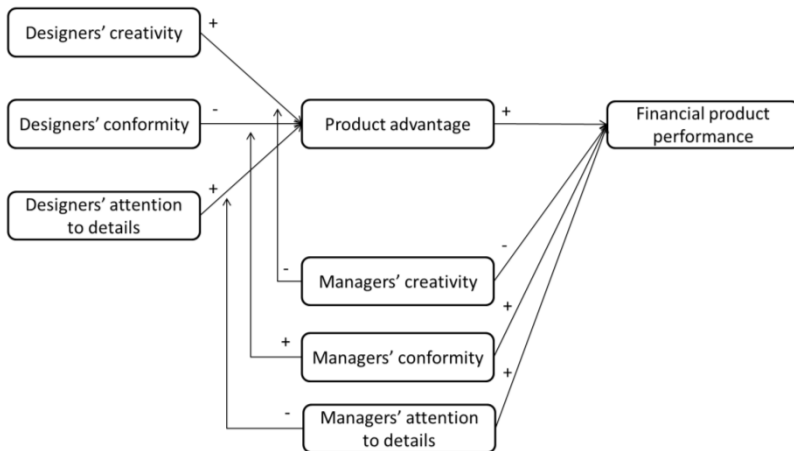

H3C. The extent to which designers and managers complement each other in terms of attention to details has a positive influence on product advantage.

Even though we do not propose formal hypotheses, we expect that designers should have high levels of creativity (and low levels of conformity and attention to details), while managers should be conformist and attentive to details (and not creative). This constellation will be most beneficial for financial product performance since designers' creativity will result in unique products and managers' will complement them to ensure that their conformity and attention to details stimulate the development of products that are of high quality.

Our final hypothesis concerns the influence of product advantage on financial product performance. In line with prior research, we expect that those products that are both unique and have higher levels of quality will

have higher level of financial product performance (McNally et al., 2010). We therefore propose:

H4. Product advantage has a positive influence on financial product performance.

The research model is presented in Figure 1.

Figure 1: Research model

## Methodology

### *Procedure*

The empirical focus was on innovation projects completed together by innovating organizations and design consultancies located in The Netherlands. The data collection procedure consisted of three steps: finding participants, selecting appropriate innovation projects and collecting data through an online survey, which all were completed between November 2012 and January 2014. To identify suitable participants for our study, we created a list of Dutch design consultancies, consisting of 227 organizations. We contacted the senior managers of these design consultancies by phone and, if they were willing to collaborate, asked them to select three or less collaborative innovation projects for our study that were completed in the past three years. This resulted in a list of 113 projects and, for each project,

contact-information of the senior design consultant working on the project and of the manager of the innovating firm. We collected our data through an online survey. To increase the response rate, we first contacted all respondents by phone to ensure their participation and to explain the research. In the end, we received 213 surveys, resulting in 103 matched designer–manager dyads (for seven projects, only one respondent answered). Of these 103 dyads, we had to drop 20 due to missing performance data, resulting in a final sample of 83 projects.

### *Sample*

The majority of the projects were completed between 6 months and two years (78.3%), had a budget between 50.000 and 1.000.000 Euros (63.8%) and the project team (i.e., the number of individuals that were involved in the project at the design consultancy and innovation organization together) was usually between 3 and 10 FTE (63.9%). The designers in our sample had an average of 17 years of working experience, are mostly males (78.3%), and an average age of 41 years. NPD project managers on average had 20 years of working experience, were also mostly males (75.9%), and were on average 44 years old.

### *Measures*

#### **Dependent variables: financial product performance and product advantage**

We operationalized financial product performance as the extent to which the innovation outcome met margin, profitability and return on investment goals (Griffin and Page, 1993). Product advantage was operationalized as the extent to which the innovation outcome offered unique attributes or performance characteristics, met customer needs in a superior way and had a superior quality as compared to competing products (McNally et al., 2010). Both constructs were measured on a 7-point Likert scale.

#### **Independent variable: cognitive style**

We operationalized cognitive style in terms of creativity, conformity to rules and group norms, and attention to details and adopted a 7-point Likert scale from Miron et al. (2004) to assess each dimension of cognitive style with four items.

### **Measurement validation**

We used our sample of 166 respondents to conduct a confirmatory factor analysis on all items pertaining to the main model. After deleting four items pertaining to the cognitive style construct due to low factor loadings, we obtained a model with a good fit ( $\chi^2 = 85.76$  d.f. = 67, goodness-of-fit index (GFI) = 0.93, comparative fit index (CFI) = 0.98, root-mean-square-error of approximation (RMSEA) = 0.04), in which all constructs have acceptable reliability and validity. All constructs have a composite reliability (CR) which is larger than the critical value of 0.70 (Hair, Black, Babin, and Anderson, 2010). Moreover, the CR is larger than the average variance extracted (AVE) for all constructs. The AVE is higher than the critical value of 0.50 (Hair et al., 2010). Finally, the maximum variance shared (MVS) and the average variance shared (AVS) are smaller than the AVE for all constructs in our study, giving indication of discriminant validity (Hair et al., 2010).

### **Common method bias**

We used a CFA based version of Harman's single factor test to evaluate whether common method bias is a problem in our study. A model in which all variables loaded on one construct had the following fit:  $\chi^2 = 655.82$ , d.f. = 77, GFI = 0.62, CFI = 0.32, RMSEA = 0.21,  $p < 0.005$ . This model is significantly inferior to our initial model, indicating that common method bias is not a major problem (cf. McNally et al., 2010).

## **Analysis and results**

### *Descriptive statistics and bivariate correlations*

Table 1 presents the descriptive statistics for our constructs. This table shows, among other things, that financial product performance is significantly and positively correlated to product advantage. We also find significant positive correlations between financial product performance and managers' conformity and between product advantage and designers' creativity.

### *Structural equation modeling*

We analysed our data by using partial least squares (PLS) structural equation modelling. When creating our structural model, we used the response of the managers for financial product performance as they are better informed of how financially successful the innovation was. We used

the average score of the designers' and managers' answers to reflect product advantage since both professionals can give an estimation of how the innovation compares to competing products. Next, the cognitive style responses were obtained from the designers and managers themselves (i.e. designers answered the questions about their own cognitive style).

Table 2 gives a summary of the hypothesis testing, including the signs and significance of the paths in our models. In the sections below, we elaborate on these results and the hypotheses we tested, while a detailed description of the structural model can be found in Appendix 1.

### **The influence of managers' cognitive styles on financial product performance**

Our results show no significant influence of managers' creativity and attention to details on financial product performance and thus we had to reject hypotheses H1A and H1C. H1B is confirmed since managers' conformity indeed enhances financial product performance.

*Do Designers and Managers Complement Each Other? The influence of cognitive style on product performance*

### **The influence of designers' cognitive styles on product advantage: the moderating role of managers' cognitive styles**

As hypothesized, we found that designer's creativity has a positive influence on product advantage, providing support for H2A. H2B was supported as well, showing that designers' conformity diminishes product advantage. We did not find a significant influence of designers' attention to details on product advantage, which caused us to reject H2C. To assess the complementary fit between designers and managers, we created interactions between their cognitive styles, which is a procedure common in research on person-environment fit (Kristof-Brown et al., 2005). We first studied the direct effect of managers' creativity, conformity and attention to details on product advantage, after which we examined their interactions with designers' cognitive styles. Our results show that managers' creativity does not have an effect on product advantage, while their conformity diminishes and their attention to details enhances it (see Appendix 1). While managers' creativity does not directly influence product advantage, their level of creativity does seem to moderate the relation between designers' creativity and this outcome. In line with our expectations, we found that managers' creativity diminishes the effect of designers' creativity on product advantage. These results indicate that designers and managers should complement each other's creativity, enabling us to accept H3A. We however have to reject H3B since designers' conformity to rules seems to be detrimental to product advantage and managers' conformity strengthens this effect. We concluded earlier that designers' attention to detail does not influence product advantage, but in subsequent analyses we found that this relation is moderated by managers' attention to detail: designers' attention to detail has a positive effect on product advantage when managers' attention to detail is high rather than low, indicating a need for supplementary fit between the professionals. Finally, our results indicate that product advantage enhances financial product performance, thus H4 is supported.

## **Discussion**

This research shows that designers' creativity pays off: the ability to reframe problems and come up with original solutions results in products that have unique attributes or performance characteristics, and such products have higher levels of financial performance. We build on the

findings of Miron-Spektor et al. (2011) by showing that creative individuals deliver solutions that are unique and of high quality. Moreover, our results suggest that, to optimize outcomes, creative designers should collaborate with managers' with low levels of creativity. Our findings also suggest that managers' creativity does not directly influence financial product performance, even though prior research suggests a negative relation between the two (e.g. Bear, 2012).

Our research also suggests that designers' conformity to rules and group norms has a negative influence on product advantage. Conformist designers may conform too much to current needs and wants, and as such may be unable to develop solutions that have high levels of uniqueness. Our results indicate that designers that do not adhere to rules and do not think about the acceptance of their ideas by the organization should collaborate with conformist managers for higher levels of performance. This will result in high product performance since the direct positive effect of conformist managers on financial product performance is stronger than the negative interaction effect of designers' and managers' conformity. Indeed, managers' conformity seems to positively influence financial product performance, which is in line with what prior research suggests (e.g. Kaplan et al., 2009).

As regards to attention to details, designers and managers should supplement rather than complement each other. Designers' attention to details in itself does not influence product quality. Apparently, only when both actors are able to supplement each other in terms of what aspects of the product could and should be improved, product advantage is created. Finally, even though prior research suggests that attention to detail directly influences financial product performance (e.g. Naveh and Erez, 2004), our findings based on NPD managers' cognitive style suggest that this is not the case.

## **Implications**

Our findings have important implications for organizations that seek to hire external designers in the context of new product and service development. Our results show that for higher levels of financial performance of the product, it is important to consider the cognitive styles of external designers and the NPD managers they will collaborate with. For high levels of performance organizations may want to select designers with high levels of creativity and attention to details and low levels of conformity.

These types of designers should subsequently collaborate with NPD managers that conform to rules and have high levels attention to details.

## Limitations and future research

Our results shed light how designers' and managers' cognitive styles influence and complement each other for higher levels of financial product performance. There are, however, some limitations to our study that provide interesting avenues for future research. First, the professionals' cognitive style was based on their self-reported scores. Future research can use the answers of a third respondent, an individual who knows the professionals well, to assess cognitive style. Second, this research focuses on cognitive styles and product performance outcomes. Designers' and managers' cognitive styles may, however, also have effects on process performance outcomes. Finally, we focussed at how external designers and managers complement each other and influence product performance: future research can study the collaboration between internal designers and their managers.

