In the course of this theoretical sampling, the codes and categories became increasingly compressed until in the end three core phenomena appeared. Abstracted from the empirical field study, these generic phenomena provided a level of theoretical explanation for the dense mass of data. They describe different characteristics of designer skills in relation to job requirements – and hence different types of cooperation and collaboration among designers and entrepreneurs – in fields like motivation for change, communication structures, and project management. They answer questions like: What kind of designer best fits the requirements of a company? Do entrepreneurs need a visionary leader or a structured realist for their tasks? Do designers need the leadership qualities of a team player or of a steersman? Do companies need designers to act as psychologists or educators?

## **Results and Findings: Three main areas of disruption addressed by the theory**

The three main (generic) categories determined by the research project were motivation for change, project management, and communication structures.

### *Motivation for change*

Questions in this field include: What type and dimension of change do entrepreneurs want in relation to designers? Do they have the same targets? Which targets are most common, and when do they match? Findings range from the antipodes 'conservative/protective' to 'visionary'.

### *Project management*

Questions in this field include: Do designers need the leadership qualities of a team player or rather of a steersman? What are the requirements of different companies? Do designers have to fit into an existing team or must they fight alone for their design project both in and outside the company? Two dimensions are explored as antipodes: 'design integration' and 'design leadership'.

### *Communication structures*

Questions in this field include: How do entrepreneurs and designers communicate with each other? Do companies need designers to act as psychologists or educators? What specific skills could be important for different kinds of entrepreneur? Findings range from the antipodes 'psychology' to 'design education'.

### **Dimensions of collaboration**

Figure 2 *Dimensions of collaboration – derived from narrative interviews via grounded theory.*

## Motivation for change

Motivation for change varies from the conservative or protective to the visionary.

### Motivation for change

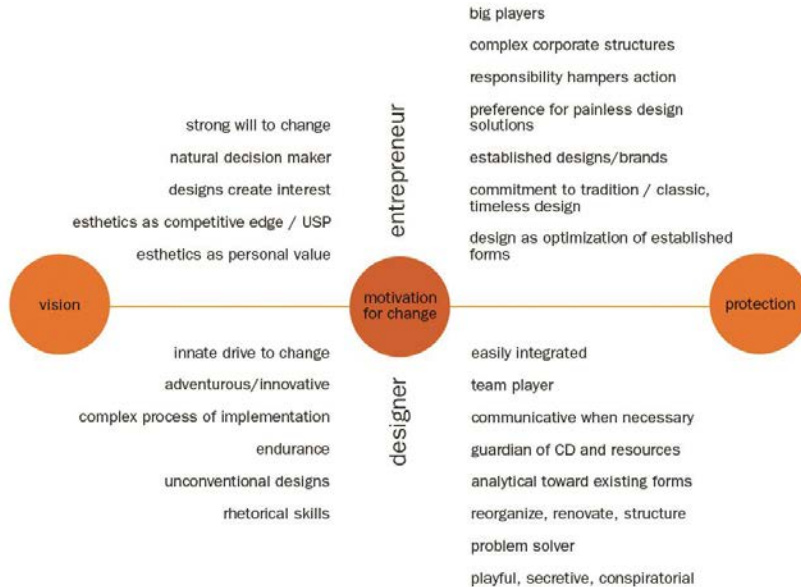

Figure 3 Motivation for change – between the antipodes 'visionary' or 'protective'.

### Entrepreneurial perspective

Fundamental or visionary change requires a powerful decision maker and a strong will to see it through. A design esthetic may either be a personal value of the decision maker or provide a competitive advantage for the enterprise. Design should in any case be calculated to stimulate market interest. CEOs of large companies with complex structures are often defensive or protective. Their wide responsibilities tend to restrict their decision-making, and they as a rule prefer smooth and painless change processes. Their company will often have an established classical and

timeless design tradition. Design in this context is generally understood as optimization of existing forms rather than as radically innovative.

### *Designer perspective*

Visionary designers have an innate drive to create radical change. Motivated by exploration and adventure, they are realistic about the time needed to put their vision into practice, and they possess the endurance necessary for this task. Their designs break conventional boundaries, but their rhetorical skill and (later) reputation enable them to convince others through both presentation and verbal argument. Conservative designers are easy to integrate into a team, and their approach to design is also conservative. Thus they will work willingly within existing corporate design structures and resources. Their first step will be to observe and analyze those structures, which they will then often seek to reorganize and renovate. They are good at problem solving and may often seem playful and secretive or conspiratorial.

In general, if both designer and entrepreneur belong to the same antipode, their cooperation could be more successful. The described way of careful analysis and description of the needs and expectations, as well as the characteristic performances and reactions of both designers and entrepreneurs, may open up new ways to bridge the gap between their partly incompatible demands.

## **Project management**

The field of project management varies between the dimensions of design integration, design management within established structures, and design leadership in which the designer assumes wider responsibility.

## Project management

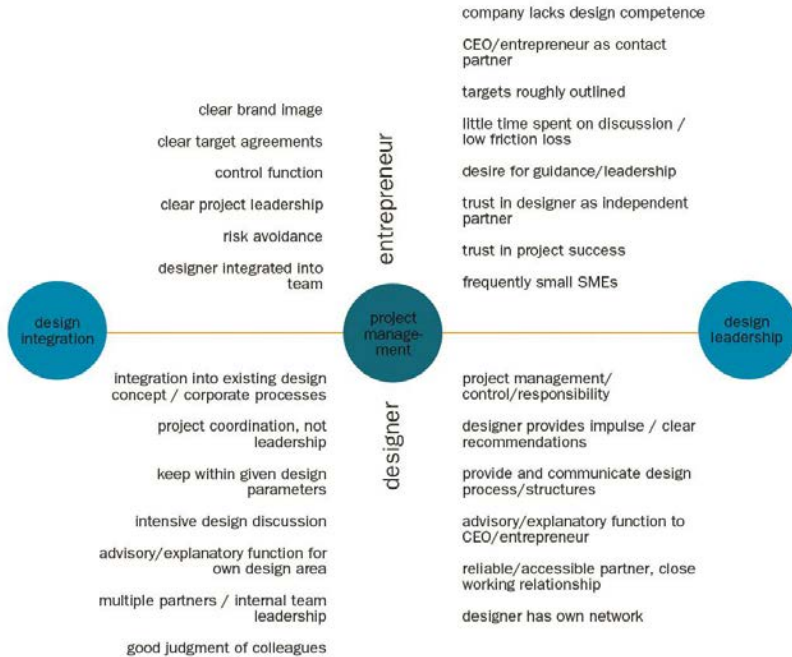

Figure 4 Project management – between the antipodes 'design integration' and 'design leadership'.

### Entrepreneurial perspective

If a company has a clear brand image, management will often be interested in updating existing design. Clear goals will be agreed and targets defined; project leadership and responsibility will be allocated within the company; the designer will be treated as a team member and subjected to fairly strict control. Every effort will be made to exclude unforeseen risks.

Entrepreneurs will generally need a designer as project leader/manager if they have no design competence themselves or in their company. They will themselves be the direct contact partner for the designer. The design goal will only be roughly outlined, as they will not be able to formulate it more clearly. As they can invest little time in the project, and are looking for

a smooth-running operation, they will want to be guided. They trust in the value of cooperation and in the success of the designer-led project.

### *Designer perspective*

Design integration demands a thorough grasp of existing design parameters and of internal corporate processes. The designer will coordinate the design project, but overall responsibility will generally be taken by another company employee. The designer will be expected to conform to established design parameters and to concentrate on the specifics of the project in hand. He/she must be able to explain and advise, and to coordinate the project with a wide range of partners in the company. This calls for tact and good judgment of colleagues.

Design leadership entails project management and associated responsibility. It entails providing the impulse for design innovation and the plan for the design process, and communicating these to project partners and company management as required. Again the designer must be able to explain and advise, and to agree the project with the CEO/entrepreneur, with whom he/she constitutes a team. In this setup the designer is constantly in touch with the CEO, and will have her/his own network of cooperation partners.

## Communication structures

The art of communicating varies between the dimensions of psychology (or empathic communication) and design education (didactic communication).

### Communication structures

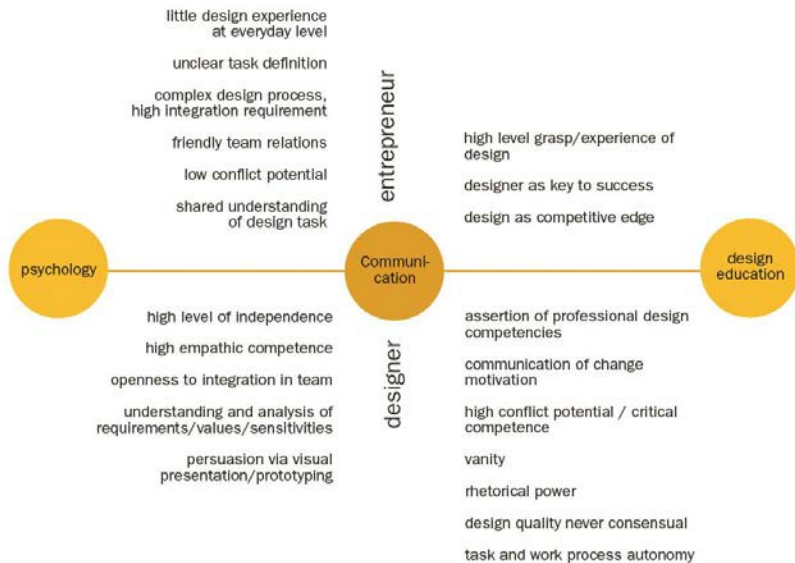

Figure 5: Communication structures – between the antipodes ‘psychology’, ‘design education’.

### Entrepreneurial perspective

Companies with little experience with design or commissioning of design usually need high empathy to establish real requirements. The design task is not clearly defined so the designer has a lot of scope. Relations remain friendly with few conflict situations. CEO/entrepreneur shares/accepts designer’s professional perspective. A didactic approach will be accepted by CEO/entrepreneurs who have high level design awareness and experience when they see the designer as a key player for corporate success. Design

guarantees competitive edge. Few examples of didactic communication occurred in the current sample.

### *Designer perspective*

Empathic communication competencies are useful for designers who work largely independently but must dovetail into existing design and corporate structures (teams, cooperation partners etc.). The designer must ascertain the values, sensitivities, and real as well as expressed requirements of the company and its teams etc. Frequent use of visualization and prototyping for communication.

A didactic approach will be used to assert the designer's professional perspective and achieve change. High critical competence, conflict potential, personal vanity and rhetorical competence. Design quality never viewed as consensual. Designer's work processes will generally be autonomous and distinct from (other) corporate processes and structures.

## **Discussion/Conclusion**

The research study outlines the requirements of the designer and entrepreneur (or CEO) as cooperation partners in the three areas of 'communication', 'design management', and 'motivation for change'.

In each of these areas it reveals two starkly opposed attitudes like antipodes. If both designers and entrepreneurs belong to the same antipode, their cooperation could be more successful. The cooperation will turn out to be much more complicated if designers and entrepreneurs belong to opposite/ crossing antipodes. Lack of awareness of these diametrical oppositions may lead to misunderstanding and unfulfilled expectations. The present study is therefore important in order to improve the relation between designers and entrepreneurs. Whether it can generate a concrete catalogue of needs and expectations for the two cooperating partners is another question. If we are able to get more awareness and describe skills more detailed the cooperation could be easier. Thus, a careful analysis and description of the needs and expectations, as well as the characteristic performances and reactions of both designers and entrepreneurs, may open up new ways to bridge the gap between their partly incompatible demands.

Further questions concern the relevance of these findings for designer education, and their extension through further theoretical sampling to other disputable aspects of cooperation. Design research could also benefit from

the application and analysis of narrative interviews in combination with grounded theory to other observation, survey and development processes in design.

## Process, Problem and Theory in the Design Discourse of Brazilian Product Designers

Júlio Carlos de Souza VAN DER LINDEN\* and Gabriela DALL'AGNOL

Federal University of Rio Grande do Sul (UFRGS)

*We present an analysis of the design discourse of Brazilian product designers aiming to contribute to the question: 'how do designers work?'. Our start point is the gap between academic design methods and methods used in practice. We interviewed eighteen product designers in Rio Grande do Sul (Brazil) using an in-depth interview protocol that comprising different aspects: professional life, influences, theoretical approach, barriers and difficulties, perceived challenges, vision of design, and design process. Those designers work in different contexts (design studio, external designer, freelancer designer, internal designer, own store), have different levels of expertise (experienced, intermediate, novice) and have different academic background (Architecture, Arts, Product Design). Results we present refer to: Design Process (how they describe and model their design process), Problem Definition (how they frame the design problem) and Design Theory (which theory supports their practices). We found different approaches for design processes and problem definition, and we observe that none of them adopts an explicit theoretical approach. We believe that the wide field of idiosyncrasies among professional designers is a consequence of the lack of a consistent and shared theoretical background among Brazilian design schools. Certainly it affects how Brazilian society and companies perceive Design as a profession.*

**Keywords:** Design Process; Problem Definition; Design Theory; Design Discourse

## Introduction

Our start point is a commonly recognized problem: the gap between academic design methods and methods used in practice. Bonsiepe (1978) and McCormack (2006), in different decades, pointed that what is taught in undergraduate courses sometimes is far from what designers need to work. Studies about how designers think and work (Jones & Thornley, 1963; Jones, 1976; Lawson, 1980; Christiaans, 1992; Dorst & Dijkhuis, 1995; Cross, Christiaans & Dorst, 1996; Lloyd & Snelders, 2003; Perks et al., 2005; Cross, 2007; Christiaans & Almendra, 2010) have increased available knowledge about designerly ways of knowing and doing. For example, Christiaans and Almendra (2010) suggested that designers may adopt different strategies: problem-driven (problem descriptions by means of abstract relations and concepts); solution-driven (one or more possible solutions are the drivers); and integration-driven (problem and solution co-evolution). Perks et al. (2005) proposed a taxonomy of design role in new product developments: Design as Functional Specialism; Design as Part of Multifunctional Team; and Design as NPD Process Leader. These works offers useful tools to analyse designers' practices.

On the other hand, despite a great effort that researchers have developed during decades, there is not yet a General Theory of Design and probably it will never exist. Between an academic theory, specific or general, and a personal or idiosyncratic theory, there exists a wide field of possibilities. Knowing how practitioners theorise about themselves is a rich source for design theory. In the 1950s, American industrial designer Henry Dreyfuss authored a book in which he described his experiences (Dreyfuss, 2003). Recently, Conran and Fraser (2004) interviewed around a hundred designers asking them about influences, challenges and some other aspects of professional life; and McCormack (2006) stressed the difficulties he experienced to deal with professional world.

Our focus is on design discourses in Brazil, a country where product design practice and design education are recent, dating from the 1950s and 1960s when governmental policies led to industrialization. As in that time in Europe the Design Methods Movement was happening, since its beginning Brazilian design education was affected for ideas concerning methodological issues. The main source for this was the Hochschule für Gestaltung Ulm (HfG Ulm), German design school that had a major influence on the first Brazilian design school conception. Max Bill and Tomas Maldonado, both working at HfG Ulm, contributed to the debate regarding design education in Brazil in the 1950s and 1960s (Niemeyer, 1998).

As a consequence of the cultural scenario in the 1970s, first Brazilian design theorists presented noticeable influence of European authors. In 1980, Austrian-American designer Victor Papanek visited design schools in Rio de Janeiro and disseminated ideas about ecology. In the 1980s, books authored by German design theorists Gui Bonsiepe and Bernd Löbach, British design methodologist John Christopher Jones, and Italian designer Bruno Munari, started to be known in Brazil by means of Gustavo Gili, a Spanish publishing. In that decade Gui Bonsiepe developed an important role in Brazil as an invited consultant and teacher, working for CNPq (federal agency for supporting R&D) and since then some of his books have been used as textbooks in Brazilian design schools. In late 1990s, when industrial environment changed and product design became an important activity, books authored by Bernard Bürdek (German design theorist), Bernd Löbach and Mike Baxter (British design researcher) were translated into Portuguese and were adopted as major references in design methodology.

After a fifty-year evolution, in our vision, design education and design practices in Brazil are still distant and sometimes unrelated fields. Brazilian design schools tend to adopt old-fashioned theories and to be more oriented to design skills than to integrative competences. We believe that it affects the way how design and designers are perceived by managers, engineers and some other stakeholders in the product development process.

Anyway, it is possible to talk about history of design education in Brazil, and it could be expected that professional designers from a region should share the same theoretical background, following a mainstream approach. Based on this hypothesis, we present an analysis of the design discourse of a sample of product designers that work in Rio Grande do Sul (Brazil).

## **Method**

We selected experienced designers, not considering their academic background, and designers who have an undergraduate degree in product design. Our sample comprises eighteen designers: seven of them are experienced designers (working for more than 15 years at local market); seven have less than five years as professional designers; and four in an intermediate group. They act as product designers in different ways: in a design studio, in a company as an external designer, in a company as an internal designer, as a freelancer or in his/her own store. We define acting in

a Design Studio differently of working as an External Design considering the higher involvement with industrial processes in the second case.

*Table 1 Subjects' academic background and experience as designer.  
\*(year) informs when he/she started working as product designer for whom that do not have a Product Design academic background.*

Subjects	Academic Background	Year of graduation	Experience as designer
DES_1	Arts	2004 (1989)	External designer and internal designer
DES_2	Prod.Design	1990	Design studio and own store
DES_3	Prod.Design	1990	Design studio and external designer
DES_4	Prod.Design	1992	Design studio and external designer
DES_5	Architecture	1984 (1993)	Design studio and external designer
DES_6	Architecture	1969 (1996)	External designer
DES_7	Architecture	1983 (1996)	Own store
DES_8	Prod.Design	2005	Internal designer
DES_9	Prod.Design	2005	Design studio and internal designer
DES_10	Prod.Design	2006	Design studio and internal designer
DES_11	Prod.Design	2007	Internal designer
DES_12	Prod.Design	2009	Internal designer and design studio
DES_13	Prod.Design	2009	External designer
DES_14	Prod.Design	2009	Design studio
DES_15	Prod.Design	2010	Internal designer
DES_16	Prod.Design	2011	Design studio
DES_17	Prod.Design	2012	Freelancer designer
DES_18	Prod.Design	2012	Design studio and external designer

We developed an in-depth interview protocol comprising different aspects: early professional life, influences, theoretical approach, barriers and difficulties, perceived challenges, vision of design, and design process. In-depth interviews were recorded by digital video, and the designers were encouraged to use paper and pencils or pens to draw while he/she was answering. The question 'How do you work?' was done after some others that deal with career and self-evaluation. In some cases, when the designer did not understand that the focus was his/her methodological approach, the question was complemented: 'How is your work process? How would you summarize your approach to design?'. Data we collected were analyzed by means of qualitative Content Analysis, according to Bauer and Gaskell (2000) and Gibs (2007).

### **3. Design processes they described**

#### *Experienced designers*

These designers present different academic backgrounds (one has a degree in Arts, three are Architects, and three have a degree in Product Design) and work in different contexts. DES\_1 has worked for years both as an internal designer and as an external designer, and recently he got a Master's degree in Design. DES\_2 has a long career that started as an interior decorator and changed to a furniture designer and furniture store owner. DES\_3 started working for an event planner company during his undergraduate course and after some years he has joined an architect to create a design studio. DES\_4 has worked mainly as an external design in his own design studio (he also has a Master's degree in Design). DES\_5 has a long career as an external designer working for industrial and service companies. Nowadays he acts in his design studio designing mainly corporate furniture and shopping mall decoration. DES\_6 started his career as a product designer after some years working as an architect, when he took the opportunity to work as external designer for a furniture company. Nowadays he owns a major design and innovation studio. DES\_7 worked some years as an architect before changing her carrier to work as a furniture designer and a furniture store owner.

DES\_1 described his process as interactive and iterative product development process. First activities involve problem understanding together with client. After problem clarification, an exhaustive research is undertaken to know all significant aspects about production, users, competitors, sales, logistics, etc. Based on these data, first concepts are developed to be presented to main internal stakeholders, starting an intensive iterative and interactive evaluative and evolutionary process. Concept design definition leads to embodiment stage: 3D models, mock-ups and prototypes development in a quasi-linear process. Production and launching stages complete his process. His process can be summarized as follow: problem clarification, research, conceptualization and testing; embodiment; production; and launching.

DES\_2 described his design process as a creative process to respond to a demand. Initially he performs formal and functional experiments by means of first roughs and after he develops 3D models to explore adjustments and tests. After this stage, prototypes are used to final formal adjustments and to solve production's problems. A summary of his process could be:

demand; formal and functional experiments; modelling; prototyping; and detailing.

DES\_3 stated that he adopts a design process based on theory and practice. It usually involves: briefing (to understand client's vision), brainstorming (to define the initial concept), market research (to analyse trends), 2D and 3D modelling (to explore alternatives), physical prototyping (to test products) and detailing.

DES\_4 described that he starts 'thinking beyond the brief', asking himself about what could be done in order to exceed client's expectations. The next step is to know the target group, considering formal and functional issues. Based on research results, he is able to reframe the brief. This leads to a concept, that defines marketing, advertising strategies and production strategies development. After this, the concept is developed considering aesthetic, functional and market aspects, in a interactive and iterative process, until a final decision. After general conception, product parts are detailed. His process can be summarized as follows: thinking beyond the brief; target group research; brief reframing; conceptualization; strategies development; and concept development.

DES\_5 described a process that reflects his current activity and his background as an Architect. His process starts in a preliminary meeting with client, usually in the place where the design will be implemented. The research is based on searching for similar situations by means of internet research and specialized books. He uses to return to the place for which was commissioned the project to analyse local restrictions and verify client's expectations. After this, he develops design concepts, initially by means of hand drawing and as soon as possible by using 3D modelling software to evaluate dimensions and arrangements. It finishes when he gets client's approval. The last steps involve detailing the approved concept and following production and implementation. A summary of his process could be: knowing client needs; searching for references; checking restrictions and expectations; conceptualizing; modelling; detailing; and production and implementation.

DES\_6 described his work as a three-stage design process. The first stage, he considers the critical one, involves knowing company's technological base and business strategy. Concept development is the second stage, an interactive and iterative process that engages all the internal stakeholders and involves product conception, embodiment and detailing. The final stage, commercial stage, corresponds to pre-production, launch and monitoring, following an iterative process in order to solve some

problems related to production and sales. He summarized his process as follows: knowing the client; concept development; and commercial stage

DES\_7 described a creative process, that always starts with an idea, either when she is working for a client or not. She stated that the initial idea leads to the final idea: her work involves idea's improvement in order to reach the desired result and to make it a feasible. She explores concepts by means of hand drawing and 3D modelling software, when she tries to get formal solutions and to solve functional and production problems. She uses to construct prototypes as early as possible to refine her concepts and to develop new paths. Summarizing, his process is: idea; formal and functional experiments; modelling; prototyping; and detailing

We found that only DES\_2 and DES\_7 adopt a common approach. The remaining designers do not share an approach (Table 2).

*Table 2 Experienced designers' design process.*

DES_1	Problem clarification > Research > Conceptualization and testing > Embodiment > Production > Launching
DES_2	Demand > Formal and functional experiments > Modelling > Prototyping > Detailing
DES_3	Briefing > Brainstorming > Modelling > Prototyping > Detailing
DES_4	Thinking beyond the brief > Target group Research > Brief reframing > Conceptualization > Strategies development > Concept development
DES_5	Knowing client needs > Searching for references > Checking restrictions and expectations > Conceptualizing > Modelling > Detailing > Production and implementation
DES_6	Knowing the client > Concept development > Commercial stage
DES_7	Idea > Formal and functional experiments > Modelling > Prototyping > Detailing

### *Intermediate level designers*

These designers have the same background and work in similar contexts: all of them have a product design degree and work for industrial companies. DES\_8 has worked for an industrial company since he was finishing his undergraduate course, where he designs tools for painting, and nowadays he is the designer-chief. DES\_9 started her career working for a design studio and since years she has worked for an industrial company, which produces home utilities. DES\_10 worked for a design studio for some years before he started working for an industrial company, in the sector of home

utilities in plastic, as a member of the product development team. DES\_11 has started her career as a product designer for an industrial company in the sector of home utilities in plastic, where she was working at the time of the interview.

DES\_8 described a design process that follows a quasi-linear path: *i*. initial research (leads to a preliminary concept); *ii*. opportunity evaluation (board of directors evaluates first concepts); *iii*. product project (starts by means of a deeper research - users' needs, competing products' performance, materials and processes - formal/functional conceptualization, cost estimative and first prototype tests - activities developed closely with marketing and engineering teams); *iv*. product evaluation (company's board of directors evaluates the product proposal); *v*. production planning (logistics and product engineering are involved in order to produce a pilot batch); *vi*. pilot batch (company's board of directors evaluates results); *vii*. launching (final processes are started and marketing team finishes launching planning - design team follow this process). It is a tacit-shared process that follows steps and uses well-defined techniques (Task Analysis, Usability Tests, Mood Board, Brainstorming) that are applied in a flexible way, in order to meet different products and contexts they work for.

DES\_9's design process starts with research in order to get visual references (by means of internet and magazines) and to analysis of competitors. Results leads to the development of concepts by means of an iterative process involving hand-drawing and 3D modelling. Technical detailing, prototyping, corrections and adjustments, and engineering validation comprise final stage of her design process. We summarized her process as: *i*. research; *ii*. concept development; and *iii*. finalization.

DES\_10 described his design process as a well-structured process: *i*. opportunity exploration (by means of a Brainstorming involving trade, marketing and production); *ii*. research (by internet: references and competitors; field research: users and market); *iii*. concept evaluation (presentation describing target group and product language); *iv*. product development (conceptualizing, technical detailing and validating); *v*. product evaluation; *vi*. injection mould development *vii*. pilot batch evaluation; and *viii*. launching. He stated that his design process is based on academic references, but he did not remember the authors influenced him.

DES\_11's design process is based on research, mainly focused on people, culture, market and materials. Initial research results uses to generate new questions that leads to deeper researches in a narrowed focus. During final research processes results she starts developing concepts by means of hand-

drawing (roughs and sketches). Research results and preliminary concepts are presented and evaluated during a meeting that involves company's board as well as marketing and commercial teams. After product concept definition she details it by means of 3D modelling software aiming to solve formal and production issues. As products are made by injection, moulds development is a relevant activity in her process. Before launching the product to the market, pilot batch is used to perform a market test in order to refine the product (mainly formal aspects and consumer reactions are considered at that moment). Her processes can be summarized as follow: *i.* research; *ii.* concept development; *iii.* concept evaluation; *iv.* detailing; *v.* injection mould development; *vi.* market test; and *vii.* launching.

These designers do not share a common methodological framework (Table 3).

*Table 3 Intermediate level designers' design process.*

DES_8	Initial research > Opportunity evaluation > Product project > Product evaluation > Production planning > Pilot batch evaluation > Launching
DES_9	Research > Concept development > Finalization
DES_10	Opportunity exploration > Research > Concept evaluation > Product development > Product evaluation > Injection mould development > Pilot batch evaluation > Launching
DES_11	Research > Concept development > Concept evaluation > Detailing > Injection mould development > Market test > Launching

### *Novice designers*

These have a degree in product design and work in different contexts. DES\_12 was working for a design studio at the interview moment, before she worked for an industrial company for few months. When we realized the interview, DES\_13 was working as an external designer for an industrial company and presented some traces of an entrepreneurial profile. DES\_14 started working for a design studio when he finished his undergraduate course, and there he has designed different kinds of product. DES\_15 was working for an industrial company as an internal designer at the time he was interviewed. DES\_16 was a graduate student in a Design Program and she was working for a design studio, when she was interviewed. DES\_17 never worked for a design studio or for a company, he was working as a freelancer product designer. DES\_18 was working as a partner of a new design and architecture studio.

DES\_12 described his process as a quasi non-stop flow that starts with problem identification and follows a divergent-convergent cyclic pattern of: *i.* research; *ii.* analysis; *iii.* alternatives generation; *iv.* evaluation; *v.* research; *vi.* analysis; *vii.* alternatives generation; and so on. She believes that it 'has no finishing point: time and resources defines when it finishes'.

DES\_13 described his general design process as: *i.* research (to know product evolution and variations; to know consumer and/or user; to know market and competitors); *ii.* concept development (based on research findings); *iii.* concept evaluation; *iv.* concept refinement (focus on ergonomic and technological issues); *v.* final evaluation.

DES\_14 stated that for him the first step is to know suppliers' limitations; knowing what he needs to consider, the second step is to develop a visual references research. Based on limitations and references he starts to develop the concept in a iterative process by means of sketches. At final steps, he uses 3D printer to prototype and conduce an evaluation test. He states that he never follows a single linear process. We summarized his process as follow: *i.* research; *ii.* concept development; *iii.* concept evaluation; *iv.* concept refinement; *v.* final evaluation

DES\_15 described his process as following: *i.* demand; *ii.* knowing the client (resources and needs); *iii.* research (similar products, target group preferences and behaviour); *iv.* concept development (product requirements and restrictions, functional and aesthetic references, alternative generations); *v.* concept evaluation; *vi.* concept refinement (interactive and iterative process: prototyping and testing); *vii.* product evaluation; *viii.* detailing (materials and production).

DES\_16 developed a mixed and flexible approach that she calls a 'five-phase methodology': *i.* informational analysis (synchronic analysis, diachronic analysis, life cycle analysis, ergonomic analysis, use analysis, functional analysis, etc.); *ii.* informational project (conceptual, preliminary and detailed); *iii.* alternatives generations (1D initial idea, 2D roughs, 3D modelling - modelling software or hand drawing); *iv.* detailing (developing alternatives); *v.* finalizing the product.

DES\_17 stated that he adopts two different processes: a deconstructive process and a linear process. In the first case, he uses to dismantle the product and analyse all components and parts aiming to understand its function and usage. After deconstruction, he classifies and organizes collected information into a set of requirements. He calls this approach a 'problem-solving method' and argues that is adequate for new product development. The second approach is a classical engineering design process:

*i.* informational project; *ii.* conceptual project; *iii.* preliminary project; and *iv.* detailed project.

DES\_18 described the process he and his colleagues developed to meet their design studio needs: *i.* research (products analysis, competitors analysis, trends and new materials); *ii.* concept; *iii.* concept evaluation (if it meets client's expectation); *iv.* alternatives generation (sketching and 3D modelling); *v.* alternatives evaluation (iterative process until reaching an optimal solution); *vi.* prototype development (adjustment and tests); *vii.* pre-production; *viii.* production monitoring. From research to prototype development, this process may be considered as a continuous searching for get information about client's needs and possibilities (technology, network, suppliers) and to optimize product features.

*Table 4 Novice designers' design process.*

DES_12	Problem identification > Research > Analysis > Alternatives generation > Evaluation > Research > Analysis > Alternatives generation > ...
DES_13	Research > Concept development > Concept evaluation > Concept refinement > Final evaluation
DES_14	Know suppliers > Visual research > Concept development > Prototyping > Evaluation
DES_15	Demand > Knowing the client > Research > Concept development > Concept evaluation > Concept refinement > Product evaluation > Detailing
DES_16	Informational analysis > Informational project > Alternatives generation > Detailing > Finalization
DES_17	Informational project > Conceptual project > Preliminary project > Detailed project
DES_18	Research > Concept > Concept evaluation > Alternatives generation > Alternative evaluation > Prototype development > Pre-production > Production monitoring

Novice designers do not share a common methodological framework (Table 4). Despite having common elements, each process follows a particular way. Five of those designers perform some kind of research as an early activity; most of them develop concept after researching. Next steps vary according to each designer process.

## 4. Process, problem and theory they described

We followed for patterns that could describe some shared approach, in design process (how they describe and model their design process), problem definition (how they frame the design problem) and design theory (which theory supports their practices). For the second and the third we adopted predefined categories, but for design process we are using categories that emerged from designers discourses and we considered that are adequate to frame our analysis. Having presented design process in last section, here we focus on analysing characteristics that each process has concerning three main stages: research (R), conceptualization (C) and development (D). We analysed designers' approach to problematization in two aspects: problem definition (Df) and design strategy (St). For theory we consider: theoretical approach (Ap) and design authors (Au).

### *Experienced designers*

Among experienced designers we found three qualitative clusters, according the variables we are considering: a corporation-oriented approach, a designer-oriented approach and a design-oriented approach. In the first, designers develop they work in a close relationship with companies' high level staffs and are involved with strategic decisions. The second case corresponds to an authorial approach, in which the designer is also a brand. And the third cluster includes designers that work for industrial and services companies acting in a tactical level (Table 5).

The corporation-oriented approach we found in cases of DES\_1 and DES\_6, both of them are highly concerned with corporative culture and may affect corporate strategy. They developed methodological approaches that enable them to deal with internal stakeholders, within the context they work, mainly constituted for medium and large industrial companies. Processes that they described are distinct if we consider only the stages, and they differ concerning research activities and problem definition activities. But when we analysed the whole approach we found some similarities. Both of them perform conceptualization and development by means of interactive and iterative activities that involves all internal stakeholders, that characterizes an integration-oriented strategy.

We classify the approach that DES\_2 and DES\_7 share as a designer-oriented approach. They start in a similar way, from an idea or a demand and develop exploratory activities. Materials possibilities research and functional and formal exploration have the role of problem definition. Solutions emerge and are followed and refined in both cases. To reach the

feasibility of an idea they like, they adopt a production's problem-solving and solution-oriented strategy characterize a way.

*Table 5 Experienced designers*

*(R) Research, (C) Conceptualization, (D) Development, (Df) Problem definition, (St) Design strategy; (Ap) Approach and (Au) Authors*

Designer	Process	Problem	Theory
<b>Corporation-oriented approach (strategic)</b>			
DES_1	(R) users activities and product (C)(D) interactive and iterative	(Df) research (St) integration-oriented	(Ap) some traces (Au) Löbach
DES_6	(R) technology and business strategy (C)(D) interactive and iterative	(Df) research and company's goals (St) integration-oriented	(Ap) no traces (Au) none
<b>Designer-oriented approach (authorial)</b>			
DES_2	(R)(C) materials possibilities (D) production's problem-solving	(Df) functional and formal exploration (St) solution-oriented	(Ap) few traces (Au) none
DES_7	(R)(C) materials possibilities (D) production's problem-solving	(Df) functional and formal exploration (St) solution-oriented	(Ap) no traces cultural references (Au) none
<b>Design-oriented approach (tactical)</b>			
DES_3	(R) client's needs (C) trends and brainstorming (D) exploring and testing alternatives	(Df) briefing (St) problem-oriented	(Ap) some traces (Au) none
DES_4	(R) client's and target group needs (C) (D) interactive and iterative	(Df) reframing client's brief (St) problem-oriented	(Ap) some traces (Au) Munari, Löbach, and Baxter
DES_5	(R) client's needs and references (C) formal exploration (D) production's problem-solving	(Df) briefing (St) problem-oriented	(Ap) some traces (Au) Bonsiepe

The third approach, design-oriented, may describe DES\_3, DES\_4 and DES\_5. In this approach, design solutions are explored in order to meet client's needs, but corporate strategy is not affected by designers' work. In their processes, they share the focus on clients' needs when they perform initial project activities, but they differ regarding the approach they adopt to conceptualize and develop the product. We consider the three of them as problem-oriented, but DES\_3 and DES\_5 tend to follow the brief and DES\_4 tries to reframe the brief ('thinking beyond the brief', in his words).

Analysing theoretical approach led us to complex room: none of them adopts a formal approach, none of them follows a school of design. Almost all of them present in his/her discourse traces from different theories that reflect his/her formal and informal apprenticeship. We registered cultural references in the discourse of DES\_2 and DES\_7, what we consider is associated with the context they work.

Among these designers, only three mentioned some design author as a reference for his/her work. It is relevant to comment that two of them do not have a background in product design; also, two have a Master's degree in design and the third one has an specialization diploma, i.e., only designers who have attended a postgraduate programme mentioned an author.

### *Intermediate level designers*

Among intermediate level designers we found two qualitative clusters, according the variables we are considering: a corporation-oriented approach and a design-oriented approach (Table 6). It is relevant to remember that these designers work for industrial companies, in this case it would be supposed that they would adopt an approach oriented to corporate strategy.

We found the corporation-oriented approach in DES\_8 and DES\_11 cases. Working internally, they have developed methodological approaches that allowed them to perform interactive product development activities. DES\_8 nowadays is involved with strategic decisions, as a member of product development board; DES\_11 has not a similar role, but she is conscious about this possibility and has developed efforts in order to play a strategic role in product development process. Methodological approaches they described are distinct and they also differ concerning research activities and problem definition activities. But they share some characteristics, as: both of them perform conceptualization and development by means of interactive and iterative activities, they present an integration-oriented

strategy, and they search for information and methodological tools by means of books.

*Table 6 Intermediate level designers  
(R) Research, (C) Conceptualization and (D) Development; (Df) Problem Definition and (St) Design strategy; (Ap) Approach and (Au) Authors*

Subject	Process	Problem	Theory
<b>Corporation-oriented approach (strategic)</b>			
DES_8	(R) users' activities and competitors (C)(D) interactive and iterative	(Df) marketing and design research (St) integration-oriented	(Ap) some traces (Au) Baxter
DES_11	(R) users life; (C)(D) interactive and iterative	(Df) research (St) integration-oriented	(Ap) some traces (Au) Verganti and Norman
<b>Design-oriented approach (tactical)</b>			
DES_9	(R) visual references and competitors (C) formal possibilities (D) production's problem-solving	(Df) own perception (St) solution-oriented	(Ap) some traces (Au) none
DES_10	(R) competitors and/or users; (C) formal possibilities (D) production's problem-solving	(Df) brainstorming (St) problem-oriented	(Ap) some traces (Au) none

In a design-oriented approach, DES\_9 and DES\_10 present different methodological approaches. Their similarities are in conceptualization and development, stages that they perform-oriented to explore formal possibilities. They differ about problem definition and strategy, and it may affect the focus they have in research activities. As a solution-oriented designer, DES\_9 searches for visual references, while DES\_10, a problem-oriented designer, tries to understand the users.

As the experienced designers, intermediate level designers do not adopt a formal approach or follow a school of design. Their discourses present traces from different theories, but we did not identify cultural references in this group. Two of them, DES\_8 and DES\_11, mentioned design authors as a

reference for working. It is relevant to observe that those are who presented integration-oriented strategies.

### *Novice designers*

In this group we found mainly, as among intermediate level designers, we found two qualitative clusters: a corporation-oriented approach and a design-oriented approach (Table 7).

*Table 7 Novice designers*

*(R) Research, (C) Conceptualization and (D) Development; (Df) Problem Definition and (St) Design strategy; (Ap) Approach and (Au) Authors*

	Issues	Problem	Treaty
<b>Corporation-oriented approach (strategic)</b>			
DES_15	(R) users' experience (C)(D) interactive and iterative	(Df) research (St) integration-oriented	(Ap) some traces (Au) none
DES_18	(R) product, competitors, trends and materials (C) (D) interactive and iterative	(Df) research (St) integration-oriented	(Ap) some traces (Au) Baxter
<b>Design-oriented approach (tactical)</b>			
DES_12	(R) users and competitors (C) iterative solutions exploring (D) production's problem solving	(Df) research (St) problem-oriented	(Ap) some traces (Au) Bonsiepe, Bomfim and Kelley
DES_13	(R) users and competitors (C)(D)	(Df) research (St) problem-oriented	(Ap) few traces (Au) Bonsiepe and Redig
DES_14	(R) client's possibilities and visual references (C) (D) meeting functions	(Df) research (St) problem-oriented	(Ap) some traces (Au) Norman
DES_16	(R) product analysis (C)(D) meeting functions	(Df) product analysis (St) problem-oriented	(Ap) some traces (Au) Papanek, Bonsiepe, Baxter and Redig
DES_17	(R) materials (C)(D) meeting	(Df) product analysis (St) problem-oriented	(Ap) some traces (Au) Löbach,

	functions		Bonsiepe, Baxter and Redig
--	-----------	--	----------------------------

DES\_15 and DES\_18, working in different contexts, share a corporation-oriented approach, as they perceive their work as a strategic activity. Both have integration-oriented strategies that are closely related to their methodological approaches. Their youth and lack of experience are compensated by a clear vision of their roles and their possibilities.

Remaining novice designers tend to be design-oriented, as they are mostly focused on solving design problems. DES\_14 deviates slightly from this approach, as he stated the importance of knowing client's possibilities. But he adopt a problem-oriented strategy and we consider that it affects the way he frames the design problem.

Like all other designers in our sample, novice do not adopt a formal approach or follow a school of design. In the same way, we found traces from different theories in their discourses. Differently, almost all of them mentioned at least a design author as a reference for his/her work. Only DES\_15 do not mentioned an author, despite the fact he stated he is influenced for design authors.

### *Design authors*

Books and authors that designers mentioned are commonly adopted in Brazilian design education, despite the fact that some of them are outdated for use in undergraduate programmes:

- Design for the Real World (Papanek, 1971);
- *Sobre desenho industrial* [About industrial design] (Redig, 1977);
- *Das coisas nascem coisas*. [From Things are Born Things](Munari, 1981);
- *Sentido do design* [Sense of design]( Redig, 1983);
- *Metodologia para desenvolvimento de projeto* [Methodology for product development](Bomfim, 1984);
- *Metodologia experimental* [Experimental Methodology] (Bonsiepe et al. 1984);
- *Projeto de Produto* [Product Design] (Baxter, 1998);
- *Design Industrial* [Industrial Design] (Löbach, 2001);
- *A arte da inovação* [The art of innovation](Kelley, 2001);
- *Emotional Design* (Norman, 2004);

- *História, teoria e prática do design de produtos* [History, theory and practice of product design] (Bürdek, 2006); and
- Design-driven Innovation (Verganti, 2009).

## Discussion

Results we presented refer to the analysis concerning Design Process (how they describe and model their design process), Problem Definition (how they frame the design problem) and Design Theory (which theory supports their practices). We found different approaches for design processes there are related to designers' field of activity and experience level. Some of them, mainly companies' internal designers, use formal and quasi-structured process but most of them adopt a flexible and intuitive approach. Also problem definition approaches vary among designers. Marketing and user research, brainstorming, product analysis are some of their approaches for defining a design problem. Finally, we observed that none of them adopts an explicit and formalized theoretical approach. All of them reflect about hers/his work, but each one uses a personnel discourse, instead of assuming a field related generic discourse.

From our results emerged a taxonomy concerning the approach designers adopt: *corporation-oriented* (strategic), *design oriented* (tactical) and *designer-oriented* (authorial). Considering Perks et. al. (2005) taxonomy, *corporation-oriented* may be related to Design as NPDP Process Leader and Design as Part of Multifunctional Team; similarly, *design-oriented approach* may be related to Design as Part of Multifunctional Team and Design as Functional Specialism. *Designer oriented* approach does not fit that taxonomy.

Experienced designers' discourses demonstrated the role of self-education and informal education even for designers who have a product design background. Probably it is a consequence of theoretical weakness design education had in first three decades. Only recently, after 1994 when started the first Master's Programme in Design and when it happened the first academic design conference in Brazil, theory has been considered as relevant as practice in Brazilian design education. Intermediate level and novice design discourses confirm our interpretation, as most of them made use of design authors to talk about their design processes.

Our start point remains as our finish point: there exists a gap between academic design methods and used in practice. Our findings may suggest that the wide field of idiosyncrasies among professional designers is a

consequence of the lack of a consistent and shared theoretical background among Brazilian design schools. Certainly it affects how Brazilian society and companies perceive Design as a profession.

## Collaborative Evaluation of Design Concepts

Andreas BENKER\* and Wycliffe RADUMA\*

Aalto University

*The purpose of this study is to explore the possibilities and constraints of applying the quality function deployment (QFD) method during the early phases of a product development process in order to facilitate collaborative design concept evaluation.*

*We investigated the potential of utilizing the QFD method throughout an iterative design process without introducing too much complexity to the agile development process through participatory action research. As active members of a product development team that works on a specific system component of a complex medical device, we were able to probe and further develop a QFD-based method in practice. Two separate experiments were conducted to test the applicability of QFD to facilitate the evaluation of different design concepts.*

*This study highlights how the QFD method allows for communicating design concepts across different functions and partly facilitates the evaluation of design concepts during the early product development stages. It also presents the benefits and limitations of the QFD-based method we developed and tested in practice throughout this study. The study concludes with suggestions how the method can be further developed to better manage design concept evaluations in the future.*

**Keywords:** *Design concept evaluation; cross-disciplinary collaboration; QFD method*

## Introduction

Involving different functions in a new product development (NPD) process potentially leads to high-performing new products (Nakata & Im, 2010; Chen, 2007; Song, Montoya-Weiss, & Schmidt, 1997). However, cross-functional development teams also imply that there are different mindsets, backgrounds, and priorities coming together (Dougherty, 1992), which possibly hinders effective communication and collaboration among the team members. In order for these different thought worlds to stipulate each other and not hinder the collaborative efforts, the different functions involved 'must actively contribute to the product design, and actively challenge each other, or the final design will be awry' (Dougherty, 1992, 195). McDonough (2000) presents a model that provides an overview of several contextual factors that support cross-functional team success, including project goal setting, team leadership, and cooperation.

The purpose of this study is to look at the individual team level and explore the applicability of a QFD-based method to facilitate cross-functional evaluation of design concepts. The expected contribution of this study is to (a) provide a description of the QFD-based method we developed in order to allow scholars and practitioners to apply and further build on this method and (b) highlight the benefits and limitations of the method for evaluating design concepts in a real case product development process.

In the following, we introduce the QFD approach and why it is applicable to probe its benefits and limitations in practice. Then, we describe the methodology of this study followed by a detailed description of the QFD-based method we developed and probed in practice. Figure 1 provides an overview of the symbols used throughout this study. Afterwards the findings are presented, which lead to the discussion and recommendations for further research.

QFD is a well-studied method applicable to integrate the voice of the customer into product design and support development teams. This is achieved by translating customer requirements into optimal design requirements, which are referred to as performance criteria in this study. QFD can be used as a tool for planning, evaluation, and, consequently, decision-making. Figure 2 illustrates that results (how much's) are derived by using defined performance criteria (what's) to quantify qualitative product features (how's), hence making them measurable or comparable (Chan & Wu, 2002; Govers, 1996).

Collaborative Evaluation of Design Concepts

Figure 1 Symbols used in this study to illustrate processes and tools.

The intention is to explore to which extent QFD can be applied during early stages of a product development process in order to compare novel design concepts and decide on which concept to develop further. Especially in the case of small, cross-functional development teams that work on highly complex systems it is necessary to compare design concepts as early as possible and include different perspectives throughout the evaluation process. Thus, it becomes necessary to investigate different methods that can be applied throughout an iterative design process without introducing too much complexity to the agile development process.

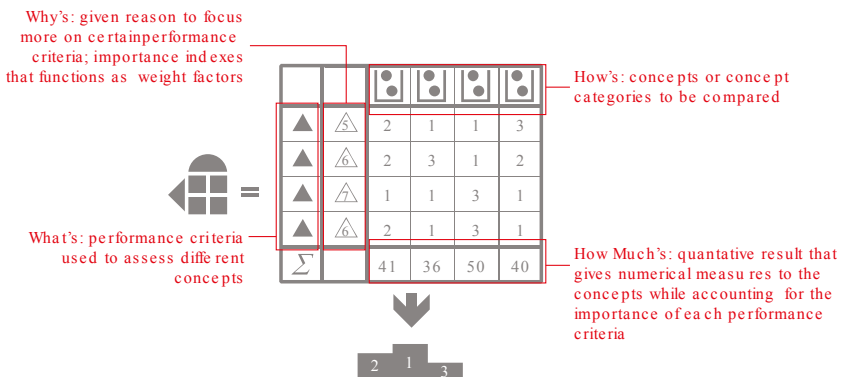

Figure 2 Format of the applied QFD.

In order to decide which concepts to further develop it was necessary to find a proper method that would include several team members from different disciplines in the decision-making process. At this stage of the design evaluation process more than one concept could be chosen for further design iterations, which means elaborating on the chosen concepts and possibly building mock-ups for initial testing. However, eventually one concept should stand out as the winning concept that serves as basis for building a functional model or prototype of the system component.

## Methodology

This study emerged from a real-case product development process and focuses in particular on the concept development and evaluation stages of a medical device system component. According to Whyte (1991), the study is based on participatory action research since we were actively involved in the development and probing of the QFD-based method presented in this study as well as the interpretation of the empirical knowledge we gained through observation and active participation. Such proximity to practice and the ongoing processes allowed us to generate practical knowledge according to the observed phenomena (Brydon-Miller, Greenwood, & Maguire, 2003; Kolko, 2010) because we were able to inquire insights “about the real, material, concrete, and particular practices of particular people in particular places” (Kemmis & McTaggart, 2005, p. 564). We chose this approach to make our study relevant for academia as well as industry and stimulate or even create change (Gustavsen, 2001).

We followed the process proposed by Kemmis and McTaggart (2005), in which action research takes place in three principal phases: planning the intended course of action, putting it into practice as well as observing the consequent occurrences, and reflecting on the emerging phenomena (see figure 3). Going through the complete research process together, discussing, and reflecting upon it highlights the collaborative effort of this study and adds to its validity since “each of the steps outlined in the spiral of self-reflection is best undertaken collaboratively by coparticipants in the participatory action research process” (Kemmis & McTaggart, 2005, p. 563).

Figure 3 The action research cycle of self-reflection. Source: based on Kemmis & McTaggart, 2005.

Since we assume that reality is subject to perception and cognitive processes that allow people to interpret what can be known (Guba & Lincoln, 1994), we do not claim here that our research provides a singular truth that can be repeated in different contexts. However, it is our ambition to address a certain phenomenon in practice and describe the steps of our research approach in detail in order to ensure our ‘research process is recoverable by interested outsiders’ (Checkland & Howell, 1998, p. 20).

## Research process

### *Introducing QFD for evaluating new design concepts*

The overall process is illustrated in the adapted action research cycle in figure 4. Based on the literature review about product development decisions by Krishnan and Ulrich (2001), we focus on the concept development and selection process of a medical device system component. Prior to the concept evaluation process, during which we applied a QFD-based method, we had a meeting in order to develop a variety of possible concepts for the system component. Throughout this meeting we brainstormed, sketched out, and discussed several ideas. Participants of this meeting included two mechanical engineers, two industrial designers, one human factors engineer, and the lead designer of the system component. At

the beginning, the lead designer introduced the overall system design. It was made clear that it is required the component to-be fits to the given system design and meets a certain standard of functionality.

Figure 4 Overview of the research process.

Following, all participants made sketches on their own, which were shared afterwards with the group. The ideas that were similar or complemented each other were then grouped into a total of seven overarching concept categories. It was decided that in order to rank the concepts, performance criteria needed to be established that are crucial for the component's quality in practice. Therefore, all participants decided on performance criteria that would serve as basis for comparing the different concept categories based on a QFD approach (see figure 5).

Figure 5 Concept development and first concept evaluation.

We compiled a list of twelve performance criteria. These criteria were ranked accordingly from one to twelve, depending on which one was seen more or less important. The assigned number in the ranking, called the importance index, was the weight given to the respective criterion. Then, we went through the concept ideas one by one in the group, assigning a score from one to three (1=bad, 2=neutral, 3=good) to each of the performance criteria and concepts. The score assigned to a criterion of a concept idea was then multiplied by the weight of the respective criterion. The final score of a concept was the sum of these products. After this exercise we had a winning concept and two successors that ought to be further developed (see figure 6).

An interesting note is that after the ranking using the QFD method, each participant was asked to state his or her favourite concept independently from the result. It turned out that three out of six participants favoured a concept that was only ranked as the third favourable concept according to the table. That means that half of the participants had a positive feeling about this particular concept despite the arguably rather objective ranking. It showed that based on the participants' professional backgrounds, the designers and engineers involved in the template development and concept evaluation phase had a different ambition and preference as opposed to the performance criteria that have been established and ranked previously. This led to the assumption that it might be necessary to involve different disciplines and especially actual operators of the system and the component in particular in this concept evaluation process.

Performance criteria	Importance index	Concept 1	Concept 2	Concept 3	Concept 4	Concept 5	Concept 6	Concept 7
Criterion 1	5	2	1	1	2	3	2	1
Criterion 2	6	2	3	2	3	1	2	2
Criterion 3	4	2	2	2	3	2	3	2
Criterion 4	3	2	2	1	2	3	2	1
Criterion 5	12	2	3	2	1	3	2	2
Criterion 6	1	2	3	1	2	3	3	2
Criterion 7	10	1	2	1	2	3	1	2
Criterion 8	9	1	1	3	3	2	3	2
Criterion 9	8	3	2	3	3	1	2	1
Criterion 10	2	3	2	3	2	1	3	1
Criterion 11	7	2	2	2	2	3	2	1
Criterion 12	11	2	1	2	3	1	3	1
<b>Total:</b>		<b>147</b>	<b>150</b>	<b>156</b>	<b>182</b>	<b>167</b>	<b>173</b>	<b>120</b>

Figure 6 Simplified QFD for concept comparison.

### Customizing QFD method

Based on the simplified QFD-based approach used in the first concept evaluation process, we developed the method further and customized it to the specific system component and applied it to evaluate the concepts a second time with different stakeholders of the development team that were not involved in the initial development of the concepts. First, we extended the number of performance criteria since we realized after the first iteration that more factors need to be included in order to evaluate the concepts more holistically and from different perspectives, including criteria related to manufacturing cost, aesthetics and perceived likeability of the component, as well as future marketing potential. Furthermore, we categorized the criteria into four sections that we established based on the primary knowledge specific functions within the development team have on specific criteria in order to allow the persons that are supposed to be the most knowledgeable in a certain criterion to make the final call if there are discrepancies among the other functions. For example, if a specific concept criterion is ranked very differently by the people involved, the persons

whose main responsibility and expertise lies within that criterion have the final say about the evaluation score allocated to it.

One change we made in the new version of the QFD was the assignment of weight to the performance criteria using a criteria comparison table. As opposed to ranking the criteria and assigning the importance index based on their respective rank number, which is the way we did it in the first workshop, we developed another table that allowed us to compare every single criterion with each of the other criteria (right box in figure 7). In this case we assigned scores from one to three (1=less important, 2=equally important, 3=more important) to each criterion compared to all of the others. The sum of the accumulative score makes up the importance index for each criterion that could then be used in the QFD table (left box in figure 7).

Figure 7 Using a criteria comparison table to define importance index weights.

In addition, a single morphological table was developed and adapted for each of the concepts to highlight the possibilities and constraints each concept category implies. As illustrated in figure 8, the morphological table is a table in which the primary column represents the features or functions of the system component's general architecture, and the items on the rows represent the alternative design solutions or component type (Wang & Chou, 2007). The morphological table used in this study is an adapted morphological box, which is commonly used for structuring complex, non-quantifiable relationships (Ritchey, 1998). It follows that abstract interrelations between the concepts can be studied.

**FEATURES / FUCTIONS**  
of the system component's  
general architecture

DESIGN SOLUTIONS;  
documented alternatives for  
implementing the respective  
features / functions

Figure 8 Morphological table.

In product concept development, the morphological table is used to determine the combination of design solutions that yields the highest value (Wang & Chou, 2007). However, in this study the morphological table is used to describe the combination of design solutions that formulate a concept.

Because the concept categories presented are difficult to compare and communicate accurately, structured concept descriptions are made using the morphological table and visual concept descriptions (figure 9). The same base morphological table is reused in each concept description, the only difference being highlighted features from the table. In other words, the created morphological table can be used to describe any of the presented concepts.

Figure 9 Structured concept description document

In this second round of concept evaluation, we probed the QFD approach to discuss and evaluate the concepts in a group that included stakeholders who were not involved in the initial creation of the concepts. This served as a good opportunity to explore the method's applicability for communicating design concepts to team members within the product

development process and have them evaluate the concepts from their distinct functional perspective. Apart from customizing the QFD method, we introduced it to the different team members who were chosen by the lead designer to participate in the concept evaluation process, and guided through the different activities of this second round of concept evaluations. Figure 10 highlights the steps from (1) introducing the six remaining design concept categories, (2) creating structured concept descriptions, (3) comparing the defined performance criteria and giving them different weight factors, (4) having participants rate the concept categories individually first, to (5) finally accumulate their scores to one final QFD model that served as basis for the discussion about which concept to develop further. The different functions involved included two system mechanical engineers, one system component mechanical engineer, one user representatives, one human factors engineer, the overall system lead designer, and the system component lead designer herself.

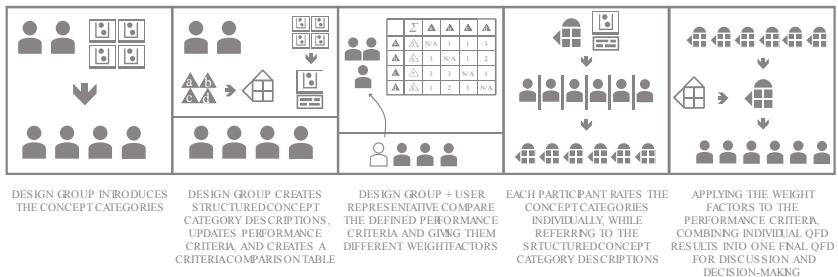

Figure 10 Second concept evaluation process.

### Introducing the concepts

All people who were chosen to participate in the concept evaluation process were invited to a meeting in order to introduce the design concepts we wanted to compare and explain the evaluation method itself. After briefing the rest of the team on the initial workshop and how the concepts have been established, the six resulting concepts were presented. One of the seven concept ideas that scored the lowest when we applied the QFD method in the first workshop was already excluded beforehand. We discussed the presented concept ideas verbally and then evaluated them for the first two performance criteria in the group to make sure everyone understands the approach and knows how to read and fill out the table.

		Concept 1	Concept 2	Concept 3	Concept 4	Concept 5	Concept 6	Comments
Main topic of criteria Final say: function A	Criterion 1							
	Criterion 2							
	Criterion 3							
	Criterion 4							
	Criterion 5							
	Criterion 6

	Criterion 23							
Main topic of criteria Final say: function D	Criterion 24							
	Criterion 25							

Figure 11 Second concept evaluation process.

**Individual rating of concepts**

We prepared a blank QFD table, only having the criteria and the different concepts stated, including a comment column where people could give feedback to the respective criteria (figure 11). This table was sent by email to all seven people that were supposed to give their opinion on the concepts. Additionally, the morphological tables with the concepts' visuals were shared in the same email in order for recipients to better understand the concepts. Each participant was asked to fill out the table individually and send it back to us for compiling the results for further discussion. Some participants did not score on all criteria and one participant did not send the scores. The participants that did not score on all criteria mentioned they either did not understand the criterion or felt their expertise was not sufficient to give a score to some criteria.

	Variance							Average					
	Concept 1	Concept 2	Concept 3	Concept 4	Concept 5	Concept 6		Concept 1	Concept 2	Concept 3	Concept 4	Concept 5	Concept 6
Criterion 1	0.3	0.3	0.4	0.2	0.2	0		2	2	2	2	2	3
Criterion 2	0.7	0.7	0.3	0.3	0.2	0		2	2	3	3	2	3
Criterion 3	0.4	0.3	0.7	0.7	0.2	0.3		2	2	2	3	1	3
Criterion 4	0.2	0.6	0.3	0.6	0.3	0.7		3	2	1	2	2	1
Criterion 5	0.5	0.2	0.7	0.7	0.5	0.2		2	2	2	2	2	3

Criterion 25	0	0	0.3	0.3	0.3	0		2	2	3	2	2	3

Figure 12 Variance between individual scores.

**Discussion of score results**

After receiving the individual evaluations, a meeting was scheduled to discuss the outcome in the group. The final result of the scoring exercise was presented to all seven participants in the group discussion. The averages from the individual results were multiplied by the previously established importance index to make up the total score of a given concept.

In addition, we included a table showing the average scoring as well as the variance between the scores (figure 12). The intention was to discuss during the meeting that involved all different functions involved in the development process the criteria that had the most variance to better understand why people ranked specific criteria for a concept differently.

In the end, there was one winning concept but it was decided that this particular concept was technically too difficult to implement and due to the project's time constraints the winning concept was put on hold and would be considered for future design iterations throughout the development process. Besides the winning concept, also the other rankings were challenged by the team members especially because people did not agree with the weight given to some criteria and the concepts are still a bit open and vague, which in turn made it difficult for participants to give scores for certain criteria.

## Findings

The variance table was a beneficial add-on to the initial QFD table and led to fruitful discussions during the concept evaluation phase since it enabled to identify where opinions between team members differed and gave the individuals a chance to explain their scoring. In particular, using the variance table had several benefits: (1) discussing the variance in scores fostered the common understanding of the criteria as well as the concepts at hand, (2) explaining why one has given high or low score in particular helped clarify the concepts in a more detailed level, and (3) identifying these specific criteria or concepts that had a high variance will help to improve the descriptions of such in future evaluation phases.

Visual attachments to the concepts supported introducing them to stakeholders that have not been involved in the initial concept creation. The method was complemented with visuals and additional concept explanations to reduce ambiguity and misunderstandings among the stakeholders. However, it was still perceived as difficult to fully understand the concepts and evaluate them utilizing the QFD method and required further explanation.

Categorizing the performance criteria according to the functions that have specialized knowledge the respective category that is attributed to them did not have an impact on the decision-making process. The initial idea was that the function responsible for a certain criterion has the final say if there is disagreement among the cross-functional team members. But as it turned out, score variances across different functions resulted in open discussions rather than the person who represents a certain function making a final call.

We discovered one limitation of the QFD method we probed in this study, which concerns the process of defining and weighing of the

performance criteria. It became evident that in the final group discussion members from different functions disagreed on the importance index we defined after comparing every 25 criteria with each other. The issue we identified was that we determined the importance index prior to the group discussion and did not involve members from all functions that participated in the evaluation process eventually.

When we used the QFD method in the first concept evaluation phase it was not the decisive factor of which design concept to select in the end. It supported the ranking process and triggered discussions among the participants but after deciding on a winning concept in a group based on the QFD, each participant was asked individually to state their preferred concept independently from the performance criteria. The opinions differed from the group rating, which means that the performance criteria we chose initially were not adequate enough, the weight given to them was incorrect, or the QFD method itself had minor flaws and needed to be adjusted accordingly, which we did in the second iteration.

In the second concept evaluation process, the eventual decision which concept to develop further was also not made solely based on the QFD results but after a further group discussion that was centred around the outcomes of the QFD method. The reasons for not going ahead with the winning concept was partly because it was the most futuristic and thus, risk-averse concept to develop further. Mainly the complexity of the system itself, which the component would become part of, as well as the timeframe given by the development project and the strategic intention to build on core competences instead of reinventing the whole system design were the causes that led to neglecting of the concept with the best score. That means there was no definite decision made solely based on the QFD approach. However, the lead designer proposed to keep the winning concept in mind for future stages of the project since all team members recognized the potential value of the winning concept for future development projects.

## **Discussion and future research recommendations**

The process of decision-making during the early and conceptual development phases can be difficult for complex, non-quantifiable design alternatives and using methods like morphological analysis and QFD adds the possibility of creating an “audit trail” that can be traced back if and when design history is needed (Ritchey, 1998). Therefore, documenting the design concepts that are evaluated in a visual and descriptive manner allows

companies to go back to and reuse the created solutions at a later stage or even within a different NPD project. Furthermore, utilizing the QFD method in order to facilitate cross-functional communication and document the design concept evaluation process accordingly allows for 'improved prototype development proficiency and product launch proficiency' (Sherman, Berkowitz, & Souder, 2005, p. 407) since the recorded data can be retrieved again at later stages of the NPD.

Having cross-functional development teams leads to different perspectives and areas of expertise coming together, which may "prelude the development of an optimal design" (Dougherty, 1992, 196). Applying a QFD-based approach in a NPD project enables companies to include objectified views from different stakeholders when evaluating design concepts. That potentially enables collaborative design concept evaluation if the method does not overcomplicate the decision-making process but facilitates discussions and allows for a better documentation of the design concepts. Especially in the case of discussing variances in ranking design concepts across different functions, the development team can utilize this input to further build on the concept at question.

Further research can be conducted in order to improve the tools created for this study, or to create process-enhancing groupware. Groupware is software that is designed or used to support groups (Grudin, 1994). From a corporate point of view, the value of this study can be harnessed by a practical groupware tool, that supports teams in generating creative design solutions, documenting their efforts and process, exploiting archived solutions for inspiration and possible solutions, and collaboration.

Since the system in question is a medical system, strict standards and regulations apply. The regulatory environment requires that medical devices meet clinical and engineering specifications. Furthermore, medical devices must also prevent human and technical error by detailing usability and maintenance that assures safety. As a result, the fulfilment for safety requirements should be taken into account in the early stages of the design process (Grant, 1998). Therefore, further research reflecting on this study could examine when and how the regulatory environment for medical systems should be taken into account during the design process. The assumed challenges would include accounting for the regulatory environment in the design process of medical device design, without limiting or risking potential solutions.

	ADJUSTABLE INDEX				
		2	1	1	3
		2	3	1	2
		1	1	3	1
		2	1	3	1
$\Sigma$		VAR	VAR	VAR	VAR

Figure 12 Idea of a dynamic QFD with interactively adjustable importance indexes.

Another possibility for further study of weight factors was identified, when participants asked to see the calculated outcome that followed from manipulating the weights of the importance indexed. Some of the participants were interested in the dynamics of the QFD and how alternative strategies affected the outcome. To aid the discussion and get an overview of these “what if” outcomes, adjustable importance indexes can provide a powerful tool for evaluating the weight of importance criteria, and comparing strategies during the group discussion in real-time (figure 12).

A dynamic QDF analysis as such, is an alternative to the use criteria comparison table, or can be used as an extension of it. Furthermore, it raises the question on whether the definition of importance index weights should be user-driven, as it was in this study, or strategy-driven. In this study the definition of the index weights was user-driven in the sense that the user representative was the only stakeholder outside of the design group who was included. For a strategy-driven approach, a managing director may best represent the stakeholder involved in the definition of the index weights. Including more than one stakeholder is an option as well. However, it may be less efficient in regards to time and resources (Romano & Nunamaker, 2001). On the other hand, an easy-to-use, time-efficient implementation of adjustable indexes may make the criteria comparison table obsolete, while including all stakeholder approaches equally. Benefits and challenges of doing this would require further study.

# **Editorial: Reinventing the customer's role: How customers can create innovation in organization's business models**

Paola PISANO, Alison RIEPLE, Ian CAMPBELL and Matthew SINCLAIR

Throughout the last decade, the focus in innovation studies and practice has shifted from the product to the business model, or rather to the elements surrounding the core offer of innovating companies. Game-changing and popular contributions such as the Business Model Canvas (Osterwalder et al., 2005) and the Ten Types of Innovation (Larry Keeley et al., 2013) have convincingly evidenced not only the importance of creating customer value, but also the seamless integration of entrepreneurial action on the one hand and disciplined innovation management on the other which characterize high innovation performers over time. As Osterwalder (2013) said "business model innovation is about creating value for company, customer and society. It about replacing outdated models." Practitioners need to start putting the innovation accent not only on the features and functionalities of the offer but also in the business model that encases the product or service. Successful disruptors feature new revenue or profit models: they have the ability to make money at low price points or to serve a small market profitably, or they play in a very different value chain with new partners, suppliers and channels to market. Within this trend the changing nature of customer participation has given rise to a lot of research, but mainly in the field of service, marketing and management. While Kelly et al. (1990) introduced the importance of the customer to many services "to contribute information or effort before the service transaction can be consummated", Dabholkar (1990) and Bettencourt (1997) highlight the importance of the customer's involvement "in producing and delivering services". Namasivayam (2003) and Luch and Vargo (2006) started "speaking about production and co-production where customers are involved in the creation of the core offering itself". Reinventing the customer's role, different business models are coming out from practitioners, but they have not yet been in existence long enough for researchers to study and analyze these innovative models.

This editorial goes some way to collecting researchers' efforts to understand the new business models that have emerged in recent years and design managers' roles in these. The list is long: From Airbnb to Lyft to Tinder, the share economy is rewiring the way customers interact with each other, Kickstarter has defined a new role as investor as well as customer, businesses such as Quirky and I.materialise, based on a sharing economy, have structured the business model on a crowdsourcing concept, and so on.

In the following papers authors have analyzed how there is a new role for customers to participate in the creation of novel business models. In the first paper, an "In depth case study exploring innovative web-based methods for 'designing-with' customers in a global watch manufacturing firm", it revised the importance of collaborating with customers through using internet enabled methods. This research demonstrates an original mechanism of designing---with customers using web---based methods and specific resources needed for supporting processes. The web- based platform has significantly improved the absorption of customer knowledge, although the company may also need to provide training sources and support, which would help steer customers in their submission of solutions using the platform. The case company uses the mechanism for generating product ideas and designs, using viral marketing and also for making decisions on the production process. Advantages are distinct but challenges also exist, not only for the case company but also for other companies.

"Specification of an Additive Manufacturing Consumer Design Toolkit for Consumer Electronics Products" reports on ongoing research which aims to understand the ways in which brands with mass-customisation offerings manage their identities across product portfolios, and the impact which AM might have on these management strategies.

In "Reducing uncertainty of New Product Development by leveraging the power of experiment" the authors highlight the importance of customers' involvement in the testing process though a "disciplined experimentation" for identifying the needs of customers, reproducing the key features of the new product/service to satisfy these needs, and simulating a realistic customer journey directly with the final customer. A rigorous testing protocol and a continuous improvement process support these experimental steps. This approach allows testing of the main working hypotheses, pivoting them continuously to verify their value growth (how to scale up the tested hypotheses up to the entire target segment) and sustainability (how to enable the needed change in internal culture and prevent direct competitors to quickly replicate the value proposition).

The article presents two concrete cases of “action research”, where researchers have been directly involved within the design and delivery of the this methodology in two different industries, fast fashion and heating systems' manufacturing, and the lessons learned from them.

In “Participatory Mechanisms in Crowdfunding” and “Business model adaptation to a new digital culture” the authors highlight a new digital role for customers in the business model: customers get involved in an internet business through finding the right idea, developing it but also financing, producing it: the customer become creator, designer and investor.

The paper examines 600 successful design-centred projects on Kickstarter from the project categories of Design, Technology, Games, and Fashion in order to classify and quantify the different types of participation leveraged by project founders in the sample. Authors define five ‘participatory mechanisms’ through which founders can leverage crowds, and further find that projects’ context and proposed outcomes are significantly related to participation. Participatory mechanisms were most often observed in the technology and games categories, and in software and hardware projects. Given the broad and explorative aims of this research, the authors encourage further verification of our findings in order to challenge and strengthen the relationships between participation other project variables.

“Business model adaptation to a new digital culture” defines a new business model based on different type of users becoming designers and makers of small quantities of different products selling to few customers thanks to digital platforms. Examples are companies such as Quirky and I.materialise. The underpinning process is based on the concept that a collaborative community outside the organization can develop an idea into a product ready to be sold.

The new model combines the open innovation and the long tail models, and identifies a number of “knowledge brokers” and “bridging ties” which link actors and allows them to propose new knowledge in the form of new ideas and products. This business model, supported by the new digital technologies, enables companies to carry far more product items in their catalogues: most of the items exist solely as descriptions in an electronic database that can be digitally distributed. This enables a long tail model, too.

As readers can discover in the paper “Business model innovation through new customer roles. Inspirational cues and insights from a design-driven case study analysis” the customer role is defined as a market bridge,

attracting new potential contacts and customers; as a company “showroom,” where the customer’s home setting is designed to convey the company’s product language mood; and finally as an external company design lab, where the customer hosts events to seek for new language moods and product propositions. Through a practice case analysis LAGO a fast-growing company in the Italian furniture landscape a new business is investigated and evaluated. LAGO pinpoints how business model innovation can be fostered by engaging customers with new roles and logics. At LAGO, the customer acts as the company’s market bridge, forming an “inner circle” that enables the company to access different market segments. The apartment of the tenant customer furthermore acts as an exhibition platform where events and workshops are organized to host potential customers in a sort of “living showroom.” Additionally, customers, by submitting their “apartment ideas” to the company, provide their own perspectives and aesthetics for LAGO apartments, acting as an external design lab and innovation promoters.

# In Depth Case Study Exploring Innovative Web-based Methods for ‘Design-With’ Customers in a Global Watch Manufacturing Firm

Wei LIU\* and James MOULTRIE

University of Cambridge

*This paper describes an innovative mechanism used by a company that designs and manufactures watches for a global market to engage customers in the design and development of new products.*

*The importance of collaborating with customers in the development of products and services has been recognised for many years. The advent of information technology has presented a revolutionary change in the way that customers can be involved. However, knowledge is still lacking on how companies can ‘design-with’ customers by using the internet-enabled methods. This paper describes results from an in-depth case study with a watch manufacturer, which has successfully introduced customer-designed watches to the market. By presenting a unique data set gathered from this company, this research illustrates an original mechanism of designing-with customers through web-based methods. The new process enables the company to integrate more customers and to obtain a higher quality and quantity of ideas. In addition, the customer can also be a decision maker on whether a design should be produced. A theoretical model is introduced which positions this innovative approach of involving customers. In addition, this paper also characterises the capabilities required to use this approach.*

## Introduction

Working closely with customers to obtain deep insights and to identify potential needs has been recognised as one of successful factors for developing new products (Gruner & Homburg, 2000; Cooper & Kleinschmidt, 1994). Although involving customers in the new product development (NPD) process may not always have a promising outcome (Schulze & Hoegl 2008; Brockhoff, 1998), the positive effect of customer involvement has been supported by many empirical studies and has been identified as a critical success factor (Poetz & Schreier, 2012; Von Hippel, 2005; Lilien *et al.*, 2002; Hanna *et al.*, 1995; Johnes & Snelson, 1988; Maidique & Zirger, 1984; and Cooper, 1979). Listening to the 'voice of the customer' is a key imperative in traditional NPD (Nishikawa *et al.*, 2012; Roman, 2010), but the process of constantly collecting and testing information on needs can be costly and time-consuming (Dahan & Srinivasan, 2000). Highly competitive environments demand that firms obtain holistic customer knowledge, not merely importing the customer's 'voice' through traditional market research approaches (Sawhney *et al.*, 2005). Solution information from customers, other than need information, is especially desirable when needs are heterogeneous, complex and fast-changing (Thomke, 2003).

With the development of Internet technology and associated toolkits, both the individual and social knowledge of customers can be followed and analysed. There is a huge growth in the range and richness of on-line interactions between the company and the customer. The Internet, as an open and ubiquitous network (Afuha, 2003), has created new approaches and opportunities that enable customers to be involved in NPD. Specifically, the Internet enhances the absorptive capacity of a company to obtain market knowledge (Prandelli *et al.*, 2006) and provides easier access to the knowledge of customers (Füller *et al.* 2007) at a lower cost (Sawhney *et al.*, 2005; Nambisan, 2002). Hence, recent attention has been given to web-based mechanisms which enable firms to interact with customers more broadly, richly and efficiently (Füller, 2010; Prandelli *et al.*, 2006; Nambisan, 2002).

With this trend, in addition to the traditional methods which are transformed into on-line forms, such as on-line interviews, on-line surveys and on-line focus groups (Ryzhkova, 2012; Prandelli *et al.*, 2006), new web-based mechanisms, such as crowdsourcing (Howe, 2006), virtual

communities (Füller *et al.*, 2007) and design toolkits (Janssen & Dankbaar, 2008), have been introduced to support the customer-engaged NPD process.

Customers may experiment and design new products using innovative toolkits where information on possible customer conceived solutions might be captured (Thomke, 2003). Consequently, apart from serving as information providers (Fang, 2008), customers are gradually becoming co-designers of products (Prahalad & Ramaswamy, 2004). This provides a distinct contrast to the previously 'company-dominated' world of product development (Füller, 2010). Recent examples of this change include:

- LEGO has developed design toolkits and virtual communities for creative consumers from all over the world to participate into product design activities (Antorini *et al.*, 2012);
- Eli Lilly, a pharmaceutical firm, has established an on-line innovation platform for the new drug discovery (Sawhney *et al.*, 2005);
- video game designers encourage customers to be co-developers of new gaming ideas and participate in the development and testing process (Jeppesen & Molin 2003);
- Harvard Medical School has stimulated collaborations with other departments by launching an open platform named 'Harvard Catalyst' (Guinan *et al.*, 2013).

There is some evidence to suggest that 'designing-with' customers can have significant commercial benefits. The research of Nishikawa, et al. (2012) revealed that at Muji, a Japanese consumer goods brand, products designed with customers generated approximately 16 million dollars more revenue than the sales of products designed by the company; a five-fold increase. They observed empirically that customer-generated products were more likely to survive than company-generated products in a three-year observation period. They demonstrate that customer-generated products can outperformed company-generated products on key market performance metrics. In another study, Poetz & Schreier (2012) compared the quality of ideas for baby products generated by a company to those generated by customers in an idea contest. The result confirms a positive benefit of engaging the customer in idea generation. These promising cases suggest that other firms might also benefit from adopting similar approaches.

New mechanisms, driven by on-line technologies, are springing up and attracting attention. However, knowledge is still lacking on how companies can effectively 'design-with' customers by using these internet-enabled methods and how the new product development process is changing as a result (Greer & Lei, 2012). These new methods enable customers to be proactively involved in the generation, design, test and refinement of ideas for new products. But there is little empirical evidence to describe how firms might achieve those goals through the synergistic usage of different methods, (Sawhney *et al.*, 2005). In addition, there has been little research exploring the pre-requisites needed to 'design-with' customers in NPD (Nishikawa *et al.*, 2012).

To address these gaps, this paper describes results from an in-depth case study with a watch company, which has successfully introduced customer-designed watches to the market. By presenting a unique data set gathered from this company, this research seeks to understand how this firm has incorporated these original web-based mechanisms to enable customers to be incorporated into the new product development process. Specifically, this study aims to answer the following questions: *how is the NPD process projected to achieve design-with customers? What methods for involving customers are used? and what are the key support needed to design-with customers using internet enabled technologies?*

## Study Method

### *Overview*

As the aim of this study is to understand how a company can design-with customers using web-based methods, an exploratory approach is adopted to derive patterns and implications. A single case-study methodology is employed for developing insights on this contemporary phenomenon within real-life context (Yin, 2003; Eisenhardt, 1989), as the uniqueness and representativeness of a single case facilitate knowledge and theory building, and also help to focus future investigations and inquiries (Yin, 2003). It also enables issues to be explored in depth, to address both 'how' and 'why' this phenomenon is addressed in practice.

To select the case study, the following criteria were first established: (1) the firm had been designing-with customers in developing new products through internet enabled technologies; (2) it had already produced and sold customer-designed products to the market; and (3) it is a leading practitioner in designing-with customers through the Internet. With these

criteria in mind, a firm that designs and manufactures watches was selected. This firm has an international market and is recognised for its radical designs.

Data was collected through documentation, observation, on-line questionnaires and a series of in-depth interviews over a six-month period with the CEO, design & development manager and marketing manager. The interviewees were selected by a key informant approach (Kumar *et al.*, 1993). Interviews followed a semi-structured format, and each lasted between 60 to 85 minutes, which enabled detailed exploration of the perceptions of complex issues and enabled the interviewer to probe further for additional clarification (Barriball & While, 1994). All interviews were recorded and transcribed. In addition, data was collected from customers whose designs were produced, using a semi-structured questionnaire. By gaining data from these customers, we sought to gain an understanding of their motivations and experiences in engaging with the firm in this way. Finally, different types of data were subsequently analysed to identify key issues and patterns following the logic of the grounded theory (Glaser & Strauss, 1967).

### *Company Background*

The watch first appeared in the 15th century as a mechanical system for showing time (Usher, 2013). In the middle of the 20th century, the quartz watch was invented and this subsequently became the dominant technology, although mechanical watches remained dominant in the premium, high-end watch market. More recently, breakthroughs in display technology such as e-ink, LEDs and LCD screens have enabled new forms of watch to be produced.

Wearing a watch not only provides the functional benefits of telling the time, but may also reveal additional insights, such as one's social status, fortune or personality. Cheap watches have become commodity products, whilst more bespoke watches are a statement of identity and can increasingly be personalised. Watch companies, are increasingly exploring how new technologies can be used to deliver unique watches that provide users with a strong sense of personal identity. In some firms, this is being done in collaboration with the customers.

The focal company in this study is reputable and well-known for its successful LED and LCD watch products that show the time in unique ways. Although it is a micro-firm with only 8 employees, the company has become

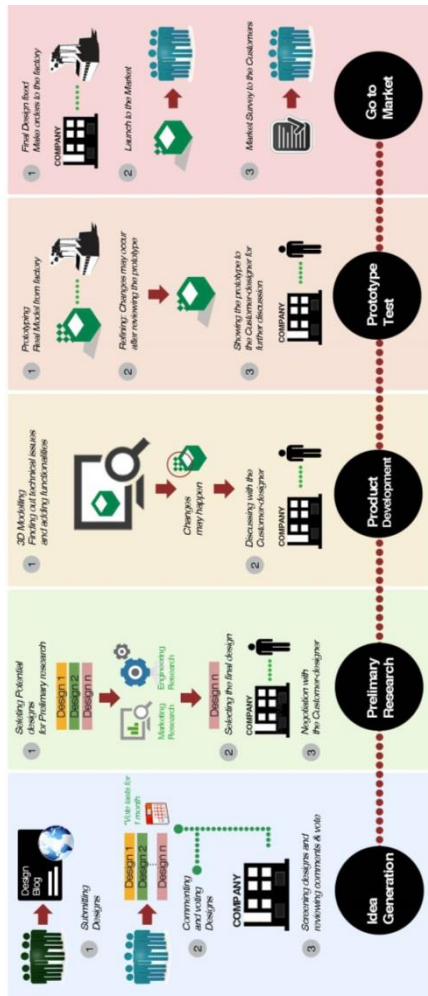

a leading company in the niche market. Without any stores and agencies, it sells 20,000 to 40,000 watches per annum in over 65 countries on six continents, primarily through the Internet. The firm has over 15 years in producing LED/LCD watches, and underwent a significant transformation at the end of 2010 due to the decreasing product sales partly caused by product designs which were not sufficiently appealing to their customers. To address this, the firm started to accept customer-generated designs through an on-line platform. The firm selected designs which could then progress to detailed design and production. As a result, these customer-generated products have gained very positive responses from the market and strong sales performance has encouraged the firm to continue with this new strategy and mechanism.

## Findings

### *A New Mechanism for designing with Customers*

In the new scheme of product development, customers are first invited to submit their design ideas through an on-line platform: a design blog. There is no special theme or deadline for submissions, but there is an expectation that the designs will embrace a unique approach to telling the time. The firm accepts new customer-generated designs throughout the year. Submitted designs are published on the design blog for a period of 30 days and during this time, there is public feedback and also voting. At the same time, the company screens the feedbacks and votes. Designs with the highest score are selected for further evaluation, market analysis and production feasibility by the company. The designs might include complex technology and the firm must also test to determine whether the proposed ideas have feasible mechanisms. Potentially acceptable designs undergo comprehensive marketing research and engineering research, which are conducted in parallel. Market research includes voice of the customer information. In addition, the company also reviews past sales performance, to reveal which previous products have been best sellers. This helps to reveal important information about favourite elements of different watches.

*In depth Case Study exploring innovative Web-based Methods for 'Design-With' Customers in a global Watch Manufacturing Firm*

*Figure 1 The new product development process for designing with customers in the focal company*

In engineering research, the durability of the design is a prominent issue. Putting the various pieces of evidence together, the company develops a holistic understanding of how the design can be implemented and how the potential market would react. This enables the firm to make a go/no-go decision regarding commercialisation. For the successful designs, the

product team in the company then refines the design, to select appropriate materials and develops the product in detail in CAD.

Meanwhile, the firm and the customer-designer maintain close communication, to discuss any changes recommended by the firm for practical or production reasons. These discussions are facilitated by 3D CAD models and physical prototypes. Finally, the modified design is moved to the full production stage. In return, the customer-designer can earn commission on sales. They can track the watch sales everyday on-line and obtain commission quarterly. An overall customer-generated product development process is illustrated in figure 1.

### *Web-based methods used to involve customers*

Ensuring consistent customer engagement, throughout the development cycle is of great importance in ensuring that the overall process works. The company has used different approaches for exchanging information along the product development process (Figure 2). All the methods used for involving customers are web-based, through which the firm may obtain rich customer knowledge at a low cost. At the beginning stage of NPD, the company uses the design blog as an interactive 'window' calling for new watch designs, attracting customers by advertising and embedding quick links on social media and design-oriented websites. The virtual community formed from the design blog also plays the role of a 'judge' for distinguishing the best designs from the rest. Individual designs might receive many comments and votes from this peer network. In some cases, contributing designers might submit more refined designs as a result of this feedback. In addition, social media such as Facebook and Twitter is also used for collecting feedback on concepts. When developing the designs, the company maintains contact with the customer-designers using emails whenever there are slight changes in the design. If there are specific design problems which may be caused by unclear design explanations or there are difficult technical problems which are hard represent through emails, or if there is a need for input from different specialists, then a video-call would be a preferred choice for communication. However, communication during the development stage is generally rare as customer-designers do not have equal professional knowledge with the team inside the company. In most cases, the company shows its solutions for a certain problem to the customer-designers and asks for their feedback. After launching the products, the firm uses on-line questionnaires for collecting feedback.

Customers are invited to participate in the survey immediately after purchasing the products.

Figure 2 Web-based methods used for involving customers in this mechanism

### *The Design Blog*

The primary mechanism in the customer-generated design scheme is the design blog, which has been serving as a platform for calling for designs, advertising designs, exchanging ideas and collecting feedback. In the past 2 years, the design blog has received thousands of submissions. Over Approximately 1000 designs are posted in the blog, after an initial filter to eliminate those of poor graphic or display quality. This collection of submitted designs has been the most important source of inspiration for developing innovative products in this micro small firm. In addition, this dynamic website provides the capability to enable customers to comment and vote on every design. Through this virtual platform, communication and discussion about the submitted design may increase the user's stickiness to the website. Gradually, a virtual community with loyal participants is forming and continuing growing through viral marketing.

### *The Customer-Designers*

The submitters of new designs are not necessarily from a design or creative background. The on-line questionnaires to all customer-designers whose designs have been selected revealed that their occupations are extremely diversified, such as engineer, designer, medical researcher, port authority officer and even maths teacher. However, they all possess the capability to deliver a 3D or 2D design rendering to the company. These

customer-designers use both open design tools or professional software, including Blender, Inkscape, Photoshop, 3D Max, Solidworks, etc. In addition to the ones with professional education in design, most of these customer-designers have trained themselves through on-line open educational resources or training courses.

The motivation most frequently mentioned their design involvement is the 'hobby' for designing a watch (80%). This might also be proved through their on-line time on the specific websites, as 80% of them confirmed that they frequently surf the design blog and company websites. Other selected motivations encompass earning money (60%), skill development (60%), recognition (40%), having fun (40%) and dissatisfaction with current products (20%).

The most significant challenge discussed by all the customer-designers investigated is a lack of technical knowledge in the electronic watch design. On one hand, they are reluctant to use much time on learning the basic technical knowledge; on the other hand, they have limited understanding of the feasibility of their designs and the technical challenges that there might be in turning their concepts to a production reality. With limited technical knowledge and requirements in mind, the customers tend to emphasise the conceptual features of the design.

### *The key Support for this Mechanism*

**Web-based Foundation.** As an e-commerce business, the company communicates with its customers only through virtual store-fronts and on web-sites where advertisements and transactions are being processed. Good performance on both web-based 'windows' and on-line reaction to the customers is required. With prior on-line business experience, the firm takes the advantage of its e-commerce foundation and concentrates its effort on developing web-based platforms for involving customers.

**Organisation Structure.** Small company size and a limited number of employees facilitate a flexible and flat organisation. The work place is an open area without individual offices, which is surrounded by prototypes, material samples and 3D-printed designs. The firm can behave as a cross-functional team and have ad-hoc discussions whenever a problem emerges, which also improve the work efficiency to a customer's demand or a certain problem. The average experience of the employees is over 6 years, which has a positive impact on both the business and the teamwork due to the familiarity on the product and the company.

**Quality Control.** Whilst the company relies upon ideas from the customers, this emphasises the importance of product quality, especially the need for high engineering quality in achieving the designs. With over 15 years history in the LED/LCD electronic watch industry, the firm and its employees have collected a significant amount of holistic experience in development and production. Although every conceptual design may bring new engineering problems, the rich experience enables the quick learning and efficient problem-solving.

**Intellectual Property.** A fundamentally sensitive issue in the open innovation area might be intellectual property (IP). As the submitted designs may be selected or rejected, an appropriate approach of coping with IP for the customers is necessary. Generally, if the designs are novel and unique enough, the company files for either a Patent or Registered design and the ownership of these rights are joint, between the firm and the customer-designer, protecting the rights for both sides. In other circumstances, the firm may think that the designs may not merit any formal intellectual property, so they will negotiate with the customer-designer to agree a basis for sharing the rights. In fact, within this company, only 40% of the customer-designers investigated tended to request any IP for their designs, as they think the watch designs are more stylistic than technologically innovative and as a result, might not be patented. The low interest in applying for patents enhances the efficiency of cooperation in product development. On the other hand, the property of the rejected designs is still owned by the original customer-designers.

## **Discussion**

The purpose of this study is to explore the mechanisms by which a company can 'design-with' its customers through the Internet. The case study firm illustrates a synergistic and dependent use of different web-based methods for obtaining rich insights into its customers and innovative new watch designs. The mechanisms used provide the company with abundant ideas in addition to a community of designer contributors who both support and critique the designs submitted by this community, increasing the overall efficiency of NPD process. The online tools also enable efficient communication with the customer-designers throughout the development process, despite language and geographical differences.

Inviting customers to vote and comment on the submitted designs increases customer engagement in developing products and supports the

decision-making process of the company. However, with such a large number of comments and votes, the firm cannot easily review them all and consequently, they might miss valuable information due to the limited time and employees. A possible solution might be to enable the customer-designer to submit iterations on the design, based directly on this feedback.

By enabling submitted designs to be open to public voting (not just feedback from other customer-designers), the firm gains substantial evidence of market acceptability and interest in the different designs. This level of pre-market testing is a capability not typically seen in a majority of traditional NPD projects. However, the company and the customer-designers have to aware the risk that this open resource of designs might be copied by unscrupulous competitors, as the designs are not protected at the point of submission. Consequently, dispute of intellectual property might occur. This issue might be somewhat mitigated in a more technology-intensive industry, such as pharmaceuticals or software, where the embedded knowledge is more complex. In such firms, an open voting mechanism might not be as suitable. Hence, for different product categories and industries, the extent to which customers can be directly involved in designing, reviewing and selecting new products might vary.

The web-based platform has significantly improved the absorption of customer knowledge, while the company may also need to provide training sources and support, which would help steer customers in their submission of solutions using the platform. A user-friendly interface is essential. In addition to the support on using the platform, the firm might also consider publishing non-sensitive technical data in an easy-to-understand way which may help the customers to achieve the design work effectively (e.g. materials and production process data). With this sort of support, the feasibility of the submitted designs might increase. Releasing relevant data to the customer-designers would probably accelerate the speed of product development and would further decrease the risk of realising a conceptual design. On the other hand, open concentrated resources and guidance for design software or toolkits would also be demanded, as the customer-designers tend to train themselves through on-line free training courses for accomplishing their design work.

## **Conclusion**

This inductive research demonstrates an original mechanism of designing-with customers using web-based methods and specifies the

resources needed for supporting the process. The case company uses the mechanism for generating product ideas and designs, using viral marketing and also for making decisions on the production. Advantages are distinct, but challenges also exist.

Other companies might also benefit from such an approach, but further empirical evidence is required to explore the conditions which might guide the selection of appropriate tools for firms of different types.

## Participatory Mechanisms in Crowdfunding

Michael PAPE<sup>a\*</sup> and Lorenzo IMBESI<sup>b</sup>

<sup>a</sup> Carleton University; <sup>b</sup> Sapienza University

*This research seeks to investigate the convergence of crowdsourcing and crowdfunding practices to affect co-design activities between project founders and user-investors through reward-based crowdfunding. To that end, it examines 600 successful design-centred projects on Kickstarter from the project categories of Design, Technology, Games, and Fashion in order to classify and quantify the different types of participation leveraged by project founders in the sample. We define five 'participatory mechanisms' through which founders can leverage crowds, and further find that projects' context and proposed outcomes are significantly related to participation. Within our sample, participatory mechanisms were most often observed in the Technology and Games categories, and in software and hardware projects.*

**Keywords:** Crowdfunding, Crowdsourcing, Post-Industrial Design, Co-Design

## **Introduction**

The emergence of the internet has facilitated tremendous communicative and collaborative opportunities amongst dispersed crowds of individuals. In the wake of this development, centralized organizations have utilized crowdsourcing as a method of directing crowds' intellectual resources and creativity towards specific predefined tasks or problems. Similarly, the practice of crowdfunding has enabled entrepreneurs to leverage crowds' financial resources towards project-oriented goals by incentivizing financial contribution. Reward-based crowdfunding platforms such as Kickstarter specifically target prospective users by offering project deliverables as investment incentives, leading to the formation of project-specific groups of active and motivated user-investors.

These collaborative practices have tremendous potential to garner useful input in design and development processes from a variety of stakeholder groups, particularly end-users. The recent growth of crowdfunding presents opportunities for designers to engage users in co-design practices via the establishment of participatory systems and methods to support and encourage such collaboration. Design can thus play a critical role in the further development of reward-based crowdfunding practices, borrowing from notions of participatory and co-design to enhance project outcomes.

This study aims to investigate, classify, and quantify the present participatory practices through which successful design-centred initiatives on Kickstarter incentivize and implement creative contribution from user-investors. It seeks to build upon existing literature from the fields of co-design, crowdsourcing, collective intelligence, post-industrial design, participatory cultures, participatory development, and entrepreneurial finance in order to synthesize a common language to describe participatory practices in crowdfunding.

### ***Overview of Major Concepts***

Crowdfunding is 'an open call, mostly through the Internet, for the provision of financial resources either in form of donation or in exchange for the future product or some form of reward to support initiatives for specific purposes' (Belleflamme, Lambert & Schwienbacher, 2013a). This emerging method of entrepreneurial finance dramatically alters the conventional role of financial stakeholders in the design and development of innovative products, services, and systems (Belleflamme et al., 2013a & 2013b;

Schwienbacher & Lerralde, 2010), though literature on the subject is presently in a nascent state (Burtch, G., Ghose, A., Wattal, S., 2012; Giudici, G., Guerini, M., Lamastra, C. R., 2013; Mollick, 2013). Reward-based crowdfunding offers project-specific rewards, generally in the form of tangible new products or services, as a way of incentivizing donations from prospective investors (Belleflamme et al., 2013a; Kim & Hann, 2013; Mollick, 2013). As such, successful reward-based crowdfunding projects are necessarily supported by groups of motivated and enthusiastic user-stakeholders rather than profit-driven investors (Belleflamme et al., 2013b; Schwienbacher & Lerralde, 2010). Kickstarter is the world's largest and most dominant crowdfunding platform (Mollick, 2013), and is increasingly viable as a platform for design projects (Kuppuswamy & Bayus, 2013).

Crowdfunding is sometimes described as a type of crowdsourcing, in which crowds of individuals are solicited to contribute labour or creative resources towards a centralized initiative (Brabham, 2012; Kleemann, F., Voß, G.G., & Rieder, K. 2008). This resembles participatory or co-design, which refers to the practice of integrating users or primary stakeholders into the design and development of products, services, and systems (Sanders & Stappers, 2008). Early research on user participation combined the design expertise of professional designers with the localized expertise of users, enabling users to assist in defining the problem and suggesting potential avenues of design and development (Bødker, 1996). It has since been found that users are capable of innovative co-creation when motivated by self-interest and guided by designers or generative design tools (Kleemann et al., 2008; Sanders, Brandt, & Binder, 2010; Sanders & Simons, 2009; Tufte & Mefalopulos, 2009).

In the emerging post-industrial context, innovation and creativity are of critical importance to success in the competitive global marketplace, and creative labour is able to generate significant value in the place of material goods (Imbesi, 2011). The dispersion of the means of production through technological advances and the internet has democratized design and production processes on a massive scale, as evidenced by open source and peer-to-peer models (Imbesi, 2011). This has shifted the role of the design profession, away from simply creating or styling products and towards formulating strategic services, systems, and processes through which value can be produced and evaluated in terms of human experiences rather than market success (Imbesi, 2011).

By borrowing methods from crowdsourcing and co-design, reward-based crowdfunded design initiatives are able to funnel the enthusiasm and

collective intelligence of user-investors towards collaborative activities to improve the quality of project deliverables, simultaneously benefiting project founders and backers (Belleflamme et al., 2013b; Schwiendbacher & Lerralde, 2010). Recently, prominent crowdfunding campaigns such as the Oculus Rift, a virtual reality hardware development project, have combined crowdfunding with crowdsourcing approaches by enabling early investors to participate in a collaborative design and development process. In the case of the Rift, the project's founders incentivized donation by offering hardware prototypes, software development tools, access to an exclusive developer forum, and centralized technical support to backers who contributed at least \$275 to the project. This enabled developers to get an early start on creating or re-appropriating software applications to work in tandem with the Rift's hardware, while also allowing the project's founders to gather feedback in order to optimize the hardware for both consumer and developer purposes. (Kickstarter, 2014). By externalizing the financing of hardware development, as well as the labour of software development and hardware testing, the Rift's founders were able to cover early development costs while simultaneously ensuring that their feedback originated from group of motivated supporters and self-interested user-stakeholders.

Collaborations such as the Oculus Rift indicate significant potential in the overlap of crowdfunding and crowdsourcing practices. As crowdfunding continues to grow, its capacity to enable collaborative communities through financial exchange may enable the development of participatory cultures, in which the open exchange of ideas, knowledge, and resources can be harnessed to co-create, co-produce, and collectively fund solutions to complex problems (Kleemann et al., 2008; Lévy, 2012; Manzini, 2013; Mortati & Villari, 2012).

### *Rationale*

This inter-disciplinary research investigates the convergence of co-design practices in crowdfunding and crowdsourcing in order to begin addressing the relative lack of academic attention in this area. Presently, while there is scholarly literature related to participatory and co-design practices, there is a significant lack of literature on these subjects in the context of crowdfunding. The influence of design on the combination of crowdfunding and crowdsourcing presents an opportunity to affect a significant positive impact on the development and subsequent value of products, services, and systems, which should be of particular interest to practitioners and researchers from the fields of design and entrepreneurship.

Our goal in this study was to synthesize a common language for the various activities and mechanisms through which participation was leveraged in our sample data, which may inform or suggest future research on this emerging phenomenon. While our study focuses specifically on successful design-centred Kickstarter projects, our findings and definitions on the subject of participatory mechanisms are relevant first steps towards affecting a comprehensive understanding of participatory practices and collaborative design in the crowdfunding context.

## Methods

This study examined 600 crowdfunding projects in order to observe and subsequently classify the varying participatory practices implemented by project founders. Due to the broad range of projects and contexts in which crowdfunding can be applied, we sought to investigate projects that displayed the following characteristics:

- **Design-Centred Goal:** Given our focus on participatory activities that influence project outcomes via the potential for co-design or crowdsourcing, we were primarily interested in crowdfunding projects that proposed to design or develop a novel product, system, or service. This was largely accomplished by limiting the categories of project that we investigated, as detailed in the following section, though we additionally omitted projects using crowdfunding to fund presentations or distribution of existing project outcomes.
- **Reward-based Incentivization:** In order to investigate the collaborative relationships between project founders and user-investors, we focused on projects that offered the aforementioned product, system, or service as a reward to prospective backers.
- **Run via a Crowdfunding Platform:** Crowdfunding platforms presently facilitate the majority of crowdfunding projects and funds raised. Due to the various tools and formats provided by different websites, we aimed to gather our entire sample from a single platform to reduce variability.
- **Successfully Funded:** A large number of varied factors can act as determinants of projects' fundraising success. While it is relevant to determine whether or not certain types of participation have an influence on project success, we must first classify the various participatory activities at work within the crowdfunding context.

This study did not aim to assess participatory activities as a determinant of project success, and as such only investigated successful projects in order to reduce variability.

In addition to meeting our other criteria, the crowdfunding platform Kickstarter was chosen as a starting point for our sample based on its increasing popularity and viability as a platform for design initiatives (Kuppuswamy & Bayus, 2013; Mollick, 2013), which we concluded would best allow us to observe current and emerging trends in reward-based crowdfunding efforts. We gathered data from 150 projects each from the categories of Design, Technology, Games, and Fashion, omitting projects that lacked explicit deliverable outcomes.

Project data was collected chronologically by fundraising end date, beginning with projects that concluded on September 1, 2013. This date was chosen to ensure that the data was relatively recent and representative of current trends. In order to locate projects that met these sample criteria, we used the external web service 'Kickspy', which allowed for searching and complex, specific filtering of Kickstarter projects.

### *Variables for Data Collection*

We recorded the following variables for each project in the sample:

1. **Participatory Activities:** This refers to the presence of crowdsourcing or co-design opportunities that were made available to the crowd by project founders. This variable was recorded via two supplementary values:
  - a. *Type of Activity:* Given that we began without clear definitions of participatory activities, we recorded the type of activity to be performed by participants via brief, qualitative descriptions. Examples include *beta access*, *voting*, or *proprietary developer kits*.
  - b. *Exclusivity:* The structure of Kickstarter encourages founders to offer participatory activities as incentives to donate, a process that potentially excludes certain members of the crowd from participation. While participatory activities can be *public*, they can be limited to *backers only*, requiring a donation of at least \$1 USD, or more specifically to *reward tiers*, which each have specific

donation requirements. Kickstarter further allows founders to implement *limited reward tiers* that have a maximum number of donors. This was recorded as a broad indicator of the exclusivity of a given participatory activity.

2. **Kickstarter Category:** This refers to the category that a project was classified under on Kickstarter’s website. The four categories that were recorded were Design, Technology, Games, and Fashion. This was recorded in order to investigate potential trends of participation within the various project categories, or significant differences between them.
  
3. **Project Outcome Type:** This refers to the type of product, service, or system that a founder proposed to produce and deliver to backers. *Software* refers to deliverables that are digital applications for one or more devices or operating systems, and which aim to deliver project outcomes through digital downloads rather than via physical artifacts. This category was created due to the low cost of distributing and testing purely digital rewards, which we anticipate could be correlated with the use of certain types of participation. *Hardware* refers to deliverables that are physical devices, which are either supplemented by software development tools or compatible with existing operating systems. This classification was defined due to such projects’ capacity to outsource the development of software applications, which we anticipate could be correlated with the use of certain types of participation. Finally, *standalone* refers to deliverables that did not fall into either of the prior classifications, and generally involve the development of physical products.

### *Classifying Participatory Mechanisms*

Upon examination, we found that several of the activities recorded during data collection were very similar to one another in terms of the input being provided by participants, and could be grouped into five distinct classifications. We subsequently defined each of these classifications as ‘participatory mechanisms’ in order to synthesize a concise list of the participatory practices leveraged by founders within the sample. These mechanisms are described in the Results & Findings chapter.

In order to further elucidate the properties of these participatory mechanisms, the values for variable 1a within our data were each recoded to one of these five classifications. We used binary indications for each mechanism in order to identify each project by the mechanisms it utilized. Given this binary measurement, multiple occurrences of activities within the same classification were redundant and only counted once. This recoded data was utilized for the remainder of the data analysis process, and can be found in the Appendix.

### *Determining Exclusivity*

We measured and compared the values for variable 1b for each instance of the five participatory mechanisms in order to determine the relative exclusivity of each mechanism. The percentages of each degree of exclusivity were subsequently charted for each mechanism. This revealed clear indications of each mechanism's level of exclusivity, providing insight into the implementation of participatory mechanisms within the sample.

### *Prevalence of Participatory Mechanisms*

We measured the incidence of participatory activities in the entire sample, counting the total number of projects that included affirmative values for variable 1a. In order to determine the average number of mechanisms used in these participatory projects, we then totalled the instances of participatory mechanisms and divided the sum by the number of participatory projects. We repeated these measurements within each of the four Kickstarter categories, as recorded in variable 2, and the three types of project deliverable, as recorded in variable 3. This allowed us to compare the prevalence of participation across a variety of contexts in order to determine whether the type of project or deliverable could be correlated to participatory practices.

Following this overall comparison, we repeated this process individually for each participatory mechanism, including only projects that included the associated value in variable 1a. This allowed us to determine which mechanisms had been used frequently or in particular contexts, potentially indicating their value to project founders or ease of implementation under certain conditions. All findings on prevalence were then graphically represented to facilitate comparison between the various participatory mechanisms established earlier.

## Results & Findings

This section details the findings derived from the collected Kickstarter project data. A complete record of the data can be found in the Appendix.

### *Classifying Participatory Mechanisms*

The first stage of our data analysis focused on examining the types of participatory activity found in variable 1a within the sample. The activities that we observed are listed, quantified, and described below:

- **Soliciting Feedback (36 instances):** Founders actively solicited participants to provide them with feedback on project outcomes via the project's Kickstarter page.
- **Open Source (32 instances):** Founders released or planned to release the entirety of their project outcomes' design or blueprint to the general public for purposes of open participation and peer production.
- **Partial Open Source (9 instances):** Founders released or planned to release some element of their project outcomes' design or blueprint to the general public for purposes of open participation and peer production.
- **User Testing (96 instances):** Founders gave participants early access to project deliverables for purposes of advanced testing and providing user feedback. This generally took the form of access to software betas.
- **Voting on Esthetics (16 instances):** Founders allowed participants to collectively decide upon a particular esthetic element of project outcomes via popular vote, either through Kickstarter, social media, or external web services.
- **Voting on Functionality (12 instances):** Founders allowed participants to collectively decide upon a particular functional element of project outcomes via popular vote, either through Kickstarter, social media, or external web services.
- **Proprietary Developer Kits (18 instances):** Founders created and distributed kits to allow participants to independently develop supplementary products or systems that would explicitly work in tandem with project outcomes.
- **Design Collaboration (123 instances):** Founders worked with individual participants to co-design some element of project

outcomes, though founders would maintain total control over such outcomes.

- **Direct Developer Contact (25 instances):** Founders met with individual participants via private channels to discuss project outcomes.
- **Design Team Membership (14 instances):** Founders allowed participants to join the team responsible for the project, enabling them to have an ongoing impact on the design and development of project outcomes.

Through preliminary examination of these participatory activities, we found that several of them involved very similar participatory processes, providing very similar types of creative input to founders. As such, we tentatively grouped the observed participatory activities based on participant input, as summarized by Table 1:

*Table 1. Sorting Participatory Activities by Participant Input*

Participatory Activities (# of recorded instances)	Participant Input
User Testing (96) Soliciting Feedback (36) Direct Developer Contact (25)	Participants and founders engage in 1-way or 2-way dialogue regarding project outcomes, though participants have no control over design decisions.
Voting on Esthetics (16) Voting on Functionality (12)	Participants collectively decide upon single elements of project outcomes from a limited set of options.
Proprietary Developer Kits (18)	Participants independently develop products, services or systems that supplement project outcomes provided by the founder.
Design Collaboration (123) Design Team Membership (14)	Participants individually communicate with founders to collaborate on the design of specific elements of final project outcomes.
Open Source (32) Partial Open Source (9)	Participants are enabled and encouraged to freely use, modify, and redistribute project outcomes to affect independent collaborative processes.

We found that each of these groupings revealed a distinct mechanism by which founders had enabled crowd members to influence project outcomes, generally via provision of some degree of participant agency.

For purposes of further data analysis, we chose to examine participatory activities within these groupings, rather than investigating each activity separately. In aggregating these activities, we sought to affect a common language for referring to the varied participatory activities in crowdfunding practice, in order to both inform future research and encompass activities other than those observed in the sample. To that end, we subsequently classified each of these groupings as a type of 'participatory mechanism', and synthesized definitions and descriptions for each. These definitions are as follows:

- ***Open-Ended Feedback:*** This describes any participatory activity in which project founders actively crowdsource feedback on non-specific project outcomes.

This mechanism is a form of crowdsourcing, in that founders are tasked with managing and filtering contributed content in order to extract value from the crowd. The crowd is free to provide feedback on any element of a project, though founders are not obligated to implement or even assess such input. While comments and suggestions are given on a volunteer basis rather than in exchange for compensation, this participatory mechanism still requires founders to employ managerial resources in order to aggregate and utilize such feedback.

Due to the mechanism's lack of extrinsic incentive, the resulting creative output indicates participants' intrinsic motivations, such as enthusiasm or an interest in improving project outcomes. This relates to the enthusiasm and potential creativity of users, ensuring that solicited feedback originates from a motivated, active group of stakeholders. The quality of participant feedback is further associated with the amount of pertinent project information available to the crowd (Mollick, 2013; Surowiecki, 2005). As such, most projects that actively sought feedback did so through rewards that enabled backers to participate in user testing prior to the distribution of project deliverables.

- ***Collective Decision-Making:*** This describes any participatory activity in which project founders enable members of the crowd to influence project elements via majority vote.

This mechanism is another example of crowdsourcing, in which crowd input is aggregated in order to inform the design of project deliverables. Members of the crowd are given a degree of collective agency through voting, though their range of influence is dependent on the subject of the

vote and their available options, which are determined by project founders. Within the sample, 42.9% of voting opportunities allowed participants to decide on some aspect of functionality in project outcomes, while the remainder dealt with purely esthetic components of final deliverables. In 2 cases, esthetic voting options were crowdsourced, indicating a rare intersection between the use of this mechanism and Open-Ended Feedback.

While other crowdfunding platforms may have implemented systems for voting, Kickstarter does not currently provide tools to explicitly facilitate the voting process. As such, founders are tasked with organizing and running the voting process independently if they are using Kickstarter. Instances of voting within the sample generally involved tallying votes through external web services or comments on the project's social media or Kickstarter pages.

- **Supplemental Development:** This describes any participatory activity in which project founders crowdsource the development of products or services that operate in tandem with primary project outcomes.

The distribution of proprietary development tools can be considered a form of crowdsourcing and peer production, as founders are leveraging and directing the crowd's creative resources to their mutual benefit. Given that contributions made with such tools are necessarily compatible with campaign deliverables, this mechanism has the potential to generate significant benefits for participants, founders, and project backers in general. Additionally, if developers are offered incentives for contributing content of high quality, these additions are more likely to enrich the user experience of final project deliverables (Surowiecki, 2005).

Access to developer tools provides crowd members with a great deal of individual agency, in that it allows them to act and create in a manner that is largely independent of project founders. However, this agency is typically restricted, in that participants must be able to leverage specialized skills, such as programming knowledge, in order to contribute. Additionally, founders maintain complete control over the implementation and distribution of participants' contributions, limiting the crowd's capacity to impact final project deliverables without founder approval.

- **Individual Collaboration:** This describes any participatory activity in which project founders work with individual crowd members to collaborate on particular elements of final project deliverables.

This mechanism is characterized by collaboration and iterative dialogue between founders and individual participants, ostensibly to generate outcomes that are desirable to both parties. This leverages principles from co-design by enabling participants to have limited collaborative influence over project outcomes, albeit with the guidance of project founders.

While participants are granted a degree of agency in regards to specific components of final deliverables, project founders typically maintain full creative control over the project and may choose to filter or modify participants' contributions through the collaborative process. It is important to note that participants' agency is somewhat restricted in that they cannot participate in defining problems or ideating broad solutions, limiting their involvement to a collaborative or consultative role.

- ***Open Collaboration:*** This describes any participatory activity that revolves around the open distribution and free modification of project deliverables.

This participatory practice revolves around explicitly enabling and encouraging the crowd to freely modify, add to, and redistribute primary project outcomes. Following the initial proposal and development phases, participants are given complete agency and independence via access to blueprints for development, enabling them to design and develop without the oversight of founders. This is most visible in the case of open source projects, in which founders seek funding as a means to initiate a collaborative project, but where external contributors can revise outcomes, redefine problems, and collaborate independently of the initial founders.

While Open Collaboration bears similarities to Supplemental Development, there are significant distinctions in the collaborative process and degree of agency afforded to participants. Proprietary development kits allow crowd members to participate in a subordinate capacity, where open source crowdfunded projects closely resemble the empowering ideals of creative communities or participatory cultures, enabling the open exchange of resources, knowledge, and expertise among enthused stakeholders.

### *Exclusivity of Participatory Mechanisms*

Following the generation of these participatory mechanisms, we sought to measure their exclusivity in order to more accurately understand the context of their implementation. To that end, we compared the values for variable 1a and 1b in order to measure the proportionate amount of each

level of exclusivity within the five mechanisms. The results of these measurements are summarized in Table 2:

Table 2. Exclusivity of Participatory Mechanisms

From these visualizations, we identified clear disparities in the relative exclusivity of each mechanism. These distinctions broadened our comprehension of participatory mechanisms, and are fully described below:

- **Open-Ended Feedback** was the only mechanism that showed no distinct trends in exclusivity, likely due to the numerous ways that founders incentivized channels for participant feedback. *User testing* and *direct developer contact* were the most exclusive forms of this mechanism, while *soliciting feedback* was the most inclusive.
- **Collective Decision-Making** was fairly inclusive, though voting rights were most commonly offered as incentives to potential backers. This is likely to ensure that project stakeholders had the most sway over project outcomes, relating to the value of user feedback.
- **Supplemental Development** was fairly exclusive in that it always required some degree of financial donation, potentially due to the proprietary nature of the associated rewards.
- **Individual Collaboration** was the most exclusive participatory mechanism, requiring individuals to opt into specific reward tiers, the majority of which had a maximum number of donors. *Design team membership* was more likely to be limited to a maximum number of donors. The exclusivity of this mechanism is possibly due to the relatively high degree of control ceded to participants, as well as the logistical costs of necessarily communicating with individual donors.
- **Open Collaboration** was the most inclusive mechanism, consisting entirely of public activities. Given that this mechanism relies on participants' freedom to access and modify project outcomes, this outcome was expected.

### *Prevalence of Participatory Mechanisms*

Within the sample of 600 Kickstarter projects, 250 (41.67%) utilized participatory mechanisms, as seen in Figure 1. Of the 150 projects within each category, we found 25 (16.67%) in Design, 87 (58%) in Technology, 104 (69.33%) in Games, and 34 (22.67%) in Fashion utilized participatory mechanisms. Further, of the 82 projects that were coded as 'software', 67 (81.71%) included participation, as did 45 (76.27%) of the 59 'hardware' projects. Conversely, of the 459 projects that had proposed 'standalone' project deliverables, only 138 (30.01%) included participation. We recorded 369 distinct instances of participatory activity in the sample, indicating that

some participatory projects used multiple mechanisms. Participatory projects used an overall average of 1.476 mechanisms, and more specifically 1.28 in Design, 1.41 in Technology, 1.68 in Games, and 1.14 in Fashion.

Figure 1. Overall Prevalence of Participatory Mechanisms

While these results indicate a fairly substantial amount of participation within the sample projects, it is important to note that participation was most common in the categories of Technology and Games, and was significantly more prevalent in the development of hardware and software projects. This suggests that implementing participation is easier, less costly, or more useful in certain contexts, dependent on the type of project outcome being proposed. Alternatively, it simply indicates that participatory activities are more or less popular amongst designers and entrepreneurs from varying fields, potentially reflecting differing professional or academic viewpoints on the value of user input.

In order to gain a more comprehensive understanding of the occurrence of participation in our sample, we then examined the prevalence of each participatory mechanism separately, as seen in Figures 2 to 6:

**Open-Ended Feedback** was recorded in 136 projects overall (22.67%). It was leveraged most often within the Technology and Games categories, occurring in 53 (35.33%) and 64 (42.67%) projects respectively, while only appearing in 9 (6%) Design projects and 10 (6.67%) Fashion projects. This mechanism was observed in 53 (64.63%) software projects, 20 (33.9%) hardware projects and 63 (13.73%) standalone projects.

PAPE & IMBESI

Figure 2. Prevalence of Open-Ended Feedback

**Collective Decision-Making** was recorded in 27 projects overall (4.5%), of which 9 (6%) were in Design, 3 (2%) in Technology, 7 (4.67%) in Games, and 8 (5.33%) in Fashion. This mechanism was observed in 7 (8.54%) Software projects, 1 (1.7%) Hardware project, and 19 (4.14%) Standalone projects.

Figure 3. Prevalence of Collective Decision-Making

**Supplemental Development** was recorded in 18 projects overall (3%), of which 6 (4%) were in Design and 12 (8%) were in Technology. This mechanism was observed in 4 (4.88%) Software projects, 9 (15.25%) Hardware projects, and 5 (1.09%) Standalone projects. Interestingly, Supplemental Development was not observed at all in the Games and Fashion categories, potentially indicating severe difficulties in implementing such practices, or incompatibility with projects in those contexts.

Figure 4. Prevalence of Supplemental Development

**Individual Collaboration** was recorded in 130 projects overall (21.67%), of which 8 (5.33%) were in Design, 11 (7.33%) in Technology, 90 (60%) in Games, and 21 (14%) in Fashion. This mechanism was observed in 46 (56.1%) Software projects, 3 (5.08%) Hardware projects, and 81 (17.65%) Standalone projects.

Figure 5. Prevalence of Individual Collaboration

**Open Collaboration** was recorded in 41 projects overall (6.83%), of which 40 (26.67%) were from the Technology category, with only 1 other instance, in Games (0.67%). This mechanism was observed in 4 (4.88%) Software projects, 30 (50.85%) Hardware projects, and 7 (1.53%) Standalone projects.

Figure 6. Prevalence of Open Collaboration

### Importance of Findings

Critically, our analysis found that each mechanism’s prevalence was correlated to particular project deliverables and Kickstarter categories, indicating that their context played a role in the mechanisms’ implementation. This suggests that different types of participation are more or less conducive to varying project types. The following are summaries of our findings on the prevalence of participator mechanisms and participation in general:

- **Open-Ended Feedback** was the most prevalent participatory mechanism. It was observed in 22.67% of sample projects, and accounted for 54.4% of all participatory projects. It was most prevalent in the Technology and Games Kickstarter categories and in projects that proposed software as primary deliverables, which we associate with a high incidence of *user testing* activities in those contexts.
- **Collective Decision-Making** was observed in only 4.5% of projects, and accounted for 10.8% of all participatory projects. While it was evenly distributed amongst most project categories and reward types, it was rarely implemented in the Technology category or hardware projects.
- **Supplemental Development** was the least prevalent participatory mechanism, observed in only 3% of sample projects and accounting for 7.2% of participatory projects. We only observed instances of this mechanism as backer rewards or reward tier opportunities, indicating a relatively high degree of exclusivity. They were only found in the Design and Technology Kickstarter categories, and were most prevalent in hardware projects.
- **Individual Collaboration** was observed in 21.67% of projects, and accounted for 52% of all participatory projects. It was most prevalent in the Games category, in which it was notably evident in 60% of surveyed projects, as well as in projects that proposed software or standalone deliverables.
- **Open Collaboration** was observed in 6.83% of projects, and accounted for 16% of all participatory projects. It was observed almost entirely in hardware projects and the Technology category, likely due to the influence of the technology-centric open source movement.

Overall, participatory practices were observed in 250 of the 600 surveyed projects. It was most prevalent in the Technology and Games categories, in which it was observed in 58% and 69.33% of projects respectively. This prevalence was even more pronounced when projects were broken down by their proposed deliverables, as 76.27% of hardware projects and 81.71% of software projects implemented participatory

elements. Participation was relatively uncommon in the Design and Fashion categories of Kickstarter, in which less than a quarter of projects were participatory. These measurements very clearly indicated disparities in the contexts within which participation and different participatory mechanisms were most often leveraged.

## **Conclusions**

The purpose of this research was to address what we identified to be a significant lack of crowdfunding literature pertaining to crowdsourcing or co-design practices. This study has provided broad, explorative insights into the contexts within which participatory practices, crowdsourcing, and co-design activities are leveraged in reward-based crowdfunding projects. Through our analysis, we have defined five 'participatory mechanisms' that represent the common methods leveraged by project founders in a sample of successful design-centred projects on Kickstarter. These descriptive mechanisms can be used as a basis for discussing participatory practices in alternative crowdfunding contexts.

### *Suggestions for Future Research*

The primary outcomes of this study suggest and frame future research in order to address gaps in literature related to design in the crowdfunding context. Given the broad and explorative aims of this research, we encourage further verification of our findings in order to challenge and strengthen our comprehension of the relationships between participation and other project variables. The following are prospective research questions that seek to address identified gaps in design and crowdfunding literature:

- *How does crowdsourcing and collaboration with user-investors impact the quality of project outcomes in reward-based crowdfunding projects?*

Presently, crowdfunding literature focuses largely on measurable variables as determinants of crowdfunding success, where success is defined by the achievement of funding goals rather than necessarily delivering proposed outcomes. Similarly, this research measures the prevalence of participation, but not the effects it has on subsequent design and development processes. While existing literature on co-design practices and crowdsourcing seem to indicate that their convergence with crowdfunding

would lead to positive project outcomes, this should be verified through in-depth case studies.

- *Is the presence of participatory mechanisms a determinant of successful funding in crowdfunding projects?*

Given that our investigation focused on Kickstarter projects that had been successfully funded, further research can address participatory mechanisms as a determinant of successful funding, both broadly and for each individual mechanism.

- *What factors influence founders of reward-based crowdfunding projects to implement crowdsourcing or other participatory mechanisms into the crowdfunding process?*

While our research indicates particular contexts within which participatory practice often occurs, the exact causes for this prevalence are not yet clear. Given that founders must actively opt into participatory practices by building participatory activities into their project proposals and reward structures, it is relevant to discover what motivates them to do so.

- *What are the demographic characteristics of participants in reward-based crowdfunding projects?*

Though we can observe and identify project founders that implement participatory mechanisms in crowdfunding projects, we do not currently know who engages in such participatory practices. Such demographic information could be pertinent in terms of promoting or facilitating participatory practices, which would be of interest to crowdfunding platforms and prospective project founders.

## Appendix

This section contains our collected Kickstarter project data. They are coded as follows:

**P.M.:** Participatory mechanisms implemented (Variable 1a from Methods), coded as such:

- OEF = Open Ended Feedback
- CDM = Collective Decision-Making
- SD = Supplemental Development
- IC = Individual Collaboration
- OC = Open Collaboration

**Exclusivity:** Exclusivity of the associated P.M., which could be Public, Backer-Only, Reward Tier Only, or Limited Reward Tier Only (Variable 1b from Methods)

**Category:** The project's Kickstarter category, which could be Design, Technology, Games, or Fashion (Variable 2 from Methods)

**Deliverable:** The project's primary deliverable, which could be Software, Hardware, or Standalone (Variable 3 from Methods)

**End Date:** The date that the project concluded

**Project Name:** The name of the project's Kickstarter page

Participatory Mechanisms in Crowdfunding

P.M.	Exclusivity	Category	Deliverable	End Date	Project Name
OEF	Public	Design	Standalone	01/09/2013	BLAZAR: Aluminum Bluetooth Speaker & Artist Collaboration
IC	Ltd. Reward				
-	n/a	Design	Standalone	01/09/2013	Eco-Friendly Snowboards
-	n/a	Design	Standalone	01/09/2013	High Strength Titanium Locking D Shackle
OEF	Reward	Design	Standalone	03/09/2013	iblaaz
SD	Reward				
-	n/a	Design	Standalone	03/09/2013	Kordii
-	n/a	Design	Standalone	04/09/2013	Steep
-	n/a	Design	Standalone	04/09/2013	One Binding System
-	n/a	Design	Standalone	05/09/2013	Machine Era Wallet
-	n/a	Design	Standalone	06/09/2013	Violin: Carbon Fiber, Tooling and Engineering
-	n/a	Design	Standalone	06/09/2013	The MostRad Minimalist Wallet
-	n/a	Design	Standalone	06/09/2013	MapBak
-	n/a	Design	Standalone	06/09/2013	Pi Fans
-	n/a	Design	Standalone	06/09/2013	Mr. Toast: Dill - Vince
SD	Backer	Design	Hardware	07/09/2013	HOT Watch: Complete Smart Watch w/Revolutionary Private Calls
-	n/a	Design	Standalone	07/09/2013	Modern Makeup Organizer
-	n/a	Design	Standalone	07/09/2013	Fingersurfing
-	n/a	Design	Standalone	07/09/2013	Nota Ultralite Stylus
-	n/a	Design	Standalone	07/09/2013	Titanite Shield Multi-Tool
-	n/a	Design	Standalone	08/09/2013	Jewelry on the Edge
-	n/a	Design	Standalone	08/09/2013	Noso Slim Wallet
-	n/a	Design	Standalone	09/09/2013	Adjust-D-Weight Tip Pen
-	n/a	Design	Standalone	10/09/2013	Tuts: Flat Tools, Round World
-	n/a	Design	Standalone	10/09/2013	QooQi for your cables
-	n/a	Design	Standalone	10/09/2013	"Armature" Playing Card Clip
-	n/a	Design	Standalone	11/09/2013	Nube: The Perfected Hammock Shelter
-	n/a	Design	Standalone	11/09/2013	Firebox Nano Stove
-	n/a	Design	Standalone	11/09/2013	Mokey Key Brace & Pocket Organizer
-	n/a	Design	Standalone	12/09/2013	Synergos Wallet Mashup
-	n/a	Design	Standalone	12/09/2013	Last Resort Zombie Defense Ring
-	n/a	Design	Standalone	12/09/2013	Dollar Wallet
-	n/a	Design	Standalone	12/09/2013	Grow your own tail
-	n/a	Design	Standalone	12/09/2013	TISUSHI Sticks
-	n/a	Design	Standalone	12/09/2013	Mix Your Match! Handcrafted Jewelry
-	n/a	Design	Standalone	12/09/2013	The Scary Godmother Doll
CDM	Public	Design	Standalone	13/09/2013	Tubecore Duo
-	n/a	Design	Standalone	13/09/2013	Camelino Valet Stand
-	n/a	Design	Standalone	13/09/2013	FADER Boards
-	n/a	Design	Standalone	13/09/2013	Bike Dock
-	n/a	Design	Standalone	13/09/2013	The Menurkey
-	n/a	Design	Standalone	13/09/2013	CAVAR Leather Bags & Journal
OEF	Ltd. Reward	Design	Standalone	14/09/2013	Sound Band
SD	Ltd. Reward				
-	n/a	Design	Standalone	14/09/2013	Pour Mason Coffee Attachment
CDM	Backer	Design	Standalone	15/09/2013	Imperial Playing Cards

	P.M.	Exclusivity	Category	Deliverable	End Date	Project Name
	-	n/a	Design	Standalone	15/09/2013	Ti2 Paa-Biner
	-	n/a	Design	Standalone	15/09/2013	Glideware
	-	n/a	Design	Standalone	15/09/2013	Business Card Dispenser
SD	Reward	Design	Hardware	Standalone	16/09/2013	Emotiv Insight
	-	n/a	Design	Standalone	16/09/2013	Alfano Shoulder Rig
	-	n/a	Design	Standalone	16/09/2013	Snap Watch
	-	n/a	Design	Standalone	16/09/2013	The Persian Empire Cards
	-	n/a	Design	Standalone	16/09/2013	Wally Case
	-	n/a	Design	Standalone	16/09/2013	Mo-To: Modern Vintage Toy Cars
	-	n/a	Design	Standalone	16/09/2013	Tenkara Rod Co.
	-	n/a	Design	Standalone	17/09/2013	Air Light Stories Shirts
	-	n/a	Design	Standalone	18/09/2013	Oungajungle Stands
	-	n/a	Design	Standalone	18/09/2013	Vesatool
	-	n/a	Design	Standalone	18/09/2013	Bandboard Modular Work Platform
CDM	Backer	Design	Standalone	Standalone	19/09/2013	Loop Organized Cables
	-	n/a	Design	Standalone	19/09/2013	The Butler Home Organizer
	-	n/a	Design	Standalone	19/09/2013	Ethical Products From A New Creative Business - Bright Stern
	-	n/a	Design	Standalone	19/09/2013	Mharajh Playing Cards
IC	Ltd. Reward	Design	Standalone	Standalone	20/09/2013	Animazoms Plusshies Series 1
IC	Ltd. Reward	Design	Standalone	Standalone	20/09/2013	Urbantrike
CDM	Public	Design	Hardware	Standalone	20/09/2013	Omate TrueSmart Smartwatch 2.0
SD	Ltd. Reward	Design	Standalone	Standalone	20/09/2013	Flanebike
	-	n/a	Design	Standalone	20/09/2013	NS Longboards
	-	n/a	Design	Standalone	21/09/2013	Better Bicycle Bell
	-	n/a	Design	Standalone	21/09/2013	SoapBox Bath Aids
	-	n/a	Design	Standalone	21/09/2013	15x20 Adventure Bag
	-	n/a	Design	Standalone	21/09/2013	Aerial Arts: Defense Discourses
CDM	Backer	Design	Software	Standalone	22/09/2013	BitGym: Interactive Trails, Tours
IC	Ltd. Reward	Design	Standalone	Standalone	22/09/2013	Triumph Pen
CDM	Backer	Design	Standalone	Standalone	22/09/2013	Minimo   A dim aluminium cooler with a difference
	-	n/a	Design	Standalone	22/09/2013	Stealth PSR Carbon Fibre Stand
	-	n/a	Design	Standalone	22/09/2013	Spirit Steels Beverage Cooling
	-	n/a	Design	Standalone	23/09/2013	The Modern American Opener
OEF	Reward	Design	Standalone	Standalone	24/09/2013	Together Farm Blocks Modular Garden
OEF	Ltd. Reward	Design	Standalone	Standalone	24/09/2013	Salt Cases
CDM	Reward	Design	Standalone	Standalone	24/09/2013	Blueblood Redux: Playing Cards
	-	n/a	Design	Standalone	24/09/2013	Handmade Cards for Men
	-	n/a	Design	Standalone	24/09/2013	Strong Like Bull Bottle Opener
	-	n/a	Design	Standalone	24/09/2013	3 Switch Revoking De-center
	-	n/a	Design	Standalone	25/09/2013	Slimfold MICRO Wallet
	-	n/a	Design	Standalone	26/09/2013	The Melies Playing Cards
IC	Reward	Design	Standalone	Standalone	27/09/2013	URBANIST Cycling Chamois Pantes
	-	n/a	Design	Standalone	27/09/2013	TILT Stealth Mac Cooling Station
	-	n/a	Design	Standalone	27/09/2013	Snapback Slim Wallet

*Participatory Mechanisms in Crowdfunding*

P.M.	Exclusivity	Category	Deliverable	End Date	Project Name
-	n/a	Design	Standalone	28/09/2013	Neat Ice Kit
-	n/a	Design	Standalone	28/09/2013	Kingko solar tree, Solar Powered charger
-	n/a	Design	Standalone	30/09/2013	TITANIUM. Incredible 12 function Ultimate Pocket Tool

## Business Model Innovation Through New Customer Roles. Inspirational cues and insights from a design-driven case study analysis

Cautela CABIRIO<sup>a</sup>, Paola PISANO<sup>b\*</sup> and Marco PIRONTI<sup>b</sup>

<sup>a</sup>Politecnico di Milano; <sup>b</sup>University of Torino

*Framing business models as relational devices governing transactions with the customers and stakeholders, the current article aims to identify new rules of customer engagement and their impact on business model innovations in design-intensive industries. These industries, framed as the locus of “cultural innovation” – where the innovation soul is characterized by the proposition of new product cultural messages and meaning – sees the customer as a product “sense giver,” an interpreter of the meaning, the cultural and symbolic messages attached to the product. In this setting, new customer roles are explored through a case study analysis based on a fast-growing company operating in the furniture sector.*

*The case study analysis highlights three main customer roles that impact business models: (i) the customer as a market bridge, where the customer attracts new potential contacts and customers; (ii) the customer context as a company “show-room,” where the customer’s home setting is designed to convey the company’s product language and aesthetics; (iii) the customer as an external company design lab, where the customer host events to seek for new product scenarios.*

**Keywords:** *business model innovation, customer engagement, design-intensive industry*

## Introduction

Business model innovation is gathering a growing attention in design and management field (Martin, 2009; Osterwalder, & Pigneur, 2010; Battistella & al. 2012).

In different industrial context the seeking for a new business model disrupted the competitive rules and the sources of value.

Cases as Hilti, Groupon, Patientlikeme, are recognized as representative of disruptive business model innovation (Markides, 2006) leveraging on a wise integration between on and off line activities and on new customer engagement roles.

A significant literature centered on business model innovation relates to web companies and e-business (Timmers, 1998). Mainly start-ups and new ventures are considered as the main players that introduced new business models and logics with the evolutionary waves of the digital economy.

On the other hand business models innovation are becoming source of value also in industries where the technology innovation and the pace of it are not relevant.

Nevertheless the scientific debate about business model innovation in design-intensive industries - as fashion, furniture, accessories, interiors, textile – where the innovation process is driven by the proposition of new product meanings and languages (Verganti, 2009) and cultural messages (Ravasi, & al. 2012) seems to be poor.

Framing business model as a 'relational device' the paper aims to identify business model innovation logics in design driven contexts where the relationship between product innovation and business model innovation seem to be relevant and fertile (Battistella & al. 2012).

To accomplish this aim, a case study based on explorative research has been conducted. The company for study was selected because it met the following three criteria: (i) had a widely acknowledged innovative business model; (ii) operates in design intensive industry where the content of innovation is based on new cultural messages and meaning conveyed by the product; (iii) generates new forms of customer relationship through new engagement roles. The article is composed of five different sections. First, a literature analysis will be presented, highlighting how the dominant studies focused on business model and business model innovation. Following the methodological part is depicted where a case study analysis research strategy is proposed. In the third section, the LAGO case study is developed, pinpointing the underpinning logics of business model innovation.

A discussion is advanced in the fourth section, where some evidence and insights based on the case study analysis support the development of a relational business model innovation approach.

In the final section, the conclusions, the main limitations of the research and new and promising research strands are proposed.

## **Theoretical background and research questions**

As can be expected by delineating the meaning of the business model in the web economy, the concepts of *flow* and *relationship* are significantly stressed. A business model represents the device by which the main flows and the company's web of relationships are designed, aiming to create benefits for the different participating actors, as providers, partners, customers (Amit, & Zott, 2001).

In their attempt to extend the business model concept by trying to go beyond the foundation originally centered in e-business, Amit and Zott (2001) define the business model as 'the content, structure, and governance of transactions designed to create value through the exploitation of business opportunities.'

Even in this case, through the term *transaction*, scholars pinpoint the relational rationale underpinning how in the business model concept the exchange and interactive dynamics prevail.

On the other hand recalling the basic business question advanced by Drucker, Magretta (2002) describes business models as

*stories that explain how enterprises work. A good business model answers Peter Drucker's age-old questions: Who is the customer? And what does the customer value? How do we make money in this business? What is the underlying economic logic that explains how we can deliver value to customers at an appropriate cost?(Magretta, 2002, p. 87)*

Here, the concept of the customer, customer value and money making are intended to be constitutive business model elements.

Other scholars have grappled with the attempt to split a business model and to identify its various components.

According to Osterwalder, Pigneur and Tucci (2005),

*a business model is a conceptual tool containing a set of objects, concepts and their relationships with the objective to express the*

*business logic of a specific firm. Therefore we must consider which concepts and relationships allow a simplified description and representation of what value is provided to customers, how this is performed and with which financial consequences. (Osterwalder, et al., 2005, p. 5)*

In an initial proposal, these authors identify four main pillars – the product, the customer interface, the infrastructure management and the financial aspects – around which some “building blocks” are identified.

In a later release, Osterwalder and Pigneur (2010) directly proposed a “nine building blocks business canvas” (i.e., value proposition, channels, customer relationships, customer segments, revenue streams, key activities, key resources, key partnership, cost structure).

Other scholars have provided a more compact version. Specifically, business model based on six elements has been depicted where value proposition, customers, internal processes/competencies, external positioning, the economic model and personal investor factors constitute the key elements of the model (Morris, Schindehutte, & Allen, 2005).

Voelpel, Leibold and Streb (2005) mention three basic components of a BM: value proposition for customers, value network configuration to create that value, and returns ensuring the satisfaction of relevant stakeholders and, thus, the sustainability of the business model.

On the other hand, a business model concept based on four characteristic elements (customer value proposition, profit formula, key resources, and key processes) has been defined (Johnson, Christensen, & Kagermann, 2008), pointing out the interlocking logic among the different elements.

In any case, the different attempts to identify the components, the transactional and relational dimensions of the business model are depicted as fundamental. The concepts of “customer value proposition,” “customer value,” “customer segments,” “key partnership,” and “customer relationship” point out the interactive and relational dimensions of the core of the business model.

If there is a common consensus about the basic components of business model as a construct there are heterogeneous perspectives about the way to conceive and interpret the business model innovation.

A primary research strand emphasized how business model innovation is induced by or mainly related to technological innovation.

*Table 3: Literature review*

Authors	Focus on
Timmers (1998)	Product, service and information flows, business actors
Weil and Vitale (2001)	Roles and relationships among a firm's consumers, customers, allies, and suppliers
Amit and Zott (2001)	Transactions
Magretta (2002)	Customer value, economic logic, value delivery
Morris et al. (2005)	Value proposition, customer, internal processes/competencies, external positioning, economic model and personal investor factors
Osterwalder, Pigneur and Tucci (2005)	Product, customer interface, the infrastructure management and the financial aspects
Voelpel et al. (2005)	Value proposition, value network, returns
Johnson et al. (2008)	customer value proposition, profit formula, key resources, and key processes
Osterwalder and Pigneur (2010)	value proposition, channels, customer relationships, customer segments, revenue streams, key activities, key resources, key partnership, cost structure

As stated by Teece (2009), 'technological innovation often needs to be matched with business model innovation if the innovator is to capture value.'

Furthermore, new business models have been usually connected to new R&D strategies. In "Open Business Models," Chesbrough (2006) affirms:

*an open business model uses the new division of innovation labor – both in the creation of value and in the capture of a portion of that value. Open models create value by leveraging many more ideas, due to their inclusion of a variety of external concepts. Open models can also enable greater value capture, by using a key asset, resource, or position not only in the company's own business but also in other companies' businesses. (Chesbrough, 2006, pp. 2-3)*

The author, going beyond the vertical integrated company concept in which the R&D exploration and exploitation are equally run, identifies two ways to build open business models: (i) the inside-out approach, where

ideas, patents and copyrights are internally produced and then licensed to external actors that take them on the market; (ii) the outside-in approach, where companies grasp ideas and technologies from external networks turning them into products to commercialize on the marketplace (Chesbrough, 2006).

Both approaches tend to stress “openness” as a dominant way to innovate business models in a successful and profitable manner.

In contrast, Johnson et al. (2008) citing real successful cases as Hilti, Intuit, and Apple as cases propose the soul of business model innovation in ‘keeping people from getting particular jobs completed: insufficient wealth, access, skill or time.’

In a similar vein another research strand relates business model innovation to the way goods and services are purchased and accessed by the customer.

Firstly, Markides (2006), claiming for the ‘need of a better theory,’ emphasizes the difference between disruptive innovations and business model innovations, pinpointing how the latter tend to basically change competitive rules of a sector and ‘enlarge the existing economic pie,’ either by attracting new customers into the market or by encouraging existing customers to consume more. Furthermore, according to the author, ‘(...) it is important to note that business model innovators do not discover new products or services; they simply redefine what an existing product or service is and how it is provided to the customer.’

Consistent with this approach and centering on the transaction dimension, Zott and Amit (2008) also interpret business models innovation as new forms of economic exchanges. According to the authors:

*novelty-centered business models refer to new ways of conducting economic exchanges among various participants. The conceptualization and adoption of new ways of conducting transactions can be achieved, for example, by connecting previously unconnected parties, by linking transaction participants in new ways, or by designing new transaction mechanisms. (Zott, & Amit, 2008, p. 4)*

The vision that business model innovation occurs when changes are made in the way to conduct transactions, to create and deliver value and to build up new customer relationships is indeed widely accepted.

Mainly in service sectors and in the fast-paced technology industry, different business model innovations have been conceived, reconfiguring the customer's role in the production process.

The dominant innovation directions that have been pursued involve the customer's role as a collaborative producer (McKelvey, 2001; Pisano, & Verganti, 2008; Johnson, et al., 2008). The advent of a user-generated content movement, the diffusion of social media and Web 2.0 technologies, and the emergence of skilled and well-educated customers have enabled whole crowds or single users to heavily collaborate in the production processes of companies. According to this framework, the customer is a company production or co-developing partner that jointly affects the evolution, the costs and the benefits of the value system.

With Apple, iPhone users are free to conceive and hopefully sell their own apps; in the Linux operating system, people take part in writing codes and strings to optimize the functionalities and the performance of the system; with different low-cost airlines, customers are empowered to accomplish check-in activities and most of the luggage handling on their own.

The entire literature aligned to this frame is usually contextualized in the fast-paced technology industry or in service industry (Mohanbir, & al. 2005; Von Hippel, 2005; Grocott, & al. 2007; Shneiderman, 2007). Specifically this literature seems to avoid the relevant distinction between the cases where the customer plays the role of a mere product assembler – thus customizing the final offering – and the cases where the user represents an operative gear of the business model or even a provider of stimuli for business model change.

In design-intensive industries, where the competitive dynamics are driven by a continuous proposition of new product languages and meanings (Verganti, 2003; 2008; 2009), there is a wide lack of literature about the business model innovation.

In design-intensive industries, products are more or less open narratives in which customers are involved in defining the product sense and meaning (Krippendorf, 1989; Norman, 2005; Verganti, 2003; 2009; Searls, 2009). Thus the customer does not play the ordinary role of receiver but acts sometimes as 'sense giver', some others as a co-designer, till to be a full 'maker'.

Moreover the creation of product meaning seems not to be delegated to the tangible product in itself, but to the entire business model that

companies run and to the ways in which customers are engaged in it (Battistella, Biotto, & De Toni, 2012).

Notwithstanding, some questions remain open and fertile to reach a deeper understanding of how companies create business model innovation by leveraging new customer roles.

What are the customer engagement strategies to change the business model in design-driven companies? Are there specific roles that appear as proper of those design intensive contexts?