*ACKNOWLEDGEMENTS: We would like to thank the Creative Industry Scientific Program and the Dutch Ministry of OCW for their financial support.*

## **Appendix 1: Results from the structural equation model**

The results from the structural model are shown in Table 3 and 4. Table 3 shows the influence of product advantage and managers' cognitive styles on product performance, while Table 4 details the stepwise inclusion of designers' cognitive styles, managers' cognitive styles and their interaction and their influence on product advantage. For the sake of clarity: the results in Table 3 and 4 come from the same model but to simplify interpretation they are presented in two tables.

# Making Design Explicit in Organisational Change: Detour or Latour

Michael Pierre JOHNSON\* and Lynn-Sayers McHATTIE

The Glasgow School of Art

*This paper explores a Latourian approach in addressing the challenge for Design Management to integrate design strategically within small, medium enterprises (SMEs). Design thinking's positioning towards providing an accessible and open process for organisational change is argued to currently manifest a rhetorical detour around the role of design practice. The proposal is that the role of design can be expressed in the repeated interactions between participants and design artefacts, and how these are then translated into the organisation.*

*The paper uses a case-study method to produce a situated account of design work within a strategic design intervention with an SME. Drawing on Latourian principles around actor-network theory (ANT), observations and accounts of the intervention are grounded in the use of tools, artefacts and activities deployed. This allows for analysis exploring the traceable influences design artefacts have on the work being performed and a reflective space for designers to assess their performative agency.*

*The paper proposes an approach to the constraints and opportunities that design management encounter around the matters of concern for organisational change; and in so doing, how this can inform reflective design practice.*

**Keywords:** *actor-network theory; design artefacts; performativity; participatory design; cultures of innovation.*

## **Introduction**

Design is performative, a divergent process of repeatedly engaging people and things in order to devise and engender new things. When these things are tangible, such as artefacts, it's relatively simple to show how design has contributed. When these things are intangible, such as change in an organisation's behaviours and culture, design's contribution is much less clear. This paper explores how a shift in perspective towards design contribution could be made more explicit in future interventions for organisational change.

The paper lays out the background context of change management and cultures of innovation where design thinking has rhetorically sought to demonstrate value. This is argued to be a misrepresentative detour in articulating design's contribution for change and instead identifies the gap in literature between Service Science and Co-Design. The paper then presents a position around actor-network theory (ANT) in relation to design and the organisation and proposes a perspective towards articulating the performative agency of design artefacts. The paper then presents a case study representing a situated account of an on-going exploratory design intervention with an SME and draws on key analysis from the case study to argue how an ANT approach can help make design more explicit within the matters of concern for organisational change.

### *Design in the Discourse of Change*

Design is being performed on an ever-increasing spectrum of levels with complex practices arising in response to developing markets and technologies, co-design, digital interaction, service design and cultures of innovation; design itself is under constant disruption. This expansion is no longer restricted to artefacts but encompasses how designers participate in the distribution of production (Atkinson, 2006), mediate social change (Papanek, 1983; Saul, 2011) and innovate organisational processes (Brown, 2009; Martin, 2008; Neumeier, 2008). As a result there is demand on the management and articulation of design's application across disciplinary boundaries, which has led to many layers of abstraction in the communication and practice of design. As design becomes increasingly multi-disciplinary, the scrutiny of design from management theory has dominated the subject of delivering innovative change for organisations.

Hayes (2002) summarises two types of change predominant in management theory: firstly, incremental change, associated with periods of external equilibrium where the focus is on continuous improvement; and

secondly, discontinuous change, occurring in periods of disequilibrium and involves a break from the past based on new relationships (Hayes, 2002:7-8). This echoes Norman and Verganti's (2012) distinction of design's capacity to innovate in their paper, 'Incremental and Radical Innovation: Design Research Versus Technology and Meaning Change'. Verganti emphasises design research having more potential to influence radical innovation by focusing research methodologies towards meaning-driven rather than technology-driven innovation, as he claims currently happens through human-centred design (Norman and Verganti, 2012:16). Norman and Verganti's reflection on design's impact for change points towards a dynamic role for designers free of incrementally gaining knowledge. Here is an initial example of the rhetorical detour positioning design; permitting intuitive and speculative indicators for what is incremental or what is radical. Pre-determining these indicators of innovation during a design intervention is potentially misrepresentative of the change design can perform.

A telling commonality that Hayes notes in the methods and concepts for change management is the approach of developing models to simplify the complex phenomenon of organisational behaviour at different levels. These focus on key elements that are seen to offer a good representation of the real world, the ways these elements interact with each other and the outputs produced by these interactions (Hayes, 2002:71). These models try to summarise an understanding of the cultural factors within an organisation in order to maximise the ability to bring about preferred futures. As highlighted by New and Kimbell (2013), much of managing consultancy is positioned as trading in specific knowledge; 'they understand the problem better than you (they do a diagnosis) and they understand the prescription better than you (they provide the solution)' (New and Kimbell, 2013:3). This reductive modelling of a chosen context is left very much to the key actors and their acceptance of the model involved, leaving the process open to misrepresentation of individual relationships and interactions.

An important distinction that emerged within change management was between the role of managers and the role of leaders in affecting change. Kotter's (1999) influential text, 'What Leaders Really Do', argues that both managers and leaders have to attend to three functions: 'deciding what needs to be done', 'developing the capacity to do it', and 'ensuring that it is done'. Kotter distinguishes a marked difference in the way that managers and leaders attend to these functions: managers focus on a process of goal

setting, whereas leaders focus on setting a direction; managers develop capacity by organising and staffing, leaders focus on aligning and empowering people to make the vision happen; managers ensure accomplishment by controlling and problem-solving, leaders are concerned with motivation (Kotter, 1999). Kotter believes leaders can overcome the inevitable barriers to change that they will encounter as the initiative unfolds by articulating the vision, involving people in decisions, supporting others' efforts, and recognition and reward (Kotter, 1999). These can be argued to have influenced design thinking's approach to organisational change up to now, how to influence people to think differently and inspire creativity, with an emphasis on human-centred innovation (Brown, 2009:18). Despite the significant role of tools and prototyping, the relationship between designers and these artefacts is still greatly underrepresented in such approaches.

Design Management has positioned itself firmly within the field of change for organisations by linking design, innovation, technology, management and customers to provide competitive advantage through effectively designed products, services, communications, environments and brands. A major influence in this positioning has been the rise in design thinking, which professes to take shape as an attitude, as a methodology and as a philosophy that can bring customers and clients into the design process (Beacham and Shambaugh, 2011). The success of design thinking is interpreted by Press (2012) as 'a strategy for companies such as IDEO to be taken more seriously by the business community and by government.' There is a conscious attempt in the literature to 'distance itself from the analytical and quantitative, to the intuitive and qualitative,' while still being 'framed in business-speak' (Press, 2012). The designer is more an expert in a process rather than in a specific problem (New and Kimbell, 2013). Its increasing adoption suggests the message is getting through to both business and government helping to diversify and strengthen the markets of the design industry.

Brown's (2009), *Change by Design*, positions design thinking as a vehicle for change, writing that it 'uses the designer's sensibility and methods to match people's needs with what is technologically feasible and what a viable business strategy can convert into customer value and market opportunity' (Brown, 2009:18). This aims to position designers as empathic leaders within strategic decision-making and to 'bring design into the boardroom' (Brown, 2009:37), allowing greater influence to use design methods to implement change. Martin (2009) presents design thinking as a term being used today

to define a way of thinking that produces transformative innovation. Martin attributes its popularity in making it easier for those outside the design industry to focus the idea of design as a way of thinking about solving problems; a way of creating strategy by experiencing it rather than keeping it an intellectual exercise, and a way of creating and capturing value (Martin, 2009). According to Martin, 'the design thinking organisation applies the designer's most crucial tool to the problems of business. That tool is abductive reasoning' (Martin, 2009). This is not specifically expressed in terms of looking to designers to meet these problems, but their methods and processes proliferated throughout an organisation, expressed as building a culture of innovation (Brown, 2009; Neumeier, 2009; Martin, 2009; Kelley, 2005 and others). A problem arises therefore in that the designer no longer embodies value, but the tools and approach an organisation is told it can acquire, as though the designer and the methods were distinct from each other. The authors' critique of design thinking is that it represents a rhetorical repackaging of design methods for the purposes of management culture, rather than a genuine innovation of organisational culture based upon values in design practice developed in and through the innovation of research.

Sanders (2006) highlights the mutual influences of the American-led Human-Centred Design, from which design thinking emerged, and the European-led Participatory Design that have begun to shape contemporary notions of co-design. The debate in the changing role of designers and their methods in a co-design process (Brandt, Binder and Sanders, 2012; Atkinson, 2006) pivot around design as a leader of innovation (Verganti, 2011) or design as the democratisation of innovation (von Hippel, 2006). With Participatory Design in particular, this has been influenced by methods of integrating new technologies and systems development within organisations, showing greater emphasis on designers and the tools and techniques they use. Bjögvínsson, Ehn and Hillgren (2012) recognise parallels in the appealing rhetoric of design thinking and many of the concepts explored in Participatory Design, but distinguish their approach to social innovation through engagement with the socio-material, as opposed to fluid notions of design intuition (Bjögvínsson et al., 2012:103).

Sanders and Stappers (2008) summarise the mixing of roles in co-design providing an indication of the blurring disciplinary boundaries in the design process:

‘... the person who will eventually be served through the design process is given the position of ‘expert of his/her experience’, and plays a large role in knowledge development, idea generation and concept development. In generating insights, the researcher supports the ‘expert of his/her experience’ by providing tools for ideation and expression. The designer and the researcher collaborate on the tools for ideation because design skills are very important in the development of the tools. (Sanders and Stappers, 2008:6).

Sanders and Stappers recognise the designer as able to occupy the researcher role in a co-design process, but also identify the rising challenge for design’s relevance as a profession by emphasising the wider skills future designers will need to adopt, such as conducting creative processes relevant at larger levels of complexity; using generative design thinking to address change in the future; maintaining expert knowledge on emerging technologies, production processes and business contexts; while maintaining recognised specialisations in product, interaction and communication design (Sanders and Stappers, 2008:15). There is a sense of a gamble for designers in the increasingly complex combinations of skills they will be expected to employ that are less and less rooted in design. This is an additional detour designers risk continuing to follow without some way of being able to make their design contribution explicit across the disciplinary boundaries they encounter.

An alternative approach is presented by the discipline of Service Science, which first emerged in 2004 from the efforts of researchers at IBM and associated academics, based on a call for more research in areas related to services (Chesbrough, 2004). There has been an increased service orientation in today’s business practices that departs from the traditional manufacturing paradigm (Oliva & Kallenberg, 2003). Services are defined as ‘the application of competences (knowledge and skills) for the benefit of another entity’ (Spohrer & Maglio, 2009). A service economy is hence bringing new managerial issues, which are linked to an intensification of not only knowledge, but also information technologies, innovation and the demand for highly qualified people (Hipp & Grupp, 2005).

Equally central to the development of service science is the complexity of business environments, which can be addressed through a focus on service innovation in a cross-disciplinary context. The service science premise is that no single discipline or philosophy can successfully be used to face complex systems, and a cross-discipline approach to decision making is required (Paton and McLaughlin, 2008b). In order to reach success in such

adverse and complex contexts, service science uses service innovation, which is now gaining recognition in academic and commercial research circles, as a key driver of sustainable socio-economic growth (Paton and McLaughlin, 2008a). Service innovation is based on the identification, support, development and delivery of meaningful service exchanges to achieve sustainable growth. A notable point of interest in the application of service science research through service innovation is the possibility to offer 'a means of securing knowledge leadership', which can be achieved through value-added knowledge exchanges, regardless of industry boundaries (Paton & McLaughlin, 2008a).

This paper sits within this gap of how we can infuse design principles from design thinking and participatory design with service science to stimulate and sustain value during cultural organisational change. The contribution proposed is that, following the emergent value discourse of service innovation, an actor-network theory (ANT) approach, already influential in Participatory Design, can better evidence the meaningful exchanges of design grounded in the matters of concern that can inform reflective design practice.

### *Representing Matters of Concern*

ANT is a sociological body of theory that 'attempts to overcome the old sociological dilemma of structure and agency by positing that structure and agency arise together' (Mewburn, 2010:365). It is derived from Science and Technology Studies (STS) research exploring object-oriented ontologies (Morton, 2011), which seeks to understand the complex connections and networks that emerge between objects, or as Latour termed them, non-human actants (Latour, 2005b). ANT emerged from STS as an approach to observing and describing the associations between human and non-human actants that produce the effects of agency we observe around us (Latour, 2005b). All effects of agency are phenomena often assumed as facts – such as a newspaper, an industrial sector, or perhaps the discipline of design management itself – and all can be thought of as actor-networks arising from the work of people and things that become visible or perceptual when performed. The focus of attention in ANT then is on the 'work of people and things which perform' the reality of an organisation 'into being' (Mewburn, 2010:365). As emphasised by Latour (2005a), it is the work, the movement, the flow, and the changes that should be stressed collectively as performative.

Butler (1990) associates the performative with a normalising power. The repetitive nature of work and language engenders actors in processes, structures, roles and artefacts that are perceived to stabilise the network. Performativity is recognised as having an increased influence within Management Studies through following the actions within an organisation and how these connect into stabilised patterns (Diedrich, Eriksson-Zetterquist, Ewertsson, Hagberg, Hallin, Lavén, Lindberg, Raviola, Rindzeviciute and Walter, 2013:16). Performativity, therefore, represents a particular articulation of the phenomena producing the effects of agency, 'pointing to the very world-making [...] effects of hybrid, heterogeneous, multi-agent practices such as designing' (Holert, 2011:28).

Key to this articulation for design are design artefacts, which draw on the position of Binder, De Michelis, Ehn, Jacucci, Linde, and Wagner (2011) 'what designers deliver is not an object, but just its embodiment – what they deliver is a thing,' (Binder et al., 2011:77). The design thing is explored through various representations to engage with the design problem, what they refer to as 'constituents of the object of design' (Binder et al., 2011:59). These constituents are not the object they [designers] are designing, but each of them allows them to interact with the object and to discuss its different features (Binder et al., 2011:59). In this scenario, the various tools, sketches, drawings, maps, diagrams, blueprints, storyboards, models and prototypes, are constitutive of the 'object of design', referred to in this paper as design artefacts.

Latour argued that through our will to modernise technologically, scientifically and economically, 'we rendered more and more explicit the fragility of the life support systems that make our 'spheres of existence' possible' (Latour, 2007); what Sloterdijk (2004) called, *explicitation*. In other words, what earlier was taken for granted has now become explicit matters of concern; an expression used by Latour to distinguish from matters of fact:

*While highly uncertain and loudly disputed, these real, objective, atypical and, above all, interesting agencies are taken not exactly as object but rather as gatherings. (Latour, 2005b:114)*

It is from this concept of *explicitation* that the following case study attempts to articulate the matters of concern and any role design artefacts play in 'gathering' and representing them. The suggestion is that any notions of strategic value generated through design should be assessed in line with notions of the matters of concern that emerge.

### *Case Study*

ANT uses qualitative methods including observation of the work being performed and interviews with the actors within the network (Mewburn, 2010) to tell 'stories of how things, objects, actors, come to be how they are... through a process of interaction with other actors;' how interaction 'changes actors' and 'translates actors' (Kraal, 2007:6). These stories, in ANT, are traditionally textual accounts with the main tenet being 'that actors themselves make everything, including their own frames, their own theories, their own contexts, their own metaphysics, even their own ontologies' (Latour, 2005a:150). This dedicated objective approach to describing the network, including allowing participants to inform what work they do in their own words, is not to say that they are describing the network for you, but in the process of interview and observation they help to describe what work they are doing, for what reasons, in response to, or association with, what things.

The descriptive textual account produced through ANT is 'not a nice story' but 'the functional equivalent of a laboratory [...] a place for trials, experiments, and simulations' (Latour 2005a:149). The analogy of the laboratory is suitable for cases of disciplined social sciences towards hypothesis and theory, but for design research there is a need to demonstrate the value of such an approach in practice. The suggestion is that the analogy of the laboratory could be appropriated towards the design studio through an act of *translation* by the designer in practice. By using embedded observations and accounts of the participants experience in the intervention, a descriptive ANT account emerges grounded in the tools and activities deployed. This allows for analysis exploring the traceable influences of work being performed and a reflective and reflexive space for designers to assess and value the affect they have. This paper presents a summary of the key observations alongside selected images representing key activities and artefacts in order to articulate the matters of concern that arose and how this affected the work during the intervention.

### *New Ways of Working with Design*

The case study presented in this paper is from a design research project working with an SME textile manufacturer based in Peebles, Scotland, who produce high quality woollen fabrics for apparel and transport markets. The company agreed to undergo a design intervention to develop a more creative and innovative organisational culture. The design intervention took place over nine one-day sessions, one session delivered per month between

October 2013 and July 2014 with a final tenth session scheduled for January 2015 to capture the progress made. The intervention involved a cross-diagonal slice of twelve of the company's personnel from management to the factory floor, who are referred to as the slice in this paper, to help embed the methods and approaches conducted throughout the company. The sessions were delivered by two design practitioners with the lead author as an embedded researcher. The embedded researcher observed the sessions through: note taking, photography and conversations with all participants. The sessions also included a change management consultant and academic who supported the delivery and reflections throughout the intervention. Before and after each session the delivery team would meet to discuss the design of the plan of activities, what was achieved, what wasn't achieved and what occurred outside the plan. A summary of selected methods and key artefacts are presented in the following account. The intention is to provide a notional indication of their interrelations and performativity through an actor-network theory approach.

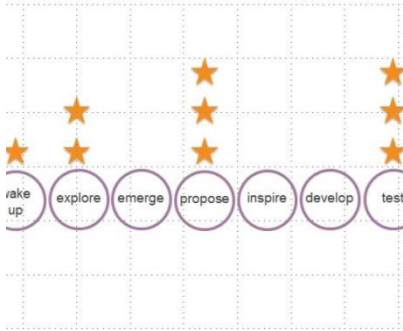

Fig. 1 'Detail from the Underlay'

Priority areas of workforce development through a topic of 'yarn stock' were agreed with the company's management team. This informed a structure for the intervention referred to as the 'underlay' (fig. 1): a live, digital document serving as a reference when designing each session and the methods to address each area for improvement. Each method was referred to as a 'beanpole' meaning the designers would not implement them, but introduce them and allow the company to appropriate them as they saw fit.

Fig. 2 'Product Journey from Bakery'

From the underlay, a key method chosen was based upon a 'user journey', which was translated into a product journey that yarn undertakes in the factory. The slice would first practise dry runs visualising the journey of beef and bread after visiting a local butcher/baker (fig.2).

Fig. 3 'Initial Yarn Journey Iteration'

The slice selected a best-selling, problem fabric with the intention of capturing the issues that occur along the entire yarn journey. The slice split themselves into pairs for gathering details of the yarn journey throughout the factory, including departments and processes that were unfamiliar. Initial pathways were text-based flow diagrams on flip chart paper (fig.3) upon which post-its were placed highlighting gaps and questions to be asked.

*Fig. 4 'Developed Yarn Journey'*

*Fig. 5 'Identifying Delays'*

*Fig. 6 'Mind-mapping Quick Wins'*

During a second iteration of the yarn journey, different ways of visualising the information emerged. A linear, box-based, process diagram with drawings or photographs of each stage and colour-coded annotations above and below were chosen and constructed. This was led by key members and put up on one of the factory walls, though all members were able to input information (*fig. 4*).

The session immediately following the construction of the yarn journey was rich with identifying the delays that typically occur along the production process and the frequency at which they happen (*fig. 5*). Employees from the factory floor also added their own contributions to the detail in the yarn journey with post-its. A video was also requested to explain the journey to board members.

The process then focused on identifying how the group could achieve 'quick wins' among the problems and delays identified. The designers introduced six hats, mind mapping (*fig. 6*) and methods of scoring issues across multiple criteria. The design team spent a long time with the slice with these techniques and how to action the quick wins, prompting an entire session to practice them and create guidelines on how to perform them.

Fig. 7 'Journey with Quick Wins'

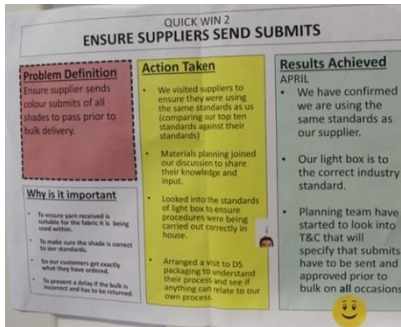

Fig. 8 'Reformatted Quick Wins'

Fig. 9 'Populating the Honeycomb'

Three quick wins were selected with attempts across the group to action them. The mind maps and action points for each one were encouraged to be displayed alongside the yarn journey (fig. 7). This produced a messy display of large flip chart sheets positioned below and above the central journey, which was deemed to be unclear for the rest of the factory.

To address this lack of clarity, the slice developed a new format of A4 single sheets for each quick win with coloured panels containing: the problem identified, why it was important, the action taken and the results achieved (fig.8). This was seen as an improvement by the designers, but still not an exciting way of communicating the achievements of the slice with each quick win.