Due to a lack of previous literature, these research questions are addressed in this paper through the development of an explorative case study analysis.

## Research strategy

Literature about business model innovation is basically centered on fast-paced technology industries. Furthermore, if design-driven innovation is a concept that has widely permeated the management literature (Dumas, & Mintzberg, 1989; Verganti, 2003; 2006; 2009; Noble, & Kumar, 2010; Ravasi, & Lojacono, 2005; Ravasi, & Stigliani, 2012), there is a neglected area of research where design management studies meet business dynamics and becomes relevant to innovate the business model as a whole.

This literature scarcity led to explorative research based on a case study analysis (Eisenhardt, 1989; Yin, 1981; 1984; Mintzberg, 1979). According to the words employed by Eisenhardt (1989):

*there are times when little is known about a phenomenon, current perspectives seem inadequate because they have little empirical substantiation (...). In these situations, theory building from case study research is particularly appropriate (...). (Eisenhardt, 1989,p. 548)*

The first methodological issue faced by the research group pertained to the criteria through which to select a particular case study. A primary sample of 25 Italian furniture companies was considered. The sector choice was indicated as a representative field of design-intensive industries where companies mostly compete on the proposition of new product languages and meanings (Dell'Era, & Verganti, 2007; 2011) and on cultural innovation (Ravasi, et al., 2012).

The sample companies were identified by matching two different criteria: (i) the turnover growth rate in the previous 4 years; (ii) the introduction of novel features in business model.

The first quantitative parameter helped to select an initial ranking of ten companies. The final selection of the case to investigate was run according to an open discussion about the concept of “innovativeness of the business model.” This concept was discussed in a research group of 5 scholars of Politecnico di Milano and University of Torino (2 Assistant Professors in the Design area; 2 Associate Professors in the Innovation Management area; 1 Full Professor in the Business Innovation area).

The concept of innovativeness was split according to two main dimensions: (i) the depth of the innovation, intended to indicate how much the transactions flows and the company-customer relationship changed in business models; (ii) the breadth of the innovation, intended to indicate how many components of the business model have been affected by change with respect to the traditional sectorial trends.

The selection indicated LAGO as the most representative case of business model innovation, where both the levels of depth and breadth of innovation were agreed to by the members of the research group.

As required by theory building based on case study, a combination of multiple sources and investigation methodologies was exploited to achieve a certain robustness and extensibility of the results (Yin, 1981; Eisenhardt, 1989).

The case study analysis was conducted over a period of one year and 5 months, involving three main sources in an iterative way:

- a press analysis conducted on 26 journals and design-related magazines in the time range 2009-2013;
- five in-depth interviews, three of which were conducted with the LAGO CEO, Daniele LAGO, and two were conducted with an external consultant architect, Massimo Antinarelli;
- participation in four workshops and events organized by the Brera LAGO Apartment, located in Milan.

The press analysis supported a primary understanding of the LAGO business system. Different articles (18 of 26 articles) emphasized both directions of innovation pursued by the company: innovation in the product and in the customer relationship, product exhibition and distributive chain. A great amount of attention (15 on 26 articles) and space has been

dedicated by the press to the “LAGO Apartment network” and its novel ways of engaging customers and building new relationships.

These initial understandings derived by the press analysis supported the formulation of the main issues and questions that were explored in the subsequent interviews.

Interviews focused on the following aspects:

- driving forces that supported innovation in the business model;
- innovative concepts related to the LAGO business model;
- product design strategies and creativity management;
- logics to engage and manage relationships with customers;
- distributive policies and the LAGO Apartment network.

Following these interviews, researchers’ participation in four workshops and events organized by LAGO was encouraged to experience and grasp the atmosphere and the social interaction among the different involved actors.

Different assessments were taken, aiming to identify qualitative customer profiles, the type of events held and how customers are involved in relevant activities (workshops, events, artistic performances, etc).

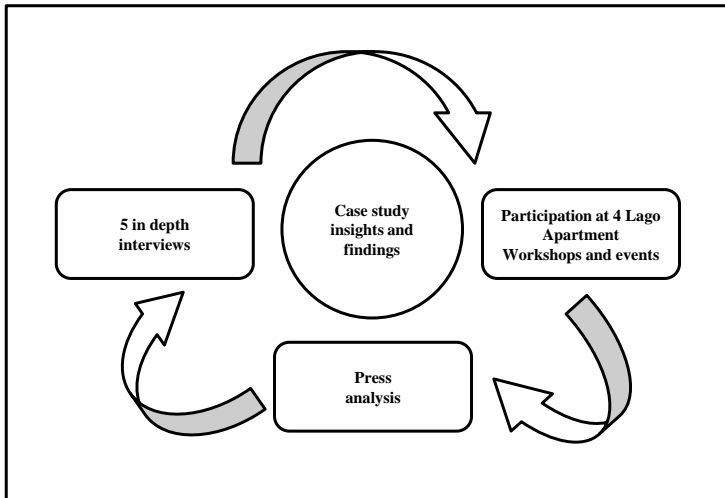

Figure 11: Iterative research process

Three data sources have been employed in an iterative way. Primarily, a first cluster of articles (15) were read to grasp an overall understanding about LAGO’s innovation and design strategy and its underpinning business model. The main concepts derived by reading the articles supported the

formulation of an open-answer questionnaire submitted to LAGO's CEO and architect consultant (2 initial interviews). The questionnaires supported the first development of theoretical constructs and some main hypothesis about the form and the logic of the business model and the company's logic of customer engagement. Following the administration of these questionnaires, the researchers' participation in three main events and workshops organized by LAGO Apartment helped to qualify a direct experience with the concepts and findings related to the tenants' and participants' experience.

A second iterative flow, mainly focused on additional articles, readings, and three more interviews, supported the refinement of the proposed concepts, and a final confirmation of findings and main concepts were derived by the last interview. In this paper, only a brief essay is presented to highlight the focal points related to LAGO's product design strategy, business model, logic, and pattern of customer engagement.

## **Case study: LAGO**

LAGO was founded at the end of the nineteenth century by Policarpo Lago, a wood craftsman who worked in aristocratic homes and Venetian churches. The generation that followed continued his tradition, but expanded their production first to bedroom furniture and later to entryway furniture. Today, LAGO is considered a fast-growing company in the Italian furniture landscape, where it grew from approximately 5 million € of turnover in the first two years of the company's redesign to 30 million € of turnover in 2010, with approximately 170 employees (of which over 25% were hired in 2008).

LAGO can be found in 400 selected shops around the world and has numerous directly managed stores in several Italian and European cities, including Rome, Milan, London, Paris and Barcelona. Lately, the company began some fertile ventures with partner leaders in different sectors to enlarge their range of products and share the pursuit of people-friendly designs, thus creating solutions that can improve the customer's quality of life.

Recently, the company has opened itself to the skills of craftspeople and designers to retrieve the importance of handwork ability, local embedded know-how, and care for detail. This was the beginning of the "LAGO Objects" collection, a set of small objects of high quality and craftsmanship.

The entire LAGO business model is based on two main pillars:

CABIRIO, PISANO & PIRONTI

- an innovative product design strategy, fostered by the LAGO STUDIO, the creative hub where young, external and talented designers are engaged to conceive new product propositions;
- an innovative customer engagement model, based on the creation of a diffused network of LAGO APARTMENT, where LAGO-furnished apartments of specific customers operate as showrooms and product-diffusing vehicles.

### *Managing product design at LAGO*

At LAGO, products are conceived as parts of an alphabet. Each product combined with other parts can assume a proper aesthetic language and style. The combination of the product language is delegated to the hands of the customer. Products are conceived as an open or unfinished work, a sort of open narrative that assumes sense on the basis of the successive “reader” interpretation (Eco, 1989). The products’ modularity and their openness and flexibility to be adapted to different contexts permit a full re-interpretation by the customer-reader (Figure 2).

*Figure 2: Slide carpet by LAGO*

The other feature of the design strategy consists of conceiving product systems. Going beyond the logic of the single product as protagonist in a specific context (as the typical design masterpieces designed by the internationally recognized designers), LAGO proposes products to be aggregated in a way to suggest a proper whole language, a coherent and organic mood of living and domesticity. Products are conceived as a part of systematic offering where each one relates to others in terms of color, shape, texture, and sense. LAGO offers a sort of language bundle more than independently designed products.

Practically, this means that the company considers the space as an organic system in which furniture products communicate with each other. At LAGO, design means creating small designs (products) and, at the same time, knowing how to create large designs (design systems) by looking at the home and its habitability as a whole.

The creation and the design of new product platforms and languages is partially internal and partially entrusted to an external creative hub: the LAGO Studio. LAGO Studio is the company's temporary environment in which different cultures and geographically dispersed people meet to generate new concepts and products.

In fact, LAGO organizes a yearly creative workshop, hosting young university students and designers from around the world and schools such as Saint Martin's, London Royal College of Art, Eindhoven Design Academy, and Milano Domus Academy. The main logic behind these workshops consists of engaging young and inexperienced designers to dive into LAGO's philosophy and to contribute to developing new design systems and single products.

### *Innovating Business model exploring new customer roles*

What about the customer?

Far from the "production function" highlighted in fast-paced technology industries, where the customer plays the role of a collaborative producer, at LAGO, customers are engaged according to other logics and functions.

First, the customer seems to act as a market bridge for the company. The tenants of the LAGO Apartment network form an "inner circle" aiming to access different market segments (Figure 3). Leveraging their own relationships or directly supported by LAGO in multiplying contacts and meeting opportunities, the tenants represent a contact gate where to experience a real LAGO Apartment with a proper mood, language frame, aesthetics, living space and organization.

In cases where the tenant is also an architect or a designer, the value of the relationship is even more evident. The professional tenant interested in enlarging his customer base and work opportunities can leverage being at the center of an open network that naturally attracts customers interested in design and architecture.

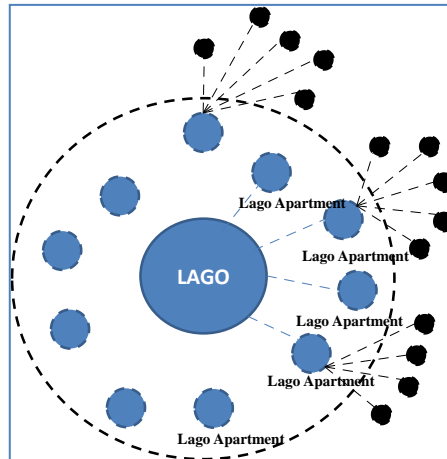

Figure 3: The LAGO Apartment network as market bridge

On a second hand the Lago Apartment constitutes a network of unconventional show-rooms, such as exhibition platforms really lived by the customers-tenants.

The fact that these apartments are real houses or offices of customers provide a more familiar atmosphere for visitors and prospects, thus decreasing the formality, the rigidity and the commercial protocols that used coupled with the typical show rooms. The informal atmosphere and the acknowledgment to be welcomed in a lived house enable more sincere and fertile relationships and the possibility to freely appreciate or not the whole aesthetics and the single items.

Thirdly, tenants can be considered as innovation promoters. As matter of fact when customers submit their project proposals to enter and take part in the LAGO Apartment network, they provide new and inspiring knowledge for innovation. They do so by proposing completely fresh product combinations and languages or by radically proposing new LAGO aesthetics and settings by reinterpreting existing product languages and meanings. LAGO Apartments, according to this role, can be depicted as extended “design laboratories” oriented towards grasping innovative signals and generating fresh insights (Dell’Era, & Verganti, 2009).

These roles directly impact the LAGO business model.

Being a market bridge, customer impacts on the market making function affecting on the company revenues. When they open their house to show their furniture to their contacts and to additional potential customers they

are creating the customer experience that is expected to affect the purchasing dynamics and thus the revenue flows.

In the same vein providing the customer houses in exhibition and show rooms affects the cost structure decreasing the exhibition and retailing costs.

Lastly the role played by customer more than feeding the actual business model provides inspirational knowledge to foster innovative products and systems.

*Table 2: The three roles played by the customer in Lago business model*

Customer as	Function	Direct impact on
Market bridge/Commercial partner	Connection with potential users	Market enlargement/New revenues
Showroom	Product placement, "living" exhibition	Reduction of communication and exhibition costs
Design innovation promoter	Exploration of new design patterns and product languages	Innovation trajectories Inspiring knowledge base

## Discussion

The presented LAGO case study evidences at least three key issues in business model innovation.

First, for long time, business models and innovation have been considered as two different aspects pertaining to the company's management. Business models as related to "value creation and capture" have been analyzed as operational devices mostly pertaining to the company operating routine. Contrarily, innovation has been framed as a changing activity oriented to move company assets, strategy and value creation means towards thriving and superior performance levels. In other words, a business model relates to *exploitation*, whereas innovation equals *exploration* (March, 1991).

This clear-cut separation seems to lose its validity. As evidenced by LAGO, the business model and innovation are intertwined concepts. LAGO innovatively created its own business model, changing the typical value drivers in the furniture industry and at the same time, its business model fosters continuous innovation because some of its constituent elements –

i.e., the LAGO apartment network – feed stimuli and insights to the company about sociocultural models and new emerging patterns in terms of product languages and meanings.

The business model in LAGO's case not only guarantees value creation and its "appropriability," but it also works as an engine aiming to update and revamp product languages and meanings.

The intertwined relationship between the business model and innovation activities proposes different questions about the *locus* and the management of R&D. At LAGO, R&D is spread out into three main moments and entities: LAGO Studio is the creative platform in which foreign and other talented designers seek for new concepts and products languages; the LAGO Apartment network feeds stimuli and insights handled and systematized to build design briefs and inspirational knowledge for LAGO Studio designers; the internal department solves technical issues and drives concepts towards the manufacturing process.

More than an open innovation pattern (Chesbrough, 2006), the LAGO business model enables a diffused R&D and design activity system in which the LAGO apartments play the role of explorative and diffused design labs, feeding cultural insights, product languages and inspirational apartment language moods.

A second finding that emerged from the case study deals with the scope and "object" of design-driven innovation. Design-driven innovation has traditionally related to the product scope (Verganti, 2003; 2009; Noble, & Kumar, 2010). Product meaning and language change has been framed by scholars as a change of some tangible product elements such as shape, material, texture, color, joining relationships, and finishing (Dell'Era, & Verganti, 2007; Person, et al. 2008; Ravasi, & Stigliani, 2012; Noble, & Kumar, 2010).

In LAGO, however, design has been applied to the entire value system and business model. Design is progressively being employed to innovate services, intangibles, applications, and interfaces (Morelli, 2002; Manzini, & Vezzoli 2003; Brown, 2008). The dematerialization of offerings is driving companies and designers to enlarge the design scope range from a product and tangible dimension to the overall value system, where business models take up a prominent role (Osterwalder, & Pigneur, 2010). This point seems to strengthen the literature strand at the intersection between design and management studies labeled "design thinking" (Brown, 2008; Dorst, 2011; Martin, 2009), where creativity and lateral thinking, with a proper mindset, knowledge and cognitive tools, foster the organizational innovation.

A third piece of evidence linked to this second point addresses the specific direction of business model innovation. LAGO introduced a novel business model in the furniture industry, reconfiguring the customer relationship system and the logic of customer engagement.

In a sector such as furniture, where fragmented and small distributive players or large low-cost malls prevail, LAGO revamps the customer relationship by introducing a familiar concept – the apartment – and provides the customer with three novel roles and functions.

These new roles and functions identify the customer as a key asset in creating the LAGO business model and in boosting and stimulating the innovation process.

Recalling some new productive roles attributed to customers in fast-paced technology industries, business model innovation through the alteration of company relational systems is becoming a critical outpost in innovation management studies and practice.

Assuming a more general perspective, business model innovation through the alteration of the company relational system can be framed according to main variables or “objects to change”: the actors and their roles.

According to this framework, business model innovation can be fostered by:

- changing the actors, when new actors (customers or stakeholders) are included in business models as providers of new assets or activities;
- changing the roles of actors, when the same or new actors are provided with novel roles in the value creation process.

The proposition of this theoretical frame tries to enlarge the perspective of business model innovation as mostly depicted in fast-paced technology industries where a robust research strand provides a dominant view in which business model innovation is mainly based on “openness” and on a collaborative production function exerted by the customer. Based on a case study methodology approach, the proposed framework aims to enlarge the range of study of business model innovations towards other industrial settings and competitive environments to deepen existing knowledge and seek new findings.

In the conclusion below, the limits of this research are highlighted and some possible new research directions are proposed.

## Conclusions

Business model innovation has undergone deep changes due to the different ways to engage R&D partners, technology providers and customers in the company value system. Innovating business models through opening them to a wider group of stakeholders has become more than a fad. Consolidated literature in the fast-paced technology industry focused on the different ways to engage external partners as co-developers or collaborative producers.

Design intensive industries, where companies compete through the creation and the diffusion of new product languages, symbolic values and cultural messages have been traditionally neglected, leaving a research gap in understanding other additional business model innovation trajectories where products are framed as “open narrations” and the customer is a “sense giver” more than user enticed by product functionalities and performance.

The analysis of LAGO as a case study notes how the customer is basically a key asset of LAGO’s business model. LAGO’s case shows how customers can assume roles different from those of co-developers or collaborative producers.

LAGO pinpoints how business model innovation can be fostered by engaging customers with new roles and logics. At LAGO, the customer acts as the company’s market bridge, forming an “inner circle” that enables the company to access different market segments. The apartment of the tenant-customer furthermore acts as an exhibition platform where events and workshops are organized to host potential customers in a sort of “living showroom.” Additionally, customers, by submitting their “apartment ideas” to the company, provide their own perspectives and aesthetics for LAGO apartments, acting as an external design lab and innovation promoters.

These highlighted customer engagement tools mainly show how other business model innovation trajectories are pursued in industries that are different from the logic pursued by the fast-paced technology industry.

The limits of the demonstrated insights and findings are related to the development of a single case study.

However, several signals by which to interpret other ways to innovate business models according to new customer engagement rules cannot be neglected.

As outlined in the LAGO study, new directions of business model innovation are even aligned with new R&D management systems. LAGO apartments become external platforms, design labs or antennas through

which part of the R&D process is managed by a community of architects, designers, and customers.

The outcome of these design labs is a sort of inspirational knowledge that feeds the LAGO Studio creative hub and internal technical offices.

Future research can deepen the knowledge surrounding new roles and functions of the customer in innovative companies' business models. A further investigation could strengthen the presented insights by exploiting a quantitative analysis on a wider case sample.

Moreover, extending the research questions and the framework of this study to other fast-paced design industries, e.g., the fashion industry, where the evolution of product language and meanings is particularly rapid, could provide additional findings about the logic of customer engagement in business model innovations.

Furthermore, the rapid emergence of fashion and the changing role of distribution within the fashion industry could provide additional rules for customer engagement and rich new insights about relationship-based business model innovations.

# Specification of an Additive Manufacturing Consumer Design Toolkit for Consumer Electronics Products

Matt SINCLAIR<sup>\*</sup>, Ian CAMPBELL and Hesam YAVARI

Loughborough University

*Online toolkits, also known as product configurators, are a well established means of enabling consumer engagement in the mass customisation of products. Such toolkits typically require the consumer to select from pre-determined menus of modules in order to create products personalised to match their requirements, however in recent years a new class of toolkit, enabled by additive manufacturing, has begun to appear. Providing consumers the opportunity to change a product's appearance presents designers and brand managers with difficult decisions, yet to date little research has been conducted to understand how a brand might restrict consumer choice in order to protect its corporate design language. This paper reports on ongoing research which aims to understand the ways in which brands with mass-customisation offerings manage their identities across product portfolios, and the impact which AM might have on these management strategies. It begins by introducing the current state of AM technologies and how these are being used in MC systems. Drawing on a survey with senior design and brand managers, a specification of an AM-enabled toolkit aimed at consumer electronics products is presented, and future steps for the implementation of such a toolkit are discussed.*

**Keywords:** Additive Manufacturing; Online Toolkits; Design Language

## Introduction

Online toolkits (von Hippel and Katz, 2002; Franke et. al; 2010), also known as product configurators (Berger and Piller, 2003; Piller, 2005), are a well established means of enabling consumer engagement in the mass customisation (MC) of products. Such toolkits typically require the consumer to select from pre-determined menus of modules in order to create products personalised to match their requirements (Pine, 1993; Tseng and Jiao, 1998). Modules may comprise physical components in a toolkit such as that offered by Dell, or properties such as colour and materials in a toolkit such as NikeiD. In this way, MC configurators are able to tailor the specification and design of products to a degree in which it is realistically probable that every configuration will be unique. In recent years however, a new class of toolkit has begun to appear; these configurators do not rely on the choice or arrangement of modules, but instead allow the precise manipulation of a product's form. This 'fine grain' control relies on two factors:

- a parametric design interface (Hermans and Stolterman, 2012) as part of the toolkit
- the use of direct digital manufacturing (DDM) technologies, in particular additive manufacturing (AM), to produce the user-customised part

Providing consumers the opportunity to change a product's appearance, as MC does, presents designers and brand managers with difficult decisions. Much MC literature has concentrated on the need to limit the solution space (Franke and Piller, 2004) and extent (Dellaert and Stremersch, 2005) of customisation for production and logistics reasons. Wide ranging evidence also suggests that consumer satisfaction is increased when the number of options is constrained (Iyengar and Lepper, 2000; Moreau et al, 2005; Dahl and Moreau, 2007; Deng and Hutchison, 2007). However to date little research has been conducted to understand how a brand might restrict consumer choice in order to protect its corporate design language. Cross et al (2009), for example, require that derivatives of a MC system should be "aesthetically pleasing", but make no mention of the resemblance of such derivatives to other products in the brand's portfolio. Yet increased consumer control over the exterior appearance of a product inevitably diminishes a brand's ability to manage product styling, both across its portfolio and over time. This difficulty is further multiplied by the use of

toolkits geared to production via AM: in their review of the literature, Fogliatto et al (2012) note that the implications of AM for MC have only recently begun to be appreciated. An understanding of the unique aspects of AM for MC, and the shift from user configuration towards genuine consumer-design which it portends, is therefore overdue.

## **Additive Manufacturing**

Additive manufacturing (AM) is defined as “the direct production of end-use component parts made using additive layer manufacturing technologies” (Hague, 2012). Gibson, Rosen and Stucker (2010; pp. 3-6) describe 8 steps within an AM process, though these can be reduced to 6 for brevity:

1. Create a three-dimensional CAD model of the part to be manufactured and save the model in STL format.
2. Transfer the STL file to the AM machine, and position and orient the part as required (this is usually done via a PC-based user interface to the machine).
3. Ensure the machine is correctly set up with regard to material supply, layer thickness, cycle time etc.
4. Build the part (generally an automated process requiring no supervision).
5. Remove the part from the machine and post process as required. Depending on the AM technology utilised, this may involve removing support structures, removing unused powder, allowing the part to cool, etc.
6. Use the part as required.

These steps reveal what Mansour and Hague (2003) describe as “by far the most important feature [of AM:] the tool-less manufacturing of parts.” Within traditional mass manufacturing technologies such as injection moulding, tooling is both complex and expensive, typically equating to 1-10x10<sup>5</sup> of the material cost of an individual part (Wang, Ruan and Zhou, 2003). The need to amortize these tooling costs inevitably leads to uniformity within a brand’s product offering, since the costs of repetition are extremely low, whereas even small design changes require significant reinvestment in tooling. Without the need for tooling, AM offers the theoretical possibility that every product sold can exhibit a unique form. The implications of such a possibility for a brand’s control of its design language form the basis of this paper.

Hopkinson and Dickens (2006) note eighteen distinct rapid manufacturing technologies, many of which have been commercialised in different ways by different manufacturers. Table 1 summarises the most commonly used processes currently implemented by MC toolkits.

Table 1. The most commonly used AM processes (Upcraft and Fletcher, 2003; Mansour and Hague, op.cit; Hopkinson and Dickens, op. cit; Z-Corp, 2005; Altair Consulting, 2012)

PROCESS NAME	MATERIALS	PART QUALITY	PROCESS DESCRIPTION
Stereolithography (SLA)	Polymer: Epoxy	Appearance: Good Strength: Good	Liquid resin material is cured by moving laser
Laser Sintering	Polymer: Nylon, Filled Nylon, Polystyrene Metal: Stainless Steel, Aluminium, Titanium	Appearance: Good, though slightly porous Strength: Very Good	Powder material is fused by moving laser
Electron Beam Melting	Metal: Titanium, Cobalt Chrome	Appearance: Good, though generally requires finishing Strength: Very Good	Powder material is fused by moving electron beam
Fused Deposition Modelling (FDM)	Polymer: Polycarbonate (PC), ABS, PC-ABS, PC-ISO, Polyetherimide (PEI)	Appearance: Poor Strength: Good	Filament material is extruded through moving heated nozzle, then welded to previously extruded material

*Specification of an Additive Manufacturing Toolkit for Consumer Electronics Products*

Multi-Jet Modelling	Polymer: Acrylic (PMMA)	Appearance: Good Strength: Good	Liquid photo-sensitive material is jet-sprayed, then cured by UV light
Perfactory Process	Polymer: Photocurable Acylate	Appearance: Very Good Strength: Poor	Liquid photopolymer is cured using DLP projector. Parts are often used as investment casting patterns for jewellery
Z-Corp Process (3DP Process)	Polymer: Composite Polymer	Appearance: Good Strength: Poor	Powder material is fused by printed liquid binder

## Product Design Language and Brand Equity

At its simplest,

*a brand is a name, term, sign, symbol, design or combination of these, which is used to identify the goods and services of one seller or group of sellers and to differentiate them from those of competitors (Kotler et al, 1996, p. 556).*

The purpose of identification is to encourage in the customer perceptions of "relevant, unique, sustainable added values which match their needs most closely," (de Chernatony, 2003: p. 9). This in turn leads to customer satisfaction and 'brand loyalty', ensuring customers return to the brand to purchase again, rather than buy a competitor's product (Kapferer, 2003: pp. 164-166). Consequently, for a large manufacturer, managing a brand or brand portfolio is a complex and multi-faceted task.

One way of measuring the success of brand management is through brand equity, a way of describing a brand's intangible assets such as "awareness, image, trust and reputation, all painstakingly built up over the years," (Kotler et al. op. cit: p.16). Initially brand equity was understood, in somewhat basic terms, as "outcomes [that] result from the marketing of a product or service because of its brand name that would not occur if the

same product or service did not have that name," (Keller, 1993). This later became recognised as just one definition of brand equity, what Wood (2000) classes brand strength, the others being brand value (the total value of a brand as a separable asset) and brand description (the associations and beliefs the consumer has about the brand).

Olins (2007: pp. 201-202) describes Peter Behrens work for AEG as the blueprint for a brand's corporate identity: products, buildings, logos, advertising and communications were all managed and required to adhere to an over-riding philosophy. By unifying elements in this way, Behrens increased AEG's recognition and reputation amongst consumers and so increased the value of its brand. As the industrial design profession matured it came to recognise ways in which a brand's image could be enhanced and maintained through the development of a "repeatable language, which can be used to generate products consistent with the brand," (McCormack and Cagan, 2003), and thus a consistent treatment of common design features across a brand's product portfolio (Karjalainen and Snelders, 2009) is now recognised as a contributing factor to brand equity. Perhaps the best known example is the Coca-Cola bottle (McCormack and Cagan, op. cit.), which has evolved over more than a century but remains recognisable when applied to both plastic and glass bottles of different sizes. In addition, Apple's filing of a lawsuit against Samsung for infringement of "trade dress" (Fried, 2011), claiming the latter's products copied the industrial design of the iPad and iPhone, is particularly relevant.

## **AM-Enabled MC Toolkits**

Piller, Salvador and Walcher (2012) describe the purpose of MC toolkits as affording consumers the opportunity to specify the "Fit, Form and Function" of a product, to more accurately meet their needs. Thus the Dell configurator mentioned above offers choices of components to customise a computer's function, whereas the NikeID configurator offers choices of shoe size (i.e. fit) and colour and material choice (form). However, whilst configuration choices may indirectly affect a product's shape (a bigger battery in a laptop might require a larger casing, for example), toolkits such as these offer the consumer no opportunity to directly interact with either the product's shape or its styling. The ability of the user to act as designer, as often claimed in MC literature (Ciccantelli and Magidson, 1993; Franke and Piller, op. cit; Randall, Terwiesch and Ulrich, 2003), is therefore a considerably limited one.

AM-enabled MC toolkits overcome some of the limitations of conventional MC systems by no longer relying on mass manufactured, multiply-reproduced modules. Instead, product enclosures produced via 3D printing can be individually styled such that not only might the component specification of a consumer's purchase be unique, its visual appearance may be also. Such an opportunity risks placing considerable burdens on the consumer however – namely how to design an attractive, functional product, and how to ensure the designed product can be manufactured. AM-enabled MC toolkits must therefore provide both design freedoms and design safeguards. This is achieved by constraining the solution space within which the user can operate (Franke and Piller, op. cit.), but with additional limitations such that the brand's design language is not compromised. Two examples of AM-enabled toolkits which work in such a way are presented below.

### *Makielab*

MakieLab is a London-based toy manufacturer, which incorporates an online customisation toolkit to allow consumers to design poseable dolls. As well as choosing clothes and hairstyles, facial features and expressions can be modified, and the doll is 3D printed in laser sintered nylon. MakieLab therefore represents a hybrid MC system, using both a modular and a parametric design approach. The hair and face section of the MakieLab configurator (Figure 1) demonstrates the ability of AM to create visually unique products. Divided into features such as eyes, nose, mouth, etc. the user controls sliders to determine the feature's shape and size. In designing the doll's nose for example, the user can control the length, width, arch and size of nostrils. These sliders offer a very 'fine grain' interaction, and the on-screen image of the doll is updated in 'real time', providing accurate feedback to the user in terms of how his/her inputs affect the doll's design.

The solution space within which the user can affect the doll's design is carefully considered. The MakieLab dolls have a recognisable aesthetic which is maintained throughout the customisation process, and which is determined by a number of factors which the consumer is unable to influence: for example the available choice of hairstyles and clothing suggests the doll represents a young 'hipster' adult, rather than a child. The proportions of the head and body are reminiscent of Japanese anime characters (some of the choices of hairstyle are described as 'Manga'), as are the over-large eyes. These features combine to create a 'collectable' product, one which appeals to those who shop in comic stores rather than

toy shops, and results in a product design language able to encompass all possible variants of the MakieLab doll.

Figure 1. The MakieLab configurator.

### *Nervous System*

Nervous System is a design studio creating jewellery and housewares, based in Somerville Massachusetts. It specialises in the use of generative design – software algorithms that create forms based on both user input and the interaction of the form with itself (Rahim, 2009). Generative design typically produces naturalistic forms, a fact reflected in names given to some Nervous System products: Algae, Ammonite, Dendrite and Xylem, for example.

The Nervous System website features three generative design configurators, the most sophisticated of these is the Cell Cycle configurator, which allows users to create jewellery items such as rings and bracelets. An on-screen model of the product can be rotated and viewed from different

*Specification of an Additive Manufacturing Toolkit for Consumer Electronics Products*

angles, and the design is automatically updated to reflect user changes. Although the products exhibit the naturalistic aesthetic described above, an underlying mathematical logic is also apparent, and this is reflected in the visual design of the configurator, which has a grid-like layout and monochrome colour palette.

Unlike the MakieLab configurator, Cell Cycle uses only additive manufacturing technologies, with users able to order products in either laser sintered nylon, or precious metals, made by the Perfactory process. The majority of interactions are via slider bars which increase or decrease a given parameter, such as number of cells or degree of twist.

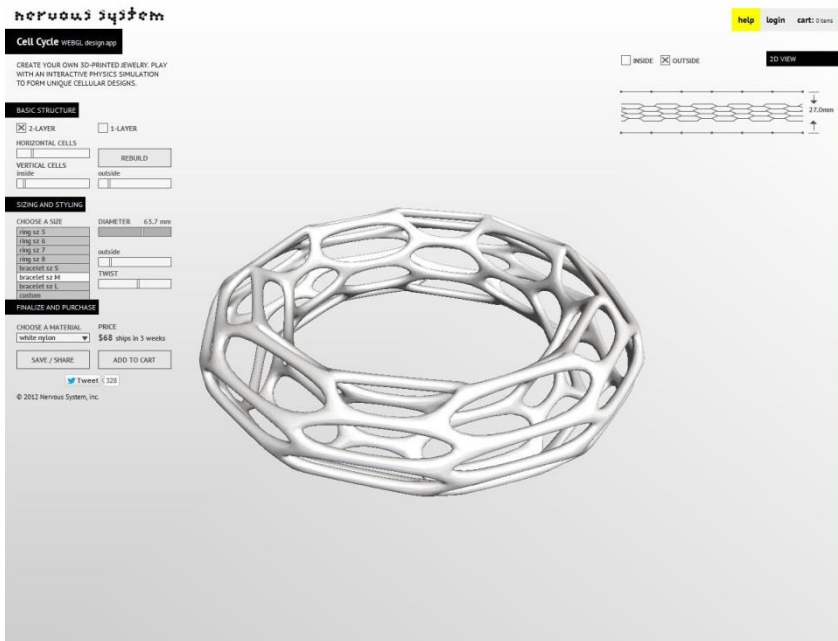

Figure 2. The Nervous System Cell Cycle configurator.

The Cell Cycle configurator again exhibits a very carefully considered solution space. Crucially, the limits set within the configurator ensure that the consumer designed product is manufacturable – for example the minimum material thickness for a piece manufactured in silver is 0.9mm; this specification automatically updates to 1.2mm if nylon is selected instead. In contrast to the the MakieLab configurator (which currently manufactures only one product), designs resulting from the Cell Cycle

system must fit within a much broader product portfolio. This is achieved largely by the nature of the configurator's generative design algorithms, which are similar to those used in other, non-customisable products. The uniqueness of such an approach means there are few findings applicable to more conventional consumer goods manufacturers. Thus, whilst MakiLab and Nervous System both indicate the potential of AM to increase the extent of customisation, they are less able to demonstrate how a brand with an established product design language might integrate AM-enabled MC products into its portfolio.

## **Product Design Language Within AM-Enabled MC Toolkits**

A carefully conceived and orchestrated product design language is not something a brand would wish to sacrifice were it to allow consumers to engage with the design of its products to create unique manifestations of those products (Abdallah and Chan, 2011). Such caution can be recognised in the NikeiD, configurator, where palettes of colours and materials available to the consumer for each model of shoe are deliberately limited, allowing Nike's designers to retain a degree of control over the brand's design language. A system which incorporates AM-enabled MC must similarly exercise control over the possible product forms which a consumer might wish to manufacture. However, by providing the user the opportunity to manipulate a product's shape and exterior surface definition, a new degree of complexity is introduced to the management of a brand's design language.

### *Survey Design and Participants*

To better understand the commercial realities of brands' design languages, and how these might be protected in an AM-enabled MC toolkit, an internet-based survey was undertaken. Since a product design language is applied across a brand's portfolio and may exist (and evolve) over time, it was reasoned that survey participants should be experienced in design and/or brand management, as evidenced by the participant's job title. All respondents were therefore required to be practising at a minimum level of 'senior designer' or equivalent. Invitations were sent to 91 potential participants and 39 completed surveys (43%) were received (4 unfinished surveys were discarded from the results). Invitations were sent to personal

email addresses and contained a link to the survey web page together with a personal log-in name and password.

Details of respondent demographics are shown in Figures 3-5 below. It should be noted that although the country of work is shown, no assumptions should be made regarding the nationality of respondents (many are living outside their home country) or the target markets for which they are designing.

*Figure 3. Survey Respondents Job Description.*

*Figure 4. Survey Respondents Country of Work.*

*Figure 5. Survey Respondents Designer Type*

### *Sampling Bias*

Sampling bias, defined as "the difference between the expected value of the sample estimator and the true value of the characteristic which results from the sampling procedure" (Federal Committee on Statistical Methodology, 1978: p.9), occurs when a surveyed sample does not represent a random sample of the population being studied. The most obvious bias within the survey presented below comes from the geographical location of respondents: 38.5% are based in the United States and 54% in Europe. The extent to which this bias distorts the survey's findings is unclear however - it is possible to argue that Japanese, Korean and, increasingly, Chinese consumer product manufacturers (for example) operate as global brands, in which case designers working inside those corporations would record similar responses. However the authentication of such a statement is outside the scope of this research, and so the survey results should be understood as applying primarily to Western brands.

### *Survey Results*

Chen and Owen (1997) propose that a form language is comprised of six attributes: form elements, joining relationships, detail treatments, materials, colour treatments and textures. These attributes were used as the basis of questions aimed at revealing the relative importance of constituent elements of a design language. However in the survey materials and textures were treated as one element; in addition a new consideration – logos or other brand identifiers – was introduced.

With particular regard to the survey's relevance to the specification and design of a consumer design toolkit, four specific findings are noted:

- 1. A successfully implemented product design language is an important factor in a brand's image and profitability.**

More than 90% of respondents considered a coherent design language to be a critical factor in a well designed product, and more than 75% considered it to be critical to a product's commercial success. Respondents unanimously believed that a successful design language leads to differentiation from competitors and increased sales to returning customers, and a substantial majority believed it results in increased consumer awareness of the brand (98%); increased consumer loyalty (95%) and a willingness on the part of the consumer to pay more for a product (82%). One caveat should be noted however - approximately half of all respondents believed the companies they work for (either as employees or consultants) placed too little importance on developing a coherent design

language. Thus it may be argued that these organisations would be willing to sacrifice design integrity if it led to increased sales.

**2. Consumers have insights and expertise which allow them to custom design products which meet their own needs better than non-customised products, however this may be in conflict with a brand's image.**

72% of respondents believed that consumers have valuable insights into the design of current products and ways of customising or configuring them. Almost all believed that current mass customisation toolkits are useful to consumers and enhance the consumer's experience of both the product and the brand. Significant majorities of respondents believed that existing mass customisation toolkits enhance the consumer's perception of a brand (84% for the Herman Miller Sayl, 97% for NikeID). However there is much less enthusiasm for AM-enabled consumer design toolkits, with a majority (57%) believing a brand's reputation for design quality would decrease.

**3. The quality of a brand's product design language may be diluted by consumer customisation, therefore any consumer design toolkit should be constrained in its capabilities in order to be acceptable.**

A significant minority (43%) of respondents felt that allowing consumers to customise products would dilute a brand's design language. Most respondents preferred to reduce the number of options for customisation that a design toolkit offers, suggesting they would seek to retain control over a brand's design language by restricting the consumer's ability to customise a product. This is confirmed by 77% of respondents who suggested a consumer design toolkit should set boundaries of acceptable designs.

**4. In order of degree of influence, a consumer design toolkit should allow:**

- Changes to the position of logos and brand identifiers
- The use of non-standard colours, patterns and graphics
- The use of non-standard materials or material finishes
- Changes to the position of common elements
- Changes to the product silhouette
- Changes to the way in which common elements are detailed

This final finding is of particular importance for the specification of an AM-enabled MC toolkit. Figures 6 and 7 show the degree of importance placed on attributes of a brand's product design language. The necessity of incorporating a common approach to the detailing of common elements is

clearly revealed, particularly in comparison to the importance of using common forms to define product silhouettes. This is largely in accordance with previous studies (e.g. Karjalainen and Snelders, *op. cit.*). Colour and graphic treatments, and the position of logos or other brand identifiers, are revealed as the least important attributes of a brand’s design language.

Figure 6. Survey Participants’ responses to the question: “Which of the following attributes is the most important to a successful and coherent design language?”

*Specification of an Additive Manufacturing Toolkit for Consumer Electronics Products*

*Figure 7. Survey Participants’ responses to the question: “Which of the following attributes is the least important to a successful and coherent design language?”*

*Table 2. Respondents answers to questions regarding AM-enabled consumer design*

	Strongly Agree	Agree	Disagree	Strongly Disagree
The system should allow the maximum design freedom possible	10.5%	39.5%	36.8%	13.2%
The system should set boundaries of acceptable designs	35.9%	41.0%	17.9%	5.1%
It would be possible to maintain a coherent design language	23.7%	52.6%	18.4%	5.3%
The system would be an addition to the brand's standard products	26.3%	57.9%	15.8%	0.0%

The brand's reputation for design quality would increase	2.7%	40.5%	54.1%	2.7%
----------------------------------------------------------	------	-------	-------	------

Table 2 above shows respondents' answers to a scenario in which AM-enabled toolkits allow consumers to design unique products. A 50:50 split occurs in opinions regarding whether the system should allow the maximum design freedom possible, however approximately three-quarters of respondents believed the system should set boundaries of acceptable designs. Such answers show that there is little common agreement amongst participants regarding the involvement of consumers in the design of personalised products. Participants were also divided on whether a brand's reputation for design quality would be enhanced or harmed by such a system, though a significant majority believed a coherent design language could be maintained.

## Specification of an AM-Enabled Consumer Design Toolkit for Consumer Electronics Products

As mentioned above, the ability of existing AM-enabled MC toolkits to demonstrate how a brand with an established product design language might integrate AM-enabled MC products into its portfolio is relatively poor. In addition, the complexity of product in comparison to a typical consumer electronics product is low. The following guidelines therefore represent a first attempt to formulate a specification for a toolkit suitable for the Consumer Design of consumer electronics products.

### *Framework Definition*

The framework definition (Table 3) of the toolkit refers to decisions required before the detail design could commence. A framework definition involves the specification of "the supporting structures and underlying concepts upon which every detail depends," (Goodwin, 2009: p. 377), and in a commercial context would typically involve inputs from product and brand managers as well as designers (ibid).

Table 3. Framework Definition of an AM-Enabled MC Toolkit Suitable for Consumer Electronics Products

FRAMEWORK DEFINITION FEATURE	EXPLANATION AND APPLICATION IN PROTOTYPE TOOLKIT
Design Method Type AM-enabled Constrained Consumer Design	A development of mass customisation, allowing user-modification of a product's form via a software toolkit. Constraints ensure the resultant product is safe, functional and acceptable within the brand's product design language guidelines.
Value of Customisation and Design Function and Form (Piller, Salvador and Walcher, op. cit.)	Allows users initially to choose from products whose specification targets usage scenarios (e.g. sports, business, etc.). Subsequently allows users to choose whether design decisions are made for functional or aesthetic (form) reasons.
Type of Modularity Component Sharing and Component Swapping (Ulrich and Tung, 1991)	Basic module of electronic hardware and non-visible chassis provides basis of all designs (component sharing). Consumer-designed parts fix to chassis using standard features (e.g. screw bosses) (component swapping).
Extent of Customisation (Dellaert and Stremersch, op. cit.).	Extent of specification customisation (screen size, memory, etc.) is small, as determined by hardware modularity. Extent of design customisation is unlimited within boundaries set by designer and brand. Functional detailing (wall thicknesses, draft, etc.) and cosmetic detailing (fillets, chamfers, etc.) is automated (Sinclair and Campbell, 2009).
Customisation Type Primarily Parameter-based	Needs-based systems are more complex to implement (Walcher and Piller, op. cit.); parameter-based systems are better suited to users who understand technical details (Randall, Terwiesch and Ulrich, op. cit.) Consumers choose base product by usage scenario, then define specification by technical details.

<p>Design Interaction Type Direct interaction with on-screen CAD model</p>	<p>Model shapes and surface definitions are modified directly using tools to push and pull surfaces by click-and-drag type interactions. Model shapes and surfaces are constrained within limits determined by designer and brand.</p>
<p>Manufacturing Scenario Production by manufacturer or authorised vendor</p>	<p>AM parts would be produced by manufacturer or authorised vendor (no 'at home' production). Product assembly carried out by manufacturer. Consumer assembly of changeable cosmetic parts would be possible, if intended (and designed) by brand.</p>

### *Detail Definition*

The detail definition of the toolkit (Table 4) refers to decisions governing the implementation of features with which the consumer would interact directly.

*Table 4. Detail Definition of an AM-Enabled MC Toolkit Suitable for Consumer Electronics Products*

DETAIL DEFINITION FEATURE	EXPLANATION AND APPLICATION IN PROTOTYPE TOOLKIT
<p>Platform and Installation Platform-independent, in-browser application</p>	<p>An in-browser application would require no download or installation ensuring maximum availability to users. Current web infrastructure would preclude the use of detailed, fully rendered models; this issue is anticipated to reduce in future.</p>
<p>Visualisation Products visualised with maximum realism</p>	<p>Realistic visualisation increases customer confidence in the product being customised (Walcher and Piller, op. cit.). Colours and materials are represented accurately. Model is shown in 3D perspective with ability to rotate as required.</p>

*Specification of an Additive Manufacturing Toolkit for Consumer Electronics Products*

<p>Price Continuously updated</p>	<p>Final price of product is updated continuously as changes are made (Dellaert and Stremersch, op. cit.). Default product is lowest priced such that consumer choices add cost rather than reduce it (ibid.).</p>
<p>Default Option Five basic choices, with option to browse library of previously submitted designs</p>	<p>Needs based system determines choice based on manufacturer's recommendation. Also possible to choose from a library of designs previously submitted by consumers, then use as the basis of a new design.</p>
<p>Order and Degree of Design Interaction</p>	<p>Order of interaction is suggested by the system, but not enforced. Specification of the technical details should take place first. Design phase has an implied order, according to importance of features (see page 13). However consumer can carry out tasks in any order.</p>
<p>Design Tools Direct interaction with on-screen CAD model</p>	<p>Toolkit provides consumer with the following tools: Scale: model scales as required; features such as the display window remain fixed in size and position during this operation. Shape (Silhouette): silhouette of the phone can be modified as required; as the shape is changed features such as fillets or buttons update automatically. Shape (Move Surfaces): model allows individual surfaces to be moved; connected surfaces and features update to reflect these changes. Shape (Modify Surfaces): model allows individual surfaces or connected surfaces to be modified and re-shaped. Colours, Materials and Finishes (CMF): CMF is applied at the part level. System allows designers to link the CMF of parts such that when consumer changes one</p>

	<p>part, others also update.                  Detailing: detailing of the product (however defined by the designer and brand) should be 'protected' and non-changeable by the consumer; a menu of alternative choices might be provided.                  Logo: consumer has the opportunity to upload a logo or type a message which would appear on the phone's cover.</p>
<p>Model Integrity                  Production by manufacturer or authorised vendor</p>	<p>Any consumer design resulting from the toolkit should be manufacturable by a suitable AM system.                  Integrity of any design should be guaranteed in terms of safety, functionality, consumer law, etc.                  Toolkit should prevent compromised performance, e.g. by specifying metal parts close to antenna.</p>
<p>Community</p>	<p>Toolkit provides opportunity to share and discuss designs, also to discuss the system, suggest improvements etc.</p>

## Conclusions

Currently AM-enabled toolkits have been implemented only by brands specialising in the application of these technologies; these toolkits are therefore of limited value in terms of demonstrating how AM technologies might be integrated into the portfolio of a brand which also includes more conventional offerings. This is particularly significant in light of the survey research presented in this paper, which shows that senior design professionals have reservations regarding the quality of design which might result from AM-enabled toolkits. In order to protect the brand equity which a successful design language contributes, AM-enabled toolkits must therefore take account of, and be limited by, the components identified as contributory to design languages.

The literature commonly identifies six influences over the design of the form of products, and the design languages which result when these are applied in a common way across a product portfolio. However, the degree of importance associated with each of these influences has not previously been demonstrated. This paper therefore presents valuable insights to a

brand which wishes to introduce customisation toolkits which allow the user to interact with a product's form. This in turn has led to a specification of the design tools required to enable interaction with an AM-enabled toolkit, whilst at the same time constraining the user's ability to create product forms which lie outside of a brand's design language.

Whilst this paper presents a first specification of an AM-enabled toolkit intended to safeguard a brand's design language, clearly further work is required to demonstrate its effectiveness. Preliminary instantiations in the form of wireframe prototypes would allow feedback to be gathered from both users and product designers, who would be required to submit designs which could subsequently be modified by users. This feedback would then inform the design of a chaffered prototype (Usability First, 2014) with which to demonstrate interaction methods and the types of tools needed to modify product forms as users wish.

## Business Model Adaptation to a New Digital Culture

Paola PISANO<sup>a\*</sup>, Marco PIRONTI<sup>a</sup>, Alison RIEPLE<sup>b</sup> and Ioannis CHRISTODOULOU<sup>b</sup>

<sup>a</sup> Politecnico di Milano; <sup>b</sup> Westminster University

*New business models are emerging in the international business environment. The reasons for this include the changing of business' attitude in favour of transparency and openness, to the massive increase in the use of easier and collaborative technologies: Quirky is producing new products developed by the community and manufactured using 3D printing technology, Google gives its glasses to different developers who create their own applications based on the Google glass; meanwhile Kickstarter attracts funds through crowd sourcing, paying them back with the promise of future sales of the products they fund. Employees, investors, customers and partners do not follow a predictable rule of conduct with the organization but revolve around it using different form of collaborations related to the organization's needs.*

*Moreover the final product is customized in a reverse Pareto principle where the business does not focus only on the top selling products but sells lot of different ones. It's in this scenario that businesses like Amazon discover that their achievement is being able to respond to different customers' needs. Our work is placed in this framework in focusing on defining an emerging business model where the open collaborative way of creating, developing and manufacturing products is addressed to a large number of different market niches. Data from practice cases is used to provide support to the theoretical evidence.*

**Keywords:** *economic accessibility; economic feasibility; 3-D printing; manufacturing industry; open long tail model.*

## Introduction

Living with global instability and uncertainty is fast becoming a way of life for organizations. While some corporations seem to respond reactively and revert back to fixed strategies, resisting change, using high control whilst basing their business on fixed and standard business models, others seem to be more open to accepting and embracing the change. These organizations are looking for the opportunities that may exist within this chaos and disorder by seeking to create business models and strategies that proactively work with the speed and scale of change. In this framework new business models are being established based on the culture of sharing new ideas, and on the ability to collect more and more collaborations in order to build the skills and resources needed to grow and develop. One example of this new category is based on internet platforms that gather, collect and sell ideas and concepts 'posted' by external designers and consumers, used crowdsourcing resources to select the right concept, build up the idea and finally raise the funds to produce it. Finally the idea takes shape through powerful software tools such as those used in the 3-D printer manufacturing process.

These new technologies accelerate innovation in the manufacturing process whilst decreasing the potential limitations of its physical constraints. This results in a more economically attractive business model. The digital manufacture allows for the production of innovative and/or customized products and to respond to the dynamics of the competitive environment. The 3D technology expands the number of products available and thanks to digital distribution is also convenient in terms of the ability to reach the consumer. This trend is in line with a new economy that is shifting away from a focus on a relatively small number of hits and moving toward a huge number of niches. The previous trend is amplified by another tendency defined as a "true economic force" (Anderson, 2013). The market movement, a term coined by Dougherty of O'Reilly Media in 2005, that identify a web generation creates physical things rather than just pixels on screens. MIT Media Lab define the maker movement as people that are treating atoms like bits using the powerful tools of the software and information industries to revolutionize the way we make tangible objects (Anderson, 2013). While the new digital tools enable product flexibility, the internet platform model gives companies the opportunity to collaborate and decrease physical constraints like shelf space and other distribution bottlenecks. The objective of this paper is to structure a series of propositions to formulate an innovative business model emerging from a

new culture and new technology trends. Three cases will be used as illuminatory examples.

## **Literature review: the two major frameworks**

In this part of the paper the authors review the most relevant and important parts of the literature on the open business model and the long tail model. From these two the open long tail model emerges.

An open system model is one in which the firm creates and captures value to take advantage of both internal and external resources. In his book "Open business model: how to thrive in the innovation landscape," Chesbrough (2006a) analyzed the characteristics that a firm should exhibit to create an open organization. According to the author in the old model of "closed organization", companies had to generate their own ideas that they would then develop, manufacture, market, distribute and service themselves. In contrast, the open organization model involves organizational characteristics that are suitable for managing creativity innovations, including the process of acquiring and integrating new ideas into the organization and marketing them. As 'valuable ideas can come from inside or outside the company and can go to market from inside or outside the company as well' (Chesbrough, 2006b), in the open organization model, firms commercialize external (as well as internal) ideas by deploying outside (as well as in-house) pathways to the market. Specifically, companies can commercialize internal (external) ideas through channels outside (inside) of their current businesses to generate value for the organization.

The vehicles for accomplishing this goal are related to the organization's ability to create connections with external actors to absorb different types of knowledge (Ahuja, 2000), improve survival rates (Baum, & Oliver, 1991), increase innovativeness (Baum, Calabrese, & Silverman, 2000; Stuart, 2000), improve performance (Hagedoorn, & Schakenraad, 1994; Shan, Walker, & Kogut, 1994) and grow faster in general (Powell, Koput, & Smith-Doerr, 1996; Stuart, 2000).

There are plenty examples of organisations structured in an open model: InnoCentive, an Eli Lilly spin-off, manages a platform where organizations can post the technical issues that need solving on a scientists' community board, will explain the unsolved problems by using the internal R&D of the pharmaceutical organizations; Fold.it, a revolutionary new computer game enabling everyone to contribute to important scientific research.

The long tail concept was created by Chris Anderson (2006) to describe a shift in the media business from selling a small number of “hit” item in large volumes toward selling a very large number of niche items each in relatively small quantities. Anderson (2006) believes three economic triggers gave rise to this phenomenon in the media industries:

- the democratization of tools of production: falling technology costs gave individuals access to tools that were prohibitively expensive just a few years ago. Million of passionate amateurs can now record music, produce short films, design simple software with professional results and create object with 3-D3-D printer technology;
- the democratization of distribution: the internet has made digital content distribution a commodity and dramatically lowered inventory, communications and transactions costs opening up new markets for niche products;
- falling search costs to connect supply with demand: the real challenge of selling niche content is finding interested potential buyers. Powerful search and recommendation engines, user ratings and communities of interest have made this much easier.

For many product categories smart technology is transforming mass markets into millions of small niche markets. Although each of these niche markets may be small when all the various niches are combined the volume of business is actually greater than the traditional mass market successes. But simply offering more variety alone won't generate greater demand. Instead, consumers need to have tools which will help them find product niches which match their tastes and interests. These tools act to simplify the finding process thanks to the filters usage . An example of an organization that uses this business model is the online video rental company Netflix or Lulu.com, a multi-sided platform- serves and connects authors and readers with long Tail of user-generated niche content.

In the following section we describe the methodology and the case studies.

## **The case studies' methodology**

Scholars have used case studies to develop theories about topics as diverse as group processes (Edmondson, Bohmer, & Pisano, 2001), internal organizations (Galunic, & Eisenhardt, 2001; Gilbert, 2005), and strategies (Mintzberg, & Waters, 1982). Building theories from case studies is a

research strategy that involves using one or more cases to create theoretical constructs, propositions and/or midrange theories from case-based, empirical evidence (Eisenhardt, 1989b). Case studies are rich, empirical descriptions of particular instances of a phenomenon that are typically based on a variety of data sources (Yin, 1994).

The literature on new forms of entrepreneurship based on creativity and design (Abecassis-Moedas, Mahmoud-Jouini, Dell’Era, Manceau, & Verganti, 2012) lays the foundation for exploratory research that builds propositions and turns them into initial statements to be used as triggers in future research. The central notion in our analysis is to use cases as the basis from which theory can be built inductively. The theory emerges by recognizing patterns of relationships in constructs and cases. The theory building process occurs via recursive cycling in the case data, emerging theory, and later extant literature (Eisenhardt, 1989a; Mintzberg, 1979; Pettigrew, 1988; Yin, 2008).

The selection of case studies was carried out in line with the criteria of extreme exemplars, as underlined by Yin (1994). We decided to select not only one case but three because while single-case studies could richly describe the existence of a phenomenon (Siggelkow, 2007), multiple-case studies would typically provide a stronger base for theory building (Yin, 1994).

As case studies can accommodate a rich variety of data sources we decided to include three semi-structured, in depth interviews with the professors of Technology Management at Stanford University, Westminster University of London and the University of Turin, to view the phenomena from different perspectives and make a more confident selection of the cases.

We ended up investigating three case studies. The first case is Quirky, a new venture firm created around the potential of 3-D printing in order to develop ideas and concepts suggested by users and designers. The second is I-Materialize, an incumbent company specialized in prototyping services that uses 3-D printing to create a digital connection platform between creative communities and users. The third is Fab-Lab, a new global network of design shops based on 3-D printing technology that works with small businesses, users and craftsmen in the production and sales of their products.

## The open long tail model in practice

In this section we will briefly describe three cases: Quirky, I-Materialize-Fablab.

Quirky is a company of consumer products that turns crowd-sourced inventions into retail products with a manufacturing process based on 3-D printing technology. Since its launch in 2009, Quirky has changed the way that product development happens.

The process, which goes from an idea to a final product, involves a plethora of different types of actors. Each week different ideas are submitted by dozens of amateurs such as kitchen workers, technology experts, jewelers, etc.; then, hundreds of online community members (or “Quirks”)- mainly made of hobby inventors, students, retirees and product-design enthusiasts -weigh in on the products and vote for their favourite submissions. The two most popular ideas are sent to an in-house team of engineers and designers to research, render and prototype. Ben Kaufman (Quirky’s founder) and his team cull the results, sort out potential patent conflicts or production problems, then make the final call on the week’s winner. At every stage--design, colours, naming, logo--the community chimes in. The best suggestions are incorporated, earning secondary “influencers” a portion of future sales revenue.

Even if a product gets community approval, it will only make it to market if enough Web surfers pre-order it to cover production costs. “This is where we find out if a good idea is a good product,” Kaufman says. “The world doesn’t need more junk.” In fact, less than a third of Quirky’s products are actually produced in the end.

Thanks to the community, Quirky collects a wide range of multi-disciplinary skills needed to turn an idea into something tangible. A background in design, electrical engineering, marketing, fund raising and access to retailers and manufacturers are all required skills that can be found inside the sourcing community in order to complete and sell a product. Thus, the community members that participate in many aspects of product creation, from design to naming and coming up with a tagline for a piece (“Protect Your Produce” is the Mercado slogan) will receive a small share of the profits.

The manufacturing process includes a small factory with 3-Dprinters, a laser cutter, milling machines, a spray-painting booth and other bits of equipment. This prototyping shop is central to Quirky’s business of turning other people’s ideas into products: Quirky’s product-development team makes a prototype. Users review this online and contribute towards its final

design, packaging and marketing, and help set a price for it. Quirky then looks for suitable manufacturers. The product is sold on the Quirky website and, if demand grows, by retail chains. Quirky also handles patents and standards approvals and gives a 30% share of the revenue from direct sales to the inventors and others who have helped.

By using its community as a strong base, Quirky can quickly establish if there is a market for a product and set the right price before committing itself to making it in bulk. Moreover, the speed with which Quirky turns designs into products (thanks to 3-D printing technology) is remarkable, “The amount of creativity that happens when you are standing next to a machine that’s making hundreds of thousands of things is much greater than when you are working 4,000 miles away,” says Mr Kaufman. “Your mind is spinning as to what else you can design for the machine to make.” Kaufman calls this process the “social product development.”

“We bring at least three brand new consumer products to market each week, by enabling a fluid conversation between a global community and Quirky’s expert product design staff”.

Our second case company, I.materialize is an online 3-D printing service which is based in Belgium and was formed in 1990 as a spin-off of Materialise, a product development company. I.materialize, is premised on the belief that people have an inherent need to express themselves, more than ever before, in this world where standardization has become the rule. its business focuses on allowing consumers the possibility to turn their ideas into reality. I.materialize provides designers and inventors with access to higher quality materials and greater choice. I.materialize gives designers the chance to demonstrate their talent and sell their products thanks to a worldwide distribution network, on the other the potential buyer can access a collection of different products that can be built on demand.

First, the user uploads a project file, then he/she selects material, size and quantity with the aid of a template. After that, a quote will appear and, upon receiving confirmation of the online payment, the product will be manufactured and delivered. It is also possible to sell the design projects and earn a percentage if the user doesn’t want to manufacture it .

A set of 3-D software is used- by the user -to create files up loadable to I-Materialize platform: Tinkercad, 3-D Tin, 123 autodesk and Google sketch up enables amateurs to design 3-D printable products without any previous expertise: the maker can just open the browser and start creating in a very intuitive way. I-Materialize supplies over 20 different 3-D printing materials:

users can sell their design, choose the fee to apply over the production price and manufacture the item in 5 to 15 business days.

Our third case example is not a single organisation, but a network of organisations. Fab labs (fabrication laboratory) are small-scale workshops offering (personal) digital fabrication facilities. Fab Labs have opened around the world from Italy to Spain, from California to Finland. A fab-lab is generally equipped with an array of flexible computer controlled tools that cover several different length scales and various materials, with the aim to make “almost anything”. This includes technology-enabled products generally perceived as limited to mass production. Each fab lab includes:

- A computer-controlled laser-cutter, for press-fit assembly of 3-D structures from 2D parts.
- A larger (4'x8') numerically-controlled milling machine, for making furniture- (and house-) sized parts.
- A signcutter, to produce printing masks, flexible circuits, and antennas.
- A precision (micron resolution) milling machine to make three-dimensional moulds and surface mount circuit boards
- Programming tools for low-cost high-speed embedded processors

Fab labs allow individuals to create smart devices for themselves. One important benefit of this network of organizations is the ability to diffuse education, business and research about a world where almost anyone can make almost anything, anywhere. Fab labs share an evolving inventory of core capabilities, people and projects that can be shared – and promoting these is an explicit part of their ethos.

The San Diego Fab Lab’s pre-college Maker Learning programs for middle and high school students are held in partnership with the University of California at San Diego. These classes are based on the ‘Maker’ philosophy that San Diego’s Fab Lab has developed in response to the need to inspire students while engaging them in learning next generation technology.

The Fab Lab curriculum includes hands-on and experience-driven activities that are standards based, as well as fun and relevant: Fab Foos is an open source Table Soccer Game, opening in Amsterdam featuring 2 web cams, an audio response, an electronic counter system and vga out. The Fab Lab House comes from the Institute of Advanced Architecture of Catalonia (IAAC) is a example of eco-living house. This Madrid-based project generates three times the energy it consumes and also houses an orchard in order to produce food. The shape of this house was dictated by its purpose: a

sustainable, self-sufficient construction whose “form follows energy”. All the characteristics of its environment were carefully studied and taken advantage of, such as the wind or the solar rays.

## **Data analysis and proposition development**

In this paper we collected qualitative information and data about the case companies’ business models from the companies’ websites, journal articles and special issues.

The companies analyzed originally offers services that are engaged all the phases of the innovative process, from the concept to the distribution where prototyping and materializing concepts are used to provide input and feedback on the quality and characteristics of products. Such organizations, by materializing objects, provide companies’ designers and R&D offices with the input and the insight that they need for the revision of engineering and conceptualization phases of their process, thus strengthening the relationship between “thought” and “practice” typical of creative processes (Shon, 1984).

3-D printing is among a spectrum of technologies being developed as a way to make easier and more cost efficient to create parts and products in a “personalized” way. The running of a 3-D printer starts from a software technique aimed at helping designers to create shapes of parts in three dimensions on computer screens and then transfer the instructions for making them to production machines. Such software is being used to make products on this basis in a range of industries from aerospace engines to jewellery. Laser scanning systems - made by companies such as the US’s Faro Technologies - can be used to measure the dimensions of items that need to be replicated or modified. Such items could be anything from products or parts made by competitors - in so-called “reverse engineering” - to parts of the human body. The information can then be converted into computer codes and sent to a production machine for turning into a solid object.

The new technology is changing many aspects of the manufacturing industry:

- The relationships between designers and production players.. The designer will have the chance to do not only the scratch but also the prototype of the product or, better, the final product as it happens in Quiky or Fablab. This change will allow the designer to acquire a part of the value chain belonging to the manufacturing organization.

- The personalization of the product as Fablab, Quirky or I materialize. A key attribute is that the technology makes it possible to produce “one-off” or highly personalised parts more easily than other manufacturing methods. This advantage will have an impact on the reduction of the relevance of inventory risk and management connected to the opportunity to print on demand the desired artifacts;
- The intrinsic characteristics of 3-D printing technology enable to produce different categories of products, in limited quantities and, above all, without a technological complementary relationship among them.

In fact in all of the cases studied, there is an extremely high heterogeneity of produced and sold categories of goods. Fashion accessories, jewels, toys, shoes, musical instruments, lamps, interior design products are indistinctively found in all product portfolios managed by 3-D printing companies. In fact, the major problems connected with this technology concern the different exploitable materials. The absence of links and technological complementary products together with the absence of large production scale and volume economies – as found in several cases – lead to a wide and diverse portfolio management. The profitability logic is founded on generating profits as well as on a number of product lines with low product volumes (Kekre, & Srinivasan, 1990; Osterwalder, & Pigneur, 2010; Amit, & Zott 2001). This characteristic founded in “long tail model” introduced the first proposition:

*1st proposition: the emerge of digital tools for design and manufacturing includes the 3 D printer the laser cutter and the 3D scanner and CAD software gives leads / is positively correlated to a diverse variety of customized and low volume products with no technological complementarities*

Based on the development of the web 2.0 technologies, the advent and the growing of a global creative class (Florida, 2003), and the evolution of a more educated and sophisticated user (Von Hippel, 2009), the crowdsourcing represents a new source to manage the innovation process leveraging on external creative sources an collaboration. As the tools of creation become digital so do the designs which are now just files that can be easily share online. Manufacturers and organizations can thereby take advantage of the web’s collaborative innovation, tapping into open source

practices and all the other social forces that have emerged on line. The old model of toiling allows space to a global movement of people working together online in a “crowd sourcing collaborative way”: crowd sourcing is used to connect labour demand and supply (cloud labour), to develop aggregate and share knowledge and information (collective knowledge), to increase audience engagement and build loyalty through online dialogue with costumers (community building) and finally to raise capital for a new projects and business by soliciting contribution from a large number of stakeholder.

Collectively a large pool of costumers will have virtually unlimited time and energy an important detail related to the long tail model where capacity need to be extended a very long way (Anderson, 2013). In fact, the increase of the human resource vote to create and make, are shifting away from a focus on a relatively small number of hit (mainstream products and markets) at the head of the demand curve and moving towards a huge number of niche in the tails (Anderson, 2006). Fablab, Quirky and I-materialize make up an example of producing different category of products as art, fashion, gadgets, games, jewelry, toys, etc... The capability of producing different products for different niches thanks to the costumers that “do the job” turned the unprofitable products and markets into profitable ones.

Platform like Quirky gathering, collecting and selling ideas and concepts that are posted by external designers and consumers.

These platforms are mainly supported by two types of makers: (i) designers who propose their own products to market them on the platform (market-oriented designers); (ii) users looking for products that are not standardized or sold in great volumes not event in an industrial scale (customization-driven users).

This new costumers have affected the world of manufacturing through (?) self-production and creating a “making culture” where users with different tools and technology (among these the 3-D printing technology) are able to build up personalised products supported by new forms of craftsmanship (Friedman, 2010; Senneth, 2009; Micelli, 2011; Yair, Tomes, & Press, 1999):

We, therefore, suggest the following second proposition:

*2° proposition: the new business model organization based on outside resources involved costumers in the R&D and prototype process as a key source of skill and competence*

Furthermore this model not only helps to increase the number of the products sold and the niches discovered but also gives boost to the collaborative behaviours between the member of the community and the organization. For example, Quirky has 8 designers on staff for a total of 40 people in the team, and hundreds of community that interact with the platform; the ideas submitted received a more than one evaluation both from the community s(?) member staff (both in Quirky, and I materialize). This collaboration involves the costumers in a new model where is not the organization that meet the needs of the costumers but is the costumer that in collaboration with the organization find the way to answer to the other costumer needs.

The essence of a business model defining a fresh way by which the enterprise delivers value to customers, entices customers to pay for value and converts those payments to profit do not seem to reflect any more the management's hypothesis. The last one could be about what customers want, how they want it, and how the enterprise can organize to best meet those needs, get paid for doing so, and make a profit but the hypothesis that come from a collaboration between makers and organization. In this collaboration the organization supports and participates to the maker process of creating developing and producing their ideas. The customer is not only involved in the creation and production but also in the profit share. These users give design advice on the product idea, the brand name, packaging and so on and will receive a percentage of the 30% profit generated by that specific product idea. Of course also the actual designer of the product will get a share of this profit once the product has made actual sales. To lower the risk, Quirky will only start to produce and sell a product in their webshop once 500 people made a pre-sale of it.

The availability of the organization tools of production (as the tool to draw and produce the object) improve the odds to produce goods and the subject who can do it reduced the time to make the product. for example, Fab-lab lends 3-D printing (and other technological devices) to those inventors who can prove their ability, or who have been educated by the Fab Lab Academy, to use these technologies properly. Quirky, I-materialize and Fablab offer digital fabrication as a service so anyone can effectively rent time on high end industrial 3D printers or computer controlling milling machines. Quirky and I materialize produce using their own 3D printer or hire them. This way to collaborate introduces the last proposition:

*3° proposition: the business value proposition is defined by costumers and reach through a platform which enabling the relationship*

*Business Model Adaptation to a New Digital Culture*  
*between customers expands the potentiality and profitability of the both organization and makers.*

Inventing something new isn't enough: it has got to get to market too, ideally in economically sustainable way. This means mass production, and traditionally that's been reserved for people who either own a factory or can afford to commission the service of one. That used to involve months or years of negotiations with different country and culture. But today the word factory is increasingly accessible on the web, open to orders of any size from anyone at any scale. Thanks to the digital production and design, factories in China are flexible enough to take order online by credit card for small as well as large quantities

Finally, the acceleration in the production seems to be sustained by the e-commerce in the distribution.

## **Discussion and Conclusion**

The business model that comes out, is based on different type of users becoming designers and makers of small quantity of different product selling to few costumers thanks to digital platform as Quirky and I materialize. The underpinning process, is based on the concept that a collaborative community outside the organization can develop an idea into a product ready to be sell

The new model balance the open innovation model and the long tail model: The disintegration of the conception-conceptualization-engineering-production-sales activities chain of business processes and the breakdown of integrated value chains (Porter, 1980) gave rise to companies specialized in micro-activities.

Moreover a number of "knowledge brokers" and "bridging ties" link actors who propose new knowledge in the form of new ideas and products with actors who are able to accomplish, implement and sell these ideas and products. This business model supported by the new digital technology and in general the improvement of the technology that enables company to carry far more product items in their catalogs, (because most of the item exist solely as descriptions in an electronic databases and are digitally distributed) permits to define a long tail model too: as Anderson said (2006): "the mass of niche has always existed but the cost of reaching it falls now".

Since the first industrial revolution the power to make things at scale has belonged to those who own the means of production, which as meant big

factories, big companies and the mass-market good they were built for (Anderson, 2013). But now we can imagine an open long tail model where the web digital instruments make the diffusion of the objects of the community: the consumers finding niche products and niche products finding consumer (Anderson, 2006) and consumer create niche products for other consumers.

This could potentially change everything because will create an era of unprecedented choice for consumers and organization together that collaborate to increase their opportunities and profit (Micelli, & Rullani, 2011). All this process is creating an opportunity for an emergent business model that makes possible a bottom up transformation of the manufacturing following the democratization of its trajectory. It is still in its early days but the potential is immense because manufacturing is one of the biggest industries in the word (Anderson, 2006).

This new niche market is not replacing the market of top selling but it start to redefine the ways we design, buy and distribute product complemented the other models.