In the very first session, the design team had introduced an A0 printed 'honeycomb' diagram, based on the Design Council's double diamond, as a scaffold of the process the slice would learn to undertake and related to the aims of the underlay. The honeycomb was used in session 6 to reflect on the progress the slice had made. The group annotated and positioned polaroids of earlier activities onto the honeycomb to understand their relation to each other in the process and present this to others in the factory (fig. 9).

*Fig. 10 'Quick Wins on the Honeycomb'*

The honeycomb template was then provided on A3 sheets to reflect on the process for each of the quick wins (*fig. 10*). Slice members would use the language from the honeycomb to describe the activities they undertook. Wider members of the factory asked for this to be disseminated as a reference to engage with the slice.

*Fig. 11 'Quick Win Fabric Board'*

There was a perceived lack of celebration of the fabric in the factory and within the slice. The design team requested a further iteration of communicating quick wins, challenging the slice to use fabric from the factory on pin boards. The slice split into three groups, each following different approaches. The most appreciated used the original problem fabric of the yarn journey, re-visualised two quick wins as diamonds and mounted it on the entrance to the yarn store (*fig. 11*).

*Fig. 12 'Dream Vision'*

A late method introduced by the design team was the dream vision (*fig. 12*), which responded to requests from the slice on how to recruit members across the factory into the process. A visual structure was devised by which to capture what workers thought was possible and the assets needed to get there. The slice immediately adopted it with management to reiterate their own vision and members began to find hooks to which they could assign methods they had learnt.

### ***Insights and Opportunities***

The summarised observations above represent only a selection of the techniques used around the development of quick wins. A key challenge during the intervention was relating the tools and techniques to each other and understanding how they can flow to achieve the goal of developing the workforce around issues of yarn stock. The process of constructing plans of action developed slowly through trial and error, pointing towards a need for deeper articulation of how they perform together. The honeycomb and dream vision emerged as key artefacts in representing that need and are perceived as central means of embedding some of the activities across the wider factory.

Each activity was introduced at a democratic level where each participant had an equal stake in the process, but once details and processes of decision-making arose, a core group of management staff often took control of discussions. Part of this behaviour was recognised in the variation in language across the group. When managers were referencing their current projects as already addressing issues identified, they referred to intangible processes of assessment or performance improvement that abstracted the matters of concern. When the weavers, darners or yarn store workers demonstrated their knowledge, reference to disruption in their equipment, tasks or techniques would inspire questions across the group to understand the process more. This was facilitated in part through constructing the yarn journey and discussion centred on understanding specific delays or issues. Seeing a problem in relation to the entire process, as well as the workers day-to-day routine, has helped articulate it as a more immediate matter for concern. The problem is immediately expressed in relation to potential causes, or at least signposts where to investigate the causes.

Building confidence in adopting and adapting a flow between the methods and wider process introduced during the intervention has been slow to take hold. There have been multiple occasions when the preparation work asked from the slice between sessions had not been fully or accurately done, indicating that the required leadership from participants was not happening. Few participants would lead in taking the activities to the wider factory. From a service innovation perspective this would look to build in additional responsibilities and requirements for workers, through the relevant design artefacts, to help facilitate each interaction. In an exploratory intervention such as this, however, such organising principles needed to emerge as an outcome at the end of the process. With the

delivery team there for no more than a couple of days a month, this depends on members of the slice understanding and repeating parts of the process to gain confidence.

Capturing knowledge on how best to perform activities was encouraged for the slice, with guidelines and criteria being produced on activities such as mind mapping and discussions following reflections on early attempts. The intention was for them to be a reference each time, but they often got forgotten among multiple sheets of flip chart paper and post-its. The performative qualities of such information struggled to translate effectively outside the sessions, raising the question of whether the visualisation, the scripting, the staging, the roles around such activities could be more explicitly represented.

In the design team meetings between sessions, the underlay was seen as an important reference tool by the lead designer for discussing and designing each session. A printed A4 page summary of each session plan was brought as reference, but more often than not a new plan would evolve on the day in response to how the slice progressed with preparation work left from the previous session. When the quality of the work performed by the slice on individual activities would become the focus it disrupted an experience of the flow of how the techniques relate to each other. Discussions around the underlay were limited in representing the actor-networks of participants in adopting techniques, but the opportunity would be to make a structure such as the underlay more explicit within such actor-networks and account for these emergent indicators.

### *Early Impressions*

The ANT account of the work performed in the intervention brings the design artefacts into sharper focus in relation to the wider goals and behaviours of the design team and the participants. The dynamism of certain artefacts, such as the visualisations of the yarn journey or the dream vision, emerge as initial evidence of performative agency. The yarn journey helped reveal key matters of concern such as the impact of delays across departments. The visual nature was easily understood by people from the factory floor to the boardroom and potentially even suppliers, gathering interest and insights that built up a demand and potential to integrate it into the wider factory process. The dream vision emerged late on, after reflection on the intervention, to become a crucial representation of the context of the process. The managing director even began referring to the honeycomb and dream vision as potentially shaping their business model,

assessing current management projects with the stages it represents, identifying the value such artefacts could provide.

In contrast, but just as compelling, there was initial discomfort in trying to mind map the complexity around the quick wins identified on the yarn journey. Emergent matters of concern included externalising blame, departmental language and low communication skills within the quick wins activities. More often than not the slice fell into old habits of talking around problems with some of the management or department-specific language infiltrating discussions. The identity of the slice, Culture Club, also showed limited impact on the rest of the factory, rather than an embraced part of the intervention. When design artefacts are not made explicit in relation to the matters of concern as they arise they can become lost, forgotten or ill understood. Their performative agency is bound by the meaning gathered in their repeatable nature in context and translation into the wider organisation.

The challenge an ANT approach represents to the designers is not only how to embed design artefacts and methods within the existing flow of work so that it gathers interest in the arising matters of concern, but that the quality of that representation translates across those actors that are gathered to inform calls to action.

### *Research Limitations*

As an embedded researcher within the intervention, the lead author has only been able to observe the participants during each monthly one day session. The work between sessions has not been able to be followed according to the immersive demands of actor-network theory. As a result, only a second-hand insight into the uptake and engagement with tools and design artefacts was possible for these long periods in between. While presentations of this work, and reflections on their value in sessions, have provided some data in this regard, much of the influence on the factory is largely anecdotal and subject to interpretation in the account obtained.

The tone of the intervention has been exploratory, with a mix of design methods and management methods provided alongside each other. This means any interpretation by the lead author into the performativity of certain artefacts has to be quite specifically situated and associated to the activities using management methods. The identification of design artefacts is therefore a fluid process after the event as identified by participants and the delivery team.

There was no prior audit of the existing culture at the company done by the authors, so any attempt to infer the influence of the intervention on the wider company can only be contrasted by the emergent impressions of the existing culture during the intervention and impressions of change offered by participants themselves. Any full assessment of design successfully eliciting meaningful change within the organisation can only be gleaned after the intervention is complete with a visit planned for January 2015, six months after the final session.

### *Future Research*

The research for this case study is part of a wider thesis continuing to collect data up until the final session is complete and will conclude with interviews with selected participants from the slice, wider members of the organisation, as well as the delivery team. A more thorough analysis of the performative agency captured in the ANT account uses methods from grounded theory to evidence and identify design's capacity to implement new ways of working within an organisation.

While the role of an embedded researcher in the sessions themselves has produced rich data for the purposes of ANT, the lack of data acquired in between the sessions represents a significant gap in telling the wider story of the intervention. Future research on similar interventions would look to obtain continuous data from the organisation during and in between sessions in order to more accurately represent the flow and nature of the work being performed by the participants and, more importantly, the work performed with the methods within the actor-network of the organisation.

Finally, the aim of this research was to capture some indicators of innovation to help make design explicit for the purposes of reflective design practice and thus reduce the rhetorical detour engaged by many designers. As a result, future research would look to bring ANT explicitly into a strategic design intervention for SMEs as action research, in order to test how some of the insights can be folded into the production and delivery of design strategy.

### *Conclusion*

This paper set out to explore a Latourian approach in addressing the challenge for design management to express design strategy within SMEs. The paper presented a gap in literature within change management and cultures of innovation where design has sought to demonstrate value, aligning to the direction and gap in literature of Participatory Design and

Service Science. The paper then presented a position around actor-network theory (ANT) in relation to design and the organisation, the effects of agency through the network of associations between people and things, and argued it provided a method articulating the performative agency of design. An on-going case study was then presented representing a situated account of design work within a strategic design intervention with an SME, summarising the interrelations and trials of strength across key methods. Finally, the paper provided key insights and outcomes from the case study to argue how an ANT approach can make design more explicit and how this could inform the delivery of design interventions for organisational change. This has been presented in response to the call seeking contributions on understanding collaboration, coordination and cross-functional integration processes as essential for effective innovation performance.

## The Impact of Space on Innovation Teams

Ulrich WEINBERG, Claudia NICOLAI, Danjela HÜSAM\*, Dora PANAYOTOVA and Marie KLOOKER

Hasso Plattner Institute School of Design

*Thinking in Potsdam Design thinking is an approach addressing wicked problems in the age of disruption. A flexible working environment enables the ability of teams to innovate, create and design. This paper outlines the impact of space on the team wellbeing and performance as an outcome of the interaction of team members with their environment. The pilot study used a multi-method approach. It includes qualitative interviews with facilitators of design processes and non-participatory observations of innovation teams in design workshops while they set up and interacted with their team spaces. The results indicate that conducting innovation workshops outside the usual corporate environment in an atmosphere that is rather perceived as self-made than perfectly designed is very beneficial. Further promoting factors include: access to raw material for prototyping, the spatial division between different teams, the possibility to use walls as presentation surfaces and flexible furniture. The opportunity to create the own team space proves highly beneficial for innovation teams. However, evidence was found that more advanced design thinkers showed a higher iterative interaction with their environment throughout the process. The authors conclude that there is a need for teams to develop a core competence in terms of creating, adapting, iterating and evolving the innovation space due to the team's changing needs throughout the process.*

## Introduction

Globalization, the acceleration of technology innovation, and the dramatic increase of interconnectedness through communication and transportation raise challenges of a vast scale for leaders and designers alike. They result in the trends of dramatically increasing complexity (IBM, 2010, p. 15) and speed (Mootie, 2013, p. 3). The immense complexity is determined by the substantial number of multifaceted interdependencies. These interrelationships cause so-called wicked problems. Wicked problems are defined as a "class of social system problems which are ill-formulated, where the information is confusing, where there are many clients and decision makers with conflicting values, and where the ramifications in the whole system are thoroughly confusing" (Rittel cited in Buchanan, 1992, p. 15)

Beside complexity, the dramatic increase of speed causes another business and design challenge: disruption. Design thinking is one of the approaches addressing wicked problems in addition to disruption, and has gained significant popularity in the context of higher education and business (Dunne & Martin, 2006, pp. 512-523). Buchanan (1992) formulates a broad definition of the term as a method to attend to intractable human challenges through design. Large organizations increasingly adopt the approach in order to sustain competitiveness (Mootie, 2013, p. 3).

A flexible working environment enables and supports the ability of design thinking teams to innovate, create and design (Thoring & Müller, 2011, p. 137). Beside the rising number of design thinking spaces in organizations, there seems to be a current overall trend in the corporate world to establish effective workspaces in order to enable appropriate spatial interactions as well as to create physical environments for diverse innovation activities (Moultrie, Nilsson, Dissel, Haner, Janssen, & Van der Lugt, 2007, p. 53). Peters (1992, p. 413) depicts space management as probably the most ignored and simultaneously the most powerful tool for the implementation of cultural change and to foster innovation and learning within organisations.

Regardless of the importance of the topic and the increasing emergence of innovation environments within organisations, there is limited scientific proof of their benefits or the wider effects on team performance. Moreover, there seems to be only insufficient and rather fragmented academic research on the attributes of effective physical environments supporting creativity and innovation. Seemingly, organisations tend to design innovation environments based on intuition and personal judgement or in

general highly rated examples of best practice (e.g. IDEO in the 2000s, now Google), rather than on well-founded research indications. (Moultrie, Nilsson, Dissel, Haner, Janssen, & Van der Lugt, 2007, p. 54)

The overall goal of the research project is to identify beneficial and unfavourable spatial factors of creative spaces in order to generate a practical framework and a catalogue of guiding criteria for the design and use of spaces that support collaborative design processes. The following paper focuses on the basis of the topic and aims to lay the groundwork for further academic research. The first section of the article presents the terms used and a literature review. It delineates the role of space in design thinking. The segment describes the working modes typically transported with innovation environments as well as the factors influencing the creation and use of such environments. The authors demonstrate the definitions of the terms “team wellbeing” and “performance” used in the context of this paper. The theoretical section concludes with the topic of spaces as a medium and an outcome of interaction and the need for more academic research on their impact on team wellbeing and performance.

The second part focuses on the methodology of the applied multi-method approach of a pilot study as it applies to the large research project on innovation spaces. It includes five qualitative interviews with facilitators of collaborative design processes as well as an observation of eight teams of design thinking workshops while they set up and interacted with their team spaces. The pilot study participants were selected based on their diverse or lack of respective experience in design thinking as well as their wide age range, working experience and educational background. The analysis of the pilot study focuses on the general estimation of the impact of space on the working process, key moments in the interaction between individuals and their environments as well as specific beneficial and unfavourable spatial characteristics. The interpretation of the conducted research includes insights on the need of facilitators and teams to design and adjust their space according to their own requirements as well as the difference of interaction with the space based on the different experience with design thinking. The authors first outline findings that reflect the needs of facilitators and team need for spaces, which support the overall and specific requirements as well as the different phases of the design process. The conclusion summarizes the study insights in terms of interior design (atmosphere and mobility), the use of creative team spaces (diversity of tasks and behavioural patterns) as well as the need for further academic research.

## Theoretical Background

The following section introduces the role of space in design thinking. It presents the working modes typically transported with innovation environments. The authors depict the factors influencing the creation and use of such environments. They are followed by the definitions of team wellbeing and performance used in the context of this paper. The theoretical section concludes with the topic of spaces as a medium and an outcome of interaction and the need for more academic research on their impact on team wellbeing and performance.

### *Design thinking and space*

As outlined in the introduction, design thinking has gained popularity in the business context as a way to address wicked problems resulting from rising complexity and to sustain competitiveness in the high-speed age of disruption. Brown (2008, p. 85) argues that design thinking could 'transform the way corporations develop products, services, processes- and even strategy'. He defines the approach as a discipline that uses the designer's sensibility and methods to match people's needs with what is technologically feasible and what a viable business strategy can convert into customer value and market opportunity.' (Brown, 2008, p. 86)

The facilitation of design thinking is enabled and supported by four basic aspects:

- a multi-step iterative process,
- multidisciplinary teams,
- a setting of the work environment, such as the work space and specifically used and produced artefacts and prototypes, and
- A particular (team) culture.

These elements are perceived as essential to every design thinking project. However, they might vary depending on the organization in which they are implemented (Thoring & Müller, 2011, p. 137). The current paper focuses on one of the aspects of design thinking: the work environment. It is a crucial and often underestimated factor in the effort to foster innovation.

### *Working modes transported through spaces in innovative organizations*

Groves (2010) assessed innovative organisations and detected spaces for knowledge creation enabling four different working modes: stimulation, reflection, collaboration and play. In order to empower the staff in their process of knowledge creation Gensler (2008) underlines the need for facilities that enable socialising, sharing, learning and connecting.

### *Creation and use of innovation environments*

Beside the working mode that should be promoted through the space, there are multiple factors influencing the creation and use of innovation environments. The process of creation incorporates the envisioned use of facilities such as the intended links within the innovation process, the planned creative activities, the potential users of the space, the allocated resources as well as the intended events. After the creation phase, innovation spaces typically evolve in order to accommodate multiple uses. Such developments aim to enable, support and serve the actual innovation, creative activities, design and events taking place as well as the concrete users and facilitators (Moultrie et al., 2007, p. 58).

### *Spaces, team wellbeing and performance*

There appears to be a general consensus that the office environment has an effect on productivity (Oseland, 1999; Clements-Croome, 2006; Leaman & Bordass, 2006).

For the purpose of the pilot study as the starting point of a large research project, the authors decided to focus on the influence of innovation environments on the broad terms of team wellbeing and performance. The Chartered Institute of Personnel and Development (CIPD), a professional association for human resource management, promotes the effort of creating wellbeing in companies as the balance of the employees' needs with those of the organisation. This encompasses 'creating an environment to promote a state of contentment which allows employees to flourish and achieve their full potential for the benefit of themselves and their organisation' (CIPD, 2007, p. 4). Furthermore, wellbeing 'represents a broader bio-psycho-social construct that includes physical, mental and social health' (CIPD, 2007, p. 4). Corporations focusing on employee wellbeing increase the opportunity for organisational success. Studies indicate that environments focusing on wellbeing have a positive effect on employee engagement. This results in higher employee retention, customer

satisfaction, financial productivity and profitability (Harter, Schmidt, & Keyes, 2003).

### *Spaces as a medium and an outcome of interaction*

This paper concentrates on the use of already created spaces and how they evolve in the course of the team's innovation activities. McEwan (2013) depicts value- and knowledge-creating processes as dynamic and developing through the interaction among individuals and their environments. Hence, 'space is both the medium and outcome of the actions it recursively organizes: what space is experienced as being limits and enables the possibilities of further social construction within it.' (Rosen, Orlikowski, & Schmahmann, 1990)

There is a current research gap on the effects of the physical innovation environment and the teams' interaction with it. Furthermore, there is a need to investigate the consequences of these interrelations for the team's wellbeing and performance in terms of creativity and innovation effectiveness. The next section of the article presents the methodology of the conducted pilot study.

## **Research Approach**

As already described above, a working environment supporting the team and execution of the iterative process is a crucial part of the method of design thinking. The outcome of this qualitative pilot study serves further investigation and experimental research in the future.

The research team formulates the following questions: How do environments, designed for design thinking activities, influence teamwork? How do the spaces evolve throughout the process of use as a result of the team interaction within them? Which spatial factors hinder or foster creative teamwork? Which challenges and recommendations for further courses of action can be derived from the outcomes of these research questions?

The team conducts a pilot study in the form of a multi-method approach, including two parts:

1. Five qualitative interviews with facilitators of creative collaborative processes

2. Non-participatory observation of workshop participants setting up and interacting with their own team workspace for a Design Thinking Workshop, and spatial adjustments throughout design thinking process.

On the one hand, the interviews generate an overview of knowledge hold by workshop moderators as representation of a meta-level of spatial factors. On the other hand the observation of workshop participants provides insights on hidden aspects about the behaviour in and interaction with space.

### *Qualitative interviews*

Altogether five qualitative interviews with facilitators of collaborative (work-) methods for creative processes were conducted. The interviewees were selected based on their diverse or respective lack of experience in design thinking and other collaborative methods, as well as working experience in different spaces.

The interviewees included three coaches of design thinking workshops, one workshop moderator for agile working methods and one kindergarten teacher. If similarities were found in spite of the diverse experience of the chosen interviewees, this would indicate a general tenet. The interviewees were between 28-64 years old with 3-30 years of work experience. The structure of the interviews was threefold. The first part included open-ended questions about key positive and negative experiences with spatial settings. The second part consisted of a questionnaire with 48 questions about characteristics of workspace set-ups. The selection was based on previous interviews and previous studies (von Thienen, Noweski, Rauth, Meinel, & Lang, 2011; Stegmeier 2008; Flueglstaller, 2005). The moderators were asked to evaluate the characteristics as very hindering, hindering, neutral, beneficial or very beneficial for the outcome of collaborative creative processes.

The 48 characteristics were grouped in three dimensions of spatial design, ranging from fixed to adjustable:

- 1) Architecture – referring to the building, including fixed, and/or build in elements
- 2) Furniture – referring to interior design elements such as movable furniture
- 3) Resources – further equipment and work material

The third part of the interview addressed the importance of spatial settings by using the laddering technique (means-end-analysis; Grunert/Grunert 1995). The interviews were recorded and transcribed.

### *Observation of design thinking workshops*

The other part of the pilot study consisted of a non-participatory observation of two Design Thinking Workshops at the Hasso Plattner Institute School of Design Thinking in Potsdam, one for design thinking beginners and one for more experienced design thinkers. Both workshops consisted of 4 teams of 5-6 members each. The design thinking beginners, all rather used to classical office configuration, received an introductory presentation on the influence of space on work processes. The group of experienced design thinkers was used to typical HPI D-School set up. All teams were asked to each set up their own team space that was best suited for a collaborative creative work process.

The teams could choose from the following furniture: stand-up tables and chairs, cubes to sit on, movable whiteboards, movable sofas and beanbags for seating. Additionally, flowers, soft cloth in different colours and other material could be added to adjust the atmosphere and appearance of the team's space. The selection of the items was based on the experience from best practice at HPI D-School.

The different workspace designs and their adjustments throughout the workshops were documented by a non-participatory observer and documented by means of field notes and photography.

## **Analysis**

The following section describes the findings from the two applied methods, semi-structured interviews and non-participatory observations. Based on our qualitative approach we will highlight identified spatial aspects that foster team wellbeing and performance as described in the section on the theoretical background.

### *Qualitative Interviews*

The aim of the semi-structured interviews with facilitators was to identify hindering and beneficial spatial factors that influence creative teamwork in order to foster innovation processes.