# Reducing Uncertainty Through Disciplined Experimentation

Davide SOLA\*, Gianfranco SCALABRINI and Giovanni SCARSO BORIOLI  
ESCP EUROPE

*New product development (NPD) is an inherently uncertain process. Such uncertainty translates into a strong risk for companies in the process of new product/services development, which typically involves substantial investments committed upfront.*

*The article presents an innovative methodology for to reduce this innovation-related risk. In particular the methodology is based on the principle of “disciplined experimentation”, a structured process to identify quickly the key vivid needs of the customers (Job To be Done), reproduce the key features of the new service/product to satisfy these needs (fast prototyping), and simulate a realistic customer journey directly with the final customers. A rigorous testing protocol and a continuous improvement process support these experimentation steps.*

*This approach allows testing the main working hypotheses, pivoting them continuously to verify the value (clients are ready to pay for the product/service a price “p” higher than the cost “c” needed to deliver the product/service), growth (how to scale up the tested hypotheses up to the entire target segment) and sustainability (how to enable the needed change in internal culture and prevent direct competitors to quickly replicate the value proposition).*

*The article presents two concrete cases of “action research”, where researchers have been directly involved within the design and delivery of the this methodology in two different industries, fast fashion and heating systems manufacturing, and the lesson learned from them.*

**Keywords:** *Innovative NPD, Disciplined Experimentation, Design of Experiments, Fast Prototyping*

## **Introduction**

New product development (NPD) is an inherently uncertain process. Research shows that as many as 40% of new products fail to deliver anywhere near the promised objectives (Castellion & Markham, 2013).

Such uncertainty of outcome derives from many factors including the difficulties in the identification of “vivid” customer needs, to the definition of the right features and user experience of the new product or service to identifying the most suitable route to market to of course the pricing. All this in an environment where there is an increasing competitive pressure to deliver products cheaper, faster better.

To examine the issue of how to reduce the uncertainty around NPD, we first undertook a review of the existing literature in order to identify NPD best and worst practices with the intent to establish what are the circumstances under which NPD activities lead to success or failure.

## **NPD Literature**

New product development can be defined as the processes employed by a business to identify and develop new products. But which processes to employ? Which are ‘key’ processes or ‘key’ factors? Research into NPD sought to identify the processes involved in order to determine if any contributed to success; identify those factors and successful NPD should be possible by more businesses. Early work by Hustad (1977) adopted a broad perspective when defining the new product development process and included topics such as market planning, product strategy, product line extension, market forecasting, product abandonment and product liability. Other researchers were also working to refine the definitions of the NPD process into more distinct factors. Another early proponent of managed NPD processes was Morris (Morris, 1990) who had spent forty years improving project management techniques and published his Management of Projects theory in 1990. In the 1970s Robert Cooper and his colleagues started looking at the difficulties businesses were encountering in bringing new products to successful fruition (Cooper & Kleinschmidt, 1986; 1987; 1990; 1991). During this period Cooper and his colleagues developed the NewProd project, which used a stage-gate process, that is, one where the NPD process is broken down into segments and after each segment or ‘stage’ there is a hurdle or ‘gate’ that must be passed before progressing to the next stage. Cooper identified five main functions in the NPD process;

scoping, building the business case, development, testing and validating, and product launch (Cooper, 2001).

However, Loch (2000) argued that while Stage-Gate is at the core of most NPD processes, survival and growth ultimately depends on how well a company adapts to its specific environment. Davidson et al. (1999) reached a similar conclusion emphasizing the need for flexibility so that a process can be continually adjusted to an organisation's changing needs and desires. According to Fixson (2009) most definitions of NPD include stages such as product opportunity identification, market and user analysis, idea generation, concept generation, concept refinement and selection, industrial design, prototyping, testing, financial evaluation and market introduction. Cormican and O'Sullivan (2004) saw strategy and leadership, culture and climate, planning and selection, structure and performance, and communication and collaboration as key factors. Kahn et al (2012) identified seven separate factors of the NPD process; strategy (including portfolio management), process, research, project climate (including team organisation), company culture, commercialisation, metrics and performance evaluation.

Amabile (1997), Smith & Reinertsen (1998), DeCusatis (2008) analysed team characteristics and found that these factors can increase the creative ability of the team and help accelerate the NPD process.

'Fail often to succeed sooner' is reportedly one of the mottos of the successful product design firm IDEO (Kelley, 2001). Thomke (2003) noted that team integration encouraged experimentation and prototyping, which Barczak, Griffin and Kahn (2009) also found was a factor of high-performing firms suggesting this was a key factor in the NPD process.

With the rapidly changing technological advances of the past decade there is a growing interest in the role of NPD processes that were created to handle uncertainty and changing customer needs and wants; among these new methods Agile NPD is leading the way.

## **Critique of NPD Literature**

While all the NPD processes reviewed help in the quest of reducing the risk of developing a new product that will not support the firm in achieving or sustaining competitive advantage, we believe that all of them, have a number of pitfalls.

First, all the NPD processes featured in our literature require commitment and time to execute effectively; speed plays second place to

quality of execution. The earlier processes focused on the need to control the process, the people taking part and ultimately the product to ensure that the development plan was completed within budget. As these NPD processes matured some of the proponents sought to keep in pace with the changing commercial environment, while others did not.

The Management of Projects and the Critical Chain Management approaches remain static. The Stage-Gate process developed by Cooper has re-invented itself to take on board the changes of a modern, fast paced world where technology forces changes in design practices and design development. Agile Development has begun to be adopted by those outside the software development arena where it was born. The flexibility of the Agile approach allows the designers and developers to take on board the fickle demands of an ever more aware customer enabling products to better meet the customers' needs. Lean Start-up takes the involvement of the customer even further by encouraging continuous involvement from the very earliest stage of development, even conception. Lean Start-up builds on the relationship with the customer to create an environment where a product could be launched well ahead of schedule, with upgrades being made available to extend the life of the product.

Design Thinking and Design of Experiments offer a different view of the NPD process. These two approaches are useful in resolving problems using unconventional means and may offer innovative insights into the development of new products and services.

However, except for the Stage-Gate process, all the other processes assume that the right product has been selected and that the main emphasis should be on its development. Even in the case of the Stage-Gate process one of the main problems with the process has been that businesses do not know how to ensure the go/kill gates work effectively. Once the product entered the NPD process it was assumed that this was the product to develop. There appeared to be a lack in any of the processes to consider outside influences, such as, an aggressive competitor bringing in a similar product earlier. Even in those processes that encourage involvement with customers (esp. lean start up), trying out and testing the product in development, there was no suggestion that a product should be terminated. Rather the product would be adjusted to take on the comments of the potential customers.

Another pitfall of the processes reviewed was the lack of emphasis on encouraging ownership to the product being developed, as soon as the product entered the process that was it; now develop it. None of the

processes reviewed provided guidance on who should be involved in the 'NPD team', despite citing cross-functional teams as vital to success. The use of true cross functional teams can improve ownership of the product being developed but this was not raised as important. Experimentation is creeping in as a means to check the viability of a product but its use is not central to the overall NPD process and, like the involvement of customers, is generally left till late in the NPD process when there is a physical product that can be handled.

The Lean Start up and Design thinking approaches, but in particular the Lean Start up, learning from the previous approaches has introduced a set of principles that contribute to overcome some of the pitfalls. The early experimentation through the construction of Minimum Viable Products (MVP) aims at testing only one or a few variables at a time. While the introduction of the Value and Growth hypothesis, that needs to be tested progressively during the NPD process, has provided the dependent variables that can be used to validate the impact of the assumptions behind the new product. Finally the concept of Pivot has reinforced the principles that when a new product fails to test positively against the value and growth hypothesis it should be reconsidered and amended or altogether abandoned.

## Research question and methodology

We believe such principles represent a great advancement in the search for a theory of NPD, nevertheless we also believe that there are still some areas that need to be addressed. This leads to our decision of investigating the following Research Question and related Hypothesis

*"Can disciplined experimentation reduce uncertainty in NPD in a fast changing environment?"*

*With the Hypothesis that it can, if two conditions are fulfilled  
First, that the experimentation is constructed in order to validate progressively three variables, in particular*

- **Value** which involves explaining how the new product or service will create value by resolving a "vivid" need (as opposed to a latent one) producing outcomes that outweigh the effort required.
- **Growth** .the aim of this hypothesis is to validate if the new product can be scaled up beyond the first group of pioneering customers,

guaranteeing that the value created will, at least proportionally, also increase.

- **Sustainability** aims at validating two mutually reinforcing sub-hypothesis. The first relates to the ease with which competitors can replicate the new product and the second concerns how easily the organisation itself will accept the changes required to implement the new product.

Second that disciplined experimentations entails two mutually reinforcing dimensions

- The use of creative experimentation techniques leveraging innovation in technology and process in order to maximise the number of experiments, while making them as inexpensive as possible through speed of execution. the speed of them as well as to make them as inexpensive as
- Use of experimental analysis approaches, such as, Design of Experiments (DoE) that maximise the learning from each experiment performed

In order to investigate the validity of our framework the subsequent step was to identify organisations that would be willing to participate in a multi-year study. We succeeded in engaging 4 different organisations from industries as diverse as rail transportation (United Kingdom), animal health pharmaceuticals (United Kingdom), gas heating manufacturing (Italy) and fashion (Italy) with whom we have worked in the last 18 months, and for which this paper reports the preliminary findings.

## **The Progressive Hypothesis**

The success of a newly developed product, defined as its ability to contribute to the achievement or sustaining of competitive advantage of the firm, relies on a set of hypotheses which need to be validated. A hypothesis, in business as in science, is an explanation or a proposition made on the basis of limited evidence as the starting point for further investigation. Until proven true, hypotheses are just statements. The only way to prove their validity is to test them. Testing will either prove or disprove the validity of a hypothesis, but it will also provide insights about how the hypothesis could be refined or even replaced by a better one.

Just like a scientist in a laboratory, executives should first make explicit the hypotheses behind their initiatives and then validate them through

experiments. We propose, as stated before, that in the case of NPD there are three hypotheses that need to be validated progressively, starting from value, going through growth and concluding with sustainability. As you move from each hypothesis to the next, the overall level of uncertainty reduces, but it is not until the new product has provided evidence for all three hypotheses that uncertainty will be meaningfully reduced, although never eliminated.

The first hypothesis is about **Value**, which involves explaining how the new product will create value by producing outcomes that outweigh the effort involved. The typical questions that need to be addressed are:

- What kind of problem does the new product solve?
- Who are the people facing this problem? How aware are they of the problem?
- Are they prepared to pay for someone to solve it?
- Will the price they are prepared to pay for the new product be sufficient to cover the cost of its development?

The second hypothesis is about **Growth**. Here we must think through how the initiative can be scaled up beyond the first group of pioneering customers, guaranteeing that the value created will also increase sufficiently. The typical questions to be addressed are:

- Does the new product address the needs of a large enough group of people?
- Will the new product need to be changed or adapted for this enlarged group?
- How difficult and how costly would it be to scale-up to meet increased demand?
- What is needed for the new product to appeal to this larger group?
- Will the price need to be changed?
- How could we reach and engage a growing group of users? How much would this cost?
- Will the increase in users be reflected in increasing value creation i.e. will the increase in outcomes outstrip the increase of the cost of achieving such growth?

The last hypothesis is about **Sustainability** which has two mutually reinforcing facets. The first relates to the ease with which competitors can replicate the new product and the second concerns how easily the

organisation itself will accept the changes required to implement the initiative. The typical questions for the first facet are:

- How easily can the competition imitate the new product or substitute it with another product? How long would it take?
- What kinds of barriers are there which will preserve the advantage?
- Are there other barriers we could create? How much would they cost?

And for the second facet:

- How will the organisation need to change to enable the new product to be implemented?
- Will the organisation be able to cope with such changes?
- Is there something about the initiative that we can adapt in order to make it more acceptable to the people and culture of the organisation? What impact would this adaptation have in terms of value creation?

By addressing these questions the NPD executives will be able to decide whether the New Product merits being moved forward. Furthermore, this approach will help NPD executives to identify potentially serious flaws which require fixing before the initiative can be progressed

## **The Two Facets of Experimentation**

To leverage experimentation successfully, you need to be clear about which tests will be carried out, in which order, and the metrics you will use to judge the outcome and decide whether or not the hypothesis has been proven. Many experimentation tools and techniques are available and new ones can always be developed, but the most important thing is to select the ones that are the most appropriate for your particular circumstances. The fitness for purpose of any technique will depend on the time and resources you have available, but the ideal should be something which is simple, quick and inexpensive.

In an experiment about new product development, managers and engineers separate an independent variable (the “cause”) from a dependent variable (the “effect”) and then manipulate the former to observe changes in the latter. The manipulation, followed by careful observation and analysis, then gives rise to learning about relationships between cause and effect, which can be applied or tested in other settings.

Fear of failure is especially pertinent in the development of new products and services, where no idea can become a product without having been shaped, to one degree or another, through the process of experimentation. Today, a development project can require thousands of experiments, all with the same objective: to learn whether the product or service can address a new need or resolve a problem before then incorporating the information in the next round of tests so that the best results can be achieved

One of the key barriers to experimentation has always been the cost, since it has often been considered expensive in terms of the time involved and the effort expended. What has changed, particularly given new technologies available is that it is now possible to perform more experiments in an economically viable way while accelerating the drive towards a successful new product.

To overcome the cost constriction barrier managers have essentially two choices:

- change the fundamental economics of experimentation through new creative processes and new innovative technologies (the first facet)
- try to get more out of each experiment employing sophisticated statistical methods, which help to manipulate multiple variables in a single experiment while maintaining integrity in its data analysis

## **The first facet – use creative processes and new technologies to increase number of experiments**

New creative processes and new innovative technologies now enable more learning to be created more rapidly, and the outcomes can be incorporated in even more experiments at less expense. Examples can be found in:

**Customer usage simulations.** Through the building of simple mock-up user interfaces to see if a customer is interested in a particular value proposition, including the description of the product features, the price and even how the product works. This particular type of process has been made very famous by the Lean Start Up and Design thinking approaches.

**Computer modelling.** Once, the first Monte Carlo based simulation was used to build a computer generated artificial world in 1945 for the development of the hydrogen bomb, computer modelling has become an

essential part of science. However, it is only with the dramatic increase of wide spread availability of computer power at very affordable cost (i.e. first cheap powerful workstation and then cloud services) that computer modelling has become an everyday reality. Today Artificial Intelligence (AI) packages or Computer Aided Design (CAD) can substitute many of the “physical experiments” and market testing requirements of numerous products. Many organisations leveraging rich “big data” can today simulate price points and conversion rates by developing computer simulation of the likely behaviour of their customer base to a particular stimulus (i.e. new products). 3D CAD has in many instances now eliminated almost completely the need for physical prototypes.

## **The second facet – accelerate learning through experimentation**

When all relevant variables are known, formal statistical techniques and protocols allow for the most efficient design and analysis of experiments. These techniques are used widely in many fields of process and product optimisation today and can be traced to the first half of the 21<sup>st</sup> century when the statistician and geneticist Sir Ronald Fisher first applied them to agricultural and biological science, which have become the foundation of what today we call Design of Experiments (DoE)

Design of Experiments (DoE) is a statistical method of establishing which variables are important in a process and the conditions under which these variables should work to optimize that process (Ilzarbe, et al., 2008). Methods from the field of DoE have been applied to quality control problems in many engineering fields for several decades (Kuhn and Reilly, 2002) and according to Ilzarbe et al (2008) many scientists and statisticians have contributed to DoE development and to its application in different fields.

*Table 1 Thomke’s (2003) Factors that affect the learning by experimentation*

Factor	Definition
Fidelity of experiments	The degree to which a model and its testing conditions represent a final product, process, or service under actual user conditions
Cost of experiments	The total cost of designing, building, running, and analysing an experiment, including expenses for prototypes, laboratory use, etc.

Iteration time	The time from planning the experiment to when the analysed results are available and used for planning another reiteration
Capacity	The number of same fidelity experiments that can be carried out per unit of time
Strategy	The extent to which the experiments are run in parallel or series
Signal-to-noise ratio	The extent to which the variable of interest is obscured by experimental noise
Type of experiment	The degree of variable manipulation (incremental versus radical changes); no manipulation results in observation only

In general usage, DoE or experimental design is the design of any information-gathering exercises where variation is present, whether under the full control of the experimenter or not. Formal planned experimentation is often used in evaluating physical objects, chemical formulations, structures, components, and materials. Practical applications of DoE do exist, for example, the list of 131 case studies provided by Bisgaard (1992), which illustrate the application of experimental design in engineering and manufacturing.

In the design of experiments, the experimenter is often interested in the effect of some process or intervention (the "treatment") on some objects (the "experimental units"), which may be people, parts of people, groups of people, plants, animals, etc. Design of experiments is thus a discipline that has very broad application across all the natural and social sciences and engineering. ([http://en.wikipedia.org/wiki/Design\\_of\\_experiments](http://en.wikipedia.org/wiki/Design_of_experiments))

Thomke (2003) identifies seven factors (see Table 1) that affect the ability to learn through experimentation which are: fidelity, cost, iteration time, capacity, sequential and parallel strategies, signal to noise ratio and type of experiment.

## Early evidence from Field work

As part of a 3 year study we have engaged with a number of multinational organisations based in the UK and Italy with a considerable part of their business outside their domestic markets. The sectors covered are fashion both production and retailing, heating systems both electric and gas powered, animal health pharmaceutical and finally rail transportation.

As part of the engagement we are allowed to work alongside the NPD executives in their process to successfully launch new products, where by successful launch it means that they will within a reasonable amount of time

(always less than 24 months) reach volumes and revenue that are meaningful for the organisation (at least their fair share) and of course contribute to the bottom line and ultimately to sustain the competitive advantage of their respective firms.

At the time of the study we have started the activities with all the four multinationals, but of course the stages of progress are different. For this reason in this paper we will concentrate on only two cases, the one of the fashion house and the one of the electrical and gas heating system.

## **Fashion House**

The fashion house is a fully integrated textile company with over a century of history with many innovations to its name. They were the first to introduce a new type of dyeing, which allows fast, very economical production. They were the first to introduce large scale fully automated cutting plants. They were also among the first to launch successfully the business model of “fast fashion”, the one made famous by the like of ZARA, which quickly became the key driver of growth and profitability.

Unfortunately, in the last years the performance of the fast fashion division went south, many management teams were called in, but none managed to turn things around. Late in 2013 a new management team, with considerable experience in turnarounds was called in, who since then have asked the research team to collaborate alongside the management in particular the NPD team. This was because very early on it was understood that the core challenge, which would unlock the turnaround, was to return to the innovation history. The products (mostly women’s fashion) had a good enough style but they had two clear problems. First their speed to come to market was always far later than the competitors and therefore it was impossible to command prices that would guarantee profitability (“by the time the products were out it was time for the heavy discount sales”). Second many products were just not in sync with what the customer wanted, which again exacerbated the situation increasing level of stocks of unwanted products.

The management decided to completely overhaul the NPD process introducing a new system called “marketeyes”, which basically introduced the discipline of experimentation to the heart of NPD. Marketeyes is a sort of social workflow management system that allows a concept idea for a new product to go through a set of super-fast experiments, which reduce the risk that the product will not succeed in the market. These experiments range

from a simple very fast survey about the concept idea (basically a professionally designed sketch of the garment with details of the price points and the type of material) that within 2 hours is run through over 3000 shop assistants who give their view about the product (minimum threshold of response is 500), to a pre-ordering e-commerce facility that allows real customers (carefully selected among their CRM database as “predictive customers” meaning that historically for this particular type of garment, if they bought it, it has then reached success) to view the product and pre-order it if they like it, which now it has been produced in few prototypes and photographed as required for an online e-commerce site. The outcome of all the experiments are analysed through statistical techniques that provides insights about the potential success of each product and also the size of the potential success (in terms of volume and value of sales).

Marketeyes keeps track of all the experiments and provides factual evidence of what works and what does not work (and what should be changed to make it work). This speeds up the process to the point where deciding if to launch a new garment or not can be made within 7 working days. The process is not only speedy but also very selective, since many products that were thought to be potential blockbusters would be stopped and not launched or launched with a far lower range than initially thought. Marketeyes as a platform is accessible and used by most of the division of the organisation from product design to supply chain, from management control to shop assistants, which enables the fashion house to seemingly spread knowledge about new products, as well as, invite suggestions for meaningful new innovations.

The early evidence of the spring collection shows that the products launched using marketeyes performs twice as well in terms of ‘in season sell’ compared with the products launched using the traditional system.

Clearly, from the evidence provided by these early cases it seems that thanks to fast experimentation and the learning gained from the analysis of the experimental results, marketeyes provides a very efficient method to validate the value and growth hypothesis. The sustainability hypothesis is not yet fully validated since only the involvement of the people of the organisation has been validated. Competition for the time being has not been able to react, because the size of the product portfolio realised with the marketeyes is still very small.

## **Electric and Gas Heating Systems**

The company is a multinational, serving over 50 countries and with production facilities in more than half a dozen countries, specialised in the design, manufacturing, and distribution of electric and gas heating systems. It has a history of successfully developing good quality, mid-range technically sophisticated products, all in the traditional core business. This has given the company the reputation of one of the best value for money brands in the world.

The company has over the last 15 years installed a huge number (millions) of heating systems, which soon will come up for replacement (normally a heating system has a working life between 7 and 10 years) and here is the biggest challenges for the company; how to ensure the heating systems are replaced their products not those of the competition and the used spare parts for the repairing are the original. Its distribution is mostly indirect, using independent “installers and service centres” who install and maintain the relationship with the users of the systems. Unfortunately most of the independent installers and service centres are multi brands and have proven to have very little loyalty to any of the brands they sell. In other words, they will promote the one that has the best commission for them at the moment of the required replacement and/or facilitates their job for the maintenance. Furthermore, recently new technology players have entered the space from adjacent markets, companies like Nest Labs who have been recently acquired by Google, introducing devices that are covering some of the features (guaranteeing warm and cool) of traditional heating systems.

Given this context the company decided to launch a project in early 2013 offering a device that would allow remote connectivity with the heating systems, as well as, a wide array of other features, such as, automatic optimisation of temperature, safety alerts, etc. The purpose was to match the “Job to Be Done” of three different actors; the end users needing to keep their houses under control (remote control) and be diagnosed by their service centrecentres, the service centrecentres needing to optimize their business through the upfront knowledge of the interventions to be done (remote diagnosis), Company internal functions needing a “laboratory on the field” (most of the installed devices are constantly under control) and a clear view of potential substitutions and spare parts. The project was mostly driven by the R&D and engineering divisions and at one point the business case was presented to the Board asking for a multi-million investment for its deployment. The board was not very convinced about it because years before a similar project (with a similar budget) failed dramatically and

causing trouble with the distribution network. As a result the board decided to change the approach and asked the marketing team, with whom as researchers we worked alongside, to investigate how the project could be de-risked. The team proceeded as follows, first it identified the bottom-up Job to Be Done of each actor and the cost of the best alternative today applied (e.g., thermostat remotely controlled, special maintenance contracts); based on this the team produced a high quality brochure and a non-functional but graphically complete app for devices that presented the product as if it existed, and it defined the price points, built bottom-up on the Job to Be Done evaluation, all the key features and it even produced a rendered picture of how it would look. Armed with this brochure and the app, a number of installer-service centres were contacted (selected upon their openness and eagerness of being part of something innovative) and presented the project with the following line “we are here to present you a new product which will be commercialised in 3 months and because you are a valued partner, we will offer it to you in advance to pre-order”. Differently from traditional market research, they asked the service centre to sign an order, therefore not just capturing an intention to buy, but actual sales.. With much surprise, the first few sales meeting were an absolute disaster since the comments were very negative about several aspects from the price to the key features, to the design. All these feedbacks were clearly tracked and addressed to the working hypothesis to pivot. Enriched with such insights the team instead of going back to the R&D team, kept on going by just simply changing the features, price points and even the design and presenting the new version to new installers-service centres. After half a dozen of these interactions, the marketing team was able to exit most of the sales meetings with firm sizeable “pre-orders”, which demonstrated that the “new imaginary” products had potential and that people were prepared to pay. This was feedback to the board and the R&D, who at first did not like the outcome, but then eventually committed in creating a first prototype of the new device, which was much simpler and much faster to develop.

Next the team, in order to further reduce the risk of the product, decided to run the same type of experiments directly with end customers (the ones that would eventually have the device in their homes). Working with some of the installer-service centres stalls in major department stores were organised, where the product was showcased, still on paper and with a very simple video cartoon, to perspective customers. Again the installer-service centres were given the possibility of pre-ordering. Much to the surprise of the installers-service centre operators, many unexpected

comments from customers were received, which again triggered changes (done overnight). The disciplined experimentation supported also the technology development. For example, an initial the working hypothesis from the technology team was to rely only on wi-fi technology for signal transmission, considering that its high penetration in Italian households. . On the contrary the experimentation demonstrated how roughly half the people having wi-fi at home, switch it of overnight (for several reasons, ranging from energy saving to concerns related to electro-magnetic field) and would prefer to buy the GPRS version. These changes in the features, prices and presentation of the product led to very encouraging sales results.

The entire process took around 10 weeks from start to finish. It allowed, at least theoretically, avoiding an investment that would have surely proved wrong, that is the original design was not well received. Instead they now have a new product that seems to have much greater chances of succeeding. Such a process also allowed many people in the organisation and in their distribution network to realise the many biases they had about what customers want and value. Finally, it also had two strong impacts on the internal processes of the company; (i) it removed many of the barriers of fast development, forcing many of the R&D to use unconventional means (such as 3D rendering, simulated cartoons, etc.) to “prototype” and test their creations; (ii) it facilitated the development of a “Go to Market” model with a clear understanding of the supporting tools and processes needed to sale a so innovative product for the salesforce.

## **Discussion and Lesson learned**

There are three major lessons learned which are:

- Front load as many experimentations as possible at the beginning of the process. This will reduce the overall time to market as well as the overall cost of new product development
- Have the courage to abandon or put to rest a new product if the evidence from the experiments is not sufficiently strong
- There is only so much uncertainty you can remove through experiments, consider every day activities after the launch as a “natural experiment” and track the outcome as if it was an experiment

The final lesson learned is also a note of caution. Some people mistakenly think that experimentation is the same as running a pilot phase.

However, we would argue that experimentation is very different from running a pilot for the following reasons:

- Pilots are usually the prelaunch of an initiative that has already been developed, with the aim of the pilot being to prepare for full implementation. Experimentation, in contrast, is a process used to develop a new product and ensure that it meets the criteria of value, growth and sustainability.
- In a pilot, the final or advanced version of the new product is tested, albeit on a small scale. This limits its usefulness as a means of testing because if it goes wrong it is hard to say which particular aspect led to the failure. As a result, areas for improvement cannot be accurately pinpointed. Experimentation is a progressive process, which scrutinises different aspects of a new product and, therefore, is much more likely to highlight exactly what is wrong, or right, about the new product.
- Although pilots are often carried out with the intention of smoothing the process of change within the organisation, if they are presented as a *fait accompli* - a predetermined new product from the top - they may have the opposite effect. In contrast, experimentation can be done as a participative exercise, which allows staff to contribute to and understand the development of a new product, process or service. Involving staff in this way not only leads to a better developed initiative, it also means they are more likely to support its implementation

## Limitations and Further Research

The research reported in this paper has of necessity been limited to two case studies. From our experience the use of the framework suggested in this paper offers a means to improve the NPD process in terms of selecting appropriate new products that fully satisfy customer needs, speed of NPD delivery, and ultimately cost. Only through the application of the methods described can the framework be further tested, which will take time. However, the more people who apply the approach the sooner this will happen.

Applying the methods described to work in tandem with other methodological processes could offer improved performance of those methods and improve the success rate in selecting the right product for the right customer at the right time and at the right price. Experimentation

could prove a useful addition to other NPD processes, provided it is conducted correctly.

# Editorial: Enterprise Eco System Design

Kaja TOOMING BUCHANAN

This track focuses on how design can help companies redesign their relationships with people through improved information systems. There are many ways that design can benefit management practice in order to improve customer satisfaction and create a positive user experience. It can be done through meaningful dialogue, through a design process that integrates all functional elements into the unified whole, or through a change in the customer's attitude and cultural interests.

In "Innovating Innovation: Deliver Meaningful Experiences in Ecosystems," Gardien, Deckers and Christiaansen maintain that companies need to work toward co-creation, since it is no longer possible for a company to understand all facets of the ecosystems, let alone create meaningful experiences for end-users. Therefore, the new ways of working and the development of new competences are crucial. At Philips Design, the authors believe that design thinking is a suitable methodology for facilitating the collaborative process of innovation. They created a framework called Co-Creating Innovation that includes elements such as Empower, Position, Create and Enable. As part of the paradigm shift that they believe this represents, Philips changed its focus from technological improvements toward innovation of meaning. This framework helps to create new meaningful experiences for end-users.

A different approach is taken by Hillner, De Leon and Qian Sun in "IP Management in Response to Changing Conditions." Instead of focusing on the co-creation process of companies, the authors focus on the designer/entrepreneur perception of the significance of Intellectual Property for prospects of their success. They are also aware of how the relevance of IP may change over time. The authors conclude that a better understanding of typical design business development cycles will lead to a more effective use of IP. What will be required in addition to new laws and regulations is a culture shift.

In "A Semantic Approach of Cultural Interpretation Toward Service Innovation," Yuan and Tai focus neither on large companies nor on individuals. Instead, they focus on small and medium businesses (SMB's) and the struggle of these enterprises with service innovation strategies in a

cultural context. They propose a semantic perspective of cultural and experiential modeling in order to design a semantic information system artifact that connects culture and personality to cultural interpretation and to the SMB owner's managerial behavior with regard to service innovation. According to the authors, this system can facilitate the work of designers to motivate or inspire SMB owners to develop new ways of thinking about service innovation in terms of cultural interpretations.

## Innovating Innovation – deliver meaningful experiences in ecosystems

Paul GARDIEN, Eva DECKERS\* and Geert CHRISTIAANSEN

Philips Design

*The world is growing ever more complex and is facing huge problems like aging societies, energy scarcity and increasing demand for healthcare. To meet these challenges we require new types of systemic solutions, based on a holistic, integrative and multi-dimensional approach. The good news is that the world is moving towards a knowledge economy, which is a suitable basis for developing the solutions for these challenges (Brand & Rocchi, 2011). Yet this in itself presents a new issue; we have to learn to design in a different way, creating ecosystems of interconnected products, services and solutions that can be accessed wherever and whenever users desire. These ecosystems need to offer a meaningful, relevant and coherent experience for the end-user. However, it is no longer possible for a company (or one part of it) to understand all facets of these ecosystems, let alone create meaningful experiences for end-users. In addition, it is evident that these experiences will be delivered by different players, such as businesses, governmental organizations and NGOs. No single entity has all the answers. We therefore need to work towards co-creation. At Philips Design we are in the process of changing our way of working to support this process. We believe that innovation is inherently driven by true collaboration from the onset, and that design thinking is a suitable methodology for facilitating this process. You could say we are innovating innovation, by not only focusing on new ideas, which is the focus of a lot of current innovation literature, but also by developing new ways of working as well as new competences at the same time. With this publication we aim to share the progress we have made so far, stimulate the debate on developing new ways of working and inspire third parties to join us on this journey.*

## Introduction

### *Shifting Paradigms*

Following the paradigm shift from the industrial and experience economy to the knowledge economy (Brand & Rocchi, 2011, Gardien et al. 2014), we live in a world of constant and rapid change; one in which users expect evolving, personal experiences. As a result, within companies both the propositions and the way of working are shifting from a linear to a networked structure. Instead of thinking in terms of single connected products, all the stakeholders of products and services need to start thinking in terms of ecosystems, while at the same time harnessing the skills and capabilities acquired from both the industrial and the experience economy.

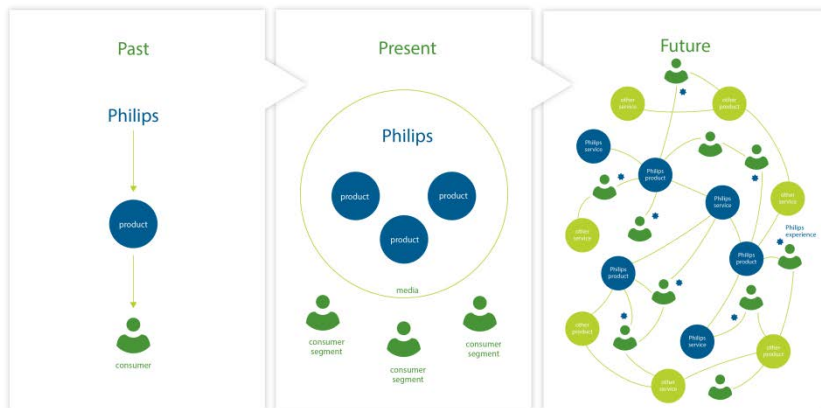

Figure 1. From industrial to knowledge paradigm, from linear to networked.

In the industrial paradigm, single products are typically delivered to a user. Value is created through efficient production and continuous (perceived) improvement. The design process is characterized by a rational, problem-solving approach, and traditional product design skills. In the experience paradigm, companies typically focus on market segmentation with tailored solutions delivering targeted experiences to customers with particular lifestyles. The design process in this paradigm is characterized by a user-centric approach and by delivering solutions as opposed to offering single products (Gardien et al. 2014).

Now society has entered the knowledge paradigm, which requires supporting people in creating and leading a life that is uniquely their own. People are looking for evolving experiences that are capable of growing and

changing with them - what in turn produces data and content that contributes to shaping their own experience. As such, companies need to shift from being the creator to becoming the enabler of experiences, providing the platform and ecosystem within which users can add their own personal touch.

### *Innovation of meaning*

As part of this paradigm shift, the Philips business focus changed recently from the importance of technological improvements toward the innovation of meaning (Gardien & Gilsing, 2013). This stems from the fact that the world is growing ever more complex and is facing huge problems such as aging societies, energy scarcity and increasing demand for healthcare. It is impossible to model these problems with any accuracy and they cannot be addressed using a reductionist approach (Zimmerman et al. 2011). Without integrative disciplines it will be impossible to adopt a holistic approach and sensibly expand knowledge and products beyond the internal environment and into people's lives (Buchanan, 1992). In innovating solutions the whole system needs to be considered with its many different aspects. What is required is a holistic, integrative and multi-dimensional approach, integrating people aspects as well as business, technology and socio-cultural developments. This poses four main challenges:

- Firstly, innovation is by definition multi-dimensional. For example, the ten types of innovation (Keeley et al. 2013) show that successful propositions innovate on multiple dimensions. As example the iPod is described by Keely, which innovates on 7 dimensions of the 10 (including, in addition to the product itself, experience, channels and business model). Seminal works such as Blue Ocean Strategy (Kim & Mauborgne, 2005) or Michael Porter's activity maps (1996) equally emphasize the multi-dimensional character of innovation. Nonetheless, all these models, in our opinion, lack any systematic connection to the societal drivers behind the change that determines whether a specific direction is sustainable. Moreover, these models fail to connect to how the innovation is expressed. Users must recognize that an innovation adds value to their lives if they are to adopt it and if the innovation is to be successful.
- Companies need platforms of innovation if their efforts are to be sustainable. A 'one product' approach lacks sufficient volume to justify the research and effort required to develop and produce it. Moreover, as for the first point, innovations need to resonate with the end-user's mindset and lifestyle. New breakthrough propositions are

built on wider social cultural changes (Holt & Cameron, 2010). We need to operate at an innovation paradigm level (both from a user and company perspective) that is applicable and valuable to a range of propositions.

- Moving towards the knowledge paradigm means a change from branded or 'staged' experiences to 'assisting in solving personal goals'. These solution approaches differ in two fundamental ways. First of all they form part of a system of different hardware, software and data elements. And secondly, ongoing engagement of the end-user with an ecosystem means that functionality, content, advice and transactions unfold only over time. The actual 'product' is more fragmented and cannot be defined in the same way as before. We therefore need to develop the skills to anticipate and design for the complexity, openness and growth of these ecosystems.
- It is no longer possible for a company (or one part of it) to understand all facets and complexity of these ecosystems, let alone create meaningful solutions or opportunities (Bhömer et al. 2012). In addition, it is evident that these experiences will be delivered by different players, such as businesses, governmental organizations and NGOs. Design as a discipline, using facilitation techniques and tools, has a key role to play in bringing these parties together. To ensure a people focused perspective in this world of ecosystems we need to articulate and develop a design perspective that looks at the 'system of innovation'. This is in addition to, for example, the business and technology perspectives where there are recognized models, like the Business Model Canvas (Osterwalder, 2010) or Porter's 5 forces (1979).

## **Towards Co-creation**

### *Design as facilitator*

In response to the challenges posed by designing for ecosystems and innovation of meaning, Philips Design has in recent years made huge changes to the way in which it works. The shift, from operating as a separate global service unit that leases out design services to each sector of the business to becoming a core function of the company, has made a huge difference (Gardien & Gilsing, 2013). The design function is now well embedded in the strategy process of Philips and collaborates strongly with group strategy, to name just one of the advantages this new approach brings.

*Figure 2. It is no longer possible for a company (or one part of it) to understand all facets and complexity of these ecosystems, let alone create meaningful solutions or opportunities; therefore we have to move towards co-creation throughout the company.*

We further operationalized the embedding of the design function by focusing on close collaboration with businesses and functions; building on the concept that innovation is inherently driven by collaboration and that design thinking (e.g. Cross et al. 1992) is a good way of facilitating this process. We embedded our designers within the Philips business groups which enabled the whole organization to make better use of the powerful perspective that design thinking brings. Next to this we are educating the whole Philips organization on design thinking - named co-create training - via the Philips University, as we will describe in the next chapter. But design thinking does not just disseminate designers' knowledge and insights throughout the company; it also means working together from the onset to ensure essential insights from all the departments and functions in Philips.

### ***New ways of working***

At Philips – like at many other companies - many products or services used to start life in research, then moved via an advanced development

department to the development and marketing groups that brought the product or service to market, effectively polishing the idea prior to launch. One of the problems with this linear approach is that everything happens sequentially. Not only is it hard to get all the disciplines involved, it is also time-consuming. To design for, and contribute to, successful ecosystems we need to be open and flexible. We can no longer follow a linear structure where we go from vision or strategy to proposition to new product development (Kyffin & Gardien, 2009).

Moreover, in addition to the time aspect the knowledge aspect is as important. It is impossible to define the whole system upfront and top-down. The aim is to reach beyond collaboration (within and outside the company) of different departments and groups, where they remain responsible for only a part of the development, and work towards true co-creation. Co-creation builds concepts from the bottom-up so that propositions are designed together from the outset (Sanders & Stappers, 2008). Adding many diverse inputs at the front-end of the process helps give a new perspective on how to design a truly holistic and integrated ecosystem. Besides, this input doesn't only originate from new products or visions; a large amount of information also flows from current (connected) products back into the ecosystem. This means that the 'concept' of the ecosystem is no longer determined solely at the front-end of the innovation process; it builds up over time.

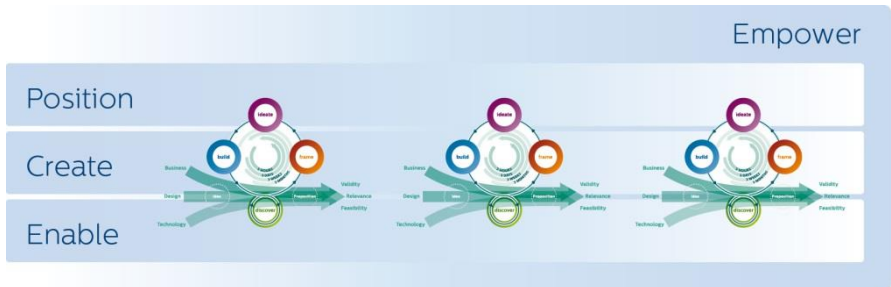

Getting to grips with this complexity means that designers have a new role to play. Rather than providing creative direction at every touch point, they will have to champion and facilitate balance and synergy between projects within the different innovation horizons, shaping and framing a story of the ecosystem that will make sense in first instance to the end users and also to the other departments in the company.

### *Co-creating innovation*

To help Philips move forward together, we created a framework called Co-Creating Innovation which is geared towards the knowledge paradigm. As mentioned above, the "concept" or "story" of the ecosystem will develop over time; this is the "position" part of the framework. As we will explain in greater detail later, the position will develop through reflection on action. For example, knowledge of current products and services, research findings and "in-market" experiments are at the base of this positioning. These activities in themselves are referred to as "create". This creation can only be carried out in an efficient way if it builds on the infrastructure of the ecosystem, for instance IT systems, hardware and software building blocks or even privacy policies.

This is called “enable”. All these 3 elements - which run simultaneously – are framed in the co-creation philosophy as elaborated upon above. Next to these three elements we set out to empower employees throughout the company to apply design thinking.

*Figure 3. The knowledge paradigm innovation framework. Position, Create and Enable run in parallel to deliver meaningful experiences in ecosystems. Empower is about spreading design thinking throughout the company.*

So we are setting out to drive change, by delivering a range of new initiatives and tools that will **empower** the company, create a **position** on ecosystems –or domains as we call them in Philips - and **enable** us all to **create** the next meaningful solutions. In this paper we will introduce the empower, enable and create elements of the framework briefly, before discussing the position element in more detail.

## **Empower**

In the introduction we elaborated on the fact that we feel, within Philips, design is too important to be left to designers alone. To spread the philosophy and knowledge on design thinking we created a co-creation training intended to empower *everyone* in our company, including those outside the design community, to deploy design thinking. The training will first teach participants about design thinking, equipping them with the tools and methods they need. The training is part of a Philips-wide initiative known as the Philips University, which encourages employees to put together courses and workshops based around their particular skill sets and interests.

The co-creation training is built on learning by addressing topics and real business challenges to solve real problems, but structured on key principles of design thinking.

## Create

The true value proposition comes only through real interaction with the end-user (e.g. Ries, 2011). So a few years ago Philips Design initiated so-called rapid co-creation projects to help accelerate the pre-seed stage of innovation (described in Fake it Make it, Crisp Magazine April 2014).

Doing fast experiments helps us to incorporate different perspectives that quickly assess the viability of ideas, and to prioritize opportunities by ensuring that the perspectives required for success have the space to evolve. By adopting this 360° view early on, concepts are developed in balance with a truly multidisciplinary perspective. Rapid co-creation brings designers, researchers, business specialists and relevant stakeholders together to focus all their insights and experience on one value area by quickly visualizing ideas and involving them all in the decision-making process. The cross-disciplinary approach also maps out what the next steps need to be.

It also means we can facilitate the early stage from innovation to market in a dynamic and hands-on way using simple tools such as sketches, models, demonstrators and videos that clearly visualize the idea, and then test it with real people. The whole team then reflects on the results of this external testing, which helps to shape the next iteration of the concept.

Rapid co-creation is primarily used to shape new products or service propositions. Currently we are working on developing a similar, co-creative approach for our strategic and visionary projects.

## Enable

These experiments and projects can be only completed efficiently if the right enablers are in place. These enablers can be very diverse, ranging from IT infrastructure, prototyping facilities, and building blocks (such as standard technologies or design templates) to privacy agreements and contracts as well as the methods and tools used in collaboration. In addition, our design locations themselves play an important role in effectively developing propositions. Experimental design labs will cater to this. For example, in our own practice we are setting up a variety of creative hubs in key office locations. These are physical meeting places dedicated to knowledge building and shared creativity, where different groups of people can come together to build and test propositions. Creative hubs support design thinking in a multidisciplinary setting. Two examples of initiatives in these creative hubs are the Digital Accelerator Lab and the ExperienceLab.

### ***Digital Accelerator Lab***

The lab is a joint initiative between our Design, Research and IT disciplines, aimed at speeding up our digital innovation and bringing digital ways of working to life. We have created teams of technology researchers, IT platform architects, software coders and designers specialized in interaction, visual and user-interface design. Using state-of-the-art equipment, they work to bring new digital innovations to the market as quickly as possible.

At the same time, we have mirrored this Europe-based lab in our research center in Bangalore, India, so the teams are able to work round the clock if necessary by passing on information at the end of the working day. For example, their recent work on data visualization has shown other areas of the business how new meaning can be found in data sets in areas such as healthcare, retail and street lighting.

### ***ExperienceLab***

Reintroduced in collaboration with Philips Research at the end of 2013, the ExperienceLab is a physical space where project teams can rapidly build and test technology and concepts with end-users in order to speed up the end-to-end innovation process. The ExperienceLab includes themed rooms that present realistic set-ups of a home, hospital and lighting concepts, each with the flexibility to be adapted to meet a project's specific requirements.

The rooms are an important tool for assessing user interactions with new technologies or design prototypes. They can be used to observe and record interactions using embedded electronics that are unobtrusively built into the surrounding environment.

An important next step is to move the interactions into "real life" with the creation of experimental design landscapes (Gent et al. 2011).

## **Position**

To be able to deliver meaningful experiences in an ecosystem, a company has to understand what drives the end-user and his/her experiences in this ecosystem. In other words, we need a clear story for innovation in which our offering is connected and which is relevant and applicable in society. We need a clear positioning on what we want to deliver and why.

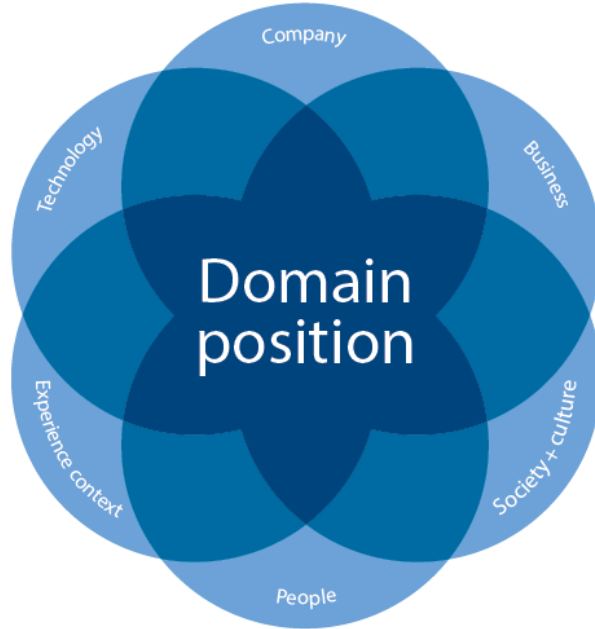

### ***Experience domains***

An experience domain is a thematic, strategic area in which design, research and business activities are organized and initiated. An experience

domain revolves around a specific user group or experience. It is a platform for collaboration, integration and building on each other's skills. Based on the thinking of the knowledge paradigm, we take a dynamic approach: experience domains are developing over time and provide directions and opportunities.

Creating the underlying knowledge that drives an experience domain is currently being developed in various projects. Developing new propositions depends on the effective collection and cross-referencing of this knowledge. Collecting and maintaining this knowledge has been difficult for a number of reasons. For example, due to the structure of businesses, it is hard to connect, design-wise, products that may target the same people but only as part of another activity or context within different business units or sales channels. Good off-the-shelf design knowledge management systems are scarce. The time required to store and code the generated knowledge effectively is often unavailable within current project structures.

Moreover, as timing is crucial, delays or temporary project stops are common. Too often, insights and knowledge from finished projects are not transferred. This problem of overview and coherence soon results in a failure to build sufficiently on each other's experiences, insights and expertise. Integration may happen on a project level, but what we want is to create a strong value network (with internal and external stakeholders) that supports us in understanding and connecting tangible and intangible facets of our business (Allee, 2000). This interconnected way of working is crucial if we are to complete the transition to a knowledge economy, let alone to move to the transformation economy (Brand & Rocchi, 2011), where trust and thus the reliability of the information is key. This interconnected way of working is equally crucial in formulating and developing a strong story for innovation, but instead of trying to 'store' all the knowledge we propose to accumulate it in the domain position.

*Figure 4. Six perspectives influence the domain position.*

### *Experience domain position*

#### **Six perspectives**

While the structure we propose works towards a *design* system for innovation, the total story, or the position of the experience domain, is made up of dialogue between activities and events different in perspectives, namely: technology, business, people, experience context, society & culture and company.

Our approach is inspired by Tom Kelly's Venn diagram on design innovation (IDEO). In this model, design innovation is at the heart of integrating technology (feasibility), business (validity) and people (desirability and usability). This model works extremely well to describe design in an organization, but in order to better link external and legacy topics, we have added three perspectives to this model as drivers for the experience domain position.

To build the position and in order to reflect upon the outcome of our activities, we needed a fourth perspective: namely, how the domain is

understood or experienced via the “experience context” in the wider socio-cultural context of its consumption (Appadurai, 2013) . The experience domain position becomes concrete in these expressions. We need to understand the cultural narrative, create an experience journey throughout the ecosystem and share this experience with our users and stakeholders. It is only at the moment the person actually interacts with the device that it becomes meaningful: meaning is in (inter)action (Overbeeke, 2007; Dourish 2004; Gibson, 1978; Verganti, 2009).

Furthermore, to put more emphasis on the disruptive character of the drivers for expression, we have added a fifth perspective: society and culture. This allows us to differentiate between personal and societal structures and developments. Since we are seeking the innovation of meaning, we can no longer focus solely on functional aspects. We must shape strategies and ideas around a preferred cultural state (Holt & Cameron, 2010). It is therefore important that we also consider the economic paradigm we are designing for, and place our work in the context of current and upcoming trends. We need to connect to what drives people, not only on a personal level but also in terms of their social and cultural environment.

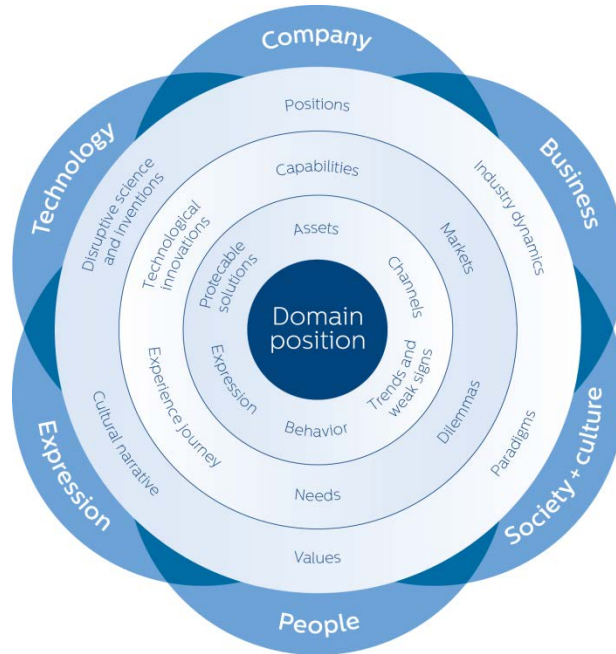

As a sixth perspective we explicitly include the company perspective. Innovation does not happen in a vacuum, but is rooted in a company’s legacy of positions, capabilities and assets. Zook and Allen explain that the strongest sources of differentiation, in a company’s strongest businesses, are like crown jewels. Most innovations, even disruptive ones, affect only one part of a business’s capabilities, assets and positions (2012).

By including a business, technology and company perspective in our story for innovation, we create a strong connection between products from different business units in Philips and thus integrate the brand identity. As explained previously, we believe it is impossible to design for our complex world without this integration. In the past we put forward design visions via the future design probes. Although we provided a very clear idea of our opinion on the preferred future (Zimmerman et al. 2011), we had no deep connection with departments in Philips to allow for emergent solutions. If we want to design for the knowledge economy, in which people and products are all connected, we have to do the same between the different departments in the company.

### **Laddering**

To define innovation at the correct level and create focus for the input from all six perspectives, we propose laddering. Laddering theory (Reynolds &

Gutman, 1988) and the related means-end theory (Gutman, 1982; Pieters et al. 1995) is very commonly used in people research activities (Parmeswaran & Raaijmakers, 2010). We also propose a laddering for the

*Figure 6. The laddering approach provides focus and helps us to understand the multidimensional character of the story for innovation by defining it at different levels.*

other six perspectives, for which this is not common practice. Laddering in people research provides insights on how people relate the attributes of a product or solution to their behavior, needs, wishes and values. We apply the same principle for the other perspectives in different ways.

Laddering all the perspectives not only gives us a better understanding of each separate perspective, it also allows us to tell a story for innovation at different levels, integrating all the perspectives. For example Verganti shows in his work on technological epiphanies how defining innovation from different perspectives at the right level leads to breakthrough thinking and implementations (Verganti, 2010). In this work, Verganti highlights how Apple, Swatch but also Philips have been successful by using technology to create products and services that people find more meaningful than current

offerings, and by integrating several perspectives in addition to the technological perspective. We use three levels: the outer circle drives change (why), the middle circle creates potential tension enabling change (what) and the inner circle describes propositions from different angles (how). If we are to work towards successful positioning of the experience domain, ensuring and demonstrating its relevance and extensibility, all these aspects, with all their perspectives at every level, must be in place.

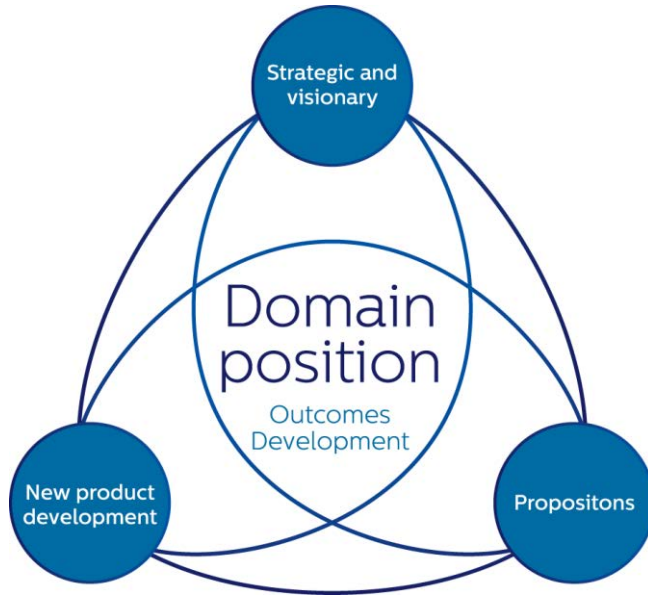

### *Experience domain structure*

#### **Balance and synergy between projects**

The experience domain is not a static, restricted area; it is open and dynamic. Not knowing where exactly you are going is inherent to the innovation process. Most true innovation starts with a vision, but the end point is not clear (Deckers et al. 2012). It takes confidence to hang out in the world of the unknown (Walters, 2013). To build this confidence and connect with the near and more distant future, the different types of projects we run are collated in the experience domains.

As described above, but also depicted in a number of influential models like Chesbrough's Open Innovation funnel (2003), innovation is often organized in a rather linear way: develop a vision (execute research), put forward propositions (advanced development) and develop new products. This linear model is no longer sufficient (Kyffin & Gardien, 2010) thanks to rapid market development and the complexity of the product-service systems. The experience domain thus needs to demonstrate balance and synergy between projects that are more strategic or visionary in nature, projects that aim to put forward realistic product and business propositions, and projects on new product developments that are on their way to market.

*Figure 7. Different types of project are connected. The projects integrate and feed back to the experience domain position.*

The structure of our experience domains is borrowed from the idea of the Reflective Transformative Design Process (Hummels & Frens, 2008, 2009). It is a bottom-up approach where all the players contribute equally and all take responsibility for the experience domain development and outcomes. Although all activities take place in the experience domain, there is no specific order. New product development may influence the strategic or visionary projects as much as the other way around. There is no linear or top-down process where decisions are made in a one-directional stream. There will preferably be a high pace of interaction between different projects, stakeholders and individual activities. Nonetheless, some projects need more independence or time than others.

### **Reflection on action**

The development and outcomes of the experience domain are reviewed through reflection on action, and exemplified by the experienceable outcomes. There is strong interplay between the experience domain position and the projects that we run. Not only should the project incorporate the overall experience domain position on a strategic level, it also needs to be

aligned at both tactical and operational level. We build towards connecting the outcomes of the experience domain in an ecosystem, offering a recognizable, reoccurring story for innovation and user experience. We therefore need to build upon each other's domain knowledge, e.g. by creating and sharing toolkits and guidelines (enablers).

Both the position and the content develop through reflection on action, taking into account all six perspectives. What are the experienceable outcomes (Experience Context)? Did we involve and affect the user, and how (People)? In which economic paradigm can we place our outcomes? What is the impact on society of our solutions (Society and Culture)? Did the businesses profit, and how (Business)? What technological advances did we integrate (Technology)? Did we integrate the company's mission and vision? (Company).

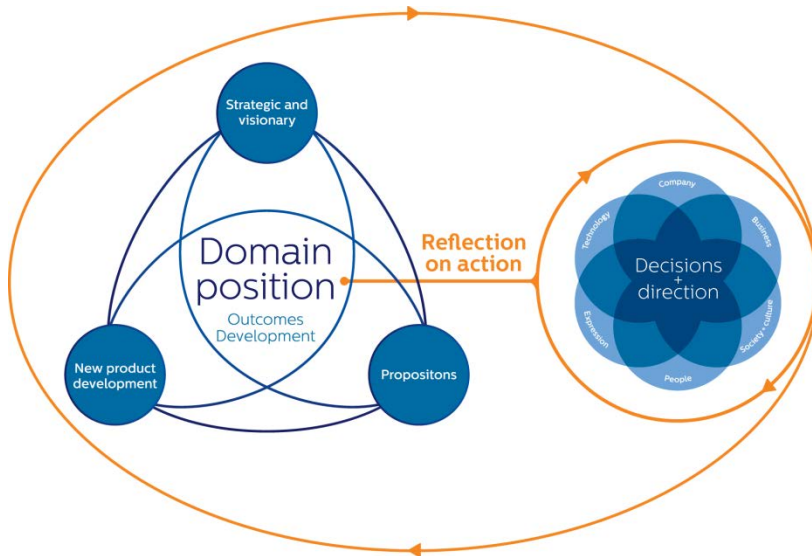

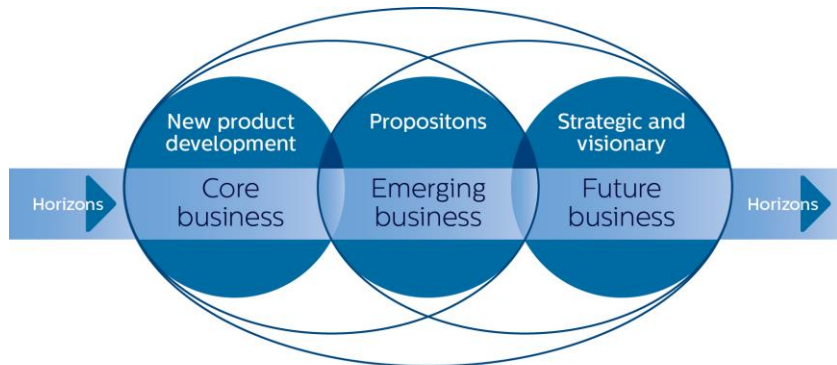

Figure 8. Reflection on action makes it possible to provide direction, make decisions and possibly redefine the experience domain position.

### Connecting existing and new meanings: MAYA

Although we organize our work in an open and flat structure, the various types of projects focus on different horizons. If we can find a balance in the different types of projects that run in the experience domain, and succeed in truly allowing the different types of projects to provide feedback to one

another, we can build a timeline in which the distant and near future are strongly connected and build on each other. We make our innovation story tangible. Not only does the story become stronger, it also helps us to take stakeholders and end-users along on our journey.

This is essential because when radical new meanings are introduced without considering existing meanings, a sociocultural gap is created (Baha et al. 2012). This results in end-users, possibly also stakeholders, failing to recognize and understand the innovation. As Raymond Loewy (1951) put it in his 'Most Advanced Yet Acceptable (MAYA)' theory: "The adult public's taste is not necessarily ready to accept the logical solutions to their requirements if the solution implies too vast a departure from what they have been conditioned into accepting as a norm". In our approach we create interplay between existing meanings and new meanings. Different types of projects that focus on different horizons contribute equally and inform each other.

### **Connecting existing and new meanings**

*Figure 9. Connecting existing and new meanings.*

As such, we bridge the sociocultural gap by establishing a balance between the introduction of new meanings and the preservation of existing meanings (Baha et al. 2012). Through our way of working, we develop a strong sense for what is most advanced, yet acceptable (Loewy, 1951). This is also the foremost reason to consider society and culture as a separate perspective, in addition to the people perspective, in our reflection on action model.

#### **Examples**

There are several examples of products where we did and did not manage to bring together all the perspectives and introduce the right innovation at the

right time. For example, when Philips launched a very early video game console in 1991, the Cd-i (Compact disc-interactive), there were too many aspects that did not fit with consumers' mindset at the time. For instance the general public did not recognize the notion of a multimedia console, and the Philips positioning: "you can do it all with CD-i" did not help in developing the understanding. Later consoles like the Sony play station clearly positioned themselves as primarily game consoles. Moreover, we failed to provide the content to support a change in mindset. For example, at the market introduction there were only a few titles available. People were unable to connect to concepts such as edutainment (educative entertainment), interactive movies or video-on-demand.

A successful example is our alliance with Douwe Egberts. The Senseo coffee machine combined new technology with a surprising but recognizable new experience. The coffee experience gained traction around the same time as Starbucks' expansion into Europe in the late nineties. People liked fast but good coffee, and the fact that you could easily just make one cup. Philips had all the channels in place for selling coffee machines. In turn, Douwe Egberts had all the channels in place to sell the complimentary coffee pads.

By positioning our work more strongly in experience domains we can actively shape and develop the story of innovation making a next step in designing for the knowledge and transformation paradigms, making sure we understand and frame all the dimensions to our innovation and bringing it to our customers in the right expression at the right time.

## Conclusion

If design is to deliver on the promises enabled by design thinking, designers need to take the next step forward. We need to redirect our creative skills away from looking at all the touch points around a proposition to developing and maintaining a position on the user experience in a domain that includes the different innovation horizons.

However, to do this effectively, not only do we need to expand our competences; we also need to adopt new ways of working that coincide with the challenges inherent in the knowledge economy. To design for connected experiences in ecosystems and domains, we at Philips Design are piloting approaches that integrate a strong position in a domain combined with rapid experimentation, built on solid enablers and embedded in a collaborative, co-creative way of working. This dynamic and iterative approach will enable us to

deliver meaningful experiences to our end-users in a rapidly changing, interconnected world.

We shared our journey because we believe that not one company, organization, NGO or government is able to deliver these experiences. This will require true co-creation, and in order to achieve this we as organizations need a shared vocabulary, methods and tools. We believe that design as a discipline, through facilitation and people focus, can take a leading role in this. With this paper we want to encourage you to join us on this journey and to create a shared understanding and attitude towards co-creation.

***Acknowledgements:*** *The contents of this paper build upon the insights of many of our Philips'colleagues. The examples, tools and approaches we discuss are the result of a communal effort. We would like to say a special thank you to everyone who is actively involved in framing our innovation program and setting up experience domains. We like to thank Caroline Hummels for her feedback and thorough editing.*

## IP Management in Response to Changing Conditions

Matthias HILLNER<sup>a,b\*</sup>, Nick de LEON<sup>b</sup> and Qian SUN<sup>b</sup>

<sup>a</sup> University of Hertfordshire; <sup>b</sup> Royal College of Art

*This paper, which has evolved from a series of qualitative interviews, examines a few examples of award-winning design-led start-up businesses in order to highlight the entrepreneurs' perceptions of the significance of IP for their success prospects. It will break the proprietary design business development process down into 3 stages in order to highlight how the relevance of IP may change over time. Following the discussion of possible business development strategy, the paper will clarify to what extent a registered design may help to delay costly and time-consuming patent filing. Based on the case studies, the paper will offer a small number of principles to follow when assessing the relevance of certain steps in conjunction with IP strategies. The paper provides a comparative assessment of patents and registered design rights with respect to costs, strength and litigation frequency. It discusses anticipated changes to the IP bill, and how these may affect designers in the future, before conclusions are drawn on how designer-entrepreneurs can make best use of IPR protection methods to get started.*

## Introduction

This paper examines the most significant intellectual property protection options available to lone entrepreneurs as well as small and medium Enterprises (SME). SMEs are recognised as an important source of innovation yet have limited resources and knowledge to select, secure and enforce their legal rights to their innovations. In their paper 'UK design as a global industry', The Big Innovation Centre confirms that 'The design-intensive industries [...] feature a large number of small businesses. It can often be hard for smaller businesses to use the intellectual property system effectively especially in a field like design where there are so many different ways to handle intellectual property.' (The Big Innovation Centre, 2012, p.83) This inhibits their capacity to grow and benefit from the returns on their innovation. This paper focuses predominantly on a comparison between patents and registered designs. It will conduct a cost-comparison, and evaluate effectiveness of both measures, before assessing to what extent either of the two measures can be deployed by design-led start-ups. To do so, it will discuss current changes in the patent bill, examine past and current start-ups, and sketch out the typical venture development processes.

This study relies predominantly on qualitative data collected through 17 open and semi-structured interviews. The ventures were carefully selected to produce a credible and representative range of case studies covering different kinds of inventions that are aimed at a variety of markets. The majority of questions raised within this study have evolved from these interviews, and their significance has been assessed with Grounded Theory methods. This is an inductive study, the results of which are compared to, and contextualized in findings obtained through literature reviews. The vast majority of sources do not differentiate between large corporations, small and medium enterprises (SME), and micro-scale start-ups. Levin et al admit to that when stating that 'the exclusion of those without publically traded securities undoubtedly means that small start-up ventures, important sources of innovation, were underrepresented.' (Levin et al, 1987, p. 791) This constitutes a problem, because the fact that the latter have limited access to financial resources and complementary assets such as manufacturing facilities and distribution networks sets them aside from established businesses. This study is aimed at filling the relevant knowledge gap through focusing on early-stage start-ups. Teece argues that IP can be utilized to compensate the lack of complementary assets during the early phase of a business development. But Teece discusses this matter in

conjunction with the risk of being imitated (Teece, 1986, p. 297). However, the risk of radical innovations to be imitated during the start-up phase is comparatively small, because the markets are mostly unproven, in some cases non-existent. Compared to established profitable businesses, start-ups, many of which are in the pre-trading stage, face a different set of challenges such as the search for seed funding, prototyping, route to market development etc., and they have different means of tackling these problems such as incubation schemes, peer-to-peer networking, bootstrapping and so on. This study will sketch out development models and strategies, which will provide the independent designer entrepreneur with guidance in their decision-making.

## **Changes to the IP bill**

On Monday, 27 January 2014 Sebastian Conran sent a letter to the Times asking for 'criminal provisions for deliberate unregistered design infringement, as well as registered design infringement' to be included to the IP bill, which is due to be re-issued in 2015. 16 May 2014 the bill, which, contrary to Conran's plea, does not treat unregistered design rights as criminal offenses, received Royal Assent. Copyright and trademark infringement have already been treated as criminal offence, whereas the infringement of Registered Designs, i.e. the formal protection of two-dimensional designs or surface patterns, and unregistered design rights, i.e. the right on the original design of a three-dimensional shape, has not. Neither has the infringement of patents. The proposed changes to the IP bill are set to turn the infringement of registered designs into a criminal offence. Infringement of patents and unregistered design rights will remain a subject of civil law. The difference lies in the liability, as well as the fact that a criminal offence can entail custodial sentences. This gives rise to the question whether or not registered designs are due to become more attractive means of IP protection than patents for start-ups.

Patent law is proposed to change in that a unitary patent will be introduced within Europe. The rules of this 'will be the same in every country and you will be able to challenge unitary patents and European patents in one action at the Unified Patent Court. This will be cheaper and easier than fighting your case in the courts of each country where the patent is valid.' (IPO, 2013d) A unitary patent application covering 25 EU member states is hoped to reduce translation costs from some £20,000 to £600, and save time and effort. A unified patent court in London will serve all unitary

patent infringement, and a patent opinion service provides out-of-court advice on potential infringement matters for no more than £200. The changes to design rights are no less drastic, as explained above. However, it has to be said that infringement of registered design rights are only to be treated as a criminal offence if the infringement happens intentionally, and that may be rather difficult to prove. A design rights opinions service provided by the IPO will be aimed at helping businesses to resolve design disputes without litigation. The costs involved in using this service equate to those needed for the patent opinions service.

Whilst many designers will argue that the proposed changes do not go far enough, the IPO expresses confidence that making the infringement of registered designs 'A criminal offence will help create a coherent approach to the protection of intellectual property rights in the UK. [...] As a result of this increased confidence design registration could become a more attractive proposition to creators.' (IPO, 2013c)

On-going discussions surrounding the current changes in the IP bill suggest that the registered design is about to be strengthened to a much higher degree than the patent. This may help designers develop more confidence in this mode of protection. Whether or not a registered design can ease the way into a proprietary design business development depends on numerous other factors too. However, one is inclined to think that it may, in particular if the technical details, which are aimed at a patent application, can be kept secret. Needless to say that the surrounding factors such as complementary assets, team building and funding must not be neglected. The benefit of focusing on a design registration as opposed to a patent at the outset lies in the reduced cost and time that is needed to obtain protection. So it allows the design entrepreneur to invest significantly more time and money into the development of other aspects, business relations and the innovation itself included.

## **A Comparison Between Patents and Registered Designs**

When discussing "The choice between formal and informal intellectual property" Brownyn et al. make no distinction between registered designs and patents, nor does Teece when introducing us to IPR in conjunction with appropriability regimes. It may be due to the fact that the US equivalent to the European design registration is a so-called design patent and the arguments are meant to encompass both patent variants. A more likely

reason is pointed out by Rebecca Thushnet from Georgetown University Law Center, who suggests that ‘The law’s traditional bias against, even fear of, the visual may help explain why design patents have been of less interest to many intellectual property scholars than other bodies of IP law.’ (Tushnet, 2012, p.409) To establish how much of a difference there is between utility patents and design registrations/design patents, we shall first look at the formal requirements for obtaining either.

### *Costs*

Whereas filing a patent costs several thousand pounds and takes several years to reach approval, a design registration takes a couple of weeks, months at the most, and costs only a few hundred, even if filed through Office for Harmonization in the Internal Market (OHIM) across Europe. The US equivalent of the latter, the design patent, costs more, around \$1,500 in total, and it takes longer, around 12-18 months, which is still less than the time required to obtain a utility patent. As opposed to the European design registration, the US design patent does not require any renewal applications, which somewhat justifies its higher costs. But its lifespan is limited to 14 years, which is 11 years less than that of a European design registration, and 6 years less than that of a utility patent.

Given that processing time and costs seemed the biggest problems associated with utility patents, one might be surprised to not see a greater emphasis on design registrations / design patents in conjunction with design-led start-ups. May this have to do with the ‘bias against, even fear of, the visual’ mentioned above? Do entrepreneurs and angel investors share this fear? And, if so, where does this fear come from?

### *Statistics*

Helmets and McDonagh’s paper on ‘Patent Litigation in the UK’ establishes that only a small percentage of IP disputes at the Patents County Court (now the Intellectual Property Enterprise Court or IPEC) are patent related, only 12 out of 64 in 2007/8 (Helmets, McDonagh, 2012). Copyright issues and trademark disputes dominate here. Regrettably the paper does not distinguish between registered and unregistered design rights. But the combined number of cases of registered and unregistered design right disputes equates to the number of patent disputes with around 6 or 7 per year. This would suggest that design rights and patents are equally significant to designers.

The situation at Patents Court at the High Court (PHC) differs significantly. Helmers and McDonagh explain that the number of cases of patent disputes at PHC level is 68 in 2007/2008, which constitutes 60% of all IP disputes at this level. The cases at PHC mostly relate to patents that protect ‘pharmaceutical and chemical compounds and production processes’, whereas the cases at IPEC level tend to relate to ‘patents of lower complexity and value’, which are secured to protect inventions of ‘mechanical, discrete nature’ (Helmers, McDonagh, 2012, p.26). Most of the case studies further down would fall into the latter category. Patents litigated at IPEC level are said to be mostly less than 10 years old, which means that design-led start-up businesses are vulnerable to either being litigated, or having to initiate litigation.

### *IP Strength*

*Figure 1: 3D trademark by Haberman*

Views on the strength of design registrations and utility patents respectively vary considerably. Adam Sudcliffe, one of the designer-entrepreneurs interviewed in conjunction with this study, thinks highly of them, but suggests using them during the later stages of a venture development rather than earlier-on. Mandy Haberman, inventor of the so-called AnywayUp cup, has little faith in registered designs, so little in fact that she filed a 3D trademark for her Smiley Cup design instead of registering the design (Figure 1). Interestingly she ‘filed the Design Patent [in the US] as a strategic measure, to obtain a granted right faster than could be

achieved by our patent application'. She further explains that 'The US patenting process can take many years and it is likely that we will be launching our product there before our patent is granted.' (Haberman, 2014) Utility patents are probabilistic rights, which means they are only proven once confirmed in court. One could argue that design patents and registered designs are equally, if not more probabilistic as are utility patents. Tushnet explains that 'the ordinary observer test makes design patent infringement findings harder to review and analyze; as gestalts, they are difficult to dissect' (Tushnet, 2012, p.417). In an interview Haberman stated that she had seen a cup similar in design to her "Smiley Cup" during a trade fair, but decided not to challenge it in court because minor differences would have limited her chances to succeed (Haberman, 2014). How similar a competing design must be for it to be litigated without risk is difficult to tell. Although the design registration itself is comparatively cheap, costs add up if applied across a range of products. Sebastian Conran's 'Universal Expert' range of kitchen utensils comprises 200 objects. To secure registered design rights for 200 items, and to do so internationally would amount to a considerable sum of money.

## **The Haberman case**

The value of patents is often rated low, because early-stage design-led start-ups usually lack the funds to defend their rights in court. Patents are perceived as no more than a necessary burden to secure angel investment. Mandy Haberman is an established designer-entrepreneur, but went through the entire process of proprietary business development. Her case proves that the threat of imitation is real, and start-ups are not perfectly safe from harm.

Figure 2: Haberman Feeder

Figure 3: AnywayUp Cup Beaker

Figure 4: Bird Cup

Figure 5: Suckle Feeder

(Images: Courtesy of Haberman Products Limited)

Figure 6: AnywayUp Cup timeline

Mandy Haberman has invented a number of products in the field of childcare and nutrition. But we are focusing on the early stages of an entrepreneurial design venture, and with regards to this, two of Haberman’s inventions stand out here: The Haberman Feeder and the AnywayUp cup. In 1984 Haberman patented the first product, a baby cup for children with feeding problems. Initially she filed the patent herself, but soon realised that she would better use an attorney. She refilled within a year. The development of the Haberman Feeder was funded through £20K worth of grants which Haberman had secured in the course of a 4-year period. Eventually the device was produced, marketed and distributed from home directly to hospitals and parents in need. Haberman had failed to secure a licensing or distribution agreement. Her market was too much of a niche, too small to attract the interest of large incumbents. The situation was different with her second invention, the patent for which was filed in 1992. The AnywayUp cup was the first reliable non-spill baby cup in the world, using a slit-valve to keep the liquid secure inside. Haberman presented the product to 18 incumbents under NDA, but secured no contracts. Together with a marketing team the inventor introduced the product during trade fairs in 1995 and secured almost instantly £10K worth advance orders. Using a bank loan rather than investment, Haberman started production and trade. Sales grew fast and much benefitted from a redesign by Sebastian Conran in 1997. But Haberman’s invention had already been copied by Jackel International Limited, one of the 18 companies mentioned earlier. The case was taken to High Court and led to an injunction in 1996. Subsequently various other infringements were successfully challenged in Holland. Last, but not least, Haberman had to take legal action against two companies in the USA, where her licensee refused to take action on her behalf. The results were mixed here. Haberman succeeded to take action against Playtex, who settled out of court. However, her lawsuit against

Gerber proved her patent valid but not infringed. An injunction could not be issued here. With her patent proven valid, Haberman found herself lucky in that the outcome attracted new licensing deals in the US. With a cap in legal fees at £300K due to a contingency arrangement with her lawyers, her losses were mitigated. This appears like a painful but successful journey. In an interview Haberman admits to one major mistake she has made: The AnywayUp cup was filed twice, in 1991 and in 1992. Both times an attorney had been used. Haberman decided not to proceed with her first application due to financial reasons. Between both filing dates the Richard Belanger had filed a patent application for a baby cup with a different kind of valve in the US. Both the Belanger patent and Haberman's patent from 1992 are valid. But due to the prior art created by Belanger, Haberman lost a huge amount of market share. 'It is true that I did extraordinarily well from the cup, way better than I ever dreamed. However, if I had proceeded with my earliest patent application, rather than abandoning that and refileing a year later, my patent would have been worth significantly more.' (Haberman 2014)

Haberman could rely on a bank loan to get started, something that is thought to be impossible nowadays. Her case suggests that patents are vital to the success of the independent designer entrepreneur, even if one does not need investment. The threat of being copied is real, but only once proof of market is established. Fund raising ambitions aside, IP seems of little benefit if one is not ready to enforce it in court. We can also learn from Haberman's case that the product language, i.e. the design that goes beyond the technical functionality, matters, at least in the retail sector. The Conran redesigns of the AnywayUp cup led to a significant increase in sales. After all Haberman has a name to herself, and now holds no less than 8 registered trademarks with OHIM. More recently Haberman has added to her product portfolio the Suckle Feeder, an improved baby feeding device, the Anyware range of child-safe kitchen ware, and the Glugs, a set of animal characters to be used to teach children healthy eating through story telling. Neither the Anyware range and the Glugs benefit from any kind of technological innovation, which again is an indication that design in terms of a product language matters, in particular if you can attach a brand value to it. The brand connects the product with the inventor and the firm.

The value of a brand depends on the recognition of a firm or person. The latter does not exist from the outset. Haberman's venture was not established until the late 90s. If we take the birth of Haberman's daughter Emily in 1982 as a starting point, then it took her some 13-14 years to reach a stable and sizable turnover. Her brand value grew gradually over time. To

verify means of appropriability other than brand recognition deployed during the development process, we will attempt to break the process down into 3 major development stages.

## Development Phases

In order to produce a rough framework of reference, we can segment Haberman’s business development into the fledging business (Haberman Feeder: 1984-1995), the transitional business (AnywayUp: 1995-2006), and the established business (Suckle Feeder, Anyware range, Glugs: 2006-present). To better understand the three stages, we can hypothesise on the characteristics of businesses during each period. The characteristics listed in the following are indicative, and not necessarily part and parcel of each and every single venture development.

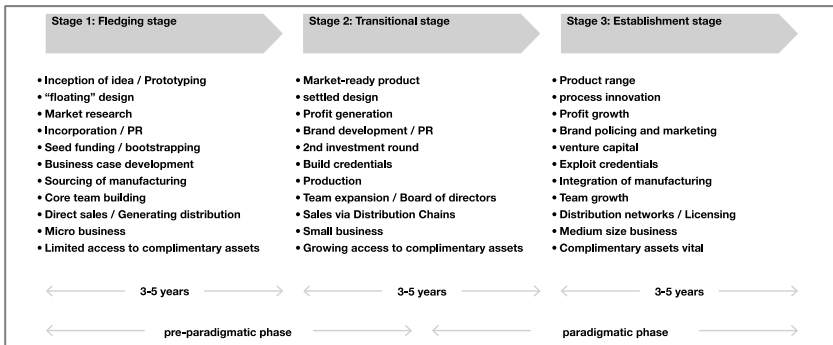

Figure 7: Business Development Stages

Murta et al. (2004) define the pre-paradigmatic phase in reference to Abernathy, Utterback, Dosi and Teece as a competitive phase during which companies rely on ‘standardized manufacturing equipment, in order to retain flexibility to adopt an alternative, should their offering fail to establish itself as the dominant design. In the paradigmatic phase of competition, companies face reduced uncertainty over product design, gravitate toward customized manufacturing equipment and compete on the basis of scale, learning, and process innovation to reduce cost.’ (Murta et al., 2004, p.8) One can argue that a start-up ceases to be a start-up as soon as it enters the paradigmatic phase. It then becomes an established business, however small it may be. One must bear in mind, however, that the customisation of

manufacturing equipment depends on the invention. Some may need a higher degree of customisation than others.

As pointed out earlier, the focus of this study is on the fledging stage of the design business development as this is commonly neglected in the literature. However, the ambition of filing for patents has long-term implications. These need to be taken into account when it comes to comparing the strengths and weaknesses of diverse IP protection methods. It also needs noting that the transition between pre-paradigmatic and paradigmatic phase is likely to be gradual, rather than sudden. It may vary from venture to venture when exactly this transition takes place. We may assume that stage 1 is predominantly pre-paradigmatic and stage 3 of a paradigmatic nature. This means that the transition is likely to take place in the course of stage 2.

Designer-entrepreneurs might trade the business towards the end of stage 2 and engage in the development of a new venture. Haberman chose to take her initiative to stage 3. It has to be acknowledged that, although she had keenly pursued the option of integrating manufacturing, she ended up outsourcing it, because some of her investors had demanded this to allow for a greater focus on sales. (Haberman, 2014)

What becomes clear in the Haberman case is that the significance of IP does not become less critical over time, its value changes. In phase one it may be a necessary burden for raising equity investment. In stage 2, when trade turns profitable and funds become gradually available to invest in lawsuits, if required. IP can be used as an effective defence mechanism to grow and sustain market share. In stage 3, IP can be connected with brand values, and be used to signal innovativeness and market control. So the relevant problems and benefits in conjunction with IP change as entrepreneurs enter the next stage. To begin with, time and money are the key concerns in relation to IPR, along with worries about the affordability of litigation. During the second phase the primary concern is market share, possible competition and imitation. In the third phase the designer entrepreneur must focus on the expansion of the IP portfolio, and on re-innovating. Adam Sudcliffe, inventor-founder of Orbel, a medical device, suggests shifting emphasis from patenting to design registrations during the second stage. These are less expensive, benefit from a faster application process, and are according to Sudcliffe easier to enforce in court. Haberman disagrees with the latter. But using registered designs in place of patents at an early stage may speed up the process of securing IP and it can save costs.

The following section introduces the case studies and highlights how the designer entrepreneurs involved handle IP.

## Summary of case studies

‘As an inventor, it is important to understand how the patent system works and to do as much as you can to protect your intellectual property before you share information.’ (Haberman, 2014b)

In preparation of this study 10 designer-entrepreneurs, who developed their business upon exit from academia, have been interviewed in relation to their invention and their views on IP. Most of the ventures are still in the fledging stage, except two, who are in stage 2. Haberman’s case differs from those of the other designer entrepreneurs, in that she did not rely on an incubator to get started, nor did she initiate her development upon exit from academia. That aside, all of the designer inventors have been dealing with comparable sets of circumstances to begin with and most of them have filed for one or several patents. The only exception with regards to patent filing is Yossarian Lives!, a digital search engine that does not qualify for patenting in Europe, and Squease, the inventors of a pressure vest designed for autistic users. Squease let their patent lapse shortly after filing because the technology was still under development.

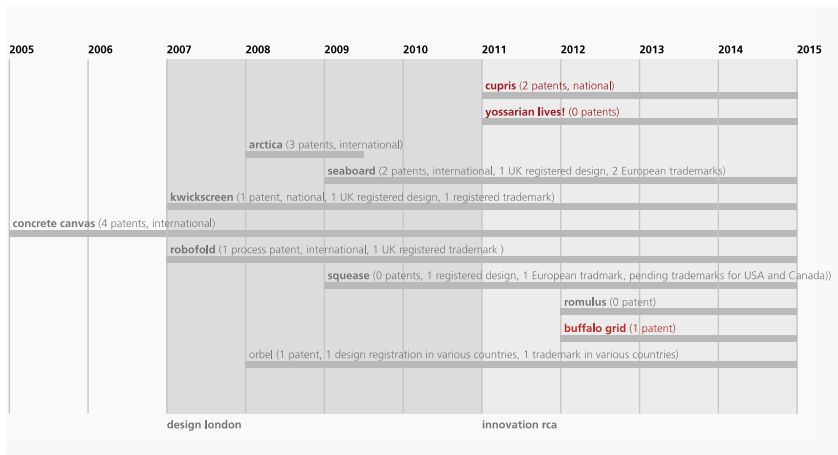

Figure 8: Incubator timeline

The team decided to build on a first-mover advantage instead. The team behind Yossarian Lives! built their IP strategy around secrecy. The majority of the remaining 8 interviewees have expressed a lack in confidence in their

patents due to the fact that their financial resources are likely to be insufficient to defend their IP in court at this stage. The main reason why they opted for patents is the fact that they assume it to be a requirement to have a patent for securing angel investment. Conversations with angel investors from the London Business Angel Network have revealed that angel investors share the interest in patents, as they see it as an indicator for innovativeness, and as a way to mitigate the risk of infringing third party IP.

## Design innovation strategies and IP

The fledging designer-entrepreneur must understand where and how to prioritise various protection methods, and how to shift emphasis over time in accordance to the business needs. To summarise the most basic mechanisms we can distinguish between formal IP (such as patents and registered designs), secrecy, and sales focus (first-mover advantage). Informal IP such as copyright and unregistered design rights are going to be neglected on this occasion because these rights are difficult and too expensive to enforce, certainly during the very early stages. NDAs and confidentiality agreements connect secrecy with formal IP. But due to the difficulty for a micro-scale start-up to enforce such rights, we subsume such arrangements in secrecy. Brand values grow only over time, and although it can be protected with IP such as trademarks, the word brand value is used as a summative term here, and it is treated as a separate asset from formal IP.

The case studies conducted to date suggest that those firms who opt for an early patent enter markets later than those who neglect the patenting option in the beginning in favour of a sales-driven strategy. Formal IP is time-consuming and costly to establish. The designer-entrepreneur needs to decide very early to what extent product developments are worth decelerating in order to pursue patents. The Haberman case has shown how costly a one-year delay in patent filing can turn out to be in the long run. Registered designs are much cheaper and faster than patents. But in the Haberman case it would not have helped to establish a barrier to entry for competitors. So the effectiveness and suitability of design registrations can be questioned. If we look at formal IP, sales orientation, secrecy, and brand value as the **four main corner stones** of a start-up's appropriability regime, then we can envisage a model that comprises a time line, based on which the deployment of these different mechanisms can be mapped out.

IP Management in a Climate of Change

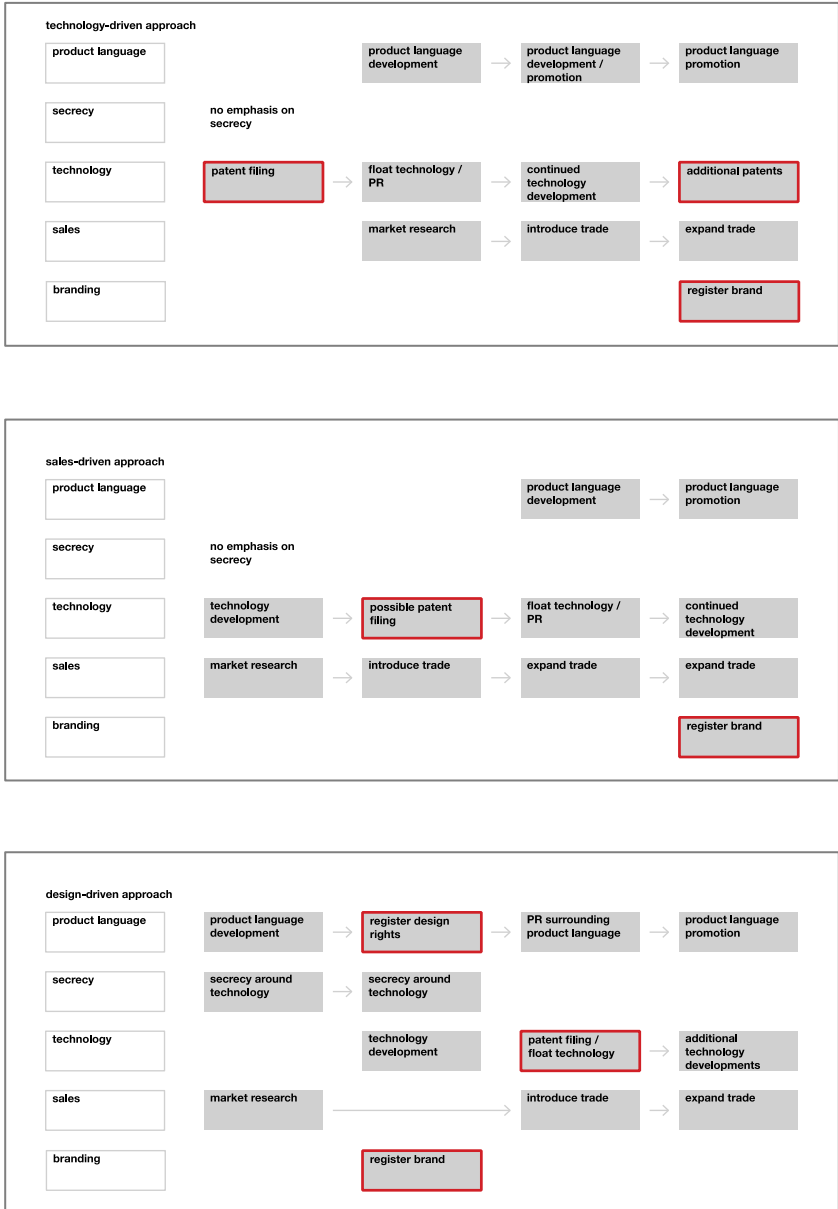

Figure 9: Possible development and protection strategies

If we separate formal IP into that which connects with the technology, namely patents, and that which relates to the visual particulars (product language), we end up with 5 appropriability aspects in total: product language, secrecy, technology IP, and sales. If we then imagine that only 2 or 3 can every be pursued at a time, how would we map out the process? If change is incremental, one may be drawn towards a sales-driven approach. If it is a radical disruptive innovation, then one of the other two options might be preferable.

The 3 schematic simplifications above illustrate how the fledging phase may roughly pan out for a start-up. The first version is the one that resembles most of the case studies. KwickScreen is closer to the second version, as is Squease. None of the ventures went through the 3<sup>rd</sup> route, which may be due to the way in which the incubatees were taught during their studies and coached during the incubation phase. The simplicity of the diagrams may reduce their credibility. However, the sales-focused approach appears to be the most straightforward. The technology-focused one may lead to a small patent portfolio, whereas a focus on product-language may lead to a coherently designed product range. It has to be highlighted that the term product-language applies not only to the items on sale, but also to the communications on the whole, including the interior design of working premises, collateral materials and media communications. Within the flow charts, the steps connected to formal IP are highlighted in red.

## Case studies revisited

Instead of discussing each of the 10 ventures mentioned above in great detail, we look at some of them as examples to discuss 3 proposed principles in relation to IP strategies:

### *Suggestion No 1: Set your priorities: design, technology, sales*

KwickScreen is a retractable divider screen aimed at use in hospitals. The company behind the novelty holds both a UK patent and a registered design, but care very little about either of the two. Their registered trademark weighs higher. After all the team focused on sales very early-on, and thus established market credentials faster than most of their peers. The company benefits from exclusive access to one particular fabric, the so-called RolaTube technology, that is vital to make their product work. They sell their expandable mobile divider screen directly to hospitals. Getting the product to work as well as building and managing their trade contacts, led this

company to success. The two founders, Michael Korn and Denis Anscorb, who are now working on the first redesign of their product, employ 5 people and the business grows by around 100% each year. The venture's sales focus has led to the development of a bespoke customer relationship management system called Romulus, which has led to an additional revenue stream because it could be licensed to some of their business contacts.

*Figure 10: KwickScreen (Image: Courtesy of Korn Wall Ltd)*

***Suggestion No 2: Adjust your IP strategy where needed.***

The team behind Squease started off with IP, but realised that their product required still a lot of development. This led to weaknesses in the patent, although having a patent pending helped to attract angel investors nonetheless. But investing time, energy and money in a weak patent was of limited benefit to the company's prospects according to Sheraz Arif, one of the company founders. The market for devices that provide autistic people with a sense of comfort and security in busy public environments was almost non-existent in the beginning. With limited competition in the field and in agreement with their investors, the team behind Squease decided to drop their patent, and to focus on developing credentials for their product through client relations, and a licensing agreement with a distributor in Australia.

Figure 11: Squease pressure vest (Image: Courtesy of Squease Ltd)

For Arctica, an environment friendly cooling system, the patent-route proved vital. The inventors and original team members, Karina Torlei, William Penfold, Daniel Becerra and Mathew Holloway, had 3 different patents to secure exclusive access to the technology, which provided an alternative to conventional air conditioning units. The start-up was confronted with the fact that the market was controlled by large incumbents who have exclusive relations with property developers. Edging their way into this tightly controlled market was impossible. The team managed to establish proof of market only through focusing on period properties, which cannot be fitted with air con in the UK due to existing regulations. Having found a way to trade their technology in a niche market, Arctica could be sold to Monodraught Limited, one of the key players in the industry.

Figure 12: Arctica cooling system (Image: Courtesy of Royal College of Art)

So here we see two opposing strategies. The focus on sales on the one hand, and the focus on patents on the other were required due to the particular nature of the relevant product and the industry it is aimed at.

*Suggestion No 3: Remain flexible. Accommodate strategy change if needed.*

Concrete Canvas is the oldest initiative here. Peter Brewin and Will Crawford invented a concrete shelter aimed at military use and at use for disaster zones. However, despite a trial with the military, the team did not manage to secure lasting relationships here. So they shifted their focus to the material, for which a separate patent had been filed in 2006, two years after the concrete shelter had been patented. All in all Concrete Canvas holds 4 patents, 40 including international filings, and trade their inventions worldwide. Their main income stream relates to the use of Concrete Canvas for lining ditches, for slope protection and for bund lining protection around petrochemical tanks. However, new areas are being discovered in collaboration with people who seek to acquire the material for untried applications. So Concrete Canvas rely on working relationships as much as on patents.

*Figure 13: Concrete Canvas applied to slope protection (Image: Courtesy of Concrete Canvas Ltd)*

Ultimately all 3 aspects, product language, technology, and sales need developing, and the designer-entrepreneur's focus of attention will at times shift from one to another. The above explanation is hoped to alert the designer-entrepreneur towards the need of establishing a focus of attention and to foster a systematic approach to navigating through these business development needs. What has been neglected is the need for the IP strategy to be aligned with the funding strategy. Whilst delaying the patent may limit the interest from investors, filing early requires funding in the first instance, and it entails other disadvantages. Rather than considering patents as a necessity from the outset, designer-entrepreneurs should be encouraged to contemplate what exactly it is that strengthens their business proposition.

## Conclusion

Despite the costs involved, many designer-entrepreneurs perceive patents as a necessity for obtaining equity funding. Given the current circumstances this does not come as a surprise. However, other means of protection often remain neglected. The way in which different forms of IP can be effectively combined and how their filing is best timed is not sufficiently understood. In particular now that we are witnessing significant changes to the UK IP bill, the relevance of registered design rights needs to be revisited. A better understanding of typical design business development cycles will lead to a more effective use of IP. To achieve this, IP in terms of patent filing must not be reduced to a tick box exercise. Instead, IP strategies must be devised in response to the predicted development route of a design-led start-up. The examinations above suggest that starting out with patents and adding trademarks and design registrations later, is currently the preferred route, as equity investment is usually required to succeed in surviving the fledging phase. This could change, provided that faith in the value of product languages grows amongst entrepreneurs and investors. What will be required in addition to new laws and regulations is a culture shift. Conran's redesign of the AnywayUp cup is only one example that evidences the degree to which attractive design propositions are valued by customers, and how this in turn benefits sales. If we can get product languages recognised as effective tools for preparing products for market, if we can establish means to defend those product languages against competitors, then we can emphasise the visual aspect of design in the early stages. This in turn will help to reduce initial costs and time spent on IP and thus speed up development processes.

**Acknowledgements:** *I would like to acknowledge the support and contribution of my PhD supervisors, Prof. Nick Leon and Dr. Qian Sun from the Royal College of Art, without whom this paper would not have been possible. I would further like to thank all the designer entrepreneurs mentioned in the article, in particular Mandy Haberman and Sebastian Conran.*

# A Semantic Approach of Cultural Interpretation toward Service Innovation

Soe-Tsyd Daphne YUAN\* and Hua-Cheng TAI

National Chengchi University

*Service innovation and the development of culture and creative industries have gained importance in recent years. Many studies have demonstrated the importance of culture and how it influences service business owners' decision-making and management behaviour. However, it's rare to see IT-facilitated use of cultural ingredients to design service and enable innovation. This study investigates whether cultural factors and information systems can be used to facilitate the designers to come up with service innovation strategies, especially for those small and medium businesses (SMBs) of which the owners mostly serve their customers directly. This paper proposes the notion of "cultural interpretation" in representing the emotions, values and behaviours which customers experience because of the culture. Cultural interpretation is a semantic perspective of cultural and experiential modelling. We design a semantic information system artefact that connects culture and personality to cultural interpretation and SMB owner's managerial behaviour on service innovation. This system can facilitate the designers to motivate or inspire SMB owners to develop new ways to think about service innovation, in terms of cultural interpretations. Our attempted contributions are to give sense to managerial behaviour by taking into account culture in a semantic view toward service innovation.*

**Keywords:** *service innovation, culturally sensitive design of information system artefact, SMB owner, cultural trait, personality trait*

## **Introduction**

In recent years, there is a trend to add elements of culture to industries to help create core values for products or services. This starts from the cultural and creative industry. Many different policy regimes support and promote the development of cultural and creative industry (Cunningham, 2002). This development involves a combination of creativeness and the local culture to produce service and product innovation (Zhong et al., 2008). The other industries can also provide the energy to facilitate the inclusion of culture elements (Lin & Lin, 2009). Lin (2009) suggested the transfer of culture and creative industry to the other industries that emphasize on service innovation by including local culture, technology and aesthetics. Lin (2009) mentioned that if culture and creative industry is to be well developed, it must be facilitated and designed with creativity, in order to create a good experience for customers. Lin (2009) also pointed out that culture and technology must be used together to design original lifestyles. The facilitated inclusion of culture elements in industries for the provision of new experiences can be regarded as a way toward service innovation, because service innovation aims to offer customers sufficiently appealing new benefits (Berry et al., 2006).

Individual business managers are the key to service innovation and to whether a new service development is successful (De Jong et al., 2003), especially when local culture is utilized for service innovation. Individuals are influenced by their cultural background, which contributes to different mental programming and determines individual thinking, feelings and actions (Hofstede, 1984). Accordingly, the knowledge of the people who deliver and create the new service innovation is important. The owners of SMBs operate and dominate the firms. Their cultural background, such as their beliefs and attitudes, affect the way in which they manage and organize a business. The business managers' underlying culturally influenced beliefs and attitudes also influence changes in the business (Bhaskaran, 2006). For example, if people are raised in a collectivist culture, they are more likely to cooperate and to interact with others, and this is reflected in their work attitude (Mannix & Neale, 2005). In addition, culturally influenced beliefs and attitudes and the way they respond to service innovation are also influenced by their business skills and by the personal contact networks that SMBs develop and access (Bhaskaran, 2006). That is, both cultural and personal characteristics nurture the performance of innovative products or services (Scott & Bruce, 1994).

This study considers the people who perform the service innovation to be the owners of SMBs. Accordingly, there is a need to understand how culture influences SMBs and how culture affects SMBs in providing service innovation and developing local cultural industry. However, existing studies rarely address SMB service innovation based on culture. Consequently, this study proposes the concept of “cultural interpretation”, which refers to the interpretations of the influences of the local cultural context and the impressions that SMBs wish to convey to their customers when performing service innovation. The concept of cultural interpretation is to facilitate SMBs to identify the possible directions for service innovation based on culture.

To this end, this study develops a technological framework of semantic information system artefact (called Cultural Experiential Semantic Modeling, CESM) taking into account culture as a sense-making concept that links local culture to the SMB owner's managerial behavior on service innovation. This sense-making concept connects culture and personality to Cultural Interpretation and SMB owner's managerial behavior on service innovation. The CESM artefact can be regarded as a kind of culturally sensitive design of information systems (Kummer et al., 2012) that focus on the utilization of culture through information systems. That is, our artefact is so designed as to address cultural elements into existing business managerial behavior, focusing on changes in SMB owner's mind-sets to support possible strategic change on service innovation. This artefact can be utilized by either the designers who motivate or inspire SMB owners or directly by the SMB owners themselves.

## **Related Background**

People reside in different countries and in different period, and the ideas they encounter cannot help but reflect the effect of their environment (Hofstede, 1993). When the ideas and decision originate from the SMB owners, they decide their business managerial behavior. Different cultures also result in different types of goods/service behavior (Winsted, 1997). These goods/service behaviors can be viewed as a SMB's management or business style.

Hofstede's (1993) cultural study mentioned that culture can be described in five dimensions, which can be used to predict how a society operates, including its management. Each of these cultural dimensions has two opposing elements (Hofstede, 1994): (1) Power Distance is defined as

the inequality between people; (2) Uncertainty Avoidance is defined as the degree of tolerance for structured or unstructured situations; in societies with high power distance, inequality is accepted, but in societies with low power distance, there is relative equality between individuals; (3) Masculinity, which most values success, competition and (the opposite is femininity); (4) Individualism is defined as the degree to which people prefer to work alone or to be in a team work (i.e., collectivism versus individualism); (5) Long-Term Oriented is defined as the values that are oriented towards the future. The opposite is short-term oriented. Adler (1991) proposed the cultural and behavioral cycle theory to demonstrate how culture (values, beliefs and attitudes) influences management behavior of individuals. This can be applied to SMB owners as well. Individual decision-making is guided by different cultural rules and principles (Briley and Morris, 2000). Individual decision making rules and principles are often derived from culture and knowledge.

According to the five factor theory of personality (Costa & McCrae, 1996, 1999), cultural and personality traits are closely related. Personality traits can be influenced by culture. Culture and personality are the classical terms according to the field of psychological anthropology (Hofstede & McCrae, 2004). For instance, Hofstede (2001) detailed five cultural dimensions, emphasizing the significance of culture on business communications, and gave a definition of “culture” as the collective programming of the mind (i.e., cultural mental programming) that differentiates the members of one class of people from those of another (Hofstede, 1984). This definition focuses on a culture’s mental programming, which can be a result of a type of thinking, feeling, or action. Hofstede conceptualized culture as ‘programming of the mind’ in the sense that certain cultures create certain reactions, based on the differences between the primary values of the members of different cultures (Hofstede, 2001).

The Revised NEO Personality Inventory (Costa & McCrae, 1992) classified personality into five big sectors, called neuroticism (N), extraversion (E), openness to experience (O), agreeableness (A) and conscientiousness (C). Each personality was defined by six specific cultural traits (Hofstede & McCrae, 2004). For example, personality openness includes the fantasy trait, aesthetics trait, feelings trait, actions trait, ideas trait and value trait; personality extraversion includes the warmth trait, gregariousness trait, assertiveness trait, activity trait, excitement seeking trait and positive emotions trait.

In sum, the literature shows that culture does affect SMB owners and that different cultures cultivate different business management styles. In order to further understand the effect of culture on SMBs management styles (i.e. decision making, service provision), this study will propose a SMB cultural model, which involves different dimensions (social and cultural embodied, religion, social relationships) within a local cultural context and Hofstede's cultural dimensions and the Revised NEO Personality Inventory (Costa & McCrae, 1992), to assess the effect of local culture on SMB's business managerial behaviour.

## **The CESM Artefact**

The main idea of the CESM artefact is to recommend for SMBs the directions in service innovation, considering socio-cultural implications. This means it requires an understanding of the socio-cultural context and behavior of the SMB that can be subsequently linked to the cultural and personality traits of SMB owners and their awareness of suitable cultural interpretations. A direction for development is then suggested, based on culture.

The socio-cultural context denotes the SMB's cultural background, which includes their local lifestyle, practices, tradition, social contacts, norms and values, ideas and cultural identity (Chiesura & De Groot, 2003). Socio-cultural behavior refers to lifestyle and may include favored behavior, habitual activities, or even implicit routines. Some behaviors are implicit, but some are explicit. Both the socio-cultural context and socio-cultural behavior contribute to cultural traits referring to the traits (attributed by the cultural) that ones have.

Given that cultural and personality traits are closely related, culture contributes to values and behavior and cultural traits signify both cultural and personality traits (Hinenoya & Gatbonton, 2000). That is, each SMB owner has its own cultural traits, because they come from different cultural contexts and have evolved different cultural behavior. A SMB owner's cultural traits shape each SMB's culture, circumstances and the cultural activities in which it participates.

The way in which cultural traits are manifested or represented, in terms of either an action or a SMB owner's self awareness, i.e., cultural interpretation awareness, which is cognitively shaped, are examined. A SMB owner's cultural traits are psychologically shaped, so the process of becoming aware is cognitive in that it involves the gathering, processing and

evaluation of information on habits or actions (Hayes & Allinson, 1998). That is, each SMB has its own traits and SMB owners realize and conceive their behavior through a cognitive process. In addition, the SMB owner's cognition can be further transformed into SMB managerial behavior. The process of cognition gathers interpretations into a mental model and then guides actions, videlicet, and applies this concept in the business field (i.e., the SMB performs service presentation).

In order to act upon the above basic ideas, Figure 1 shows the framework of the CESM artefact and identifies four main components, which include Modeling SMBs' cultural Traits (to classify and identify SMBs' cultural traits), Proposing Knowledge Based Cultural Interpretations (to recommend cultural interpretations for SMBs), Rethinking and Appraising Current Service Status Quo (to recommend SMB new service innovation directions using cultural interpretations), Evaluating and Suggesting Cultural Interpretations for Cultural Service Innovation (to evaluate and suggest the most suitable interpretations to a SMB). The details of the components are described in the following subsections.

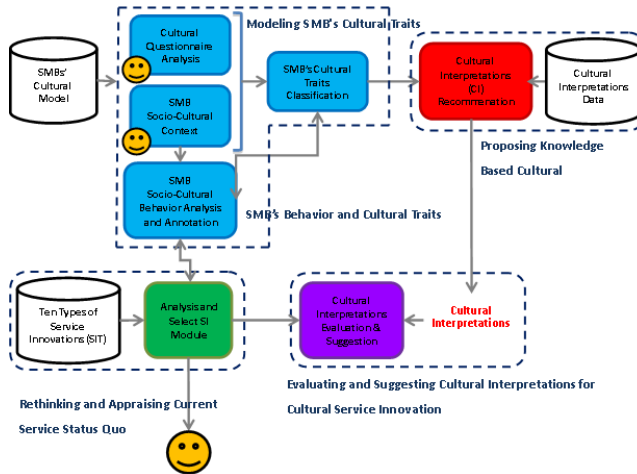

Figure 1 The CESM artefact.

### *Modeling SMB's Cultural Traits*

This component identifies the SMBs' socio-cultural background and behavior and then classifies them into cultural traits. At the beginning, a series of questions which are related to the user's cultural context are

posed. The user provides information by answering those questions. This component subsequently analyzes these statements to identify the cultural traits which characterize the user. Once these cultural traits are identified, cultural interpretation recommendations will then be made. This study is conducted in the context of Chinese culture and we use a model of three levels of analysis for the classification of cultural traits, as shown in Figure 2. This model is proposed with the following theoretical basis.

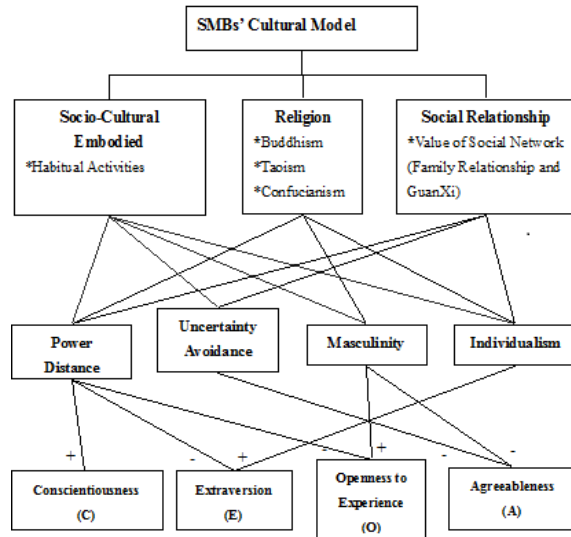

Figure 2 SMBs' cultural model.

The first level of cultural background requirement represents the socio-cultural context (religion and social relationship) and socio-cultural behavior of SMBs (socio-cultural embodied). Traditionally, a local Chinese culture is often tied up with a local religion (Yu & Miller, 2003), including Buddhism, Taoism or Confucianism (Haber & Mandelbaum, 1996). Meanwhile, the social relationship more focuses on the value of social network which includes the relationship in the family and 'GuanXi' that refers to the interconnected nature of relationships based upon reciprocation and obligation (Imrie, 2008). In addition, the socio-cultural embodied is about the living style, that is, SMBs' habitual and cultural activities that SMBs participate such as tea activities, traditional festival celebration or some special local activities.

The second level (linking to the first level) includes the four dimensions (power distance, uncertainty avoidance, masculinity, individualism) of Hofstede's cultural model, because these dimensions can reflect the fundamental dimensions of culture from the view of value systems at different levels (individual, group, organization) (Inkeles & Levinson, 1969). That is, to understand SMBs' local socio-cultural background, the knowledge of culture can give a big picture about how culture affects people's behavior. Culture is a shared experience of those people who come from the same culture context; they will teach their offspring the value systems of viewing the real world (Yu & Miller 2003). These values compose the kernel of the society and serve as the foundation of the attitude and anticipation of the members from the culture (Yu & Miller, 2003). The linkages between the first and the second layers can be attained according to previous studies. For example, the linkages to the manifestation of socio-culture embodied behavior and activities can include Hofstede's power distance dimension about how a person handles inequalities when it occurs, the uncertainty avoidance dimension about the degree of how people feel uncomfortable when the future is unknown or ambiguity, the masculinity dimension about people's self-concept about the role they view and play (e.g., more assertive role or to be more caring, nurturing role), the individualism dimension about people's view and preference (e.g., preferring a loosely knit social network or a tightly knit social network) (Hofstede, 1983), simply in terms of relating their capacities attempted.

The linkages to religion are also based on previous studies about different religions contributing to different behaviors. For example, the value of Buddhism is related to the three cultural dimensions (high power distance, femininity and collectivism). For SMB owners, their religions contribute to their business styles more or less (Yu & Miller, 2003) and the main characteristics of Chinese business/management style are under the influences of the three religions (Buddhism, Taoism, Confucianism). For the business style of Buddhism being to obey, trust and carry morals and stable mentality (Yu & Miller 2003), the characteristics of Buddhism is to behave morally good and nice. Accordingly, it is inferred that Buddhism SMB owners have the characteristics of high power distance (more willing to see a peaceful world), femininity (willing to show their caring to others), and collectivism (without strong self-centered argument and unfair feeling). Similar inferences for the other two Chinese religions are omitted in this paper.

The linkages to the value of social network involve three cultural dimensions (power distance, individualism/collectivism and uncertainty avoidance). Our main focus is the relationship and “GuanXi” between SMBs and their families. Most of Chinese people are family oriented, and have considered 'family', rather than 'individual', as the basic social unit (Hung, 2004). In addition, Hofstede and McCrae (2004) mentioned “in collectivist societies, people are integrated from birth onward into strong, cohesive in-group, often extended families (with uncles, aunts, and grandparents), protecting them in exchange for unquestioning loyalty. And a society’s power distance level is bred in its families through the extent to which its children are socialized toward obedience or toward initiative.” We also argue that family education might lead their children to be willing to take risk and adventure or just stay in a comfortable atmosphere.

The third level (linking to the second level) includes the four<sup>50</sup> of the five personality traits of the revised NEO personality inventory (NEO-PI-R) (Costa & McCrae, 1992), which include conscientiousness (C), extraversion (N), openness to experience (O) and agreeableness (A), to examine personality traits at the culture level (Hofstede & McCrae, 2004) for our purpose of finding the cultural traits of SMBs. Hofstede and McCrae (2004) provided the research results about the zero-order correlations (Table 1) between the personality factors and culture in Asia. The correlations indicate that all five personality factors are significantly associated with at least one dimension of culture and that all four cultural dimensions are related to at least one personality factor. That is, the links between the Hofstede’s cultural dimensions and the NEO-PI-R personality factors are based on the results shown in Table 1.

With the links of the NEO-PI-R personality factors, it is possible to recommend possible personality traits to SMBs and allow them to confirm their main personality traits given a personality is defined by six specific cultural traits (Hofstede & McCrae, 2004) as mentioned in Section 2. These cultural traits can subsequently form the basis of the next step in recommending cultural interpretations to SMBs. The process to identify the cultural traits is through the collection of socio-cultural embodied information and the analysis of cultural questionnaire (related to the religion and social relationship), attaining the possible main personality

---

<sup>50</sup>In this study, the personality of neuroticism is excluded for consideration SMBs because we focus on the use of positive cultural traits and positive emotions to encourage SMBs to do service innovations.

factor. To confirm the correctness of the main personality, another personality questionnaire related to its six traits will be also tested.

*Table 1 Zero-Order Correlations between Mean NEO-PI-R Factors and Culture Scores (Hofstede & McCrae, 2004).*

**Zero-Order Correlations Between Mean NEO-PI-R Factors and Culture Scores Across 33 Countries**

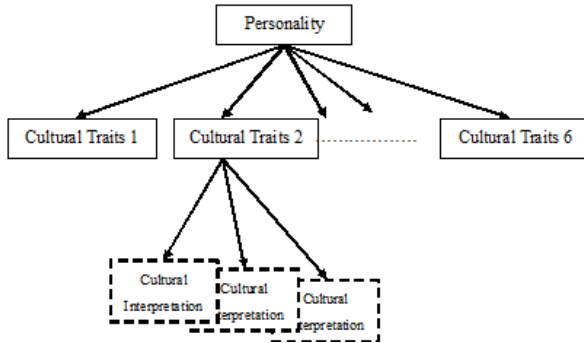

<i>IBM Culture Dimension Score</i>	<i>NEO-PI-R Factor</i>				
	<i>E</i>	<i>C</i>	<i>O</i>	<i>N</i>	<i>A</i>
Individualism	0.64***				
Power distance	-0.57**	0.52**	-0.39*		
Masculinity			0.40*	0.57**	-0.36*
Uncertainty avoidance				0.58**	-0.55**

NOTE: E = extraversion; C = conscientiousness; O = openness to experience; N = neuroticism; A = agreeableness.  
 \* $p < 0.05$ . \*\* $p < 0.01$ . \*\*\* $p < 0.001$ .

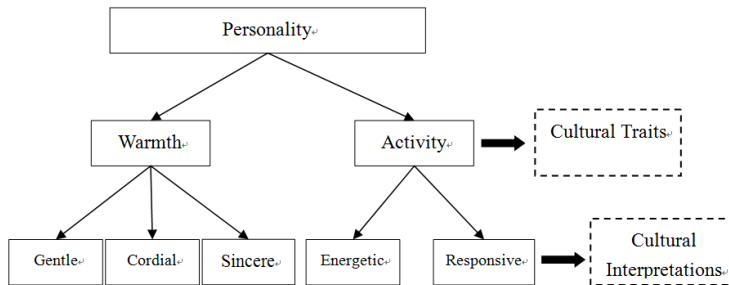

### *Proposing Knowledge Based Cultural Interpretations*

This component uses cultural traits to recommend suitable cultural interpretations to SMBs. In this study, Cultural Interpretation (CI) is defined as the styles of behavior and the rules that allow individuals to express their unique attributes and to determine the very nature of their own life experience, including cognitive, emotional and motivational behavior. It is assumed that cultural interpretations are the adjectives used to describe the behavioral styles of SMBs. These adjectives have a series of related meanings that characterize cultural traits. The CESM artefact adopts the ontology shown in Figure 4(a) specifying the relationships among personality, cultural traits and cultural interpretations, i.e., SMB’s six cultural traits and the cultural interpretations for each of the four personalities (i.e., totaling to 24 cultural traits).

For example, the personality of extraversion is defined as having the six cultural traits of warmth, gregariousness, assertiveness, activity, excitement seeking and positive emotions. For the cultural trait of “warmth”, there is a series of adjectives to describe the meaning of warmth, such as gentle, cordial, or sincere. That is, these words indicate an individual who has warmth as a cultural trait. Therefore, the cultural interpretations of gentle, cordial and sincere are classified into the cultural trait of warmth as exemplified in Figure 4(b).

(a) Ontology specifying the relationship between cultural traits and cultural interpretations.

(b) An exemplar.

Figure 4 The semantic relationship of cultural interpretations classifications.

The aforementioned semantic design allows the construction of a cultural interpretations knowledge database that can easily classify or aggregate the cultural traits information. Suitable cultural interpretations that are classified as members of the SMBs’ cultural traits can then be recommended to the SMBs. These semantic relationships between the classification of cultural interpretations and cultural traits (i.e., the classification of cultural interpretations using cultural traits) are based on the meaning of cultural interpretations and cultural traits. Semantic similarity (Resnik, 1995) is used to analyze and evaluate the similarities between the meaning and information about cultural interpretations and cultural traits. Table 2 shows an exemplar relationship between personality, cultural traits and cultural interpretations, based on their similarity. DISCO (extracting DIStributionally related words using CO-occurrences) is used, and

this is a Java class program that allows the semantic similarity between two words to be identified (Kolb, 2008, 2009). It produces a semantic similarity score. This score represents the similarity between two given words; a higher score signifies a greater semantic similarity.

*Table 2 An exemplar relationship between personality, cultural traits and cultural interpretations.*

Personality	Extraversion (E)					
	Cultural Traits	Warmth	Gregariousness	Assertiveness	Positive Emotions	Activity
Cultural Interpretations	Excitement	Friendly	Assertiveness	Practical	Action	Seek
	Kindness	Harmonious	Refresher	Definite	Growth	Dream
	Comfort	Compatible	Problem-Solving	Positive	Concentration	Trying
	Pleasure		Presentational	Specific	Stimulation	Wish
	Strength		Supervisory	Strong	Organization	Able
	Warm			Constructive	Interaction	Willing
	Touch			Interesting	Effects	
	Tenderness			Direct		
	Happiness					
	Sympathy					
	Softness					
	Affection					
	Joy					
	Charm					
Passion						

There are 24 diagrams in total representing each of the four personality factors and its six cultural traits. This component recommends six cultural interpretations to a SMB owner, based on his/her personality and cultural traits. The cultural interpretations are determined by randomizing the selection of the cultural interpretations and cultural traits in accordance with the personality traits of the SMB owner. Random choices are used to identify recommended cultural interpretations in order to ensure impartiality and diversity and prevent choosing the most similar or the least similar cultural trait, because each cultural interpretation may have a different degree of similarity to a cultural trait in each diagram.

### *Rethinking and Appraising Current Service Status Quo*

The component, Rethinking and Appraising Current Service Status Quo, allows SMBs to assess the current service status quo from a list of questions

related to the SMB's business activities and their yes/no connection to the ten types of service innovation identified by Keeley (1999), which are of four different categories (process, offering, delivery, finance) each of which can be further divided into two or three subtypes.

Going through the questions, SMBs would review their current business situation and the cultural interpretations attained from the previous components that connect the cultural interpretations with the factors considered within the ten types of service innovation. We anticipate SMBs could get some inspirations about how to utilize their cultural interpretations for the purpose of inspiring SMBs to think about the new chances of service innovation based on culture and personality elements.

### *Evaluating and Suggesting Cultural Interpretations for Cultural Service Innovation*

This component allows the SMB user to understand cultural interpretations and their use to improve the current service and business by connecting their cultural activities and their current business status quo to cultural interpretations, in order to identify possible SMB service innovation opportunities. In order to allow SMBs to implement service innovation based on cultural interpretations more clearly, the suggested advice shows descriptions of cultural interpretations-service innovation that combine cultural interpretations and the four categories of the subtypes of service innovation. That is, this component suggests possible directions of cultural interpretation based service innovation according to the SMB cultural traits, allowing the SMB to develop a holistic appreciation of their own personality results and exercise more imagination on them for their future service innovation.

In sum, the CESM artefact is used to facilitate and inspire SMBs who want to do service innovation or to impress their customers with servicescape using their socio-cultural strengths. Our implemented artefact system currently is still in its small scale form that does not involve corporate-level service oriented technology and management to enable the transition from domain-specific business views to formalized technical service view in order to facilitate the sharing or transferring as addressed in Demirkan et al. (2008), partly because the system is used by SMBs that have very limited resources and their owners mostly serve their customers directly. However, this artefact can further be integrated with a co-design tool in order to generate some groundbreaking innovation concepts.

## **Data Analysis**

Our preliminary evaluations adopt qualitative interpretation data analysis (Saldana, 2009) to evaluate our CESM artefact. This study has two assumptions: (1) Local cultural elements can be implemented and included in different domains of cultural industries toward service innovation, so regardless of the type of industry, local cultural elements would influence SMBs, because local culture is a part of the SMB's cultural context. (2) Different individuals are depicted by different cultural interpretations because of their different cultural context and personality, so cultural interpretations can represent the explicit and implicit behaviour of SMB owners (which contribute to SMBs' different degrees of service innovation and different business styles).

The evaluations of our CESM artefact are twofold. The CESM artefact begins with an analysis of a SMB's local cultural context, in order to discover the cultural interpretations which apply to the SMBs and can guide SMBs to execute service innovation. Hence, it is necessary to ensure that cultural interpretations can indeed represent a SMB's cultural context and can inspire SMBs to perform service innovation. In other words, SMBs are influenced by local cultures and then contribute to their explicit and implicit behavior. This type of explicit and implicit behavior is described using the notion of cultural interpretations proposed in this study. Accordingly, the following hypotheses are presented:

***Hypothesis 1:*** *Local culture contributes to cultural interpretations that can represent SMB owners' behavior and thinking.*

***Hypothesis 2:*** *Cultural interpretations can be a local cultural driver to guide SMB owners to perform service innovation.*

The field chosen for this study's evaluation was in the city of Yi-Lan, a typical agriculture tourism city that features a variety of SMBs with limited resources aspiring to increase innovation opportunities. The field interviews focus on an exemplar leisure farm area named "pillow mountain leisure agriculture area", which was the first leisure agriculture area in Yi-Lan, founded in 2000. It includes four villages: Zhen-Shan village, Tung-Le village, Tou-Fen village and Yong-He village. Zhen-Shan village is the major development area, with an area of seventy-eight square hectometers. Many different services are provided by the vendors in Zhen-Shan village, such as bed and breakfast, fruit picking experiences and many other different and

colourful tourist products and services that highlight the natural aspects of Zhen-Shan and support an interest in agriculture.

To examine the values of our artefact, we take four successful SMBs from the field of Zhen-Shan village and shown them our semantic information system artefact and gather data from them by interviewing these SMB owners. These interview subjects also exemplified the typical business in Zhen-Shan village and in Yi-Lan, most of which nevertheless are not considered as successful. That is, we would like to know if our system artefact can resonate with the service innovations made by these four successful SMBs in Zhen-Shan village. The data were gathered through group interviews and individual in-depth interviews. The data collected from the field interviews is used to evaluate the hypotheses that cultural background does contribute to SMBs' thinking and actions and that it can influence the way with which SMBs serve their customers toward service innovation.

In order to evaluate the hypotheses, we delimit the encoding of the interview data first. These data will be used to evaluate the hypotheses. Data encoding (Saldana, 2009) is an interpretive act in qualitative research that symbolically assigns summative, salient, or evocative attributes for a portion of data, which can be further analyzed to attain an in-depth understanding of human behaviour or decision-making and the reasons behind it. There are two coding cycles. The first cycle uses vivo coding (i.e., code mostly taken directly from the text) to identify the preliminary codes. The second cycle then classifies the themes of the preliminary codes into the final codes used to verify the hypotheses.

***Hypothesis 1: Local culture contributes to cultural interpretations that can represent SMBs owners' behaviour and thinking.***

In order to collect useful information to show that local culture can represent SMB's behaviour and thinking, the relevant interview data is used to demonstrate the findings. Knowledge of the SMB's background and the factors that influenced SMBs is vital. The raw data is classified into two different final codes: cultural context and cultural interpretation. Cultural context is local culture, which includes family relationships, education, values, environment and background. The cultural interpretation is the thinking and behaviour that is contributed by SMBs' cultural context and experience. The encodings of the interview data show the positive linkage between cultural context and SMB owners' thinking and behaviour as

indicated in Table 3. That is, cultural context would contribute to cultural interpretations implying SMBs owners' behaviour and thinking.

The data collected here are all from the in-depth interviews, because the details of each vendor are important. According to the data collected from the interview sessions, as noted in Table 3, the common backgrounds of the SMBs affects them, internally or externally. However, they use different ways to reflect and show this effect. The abduction method is used to show the findings for their cultural effects. The abduction method requires that the interview data is given as a preliminary code that would be inferred into final code. In other words, the final code represents the spirit of the interview data.

For example, the owner of Vendor D B&B, Mrs. Lee, was a child who grew up in a farming family, so the working principles of Mrs. Lee are highly influenced by her family working on farm. Mrs. Lee said, "<sup>10</sup>I was born and brought up in farming families. All I know is that we have to be diligent and to do our best at what we are doing now." Her diligence is firstly encoded as her<sup>10</sup> family education style and then her family education style is classified into a part of the cultural context. In addition, her background also contributed to her<sup>11</sup> Conservative and with low ambition personality, inferred from her description: "<sup>11</sup>I think that I am so conservative because of my family background. I do not have such ambition to achieve everything." This conservative and low ambition personality is an example of a type of thinking, represented as a cultural interpretation. That is, she prefers to observe first and then starts to ascertain whether something is worth the effort, when she encounters an innovation opportunity. In sum, it is inferred that Mrs. Lee is influenced by her cultural context, which contributes to her thinking and behavior. Through these illustrative stories shown in Table 3, it is inferred that the influence of local culture does affect SMB owners' behavior and thinking, which is represented as cultural interpretations. Their current actions reflect their own experience and cultural context.

Table 3 Interview data analysis for evaluating Hypothesis 1.

[Interview Data].	[Preliminary Codes].	[Final Code].
<p><sup>1</sup><i>“My father really worked very hard and did not care about how much money that he made, He just thought that he could not stop working and had no concept of planning.” – Vendor A - Mr. Tseng</i></p>	<p><sup>1</sup><i>Father had no concept of planning - Family Values.</i></p>	<p>✓ Cultural context.</p>
<p><sup>2</sup><i>“My parents’ generation only cared about contribution and did not ask for a return. Therefore, they grew a lot of different fruits and vegetables, but they did not try to understand which was suited to the market. <sup>3</sup>I want to do my work in a smart way; I do not want to follow the old paths. ” – Vendor A - Mr. Tseng</i></p>	<p><sup>2</sup><i>View contribution more than return - Family Values.</i>  <sup>3</sup><i>Self-awareness from the past experience</i></p>	<p>✓ Cultural context.  ✓ Cultural- Interpretation.</p>
<p><sup>4</sup><i>“The reason why I started to make Chinese refreshments is because it was hard to get one when I was young. <sup>5</sup>The situation at that time was bad, and we had to be satisfied that we had food and were not starving. For us, bread and refreshment were luxuries, so, once we got the chance, we tried to make it by ourselves.” – Vendor B - Mr. Lin</i></p>	<p><sup>4</sup><i>Lack of resources</i>  <sup>5</sup><i>Be satisfied and cherish</i></p>	<p>✓ Cultural Context  ✓ Cultural- Interpretation.</p>
<p><sup>6</sup><i>“To be honest, <u>Yi-Lan</u> is in the Taiwanese countryside and the people here seem lazy and not so ambitious in terms of their careers. However, that is because the atmosphere here is really closed and conservative, so the outside world has little influence, so <sup>7</sup>Mr. Wu felt inferior at that time.” – Vendor C - Mrs. Wu</i></p>	<p><sup>6</sup><i>Social morals are closed and conservative</i>  <sup>7</sup><i>Environment effects self-cognition feeling inferior</i></p>	<p>✓ Cultural Context  ✓ Cultural Interpretation.</p>
<p><sup>8</sup><i>“When he (Mr. Wu) finished serving in the army and went to his first job, at first, he thought that he was hard working and dedicated himself to the work. However, his supervisor did not give him any encouragement and reward, but gave it to those who graduated from university or college, so he finally found out that the importance of educational background. <sup>9</sup>This really affects him a lot; so he keeps learning and he is going to get a degree even when he is almost seventy years</i></p>	<p><sup>8</sup><i>Education background matters.</i>  <sup>9</sup><i>Preseverance with learning</i></p>	<p>✓ Cultural Context.  ✓ Cultural Interpretation.</p>

*A Semantic Approach of Cultural Interpretation toward Service Innovation*

<p>old.” – Vendor C - Mrs. Wu <sup>10</sup></p> <p><i>“<sup>10</sup>I was born and brought up in farming families. All I know is that we have to be diligent and do our best at what we are doing now.”</i> – Vendor D - Mrs. Lee <sup>11</sup></p> <p><i>“<sup>11</sup>I think that I am so conservative because of my family background, I do not have such ambition to achieve everything.”</i> – Vendor D - Mrs. Lee <sup>11</sup></p>	<p><sup>10</sup>Family education - diligent<sup>10</sup></p> <p><sup>11</sup>Conservative and with low ambition<sup>11</sup></p>	<p>✓ Cultural Context.</p> <p>✓ Cultural Interpretation<sup>11</sup></p>
--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------	----------------------------------------------------------------------------------------------------------------------------------	--------------------------------------------------------------------------

**Hypothesis 2:** *Cultural interpretations can be a local cultural driver to guide SMB owners to perform service innovation.*

In order to evaluate this hypothesis, the interviews focus on why and how SMBs design their services and whether they gain any inspiration from their own experience or cultural background. That is, we would like to know if these inspirations are either resonate with our system artefact or could be guided by our system artefact. The interview data is encoded into three main final codes. The first is the cultural context presented as local culture, which includes family relationships, education, values, environment and background. In the second, cultural interpretation represents the thinking and behaviour that is contributed from the SMB owners’ cultural context and experiences. In the third, service provision and design represent SMB owners’ business style and their services. These raw data are firstly given their preliminary codes and then categorized into proper final codes. Table 4 of interview data to evaluate Hypothesis 2, shows the raw data, followed by the preliminary codes and the third column shows the three final codes. The relationship between the interview data and the final code is then inferred. It is found that local culture drives the way with which SMBs design their service and what they hope to provide to their customers.

For example, Mrs. Lee, the owner of “Vendor D”, designed her B&B based on the way she worked on the farm, with several different but square rooms. *She said,* <sup>22</sup>*“I divided my B&B into several different square spaces and I decorated those spaces as differently themed bedrooms. <sup>23</sup>Like a vegetable farmer, we divide our land and grow different vegetables.” This shows that her behaviour was influenced by her <sup>23</sup>Family working style and <sup>22</sup>working experience, the influence of the cultural context transformed into the action. In her mind, she prefers <sup>24</sup>harmony style to competition, as shown by her interview data: <sup>24</sup>*“I do not like to compete with other B&B providers; I think that that will lower the quality of the B&B industry. I think that customers will feel what we convey to them. <sup>25</sup>I try to make visitors feel**

*comfortable and relax, so that they can enjoy the peace and beauty here.”* Therefore, she would like her B&B to be a place to <sup>25</sup>*convey peaceful atmosphere*. Her need for harmony shows her cultural interpretation and her wish to convey a peaceful atmosphere to her customers and shows her service provision and innovation.

*Table 4 Interview data analysis for evaluating Hypothesis 2.*

<b>[Interview Data]</b>	<b>[Preliminary Codes]</b>	<b>[Final Code]</b>
<p><sup>12</sup><i>I do not want to go along my parents' old path, I try to know more about my customers, to suit their needs and interests, <sup>13</sup>I am really sensitive to the trends for different fruits and I know the right time to change my key fruits.” – Vendor A- Mr. Tseng ◦</i></p>	<p><sup>12</sup><i>Suit customers' needs and interests.</i></p> <p><sup>13</sup><i>Has sensitivity for his products.</i></p>	<p>✓ Service Provision and Innovation.</p>
<p><sup>14</sup><i>When I was young, our situation was not so good. We did not have much time to study, or even to play. We had to work on the family farm so, <sup>15</sup>we learned by doing, by trial and error. ### A Semantic Approach of Cultural Interpretation toward Service Innovation

forget the pressure of work and life. I will not change this key concept. I insist." – Vendor C - Mrs. Wu - c.	country style feeling to customers.	Innovation.
"22I divided my B&B into several different square spaces and I decorated those spaces as differently themed bedrooms. 23Like vegetable farmers, we divide our land and grow different vegetables." – Vendor D - Mrs. Lee .	22Behavior influenced by working experience. 23Family working style.	✓ Cultural Interpretation. ✓ Cultural Context
"24I do not like to compete with other B&B providers; I think that that will lower the quality of the B&B industry. I think customers will feel what we convey to them. 25I try to make visitors feel comfortable and relaxed, so that they can enjoy the peace and beauty here." – Vendor D - Mrs. Lee .	24Be herself, harmony. 25Convey peaceful atmosphere.	✓ Cultural Interpretation. ✓ Service Provision and Innovation.

Using the encoding process for these SMB owners' vivo data, it is possible to understand, as mentioned in Hypothesis 1, that their cultural context could have a motivating effect on their behaviour and thinking. These action and thoughts are deciding factors in how they decorate their businesses, how they convey their views and how they run their business as mentioned by Hypothesis 2. It states that cultural interpretation is a local driver that can guide SMBs to execute service innovation. The four SMB owners assert that what they present and how they act can be interpreted as their personality and their deep motivation based on cultural interpretations. This resonates with the attempted contributions of our system artefact that were highly appreciated by the four SMB owners.

## Conclusion

This study is presenting a framework of semantic information system artefact used to determine the social cultural drivers, called cultural interpretations, which can help guide SMB owners toward service innovation in combination with further enterprise design research on creating new services in line with the cultural interpretations as driven by the owners. This artefact proposes a local cultural model to describe the main local cultural contexts which influence people's acts, thinking, or service behaviour. This artefact uses cultural interpretations to motivate and guide SMB owners toward different types of service innovation. In the analysis of the interview data and inferences, it was found that some SMBs have no idea that their behaviour and their cultural background are linked in the beginning. However, during the interview sessions, it was discovered that what they described could be traced back to their cultural background

and gave clues to the link. It was also found that they can easily accept the concepts of our artefact, as long as it is presented in an easy and straight forward manner. The data from the interviews shows a positive relationship between the new service provisions and the SMB cultural characteristics. In other words, our CESM artefact is believed to be able to help guide SMBs to link their service innovation to their own cultural traits in terms of cultural interpretations. Our CESM artefact can also emerge for SMBs as an enabler bringing together cultural elements into existing business managerial behaviour, focusing on changing SMB owner's mind-sets to support possible strategic decision making on service innovation.

There are several limitations of this study. The first limitation is our local cultural model might be less robust owing to its limited coverage of cultural contexts (e.g., for example, the dimensions of religion and social relationships are two main cultural factors in the Chinese society). The second limitation is the possibly limited collection of cultural interpretations and the further consideration of the emerging cultural dynamics. Future researchers can continuously improve our local cultural model in order to cope with these limitations.

This page is intentionally left blank.

# Editorial: Co-creating shared value with stakeholders in service design

Tung-Jung (David) SUNG<sup>a</sup> and Yuan LU<sup>b</sup>

<sup>a</sup> National Taiwan University of Science and Technology; <sup>b</sup>Eindhoven University of Technology

Service design plays an increasingly important role in provision of value in a modern economy (Mager & Sung, 2011). In addition, value co-creation is often considered as a fundamental cornerstone of service design (Schneider & Stickdorn, 2011), while co-creation is today's most accepted model for innovation (Forbes, 2011). However, value co-creation with stakeholders under the service-dominant logic can occur in different ways. Therefore, how to effectively manage value co-creation to be a sustainability strategy has become relatively crucial for different kinds of organisations, such as enterprises or non-profit organisations (NPOs).

As a result, revisiting an integrated model or framework of value co-creation with stakeholders is becoming a major challenge for user-centred service design. So far, there has been very limited research on exploring co-creating shared value with stakeholders in service design. Therefore, this session aims to offer a platform for researchers and practitioners to present the state of the art research, discuss latest developments, and envision future directions.

This session consists of eight articles. Each of them contributes important insights into the understanding of co-creating shared value with stakeholders in service design, and the findings provide an important benchmark for subsequent research on related topics. To provide readers with a quick overview of the eight collected articles, a brief summary for each of them is presented as followed.

The first article, by Anders Haug and Pia Storvang, discusses how the concept of 'consumer communities' can be integrated into store concepts based on two case studies of outdoor product stores. Furthermore, Haug and Storvang explore the four key issues and relative approaches for the related stores as a reference for future consumer community development.

The second article, by Satu Miettinen, Simon Rontti, and Jaana Jeminen, highlights that service simulations and prototypes are crucial in service

design methods since they can serve as personalized emotional samples, which reveal customers' emotional reactions and enable decision makers to go through their own experiences with an early engagement of the process. Moreover, Mittinen et al. advocate that the role of the designers should be placed in more strategic positions in the new value of co-creation system.

The third article, by Jeff Man, Yuan Lu, Aarnout Brombacher and Fangtian Ying, examine the issues of team communication and design challenges in distributed intercultural design teamwork. Through conducting design courses and related co-creation workshop, Man et al. uncover that team communication is important and requires some effective communication tools to improve intercultural design teamwork. The fourth article, by Shu-Shiuan Ho, Yi-Fang Yang, and Tung-Jung Sung, offers valuable insights into exploring the relationships between co-creation and store image consistency in creative stores. The findings of the study reveal that higher levels of store image consistency require not only tangible or intangible elements, but also the image co-creation through different types of actors. The fifth article, by Chih-Shiang Wu and Tung-Jung Sung, discusses the importance of facilitating stakeholders to co-create for customer experience management in tourism. In a service design project, Wu and Sung integrate practical insights of customer experience management and stakeholder co-creation into each stage of the service design process. The sixth article, by Busayawan Lam and Andy Dearden, aims at investigating current state of co-design knowledge of the community-based organizations. Through surveys, interviews, case studies, and a creative workshop, Lam and Dearden provide a valuable guidance for effective co-design services with the beneficiaries during the design process. The seventh article, by Pelin Gultekin-Atasoy, Hanneke Hooft van Huysduynen, Yuan Lu, Tilde Bekker, Aarnout Brombacher and Berry Eggen, develops a method that combines both insights from the user and business in a single design process for multi-stakeholder settings. After examining two cases, the study reveals that conflicts are valuable moments in multi-stakeholder discussions as to providing new insights to the participants and reducing the uncertainties in the earlier stages of innovation processes. The final article, by Erez Nusem, Cara Wrigley and Judy Matthews, presents a longitudinal action research of the effects of applying design-led innovation, which is a customer-centric method, into NPOs. Nusem et al. argues that NPOs should better understand the stakeholders with design-led innovation and redefine the value they offer to market as to driving innovation effectively and responding to the rapid changing dynamic environment.

Last, these articles included will provide new prospects for exploring value co-creation with stakeholders in service design that is at its infancy. Our thanks go to the authors, the reviewers and all who were involved in preparing this session.

## Communities as a Retail Store Concept

Anders HAUG\* and Pia STORVANG

University of Southern Denmark

*Because of increased competition, retail stores are looking for new ways to attract and retain consumers. Along this line, this paper explores how the concept of 'consumer communities' can be integrated into store concepts. This is done through two longitudinal case studies of outdoor product stores. Such stores have seldom been studied in the literature, but they may be particularly interesting in relation to consumer communities, because of the consumers' often passionate relationship to activities related to the products in focus. The two cases are investigated through interviews, store observations, network meetings and workshops. On this basis, the paper defines: 1) the community form to aim for, 2) the premises for creating communities, 3) the relevant activity types, and 4) the set of activities to be chosen.*

**Keywords:** Consumer communities; Outdoor product stores; Retail design, Service design; Concept design

## Introduction

Increased competition implies that retail stores are constantly looking for new ways to improve their customers' experiences. As a basis, the store atmosphere and the signals the interior sends are decisive for producing the right customer experience (Van Rompay et al., 2012). Society, however, is always changing, so stores must constantly evolve to attract new customers while retaining the old ones (Babin & Attaway, 2000). This also implies that retail stores need to explore more untraditional means to achieve the desired effects. In fact, there is an increasing tendency to perceive retail stores as more than a place for purchasing goods, but also a place for socialising and leisure (Hu & Jasper, 2006; Simonsen, 2014). Along this line, this paper explores how 'consumer communities' can be integrated into retail store concepts.

Most literature on retail store design has a general perspective or focuses on one particular store type, mainly supermarkets and fashion stores. Outdoor product stores, on the other hand, are a store type that has seldom been studied, but may be particularly interesting in relation to retail store-centred consumer communities. Outdoor product stores offer products that support outdoor activities, which can be characterised by longer stays outdoors, where the experience of and attitude towards nature is significant — unlike intense sports activities, where the nature experience is pushed into the background because of the physical exertion and competitive focus (Friluftsrådet, 2013). Thus, this store category, among others, includes retailers of equipment for diving, camping, hunting, mountain climbing and scouting.

Outdoor product consumers might need more than just product information. More specifically, customers may request information about possible places where the products can be used and about others' experiences with different products in these contexts. Since it is unlikely that a sales assistant has the necessary expertise to fulfil such needs, the information must then come from other sources. Such information can come from books, brochures and contact with other organisations, but it can also come from being part of communities of consumers with similar interests. In practical terms, such communities may emerge from activities like product demonstrations, boutique cafes, lectures, activity events, special areas for product testing and the like. If a store can stimulate the creation of such communities anchored at a particular store, then this may produce significant benefits in relation to customer loyalty, customer satisfaction and understanding of customers.

Based on the discussion above, the question addressed by this paper is as follows: 'How can retail stores stimulate the creation of consumer communities anchored in the store?' The question is investigated through two longitude case studies of outdoor product stores. On this basis, this paper addresses four issues: 1) the community form to aim for, 2) the premises for creating communities, 3) the relevant types of activities and 4) the set of activities to be chosen. The findings from these two case studies are, to some degree, applicable to other store types and this is also addressed in this paper.