### **The Importance of Space**

Overall all interviewees evaluated the influence of space on collaborative creative processes as 'very important'. Quite often the atmosphere and the interplay of different spatial factors were mentioned as playing an important role to foster collaborative teamwork: 'Not a single factor is important, it is rather the whole atmosphere including size, light, and space climate.' Additionally, the transformability and flexibility of the workspace and the possibility to adjust it to different working modes during the innovation process were mentioned as well. Besides that the influence of spatial settings on individual wellbeing was highlighted: 'The space represents my inner self - both are related to each other. A transformation of space brings along a transformation of me.'

When asked for key positive and negative experiences of facilitating innovation processes in different spatial settings two interviewees referred to experiences outside the usual workspace in the company: 'I remember a setting in a town that was very provisional with construction fences, beer crates, wooden boards, etc. The reason for the exceptional results and atmosphere within the teams was, as it seems, that everyone was taken out of his or her out of their usual behavioural comfort zone.' A moderator for agile work methods remembered the following: 'The worst case was: the workshop is located in the basement, with only artificial neon light, heavy curtains, fixed conference tables and chairs that cannot be moved, and little space around them; musty and impossible to ventilate with fresh air. Even worse it get's if the chairs are fixed, then the whole process becomes stuck. You don't get close to the people if furniture is always in between.'

### **Evaluation of Spatial Elements**

In the following the moderators were asked to assess the influence of different spatial elements as hindering or beneficial for the collaborative teamwork of innovation teams. Interestingly out of 48 presented elements only 14 elements were assessed as 'beneficial' or 'very beneficial' on average and only 8 elements were assessed as 'hindering' or 'very hindering'. 6 spatial elements received contradictory evaluations, thus they were perceived as fostering or hindering innovation processes. Figure 1 shows the spatial elements assessed as 'beneficial' or 'very beneficial'. The sum is based on the ratings as 'very beneficial'(2), 'beneficial'(1), 'neutral'(0), 'hindering'(-1) and 'very hindering'(-2).

Figure 1 Promoting Spatial Factors for Creative Teamwork in Innovation Teams

It is interesting to notice that an open space at a different place than the usual setting within an organisation that offers a flexible setting of furniture and is well equipped with resources is seen as most supporting for collaborative teamwork of innovation teams.

With regard to spatial elements that are hindering collaborative teamwork the innovation experts focused in particular on the architectural element of an ‘over-designed space’ that quite often comes along with perceiving it as a space not inviting to touch it or to move anything (design expression – ‘do not touch’). The other spatial elements perceived as ‘hindering’ or ‘very hindering’ can be described as an expression of different aesthetical preferences: some interviewees do not like cold or warm colours, some do not like vinyl or carpet as a spatial setting. Figure 2 summarizes the evaluations.

### The Impact of Space on Innovation Teams

Figure 2 Hinderling Spatial Factors for Creative Teamwork in Teamwork

The influence of aesthetical preferences on assessing an innovation space as promoting or hindering collaborative teamwork can also be found by having a closer look at those elements that were evaluated in both directions by different interviewees: e.g. the elements of indoor plants, decoration, and wooden walls. Regardless the differences in professional backgrounds and work environments, the interviewees over all shared a common perception concerning spatial factors for collaborative team processes.

### Identifying Patterns of Spatial Settings

Based on the qualitative content analysis of the interview transcripts the authors identified three key insights due to their frequency of mentions. The findings are in many aspects interrelated, but have their unique attributes that are underlined by using quotes from the interviews.

### Outside: Getting out of the Company and the Comfort Zone

Innovation processes and teams seem to be supported by an environment that is new to the participants and located outside their typical workplace: 'Getting out of the usual environment – I think is crucial to create something new.' 'Outside, it's easier to find a good working atmosphere, the best are surprising things.' 'If I want to build the team or solve a conflict, I always do it outside of the company, e.g. in a cabin, a tent – everything that's simple. If a workshop lasts only one day, I would start in

the afternoon. You always get different results, if they exchange their thoughts in a different setting at night. One day within the company is fine, but if it's too close to the usual work environment, there's too much distraction.'

Additionally having access to nature or being able to relocate the teamwork outside was evaluated as a beneficial enhancement of innovation spaces: 'Working outside, fresh air, sun - all widens the sphere of thoughts – the best is on ground level: beanbag for seating, whiteboard, chairs, cubes, table outside, up to 30 minutes is perfect.' 'Warm-ups outside bring an additional push of energy.'

### **Inside: Creating an Open Atmosphere**

A design expression and atmosphere that supports creative teamwork is rather self-made than perfectly designed: 'A space with a design expression "don't touch" does not work for being creative.' 'Nothing ready-made and no laboratory white; rather raw steel, wood – oiled or waxed –, something like that.' 'Rather back-to-basics than over-designed, a self-made atmosphere. Everything that's loaded with meaning from the outside, I find difficult. Neutral is better: Wood, stone ... elements that get "painted" during the process.'

Nonetheless a self-made space should provide orderliness in order to be able to function as an inviting space for collaborative teamwork: 'In disorder, nothing new can evolve. Concentrated work and play is, I believe, a precursor of innovation. If a team comes into a messy and covered room, it cannot create anything anymore. On the other hand, team has to be allowed to make a certain mess, in order to be able to play and create.' 'It depends on the setting - prototyping plus disorder is fine. Bricks, stone, exposed concrete plus disorder would be a clash.'

### **Change: Enabling Different Work Modes**

Specific spatial elements, lighting, surfaces, and colours, are perceived as in particular helpful to foster not only collaborative teamwork, but also to trigger the needed changes to different work modes during the innovation process. The key enabler is that these elements have to be easily adjusted by the innovation teams themselves.

The lighting should be adaptable to create different illuminations at the work place of a team: 'It depends on the source [of light]. Light from the ceiling with very bright light doesn't work at all. Standing lamps are better, ceiling light presses you down, takes your air to breeze, and destroys the

atmosphere.’ ‘I prefer to make the change physically comprehensible, so rather candle light or standings lamps for mindfulness reflection.’ ‘Window blinds for obscuration are crucial to change the work mode.’

The surface of the floor has to be inviting to change between work-modes: ‘Switching between working modes at a table and on the floor keeps teams focused. This resonates with their different needs. New ideas come up, if one does something that makes them see the room from a different perspective – lying on the floor, standing on a ladder.’ ‘Prototyping on floor has a better atmosphere, it’s warm and grounding.’ Wooden floors and carpet seem to be good for sitting right on it to change perspectives and mode.

The colours and colouring of a space seems to influence the team mood and wellbeing: ‘One needs different colours, for different expressions. Warm colours foster emotion, cold colours foster rationality. Too many colours are not ideal.’ ‘Possibility of changing colours is important. It is the task of the teams to design these.’

### *Non-Participatory Observations*

An experimental design with non-participatory observation was conducted in order to better understand if and how different spatial settings affect team wellbeing and performance of innovation teams. The research participants were divided in two groups: one consisted of young professionals working in innovation departments in different industries with no experience in the design thinking (design thinking novices). The second group went through a six-month training program in design thinking (design thinking experts). Each group was divided into four teams. Both groups were assigned to an innovation project. For the duration of the innovation project the teams were asked to set up and alter their own creative workspace of approximately 20 m<sup>2</sup> in the same open space environment. All four teams in both groups were working next to each other. During the experiment the observers were passive and had minimal interactions with the research participants (Spradley, 1980). Both groups had access to the same repertoire of furniture and resources.

Furniture included:

- High chairs, normal chairs, sofas, sitting cubes and beanbags,
- Normal rectangular tables, moveable rectangular high tables,
- Mobile whiteboards.

Resources included:

- Prototyping boxes,
- Time timers,
- Snack and drinks.

### **Creating and Changing Spatial Settings: Design Thinking Beginners**

The innovation teams of design thinking beginners used all the available furniture – except the normal chairs and the normal rectangular tables – and all provided resources to equip their innovation team space. Except one team the initial spatial setting remained untouched for the duration of the innovation project, although all furniture was easy to move (both lightweight and easy to carry around or flexible and on wheels). All teams set up their team spaces at a window and surrounded their team space with mobile whiteboards on two sides. They left one side intentionally open to face the sharing space (see Figure 3).

*Figure 3 Using the Team Space: Design Thinking Beginners Team (Ideation)*

Most of the teamwork happened around the high table with team members either standing around the table or sitting at the table on high chairs. No changes were made for the different work modes including analysis and synthesis, brainstorming and ideation as well as team-reflections. Therefore, during active team sessions the team members sitting in front of one of the two whiteboards in use became more active than the team members on the opposite side of the table (e.g. writing on the whiteboard, putting their own post-it's and post-it's with ideas and thoughts of other team members there). Thus, these team members became moderators or facilitators due to the spatial setting and not due to the team's 'official' assignment. The sofas, sitting cubes and beanbags were only used during team breaks to relax or to do some individual work on a personal laptop – on other projects.

### **Creating and Changing Spatial Settings: Design Thinking Experts**

Overall, the innovation teams of design thinking experts spend more time on setting up their workspace compared to design thinking beginners. Nonetheless they ended up with using the same selection and amount of available furniture. The main difference was that three of four teams divided their workspace into two separate parts: the sofa, the sitting cubes and the beanbags were used to create a comfortable looking sitting area arranged in the form of a circle at the window side. The mobile standing table was standing at the opposite end of the team's space; and was facing the open side to the sharing space in one team. Thus the table itself created the 'natural boundary' to the open space. Mobile whiteboards were used as well to separate the team space on two sides from other teams. In contrast to the design thinking beginner's teams the design thinking expert teams used individual artefacts to 'decorate' their team space. These items fall into two categories: individual decorating items (e.g. plants and a carpet) and items intentionally brought in by team members related to their innovation challenge (e.g. posters, a dummy and two artificial limbs for a health care project on lower limb loss). During the process they added first low-resolution prototypes built by the team themselves.

The sofas were also not used as places to sit – neither for teamwork nor for relaxation. They turned into the storage space for personal belongings (e.g. coats and bags). Compared to the spatial settings of the design thinking beginners teams their spaces looked more 'messy' because they were filled with more objects.

*Figure 4 Using the Team Space: Design Thinking Experts Team (Ideation)*

During their teamwork sessions the teams switched frequently between two or more spatial settings (see Figure 4 and Figure 5). Working on analysis and synthesis was quite done at the high table while sitting on high chairs or standing in front of the whiteboard. Brainstorming and ideation was most often done either sitting or standing in front of one or two whiteboards. For team reflection the teams preferred to use the circular sitting area. The sitting area was also used for individual project work. The set-up of the workspace was constantly changing throughout their work process. The teams changed their working position every 10 – 40 minutes.