## **Literature review**

Literature searches in scientific journals, including the databases of ISI, EBSCO and A&HCI indexed papers, did not lead to the identification of relevant papers concerning store concepts for outdoor product stores. Searches on specific types of outdoor stores yielded little as well. Therefore, this chapter discusses the more general literature on retail store design, service design and consumer communities.

### *Retail store design*

To design retail store environments and services that produce the desired effects, an understanding of the potential consumers is a key issue. From an overall perspective, shopping can have two types of objectives: goal-oriented and recreational purposes (Joye et al., 2010). When shopping is a goal-oriented activity, the shopper feels bothered by factors such as having to wait in line, having difficulty in finding the desired products, having to pass physical obstacles, etc. Such issues result in a bad shopping experiences, which, in turn, can lead to the shopper avoiding specific shopping situations (Donovan & Rossiter, 1982). On the other hand, recreational shoppers are less adversely affected by such factors, but, in fact, prefer some stimulation during their shopping activities (Van Rompay et al., 2012).

An important aspect in store design is to understand how potential consumers perceive themselves, as shoppers usually prefer shopping environments that match their self-concept (Sirgy et al., 2000; Yim et al., 2007; Chebat et al., 2009). According to the study by Chebat et al. (2009), store loyalty can be predicted by consumers' self-congruity (match between the brand image and consumer's self-concept) — and store dimensions such as atmosphere, merchandise, price and promotions can predict this self-

congruity. Another way to understand consumers is through the concept of 'lifestyle', as used in the sociology of culture to distinguish between social groups in general patterns of values, attitudes and preferences (Ritterfeld, 2002).

Much retail store design research has focused on the design of shopping environments that stimulate consumers towards a desired behaviour. Such research has been heavily influenced by the work by Philip Kotler, who in the beginning of the 1970s was a key figure in relation to exploring the more subtle aspects of service environment design — what he termed 'atmospherics,' or "the conscious designing of space to create certain effects in buyers" (Kotler, 1973, p. 50). Since then, there have been many studies on environmental psychology and retailing that have established the importance of creating pleasant consumer experiences, conveying a desired store image and promoting specific behaviours (see, e.g., the review by Van Rompay et al., 2012).

According to Simonsen (2014), there is a tendency for more stores to sell mixed products. She mentions that a bike shop may open a café, a hairdresser may sell glasses and a hardware store may sell clothing. Furthermore, in the coming years, we may expect to see more social shopping, whereby stores become places where we listen to music, go to events and places where we meet new people (Hu & Jasper, 2006; Simonsen, 2014).

### *Service design*

The concept of 'design' has traditionally been linked to products, and, in many aspects, the insights produced in the field of product design cannot be applied to 'service design', because of the different characteristics of services, such as intangibility and perishability (Holopainen, 2010). More specifically, service systems can be defined as configurations of people, technology and other resources that interact with other service systems and help create value (Maglio et al., 2009; Patrício et al., 2011). In this context, the field of design management focuses on how particular methods and approaches of design, such as visual representations of customer journeys and creation of 'personas', may be applied in the design of services (Holopainen, 2010).

Service design processes have often been described in the form of 'water wall models' (i.e., a set of predefined steps) (Bullinger et al., 2003), but this linearity perspective has increasingly been criticised (Alam, 2002; Toivonen et al., 2007). Also, the traditional perspective on service design,

which has a focus on offering value through predefined services, has been challenged. For example, it has been argued that the design of complex service systems requires a holistic approach, i.e., a focus on both design system components, and the network of relationships that make up the service, which overall results in the full service of greater value than the sum of its parts (Norman, 2011). Another perspective is that value is created through 'co-creation', which can be done through social interaction with employees, other companies and customers (Vargo & Lusch, 2004; Toivonen et al., 2007; Roser et al., 2013). Thus, instead of delivering shrink-wrapped services, companies may offer value propositions that customers can turn into value through use (Normann & Ramírez, 1993). The resources that a company use in co-creation of value can, according to Saarijärvi et al. (2013), come through B2B, B2C, C2B and C2C value relations.

### *Consumer communities*

Because of the high costs associated with winning new customers for companies, it has become increasingly important to establish long-term relationships (Casaló et al., 2008; Morgan & Hunt, 1994; Andersen, 2005). One way of building such long-term relationships is through the establishment of consumer communities anchored in a company. The literature with a focus on consumer communities has its main focus on online (or virtual) communities, i.e., communities connected through message boards, chat rooms, and blogs. Such communities are often referred to as 'virtual communities' — a term introduced by Rheingold (1993). This paper, on the other hand, focuses mainly on communities based on real-world interactions.

An important type of a consumer community is a 'brand community', which is defined as group of individuals who voluntarily relate to each other because of their interest in some brand or product (Muniz & O'Guinn, 2001). The concept of brand communities involves the concepts of productive consumers and of value co-creation (Algesheimer et al., 2005; Schouten et al., 2007). The company benefits from brand community strategies can be significant, including higher consumer satisfaction, greater consumer loyalty, more information and an amplified word-of-mouth effect (Atkin, 2004). According to Casaló et al. (2008), a brand community is characterised by three core components. The first is termed 'consciousness of kind', and it refers to the feeling that binds every individual to the other community members and the community brand. This type of community is determined by two factors: 1) legitimisation (establishing a difference

between true and false members) and 2) opposition to other brands. The second core component is termed 'rituals and traditions', which describes the processes carried out by community members, in which the community is reproduced and community meaning is transmitted in and out of the community. The third core concept is termed 'sense of moral responsibility', which refers to the feelings that create moral commitment among the community members. There are two fundamental types of actions in relation to moral responsibility: 1) the integration and retention of members that guarantee the community's survival and 2) the support in the correct use of the brand.

In relation to consumer communities, an important distinction can be made between enduring involvement and situational involvement, where external stimuli cause situational involvement and internal factors cause enduring involvement (Houston & Rothschild, 1978). Enduring involvement requires commitment, which is a central objective for most organisations (Andreassen, 1999). Commitment can be defined as a continuing desire to maintain relationships that are considered important and valuable (Moorman et al., 1992; Morgan & Hunt, 1994). Commitment can be divided into calculative and affective commitment (Geyskens et al., 1996; Roberts, et al., 2003; Gustafsson et al., 2005). The calculative commitment refers to an individual being committed to a relationship because the value of the resources invested in the relationship would be substantially decreased if the individual ends this relationship and starts another one. This also includes situations in which there are no attractive alternatives to the established relationship. Affective commitment refers to the emotions and closeness between the parties, and this type of commitment assumes that both parties involved in a relationship will be interested in continuing it.

In relation to the focus of this paper, the concept of 'communities of practice' is also relevant. The concept was introduced by Jean Lave and Etienne Wenger (1991) to describe a group of people who share a craft or profession and are bound together by their common interest in that domain in which they share their information and experiences with each other and thereby are part of a learning process. In some cases, this describes what happens when communities are established around brands or retail stores, namely, that consumers are bound together by a common interest and through these relationships they learn from interacting with each other.

## **Research method**

To investigate consumer communities as a store concept, two case studies were carried out. The two companies were identified through a network meeting in the project 'Design to innovate' (D2i, 2014). The idea of D2i is that universities help small and medium-sized businesses (SMEs) in the southern region of Denmark to develop their businesses by using design thinking. The two cases were selected because of their focus on building communities in relation to their stores. The two selected stores were a diving store (combined with diving centre) and a camping store.

The two cases were examined through interviews, store observations, networking meetings and workshops from autumn 2012 to the summer of 2014. The interviews were carried out as semi-structured interviews with managers and were digitally recorded. In addition, information was acquired through several informal conversations with persons from the companies. The observations at the stores had the purpose of understanding communication with customers, store design and consumer behaviour. The observations were registered through notes, process maps and photos. In the case of the diving store, also role-playing activities were carried out with the purpose of understanding how customers met and interacted with company staff. The network meetings involved four to seven companies, including the two in focus, and they had the purpose of learning the companies about branding, store design, design thinking and letting the companies share experiences with business developing initiatives. The first network meeting focused on marketing and how to create customer events. The second network meeting focused on new online marketing and web challenges. The third network meeting focused on store design and company branding. The final network meeting focused on tools to use to develop interaction on different kinds of media. Finally, three workshops, customised according to specifics of the individual stores, were carried out. Two of the workshops were facilitated by either the researchers or design consultants, and one workshop was carried out as an 'idea generation camp', facilitated by a group of business students (Bager 2011; Heidemann & Nielsen, 2011). Information about the two case studies is shown in Table 1.

Table 1 Case study characteristics.

Case	Interviews	Store observations	Network meetings	Workshops
Diving Store	2	2	4	3
Camping store	1	2	4	2

## Creation of communities around retail stores

The question in focus, as mentioned in the Introduction, is divided into four issues that are addressed in the subsequent subsections:

- 1) Community form
- 2) Premises for the creation of communities
- 3) Identification of possible activities
- 4) Identification of sets of activities

### *Community forms*

To define different types of consumer community, a basic distinction is made between relationships between businesses and consumers, and relationships between consumers. This distinction produces three archetypical types of consumer communities, which are illustrated in Figure 1 and subsequently explained. In Figure 1, the 'B's' refer to 'businesses', the 'C's' to 'consumers' and the lines to relationships.

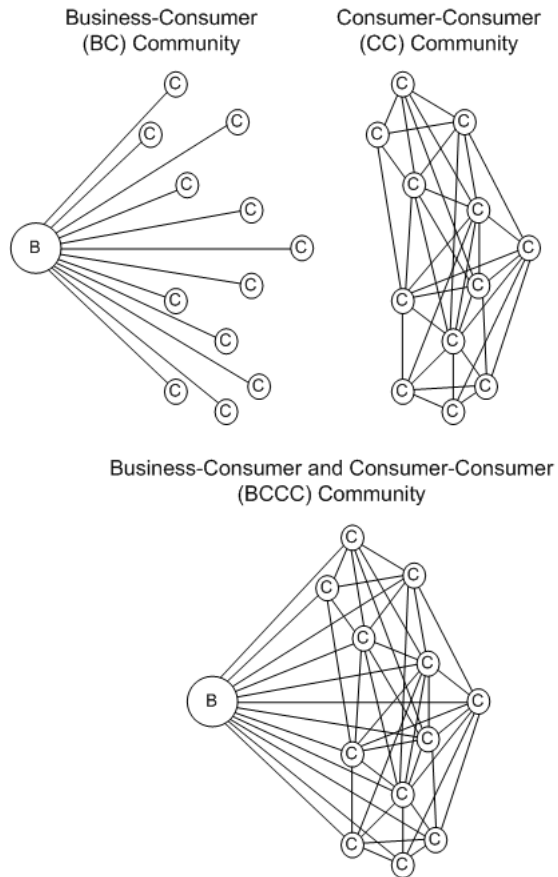

The first archetype describes communities in which the communication in the community is between the company and individual consumers. This can, for example, be in the form of a web-page where it is possible to communicate with a company but not with other consumers. The downside of this form of community is that it requires much communication to keep the community alive — and although providing consumers with this communication, they may still desire to communicate with other consumers as well.

The second archetype describes communities in which the communication is between the consumers. This can, for example, be in the form of a society of people with a common interest. From the perspective of a company, the problem of this type of community is that it is not related to the particular company, and for this reason its participants may use different companies to support their activities.

The third archetype is a community in which there is communication between the company and individual consumers, but also between individual consumers. To avoid the downsides of the previous two

community types, this kind of community, in most cases, seems to be the one to strive for. This was also the aim of the two outdoor product stores in focus.

*Figure 1 Archetypal consumer communities*

### *Premises for creating retail store communities*

Before attempting to establish a consumer community anchored in a store, the first question must be asked: Is it feasible? Based on the discussions during the interviews, network meetings and workshops, three overall aspects emerged:

- 1) Consumer motivation

- 2) Consumer availability
- 3) Consumer homogeneity

Firstly, it is obviously important that the consumers in focus have a desire to spend their spare time on activities involving a store and other consumers. This to a great extent depends on the type of products that the store offers. In other words, the products need to be related to a special interest, even passion, of the consumers. This was also the case for the diving and the camping stores.

Secondly, the consumers in focus need to be available in the sense that they are not already involved in other communities that would make it difficult to involve them. For the diving and camping stores, the community needs of a significant number of the 'motivated consumers' did not seem to be completely fulfilled by other organisations.

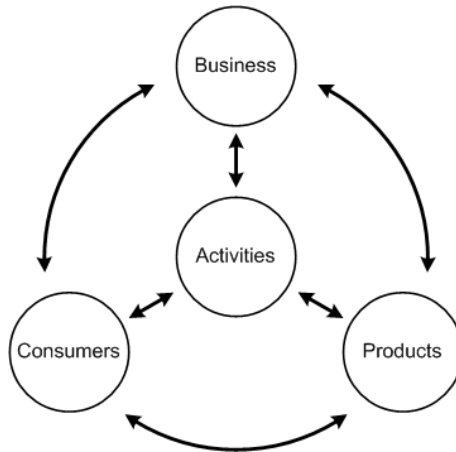

Thirdly, consumer homogeneity needs to be considered because, while a store's consumers may be motivated, available and share a common overall interest, they may not necessarily have the same exact interests. If such interests are too divergent, then this implies the need for several specific consumer communities, which could be extremely resource-demanding to support. In relation to the two cases studied, only the camping store had made an actual study of its customer types, while the diving store believed that they have acquired a good understanding of this issue through their daily experiences. However, after having participated the last workshop, the diving centre decided to produce some customer profiles to help them become better at addressing the needs of their customers. In neither of these two cases did the stores find that their customers were too inhomogeneous, which would thus prevent the formation of communities across the different customer types.

Among the companies participating the 'D2i' B2C networking, two other outdoor product stores were identified: a bike store and a scout store. Although, these seemed to have customers motivated for community participation, there were some other issues. For the bike store, on an overall basis, many of their customers were just interested in buying a bike without further activities. For the customers having cycling as a more serious hobby, most were members of cycling clubs that fulfilled their community needs. Thus, although certain activities could generate attention and attract consumers, it seemed to be difficult to establish a customer community anchored in the store. As for the scout store, Denmark has a long tradition of young people being members of scout organisations. Thus, although activities initiated by the scout store were well capable of attracting

consumers, but such activities did not seem to lead to the creation of a group of customers with special ties to the store, i.e., a community. In other words, such activities generated attention and attracted customers, but they did not create communities anchored in the store.

### *Community activity types*

Communities are established and evolve around activities. Thus, having understood which type of community a business is interested in building and having established that there are relevant consumers to build it, the next question is: Which types of activities would enable this? The discussions of activity creation in the two case studies revolved around three types of entities: the business, the consumers and the products. This is illustrated in Figure 2 and subsequently explained.

*Figure 2 Creation of community activities*

The model in Figure 2 includes six relations between its four entities. The relation between the business and the products involves that the business (store) retrieves information about products, as well as actual products, and defines demands for future products. The relationship between the business and the consumers involves that the consumers share their experiences and make demands for products and services for the business to respond to. The relationship between the consumers and the products involves that consumers acquire and use the products.

An understanding of the characteristics of the three outer entities provides a basis for defining relevant activities. Firstly, there is the business

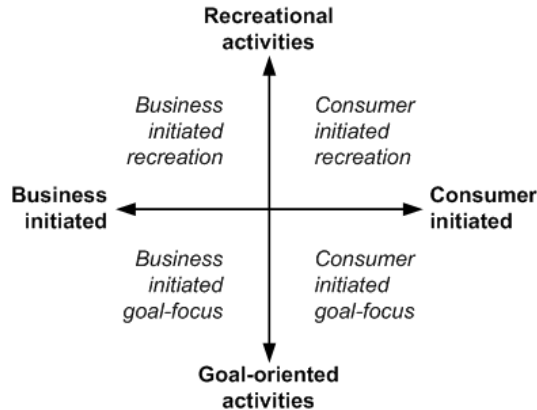

perspective, in which an activity needs to produce some benefit. This can either be a direct benefit, for example, that consumers pay for participation or buy products while participating in the activity, or it can be indirect benefits, for example, consumer loyalty or community building. From the product perspective, an activity needs to consider the products offered by the store at a minimum in the sense that the activity does not negatively impact the consumers' interest in the products. More specifically, certain activities may have the focus of strengthening the bonds between the business and its consumers, while not involving the actual products offered in the store. For example, if a bicycle store gave away cinema tickets to a cycling movie, the movie should not directly or indirectly promote bicycle products that the store does not offer, which, in the worst case, could drive the customers to competitors. Finally, in the consumers' perspective, the activity needs to be interesting so that they would want to participate.

Activities can emerge from all three of these outer entities, i.e., the business, the consumers and the products. As mentioned, a business may create an activity in order to strengthen its bonds with consumers or stimulate community creation. Activities of all three of these types were identified in the three cases. From the business perspective, the diving store, for example, arranged club nights, while the camping store arranged themed exhibitions. From the consumer perspective, diving store consumers, for example, suggested certain social events, while camping consumers socialised with each other in the store café. From the product perspective, for the diving store, certifications from external parties could be acquired through the store, and in the camping store, suppliers organised product presentations.

### *Identifying the 'right' set of activities*

Having defined possible activities and realised that realistically only a subset of potential activities can be initiated, the question is: Which combinations of activities should a business choose to initiate? As argued earlier, activities can be consumer initiated or business initiated ('business' in this context covers both store and supplier initiatives). Further, as described in the literature, consumers may have a recreational and/or a goal-oriented agenda. In the cases studied, both the recreational and the goal-oriented focus were observed in which the 'recreational' agenda refers to participation with the motive of relaxing and having a good time, while the 'goal-oriented' agenda refers to a motive of acquiring something. In the cases studied, such goals were mainly related to acquiring information, but

also including getting certain discounts, having certain experiences, being helped fixing defect products and trading used products. Obviously, many of these activities also had a strong recreational (socialising) aspect at the same time. The two distinctions give rise to defining four types of community activities, as illustrated in Figure 3.

*Figure 3 Community activity types*

When considering the cases in relation to Figure 3, ‘business-initiated recreation’ includes activities such as organising club nights (diving store) and serving hot dogs (camping store); ‘business-initiated goal focus’ includes diving education and lectures about camping; ‘consumer-initiated recreation’ includes socialising with consumers and personnel on the ‘diving ship’ and consumers socialising with each other in the camping store café; and ‘consumer-driven goal focus’ includes consumers sharing experiences about diving on the ‘diving ship’ and consumers offering to give lectures in the camping store. As mentioned earlier, many activities obviously may have both recreational and goal-oriented aspects at the same time.

Often it would be preferable to include both business-initiated and consumer-initiated activities in order to avoid that the business needs to use too many resources or that the community is not connected to the business. Furthermore, if consumers have either, or both, recreational and goal-oriented needs, there is a need to support both types in order to keep as many consumers as possible in the community. Finally, although outdoor customers may have the same general interest, they may have very diverse preferences and needs. Thus, a store must identify activities that simultaneously satisfy (almost) all customer types or target a subset of their

customers. This kind of analysis may be carried out by dividing customers, sharing relevant characteristics, into subgroups, and then map these groups to possible activities, using a rating that describes their expected interest in the activity. This illustrated in Figure 4.

Figure 4 Mapping consumers and activities

To produce a consumer community, the diving store acquired a ship and established a voluntary association with the purpose of creating water activities and engaging in ship traditions. According to the owner of the diving store, the purpose of the ship was “to provide a setting for sharing stories, education, information sharing, fishing, scuba diving, boat trips, events and a lot of other crazy activities”. Other initiatives of the diving store included:

- Diving club membership
- Club nights
- Dining arrangements
- Diving trips
- Fishing trips
- Lectures about diving
- Diving education/courses
- Equipment repair facilities
- Used equipment marked

The experiences of the diving store after launching these initiatives were that they, to a large extent, had enabled the creation of a community that included both the staff and consumers. The owner described the community anchored in the store as “a special kind of interest community, where there is a feeling that the employees are like one big family”. Further, the

activities around the ship and at the diving store were believed to have attracted new customers.

The camping store had observed that there was much activity on the Internet involving camping enthusiasts helping each other out and sharing information. Furthermore, the store staff had attended a design seminar and a workshop where they learned about different customer trends of campers. On this basis, they saw the potential for the creation of consumer community anchored in their store, as well as just attracting new customers through improved services. The initiatives launched, or with concrete plans of launching, included:

- Repair shop for altering and repairing caravans
- Store café (in a sparse variant, including chairs, tables, coffee/tea/water and brochures)
- Lectures in the café (done by personnel, suppliers, or expert customers)
- Lending of their meeting rooms to other companies
- Product demonstrations (by personnel or suppliers)
- Leisure events (e.g., serving hotdogs, arranging competitions, etc.)
- Product testing (areas for trying products)
- Games (floor games in the store)
- Children's areas (play areas)

The experiences of the camping store with these initiatives have so far been mixed. While activities, such as leisure events, children's area and floor games seemed to have drawn attention to the store and increased consumer satisfaction, the store café had not yet had the desired result. The café was not only intended as a self-service café, but also as a space in which the store could arrange lectures, social events and other arrangement in the evening. However, they had never quite gotten this cafe to operate as intended, since the store had difficulties in finding resources for arranging such events and because of fewer consumer-initiated events than expected.

Despite the different experiences of the two stores so far, common for both was that they saw a great potential for harvesting the benefits from the initiation of different consumer-oriented activities. On the other hand, a central issue for the stores was that they, like many other SMEs, had limited financial and time resources to invest in such activities. Further, the two cases showed it could be extremely difficult to anticipate which activities consumers would participate in. Thus, there was a need for constantly evaluating initiatives and, if necessary, new ways to activate the community.

In this sense, communities may be seen as ever-changing organisms with constantly developing needs.

As mentioned, the majority of the literature on consumer communities focuses on web-based communities. This issue was also found important by the companies in the design network, since they had all recognised an increasing necessity of using social media. On the other hand, the administration of web-based news and forums were found to be rather resource demanding, for which reason the companies in focus found it very difficult to keep up with. Further, the actual effects of web-based activities on the sales numbers can be harder to pinpoint than activities organised at the stores. Thus, in relation to community creation, the case companies had their main focus on store-related activities, while web activities were almost only in the form of one-way communication through webpages to an unknown group of recipients. In other words, such web activities had the purpose of creation attention and attracting customers, not on creating communities.

## Conclusions

This paper focused on how retail stores can stimulate consumer community creation. More specifically, the paper raised the question: 'How can retail stores stimulate the creation of consumer communities anchored in the store?' A focus was made on outdoor activity product stores, since their consumers seem to be particularly relevant because of their often passionate relationship to activities related to the products in focus. Thus, two longitudinal case studies of such companies were carried out. With a basis in the two case studies and to address the question in focus, four issues were explored: 1) the community form to aim for, 2) the premises for creating communities, 3) the relevant activity types and 4) the set of activities to be chosen.

Firstly, in relation to community forms, the paper defined three archetypes: business-consumer (BC), consumer-consumer (CC) and a combination of the two (BCCC). In the two cases studied, the latter seemed to be ideal, as the BC community type implies that the stores needed to spend too many resources on consumer interaction and unfulfilled consumer needs of talking to other consumers, while the CC community type implies a lack connection between the community and the stores, thus posing the threat of the consumers choosing competitors. However, although the BCCC community type was the ideal for the cases studied, it

may not always be so. For example, some fashion stores and supermarkets offer memberships to their consumers to create loyalty towards the store or brand in focus, but they may not have a particular interest in their consumers socialising with each other. Thus, in such cases, the BC community type seems to be most suitable. On the other hand, for companies producing a new or special type of product, the CC community may be relevant simply to increase the awareness of the product type. For example, fair trade product producers and ecology producers would have an interest in communities promoting and creating greater awareness of these types of products in general, as this is likely to be beneficial for all, or at least the majority, of such producers.

Secondly, in relation to the premises for the creation of communities, the paper defined three types: consumer motivation, consumer availability and consumer homogeneity. These were all extremely important in the two cases studied, but the question is if this would be the same in other cases? At least the first two seem to be of a general nature, as it would be hard to imagine a well-functioning community without consumer motivation or availability. This homogeneity aspect as a minimum involves that consumers have a common interest in the types of products offered. It could be assumed that, for example, communities initiated with the purpose of learning about consumers or to stimulate innovation could be effective if they included persons with very different perspectives.

Thirdly, in relation to consumer community activities, the paper argued that these could be understood as being defined by three elements: the business, the consumers, and the products. Given that the latter is defined as minimally implying that the activity does not discredit the company's products or promotes competitors' products, it seems that this perspective is adequately fundamental to also be useful in other cases.

Finally, the paper defined four overall types of community-initiated activities by distinguishing if they are consumer-initiated or business-initiated and if they have a recreational or goal-oriented purpose. For the two stores studied, it appeared that there was a need for having both business-consumer and consumer-consumer activities, as well as both recreational and goal-oriented activities. This may, however, not be the case for other companies. For example, some malls focus on attracting consumers with recreational activities, while some hi-fi forums seem to be highly focused on sharing information about products. Also, as earlier mentioned in relation to the community form discussion, both pure BC and CC communities may be relevant in some cases.

In contrast to the type of consumer communities that the literature mainly focuses on, namely, Internet-based communities, the two companies mainly focused on communities involving real-world interactions. In fact, the case studies showed that for some SMEs, the work associated with maintaining and evolving Internet-based communities can be too time consuming to employ as a community strategy. On the other hand, the two case studies showed that outdoor product stores can achieve a number of benefits by implementing 'real-world' activities that stimulate community creation. Such communities can, for example, provide an incentive to spend more time in stores and produce customer loyalty, while minimising the need for traditional market investigations. As argued, the framework may also be useful for other types of stores, and even other types companies. Thus, besides further studies of the framework in relation to outdoor stores, future research needs to study the framework's usefulness in other contexts.

## Co-Prototyping Emotional Value

Satu MIETTINEN, Simo RONTTI\* and Jaana JEMINEN

University of Lapland

*Service design methods provide tools for both the analysis-based perspective to understand user motivations, emotions, the participatory development and co-design process. This research specifically focuses on audio-visual concretization with agile methods and technological tools to simulate the service journeys and solutions. This article examines the question: ‘How can profitable solutions and value be created from intangible experiences and customers’ emotion in the use of service design methods?’ The findings of this study suggest that service simulation and prototyping help in decision making of new service development. Simulations and prototypes serve as personalized emotional samples, which reveal customers’ emotional reactions and enable an early engagement of the process for decision makers through their own experiences. New systems for value co-creation place designers in more strategic positions.*

## Introduction

The labor-intensive service sector is the largest part of the Finnish national economy, but investments in intangible capital continue to produce less profit than tangible investments (Mahmood, 2011). In developing service quality, the customer focus and meanings created during the service experience are key development elements (Rintamäki, Kuusela & Mitronen 2007). Service design methods provide tools for both the analysis-based perspective to understand user motivations and emotions and the participatory development and co-design process. This research specifically focuses on audio-visual concretization using agile methods and technological tools to simulate the service situation and solutions. This study utilizes the SINCO laboratory methodology developed at the University of Lapland (a technology-enhanced service prototyping and simulation environment) to answer the research question: ‘How can profitable solutions and value be created from intangible experiences and customers’ emotion in the use of service design methods?’

*Figure 1. SINCO laboratory is a concrete example how to do service design. SINCO consists of the environment and a set of tools for co-design and service prototyping. In SINCO technological equipment and digital material such as photos, videos, and sounds are used to create the atmosphere of actual service moments for prototyping and re-enactment. As the set-up for prototyping services, SINCO has two 117” background projection screens perpendicular to each other, to provide the background scenery and enable partial, yet immersive, spatiality. This helps to concretize different aspects of service concepts and ideas for participating users by giving them a better idea of what the service experience might contain and feel like. In SINCO, it is possible to simulate all kind of services, processes, and practices.*

This study is a part of the outcomes of a research called 'Value through Emotion' and was funded by TEKES (Finnish Fund for Technology and Innovation). This study is a case study research in which the practical development projects of five companies (KONE Oyj, Danske Bank, Norrhydro, Lapland Safaris, and Santa Park) and supporting interviews with nine other companies (GE, Intuit, IDEO, Adaptive Path, LVL Studio, Volkswagen, Whitespace, BetterDoctor, and Experientia) created a case to understand both the designer's role in value creation and the service design approach that enables this value creation. Research data were collected through thematic interviews and participatory observation and were analyzed using a theory-driven content analysis.

One important result is that the service design approach can generate appropriate solutions to support positive emotional reactions and guide positive feelings throughout the service situation (Miettinen, 2011; Miettinen & Koivisto, 2009; Miettinen & Valtonen, 2012; Stickdorn & Schneider, 2010; Tassi, 2009). The service design serves as a platform through which company values, customer needs, and motivating emotions meet. Prototyping and simulation concretize and visualize intangible service products that enable identification of customers' feelings and objectives during the service experience. Emotional aspects can be captured early in the development process through contextualized and personalized prototypes when used with appropriate fidelity. Accordingly, the identified premises to support this process in companies include an appropriate prototyping environment and embracing the new facilitator role for service designers.

Service simulation and prototyping aid in decision making and serve as personalized emotional samples that reveal customers' emotional reactions and enable decision makers' to engage in the process through their own experiences. Furthermore, simulation serves as an internal communication platform, which reveals strategic tacit knowledge. Simulation also helps the service staff train employees to handle the emotional responses of customers? This process is critical because the emotions of the service staff are present while providing service and create value through this interaction.

## **Research data and methods**

This paper is based on thematic interview and group discussion data collected from Finnish (N=5) and international companies (N=9) that have

used service design and the designing thinking process or have used designers in their service development process. The research data was collected from two research projects: 'Practices, Processes, and Products for Medicine and Healthcare' and 'Value through Emotion'. The data was collected in 2013 and 2014. The interviews with the international companies were deep thematic interviews about the role, process, and benefits of service design. The Finnish companies were involved in action research focusing on the understanding and concretizing of customers' emotional value in the service process and the benefits of service prototyping. The group discussions (N=6) and interviews (N=6) were conducted usually after the co-creation sessions were facilitated with technology-aided prototyping and simulation methods. Participatory observation was also used as a research method for this paper. The service prototyping sessions (N=10) were both documented with video, and fieldwork notes were taken. Fieldwork notes were analyzed in the same manner as the interview material. The fieldwork notes were important as the emotions (laughter, frustration, anger) that emerged in the prototyping sessions were noted carefully. Video documentation served as a visual note to confirm the outcome of the analysis.

The content analysis was conducted using two analyzing rounds in which researchers first selected key terms and phenomena that responded to the research questions and the main concepts related to the terms. The researchers read the transcript material through looking for themes related both to service designers' role as well as the emotional aspects related to service prototyping. They marked the themes and categorized them. In the second round, the findings were discussed in research meetings to understand the significance and meaning in relation with research questions. The findings were discussed in theoretical context.

## **Emotion, co-creation of value, and service prototyping are integrated in service design**

The service design process provides the platform and the tools for the stakeholders and the developers to integrate the themes of emotion in service development. This includes the customer's emotion and experience during the service experience as well as the emphatic effort to understand the customer's emotion and use this knowledge during the decision-making process when developing services. Service thinking is an on-going consideration of how collective needs are met without overstretching the

human and natural resources (Reason, Downs, & Lovlie 2009). The core of service design is to uncover these needs and emotions. This approach is used in experience design, which is an approach to creating an emotional connection with users through the careful planning of tangible and intangible service elements (Pullman & Gross, 2004). Designers can facilitate change and assist all stakeholders in understanding what the steps toward desired outcomes are. Cook, Bowen, Chase, Dasu, Steward & Tansik (2002) have discussed human issues in service design. They present *"the concept of scripting where customers interact with services according to some pre-existing paradigm, which are referred to as scripts. These can indicate where standardization is value added, and where customization of the service would be more appropriate. Conflict between the service system design, and the customer's chosen script is a major source of service failure."* Further, they discuss the customer experience and emotion from delight to rage and use scripting as means to appropriate the emotion in customer encounter situation. Service prototyping can give means to experiment different service encounter situations and analyze feelings related to these situations. This is a quick way to see if the encounter engaged users in laughter or frustration.

Sangiorgi (2012) proposes that design researchers work at two parallel levels. At one level, they introduce Design for Services methods with a focus on improving service experiences and offerings designed to meet customer needs. Second, they introduce a new way of thinking about value co-creation and innovation (Service Thinking) that could transform the way organizations perceive their role, offerings, and innovation processes. In this way, the service design approach integrates both the themes of a customer's emotion and experience in the innovation process and concretizes them for the benefit of value co-creation efforts.

Srivastava and Verma define the co-creation of value as 'a systematic and structured process based on collaboration with outsiders to generate value for the firm as well as for the customers' (2012, p.192). Consumers want to define choices in a manner that reflects their view of value, and they want to interact and transact in their preferred language and style (Srivastava & Verma, 2012, p. 192). In goods-dominant logic point of view, a company can create more value for its customers either by lowering costs or by making the product more attractive when value is assessed as value-in-exchange or value-in-product (Vargo, Maglio & Akaka, 2008, p. 148; Srivastava & Verma, 2012, p. 198). In service-dominant logic, value creation focuses on value-in-use or value-in-context. Vargo and Lusch suggest that

'there is no value until an offering is used – experience and perception are essential to value determination' (2006, p. 44). Moreover, one of the foundational premises of the S-D logic is that value is always uniquely and phenomenologically determined by the beneficiary (Vargo et al., 2008, p. 148). The definitions of value co-creation ground well the role of experiential learning and prototyping as a method in the co-creation process.

Service prototyping provides a means for concretizing the customer's emotion and experience. Service prototyping is a new area for a designer that locates him in the centre of a business development case working as a facilitator and using concretizing tools that connect the stakeholders and visualize the service offerings in the case. The short duration of a prototype cycle, from trying something out and testing it with users, is what makes the relationship between design and business successful (Moggridge, 2006). Prototypes can quickly and cost-effectively communicate a service proposition and prompt questions regarding the technical feasibility, consumer desirability, and business viability (Samalionis, 2009). Prototypes are tools for thinking (Brown, 2009). According to Coughlan et al. (2007), prototyping is a powerful means to facilitate organizational development and change.

Blomkvist (2012) proposed four distinguishing features of prototyping approaches and presented them as levels in which prototyping can be conducted: 1) artefact, 2) use, 3) context, and 4) service levels. This division of prototyping approaches is done to make the constituents of service prototyping more explicit. Representations, such as service sketches, service walkthroughs, and live service prototypes, allow service developers to approach and understand the experience of service propositions. Also, the development and low cost of audio-visual devices and mobile technology with a variety of applications enable the rapid simulation of use contexts and high-fidelity experiments with ideas early and inexpensively (Rontti, Miettinen, Kuure & Lindström, 2012). These kinds of methods also allow designers and users to enact or simulate service experiences before they have been established in an organization (Holmlid & Evenson, 2007).

## **Service designers have strategic roles in value creation**

*In the company my role is combined designer's and sociologist's role adding the self-driven researcher's role in that. I do the research work related to the projects from the human factors and design research aspects. So I haven't got traditional industrial designers' role at all.*

The designer's role has changed. Design thinking has changed the designer's work on both the operative and the strategic level. On the operative level, the design competencies and methods are applied in a wide range of things from the development of social services in the public section to the addition of service aspects in the manufacturing processes.

*First, prototypes are scenarios that are sketched by a professional visualizer who can manage them quickly. I have also produced concept videos and service concept videos in few days warning. You need to have quick storytelling skills.*

The designer's responsibilities and job descriptions have become more research-oriented. On the other hand, social and communication skills in addition to having experience with the methods and tools used in different phases of the innovation process are necessary. The designer's role and activities are increasingly international. The designer's role in the co-design and participatory design work has become more important and diversified. Design is no longer used only in the beginning of the innovation process but also as a tool to maximize the possibilities for all types of innovation during the continuous development and the quality control of service products.

The process of service design enables the concretizing and the understanding of the overview and the details. This facilitates the development work and the innovation process. Service designer appears in a role of pushing the shift from company's 'inside-out' development strategy into 'outside-in' view (Rhea, 2003, p. 146).

One aspect in shaping both the strategic and the operative role of service designers is whether or not to incorporate design as an in-house or as outsourced activity. The service design teams conducting the Finnish case projects were outsourced. According to the company executives – especially the SMEs with limited in-house resources dedicated to service development – the outsourced team provided them with 'fresh external thoughts':

*As you (service design team) are not involved in this business, it like brings very different approach in this (development). It is a good thing. (---) And you have been indeed working on these (service design*

*projects) with many different business fields so you maybe have a bit more extensive view.*

The appreciation of the external view not only concerned the development of the particular services but also the strategic transformation process from a production-oriented development strategy approach to a customer experience -based innovation approach. In large and established organizations, this may be a long process of change.

*I have been working for many years (as an in-house service designer), moving through a machine centered company, so some technology driven to a customer and end user and this (transformation) is something that we will take to many years. So that's the biggest challenge, the change of culture.*

Regardless of the size of the organization and whether the designers were in-house or externalized, the designer's role as a communicator and a facilitator of the process is evident. Knight (2012) proposed the designer's role: 'design is not just thinking or pure creativity but is also communication. A designer's role in shaping services is important not just in helping to meet a need but also in communicating what it is or what it could be in whatever way to make it understandable to others' (Knight 2012, p. 170). In our research, examples of practical communication skills were described as follows:

*First prototypes are scenarios that are sketched by professional visualizer who can manage them quickly. I have also produced concept videos, service concept videos in few days warning. You need to have quick storytelling skills.*

These kinds of comments in the interview data are submitted by engineers and managers as well as designers. The trend is that companies such as Intuit and Volkswagen are placing designers within the RDI team not isolating them in their own units anymore. A strategic level designer's role is to facilitate the transformational change in companies and governmental institutions. Service design is an outcome of this transformation process and is demonstrated in almost all of the interviews conducted during the research process. It is clear that service design and designers play a strategic role in the co-creation of value by using not only different service design methods but also a wider approach that integrates service thinking,

understanding the user relative to service rationales, and constructing service propositions. Wetter-Edman (2012) discussed the service design discourse in which the relationships between users, designers, and design objects are important; however, in service management, the underlying rationales are present. There is an increasing interest in methods and tools used for understanding users in their context and in how to transfer this understanding to successful service propositions and profit. There is a need to identify and understand the rationales as well as the relations.

## **Prototyping as an emotionally engaging co-creation platform**

Prototyping sessions serve as platforms for co-creation. Through prototyping, simulation and empathizing methods the knowledge, which is perceived as value is either triggered or supplemented by the emotional experiences of the participants who attended the co-creation sessions. Emotional value for a stakeholder is conveyed through personally experiencing the prototypes. Audio-visual simulation enables sampling both the conscious and subconscious signals affecting the experience (Shaw, 2007, p. 28-29).

In the service design cases for the Finnish companies, the process consisted of two to three workshops for each case. Prototyping and simulation served as a central platform for analysis, testing, ideation, and communication. Between the workshops, the service design teams either worked on mystery shopping and observing actual service situations or they developed concepts and prepared the next workshop at the prototyping lab. Some of the workshops were arranged at the company's site with a 'mobile' setup of the simulation devices and prototyping equipment. The prototyping methods used in the workshops included a customer journey walkthrough with audio-visual simulation, enacting, physical props, and idea mock-ups. Technological devices and applications were used in an innovative and creative way to achieve quick high-fidelity demonstrations of ideas and supplement drama and to help participants engage and empathize with various tasks, goals, and situational determinants. (Rontti et al, 2012.)

When analyzing the research data, the benefits, roles, and premises of prototyping sessions in co-creating emotional value were outlined through the place and time, facilitation, and the involvement of stakeholders.

### *Place and time for development*

According to our research data, companies see prototyping workshops as a place, time, and a 'warrant' for development and co-creation. An interesting point of reference for this finding is the Japanese concept of 'Ba,' which is a word meaning 'a shared space and time opportune for the development of knowledge in the organization' (Nonaka & Konno, 1998). Similarly, in the Japanese Lean Management Philosophy the term 'gemba' denotes the 'place of action' or 'the real place'. 'Gemba walks', in turn, refers to the action of going to see the actual process, understanding the work, asking questions and learning instead of simply forming theories (Womack, 2011). Prototyping and simulation labs dedicated to experiential and creative working - or even a corresponding space arranged temporarily with relevant equipment - are important practical premises for co-creation sessions. Smart use of configurable space can also foster creative serendipity producing unexpected innovations (Kelley 2001, p. 122-129). The agile use of technological devices and digital content enrich the possibilities to modify the space and add to the dimension of virtual reality.

Each case company was able to figure out the potential role and location for a service prototyping environment through the conducted service design cases. The three SMEs preferred the use of prototyping and the simulation environment to be an outsourced service not only due to the investment costs but also because they valued the opportunity to physically leave company and concentrate on creative thinking. In these companies with no dedicated in-house service development department, the adoption of service design thinking and the participation in the sessions was the responsibility of active entrepreneurs or a person responsible for services marketing and sales. In the two larger global companies with in-house R&D departments, at least two functions were identified for the service prototyping environment: at the headquarters for service offering development and at national branch offices for localization and service staff training.

### *Facilitation – the designer's new responsibilities*

Facilitation is a crucial activity in prototyping and in co-creation workshops. In the sessions using simulations, the facilitator's role is divided into three parts: 1) directing the participation and the script of the physical experience of the customer journey, 2) a rapid building of mock-ups 'on the fly' (both tangible and digital ones), and 3) documenting the findings and results. One good practice is to have two facilitators with designated roles. Good preparation is emphasized for the workshops using technology.

Engaging the participants and creating a relaxed and secure atmosphere are vital actions of the facilitator (Sibbet, 2005, p. 164). In addition to the facilitator’s personality and various collaborative warm-up techniques, prototyping methods and audio-visual simulation devices offer great tools for a warm-up (e.g., enacting an off-topic task in a relaxing place). An important finding in supporting the eliciting of emotional value is personalizing prototypes for the attendees (see Table 1.). The facilitator must be observant and continuously visualizing, concretizing, or co-building the participants’ ideas (Sibbet, 2005). In ensuring productive outcomes, the structure and rhythm of the workshop is important. The research on the meaning of pauses between prototyping sequences conducted by Blomkvist and Arvola (2014) shows that a walkthrough with pauses provided both more comments and more detailed feedback. Moreover, inviting the participants to summarize the workshop findings both individually and collaboratively enhances the externalization of the participants’ tacit knowledge, which has already been stimulated through prototyping.

Table 1 presents the features of prototyping and simulation that can help in understanding the emotional value in different phases of the service design process in more detail (Blomkvist, 2014; Buchenau & Suri, 2000; Kronqvist et al., 2013; Sibbet, 2005).

*Table 1. Features of prototyping and facilitation that support emotional engagement*

Activity in the service design process	Specific features in prototyping for emotional engagement	Examples of the methods
1. Gathering customer experience data	Emphatic methods, testing the service with as authentic need and goal as possible	mystery shopping, service safari, photographing customer views as a sequence of the service journey
2. Studying customer insight findings	Enacting, Analogous role play, exaggerating	Servicescape simulation (images and sounds) e.g., for a Finn team to understand a foreign travellers feeling of contrast and exoticism when coming to Lapland, the team goes through a simulation of travelling from Finland to Africa.
	Pausing for documentation	
3. Teaching /	Experiencing a service	Servicescape simulation

		<i>Co-Prototyping Emotional Value</i>
learning customer insight	journey with personal configuration	using images from the actual surroundings of the service place or otherwise similar to which the stakeholder can identify him/herself with. 'Matti recommends' rather than 'imagine your friend is recommending.' (Matti being the friends name)
	Personalized information in prototypes	
4. Generating and testing ideas	Switching roles	e.g., a ticking-timer mobile app running given to a participant in order get the 'in a hurry' feeling, virtual baby or dog with sound, simulate blindness with eye-patches, etc.
	Concretizing situational restrictions and exceptions as a personalized setting	'Quick and dirty' mock-ups and props, inserting ideas live as overlay images or sounds on simulation,
	Concretizing 'what ifs' quickly, iteratively, and often Offering a personal trial for each participant	e.g., remote paper prototyping with mobile devices
	Decreasing intervention while running	Using corresponding or analogous existing applications, combining multiple applications and devices or using them in a 'wrong' way to concretize idea functionally
5. Communicating finished concepts	Using high-fidelity emotional samples especially for ideas utilizing new technology or functional principles	Co-building potential solutions
	Involving participants with converging ideas as results	Summarizing results both individually and together
5. Communicating finished concepts	Orientation to the desired mood	Storytelling, music, video
	Involving the audience by assigning roles	Servicescape simulation
	Giving personalized tasks and goals	

### *Value through involvement*

In the case projects of the Finnish companies, a variety of selected stakeholders were present at the prototyping workshops. According to the executives, the ideal line-up of co-creation sessions would consist of the following stakeholders:

- 1) Business development manager(s) with a decision making mandate in the development case
- 2) Sales and marketing representative
- 3) Real customers (in b2b cases this may consist of a decision maker, a purchase representative, a substance specialist, and an end-user)
- 4) Service staff member(s) who daily interact with customers
- 5) Stakeholder in charge of the development of the technical system and/or internal processes for the development case
- 6) Service designer(s) as facilitator(s) of the sessions

These roles were present in some way in all of the case projects but especially in the SMEs in which a participant from a company may occupy multiple roles; however, challenges arose in having all of the stakeholders attend the sessions. In addition to this practical scheduling issue of a relatively short and effective project, this may be related to the size of the organization and its hierarchies as well as to the unestablished strategic commitment to use service design and co-creation as a tool. The case projects also show that if higher management has an understanding and commitment to service design thinking, then the practical arrangements will be arranged more easily.

Different stakeholders suggested several benefits of co-creation sessions in the interviews and group discussions. One of the more valuable benefits appeared to be the 'emotional wake-up', which occurred several times not only for managers who are possibly more distant from the everyday customer interactions but also for the service staff. Through the personal experience of their everyday surroundings through the eyes of a customer, they were able to understand what customer-centred innovation strategy means in practice. The 'wake-up' happened often despite the possible prior explicit awareness of the issues. For instance, a customer servant of a tourism company explained the effects of servicescape simulation with a detailed example:

*Road signs were askew and even though you bypass it yourself like hundred times a year, you don't notice the post like it's askew. (--)  
And if you read it on paper (refers to mystery shopping reports), you*

*still don't get it that it's askew (laughs). But when you see the image (the 1:1 photos used as simulation backgrounds), then you understand, damn it is askew!*

Chaw (2007) also suggests a similar experiential learning approach for capturing emotional insight: bringing decision makers on 'safaris' at actual service situations enables them to 'get it' – to personally feel the experience and the subsequent emotions in order to understand 'the DNA of the customer experience' (Chaw 2007, p. 139).

In large companies, prototyping sessions bridge functional silos by bringing together representatives from different departments. The internal collaboration through experiential methods enable the appearing of the personnel's tacit knowledge about both the company's internal service delivery processes and important experiences with customer interactions (Konttinen et al., 2011, p. 67-68). Prototyping and simulation serve as a rich knowledge transfer mechanism between the service design team, the company management, and the service staff. The explicit customer insight findings brought forward by the design team together with the concretizing of the issues through prototyping triggered the externalization of the participants' tacit knowledge (Konttinen et al., 2011).

Prototyping sessions also helped in making the company's internal processes transparent. Ideally, the sessions helped the development management realize what is actually happening in the company regardless of formal guidelines or service manuals. On the other hand, the participants were able to identify and suggest good practices and successes worth spreading across the entire company. This was not limited to increasing customer satisfaction but also includes potentially increasing job satisfaction and helping employees achieve personal sales goals. Prototyping sessions also serve as an internal benchmarking and platform for analyzing and developing the customer experience of different existing business sites of the company (e.g., travel destinations). Using prototyping methods was also identified as a new education tool for training service staff's actions during interactions with customers. This is important because the mood of the customer servant impacts the customer's emotional experience.

## **Assessing the value of emotional experimentation**

Prototyping and simulation provide value to businesses through the information and insight revealed and communicated to different

stakeholders. According to Hubbard (2007, p. 99) there are three reasons that information is valuable to businesses. First, it can reduce the uncertainty about decisions that have economic consequences. Second, information may affect the behaviour of stakeholders, which has economic consequences. Third, the information may have its own market value (ibid.). The breakdown of the value of information leads to the question: to what extent can emotions and feelings be considered to be reliable information? The question was also asked by one of the development managers from a large case corporation, which according to the manager, attaches great importance to academic and theoretical recommendations as development triggers and decision making arguments. According to psycho-sociologist Schwarz (2012), people refer to their feelings as a source of information, and feelings also provide information that can serve as a basis of judgment and influence how people process information. In his Feelings-as-information Theory, Schwarz (ibid) further distinguishes emotions (e.g., being angry *about* something) from moods (e.g., being *in* a bad mood), cognitive feelings (e.g., surprise or boredom), and metacognitive experiences (e.g., feeling something is easy or hard). According to him, people use feelings as a source of information until it is attributed to an incidental source when it loses its informational value. He also proposes that changes in feelings are more informative than stable emotions.(ibid)

Another conclusion that the interdisciplinary theoretical examination of the research results lead to is the connection between emotions and learning. Moon (2004, p. 53) defines emotional insight as a 'common activity that becomes evident when we acknowledge and label it as relatively distinct'. According to Moon (ibid., p. 54), emotions influence the structure of knowledge and the process of learning. Emotions may arise in the process of learning and may also facilitate or block learning. Emotional insight occurs when the emotional orientation of the person changes. Blomqvist (2014) studies service prototyping using the theoretical framework of situated cognition that also connects with learning. He identifies the reasons for using an external representation in service design as articulation, learning, communication, collaboration, and maintaining empathy (Blomqvist 2014, p. 73). As a future research topic, he also suggests studying the kinds of learning that occur during prototyping (Blomqvist, 2014, p. 81).

Prototyping and simulation methods are experiential learning and teaching tools that enable the emotional engagement of participants (Kuure & Miettinen, 2013). Physical prototypes and co-building can support stakeholders' ability for expressing personal experiences (Kronqvist et al.,

2013). Service design creates new art-based practices to express meanings. Computer-aided methods can enrich the ways in which art conveys meanings, and simulation becomes a language and a platform for communication (Kronqvist et al., 2013). Audio-visual simulation helps engage a participant's schema in service contexts and understand new ideas better through assimilating them in the existing contexts of a participant's experience (Blomkvist, 2014, p. 58). Service prototypes enable constructing both conscious and subconscious elements to be experienced.

## **Conclusion**

Value co-creation models have changed. New models place the customers' needs in the focal point of the development process. There is more pressure to engage and involve the customer in the innovation process. This places the designer in a more central and strategic position in the company. This has also changed the role of the designer and added new skills and competencies to her or his professional portfolio.

Prototyping serves as a platform for co-creation, and it helps to convey the emotional components of service value. Prototyping and simulation methods are experiential learning and teaching tools that enable the emotional engagement of participants. Prototyping can provide emotional value to businesses through the conscious and subconscious information it can reveal and communicate to different stakeholders. A dedicated place and time for prototyping, a skilled facilitator, and the active participation of stakeholders are the practical premises for co-creation sessions. Personal experimentation and collaboration is emphasized in eliciting emotional insight in co-creation. Prototyping sessions can support decision making, help in bridge functional silos in big companies, and help in using tacit knowledge as a resource in these mutual learning sessions.

# Impact of Team Communication on Co-design Teamwork in Distributed Intercultural Teams

## Introduction

In the recent decades, as the development of global industry and economy, design management is making disruptive changes according to mass customization and globalization, in line with the change of business model and consumer behavior. The demands from consumers and the supplies of production are increasingly global distributed, thus leading to the experience of intercultural impact on both consumers and designers. It is transformed accordingly not only the way of product and service design but also the role of designers. As the tendency of disruption and innovation, design management and strategy transformed for the creation of value and meaning. On one side, the innovation of communication technologies makes it possible for distributed intercultural product creation and development, on the other side, the effectiveness and efficiency of team communication for information has impact on distributed intercultural design teamwork.

### *Research Objective*

This paper is designed to investigate the impact of team communication in distributed intercultural design teams and explore the communication issues and design challenges for distributed intercultural design teamwork. Three different design teamwork modes (cooperation, collaboration, competition) are introduced to investigate the impact of team communication and improve the process and result of design teamwork. To achieve the research objective, the research questions are: how different design teamwork modes affect team communication in distributed intercultural design teams? What are communication issues and design challenges for distributed intercultural design teamwork?

### *Research Model*

In the recent trend of globalization, the business process of product development has become more complicated with diversity in many perspectives. In the context of international teamwork, team communication in distributed intercultural teams has to be taken into account to facilitate design teamwork worldwide. The paper is designed to investigate the impact of team communication over distance and cross culture in distributed intercultural teams. To achieve the research objective, the research question is how different design teamwork modes affect team communication in distributed intercultural design teams?

As the research model shown in figure 1, this research is designed to study the effect of three different design teamwork modes on team

communication and the impact of team communication on co-design teamwork, with cultural difference of Dutch and Chinese, in the context of distributed intercultural team composition, in order to find implicit factors and explicit factors of communication issues and design challenges, and their influence on design teamwork.

*Figure 1 Research model (effect of teamwork modes on team communication in distributed intercultural design teams).*

### **Team Communication**

Team communication has impact on design teamwork in distributed intercultural teams. Designers are required to share information and also communicate with each other (Kvan, 2000). Distant communication between designers supports distributed design teamwork. Communication tools facilitate designers to collaborate more conveniently and make it possible for designers to benefit from sharing information and working together (Cheng and Kvan, 2000). Considering the communication for design teamwork, the most important issue is interaction, both interaction with the communication tools and interaction between designers. In the international team, people from different countries with diverse cultural backgrounds have different meanings of the same word in communication. For example: an answer "yes" to a question can mean: I hear you, I understand you, I see your point, I agree with you.

### **Cultural Difference**

Cultural differences affect the design teamwork in international teams. It is found that cultural differences have influence on design process (Razzaghi et al., 2009). Some researchers have explored cultural differences for teamwork (Hofstede et al., 1990; Smith & Malina, 1999). Distributed design teamwork in different cultures requires an understanding of cultural context in communication. Communicating with people in different cultures also requires an understanding of the cultural context. Thus, it is important for

designers to draw attention to teamwork and understand the cultural differences, which requires designers to learn not only design skills and also intercultural communication for design teamwork. Unfortunately, cultural differences act as barrier to improve design teamwork and limited research has been found to solve design teamwork problems in the context of cultural differences. There exist problems of teamwork with people from different culture. Design teamwork has to confront the cultural differences, which hinders distributed communication (Ostwald, 1995).

### **Team Composition**

Together with cultural difference, team composition is an important and crucial factor of design teamwork. It is found that team composition is crucial to design process and teamwork (Miranda et al., 2007). The research about team composition also can be found in the field of teamwork (Cross et al., 1995). In addition, personal character is also related to team composition. To set up an appropriate design environment, design teams analyse team composition and allocation for design management (Girard and Robin, 2006). In this research, two cultural measurements were used for team composition. Value survey module was used to measure designers personal cultural character. Team role questionnaire was used to identify their suitable team position. With the two cultural measurements, very different Dutch and Chinese were teamed up over distance. As the participants of the case study, design students worked together in distributed teams, consisting of industrial design students from Eindhoven University of Technology in the Netherlands and Zhejiang University in China.

## **Methodology**

This research conducts a distributed intercultural design course and related co-creation workshop with design students from China and the Netherlands as a case study, working in different design teamwork modes and interacting with different communication tools during the design teamwork. In the case study, design teams take on the design case of design for health and make use of different ways of communication for different design teamwork modes. In the context of cultural and geographical difference, interview observation and diary reflection are used for research data collection and related analysis. This study analyzes the strength and weakness of different communication tools in distributed intercultural

design teams, so as to interpret the advantage and disadvantage of different design teamwork modes for distributed intercultural design teamwork.

### *Approach*

In this research, qualitative research methods were used to study design teamwork from various aspects. In the case study, diary reflection was used to record the team process and design result. Meanwhile, interview observation was also used to investigate design maintenance and achievement.

In this research, different communication tools are used for different teamwork modes in design teamwork. Three different design teamwork modes are used to investigate the impact of team communication and facilitate teamwork effectiveness and efficiency. For the contact in distributed intercultural design teams, video conference is used for the formal sessions, while Skype is used as the team communication media and Email is used as well for team communication.

### **Design Teamwork Modes**

In this research, three different teamwork modes are investigated, which are cooperation mode, collaboration mode and competition mode. Design teamwork modes are used to support designers to construct an understanding of design problems and potential solutions (Ostwald, 1995). According to the definition of collaborate, collaboration means work together on common tasks to solve joint problems and find solutions. As to the definition of cooperate, cooperation means work along with others on division of tasks to get mutual benefit. From the definition of compete, competition means work separately on same tasks to compare with each other (Hutter et al., 2011).

As shown in table 1 (Mattessich and Monsey, 1992), cooperation is characterized by informal relationships that exist without a commonly defined mission, structure or effort. That means cooperation requires a flexible attitude. Communication could be asynchronous and information is shared limited. Competition is characterized by more formal relationships and understanding of compatible missions. It requires project plan and division of role is considered. Communication should be synchronous and information is shared partly. Collaboration is characterized by more durable and pervasive relationship and being a full commitment to a common mission. It also requires project plan and division of work is considered. Communication should be more frequent and information is shared further.

Table 1 Comparison of teamwork modes.

Attribute	Design teamwork modes		
	cooperation	competition	collaboration
Relationship	informal	formal	durable & pervasive
Mission	without mission	compatible mission	common mission
Requirement	flexible attitude	project plan & role division	project plan & work division
Communication	asynchronous	synchronous	frequent
Information	shared limited	shared partly	shared further

### Teamwork Modes in Case Study

In the international design teams, a joint design course is taken as case study. With the cooperation design mode, one sub-team collects information from target market and another sub-team dominates the design ideation. Afterwards, the first sub-team gives feedback and suggestion to these preliminary design ideas. Finally, the second sub-team makes improvement and final decision and the first sub-team works out the prototype. With the collaboration design mode, both sub-teams collect data in a collaborative way, and then make a collaborative ideation for target market. After discussion, the design solution is improved and the final case will be chosen. With the competition design mode, both sub-teams collect data separately. Then, designers from each sub-team make an idea generation independently. Next, they present and discuss to choose the better idea or to mix them into a final design idea, and improve it together as the final solution.

## Analysis

### *Communication Tools*

Design teamwork is an important tendency for both education and industry that distant communication has been researched to support it. Many designers undertake teamwork projects in distance. The existing communication tools, such as email, telephone, short message, instant message, videoconference, whiteboards, etc., are plentiful and increasing. Considering the existing design communication methods, there are five common used communication tools, which are telephone, voicemail, short messaging service (SMS), email and instant messaging (e.g. Skype). They are

used for different purposes and circumstances in design teamwork. This study analyzes common used communication tools with different purposes and circumstances, so as to reveal the strength and weakness of them.

### **Telephone**

As a commonly used communication tool, telephone plays an important role in communication. It is most frequently used by designers, and requires less effort and time before calling. But the receiver has to answer and it may disturb him/her. It is feasible to improve the product with less intrusive calling and make the receiver more convenient to choose whether to answer or not.

### **Voicemail**

As the attachment of telephone for assistant purposes, voicemail is a good tool for asynchronous communication. That is because the other can listen to and reply the message at convenience. Sometimes the message will be lost for systematic reason. Therefore it is possible to set up a feedback system to strengthen the effectiveness and interaction after leaving a message.

### **SMS Message**

SMS message is sent at any time and at any place. It can be read and replied at the convenience of the receiver and does not disturb the receiver too much. However, the short message is used with low efficiency and time consuming, and cannot contain too much information. It will be better if it is integrated with other communicate methods for more information and interaction.

### **Email**

Email is the popular communication method online, because it can be saved and read later, not only for messages, but also for pictures and videos. Designers don't know when others read without synchronous interaction. Email has the high capability to expand function with Internet and also to combine with other physical communication terminals.

### **Instant Message**

As another popular communication tool online, instant message is a multimedia via internet, so designers feel free to talk with each other without any time pressure, but it cannot be used without Internet. It can

make a video conversation, although it requires complicate preparation before calling. Thus, it will be better if the preparation steps become simpler.

### *Contacts Classification*

After the analysis of existing design communication methods, it is found that the existing communication tools used for design teamwork have their different strength and weakness. In order to support designers to improve design teamwork in international design teams, the contacts of team communication are classified within designers according to the existing design communication tools. This study classifies the contacts into groups according to different conditions in terms of the variety of communication (see table 2).

Table 2 *Contacts classification.*

Classification	Contacts of team communication	
Purpose	functional	affective
Duration	long	short
Initiative	active	passive

### **Functional and Affective**

Based on the purpose of communication, the contacts are classified into two groups: functional and affective. Some contacts are functional for practical purpose. This type of contacts is usually with a short duration to convey the necessary information. Therefore, SMS or email is used for practical purpose instead of telephone. Male designers are shown to communicate mostly for this type, while female designers focus on communication mostly for the other type. The other contacts are affective for unpractical purpose, including social matters or emotional communication. Telephone is mostly used for this type, and often results in long time. The topic of these contacts almost contains everything, e.g. past activities/experiences, work, life, and even other people. Email is also used for this type if the other is busy or unavailable.

### **Long and Short**

According to the duration of communication, the contacts are classified into another two groups: long and short. The quantity and frequency of communication highly depend on their attitude. Some positive designers communicate very frequently and tell each other everything about anything

happened the other days. Initiative comes from both sides, and they prefer the proper communication tools for different circumstance, e.g. telephone for urgent or social matters with interaction, SMS for practical matters with less interaction, and email for busy or unavailable time. Other negative designers value their independence, so they contact to each other occasionally and only communicate for practical matters, such as convey a message. Initiative usually comes from the side that has the matter, and it takes short time for high efficiency.

### **Active and Passive**

In terms of initiative of communication, the contacts are classified into another two groups: active and passive. Most of designers are active to contact with each other. If one side is active to communicate with initiative, the other side usually waits for their calling. On the contrary, if one side is passive to contact, the other side will take the initiative, calling or sending short message to them.

## **Discussion**

### *Communication Experience Process*

Communication experience process is introduced to compare the communication tools during the different phases of communication process. The communication experience process comprises four phases: purpose, initiative, duration communication and consequence (after communication). In this case study, researchers focus on the first three phases. In the context of communication, researchers put the common communication device into communication experience process form for comparison (see table 3).

*Table 3 Comparison of common communication device.*

Device	Experience process			Benefit & Cost	
	purpose	initiative	duration	benefit	cost
SMS	functional	passive	short	low	low
Telephone	affective	active	long	high	high
Email	functional	passive	short	high	high
Skype	affective	active	long	high	high
Voicemail	functional	passive	short	low	low

From the form above, SMS, Email and voicemail are more functional in purpose, while instant message like Skype is more affective. Telephone, as

the most common communication, has both functional and affective purpose. As to the initiative, researchers divide five common communication devices into two groups: active and passive. Telephone and Skype are more active than other three communication device. People can reply immediately via telephone or Skype that means active interaction. On the other hand, telephone and Skype also have long duration, although sometime telephone can be short only for functional purpose. SMS, email and voicemail usually do not have response synchronously. As the same time, researchers also consider the benefit and cost of communication. In the context of benefit and cost of communication device, researchers find telephone, email and Skype have both high benefit and cost, while SMS and voicemail are on the opposite.

### *Communication Interaction Process*

Communication interaction process is also identified to generalize the communication process. The different phases of communication interaction process are identified, from the initial motivation to final communication. The framework of communication can generalize the interaction process to improve the communicator design for ambient assisted living. With these interactions process can also provide the support for the design process to explore the feasible solutions in the interaction context.

The general framework is based on the current communicator and consists of four interaction phases:

- (1) motivation: elicit the communication,
- (2) preparation: prepare the communication,
- (3) action: facilitate the communication,
- (4) reception: keep the communication.

In the first phase, people generate the initial motivation without actual interaction with communicator. Although there is no actual action of communication, they elicit the communication initiatively. They think about whom they intend to contact and how to contact. In the second phase, people make some preparing according to their motivation. They choose the different communication media in order to actualize the communication. The purpose in this phase should trigger the interest and makes the aware of the communication media. In the third phase, the sender facilitates the interaction with communicator. They use various function and also explore the various possibilities. The main goal of this phase is to make the communicator easy and playful to use. In the last phase, receiver gets the

communication from sender and reply to them, which is to keep the communication. This phase makes a bridge between interaction with communicator and communication in reality. After the interaction process, people get the social cohesion and meet the needs of communication in both sides. For the design of the communicator, it should focus on the first two phases to elicit people to use the communicator more convenient and accessible. That is also the purpose to meet the emotional needs for people in the modern society.

## **Results**

In order to improve intercultural design teamwork, it is necessary to be aware of cultural difference and make use of different teamwork modes. For all the design teamwork modes, it is important to use communication tools for interaction in design process. The existing communication tools can be used for different purposes and circumstances in design teamwork. However they do not take cultural difference into account and cannot manage it. Thus, the existing communication tools are not enough to support designers to improve design teamwork in international design teams, especially in the context of cultural difference. The analysis of communication process interprets the different phases in communication to support designers to improve the effectiveness and efficiency of team communication during design process.

### *Communication Design*

In the current research, the most important aspects of communication for improving the quality of life is presented, which is mainly targeted in improving the ways of providing intelligent products or services for ambient assisted living. The communicator designed for people should be easy to use and playful, which can trigger them to use. They should be not only in function, and also in emotion. Most of people are ready to accept new forms of communication. Therefore, people are willing to do what they want, if the communicator can help them to achieve their purpose. One important thing is the positive opinions about additional value of communication, which can be used in communication product development.

As to the culture in communication for people, designers have to consider the habits and customs of people. People are often afraid of changes and rarely accept structural alteration works. They are used to the

traditional communicator in their daily life. Although the current communicator cannot meet the variety of needs, people don't want to access the new communication technology positively. However, the overall willingness to use new technical devices among people is higher than often expected. On the other hand, there are still some challenges to face. Most urgent needs and wants of people often concern personal contact. The financial restrictions of people also have to be taken into account.

Ease of use and actual need of the communication are important criteria. Designers should focus on the interaction between people and communicator with good usability. To design communicator for people, designers consider the design approach for them. There are two directions: one is to redesign the current communicator to make them fit for people, another is to design the new way of communication for people. As to the users, designers should make the survey with target group to find the requirement. Designers also should to explore the current communicator to find the disadvantages and improve them to fit for people. By bringing in the user perspective, potential improvements can be pointed out. If these challenges are successfully taken, a communication solution might find broad acceptance by the target group and become a realistic alternative to the solutions available. To reach this acceptance it will be necessary to continue developing technology and accompanying service packages in close contact with the target group.

### *Communication Issues and Design Challenges*

During the team communication in international design teams, ten relevant factors are indicated to investigate their influence on design teamwork (see table 4). These factors are generated by designers in distributed intercultural teams, and they have explained the details of each aspect. The factors include interaction, interpretation, relationship, atmosphere, tools, information, language, design process, culture and distance. They are divided into two groups, implicit and explicit. Based on the discussion about team communication in the design workshop, interaction, interpretation, relationship, atmosphere, culture are considered as implicit factors, and tools, information, language, design process, distance are considered as explicit factors, among others, culture and distance are as given factors. More specifically for each factor, designers have discussed the specific aspects of each factor for the influence of team communication on design teamwork. These ten factors are not only communication issues in distributed intercultural design teams, but also design challenges for

*Impact of Team Communication on Co-design Teamwork in Distributed Intercultural Teams*

distributed intercultural design teamwork. With the implicit factors and explicit factors of communication issues and design challenges, designers can facilitate team communication and improve design teamwork in distributed intercultural teams.

*Table 4 Communication issues and design challenges.*

Implicit factors	
interaction	time and frequency, synchronous / asynchronous, action and reaction, proactive and reflective, offline and online, discussion and presentation
interpretation	content convey, agreement / disagreement, different meanings, explain and understand, templates
relationship	team roles, expertise and skill, strength and weakness, common grounds, introduction / profile, friendship, education and background, interest and hobby
atmosphere	context / environment, group tension, inside and outside
culture	difference and similarity, cultural context and background, culture insight, personal character
Explicit factors	
tool	social media, technology: technical equipments, written and visual, internet connection, video and audio, sound quality
information	project info, personal info, meta info, distribute and share, update, missing, back-up
language	language difference, language barrier, translation, decent English, body language
design process	process oriented, unaware of progress, different processes
distance	physical contact, distant communication, time difference, modalities and senses

## Conclusions

In the distributed intercultural design teams, team communication is important but difficulty for design teamwork, and team composition with cultural difference also has impact on distributed intercultural design teamwork. In order to improve distributed intercultural design teamwork, it is necessary for designers to be aware of cultural difference and make use of communication tools for all the design teamwork modes. As a result, different aspects of communication issues in distributed intercultural design teams are stated and discussed as design challenges for distributed

intercultural design teamwork. Based on the discussion and related results of the case study, this research shows the importance and relative difficulty of distributed team communication and intercultural teamwork, in order to help designers facilitate team communication and improve design teamwork in distributed intercultural teams.

In conclusion, this research has investigated the team communication in distributed intercultural binational teams, and made use of communication tools in different ways for distributed intercultural teamwork. In the context of international teamwork, team communication in distributed intercultural teams has to be taken into account to facilitate design teamwork worldwide. The research is designed to investigate the impact of team communication over distance and cross culture in distributed intercultural teams. Different communication tools are used to investigate the impact of team communication and facilitate teamwork effectiveness and efficiency.

## The Image Co-creation: Store image consistency in creative stores

Shu-Shiuan HO<sup>\*</sup>, Yi-Fang YANG and Tung-Jung SUNG

National Taiwan University of Science and Technology

*Nowadays, an increasing number of enterprises and organisations are treating value co-creation as a key source of competitive advantage. Furthermore, past studies have advocated that the store image consistency between customer perceptions and store position plays a vital role in satisfying customer preferences. Therefore, in order to enhance store image consistency, this study aims to explore the approaches and stakeholder engagement of value co-creation of creative stores. After investigating 300 customers with constructed questionnaires, doing a survey of 9 recommended creative stores' managers and 179 customers with an image interaction tool, and conducting the in-depth interviews with the 9 store managers, the findings of this study first reveal that the store image consistency is a major influence in the store's evaluation, but the highly recommended stores have different levels of store image consistency. Next, the stores build higher levels of store image consistency via not only tangible (product or servicescape) or intangible (music or customized core service) elements, but also by the image co-creation. In our case, the image co-creation approaches of recommended creative stores centralized in both of the development phase and the full launch phase of the NSDP. Especially, the more types of actors that engage in image co-creation, the higher level of store image consistency will be created.*

## **Introduction**

Hopkins & Alford (2001) stated that the importance of store image has been widely supported. The store image has a critical impact on the customers' store evaluation (Palupski & Bohmann, 1996). It also has an effect on the choice (Lewis & Hawksley, 1990), shopping intentions (Agarwal & Teas, 2001; Bell, 1999), and loyalty (Osman, 1993). Store image could be regarded as a series of brand connections in strategy, commerce, and society (Juan Beristain & Zorrilla, 2011). When the customer recognizes the same store image as expected, the customer would commend the value of service (O'Cass & Grace, 2008). Briefly, the store image mapping that the customer recognized and the store image expected can be defined as an image consistency, and it plays the key role in satisfying the customer's store preference (Kleijnen, De Ruyter, & Andreassen, 2005). Many studies (Darden & Babin, 1994; Lin, 2004; Ryu, Lee, & Kim, 2012) have conceived how to build a fine store image that is mostly generated from the products, price, service providers and environment. However, how could the store image be clearly delivered to the customer, be identified by them, and create a high level of store image consistency.