*Figure 5 Using the Team Space: Design Thinking Experts Team (Team Reflection)*

## **Interpretation**

Our pilot study has shown that innovation experts, moderators and facilitators of innovation teams are considering the spatial setting as an important success factor of innovation processes. Despite the fact that they were able to identify and describe the qualities of some promoting and some hindering factors of spatial settings, even these experienced people had difficulties to address the influence of space on team wellbeing and performance on a meta-level. By using non-participatory observations we were able to identify and compare work modes of innovation teams in a given architectural setting; thus we could control the influence of architecture and were able to observe the usage of the two remaining categories: furniture and resources.

### *Spatial Settings Supporting Innovation Teamwork*

That nature fosters wellbeing and creativity is nothing new (Flade 2010, p. 197), nor the assumption that humans are more creative while being outside of their usual environment (Flueglister 2005). Writable surfaces

and flexible furniture are also already used in practice (Doorley & Witthoft 2012, p. 76).

It was surprising that a general ambience appearing as rather „styled through“ than „self-made“ was evaluated as the most hindering spatial factor out of 48 factors, regarding a space for creative teamwork. According to the outcome of the pilot study, additional to the ‚self-made‘ atmosphere, the ideal ‚creative work space‘ should not be already marked by means of colours and firmly installed accessories. The results evoke the association of a studio or new apartment that has to be filled with life by the inhabitants over time.

As entry into the new work mode, standing tables and high chairs appear to be suitable. They lead to more activity and mobility and are easy to combine with a mobile whiteboard. The shift from a horizontal to a vertical working surface, evidently are further spatial adjustments that are easy to adapt to. Employees of companies appear to be conditioned in a more static work mode. The beginners of design thinking have shown in the workshop that these changes from their work routine are easy to adopt.

### *Adapting Spatial Settings for the Innovation Process of Teams*

It appears as if workshop participants and team members first have to learn to make use of the space as help for their work. Spatial possibilities only become conscious through new experiences. On the one hand, setting up the team space is crucial. On the other hand, the experience of transforming and adapting the work environment according to the requirements of different phases in the innovation process (analysis vs. ideation and solution building) turned out to be equally important.

Especially the possibility to work without a table and sit on the floor, as well as the intuitive switch between relaxed and slow versus concentrated and fast modes of working, seem to be rather unusual to less experienced workshop participants. Among design thinking experts it is more popular.

Experienced teams individually decorate their workspace with artefacts, posters, and pictures. They surround themselves with (important) work results and constantly change their space throughout their work process. The visibility of selected works on surrounding walls seems to be beneficial for further developing their project as shown by the advanced design thinkers. The constant change of the working mode of experienced teams between different parts of their team spaces is striking. Different settings were used for phases of verbal communication compared to those of

ideation and building prototypes. The switch from focused teamwork in front of a whiteboard to more reflective work when sitting in a circle seems to be helpful for many experienced teams.

Even experienced teams had difficulties to adapt spatial settings to the appropriate phase in their work process. Here, further research and practical experience is needed. Coaches could also facilitate and support the initial setup and the adaptations of the spatial factors of their teams (the aspect of appropriate use and design of spatial factors as support). Additionally the use of different settings for beginners vs. experienced innovation teams needs further elaboration.

## **Discussion and Conclusions**

Based on the model of cultural layers developed by Edgar Schein, common material artefacts influence the behaviour and mind-set within a culture (Schein, 1985). Hence, the provided furniture will affect the ability of innovation teams to use and adapt their work space according to their specific team requirements of wellbeing and performance. The use of lightweight, modular or mobile furniture seems to be easily implementable. However, a greater variety of such furniture is missing on the current market.

Furthermore, if the atmosphere of the innovation space is perceived as important and the design expression of 'don't touch – too perfectly designed' hinders the interaction of innovation teams with the space, it becomes clear that the spatial settings of innovation labs have to be rethought and redesigned.

Although the findings of the current study have been limited due to the small sample size as pilot study, different aspects to be considered for further research were identified.

The study focused on the mobile furniture developed and used at one specific location. It would be worth considering other spatial settings and to develop and test different lightweight, modular and flexible pieces of furniture to compare their impact on team wellbeing and performance. In particular the spatial elements of lightning, sound and noise have not been investigated in this study and need further exploration to test their effects on teamwork, team wellbeing and performance.

Additionally this study has only focused on innovation team spaces for design thinking. Unfortunately not all companies can provide the resources and spatial set ups as are found in innovation labs. The impact of other

spatial configurations at innovation labs (e.g. workshops for prototyping, sharing spaces for presentations, design review and feedback sessions, lounges spaces for communication and interactions) has to be further investigated as well. Furthermore, the influence of the architectural setting on team wellbeing and performance can be addressed in future studies.

Another important aspect to consider is the configuration of individual creative workplaces and team workspaces and the relationship between both. The change between different, physically active and team-oriented working phases and quiet individual-oriented, work phases and work positions seems to be a natural human need. This can be related back to the observations made by the facilitators as well as by the workshop observations. After decades of concentrating on optimization of seating position in front of a desk (Stegmeier 2008), it could be time to support the natural switch between body positions through offering different options in workspaces. Different possibilities concerning the design and creativity of work belong to main characteristics of „good work“ (Schröder, 2010 p. 264). Therefore, new workspaces with more design options that foster creativity could lead to more satisfaction at work. This has to be investigated further.

This rather descriptive pilot study was able to identify different patterns of designing and adapting creative work environments for innovation teams. A German study on the transformation of office work identifies that in the year 2025 the spatial design of office and knowledge work will be largely self-organized (Spath, et al 2012). Due to this study there will be an increasing need for the development of design competences such as the selection and creation of physical workspace. Considering the use of design thinking as an approach for innovation processes, further research is needed that provide insights about the appropriation of spatial situations for certain phases in the innovation process. Thus, research questions to be addressed in the future are: how to measure the influence of the spatial setting on team wellbeing from an internal perspective of the individual team members and how to measure the influence of the spatial setting on performance in order to define requirements for effective and creative teamwork as well as innovative outcomes.

## Discovering the Real Needs of the Client – possibilities of grounded theory in design processes

Sylke LÜTZENKIRCHEN\*

University of Wuppertal, Germany

*As service providers for SMEs, designers usually have to adapt to various needs when working in cooperation with different clients. However, these needs and requirements are often not transparent and cannot be determined in a structured way. In this investigation, data is collected through narrative interviews, which often reveal information the interviewees themselves are unaware of. Furthermore, grounded theory will be discussed as a possible basis for a profound, empirical research method that is also applicable to the field of design. The present contribution analyzes the fields of ‘motivation for change’, ‘communication structure’ and ‘project management’. On the basis of these three fields, various forms of cooperation among designers and clients will be described and compared. Research questions considered are: What kind of designer best fits the requirements of a company? Do entrepreneurs need a visionary leader or a structured realist for their tasks? Do designers need the leadership qualities of a team player or rather of a steersman? Do companies need designers to act as psychologists or educators? A concluding overview/summary will describe different characteristics of designer skills in relation to job requirements – all excerpted from the empirical field study.*

**Keywords:** *Collaboration of designers and entrepreneurs; narrative interviews; grounded theory*

## **Introduction**

When designers and entrepreneurs – especially CEOs or Managing Directors of SMEs – work together, there are often disruptions in their collaboration process. They may well have different targets and needs, and sometimes it seems they just don't fit together. Furthermore, entrepreneurs of small companies are often skeptical about finding a suitable associate for their tasks, while on the other hand designers are not informed about the specific needs of the client on which they will have to focus in the design management process. The present field study focuses on the collaborative interface between designers and entrepreneurs (or companies). The main questions here are:

- How do designers and entrepreneurs work together?
- What are their essential requirements?
- When is the cooperation successful?

## **Collaboration in design processes – an investigation of disruption**

Research on the collaboration process in entrepreneurship is a recent phenomenon. Indeed, scholarly research on entrepreneurship was only a generation ago virtually non-existent (Audretsch, 2012). Recently, however, entrepreneurship has emerged as one of the most dynamic, vital and relevant fields in management (Wiklund, Davidson, Audretsch and Karlsson (2011)). Audretsch emphasizes its multiplicity and breadth when he sees the current focus of entrepreneurship as 'more on the characteristics of the individuals and organisations that exhibit entrepreneurial behavior [...] Entrepreneurship is anything but unified and singular'. On the contrary, it is 'heterogeneous and differentiated [...] in a rapidly emerging field that is rich and dynamic, and appeals to theory, practice and policy' (Audretsch, 2012).

But what of the collaboration process itself, when two entrepreneurs – the designer on one hand and the CEO of an SME on the other – are working together? Some commentators suggest the field is fraught with misunderstanding. Here are two insights from Brigitte Wolf (Professor of Design Theory, Industrial Design, University of Wuppertal):

'The existing communication problems have something mystic and are bewailed by many designers but also by SMEs' (Wolf, 2008, p. 48). This may be because designers, as service providers for SMEs, generally have to adapt both their aims and their working methods to the diverse needs of their

various clients. But these needs and requirements are often not transparent and cannot be determined in a structured way. 'Understanding the thoughts and activities of SME leaders is the key to all further collaboration' (Wolf, 2008, p. 48).

The field study presented here was launched in order to learn more about the relations and interactions between designers and entrepreneurs, and to investigate the role of design as a key element in the innovation process – especially in SMEs. In addition to the 10 (measurement) design framework categories developed by Thomas Lockwood, there may be some further, as yet unidentified issues worth pinpointing (Lockwood, 2007). The study aims, therefore, to provide a full description of the interface between designer and entrepreneur. According to Audretsch (2012): 'The methodology involving the behavioral approach to entrepreneurship typically does not involve large-scale comprehensive data sets [...] rather, the experimental methodology offers a viable way to identify (observe) and analyze entrepreneurial behavior.' Reflecting Audretsch, an open instrument consisting of a qualitative empirical field study was chosen. Designers and SME entrepreneurs were interviewed with a view to gaining information about their collaboration processes and the value of successful design projects. Key questions here are: what specific designer skills do SMEs consider important; and what skills are rated highly by designers? The aim was to determine and examine different points of view, new approaches, and empirical findings that describe highly valued design abilities – i.e. abilities that give rise to successful cooperation between designers and SMEs (or their CEOs) and generate high added value.

## **Narrative interviews and Grounded Theory – how to improve a theoretical construct from inductive data**

### *Aim of research*

Individuals are only limited informants about their subjective points of view. When interviewing people, aspects and details hidden from the interviewee cannot be discovered by a simple request for information. An open instrument like a qualitative social research field study is a more appropriate instrument for revealing such hidden aspects – not least because of the lack of necessary knowledge to serve as a guideline.

This study therefore uses narrative interviews for investigation. These allow a full description of the interface between designer and entrepreneur, and shed light on the way in which SMEs and designers (subjectively) experience and evaluate new and hidden things about their cooperation. The questions considered are:

- How do entrepreneurs and designers work together?
- What are their specific goals and expectations from the collaboration?
- What are the main potentials and problems of cooperation?
- What are the potential conflict and/or risk situations, and how do they relate to the gain of the teamwork/collaboration?
- What are the decisive criteria for successful and satisfying work?