Several studies (Pralhad & Ramaswamy 2004; Ramaswamy & Gouillart, 2010) have noted that value co-creation can integrate the organisation, individual, and group, and make a solution together by creating value as well as bringing transitions among the society, culture, economic and technology. Thus, value co-creation has been recognized as one of the critical competence superiorities among companies (Cao & Zhang, 2010). It is easier to deliver value if the stakeholders engage in the value co-creation processes; if the store image is a part of value position, does the storeowner manage the value co-creation to enhance the store image consistency? In other words, compared to traditional unilateral service providing processes, if customers and stakeholders engage in value co-creation, does the provider's position easily deliver to customers? In fact, there are some challenges in practical situations; for instance, it is harder to realize the stakeholders' perspective on creativity in service network, to find a strategic scheme for uncertain requirements of stakeholders, and to overcome the fear of disclosing the stakeholders' service (Dabholkar, Bobbitt, & Lee, 2003). Hence, this study is aimed at realizing the practical condition in the stakeholders' value co-creation.

Recently, the creative industry had been gaining popularity; many creative stores with unique store images have been established. Regardless of providing a product or service, Caves (2000) claimed that the creative

stores needed to invest into many skills to create an association with originality and make it successful. Thus, creative stores often manipulate value co-creation to provide customers with a product or service. However, the creative industry had features of the high complex network interaction relationship and the non-linear development path (Caves, 2003). The frequency of image fluctuation increased, and as a result, there was also increase in the risks of the company's sustainable management. (Levickaite, 2011). Therefore, one of the purposes is to find how to co-create a fine store image. This study will use the recommended creative stores in the Taipei creative district as research cases. The main objectives of this study are 1) to compare the store image consistency between 'customer cognition' and 'provider's position', and explore the reasons; 2) to investigate the approaches and stakeholders of store image co-creation; and 3) to discover how to build a high level of store image consistency.

## Theoretical Underpinning

To realize how the creative stores' owners co-create with the stakeholders, and how to build a specialized store image, the purpose of this chapter is twofold. Firstly, this study explores the components and elements of store image. Secondly, this study investigates the possible approaches and actors of image co-creation.

### *Store Image Consistency*

Houston and Nevin (1981) defined store image as the complex consumer's perceptions of a store on different (salient) attributes. In fact, Thompson and Chen (1998) indicated that the store image represented more than just the important psychological and social value. In general, store image can be divided into two components; one is the store character (Bloemer & Ruyter, 1998) which is the image the store provides, while the other component is the image perceived by customers' viewpoint pertaining to the revenue and the attitude of the store (Keller, 1993; Thompson & Chen, 1998) is the customers' perceived image. Thus, this study will be viewed from the perspectives of 'customer cognition' and the 'provider's position', to realize if the store can provide a consistent store image. By utilizing image survey, this study can determine what the high level of store image consistency is.

### *Image Co-creation*

Today, value and value co-creation are regarded as the core of service (Vargo, Maglio, & Akaka, 2008). Binder, Brandt, and Gregory (2008) inferred that companies and organisations have placed more emphasis and attention on value co-creation. And, companies do not create value alone any more (Håkansson, & Snehota, 1989); on the contrary, they create value through multiple resources and co-create value with stakeholders (Prahalad & Ramaswamy 2004). Sander and Stappers (2008) delineated the value co-creation as a valuable activity completed by two or more stakeholders. Saarijärvi, Kannan, and Juusela (2013) highlighted three prerequisites of value co-creation: 1) what kind of value for whom (such as, the company or the customer), 2) by what kind of resources (such as, B2B, B2C, or C2B), and 3) through what kind of mechanism. This study will treat store image as one kind of value proposition and define image co-creation as value co-creation, then discuss image co-creation on actors and approaches in the following sections.

Johnson, Menor, Chase, and Roth (2000) proposed a new service development process (NSDP) which is divided into four phases: 1) the *design* phase – the company identifies the new service target' strategies and concepts, 2) the *analysis* phase – the company examines the business model, 3) the *development* phase – the company designs the new service, plans marketing strategies and tests the service, and 4) the *full launch* phase – the company implements the new service and makes adjustments to the service content. Considering strategy, design and marketing aspects, this study will adopt these four phases of the NSDP to explore the approaches to image co-creation. Based on the literature review, this study has identified 13 types of value co-creation approaches in the NSPD, as shown in Figure 1.

Firstly, at the *design* phase, there are two types of co-creation approaches: 1) co-conception of ideas: the company realizes the real needs of customers and invites the customers to co-create knowledge through approaches (Frow, Payne, & Storbacka, 2011; Medeiros & Neefham, 2008) and 2) co-meaning creation: the company obtains knowledge of the stakeholders to build new definition (Schouten & McAlexander, 1995).

Secondly, at the *analysis* phase, there are also two types of co-creation approaches: 1) co-evaluation of ideas: the company manipulates simple mechanisms to engage the stakeholders that are involved in service systems to evaluate the concept (Russo-Spena & Mele, 2012) and 2) co-outsourcing: the company shares their expertise and contracts out some activities (Spohrer & Maglio, 2008).

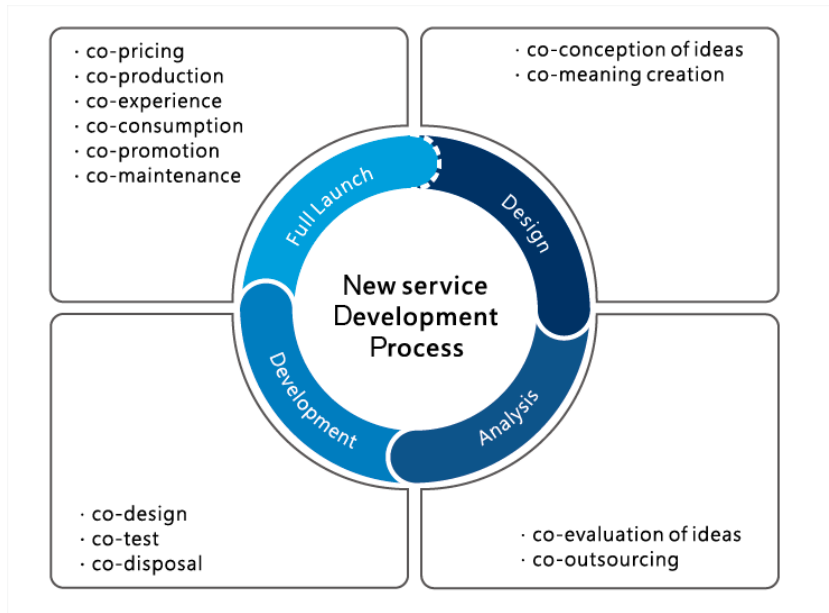

Figure 1 Co-creation approaches in the NSDP (revised from Johnson et al., 2000)

Thirdly, at the *development* phase, there are three types of co-creation approaches: 1) co-design: the company engages the stakeholders with different perspectives on how to co-design the new product or service (Blazevic & Lievens, 2008; Pini, 2009), 2) co-test: prior to market entry, the stakeholders will co-test the new product or service in order to improve the experience and sales volume (Russo-Spena & Mele, 2012) and 3) co-disposal: the stakeholders are responsible for assisting the company with waste disposal (Frow et al., 2011).

Finally, at the *full launch* phase, there are six types of co-creation approaches: 1) co-pricing: the company and stakeholders co-decide the price of the product or service (Mascarenhas, Kesavan, & Bernacchi, 2004), 2) co-production: the customers become the partners of a company, and they create service, product, and value together (Prahalad & Ramaswamy, 2004; Zeithaml, Bitner, & Gremler, 2006), 3) co-experience: the stakeholders share their resources and experiences (Prahalad & Ramaswamy, 2004), 4) co-consumption: when the stakeholders participate in certain services, different individuals will have the same experience. It is noteworthy that this service must simultaneously produce and consume (Edvardsson Enquist, &

Johnston, 2005), 5) co-promotion: the stakeholders co-promote a new service; meanwhile, customers can be regarded as the image co-creators (Frow et al., 2011; Pini, 2009), and 6) co-maintenance: the company and the stakeholders co-maintain the product or service (Frow et al., 2011). These possible roles of the stakeholders discussed above provide a feasible way to identify how the stakeholders engage in the co-creation of the store image.

### *Creative Stores*

Facing the global depression, many cities popularized the creative industry as an approach to economic recovery (Ponzini & Rossi, 2010). In East Asia, almost every government was devoted to developing creative industrial communities, like Shanghai (China), Puchon (Korea), and Taiwan (Yusuf & Nabeshima, 2005). To implement the policy of industrial aggregation, Taipei City Government developed many creative districts. By doing so, they wanted to attract more funds letting creation become an industry. In fact, the value of creative products originates from the creator and the customer based on their individual evaluation; if the creator doesn't realize the customer's need, the creator may run into a loss; meanwhile, until the customer visits and experiences the store, the customer cannot evaluate the value of the creative product (Caves, 2000). Therefore, if creative stores could integrate image co-creation with the NSDP, these new approaches might strengthen the provider's position and increase the store's valuation.

In conclusion, the creative industry is booming on a global scale, and many creative communities are located in the East Asia. The uncertainty of this industry may force store owners to manipulate the image co-creation to increase the value and enlarge the development. In addition, the store image is an essential standard of store evaluation that can be viewed from two perspectives, 'customer cognition' and 'provider's position', to realize if the store can provide a consistent store image. Furthermore, stores can manipulate co-creation to build a specific store image, while the image co-creation approach and stakeholders have yet to be studied. Thus, this study will use the recommended creative stores in Taipei creative district as research cases. As for the recommended creative stores, this study will interpret the components and elements of store image from two perspectives and explore the approaches and actors of store image co-creation later.

# Methodology

## Research Process

As stated earlier, this study has three purposes: to compare the store image consistency of ‘customer cognition’ and ‘provider’s position’, to explore the image co-creation approaches and actors in co-creation, and to discover how to build a high level of store image consistency. In doing so, a three-phase study was designed (Figure 2), that is to 1) select the recommended creative stores, 2) investigate the levels of store image consistency of these recommended creative stores, and 3) explore approaches and actors of store image co-creation.

Firstly, a purposive sampling approach was utilized. To select the recommended creative stores, our data consisted of structured questionnaires taken from 300 customers who have visited the creative districts. Secondly, this study did a survey of 9 managers of the recommended creative stores and 179 customers by using an image interaction tool. Finally, to realize the image co-creation approaches and actors in co-creation, this study further conducted in-depth interviews with the 9 store managers. The research purpose, participants, research tools, and analytical methods will be shown in the following sections.

Figure 2 Research process

### Step 1: Identify the recommended creative stores in the Taipei creative district

The first step is to identify the recommended creative stores. Considering the cultural features, industrial development, and customer volume, this study used the Taipei MRT (Mass Rapid Transit, Taipei Metro) stations at Zhongshan and Shuanglian as a research field. Both stations are

considered to be creative districts. This district is located along Zhongshan N. Rd., and the MRT Red Line lies in the centre of Taipei. Although this creative district is a mixed residential commercial area, the resident and storeowners rarely create a win-win situation in which vital functions are enhanced and business activities are prosperous. Thus, these situations attract the nearby department stores or other creative stores to gather and execute collaborative activities. First of all, this study discovered 39 creative stores in this creative district from a publication titled 'Walk to Find Taipei's Creation'. Finally, the top 9 recommended creative stores were selected via investigation with 300 customers. And the 9 store managers were willing to assist in this research. The recommended creative stores are (B), (C), (D), (E), (F), (G), (H), (I) and (J).

### *Step 2: Investigate the store image consistency level*

The second step is to investigate these creative stores' store image consistency level of 'customer cognition' and 'provider's position'. This study used a purposive sampling; the participants for this study were selected from the population of customers who just finished the consumption. This study did a survey of 20 customers per store and 179 customers with an image adjective tool (as shown in Figure 3). As for 179 customers, 67.0% were females; their ages distributed among 16-25 years old (72.1%) and 26-35 years old (17.9%); most of them were tourists (92.7%); most of them visited this district for dining (70.4%) and shopping (58.7%), and participating in art and cultural activities (35.3%). Besides, this study further interviewed one manager of each recommended creative store that is familiar with the store image and operation content.

Figure 3 An image adjective tool

These 9 managers are operators (D), store managers (B, C, E, I, & F), planning directors (H), planners (G), and public relation specialists (J).

During the in-depth interviews, this study asked customers to select the top 3 store images as the 'customer cognition', and to describe the reason for their selection. Meanwhile, the recommended creative stores' managers also selected the top 3 store images as the 'provider's position', and described how to create unique store images. To elaborate, this study adopted an image adjective tool (Yang, Wang, & Sung, 2013). This tool is comprised of 14 cards, and the image adjective is printed in both Mandarin and English on the top of each card as well as the image colour and the picture. The 14 main image adjectives are modern, elegant, romantic, dandy, chic, clear, pretty, casual, cool-casual, formal, gorgeous, classic, natural, and dynamic. Moreover, the image sub-adjective is also printed in both Mandarin and English on the back of each card. These functions can easily help the participants to select the store image.

Furthermore, this study made a statistical weight order to every single selected image adjective from the participants: the top one selected image adjective was given triple weight, the top two selected image adjectives was given double weight, and the top three selected image adjectives was given basic weight. Taking store H as an example: 12 customers selected 'natural' as the first image adjective, 5 customers selected 'natural' as the second image adjective, and 1 customer selected 'natural' as the third image adjective. That is to say, the statistical weight of 'natural' is  $12 \times 3 + 5 \times 2 + 1 \times 1 = 47$ . The data basis of customers (179) and the stores' managers (9) are distinct, so the volume showed significant differences. Finally, this study compared the top three 'store's position' images and 'customer cognition' images.

### *Step 3: Explore the approaches and actors of image co-creation*

The third step is to explore the approaches and actors of image co-creation, and this study conducted in-depth interviews with 9 recommended creative stores' managers. After typing the interview record, this study analysed the co-creation type by 13 co-creation approaches in the four phases of the NSDP (see Figure 1). Moreover, to analyse the actors (stakeholders) engaged in the co-creation approaches, this study divided the actors into several types. Actors related to the stores are: 1) storeowners, 2) employees, 3) investors, 4) business partners, 5) customers, 6) local or national governments, 7) non-governmental organisations (NGO), 8)

residents of local community, and 9) others nearby. To illustrate, employees included managers and the first-stage service providers; investors included founders or investors; and business partners included service co-providers. Local or national governments may be related to the policy of creative industry; non-governmental organisations refer to the organisation or institute with professional creative industry expertise; residents of local community, and other stores nearby have territorial relationships with the stores.

## **Findings**

### *Effecting Factors of the Store Image Consistency*

After interviewing 9 recommended creative stores' managers and 179 customers, the levels of store image consistency of 'customer cognition' and 'provider's position' is shown in Figure 4. The highest level of store image consistency is H (3/3), the second highest levels of store image consistency are E and F (2/3), the next are B, C, E, G and I (1/3), and the lowest is J (0/3). This study discovered that although store image can bring higher evaluation for the store, not all stores with high-evaluation possess high levels of store image consistency. When asked to comment on the store image in the post-study interviews, the manager of H asserted that this store sells the products made of local material, and usually plays the music that they sale to increase the store image consistency level. Moreover, the manager of H said that they often use furniture, music, and the other facilities with natural decorations such as wood, bamboo, and steel that are related to local Taiwanese elements. Furthermore, to enhance the store image, the manager of H referred that they often co-create image with stakeholders. For example, they conduct online platforms to popularize exhibitions and introduce the products. By doing so, customers could clearly perceive the atmosphere, and identify the image of the provider's position. Besides, as for stores E and F, the manager of E indicated that they play the music from radio to build the atmosphere; meanwhile, they also provide flexible service content. For example, they supply customized food and to adjust the interior space to accommodate customers with children. In addition, the manager of F referred that their interior design is coordinated with the craft style they sell, and they often hold speeches to interact with customers; more importantly, they encourage customers to touch the craft. As mentioned above, store image originates from two fields: tangible (product, price, service provider, and the services cape) and intangible (atmosphere,

psychology, and social value) (Darden & Babin, 1994; Hopkins & Alford, 2001; Lin, 2004; Ryu et al., 2012). However, this study found that a high level of store image consistency is not only originated from tangible and intangible elements, but also generates from using image co-creation to deliver the image to customers. Image co-creation is an important approach to enhance the store image consistency.

Figure 4 The store image consistency level of recommended stores

### *The Approaches of Image Co-creation*

By utilizing in-depth interviews, this study synthesized the image co-creation cases of the 9 recommended creative stores, and analysed the period of image co-creation approaches and number of actors in the four phases in the NSDP (as shown in Figure 5).

To begin with, majority of the creative stores (B, C, D, E, F, G, & H) were co-created in the phase of development and full launch. In other words, stores with high-level evaluation would co-create in the last half of the NSDP (development and full launch phase). This study estimated that image in the last half of the NSDP is more concrete and clear, and these phases are highly related to the delivery service to customers. In other words, image co-creation in these phases means that the recommended creative stores mutually build the image and delivery service with stakeholders. And it is possible to convey the consistent store image to customers. Additionally,

there are several image co-creation approaches that are also often used by the recommended creative stores, which are co-design (B, C, D, E, I, J, F, H, & G) and co-promote (B, D, E, F, H, & G). Firstly, co-design is the most frequently used approach that is manipulated by the recommended creative stores in this district, the practical examples included: 1) co-design the opening hours and service content with the residents or customers, 2) co-design the new product or service with providers, and 3) co-design the interior decoration with customers. Secondly, the practical examples of co-promotion are included: 1) co-promote new activities to customers with the creative stores nearby, 2) build an online platform for customers to make commentary, 3) hold activities with several sub-brands, 4) publish the online magazine with sub-brands or business partners. To elaborate, these stores often rely on their territorial relationships and cooperated with the creative stores nearby to hold seasonal activities and attract customers.

On the other hand, as far as stakeholders are concerned, this study found that there are multiple actors when it comes to image co-creation. In spite of the store itself, the 'residents' in community are often the co-creation actors (D, E, I, J, H, & G), even if they become the main-actor in image co-creation. This study synthesized that the possible reason for the development of community and the rights of the residents, is that they often discuss the service content with these recommended creative stores, and these stores usually adopt their comments or co-create new services.

Then, this study analysed the time period and the phases the actors engaged in (Figure 6). Compared to the other creative stores, this study found that store H with the highest level of store image consistency (3/3) co-create images in two phases (development and full launch) and more actors (store owners, employee, investors, NGO, residents, customers, and others) engage in; while stores B, C, D, I, G, E, and F with the medium levels of store image consistency (1/3 & 2/3) have medium to longer image co-creation phrase. As we known, service is a holistic experience created by multiple stakeholders. Thus, more stakeholders engage in image co-creation, it is better to deliver image and value of service to customers. For instance, store H established its own online platform and published the online magazine to communicate with customers.

First, this store not only built a well-structured dialogue and access with its customers, but also allowed the customers easily and proactively to co-promote image and leave commentary. Second, this store publishes the online magazine with sub-brands or business partners to promote the store's position and propagandize its new product, services, or activities.

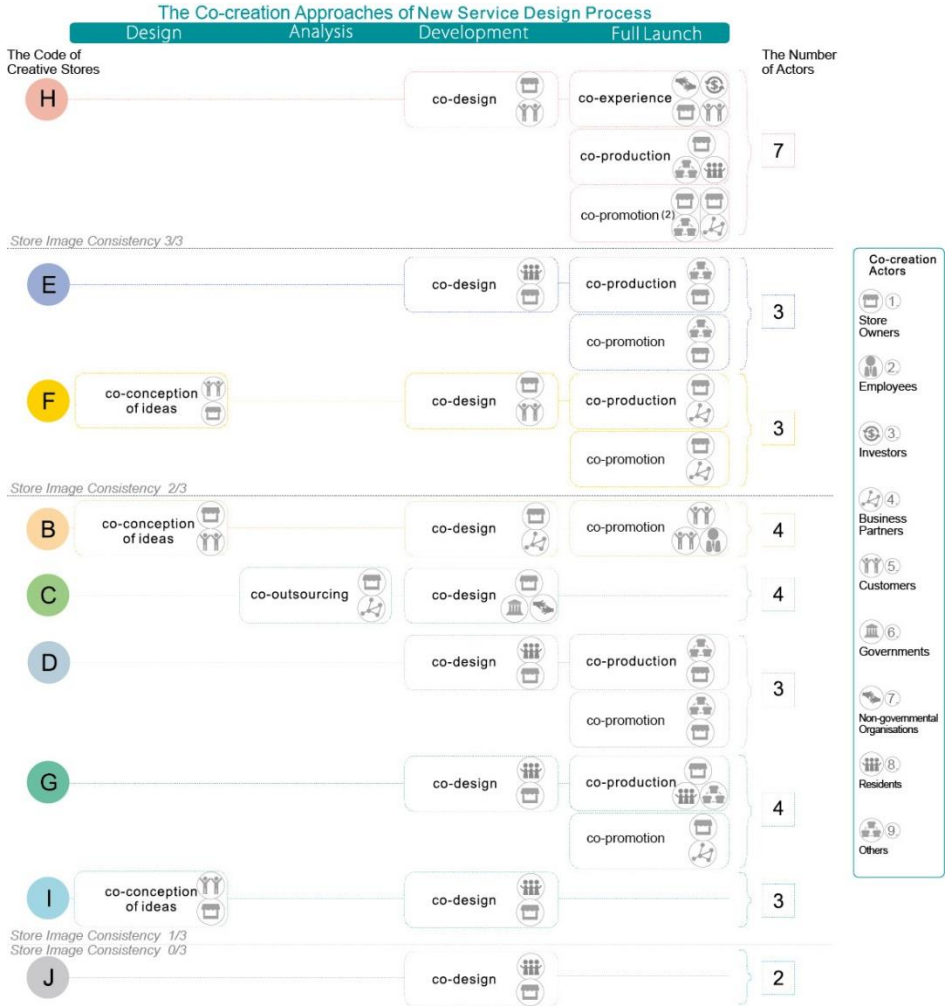

Figure 5 Co-creation approaches in four phases of NSDP by the recommended stores

However, stores with the medium level of store image consistency had no significant differences in both image co-creation and stakeholders. Stores C, D, G and E have two phases: *design* and *development*, and stores B, I, and F have three phases: *concept*, *design*, and *development*. Besides, store J (0/3) has the shortest period (only one phrase) and has the least amount of stakeholders (stores and residents in the community). In other words, it is

*The Image Co-creation: Store image consistency in creative stores*

efficient for stores to convey the store image of the provider's position by spending a longer period of time executing image co-creation in the NSDP.

To sum up, this study inferred that even though image is comprised of various elements, image co-creation maybe the possible reason for significant differences in the image consistency level. Moreover, stores with high levels of store image consistency would co-create in the later phases, such as *development* and *full launch*, of the NSDP. Last but not least, when more stakeholders engage in the image co-creation, it is easier to create a high level of store image consistency in this case.

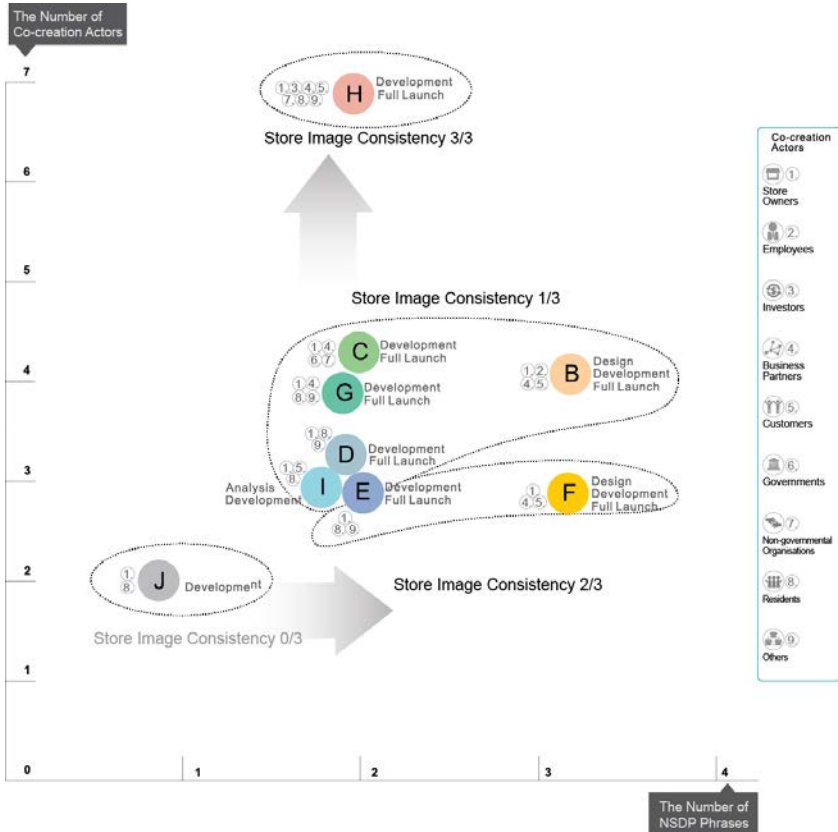

Figure 6 Comparison figure of the recommended stores' image consistency level and period of co-creation and number of co-creation actors.

## Conclusions and Suggestions

To sum up, this study found that store image consistency is a major influence in the store's evaluation, but the highly recommended stores certainly would not possess a high level of store image consistency. And, the stores build high levels of store image consistency via not only tangible (product or services cape) or intangible (music or customized core service) elements, but also by the image co-creation. In addition, the periods of image co-creation and types of actors have an influence on stores' image consistency. The image co-creation approaches of recommended creative stores with high levels of store image consistency centralized in the later phases, such as *development* and *full launch*, of the NSDP. Finally, in order to effectively deliver the store image of the provider's position, the more types of actors that engage in image co-creation, the more likely it is possible to create a high level of store image consistency.

Furthermore, based from the in-depth interviews, the store with high-level store image consistency indicated that the servicescape atmosphere is an important factor. Thus, to create a unique store image, this study suggests that the creative store should start from the service touch-points. That is to say, the storeowner can match the servicescape with the colour or the material of product and let customers have a store image evaluation before contacting with the service provider. Moreover, one essential feature of a creative industry is the creator and customers will continuously interact and they will also continuously upgrade (Lin, 2004). Image co-creation is indeed the approach to build a high level of store image consistency, especially in the last-period of the NSDP phases. The creative store should develop more kinds of activities, and let stakeholders (especially customers) co-create images from different approaches. Moreover, this study also suggests that it will be more beneficial to have more stakeholders involved in the image co-creation, e.g. cooperating with stores in the community, keeping in touch with other stores nearby, and holding activities with other stores at irregular intervals. Besides, when the store conducts the value co-creation, the friendly relations among the community should be promoted since creative stores are located in the community.

Additionally, Ramaswamy and Gouillart (2010) indicated that stakeholders should interact directly. Depending on the technological and environmental shift, more and more customers have manipulated the virtual community to have a C2C value co-creation, and observed the change of the impact on products or services, so stores can establish a platform for stakeholders to interact or share experience. However, these

platforms are not only built for interaction among customers. For example, store C's platform had an effective collaboration with similar or different kind of stores; while store B manipulated the resources from the upstream brand and integrate these resources from catering businesses and housewares. One thing for sure is, when having a dialogue or interaction, the issue should be confined to the interest of the stakeholders (stores or customers). Otherwise, the engagement should be clearly identified. If the stakeholders are lacking the same channel to interaction and transparent information, in this situation, dialogue could hardly have an impact. More importantly, dialogue, channel, and transparency can allow customers to contemplate on the evaluated risk-benefits (Pralhad & Ramaswamy, 2004). As for the sustainable development aspect, the connection among stakeholders is crucial. Future studies can be conducted on customer engagement (Brodie, Hollebeek, Jurić, & Ilić, 2011) or channels between P2P and virtual (Kohler, Fueller, Matzler, & Stieger, 2011) or business sustainable development.

However, except for the common research limit, this study had the following limitations. Firstly, this study was based on Taipei MRT stations at Zhongshan and Shuanglian. Only these two creative districts were used as the research field. Future studies should implement more locations to serve as a research field. Secondly, a majority of Taiwan's businesses belong to small and medium enterprises, so do the creative stores in this study; thus, the outcome of the study may not adapt to other kinds of industries or large enterprises. Therefore, future studies can probe into other kinds of industries or adopt research on objective estimates, and it will provide more research outcomes from multiple aspects.

# Stakeholder Involvement and Co-Creation in Service Design: Customer experience management in tourism

Chih-Shiang WU <sup>\*a</sup> and Tung-Jung SUNG <sup>b</sup>

<sup>a</sup> Industrial Technology Research Institute, National Taiwan University of Science and Technology; <sup>b</sup> National Taiwan University of Science and Technology

*In recent years, studies have pointed out that customer experience management (CEM) should be particularly considered in tourism service. Different from other service industries, customer travel experience is continuous and constructed by various stakeholders; therefore, it is crucial to facilitate stakeholders to co-create customer experience in the development of tourism service. Through literature review and a case study on the service design for a type of public transportation service in tourism, this study proposes some guidelines for effectively integrating customer experience management and stakeholder co-creation in each stage. Firstly, in the 'Discover' stage, a qualitative research method should be applied to explore the overall customer travel experience and the needs of stakeholders. In the 'Define' stage, organisations should focus on increasing value rather than maximizing interest, and specify concrete value propositions to attract stakeholders for the purpose of value co-creation. In the 'Develop' stage, co-creation workshops and visualization tools can be organized to facilitate communication and knowledge sharing between the stakeholders. Finally, in the 'Deliver' stage, it is important to organize a multi-discipline team and continuously monitor the progress of co-creation.*

**Keywords:** *Co-creation; stakeholder involvement; service design; customer experience management; tourism industry*

## **Introduction**

In recent years, with the rise of the experiential economy, the customer attitude towards value has shifted from focusing on the features, price, and quality of a product to the interactive experience during the using process (Gentile, Spiller & Noci, 2007; Grönroos, 2001; Mayer & Schwager, 2007; Palmer, 2010; Pine II & Gilmore, 1998). Therefore, in order to allow organisations to provide innovative user experience to elevate customer satisfaction and loyalty, Schmitt (2003) proposed the concept of Customer Experience Management (CEM) to allow organizations to focus on the customer experience development and delivering system.

Basically, tourism is a service-intensive industry, and generally, customer attitudes towards service values frequently skew towards experiential quality (Otto & Ritchie, 1996; Zehrer, 2009). Previous studies (Carreira, Patricio, Jorge, Magee & Hommes, 2013; Stickdorn & Zehrer, 2009) have shown that travel experience is continuous and constructed by services from different stakeholders. As such, for travel service providers, how to integrate service provisions from various stakeholders and how to facilitate them to be involved in the management of customer experience are still largely unknown and unexamined (Cabiddu, Lui, & Piccoli, 2013).

Service design is a method with a holistic view that not only allows organisations to deliver valuable service to the customers, but also emphasizes the efficiency and effectiveness of the service delivery process (Mager & Sung, 2011; Moritz, 2005). Stickdorn and Schneide (2010) highlighted that to deliver service more effectively, it is important to invite stakeholders to co-create in the design process, so as to facilitate every participant to follow the service system.

However, Waligo, Clarke, and Hawkins (2013) argued that within the tourism industry, stakeholders often lack consensus due to their differences in value propositions, even resulting in unsuccessful collaborations. Therefore, organisations should apply different strategies during the stages from planning to implementation, in order to facilitate stakeholders to participate in the planning process, develop a shared vision, and achieve management possibilities. Nevertheless, in fact, with regards to customer experience management and stakeholder co-creation in tourism, there have been only a few studies providing practical suggestions of the following questions for organisations: 1) how to manage customer experience in tourism; 2) how to integrate stakeholders in tourism; and 3) how to facilitate the stakeholders to co-create in CEM in tourism.

In Taiwan, following the social emphasis on leisurely lifestyles and changing global trends, the government of Taiwan has been proactively participating in the development of the tourism industry in recent years. Starting from 2009, the government passed a NTD\$30 billion 'Top-Notch Sightseeing Attraction Pilot Campaign.' The successful implementation of the program has seen a tourist surge from 8,142,946 in 2009 to 11,052,908 in 2013 (Tourism Bureau, R.O.C., 2014). This reflects the current dynamic development situation of the Taiwan tourism industry. Similarly, Taipei, the capital of Taiwan, possesses numerous highly rated tourist attractions, with many of them topping charts in terms of visiting numbers (Tourism Bureau, R.O.C., 2014). Especially, Maokong, a place recognized as the backyard of Taipei, which not only possess convenient travel, but also has unique culture and natural scenery (Lin & Chang, 2009), as shown in the Fig. 1. In order to attract the tourists to visit Maokong thoroughly, the Taipei City government implemented the Maokong Tour Bus for internal transportation. However, it is unfortunate that the bus use rate is only 16% (Department of Transportation of Taipei City Government (hereafter referred to as DoT Taipei), 2011), and the customer experience and stakeholder collaboration needs improvement urgently (Chu, 2008).

*Figure 1 A Scenic picture of Maokong*

Therefore, this study deployed a service design project for the Maokong Tour Bus system based on the 4Ds design process (Discover, Define, Develop, Deliver) proposed by Design Council (2005), with the aim of providing practical insights to answer the questions mentioned above. As such, this study firstly reviews the literature that related to customer

experience management in tourism and stakeholder co-creation in service design. Consecutively, this study gathered insights through observations and in-depth interviews with the stakeholders at various stages during the design process. Finally, this study proposed some guidelines for effectively integrating customer experience management and stakeholder co-creation in each stage based on the findings from the case study.

## **Literature Review**

### *Customer Experience Management in Tourism Service*

As stated earlier, tourism is a service-intensive industry, where customers expect to fulfil emotional requirements through experience; therefore, organisations in tourism should focus on the quality of customer experience and the performance of service operation (Stickdorn & Zehrer, 2009; Otto & Ritchie, 1996).

Regarding the issue of customer experience innovation and management, Schmitt (2003) proposed the CEM framework in the expectation of assisting organisations in better understanding customers more directly, so as to build concrete customer relationships. The CEM framework includes five steps: 1) analysing the experiential world of the customer; 2) building the experiential platform; 3) designing the brand experience; 4) structuring the customer interface; and 5) engaging in continuous innovation. As for service operation, Vargo and Lusch (2004) stated that when designing service, organisations must respond to Service-Dominant Logic (S-D logic), a new customer relationship perspective that claim that organisations cannot create value but can only offer value propositions and then collaboratively create value with the beneficiaries. Hence, in the perspective of organisations, providing superior value is largely related to customer experience (Zehrer, 2009).

Moreover, Parasuraman, Zeithaml, and Berry (1985) developed the service gap model to help organisations to evaluate the service quality. The model includes five kinds of service gaps, which are consumer expectation – management perception gap (*GAP 1*), management perception – service quality specification gap (*GAP 2*), service quality specification – service delivery (*GAP 3*), service delivery – external communications gap (*GAP 4*), and expected service – perceived service gap (*GAP 5*).

As a result, based on the perspectives of S-D logic, this study modified the original CEM by integrating the concept of ‘providing service value

propositions' with the related steps of 'building the experiential platform' and 'designing the brand experience' in CEM. Figure 2 shows a process of CEM with S-D logic.

Figure 2 A process of CEM with S-D logic. (Revised from Schmitt, 2003, p. 25).

Since the customer travel experience is continuous and is comprised of the services of different stakeholders, the quality of the experience is easily influenced by the overall travel itinerary. As such, when implementing customer travel experience management, organisations should not only consider their own service, but also take a holistic view to integrate the corresponded stakeholders' service provisions into the service system (Gopalan & Narayan, 2010; Stickdorn & Zehrer, 2009).

### *Stakeholder Value Co-Creation in Service Design of Tourism*

Evan and Freeman (1988) proposed the stakeholders theory, and defined stakeholders as 'groups and individuals who benefit from or are harmed by, and whose rights are violated or respected by corporate actions.' Moreover, Sautter and Leisen (1999) argued that organisational success is determined by the effectiveness of internal and external stakeholder management. In fact, in the tourism industry, services are inter-twined, and service provisions of stakeholders affect one another; therefore, the involvement of the stakeholders is one of the critical factors in the management of travel service quality (Carreira et al., 2013; Gopalan & Narayan, 2010). However, the stakeholders of tourism service are generally subjective and have difficulty reaching a consensus, causing the process of facilitating stakeholder cooperation to be difficult and complex (Waligo et al., 2013).

As such, with regards to the sustainable development of the tourism industry, Waligo et al. (2013) noted that in order to effectively facilitate the involvement of the stakeholders, organisations should apply corresponding strategies in different stages (including attraction, integration, and management), such that the stakeholders may have chances to start participating from the early planning process and build consensus; thus, the organisation can achieve the possibility of integration and management.

Moreover, from the perspective of S-D logic, in order to reduce the potential risks during stakeholder cooperation, Frow and Payne (2011) proposed the value alignment mechanism, according to which in the early stage of service development, organisations should clarify the relationships, interests, and needs of stakeholders, and define suitable value propositions in order to attract stakeholders. And, through the process of communication and knowledge sharing, the stakeholders may identify the opportunities for future collaboration and value co-creation. And, this study integrated the previous study regarding the process to facilitate stakeholders to participate in co-creation in Figure 3.

*Figure 3 A process to facilitate stakeholders to participate in co-creation*

Although the abovementioned theories support both CEM and the facilitation of stakeholder involvement in value co-creation, there are only a handful studies that actually illustrated the practical insights to facilitate stakeholders to involve in the value co-creation for CEM. Therefore, this study conducted a service design project in tourism in hopes of integrating practical insights into the 4Ds design process as a reference for the tourism industry in the future.

## **Case Study**

### *Case Study Process*

As mentioned above, based on 4Ds, this study conducted a service design project for Maokong Tour Bus as case study. Firstly, in the Discovery stage, this study adopted some methods of shadowing, observation, and the interview to uncover the service gaps of the Maokong Tour Bus and to analyse the needs of the various stakeholders. Secondly, in the Define stage, based on the findings, this study highlighted a new customer experience value proposition, and met various stakeholders individually to illustrate the needs for the co-creation of stakeholders in the future. Thirdly, inviting stakeholders, this study organized a co-creation workshop for the

communication and knowledge transfer in hopes of developing collaboration opportunities among the stakeholders in the future. Finally in the Deliver stage, through social networks and meetings, this study continued managing the collaborations and value co-creation among the stakeholders.

Meanwhile, during the 4Ds design process, through observations and interviews, this study collected stakeholders' feedback in order to extract practical insights from the Maokong Tour Bus service design project. The relationships between the interviewees and the Maokong Tour Bus are illustrated under the structure of the customer journey in Maokong as shown in figure 4.

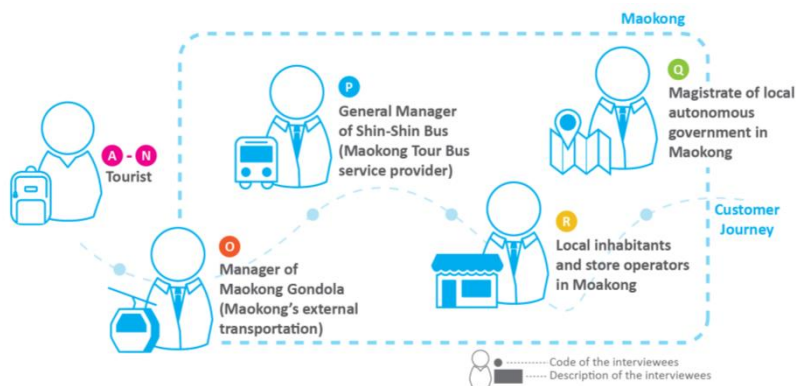

Figure 4 Background information of the interviewees

### Maokong Tour Bus

In recent years, the Taiwan government has actively promoted the tourism and hospitality industry, and the number of inbound tourists continues to rise in every year. Especially, Taipei City, the capital city of Taiwan, has the highest number of visitors in Taiwan most of the time (Tourism Bureau, R.O.C., 2014). As stated earlier, Maokong is a famous local destination, which is endowed with profound and unique cultural and natural views and resources, and recognized as the backyard of Taipei City (Lin & Chang, 2009). In 2007, Maokong Gondola was built for the purpose of external transportation linkage and for its tourism value. The introduction of the Maokong Gondola has successfully brought in a flow of new visitors for Maokong, and gradually turned Maokong into an international tourist attraction (Chu, 2007). Moreover, for the convenience of customers who

plan in-depth tours in Maokong, Taipei City Government commissioned Shin-Shin Bus to run the operation of the Maokong Tour Bus (Figure 5) for internal transportation in Maokong with its first station at the Maokong Station of the Maokong Gondola. With the 'Continual Ride Tickets', customers only need to pay NT\$ 15 to enjoy unlimited rides on the same day (DoT Taipei, 2012).

*Figure 5 Maokong Tour Bus*

However, according to the statistical report issued by DoT Taipei (2011), even though 5,000 customers per day arrived at the exit of Maokong Station through Maokong Gondola, the average number of customers who take the Maokong Tour Bus is only 150 people per day, which reveals that the usage rate is too low and causes losses for the service. With in-depth research, this study found that the service experience of Maokong Tour Bus was desperately in need of improvement. Moreover, lacking the integration of different organisations has led to poor customer travel experience in Maokong (Chu, 2007). As a result, it has affected the willingness of customers to engage in in-depth trips and consumption in Maokong, and indirectly caused a low usage rate of the Tour Bus. Therefore, starting from March 2013, we conducted a service design project and attempted to improve customer experience for the Maokong Tour Bus service.

## **Service Design of Maokong Tour Bus**

### *Discover*

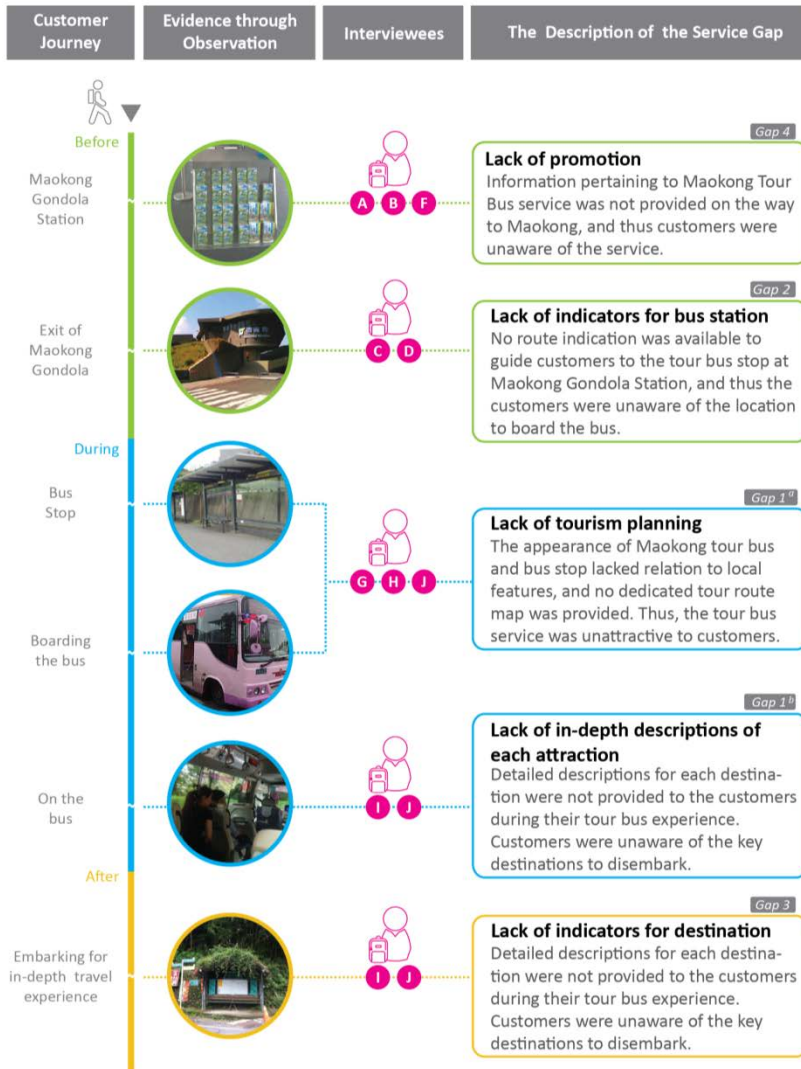

In the 'Discover' stage of Maokong Tour Bus service design project, in order to gain a holistic view of the customer experience and deep insights of

the service gaps, this study applied shadowing, observation, and interview methods in three stages during the customer journey, including 1) the 'Before' stage, in which Interviewees A to F were interviewed to share their service perceptions from taking the Maokong Gondola to walking to the tour bus stop; 2) the 'During' stage, in which Interviewees G to J were interviewed to provide their service perceptions from waiting at the tour bus stop to taking the tour bus; and 3) the 'After' stage, in which Interviewees K to N were interviewed to share their service perceptions from disembarking the tour bus to experiencing Maokong.

This study identified that some of the service quality problems that caused the low usage of the Maokong Tour Bus are not mainly from the service of Maokong Tour Bus, but the whole service system in Maokong. Therefore, in order to analyze the attribution of the problems, we categorized the major problems into four kinds of service gaps based on the service gap model. The research results of customers' Maokong Tour Bus experience are summarized in the customer experience journey map, as illustrated in Figure 6. As for Gap 1<sup>a</sup>, since the Maokong Tour Bus was not specifically designed for tourism and leisure purposes but only as transportation, the appearance of the tour bus and the bus stop lacked relation to the local feature, and no dedicated tour route map was provided for the customers, so the service was unattractive to the customers in the "during" stage. As for Gap 1<sup>b</sup>, the description of each bus stop was not dedicated for the tourism, and customers could not easily understand where to disembark for in-deep travel.

Regard to Gap 2, lacking the support from the Maokong Gondola, the indicators of Maokong Gondola to Maokong Tour Bus was absent, the customer can hardly find the bus stop of the Maokong Tour Bus in the "Before" stage. For Gap 3, due to the regulation and the habits of the resident, the quality of the surrounding environment of Maokong lacked sustainable maintenance and management. As a result, the damages to public facilities and messy public spaces undermined customer travel experience in the "after" stage. As for Gap 4, without clear information regarding the Maokong Tour Bus service during the Maokong Gondola ride and at both the entrance and exit point of Maokong Gondola Station in the 'Before' stage, customers were unaware of the Maokong Tour Bus.

*Stakeholder Involvement and Co-Creation in Service Design: Customer experience management in tourism.*

*Figure 6 The customer experience journey of Maokong Tour Bus*

Although it is crucial to apply service design and integrate the stakeholders to fill the gaps, the collaborations could not be easily achieved. This study collected the opinions and feedbacks from Interviewees O to R and discovered that the various conflicts and lack of communication

undermined the possibility of collaboration in the past (As shown in figure 7). First of all, Interviewee O stated that ‘since the resident and the local government did not carefully manage the environment in Maokong, the customer journey in Maokong was not qualified.’ Secondly, Interviewee P considered that:

*Most of the residents in Maokong only focus on their individual interests and it impede the development of the tour bus service for the customers to enhance travel experience.*

Thirdly, as for the stakeholders of local business sector, Interviewee R showed disapproval for the establishment of the Maokong Tour Bus service and the Maokong Gondola, stating that:

*The Maokong Tour Bus and Maokong Gondola service do not help promote local businesses and the customers who ride Maokong Gondola and the tour bus seldom disembark to purchase items. This further reduces revenue of our local business.*

Finally, from the viewpoint of local government, Interviewee Q considered that:

*When developing public facilities, it needs carefully consideration; otherwise, the construction may violate the environmental regulation or harm the interests or habits of the stakeholders in Maokong area.*

*As a result, in order to integrate the stakeholder for co-creation, further strategies are required (Waligo, et al, 2013).*

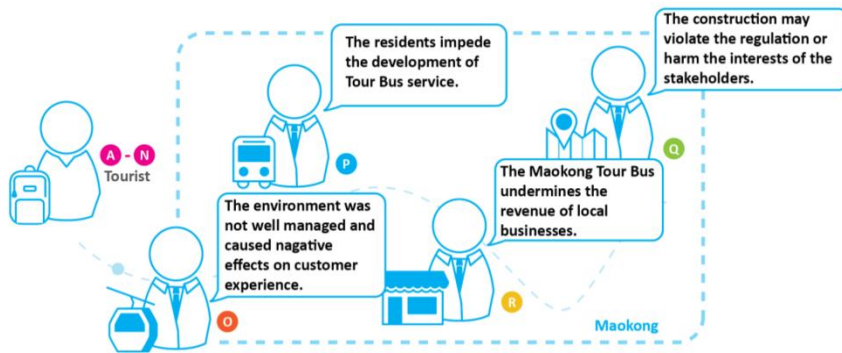

Figure 7 Conflicts among the stakeholder in Maokong

In summary, through a holistic and qualitative research, this study found that the problems, which cause the low usage of Maokong Tour Bus, are not mainly from the riding experience, but from the whole service system in Maokong. These findings correspond to the statement in Zehrer (2009) that tourism is a series of sequential service processes so that problems do not singly originate from a single service. However, without the support from other stakeholders, the service gap can hardly be filled. Thus, in the 'Discover' stage, the service design project should focus on the before, during, and after of the service, and apply the tool of customer journey map in order to fully understand customers' tourism experiences and to identify key stakeholders from a holistic perspective (Stickdorn & Zehrer, 2009; Stickdorn & Schneider, 2010). Moreover, although certain information or problems can be revealed through employing traditional quantitative analysis results (e.g. the low usage of Maokong Tour Bus or the customer satisfaction), underlying causes remain unclear and contributions to design implementation are limited (Polaine, Lovlie, and Reason, 2013; Tripp, 2013). Therefore, the service designers should alternatively apply qualitative research methods to uncover underlying problems from both customer experience perspective and stakeholders' business considerations, which can then be used as references for service experience innovation.

### *Define*

In the 'Define' stage, this study examined the findings from the 'Discover' stage through interviewing with different stakeholders in order to define appropriate value propositions of the Maokong Tour Bus service for customers and also as a strategy to attract stakeholders for collaborations as well. Based on the customer journey map, this study selected key stakeholders, and met them individually to illustrate the problems and the need for value co-creation and collaborations.

From the results of the meetings and discussions, this study found that some of the gaps (Gap 1, Gap 2, and Gap 4) could be filled through the co-creation among the stakeholders. For example, Interviewee O stated that 'the customer travel experience could be extended if the services of Maokong Gondola and Maokong Tour Bus connected.' On the other hand, Interviewee Q considered that 'if the Maokong local culture is connected to the Maokong Tour Bus, it could not only give support on the promotion of the Maokong local culture, but also to improve the travel experience for the customers.' However, it is also found that some of the gaps, which related

to the regulations or the habits (Gap 3) of the stakeholders, could hardly be solved. For example, Interviewee P mentioned that 'since the residents have established their habits over time, it is difficult to make them change immediately.' In addition, Interviewee Q stated that 'the regulations that established by the central government are designed for the protection of the environment and impartial principle, so it is hard to filled these types of gaps.'

As a result, based on the Gaps of 1, 2, and 4, this study strategically proposed the core value proposition is to connect and expand the services for the stakeholders in Maokong so as to provide a rich and comfortable travel service experience for the customers in Maokong. Firstly, this study proposed that the values of the Maokong Tour Bus service should be elevated from serving a transportation function to a travel orientated service. As a result, the characteristics of Maokong culture were integrated into the Maokong Tour Bus visual identity (Figure 8) that complies with Maokong's tourism image in this study.

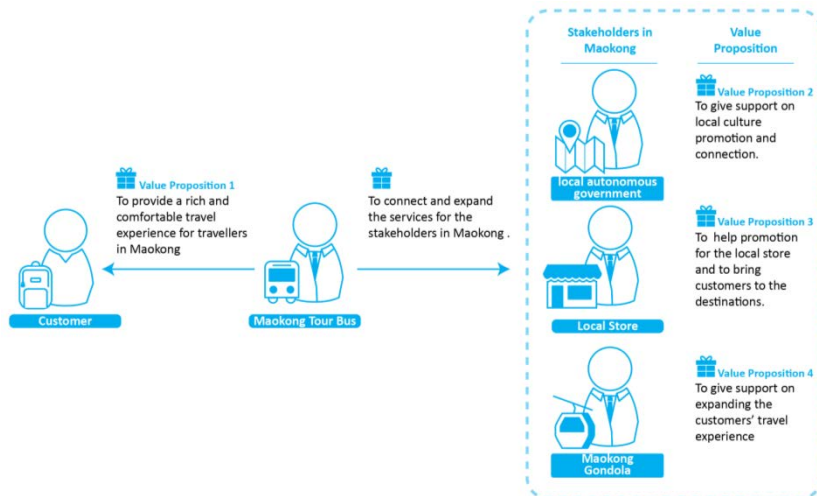

Figure 8 The new logo design for the Maokong Tour Bus

Secondly, this study illustrated the value proposition for each stakeholder (as shown in figure 9) to increase the willingness for value co-creation: 1) Customers: providing a rich and comfortable travel experience; 2) Maokong Gondola: giving support to Maokong Gondola on expanding the customer travel experience; 3) Local store: assisting promotion and bringing customers to the local store; 4) Local autonomous government: providing support for the promotion of the local culture and the connection between different areas in Maokong.

*Stakeholder Involvement and Co-Creation in Service Design: Customer experience management in tourism.*

*Figure 9 The new value propositions of Maokong Tour Bus for each stakeholder*

Thus, in the 'Define' stage, this study argued that organisations should meet key stakeholders to identify the causes of each gaps and to clarify their expectations, and propose suitable value propositions to meet their needs. Consecutively, when defining the value propositions, it is crucial to emphasize on overall value rather than maximizing profit individually as an objective to minimize conflicts and competition with other stakeholders. This method of promoting collaboration through value proposition is similar to that proposed by Frow and Payne (2011), namely, organisations should be focused on increasing value rather than maximizing profit to avoid competition and conflict, thereby successfully attracting the stakeholders to the collaboration.

### *Develop*

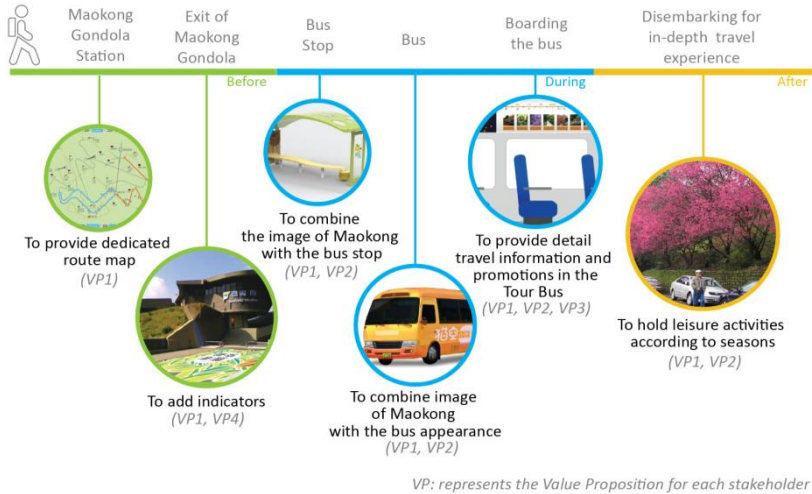

To integrate potential collaboration opportunities between stakeholders in the 'Develop' stage, this study hosted a co-creation workshop in late 2013 (Figure 10), thus providing a platform for interaction and knowledge sharing. Shin-Shin Bus Company (Interviewee O), service providers of the Maokong Gondola (Interviewee P), the local autonomous government (Interviewee Q), and external designers were invited to the workshop.

*Figure 10 The co-creation workshop in the Maokong Tour Bus service design project*

During the workshop, to familiarize the stakeholders with the purpose of collaboration, this study first demonstrated the Maokong customer experience journey by creating a servcescape 3D model and pointed out the customer experience problems caused by the lack of stakeholder cooperation. Then, this study illustrated that the purpose of this co-creation workshop was to improve the travel experience and realize the value propositions through collaboration among the stakeholders and to create mutual business models. Therefore, this study applied visualization tools and the customer experience journey map, which derived from the 'discover' stage, to facilitate the discussion and co-creation among the stakeholders. Interviewee O responded that 'the demonstration of the customer experience research helped us to put more focus on the discussion for future collaboration and to create new business opportunities.' The following is the concrete collaboration opportunities that responds to the value propositions and innovative customer experience journey map (Figure 11), which was derived from the co-creation process during the workshop. Firstly, in the 'Before' stage, in order to gain the customers awareness of the tour bus service and to extend customers experience from Maokong Gondola, Maokong Gondola would plan to install brief introduction, guiding signs, and road guidance painted on the ground for the Maokong Tour Bus service. Secondly, in the 'During' stage, it was proposed that the appearance of the bus stop and the tour bus of Maokong Tour Bus should be incorporated with local features to promote the tourism industry in Maokong. In addition, detailed information and other travel promotion in the Maokong area were provided in the Maokong Tour Bus.

Finally, in the 'After' stage, leisure activities would be added to the operation of local travelling services in Maokong such as seasonal theme events. With the help of cooperative promotions, these activities were expected to provide novel experience for customers in Maokong and to attract customers in the future.

**Figure 11** The new customer experience journey of the Maokong Tour Bus

After the workshop, all stakeholders have established their implementation plans with detailed schedule in the future. Interviewee R suggested 'The workshop opened up effective communication, which allowed us to understand each other better, and creates more opportunities for future collaboration.' As such, this study considers that in the 'Develop' stage, in order to facilitate stakeholders to build up consensus for value co-creation and future collaboration, organization should invite the key relevant stakeholders of the service and a few of irrelevant outsiders into the co-creation workshop. Stickdorn and Schneider (2010) underlined that a co-creation workshop is an open development model. With appropriate arrangements, it can facilitate stakeholders to formulate excellent ideas as a source of inspiration for core design teams to execute. Moreover, since the stakeholders will be eager to share the results, which originated from their

efforts and contributions during the co-creation process, it may increase the possibility of future collaborations.

On the other hand, the arrangement of designers to participate in co-creation is in alignment with the concept of free agent proposed by Kania and Kramer (2011) that it not only provides diverse sources of innovation, but also improves the performance of coordination and communication. In addition, to ensure effective communication between stakeholders, physical tools can be employed in the workshop (e.g., Legos, post-its, customer experience journey map). These tools were used to help in the visualization of innovative concepts proposed by the stakeholders, which created effective communication, enhanced the effectiveness of co-creation in the workshop, and elevated the quality of outcomes (Clatworthy, 2012).

### *Deliver*

In the 'Deliver' stage, together with the stakeholders, this study selected the prototypes for further implementation and evaluation, including the indicators, route map, appearance and interior of the Maokong Tour Bus, and the leisure activities. Since 2014, the aforementioned cooperative projects have been initiated, and the goals and the responsibilities for each stakeholder are illustrated in figure 12.

Moreover, in order to facilitate the process of the projects, a multi-discipline team has been established by this study that involves different stakeholders, experts, designers, and consultants. Moreover, with the assistance of social networking software (e.g., Line and Facebook) for virtual and physical meetings, this study continues to monitor the development progress of each prototype.

Sung and Wu (2011) indicated with various knowledge, multi-discipline team can propose solutions more effectively during the projects. However, in the beginning of establishing a multi-disciplinary team, it is necessary to apply virtual communication software and official or unofficial physical meetings to build up trust and consensus so as to improve collaboration maturity.

Prototype	Goal Description	Stakeholders and Responsibilities
	To establish indicators for the Tour Bus in the exit of the Maokong Gondola.	<ul style="list-style-type: none"> <li> To provide spaces for the indicators.</li> <li> To design and provide the indicators.</li> </ul>
	To design dedicated route map that introduce the Maokong Tour Bus.	<ul style="list-style-type: none"> <li> To verify the detail information shown in the map</li> <li> To design and provide the indicators.</li> </ul>
	To redesign the appearance of the Maokong Tour Bus that combines with Maokong local culture.	<ul style="list-style-type: none"> <li> To design the appearance of the Tour Bus.</li> </ul>
	To add detail information of the attractions according to the bus tour route and bus stop.	<ul style="list-style-type: none"> <li> To provide information of the attractions.</li> <li> To provide interior spaces for the information.</li> </ul>
	To launch leisure activities to promote the tourism in Maokong.	<ul style="list-style-type: none"> <li> To gather the local stores and residents to plan for the activities.</li> <li> To promote the activities through the appearance and the interior of the Tour Bus.</li> </ul>

*Figure 12 The prototypes selected for implementation in the service design project of Maokong Tour Bus*

## Conclusions and Suggestion

At the present stage, this study has successfully guided the stakeholders to participate in co-creation and CEM, based on the signature of memorandum of understanding with Shin-Shin Bus and other stakeholders. The project has started implementing the concepts during 2014–2015.

Based on the literature review and case study, this study has explored the theoretical and practical insights for the three questions proposed in the beginning of this paper and integrated into the 4Ds design process as a

reference for the future service design in tourism (Figure 13). Firstly, in order to manage customer travel experience, this study applied qualitative research methods such as shadowing and interviewing involving a holistic customer experience journey, including before, during, and after, in the 'Discover' stage. With such research methods, this study uncovered certain hidden problems (e.g. lack of promotion, lack of indicators in the Maokong area, lack of the collaboration among the stakeholders) that are not directly related to the Maokong Tour Bus riding experience, but caused the low usage rate of the Maokong Tour Bus. Meanwhile, as shown in the 'Discover' state, opinions of the stakeholders should be collected to analyse difficulties that may occur during the collaboration and value co-creation. Secondly, to integrate the stakeholders, organisations should differentiate the causes of the service gaps with stakeholders and work on the overall value and clarifying the expectations from different stakeholders to specify concrete value propositions to attract stakeholders. For example, after evaluating the causes of the service gaps and identifying the stakeholders' position and resource, this study strategically proposed the value proposition of Maokong Tour Bus that benefits both customers and stakeholders to fill the service gaps of 1, 2, and 4; as a result, it raised the possibility to align the stakeholders for collaboration.

Thirdly, by introducing designers and visualization tools that related to customer experience into the workshop, this study found that it could facilitate the open discussion and co-creation among the stakeholders and to create opportunities for future collaboration. For example, in the 'Develop' stage, this study applied some tools to illustrate the customer experience, and invited key stakeholders and external designers to join the co-creation workshop. With this workshop, the stakeholders were willing to co-create and build up connections with others. Finally, in the 'Deliver' stage, organisation should organize a multi-discipline team to implement the prototypes with corresponded stakeholders for further customer experience evaluations. Moreover, through adopting social networking software and official or unofficial meetings, organisations could facilitate the progress of the prototype implementation more effectively.

*Figure 13 Insights from the Maokong Tour Bus service design project*

In summary, this study found that when working on service design in the tourism industry, organisation could hardly fill all the service gaps by itself. Therefore, it is crucial to integrate the relevant stakeholders into the service systems. However, service design and stakeholders' co-creation are not panacea. If the causes of the service gaps were related to regulations or habits of the residents, it would need other resource or method to fill the gaps.

Since the case study of the service design examined by this study is still in the preliminary developmental stage, in future research, this study will further explore the improved design and customer experience. Moreover, to improve the completeness of this research, this study will continue to explore the relationships between the value propositions and the interaction of the stakeholders based on the stakeholder theory. Finally, this study expects to verify the proposed insights through various projects in the future to serve as an important reference for organisations in the tourism industry when implementing the management of customer experience.

**Acknowledgements:** *This study received partial financial support from Service Science Society of Taiwan. Also, our deepest respect and gratitude go to the designers, include Hsiao WenFang, Chiu Chi, Chang JheJhao, and Allen Tsai, who participated in the service design project of Maokong Tour Bus.*

## Co-design for Not-for-profit Organization

Busayawan LAM<sup>a</sup> and Andy DEARDEN<sup>\*b</sup>

<sup>a</sup> Brunel University; <sup>b</sup> Sheffield Hallam University

*Co-design has potential to help community-based organizations deliver better services to their beneficiaries, since it encourages users to get involved in designing services that will be delivered to them. Good use of co-design could bring several benefits, e.g. ensuring that services match users' needs. However, the extent of co-design knowledge among community-based organizations is currently unknown. Hence, this study aimed at investigating their current state of co-design knowledge in order to develop guidance to help them effectively co-design services with their beneficiaries. This project employed a mix-method approach including a survey, interviews, case studies, and a creative workshop. This paper will discuss results of case studies conducted with five organizations, which involved observations and interviews with key staff and users. The results revealed that the level of understanding of co-design among community-based organizations varied greatly. While most organizations have the right mindset for adopting co-design, since they are keen to listen to users' ideas, only the minority actually involves users in designing services. The lack of awareness may be the main reason of the slow adoption of co-design. Thus, it is important to help them understand the value of co-design and how it can be used to suit their needs.*

**Keywords:** Co-design, Service Development, Community-based organizations

## Introduction

This paper discusses the results of the research project titled “*securing the value of co-design for community-based organizations*” funded by the Arts and Humanities Research Council under the Connected Community scheme. This project is a collaboration of Brunel University, Sheffield Hallam University and the National Council for Voluntary Organisations (NCVO). In this case, community-based organizations are defined as small locally-based not-for-profit organizations providing support to disadvantage people in their areas, such as local charities and volunteering groups.

Increasingly, the UK government is keen to get charities and voluntary organizations more involved in delivering public services, e.g. community healthcare and social care, since they excel at connecting with certain hard-to-reach groups, which are often defined as people who do not engage with the community (HM Treasury, 2002). However, the study carried out by Charity Commission (2007) revealed that small charities and voluntary organizations hardly engaged in public service delivery due to several barriers that are caused by their size, such as a limited staff and resources. Apparently, there is a need to help community-based organizations that are interested in delivering public services to overcome existing barriers and deliver high-quality services to disadvantage people that they are committed to support.

Although most community-based organizations operate within poor/disadvantaged communities, they are not always organizations of the poor and disadvantaged. Leaders and members of community-based organizations recognize problems and needs in communities, but do not necessarily have first-hand experience. Hence, effective collaborations between community-based organizations and their beneficiaries could lead to better services and more effective means of delivery, e.g. reducing unnecessary costs and maximizing value. Moreover, Charity Commission (2010) suggested that small not-for-profit organizations need to make a better use of collaborations, since they heavily rely on small numbers of committed staff and/or volunteers and thus are vulnerable if they leave.

## Background Research

In this case, **co-design** was considered as a suitable approach to address key challenges that community-based organizations currently face. *Co-design*, which is short for collaborative or cooperative design, is a distinctive approach to design that promotes collective creativity of designers and

people who are not trained in design (such as frontline staff and service users) throughout the whole design process (Sanders and Stappers, 2008). Co-design reflects a shift from user-centered design (user-as-subject) to participatory design (user-as-partner), which matches the ‘*bottom-up*’ and ‘*pro-people*’ ethos of the community-based organizations.

Boyle and Harris (2009) noted that good use of the co-creation approach brings several benefits. Firstly, turning beneficiaries (service users) into taskforce could help small charities and volunteering groups overcome problems caused by the lack of staff. Secondly, collaborating with users could ensure that services match their requirements and lead to better outcomes. Thirdly, active user engagement encourages self-help and positive behavior changes, which in turn could prevent potential problems in the future. Being involved in a creative process could help people gain confidence to solve problems themselves rather than asking for help from others (Bontoft, 2006). Besides, the participatory approach could enhance stakeholder engagement, which leads to higher productivity, higher creativity, and lower costs and risks (Ramaswamy and Gouillart, 2010).

Charity Commission (2010) reported that most not-for-profit organizations are interested in collaboration for idea/information sharing, which fits well with co-design principles. It is important to stress that co-design goes beyond conventional consultations and qualitative user research. To achieve full benefits of co-creation, users must be actively involved in designing and delivering services (Buur and Larsen, 2010).

As a result, the project aimed to 1) find out values/contributions that the co-design approach could bring to the service development process in the context of community-based organizations, and 2) answer the key question: *how best should community-based organizations use co-design with their beneficiaries to design better services and more effective means of delivery?*

## **Research Methodology**

This project employed a mix-method approach which included an online survey, semi-structured interviews, case studies, and a creative workshop. This paper will discuss results of case studies conducted with five community-based organizations. The main purposes of the case studies were to develop in-depth understanding of community-based organizations’ state of knowledge of co-design and their current practices in order to understand values that co-design brought to their service development

process. These insights will help the researchers develop guidance to help community-based organizations effectively co-design with their users.

To ensure representative and balanced results, the purposive sampling strategy was employed. Two organizations (MERU and the Blackwood Foundation) were selected due to their design-led approaches. They were considered to be at the forefront in terms of co-design knowledge and design practices. The rest (DASH, Age UK Hillingdon and Destiny Support) were chosen, as they were considered to be the representatives of the majority of community-based organizations. Most community-based organizations in the UK have a very small number of full-time staff, heavily rely on volunteers to provide services and rarely work with designers. The detailed profiles of all participating organizations are shown below:

- **MERU** is a regional charity supporting people living in Southeast England (see: <http://meru.org.uk>). Its mission is to *“help disabled children and young people achieve their aspirations”* by giving advice on appropriate assistive equipment and providing a custom-made solution if the suitable device does not exist. The charity has in-house design engineers, design studios and workshops for producing prototypes and manufacturing custom-made devices.
- **The Blackwood Foundation** is a charity established in 2009 by Blackwood, an organization that specializes in providing housing and care services for people with a disability or support needs based in Scotland ([www.mbha.org.uk](http://www.mbha.org.uk)). Its mission is to promote independent living and provides support for people with a disability or support needs. The work is mainly focused on design and technology. It has only two members of staff. However, the charity has access to various experts in Blackwood, e.g. human factor specialists.
- **Disablement Association Hillingdon (DASH)** is a charity, which aims to provide *“advice, support and information that will enable disabled people to make choices about how they live their lives”* (<http://dash.org.uk>). The charity perceives itself as user-led, since many of the trustees are disabled people. It originally offers advice and information (e.g. Direct Payment) on a one-to-one basis. Recently, the services have been expanded to include many activities designed to support disabled people, e.g. art & craft.
- **Age UK Hillingdon** is a local charity, which is part of a larger not-for-profit organization, Age UK ([www.ageuk.org.uk/hillingdon](http://www.ageuk.org.uk/hillingdon)). The goal is to *“improve the quality of life and promote a positive view of all older people in the London Borough of Hillingdon.”* As a result, the

organization offers a variety of support for older people. Its services can be grouped into four categories: 1) advice, 2) social contact services, 3) homes and hospital services, and 4) voluntary services.

- **Destiny Support** is a community interest company (CIC) that promotes independent living ([www.destinysupport.org](http://www.destinysupport.org)). The organization supports people of all ages and ethnicity, especially those that are hard to reach. Destiny Support perceives itself as user-centered. It provides one-to-one support and advice for a variety of everyday needs – ranging from helping people filling in benefit forms to providing emotional support for senior citizens. It also acts as a coordinator that helps connect people with available resources and coordinate services to match their needs.