For the analytical phase, this research study used an open instrument, which was able to develop a theory and description of needs and expectations step by step from the data. Grounded theory fulfills this requirement in to a high degree. It enables 'discovery from data' – i.e. reveals information hidden in the data. It takes account of comparisons and provides an open process throughout the investigation.

The methods of narrative interview and grounded theory were both initially developed by the Chicago School (Alfred Schütz, Barney Glaser and Anselm Strauss) in the early 20th century, and focused on symbolic interactionism and phenomenology (Bohnsack, (2003), p. 91; Apitzsch & Inowlocki (2000) pp. 53, 58). In general, grounded theory – with the general mechanism of theoretical coding, comparative analysis, and theoretical sampling (Strauss, Corbin, (1996) p. 163) – is not the way to analyze narrative interviews, but even Flick named theoretical coding as a possible method for this purpose, as it can access a subjective point of view (Flick 2011, p. 550). The present investigation has brought narrative interviews and grounded theory together as a time-effective toolkit derived from qualitative empirical social research for discovering hidden things.

This relates to the working hypothesis: We assume that a careful analysis and description of the needs and expectations, as well as the characteristic performances and reactions of both designers and entrepreneurs may open up new ways to bridge the gap between their partly incompatible demands.

## Sample Study: Faces of Cooperation – designers and entrepreneurs

Designers (with management tasks) and SME entrepreneurs (including managing directors and heads of marketing) were interviewed with a view to gaining information about their collaboration processes and the value of successful design projects. The designer and entrepreneur spoke in individual narrative interviews about a specific design project chosen by the interviewer before the interview started. Selection criteria for the sample were that it should be as representative as possible and cover all relevant aspects. In order to achieve this, an initial pilot sample was taken and the results analyzed and used to develop a wider range of variations. The theoretical sample, unknown in its overall dimensions at the beginning, was developed step by step in separate interviews.

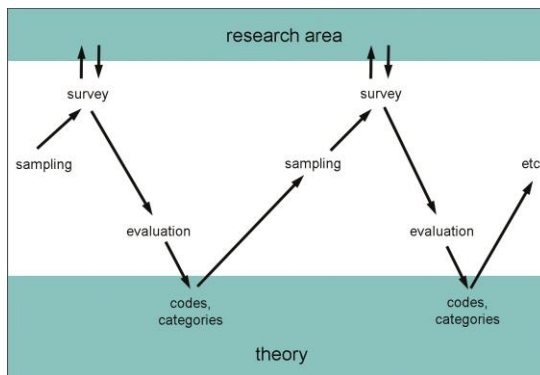

Figure 1 The iterative Grounded Theory Method research process (adapted from Haller, 2000, p. 14).

Data was collected through narrative interviews (following Schütze), which fulfil the requirements of an open instrument to a high degree. A narrative interview should have three parts:

- open narrative with stimulus (narrating stimulus) from interviewer but without additional questions; narrator closes the narration by

him/herself; pauses (and conclusion) should not be filled/prompted by interviewer;

- narrative with immanent probing questions (in-depth interview technique supported by notes and note-taking);
- narrative prompted by generic guideline questions (for completion).

So far 6 entrepreneur interviews and 6 designer interviews have been evaluated. Interviews were electronically recorded and subsequently transcribed so that the material gathered could undergo a detailed analysis.

## **Narrative interviews – what can they accomplish?**

### *The aim of narrative interviews as investigative method*

This investigation makes use of the possibility of narrative interviews which often reveal information the interviewees themselves are unaware of. This is due to the immediacy of the narrative situation that draws the interviewee into its own logic where one detail prompts the disclosure of another. By being put on the spot, interviewees are prompted to describe the whole of a particular process. It has recently been demonstrated that even managers who are specialists in communication will disclose hidden things in narrative interviews (Holtgrewe & Taffertshofer (2009) p. 60).

### *Function of narrative interviews as investigative method*

The disclosure of hidden things is achieved through so-called enmeshments or entanglements and by maneuvering the interviewee into a tight spot (Flick (2011), Helfferich (2011), Küsters (2009)). The technique has three strands, each of which generates a different type of compulsion to talk (Kallmeyer & Schütze (1977) p. 162, 168):

- compulsive detail – the interviewee focuses on the historical sequence of events being described and their connections; this creates pressure to go into enough detail to make the story intelligible and credible.
- compulsive form – the interviewee strives to round off the cognitive structures of the narrative and create closure from other stories.
- compulsive compression – the interviewee is confronted with a mass of detail that must be edited and compressed by constant evaluation and omission on the basis of greater or less relevance.

During the interview it is necessary to take the interview partner by surprise, so that they tell their story spontaneously. They are told about the process but not about its specific aim, and they are allowed to choose the development of the narration themselves. Interviewees should be active project partners from the pilot project. They will then click into their earlier story and revitalize its structures and details. It is important that they narrate the processes they are describing as timelines or content connections to make the story easier and more coherent. The process begins with a carefully prepared trigger question that stimulates a process of narration. The question should be the same in all interviews and should contain (or at least be connected with) the invitation 'tell...'

In the study described here the trigger question was, for the designer: 'Tell me how you came to work together with your client, how you got to know him/her and how the cooperation went.' For the entrepreneur the question was simply the other way round: 'How you came to work together with your designer, etc.'

This allows the interviewee to freely select the structure, figures and values of the narrative without having to follow a set of questions or instructions. The story can stray into contexts unexplored by either interviewer or interviewee, or which the interviewee would not otherwise be prepared to embark on (Schütze (1976), p. 222). Thus it regularly reveals new information. The interview form requires patience and tolerance from the interviewer, as well as openness to new areas of knowledge (Köttig & Völzke (2004)).

## **Grounded theory – what can be discovered by analyzing interview data?**

### *Why use grounded theory?*

Purely quantitative procedures cannot adequately grasp complex social realities. Moreover, they can only formulate what established theory and the hypotheses derived from it allow. But the development of new theories is just as important as the demonstration of established ones: indeed, on them frequently depends 'the accessibility of the 'new'' (Mey & Mruck (2011) pp. 11, 33). Grounded theory techniques are eminently suited to this task. Grounded theory is not so much concerned with the demonstration of any established theory but with 'the discovery of theory from the data' (Glaser & Strauss 1967 p. 1; see also Mey et al. (2011) p. 14). Its object is not

‘that data should fit the theory’, but that ‘the theory should fit the data’ (Glaser et al. (1967) p. 261; see also Mey et al. (2011) p. 16). Grounded theory is a method of reflecting on social reality and awakening to life the theory that lies dormant in the data. What it offers is a set of useful procedures, not of rigid instructions.

Grounded theory does what it says: it develops step by step a theory that is grounded in the data. As a scientifically established method it can address any type of data – interviews, field observations, documents, or statistics – and it has in fact become one of the commonest qualitative research strategies not only in sociology, pedagogics and psychology but also more recently in health studies and in management action research (Strauss, A., Corbin, J. (1996); see also Mey et al. (2011) p. 11; Titscher, Meyer, Wodak & Vetter (2000) p. 74).

Grounded theory is, therefore, particularly appropriate to situations in which specific guidelines for action, and recommendations for change, are called for. Practical disciplines like training, healthcare (at all levels), marketing etc., and indeed any discipline that transcends the purely descriptive, can benefit from a methodology that takes the perspective of the participant as its starting point and arrives at a theory that ‘fits, is relevant and works...’ (Glaser, in Mey et al. (2011) p. 56). For when it comes to introducing change and stimulating decisions, a theory is stronger than a description. And many professionals are in this position: they must change the realities with which they are confronted, and must do so with the confidence that they have a solid theory behind them.

### *What does grounded theory mean?*

Grounded theory is a method of developing relevant and effective concepts from data (Glaser, in Mey et al. (2011) p. 66) by means of systematic observation and analysis (Strauss, et al. (1996) p. 8). Derived inductively from the observed phenomena, it is firmly anchored in reality. ‘At the beginning [of the process] stands the area under investigation. What is relevant here will only become apparent in the course of the research process’ (Strauss et al. (1996) p. 7): The systematic development of concepts leads to the systematic development of theory. Strauss and Corbin comment:

*The development of a grounded theory seeks to capture as much as possible of the complexity and dynamics of the real world. We know, however, that this attempt can never be entirely successful. [...]*

*Grounded theory is not concerned with counting frequencies, even when we are looking to prove our theory. The perception and specification of similarities and differences within and between categories is, on the other hand, of the utmost importance. This is the core of grounded theory. (Strauss et al. (1996) p. 89)*

The perception and naming of phenomena leads to the perception and naming first of categories, then of core categories, and from there to the theory that explains them. This is a step by step process: 'Data are indicators for a concept that is at first provisional, but gradually emerges with more certainty from the data' (Strauss (1991) p. 54). The constant to and for between inductive hypothesis and deductive checking ensures the grounding of these various steps, right up to the construction of a theory, in phenomenal reality.

The computer program MAXQDA (Verbi Software, 2014) provides useful technical backup for the gradual development of codes and categories. A wide spectrum of encoding functions facilitates the analysis and assimilation of extensive (even heterogeneous) material like interviews, films, images etc.

As one does not know in advance what theoretical codes and categories will emerge from the process of observation and analysis, this remains open-ended (Glaser in Mey et al. (2011) p. 66-67), but at the same time not entirely controllable. A key characteristic of this method is that assumptions and premises, whether prior to or developed during the research process, must be broken – indeed it is this breaking that (as in all intellectual activity) constitutes the threshold from one step of the inquiry to the next. At the end of this iterative process, composed of inductive development and deductive demonstration, stands a theory rooted in – because derived immediately from – the data: in other words a grounded theory.

### *How does this work?*

In the project reported here, entitled 'Faces of Cooperation – Designer and Entrepreneurs', the data was gathered in successive instances of sampling. The sample, that is to say, was not known in its entirety from the beginning: it arose out of and during the investigative process. In this way it was ensured that the most relevant aspects had been uncovered. The sequence of the interviews would not produce any different results. Hence it was important to start the analysis and evaluation, the composition of memos and formulation of hypotheses, directly after the first interview. This

formed the basis for the selection of the next interview. The data transcribed from the theoretical sampling process was then encoded via the MAXQDA program. Individual data-incidents were bundled and designated with an appropriate concept (the 'code'). These codes were then singled out on the basis of their recurrence or non-recurrence in the body of data-incidents, or of their ability to generically incorporate other codes (in vivo code), and similarly bundled to generate categories. In the case of in vivo codes, the generic code would provide the name for the category; in other cases an appropriate category name would be supplied from the range of technical terms available in the discipline.