All case studies involved site visits, semi-structured interviews with senior managers and frontline staff, and observations. In some cases, interviews with users and other key stakeholders (e.g. carers) were also carried out. To ensure the consistency, the same set of questions was used for all interviews. The questions can be categorized into six groups: 1) service development process, 2) service quality, 3) associated costs, 4) user involvement in designing services, 5) designer involvement in designing services, and 6) state of knowledge of co-design and current practices.

All interviews were recorded with permission and transcribed. Results were compared and analyzed using Thematic Analysis in order to extract all key issues in a form of the main lessons learned. The rationale was that all good practices gathered through case studies can be used to form a basis of the guidance designed to help community-based organizations use co-design with their beneficiaries more effectively in order to achieve better services and more effective means of delivery. The observation notes and pictures taken during the site visits were used to support the analysis.

## **Principal Findings from Case Studies**

This section presents the main findings of five case studies conducted in the project. The outcomes were compared to identify similarities and differences in terms of current knowledge of co-design and existing service design processes, especially how much users and designers are currently involved, as well as how the involvement affecting service quality and costs.

### *Case Study 1: MERU*

**Main Focus:** This case study focused on MERU's custom-made services. The charity designs and manufactures a variety of custom-made assistive products for disabled children and young people ranging from a computer control device right through to floor exercise equipment.

**Current Understanding of Co-design:** The interviews with the CEO and three design engineers revealed that the top management and frontline staff have a good understanding of co-design and already applied its principles to co-create custom-made devices with service users and other stakeholders (e.g. parents, carers and social service officers).

**Service Design Process:** For all custom-made products, the process begins with a request from beneficiaries, such as users, parents or healthcare professionals. All requests will be thoroughly assessed by the project referral committees (including an occupational therapist, a physiotherapist, an engineer and a project administrator) to establish that there is no other suitable device available in the market.

The process consists of three stages: 1) co-creating the brief, 2) co-designing the concepts and 3) co-evaluating the outcomes. Firstly, the co-creation of the design brief will be carried out by a design engineer who is assigned as a project leader and the end user. The current design brief template is a subject of many years of refinement. Unnecessary questions have been removed and new items have been added to capture users' detailed requirements and emotional needs, e.g. aspirations. The co-creation of the design brief is crucial to the quality of the service. Unrealistic requirements must be identified and eliminated at the early stage.

During the second stage, all stakeholders are treated as co-decision makers. However, healthcare practitioners often make the final design decisions. This was because many custom-made products are considered medical devices. Thus, they are regulated by the Medicines and Healthcare Products Regulatory Agency under the Medical Device Directive.

In the last stage, a handover meeting will be held to make sure that the user is satisfied with the outcome. To ensure the quality of the outcome, the product will also be thoroughly assessed by another design engineer whether it fulfils all the requirements in the design specs.

**User Involvement:** If users do not have any severe cognitive impairments, they will be involved in all stages in the co-design process, namely defining problems, creating the brief, developing design concepts, selecting concepts, finalizing details and testing the product. Nevertheless, it was observed that some disadvantaged children and young people may lack

confidence to co-create and/or make decisions. Hence, it is important to help them express themselves and their ideas. Nonetheless, it is not practical to expect service users and other beneficiaries to be physically present at all stages of the design process, since many of them have mobility impairments. Thus, most communications are carried out via phones/emails.

**The Main Challenges:** Getting all stakeholders involved in the design process is very challenging, especially in a case where several professionals are involved and cannot agree on what is 'best' for a child. The high level of user engagement has significant impacts on the time, human resources and costs. Currently, each project takes at least two months to complete. Some requests which are considered low priority (e.g. an adapted Xbox controller) may have to wait for a few years. Due to limited staff, the charity can handle around 10 – 12 projects at one time. Although the total cost varies from one project to another, on average, each costs approximately £1,000.

**Main Lessons Learned:** By breaking down the co-design process into three key stages, MERU has achieved an effective way of working with users and ensured that all key stakeholders are involved throughout the process.

*Figure 1 from left to right – MERU's design studio and workshop facilities.*

### *Case Study 2: The Blackwood Foundation*

**Main Focus:** This case study will discuss how the foundation applied the co-design principles to develop its services. Currently, the foundation offers two main services. Firstly, it helps connect people with a disability or support needs with designers and the design process. Secondly, it helps connect people with an interest in independent living together so that they can share problems, ideas and recommendations freely.

**Current Understanding of Co-design:** The interview with the director suggested that the charity has a good understanding of co-design and

already applied its principles to develop two main services. In 2010, the foundation conducted 11 consultation and engagement workshops with approximately 100 people Scotland-wide as a means to capture what people with a disability or support needs really want. The key findings are:

- Firstly, many workshop participants have strong potential to play co-creating roles. Using Sanders and Stappers (2008) framework for classifying users based on level of expertise, passion and creativity, many participants are considered '*creators*'. They know what they want and already designed/modified products and/or built environments to suit their physical and emotional needs.
- Nevertheless, there are limited opportunities for these '*creators*' to engage in the design process. There is need to utilize their knowledge and creative skills by giving them more opportunities to co-create new designs and technologies with trained designers.
- Most people do not know about existing products/services to support their independent living. There is a need for a platform that allows people to exchange knowledge more effectively.

**Service Design Process:** The principal findings from the co-design workshops were used to inform the service development, which can be divided into two main stages. The first stage is the development of **bespoken** ([www.bespoken.me](http://www.bespoken.me)), a social media site that bring together anyone with an interest in independent living. The site offers a forum that allows people to exchange ideas, tips, problems and recommendations more effectively. It also showcases good designs so that members are aware of existing solutions in the marketplace as well as recent developments.

The second stage is connecting users with designers through a university engagement scheme. The Blackwood Foundation conducted the pilot work with School of Engineering and Design, Brunel University. The charity set a design challenge for a final-year design student by asking forum members to come up with problems and/or new design opportunities for the chosen student to work on. The idea was to encourage a trained designer to co-design a product with bespoken members. At the end of the project, a meeting was carried out with the student to discuss the overall experience and identify potential problems that should be taken into consideration before launching a larger scale of design challenge in the future.

**User Involvement:** The charity has made a good use of an online digital platform to help people with a disability and plays an active role in the co-

design process. By encouraging online collaborations, certain limitations imposed by disabilities can be overcome.

**Main Challenges:** Although an online platform has helped overcome some problems, an effective way to collaborate still needs to be established. The reflective interview conducted with the designer at the end of the pilot project revealed that the designer did not know how to utilize users' knowledge and creative capabilities effectively. The interview results show that the designer perceived the user as an adviser rather than a co-creator.

**Main Lessons Learned:** It is important to encourage trained designers to fully utilize users' insight and creative skills. Sanders and Stappers (2008) observed that, in order to successfully embrace co-design practices, one must believe that *"all people are creative."* This is not a commonly accepted belief. That is why some designers or persons in charge might find it difficult to let go of control and let users make key design decisions.

Figure 2 from left to right – Consultation and engagement workshops, and the online collaboration between a designer and bespoke members.

### *Case Study 3: Disablement Association Hillingdon (DASH)*

**Main Focus:** This case study mainly focused on the recreation services designed to support disabled people in Hillingdon.

**Current Understanding of Co-design:** The semi-structured interviews conducted with the Chief Officer and Activity Leader revealed that DASH has very limited experience with trained designers. The charity has never involved a designer in any service development project. Thus, they have never come across the term co-design. However, they found the principles of co-design well aligned with their ethos, since DASH is committed to deliver user-led services to its beneficiaries. Most service developments in the recreation area are truly user-led, since ideas are often initiated by users. In many cases, users take the ownership of the activities – see the actual quote from the Chief Officer below:

*Boccia is the newest activity, only starting a couple of weeks ago, as a result of one of service users telling us that the nearest place he can play boccia is Hemel Hempstead. Obviously, transport for disabled people is much more difficult. To travel to Hemel Hempstead just to play for a couple of hours is not very feasible. That's why we set it up for him. Now he actually runs the group himself (see Figure 3).*

Figure 3 Discussions with users and carers carried out during the Boccia session

**Service Design Process:** Although users are seen as a main source for new service ideas, there was no formal process of developing service with users. Most ideas for new services were captured through casual conversations. The organization occasionally sends out a questionnaire as a means to identify users' requirements. This kind of questionnaire is part of an on-going review to ensure that users are satisfied with the services offered. Nevertheless, there is no specific timetable for this kind of survey.

DASH sometimes uses creative techniques, e.g. brainstorming, to generate new ideas with users. Nevertheless, in most cases, they rely on close relationships, good communication skills and intuition. They have practical techniques for teasing out ideas from different groups of users. While open questions work well with people with physical disabilities, a lot of probing questions are needed for people with learning disabilities.

Currently, there is no evidence of a formal process for the new service development. Once a new service idea is picked up by a staff or a volunteer, they will share the idea with their colleagues and line managers. If the team agrees that this service idea is interesting, they will explore how to deliver it, e.g. contacting suitable funders. After the funding is secured, the team will start investigating practical aspects, such as finding suitable venues.

**User Involvement:** According to discussions with several users and carers, DASH is perceived as approachable, open-minded and responsive to users' ideas. If the service does not require a large amount of setup costs, the charity is willing to put the new idea in practice without delay. Most

users and carers felt that their opinions were listened to and valued. Thus, they are willing to share ideas, because they have seen that their suggestions have been implemented. All service users took part in the interviews, especially those with physical disabilities, are keen to be more involved in service development (e.g. leading the activity that he/she suggested). In general, the charity encourages users to lead an activity that they suggested, since it is perceived as a way to help service users develop important life skills, e.g. planning, organization and management.

**Main Challenges:** The biggest expenditure is staff. Although the charity always seeks ways to reduce costs, user satisfaction is more important than cost effectiveness. This is because the level of user satisfaction and rate of attendance are main criteria where external funders judge the service quality.

**Main Lessons Learned:** By treating user involvement as part of skill development schemes, this could get more users interested in working with charities and voluntary organizations on service developments.

#### *Case Study 4: Age UK Hillingdon*

**Main Focus:** This case study focused on social contact services provided under the 'Active Ageing Group' scheme which aims to promote active lifestyles and social interaction through numerous recreational activities, e.g. social outings and group exercises. The data was collected via a combination of an observation and semi-structured interviews with staff and volunteers, as well as service users (see Figure 4).

*Figure 4 Observation and interviews carried out at Wallis House, Ruislip, UK*

**Current Understanding of Co-design:** The charity has no experience of working with designers – not even well-established disciplines, such as

graphic design. Thus, they have never come across the term co-design. Nevertheless, the charity is interested in learning more about co-design.

**Service Design Process:** The charity currently does not have a formal process for developing a new service or improving existing ones. New ideas are often emerged from users' feedback. The organization employed both formal and informal processes to evaluate user satisfaction and identify new opportunities, e.g. questionnaire surveys. This ongoing evaluation helps ensure that the services are continually improved and evolved.

According to the interviews, service users are welcome to be involved in all stages of service developments ranging from identifying problems right through to planning service details (e.g. choosing types of exercise that they would like to do). In general, when a user suggests a new idea, the charity will try to accommodate it and test it with other users. If the new service idea receives positive feedback, it will be introduced to wider audiences. If not, the idea will be removed. Several ideas (e.g. t'ai chi and Nordic Walking) were suggested, tested and removed due to unsuccessful results.

**User Involvement:** The staff observed that when users first joined the group, they can be quite shy. However, as they become more familiar with staff and other users, they will be more 'vocal' and confident to express their thoughts and opinions. Since not all users are interested in creative activities, e.g. designing services, it is important to make the tasks relevant. Since many users have hearing impairment, the ability to frame questions in a short, sharp and simple sentence makes a significant difference.

The informal discussions with several users confirmed that users' opinions and suggestions were valued and taken seriously by the charity. Most users found staff and volunteers to be open-minded and patient. This makes them feel comfortable to give feedback and suggest new ideas.

Most users said that they are willing to spend their time planning service details with the charity, e.g. designing the itinerary of a day trip. Only a few users are interested in leading the service development project while others feel rather shy and do not wish to take the lead. They would rather give suggestions and let the staff develop the ideas further themselves.

Many users are willing to help the charity test and refine their new service ideas. Since the services are user-centered, users can choose what services they want. If they do not like the activities, they will not take part. In this way, users' attendance can also give a clear indication about the service quality. The users pointed out that, at the beginning, there were only three people attending the group activities. Now there are approximately 20 people attending. This was because the charity listened to users.

**Main Challenges:** The biggest costs of services are transport and staffing, especially services designed for wheelchair users, since the charity must have enough staff to support each user. Hence, it may not be practical to get users physically present in all service design activities due to mobility problems. Even a short distance, some users need assistance.

**Main Lessons Learned:** Some users may have relatively low confidence to begin with. It is necessary to create an environment that makes them feel comfortable and enhance their confidence so that they can openly express their concerns and creative ideas. Thus, staff's attitudes and behaviors are crucial to the success of co-creation. Besides, sensory impairments must be taken into consideration when planning creative activities for older people.

### *Destiny Support*

**Main Focus:** This case study will focus on the practical support that the organization provides for its beneficiaries. This group of services aims to enable independent living and personal development, e.g. applying for council housing and giving lessons on basic IT skills.

**Current Understanding of Co-design:** The organization has never worked with any designers – not even tradition disciplines, such as graphic design. Thus, it is not familiar with the term co-design or co-creation.

**Service Design Process:** Although Destiny Support does not have a formal process for designing a new service, they were truly user-centered – see the quote from the Head of Operations below:

*We decided that we are a supporting organization - just come through the door, tell us what you want us to support you with, even if we don't have resources or specialists in house, we will try and look for the help you need if it is out there.*

**User Involvement:** Although all service ideas were identified based on users' needs, service users are involved mainly at the front-end of the service development process. They are not involved in the planning and delivering of services. Most user engagements were carried out in an ad hoc manner (e.g. informal conversations with users), since there is no formal process – see the quote from the Head of Operations below:

*We don't choose what services we are going to deliver. We identify. When people talk to us, we listen and think: 'what can we do?' We very much react to the needs rather than set up something because we think that might be what people want. We want the problem to*

*be solved in the long term. We don't want this person to keep coming back to us or be dependent on the services. What normally happens with other organizations is that a user would resolve one issue. Like that, you have not empowered that person. The rest of the problems are still there. For us, we listen to them and list down their problems. If you identify the real problem, the rest will fall into places.*

Moreover, there is no formal process for evaluating service ideas before the launch. The current service planning mainly concentrates on identifying resources needed to deliver the service (e.g. expertise, materials, equipment), because the organization has to apply for external funding.

**Main Challenges:** The main barrier preventing the organization from increasing the level of user involvement is not staff time or money, but characteristics of service users. Most of which have many serious problems, e.g. losing their council houses or benefits, having financial difficulties and being taken to court. They are not in the right frame of mind to engage with creative activities, such as service design and development.

Interestingly, many users have become volunteers of the organization. While it would be difficult to get users involved in planning and delivering services, there is a strong possibility to engage volunteers in designing services for people who experience similar problems and challenges that they previously encountered. According to the interviewee, volunteers are perceived as another group of service users which the organization also wants to empower. The organization provides support to volunteers by giving them an opportunity to further their education. As a social enterprise, it is in a good position to help volunteers get access to free training courses.

**Main Lessons Learned:** Co-design might not suit all types of users. People in stressful situations are unlikely to be interested in co-designing services. The mundane process of applying for external funding and lengthy paperwork may be the main reasons that make a number of not-for-profit organizations decide not to involve users in service planning.

## Discussions

This section summarizes all key issues, as well as the similarities and differences in terms of current state of co-design knowledge, existing service development processes, the level of user involvement and designers' inputs.

Firstly, the practices employed by organizations that make good use of co-design (MERU and The Blackwood Foundation) are compared with those

of ‘*typical*’ community-based organizations in order to identify values contributed by the co-design approach (see Table 1). Next, the key issues emerged from the case studies are discussed.

Table 1 Summary of main differences of all case studies

	Design-led Organizations	Typical Community-based Organizations
Current State of Knowledge	Good understanding	Unfamiliar with the term, but demonstrated interest in learning more about co-design
Service Development process	Systematic approach; exploring practical and emotional needs	No formal process; focusing on planning practical aspects, e.g. finding suitable venues
Roles of Users	Users as <i>co-creators</i> – users were involved in all design activities	Users as <i>advisors</i> – users provided feedback and ideas, and tested new services
Roles of Designers	Lead the co-creation	Designers were not involved
User Satisfaction	High level of user satisfaction	High level of user satisfaction
Values Added Through Co-design	Empowered people by encouraging them to develop solutions with designers and make key decisions by themselves	Limited use of collaboration means only a few active users gained full benefits of being involved in a creative process, e.g. developing new skills

The key issues captured from the five case studies are:

- The level of understanding of co-design among community-based organizations varied greatly. While some organizations have successfully applied this approach to develop and/or improve services, others have never heard of the term co-design.
- The size of the organization and resources do not appear to impose significant barriers for adopting co-design. For example, The Blackwood Foundation, which has only two staff, showed good understanding of co-design and already made good use of it.
- While most organizations have the right mindset for adopting co-design, since they are keen to listen to users’ ideas, only the minority actually involves users in the service development processes. Most participating organizations tend to involve users in the early stages of service development only, e.g. identifying

- problems and generating ideas. Users are not involved in the later stage of service development, e.g. planning service touchpoints.
- The staff and volunteers of participating organizations have developed exceptional communication skills which allow them to build good relationships with service users and help them capture useful ideas and feedback. Several participating organizations heavily rely on personal relationships between their staff and users. This makes them vulnerable if their staff/volunteers leave.
  - It was observed that both organizations that make good use of co-design have a systematic process for developing services and access to trained designers. Having a systematic process for co-designing with users and inputs from designers allow them to explore all issues thoroughly before creating the briefs and the solutions.
  - The organizations without a systematic process or inputs from designers appeared to focus on planning practical issues only and did not demonstrate a thorough investigation upfront. Hence, emotional issues, e.g. aspirations, might not be properly addressed.
  - The slow adoption of co-design might not be because of perceived benefits and risks, since most participants considered user involvement to be beneficial and did not display serious concerns apart from resource implications. The lack of awareness may be the main reason, since most organizations rarely work with designers and, thus, have limited understanding of design contributions.
  - In some cases, beneficiaries of these organizations present serious challenges. For example, it is not practical to expect disabled children and/or elderly people to be physically present at all stages of the co-design process. Moreover, some disadvantaged people may lack confidence to co-create/make decisions. It is important to make them feel comfortable and enhance their confidence so that they can honestly express their thoughts and opinions.
  - Good use of co-design was considered valuable, as it allows community-based organizations to help disadvantage people beyond providing them with good services. Involving people in the design process could encourage them to think creatively and make decisions by themselves, as well as help them develop new skills.

The key issues extracted from the case studies suggested that there is a need to help community-based organizations understand design contributions and help them start adopting co-design and its practices.

## Conclusion

The case studies helped the researchers develop better understanding of current state of co-design knowledge of community-based organizations and their existing service development processes. The studies suggested that community-based organizations have the right mindset for adopting the co-design principles. The most important thing is to help them understand how design, especially co-design, could contribute to their organizations, their services and their beneficiaries. As a result, a series of short educational videos were created in order to help community-based organizations see how other organizations in the not-for-profit sector use co-design to help them develop better services with users (see Figure 5). These videos are the results of the co-creation between researchers and community-based organizations that took part in this study.

By getting community-based organizations to share their real-life examples of how co-design has helped them developed better services, the team can ensure that the materials are relevant to the target audiences. Moreover, academic languages (which, in many cases, are considered *off-putting*) can be avoided. Since all examples are in the not-for-profit context, it could help inspire other organizations to learn more about design and co-design. The case studies' results were later combined with those from the other primary research to form the co-design guidance for this sector.

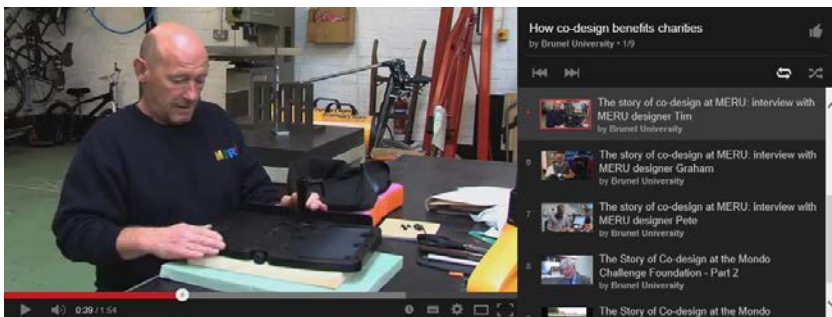

Figure 5 A series of videos sharing real-life examples of how co-design helped community based organizations developed and delivered better services with users

## Conflicts as Opportunities for New Insights

Pelin GULTEKIN-ATASOY\*, Hanneke HOOFT VAN HUYSDUYNEN, Yuan LU, Tilde BEKKER, Aarnout BROMBACHER and Berry EGGEN

Eindhoven University of Technology

*Collaboration is increasingly valued for innovation, however setting up collaboration between different stakeholders is challenging due to the high level of uncertainties at the early stages of the innovation process. In networked innovation, the what (proposition) and the how (development process and business model) need to be designed together. Involvement of potential partners early in the design process is important to gather valuable insights to enrich the value proposition, and reduce uncertainty.*

*To support the multi-stakeholder collaboration, we are developing a method that combines user insights and business insights in a single design process for multi-stakeholder settings. In this paper, two cases are examined in which we applied our method with the purpose of defining a combined service proposition with a triple-helix innovation model by inviting core stakeholders. We observed different dynamics in the discussions during the sessions, and more specifically, in the way conflicts emerged and new insights were created. Conflicts were observed to be valuable moments in multi-stakeholder discussions; they acted as a driver for the conversations that provided new insights to the participants and reduced the uncertainties, as a consequence. Confrontation rather than suppression of conflicts is suggested to reduce uncertainties in the earlier stages of innovation processes.*

**Keywords:** *conflicts; collaborative design; participatory innovation; stakeholder involvement*

## Introduction

Product/service design and development is an interdisciplinary activity, which requires people/organizations with different skills and knowledge to collaborate throughout the process (Ulrich & Eppinger, 2004). The intensity of the required collaboration usually increases with the level of complexity of the design problem or the designed product/service.

When we look at the contemporary practice in the design field, we can see that the design challenges are more complex than before: the focus of design shifted from designing products for users to designing future experiences of people, communities and cultures (Sanders & Stappers, 2008). We are also faced with societal challenges, like people having an inactive lifestyle, or meeting the needs of the aging population in society. In many cases, understanding the dynamics of these problems requires an inquiry from multiple perspectives and finding real solutions becomes possible with a trans-disciplinary approach (Brown, 2009), by bringing together complementary experience, skills and resources from different parties (Den Ouden & Valkenburg, 2011), which makes collaboration in product design and development even more important.

However, initiating collaboration between diverse stakeholders is challenging. In networked innovation, it is important for the collaborating parties to be able to check the feasibility and attractiveness of the solution, and the value it delivers to them (den Ouden & Valkenburg, 2011). But a number of uncertainties in the early stages of the design process makes it difficult to define the value proposition: a) many large-scale design problems such as interactive system design, product-service design or design for societal challenges, have a wicked character; the understanding of the problem evolves with the solution (Cross 2006; Dorst, 1996); b) the front end of the design and collaboration process is fuzzy, since the scope and dimensions of the problem are still vague (den Ouden & Brankaert, 2013); c) the capabilities and expectations of the different stakeholders are unknown to each stakeholder at this early stage (Atkinson, Crawford and Ward, 2006).

In multidisciplinary innovation processes, people from different disciplines, organizations and communities of practice need to collaborate. For the collaboration to be effective, shared experiences and moments of conversation are necessary (Eriksen & Vaajakallio, 2013), and also stated as valuable to achieve innovation (Buur & Larsen, 2008). It is advised that the stakeholders should be involved from the early stages to increase the added value, allow the affected parties to have a say in the proposal and enforce commitment (Abma, 2000).

One of the challenges in both traditional and more recent innovation processes is the alignment of interests of different stakeholders. Bringing an innovation to the market requires not only alignment with (future) market needs but also alignment between the understandings of all the parties involved in this process.

In traditional innovation processes, carried out within the structure of a single (often multinational) company, this alignment was often achieved through the organizational (hierarchical) structure of the company. Creating modern innovations often requires the collaboration and alignment of a much wider range of parties due to the increasingly complex structure of the required network. This will inevitably complicate the process since there is no natural guidance through the hierarchical structure of the major/dominant company involved. Although this more complicated alignment process will result in more conflicts during the initial phases of the innovation process, this is, in itself, not a bad thing.

Many authors have stated that resolving conflicts is a natural and essential part of the iterative process of innovation (Abma, 2000; Cuppen, 2012). Identifying (and resolving) these conflicts “upstream” early is considered far more efficient than “downstream” later due to the far higher flexibility in the earlier phases of the process. Since modern, networked, multi-stakeholder processes lack a central coordination mechanism it is expected that more conflicts will appear in the process. However high level of uncertainty may prevent the conflicts to surface until the later stages, and when the conflict is surfaced, intervention through the design of the process can be required for the conflicts to be constructive.

We are developing a method and a tool to support these collaborative design discussions between different stakeholders, by combining design and business insights, to create a shared understanding and reduce uncertainty in the early stages of design and collaboration. We are developing our method by a research through design process, in which we apply our method through a workshop process and a visual layout-tool, named Value Design Workshop, in multi-stakeholder sessions and reflect on the dynamics of the discussions and how those relate to our intervention.

We applied the Value Design Workshop in two cases with an aim to define the service proposals through Field Labs and the related value networks. This paper examines two cases that we conducted as a part of our research through design cycle. We will present our observations and user evaluations in these two sessions, with a focus on how conflicts took place in these two sessions and in which ways they affected the content of

discussion. We will elaborate on the effects of conflict in creating new insights in the multi-stakeholder dialogue, at different levels of uncertainties. Then we will discuss on the potential and limitations of the workshop process and tool from this perspective to support the design process in a stakeholder group.

## Available work

### *Uncertainty*

Networked innovation projects are usually complex in nature, due to the dimensions of the problem at hand and the possibility of solutions. In most cases, there is high level of uncertainty especially in the early stages of project lifecycle (Atkinson et al., 2006; den Ouden & Valkenburg, 2012). A significant amount of work is done to conceptualize uncertainty, and large amount of the available research is focused on internal uncertainty in organizations (Perminova, Gustafsson & Wikström, 2008). A commonly used definition of uncertainty is *the lack of required information to perform a task*: “The difference in the amount of information required to perform a task and the amount of information already possessed by the organization” (Galbraith 1973, cited in Harkema, 2012, p.44). A classification of uncertainty based on an overview of literature is presented by Lipshitz (1997). In this classification, the issues of uncertainty (what the decision maker is uncertain about) are *outcomes*, *situation*, and *alternatives*. These are induced by *incomplete information*, *inadequate understanding* and *undifferentiated alternatives* (Harkema, 2012). Atkinson et al. (2006) presents three key areas of uncertainty featured in networked discussions as:

- uncertainty associated with estimating: variability in relation to the performance measures like cost, duration, or quality, resulting from lack of data/inaccurate detail, bias, limited control, ignorance
- uncertainty associated with project parties: arising from uncertainty about the party’s level of performance, objectives and goals, the extent to which these objectives are aligned, reliability of the work undertaken, abilities of the party and availability of the party
- uncertainty associated with stages of the project life cycle.

They add that when the agents of the network are from different organizations, these problems can be particularly challenging, because sharing of information, responsibility and objectives can be limited.

Uncertainty may vary on the type of the project and the output. For some projects, like the ones that have a tangible outcome that can be presented with physical models and prototypes, the goals are clear and well defined and can be given from the start. On the other hand, in the projects in which the outcome is not tangible, clarity and agreement are harder to achieve, and the measures are qualitative rather than quantitative (Atkinson et al., 2006). Crawford & Pollack (2004) define dimensions of *hardness and softness* of projects that define the scope of uncertainty involved. These dimensions are *goal clarity, goal tangibility, success measures, project permeability, number of solution options, participation and practitioner role and stakeholder expectations*. The projects in which the output is not tangible and many stakeholders are involved are located towards the Soft end of the spectrum, being high in uncertainty (Atkinson et al., 2006).

Therefore, they emphasize the importance of clarifying stakeholder expectations and priorities at an early stage to avoid major difficulties in the later stages.

### *Conflicts in Multi-stakeholder Collaboration*

One characteristic component of multi-stakeholder collaboration process is conflicts. When the participants from different disciplines and stakes meet, it is more likely that different stakeholders have different or conflicting views on a shared problem or a goal (Abma, 2000). In fact, since the different viewpoints challenge each other when people from different communities (Eriksen & Vaajakallio 2013) and perspectives (Cuppen, 2012) are brought together, “consensus on all issues is rarely if possible” (Guba & Lincoln, p.41, cited in Abma 2000).

Although conflicts are normally perceived as a negative term, the value of conflicts in multi-stakeholder dialogue as an enhancer of learning (Cuppen 2012), creativity (Nemeth, Personnaz, Personnaz, & Goncalo, 2004). 2004; Buur & Larsen, 2010), empowerment, constructive dialogues and innovations (Abma, 2000) are addressed in literature. Especially in the early phases where the flexibility is high, conflicts not only may identify potential future roadblocks but also potential future opportunities. It has been argued that they can be the drivers of innovation; therefore recognizing the quality of conversations in such settings are valuable for supporting innovation and collaboration (Buur & Larsen 2010). Although

most of the participatory methods aim at consensus building (Cuppen, 20102), suppressing conflicts may move discussions into a form of formal meetings and decrease the likelihood of arriving at novel solutions in a team.

However not all types of conflicts are useful. For instance, Abma (2000) differentiates *functional conflict* from *dysfunctional conflict*. While in functional conflict, participants are “the prisoners of their own construction and unable to re-construct their position and situation” (p. 204), in functional conflict they can arrive at new meanings and solutions. Cuppen (2012) coins the term *constructive conflict* as a mechanism to enhance learning in stakeholder dialogue. Which “refers to an open exploration and evaluation of competing ideas and knowledge claims in order to achieve new ideas, insights and options for problem solving” (p. 26). Others use the terms *productive conflict* and *creative conflict* to describe the concept (Cuppen, 2012).

Conflicts are more useful in the early stages of collaboration, however they may remain hidden. Especially when the abstract concepts are to be implemented through stakeholder collaboration, consensus can be a superficial one (Abma, 2000). High level of uncertainty in the early stages may allow the conflicts to remain hidden until the later stages where concrete action is need. During the initial stages of the projects with soft characteristics where uncertainties are high, uncertainties can be inappropriately accepted due to partners feeling the need to accept the risk, in order to win the work, or because of the ignorance of the scope of uncertainty (Atkinson et al., 2006). This doesn’t mean that consensus cannot be reached, but it may be dangerous to reach it “too soon and for the wrong reasons, e.g. because of the inability to tolerate conflict” (Mitroff & Enshoff, 1979, p.10 in Cuppen, 2012). Therefore, it is particularly important to clarify stakeholder expectations and priorities at an early stage (Atkinson et al., 2006). Conflicts are the moments at which uncertainties are reduced and new balance is searched.

## Case Study setup

We organized Value Design Workshops to define the services provided by FieldLabs in two different cities, and to map out the related value networks to realize the services. A FieldLab can be described as a living-lab concept for (sports) innovation, based on Triple-helix innovation model (Etzkowit, 2003). It is “a research and development location in a real-life

setting where citizens engage in sports & play activities and where businesses can test their product prototypes” (<http://fieldlabs.eu/>). Therefore FieldLab services are composed of overlapping services provided to different customers, in this case, the local citizens, sports industry and knowledge institutes.

In both sessions we invited the core stakeholders who are the possible collaborators from the local network, or already started collaboration a short time ago. The value proposition of the FieldLabs in two cities was similar; however they are in the different stages of establishment, therefore the collaboration and involvement of partners were in different stages.

City A was in the earlier stages with partial infrastructure installed and a pilot project is being carried out at the time of the writing of this paper. During the pilot project, collaboration with the business partner has already been started a year ago; therefore the business representative was familiar with the concept. The participants from the neighbourhood activity organizers were not familiar about the service but wanted to get more information. However the services were not clarified and a FieldLab manager has not been assigned yet.

In City B the establishment of the FieldLab had already been started 4 years ago with the support of government organizations. A number of projects were carried out in collaboration with the partners from the business. A FieldLab manager has already been assigned by the municipality, however the FieldLab was being operated with the support of the NWE ProFit Project which is coming to an end in 2015, therefore the project partners were aiming to establish the business model without the project support. In both cases, the project partners from the municipality and university were looking for ways to involve the local stakeholders to organize activities and define a service structure with a business model to set-up a standalone operation.

In both sessions the same discussion process was followed, as proposed by the Value Design workshop.

## **Value Design Workshop**

Networked innovation with the involvement of different stakeholders has different dynamics than designing from single producer perspective (den Ouden & Valkenburg, 2012). It requires not only defining the solution but also defining the collaboration space with roles of different stakeholders. The need for methods and tools that support the initiation of multi-

stakeholder collaboration are stated (den Ouden & Valkenburg, 2012; Cuppen, 2012)

User Centred Design methods and tools do not necessarily address this issue, since the main focus is to create empathy with users and feed the design process with user information. Other methods from innovation studies often focus on creating new business models (Osterwalder & Pigneur, 2010; Reis, 2011) but they often assume that the solutions that connect the different stakeholders are already there and they do not necessarily develop the proposition together with the potentials of the collaborating parties. Den Ouden (2012) proposed a value model to support the value creation with multi-stakeholders. This method focuses on designing based on business insights and creating balanced value network. However, there is no direct association in her approach to connect the user insights and business insights together and make the innovation action more dedicated.

We therefore developed a method to support the initiation of multi-stakeholder innovation which allows designing the value proposition with stakeholder input. With our method we aim to integrate user insights with business insights in a single design process, to deepen the understanding on user requirements, business requirements and the collaboration structure needed for a value proposition. We propose that our method is useful in the early stage of product/service development and collaboration, when an initial proposal is defined, but still open to take shape with the contribution from stakeholders.

We designed a workshop process and a visual layout –tool, named Value Design Workshop, to apply our method and gather insights on multi-stakeholder collaboration and improve our method further (Gultekin-Atasoy, Bekker, Lu, Brombacher & Eggen, 2013).

The workshop process supports the discussion by proposing topics and keywords for the group to follow a structured discussion, enabling the participants to discuss the concept from different perspectives and position themselves in the value proposal (see Figure 1).

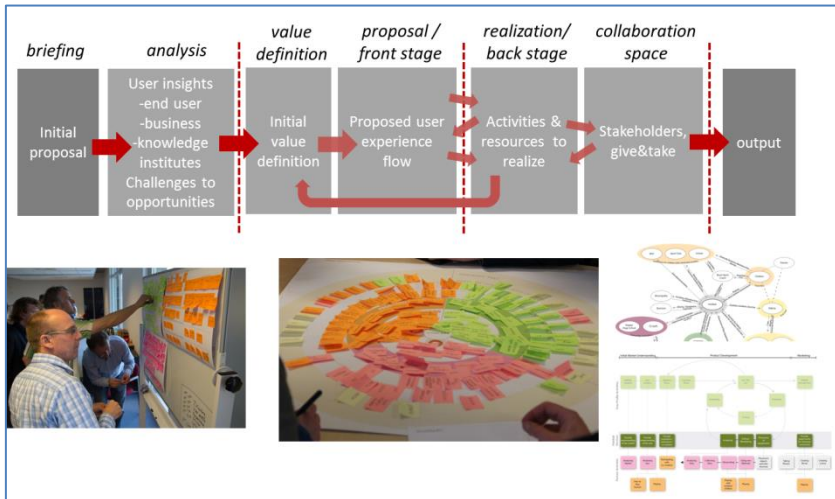

Figure 12 The Value Design Workshop Process

The process starts with an analysis of user profiles and requirements. It is followed by defining proposed experience flows with the service and then related activities and resources to support the business process. The final step includes positioning related stakeholders and their roles in the value proposition. The workshop process is supported with a paper layout which proposes topics of discussion and provides a surface that the discussion can be recorded with sticky notes. The consequent steps with the proposed layout help the participants to connect the design decisions given in the earlier stages of discussion as a means to generate new perspectives or details regarding the discussed design concept.

In the earlier stages of our research, we evaluated an earlier version of the process in terms of facilitation (Gultekin-Atasoy et al., 2013) and on how participants experienced it (Gultekin-Atasoy, Lu, Bekker, Eggen & Brombacher, 2014). In the cases presented below, we were interested in evaluating the method for the service design proposal with the involvement of key stakeholders.

## Method of analysis

The sessions were video recorded. Following the sessions interviews were held with the participants on what their expectations were, whether the session met their expectations, what they liked or did not liked about

the session and whether it provided useful insights. Following the interviews, the first and second author made a qualitative analysis of the discussions by identifying the structural categories (Popovic, 1996) in the discussion. The pattern coding (Miles & Huberman, 1994) was made in two steps: In the first step the discussion clusters were defined based on discussion subjects, and the type of statements made by each participant were identified with a summary of the statement. The following coding was used to classify the statements:

- *Argument*: Statement of reasoning regarding the concept
- *Question*: Asking a question for a better understanding/explanation
- *Explanation*: Explaining to provide better understanding
- *Idea*: Proposing a specific aspect of the design concept or solution to the problem
- *Agreement*: Confirming
- *Problem*: Mentioning a problematic condition
- *Disagreement*: Not being in agreement

Activity flows in each discussion cluster were identified to understand the main purpose of the discussion, i.e. in which way the discussion cluster helped the group to have an understanding over the discussion topic, (*clarification, ideation, problem spotting, opportunity spotting, disagreement*). The classifications were decided on by the two analysts discussing together on each cluster and try to arrive at an agreement. In some cases, the classifications made by the two analysts did not match with each other. In these cases, the analysts discussed why it was interpreted differently and whether the analysis scheme can be improved. This pattern analysis served for a deeper understanding of the content and purpose of the discussions.

In the second step of the pattern coding, discussion clusters were classified on whether the participants had an agreement, whether they had aligned their understanding of the problem/solution or whether a conflict arose, with the following categorization:

- *Clear Agreement*: Participants clearly agreeing on the presented argument
- *Alignment by defining a common ground*: Developing a shared understanding regarding the possible solution/design proposal through defining the aspects of a solution

- *Alignment by defining problem:* Developing an understanding on dimensions of the condition at hand by addressing problems
- *Clear Conflict:* Participants clearly being in disagreement regarding the presented argument

Finally, the two cases were evaluated by relating the evaluations from the analysis of interviews and discussion patterns.

## **Results**

It was observed that the discussions in the two cases have different characteristics: In City A the session went smoothly and the participants were mostly in agreement with each other. The proposed solution was evaluated and roles of the participants and the activities that can be carried out in the FieldLab were discussed. In City B, conflicts occurred in the process, which blocked the discussion many times, and terminated the proposed process. Mainly the existing problems, why these problems occurred and the possible solutions were discussed; however the service concept was not defined due to time limitations of the session. At first, the two sessions appeared to be one smoothly running session which provided general insights, and the other a session in which the proposed workshop process could not be followed and shared vision was not constructed.

However the post session interviews revealed that:

In City A: The owners of the session were satisfied with having the partners involved. However the participants mentioned that the insights they obtained were not surprising. The organizers said they benefited the session to confirm the concept with stakeholders.

In City B: The owners of the session found the session very useful for being able to discuss the problematic situations with the participants. Each participant had differing insights which they didn't have before, and this eventually affected their understanding of the situation and challenges ahead.

The discussions in City A were mainly on defining the solution by aligning the understanding on the possible solution and possible roles of the partners. In city B, participants aligned their understanding through discussions on both problem and solution, made more jumps, and had more conflicts.

The pattern flows of the two sessions show that the discussions had different characteristics as presented in Figures 2 and 3.

Figure 2 Pattern flow of the discussions in City A.

Figure 3 Pattern flow of the discussions in City B.

In the following part we present the results based on interviews and the qualitative analysis of discussions in more detail.

### City A

We observed that the discussion in the session went fairly smoothly and there has been only one conflict occurred. The group was discussing the different aspects of the concept based on the proposed topics by the tool and the process proposed by the facilitator. The participants were mainly in agreement with each other and proposing supportive arguments to strengthen the concept. Ideas to refine the existing service concept were proposed as if they were complimenting each other, and those mainly got accepted by the other group members.

### Interviews

The post-session interviews were made with the company representative, sports event organizer from the neighborhood, project member and partner from the municipality. The company representative, who was familiar with the field lab concept and the project members, mentioned that they found the session valuable to confirm the concept with

everyone and he got some insights from the session but those were not surprising. The project members were satisfied about hearing the stakeholder perspective and get them involved early in the process. They mentioned that they got insights from the participants in the sense that they had the chance to confirm the concept with their participation as well, and it was possible to detail the concept with their input. However they mentioned that those insights were not in-depth, mostly expected and it did not shifted their understanding to a totally different level.

### **Qualitative analysis**

The pattern analysis (Figure 2) show that, the participants were mainly developing a common ground in their discussions, rather than spotting out differences or possible problematic situations. The discussion clusters composed of small number of statements, which in some cases included questions to clarify the given statement. High number of discussion clusters with low number of discussion steps was observed. The group finished the session on the proposed time.

The participants hardly confronted each other's statement by rejections or counter-arguments. Conflict occurred only once; while defining the activities that will be provided to the businesses and knowledge institutes, on the subject that the product testing that can be provided by the university will not be matching the need of the businesses that utilize the FieldLab services. The university would like to use new methods, the companies who would like to test their products, therefore they would like to use proven methods that provide results in the shortest time. Although the issue surfaced while discussing the expectations and roles of the different (possible) partners, which may result in a problem in the later stages of collaboration, the issue was left undiscussed after the statements were made and the participants moved on by discussing the roles of the other partners in relation to other activities provided in the field lab.

### **City B**

The session at the City B revealed that there were obstacles for providing service in the current situation. The *Initial Value Definition* stage of the workshop led this to surface: While the participants were trying to define the "value" of the field lab for each user group, they made a definition of what FieldLab means, and what it can provide. This discussion made it visible that there were challenging conditions in the current FieldLab

operation which makes it difficult to provide and sustain certain expected activities.

One of the participants in the session was the business owner who rented the location from the municipality, which provides services to the FieldLab location visitors, makes connections with end-users and attracts them to the location. However the business has not been able to receive enough revenue as required and it was difficult for the business to sustain its presence and organize activities to attract visitors.

In the early stages of the workshop, the discussion rotated around this re-occurring topic of “how to bring the citizens to the field lab”. The participants made a re-framing of the problem from their own perspectives, and this re-framing revealed how the current operating structure of the FieldLab was and what could be the possible solutions. However, the spotted problem had not been resolved. The proposed process couldn’t have been completed due to the time limitation and the long discussion clusters that challenged the flow of the workshop.

### **Interviews**

Although the session was not finalized as expected, the participants were satisfied with the insights they got from the session. They had different insights: the session owner (FieldLab manager) was satisfied to have everyone talk to each other rather than only with the FieldLab manager, in a constructive manner. She found the session useful to have everyone comment with good examples of the service, which would make it possible to communicate on how to realize the service and the expectations from it. She mentioned that it would also be better if she had the session much earlier. For the business representative, it was a good insight to hear what sports field owner and sports sector wants, and that they have two different profiles of visitors, which opens up a lot of possibilities. For the knowledge institute, it was good to provide comments to help the field lab, and it was possible to discuss the problems the knowledge institutes had and the ways to resolve these.

On the other hand, discussing around the existing problems was mentioned as an obstacle to participate in discussion by some partners. Apparently, the position of the business owner on the location was different than the others present at the session: his business relied on the existence of the field lab, and he had already experienced some problems in the past years. For the other participants collaboration with the FieldLab was just an opportunity. Some participants arrived at the session with an expectation to

discuss about the future possibilities, but they stated that they could not feel like commenting on the vision of the FieldLabs, since the other issues were of discussion.

### **Qualitative Analysis**

In the part of the session where the values for different users were discussed, the discussion rotated around the problem of “bringing the citizens to the FieldLab”. Although the facilitator tried to bring the conversation to focus, and continue the proposed process, the issue emerged again in the consequent discussions, and opened up with the questions from the participants.

In discussion clusters, loops of problem spotting to ideation occurred, and sometimes resulted in conflicts which created a depth and dynamism in the discussion. The emergence of these conflicts terminated the planned discussion process. The facilitator tried to focus the discussion back at the topic with an intention to find a consensus. Eventually the proposed experience flows and the roles and expectations of the partners were not discussed due to the time being not enough to finalize the proposed discussed topics by the tool. The session ended by asking the participants to state their role in collaboration.

The pattern flow of discussions in City B illustrates that the participants mainly referred to existing problems and clarified the situation. The clusters of discussions took longer. The conflicts were followed by an alignment by defining problems and ended up in the alignment through defining the solution, with ideation.

## **Discussion**

We are interested in supporting multi-stakeholder collaboration by developing a method and a tool. Our approach is focused on bringing the important concept and collaboration related topics to discussion, through a collaborative design process which combines design and business insights together, and it provides a graphic layout to support this process. Therefore in this paper we are interested in the function of conflicts in enhancing the development of new insights about the dimensions of the problem/situation at hand and how conflicts can be addressed in the process and tool design.

The two cases that we examine in this paper had the same soft characteristics in terms of uncertainty, i.e., closer to the soft end of the uncertainty spectrum (Atkinson et al., 2006). However they were at

different stages of stakeholder involvement, therefore they had different levels of uncertainty. Our method was useful in these two sessions in supporting the alignment of understanding between the participants. We observed that it also helped the hidden conflicts to surface, however it did not address conflicts constructively.

In city A, there had hardly been conflict moments, since the participants were mainly looking for developing an understanding over a common ground. Although our method supported to spot a conflicting view once, it remained undiscussed. Since the collaboration has not been started yet, the participants did not mention any concrete problems. At this early stage, there were not detailed information available to the participants about the upcoming collaboration stages and challenges; uncertainty was high, which made it harder to reveal possible differences in expectations and understandings. However, the participants benefited by having a shared understanding over the concept, and having the stakeholders involved in the discussion.

In the case with the latter stage of multi-stakeholder involvement (City B), the conflicts aroused from the beginning of the joint discussion about the “value” of the proposed service combinations by the FieldLabs, and the statements were backed up with specific problems that have already been experienced by the business partner of the FiledLab for some time. In this case, the uncertainty was lower, since the problems had already been experienced in the “harsh” way. The moments of discussion were useful in providing an understanding on the problematic situation.

Although we were expecting the conflicts to emerge in the discussion, conflict was not addressed centrally in our design. We observed that our method supported the conflicts to arise by providing specific discussion points on the table from multiple perspectives. However our method was not equipped to transform the conflicts into constructive conflicts. The discussion evolved by itself within the group dynamics. Atkinson et al. (2006) point out that the projects with many uncertainties require a primary emphasis to reduce ambiguity, by having a more flexible approach in the project management which keeps the options open. In our case, when the conflicts emerged, we saw that the proposed process was not flexible enough to cover the discussion moments, which put a pressure on the timing of the session. While the conflicts led to useful insights regarding the problem and situation, those insights were not able to be transformed into solutions.

Abma (2000) mentions two ways that a conflict can be resolved: by compromise through bargaining or by an exchange of values, and by a new synthesis, indicating a new solution. He argues that the conflicts become dysfunctional not because of the lack of consensus, but the lack of other meanings, people or solutions. To manage a dysfunctional conflict, he suggests increasing variety, so that the participants see that the conflicts are constructions rather than the reality, therefore they can be open to re-construction. He proposes ways to deal with conflict, first by making the hidden conflicts visible by confrontation, and then solve it by creating other-point multiplicity, by using metaphors or dialogue and receptive listening. On the other hand, "if impasses (built up of conflicts) and conflicts are handled well – not necessarily resolved- they can be occasions for empowerment, constructive dialogues and innovations" (Lincoln in Abma, 2000, p.201).

We observed that our method mostly supports detailing a central concept rather than spotting out different directions of design. Our method can be further developed by integrating design components that the challenges and conflicts can be spotted and documented as they emerge, and alternative solutions regarding a conflict situation can be made visible as the discussions emerge. In terms of the process, more flexibility can be provided to give room for discussion.

Different stages of collaboration may require different approaches in handling conflicts. Conflicts may not get revealed in the early stages of collaboration easily due to high level of uncertainty and ambiguity. In the early stages, the effort can be placed to enable depth in discussions by addressing diversity in interpretations or expectations rather than allowing those differences remain undiscussed. In the later stages of collaboration, more conflicts can be expected due to available knowledge. High level of flexibility may be required to allow the participants to discuss on certain topics while following the steps of the process.

Lastly, stakeholder selection requires attention, since the unbalanced involvement between different participants can make it difficult to maintain a balanced in discussion.

## **Conclusion**

Conflicts arise when people from different communities are brought together and they are important and -most of the time- inevitable elements of multi-stakeholder dialogue. Although conflict has a negative connotation,

they can be seen as opportunities to reduce uncertainty and develop a shared understanding. When the conflicts are surfaced, differing expectations and understandings are disclosed and ways to resolve these are discussed, and by this way uncertainties are reduced.

High level of uncertainty in the multi-stakeholder projects may cause the potential conflicts to remain hidden until the later stages of the project lifecycle when concrete actions are necessary. However handling conflicting situations at the later stages of collaboration is harder due to diminished flexibility in the later stages. Therefore interventions to organize multi-stakeholder dialogue are required. Making conflicts manifest rather than suppress in the early stages of collaboration is healthy for the collaboration as it serves to create an in-depth understanding. While designing for multi-stakeholder communication processes, conflicts should be considered and time and moments of impasse should be taken into account.

In the two cases presented in this paper, we observed that our method is supportive in reducing uncertainty in multi-stakeholder dialogue through creating a shared understanding of the value proposal, shared analysis of the problem at hand and alignment of expectations in the early stages of multi-stakeholder collaboration. However in our design the conflicts were not addressed as central. Different levels of uncertainty may lead to emergence of conflicts, or may let them hidden. Our next steps of design will address conflict as a central issue for creating insights in a stakeholder dialogue.

## A Non-Profit Design-Led Innovation Journey

Erez NUSEM<sup>\*</sup>, Cara WRIGLEY and Judy MATTHEWS

Queensland University of Technology

*Non-profit organisations in the aged care sector are currently under pressure from more than just a sheer increase of customers. A need to respond to changing legislative requirements, increased expectations from customers and increasing likelihood of shortage in appropriate experienced staff are also contributing to instability within the sector. This paper will present a longitudinal action research study of a non-profit organisation revisiting its core purpose of providing relevant services and attempting to build a customer-centric method for addressing the current and upcoming change drivers in an Australian aged care context. The study found Design-Led Innovation to be an effective methodology for capturing deep customer insights and conceptualising new business models which address the prevalent change drivers. This paper details a design-led approach to innovation, tailored to a non-profit organisation seeking to better understand its stakeholders and redefine its value offering.*

## Introduction

An increasingly discerning customer base, major changes to regulations and an ageing population are driving many non-profit organisations in the aged care sector to question the services they offer and the way in which they are delivered (King et al., 2012; Swan, 2010; Weerawardena & Mort, 2001). If these organisations remain complacent to these changes and simply present an existing offer to market, they are unlikely to endure through this phase of industry reforms and customer needs. With the decreasing relevancy of the current aged care offering, innovation is now beginning to be seen as a core competency of leading organisations.

This research therefore explores an Australian non-profit aged care provider's journey, and specific steps undertaken, in attempting to develop a Design-Led Innovation capability in response to these change drivers. Previously Design-Led Innovation has not been applied in a non-profit organisation with the aim of creating shared value; the practice of concurrently building competitive advantage within a business and producing social value in the economy for which it caters (Porter & Kramer, 2006, 2011). Hence, placing this research in a novel position.

In order to understand this journey the first author engaged in a longitudinal action research study revealing two major challenges faced by the organisation; an inability to define the organisation's value proposition, and a concentrated understanding of the value of design in a business context. Therefore, this research sets out to contribute a new approach for realising and leveraging opportunities for shared value creation through a Design-Led Innovation methodology, with the outcome of business model innovation.

This paper features a brief review of relevant literature, and outlines the research design and methodology, along with methods of data collection utilised in the study. An overview of the organisations journey and the specific tools and approaches explored by the organisation are presented. Findings from a thematic analysis of interviews, focus groups and a reflective journal are discussed, concluding the paper with implications for industry.

## **Literature Review**

### *The Aged Care Sector*

Three tensions in the current aged care approach suggest that the direction of the industry is unsustainable (King, 2007, pp. 202–203); (i) the ever-growing movement in consumer rights that places the needs of care recipients at the centre of care provision, (ii) the ongoing issue of recruitment and retention of care workers in an environment where demand outstrips supply, and the (iii) requirement for organisations to recognise unpaid carers as partners in the care-giving process and as people who need to be supported in their provision of care. These tensions are underscored by a heavy reliance in the industry on Federal Government funding, often resulting in a compliance-focused culture and operational approach (Weerawardena & Mort, 2001). This approach tends to distract providers from effectively addressing their social mission (King, 2007), and often translates as an inability to define whether an organisation is operating with a customer-centric or government-centric frame of mind. The inherent risk to the organisation is therein failing to understand its core customer, and compromising the organisation's social mission by attempting to respond to the needs of multiple stakeholders without truly understanding their needs.

As incremental changes and product innovation are not disruptive in nature, they will be insufficient in building a solution that responds to these challenges. To effectively drive a change of this scale business model innovation is required. In undergoing such a change an organisation's culture will significantly impact the success of the venture. Likewise, it is improbable that such an undertaking will succeed without the utilisation of an appropriate strategy to drive innovation. It is also important to consider that innovation strategy is not identical in the private (Moore, 2000), public (Albury, 2011; Borins, 2001; Moore, 2000; Mulgan & Albury, 2003), and non-profit (Huang & Yu, 2011; Moore, 2000; Weerawardena, McDonald, & Mort, 2010; Weerawardena & Mort, 2001, 2012) sectors.

Articulating the strategy of a non-profit aged care provider can be a complex matter as organisations operating in this space are required to address both an ethical orientation and a need to be financially viable (King, 2007). Given the predominance of non-profit organisations operating in the field of home and community care (King, 2007), the concept of an organisation's strategy creating superior customer value, not just superior profits (Weerawardena & Mort, 2001) is particularly relevant (King, 2007).

Especially when coupled with pressure from government on non-profit organisations to pursue competitive strategies, which can often conflict with an organisation's social mission (Weerawardena & Mort, 2001). Furthermore, such a framework could be more engaging for care workers, who are value-driven and find social contribution to be central to their performance and their identities as workers (King, 2007). Often non-profit organisations struggle to cater for the social need they seek to address due to a lack of access to significant financial resources (Tyler, 2005). As such, they do not have the luxury to facilitate the tensions created by the dichotomy between the two agendas, they must face the challenge of balancing these agendas rather than allowing one to dominate the other (King, 2007; Mumby & Putnam, 1992).

### *Innovation in Non-Profit Organisations*

Innovation is key to the ongoing success of an organisation (McDonald, 2007). Markets and environments change, organisations that do not change along with them are likely to falter and fail (McDonald, 2007). But people and institutions, for the most part, do not like change. It is painful, difficult, and uncertain (Cain & Mittman, 2002). The issue being that the act of innovation is to change. Without innovation the cost of public services rise faster than the rest of the economy. Without innovation the inevitable pressures to cut costs and drive efficiency can only be met by stretching an already strained workforce (Mulgan & Albury, 2003). To remain effective government and public services depend on successful innovation. Innovation is a means of developing better ways of meeting needs, solving problems, and using resources and technologies. Even in fields such as health care, innovation is frequently seen as a luxury or burden when it should be seen as a core activity (Cain & Mittman, 2002).

Remaining relevant in a dynamic market is difficult, to do so an organisation requires an appropriate strategy and a culture which is aligned to it. This is especially true for organisations seeking to face multiple change agendas to maintain relevancy. It is important that a strategy crafted for this purpose not only try to address the need for a competitive advantage but also address an unmet customer need, or in this scenario, an existing social issue (Porter & Kramer, 2006, 2011); as leveraging these two change drivers concurrently can provide organisations with a suitable platform for innovation.

For innovation to succeed, in any sector and by any organisation, the innovation needs to be well-formulated and designed to address a clearly

articulated problem (Mulgan & Albury, 2003). To translate innovation into fully realised competitive advantage which can be sustained in a NFP human services environment, the organisation's staff and management need to see a link between the organisation's strategy and social mission. Therefore, any attempt to redefine the organisation's value proposition or underpinning business model must be deliberately linked to its culture. However, most organisations do not consider their business model, let alone link it back to their respective cultures.

### *Design-Led Innovation*

While there is no certainty behind the success of adopting a new strategy or attempting something new and innovative, not responding to a burning platform such as the one being faced by the aged care sector can be disastrous (Carlopio, 2009). Previous research has identified that organisational cultures that engage employees in developing new ideas and strategies are better suited for implementing innovation (Chenhall, Kallunki, & Silvola, 2011; O'Cass & Sok, 2013). To sustain the changes required to develop and maintain innovation organisations require that employees understand the need to continuously improve or change product offerings, learn, and adapt to customer-focused demands (Bucolo & Matthews, 2011a; Chenhall et al., 2011). This is most effectively achieved where the underlying value structures of organisational cultures encourage innovation by way of cooperation, flexibility, and adaptation (Chenhall et al., 2011).

Often this journey begins by questioning where an organisation is, and where they are headed - having a clear vision of their reason for being, their offering, their market and their competitors – and a clear idea of what they want to become (Ward, Runcie, & Morris, 2009). Even once articulated, realigning to a collective vision is a challenge in itself, as is ensuring that all of the company's plans for growth are strategic and focused on achieving its aims (Ward et al., 2009). These, along with a change agenda that is simultaneously driven internally and externally through continuous engagement with customers and employees, are integral elements for successful innovation.

While design has been demonstrated to be a crucial strategic business resource (Dell'Era, Marchesi, & Verganti, 2010, p. 12) traditional conventional views maintain that designers are primarily concerned with the aesthetical and technical considerations of a product or service (Cox & Dayan, 2005). As with the term innovation (Baregheh, Rowley, & Sambrook, 2009; Smith, Busi, Ball, & Van Der Meer, 2008), design has continued to be

described as a wide range of activities, resulting in an array of outcomes that do not fall under a single definition (Bucolo & Matthews, 2011b). Design-Led Innovation (DLI) is a methodology that bridges these two terms and provides practitioners with a method for creating a compelling value offering for customers by radically changing a product, service, or business model's value proposition. This method of innovation, along with general design principles, has been proven to be applicable in separately creating both competitive advantage (Bucolo & Matthews, 2010; Carlopio, 2009; Holloway, 2009; Martin, 2010) and social value (Brown & Wyatt, 2010; Brown, 2008; Bucolo & Wrigley, 2011; Sklar & Madsen, 2010; UK Design Council, Danish Design Centre, Design Wales, & Aalto University, 2013).

Being 'design-led' implies utilising a set of tools and approaches which enable a business to embed design thinking in the form of a cultural transformation (Bucolo & Matthews, 2011a). From a business perspective this requires an internal vision for top line growth. For this vision to be realised it needs to be based on a base of deep customer insights and expanded through all customer and stakeholder engagements, with each outcome being mapped across all aspects of the business (Bucolo & Matthews, 2011a).

There is increasing understanding in the private sector of the enormous value this adds, even in areas not traditionally seen as the domain of design (Martin, 2010). Likewise, and for similar reasons, it is increasingly clear in the public sector that utilising design as strategy is an appropriate way to overcome common structural flaws in service provision and value offering (UK Design Council et al., 2013). DLI is a collaborative process which bypasses inefficient handovers that occur between analysis, solution and implementation. Rather than disjointedly patching together incremental solutions to problems as they arise, design looks at an entire system and redefines the problem from the ground up. It begins by understanding user needs in order to ensure that the solutions generated are appropriate to these needs, waste is avoided and end users buy into these solutions. Rather than jumping straight to expensive or risky pilots the design process tests iteratively, starting with low-cost, simple prototypes and designing out risk as prototypes become more evolved (UK Design Council et al., 2013). For these reasons, it becomes a feasible option for non-profit organisations to explore.

## **Research Design and Methodology**

While a single clear cut approach to drive all innovation does not exist, some approaches are more suitable than others in certain contexts. This paper outlines the journey of the first author, whilst working as a Design Innovation Catalyst embedded in a large non-profit aged care provider based in Australia. A catalyst's purpose is to translate and facilitate design observation, insight, meaning, and strategy into every facet of a company. This role is defined by continuously instigating, challenging and provoking innovation both internally and externally from within the company whilst maintaining a link to the strategy of the business by re-aligning and mapping these activities (Wrigley & Bucolo, 2012). In the scope of this role, the first author was tasked with (i) assisting in conceptualising, designing and implementing an innovative business model, and (ii) diffusing the design-led capability throughout the organisation as part of an action research study. This paper aims to provide an overview of the early steps of the organisations journey, focusing on the specific steps and activities undertaken in addressing the organisations mandate to design and develop a customer-centric business model.

As the methodologies and processes incorporated in action research are shown to be suitable drivers for innovation, creating change, and facilitating learning (Gustavsen, 2005; Zuber-Skerritt, 2001), action research has been selected as the primary research method. Using this method, the researcher engaged in several cycles of action research. Data collection throughout these cycles consisted of content analysis, participant observation, semi-structured interviews, field notes and reflective journal entries. As the aged care sector is in constant flux the agenda driving this research exceeds a one-time solution. The real future challenge lies in disseminating the capabilities required by an organisation to action design-led innovation in response to, or ideally in prediction of, future shifts in the market.

### *Data Collection*

Data collection methods for this paper consisted of (i) 13 semi-structured interviews with middle to high level internal staff ranging between 40 to 70 minutes, (ii) participant observation, (iii) reflective journal entries, and (iv) 11 focus groups. The purpose of these methods was to: (i) capture internal stakeholders' baseline understanding of the role of design in business, and to ascertain whether staff could articulate the value proposition of the case study; (ii)(iii) gauge any shifts in the staff's understanding of the case studies value proposition and their understanding of the role of design in business;

and (iv) identify the future direction of the organisation featured in the case study through co-design with internal and external stakeholders.

### The Journey

Internally within the participating organisation several streams of work have occurred as a response to the change drivers faced by the Australian aged care sector, this is illustrated by Fig. 1. As part of the scope of this paper the five streams deemed to have been the most influential will be discussed. These streams include competitor analysis, customer segmentation, narrative cycle, design workshops and culture transformation. Fig. 1 represents the existing relationship between these streams, the order in which they took place, how each stream informs another, and how the streams fit into the broader action research approach.

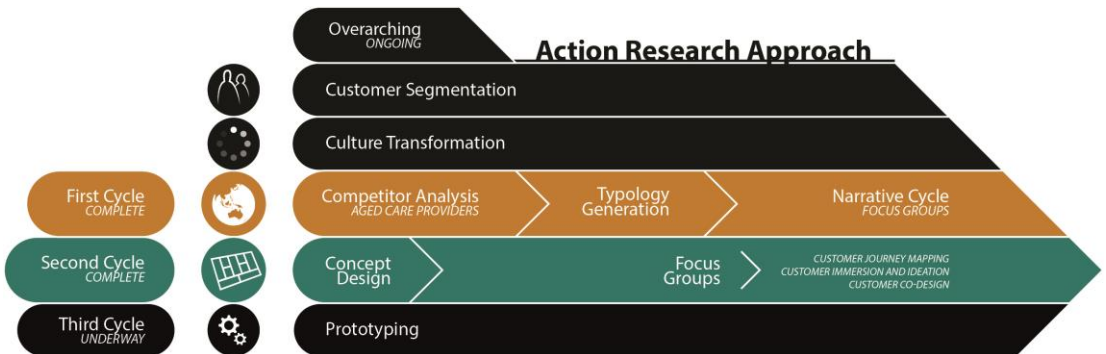

Figure 1 This figure illustrates the relations between each stream of work along with when they occurred and how they informed one another.

A set of underlying activities and objectives are grouped under each stream of work. The activities for which the first author was directly responsible or had a large contribution as part of the action research study are outlined in Fig. 2. This figure aims to depict the actions taken in each cycle of research and the outcome of each of these actions.

The first cycle of action research was structured to internally demonstrate the value of design in a business context. This cycle was about gathering a deep understanding of the organisations stakeholders, its internal and external environment, and capturing a rich base of customer

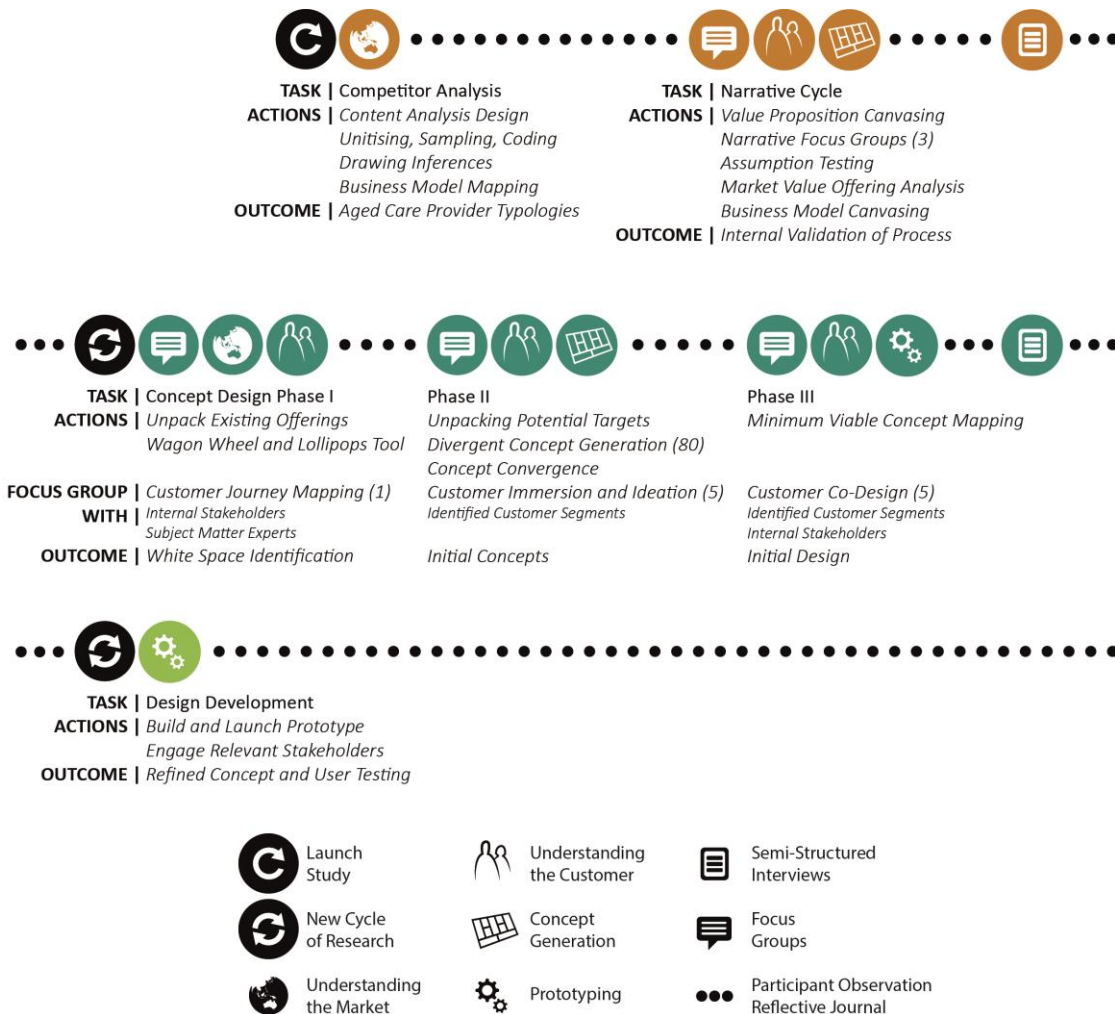

Figure 2 Action Research Cycles. This figure illustrates the specific actions in each research cycle.

insights which would act as a foundation for future innovation. Following this, the purpose of the second cycle was to build momentum. This was achieved by identifying opportunities for innovations, conceptualising what

form the innovations could take, and co-designing alternative products, services and business models to address the insights captured in the first cycle. The third cycle of action research will aim to shift from conceptualisation to implementation of the solutions developed in the second cycle.

### **Sector Analysis**

Sustaining a competitive advantage requires an organisation to constantly monitor the uncertainties that could invalidate the assumptions underpinning its strategy. The preliminary stages of this process consisted of the researchers using the business model canvas (Osterwalder & Pigneur, 2010) to analyse the business models of over thirty local and international organisations, both within and outside of the aged care industry. For organisations in the aged care industry, the canvas was utilised to understand the value proposition of each organisation, identify if they delivered on their value proposition or if it was for marketing purposes, articulate unique elements of operation, and categorise organisations with similar operating structures into typologies. The organisations analysed outside of the aged care industry were selected based on their exemplary performance. In this scenario the canvas was used to identify how these organisations were able to deliver on their value proposition and, in a hypothetical context, how they would approach the delivery of aged care if they were to enter the market.

### **Culture Transformation**

The organisation took the initiative to rebuild the values exhibited by its internal culture. This was proposed to occur over a set of three horizons where culture foundations would be established, the skills & capabilities required to live the aspired culture would be developed, and finally the culture recognised by the industry, customers and staff as a differentiator. This stream of work was structured to begin with engagement, followed by creating a future state culture, launching the vision and values of the organisation, creating regular culture checkpoints, embedding the culture internally, and Institutionalising the culture across the organisation's external sites.

### Narrative Cycle Focus Groups

The emphasis of the focus groups was on co-creating with consumers through the use of a narrative (see Figure 3 for an example board). Given that the definition of value and the process in which it's created is rapidly shifting from a product and firm-centric view to a personalised and customer-centric view, it was vital that the consumer became the locus of value creation and extraction (Osterwalder & Pigneur, 2010; Prahalad & Ramaswamy, 2004).

Figure 3 Example Narrative Board

Narratives begin by capturing the smallest of insights, glimpses of an unrelated detail that gradually grows into a more comprehensive appreciation and understanding. The deepest of these insights arise from judgemental questions that elicit personal responses (Dillon & Howe, 2003). Interacting with firms in this manner allows consumers to co-create with organisations, redefining the meaning of value and the process in which it's created (Bucolo & Matthews, 2010; Prahalad & Ramaswamy, 2004). Dialogue can then flow in both directions, from consumer to provider and from provider to consumer. A narrative not only teaches participants how to bring their lives into the narrative, but also to bring the narrative into their lives (Dillon & Howe, 2003).

The narrative cycle was utilised to unpack customer insights, and conceptualise how these insights could then be leveraged into business models through iteratively learning and questioning the underlying values of the insights. Initial stages of the process involved using the 'Value Proposition Canvas' (Osterwalder & Pigneur, 2010) to hypothesize unmet customer needs and to prototype a service around these needs. The first author constructed and tested the narrative with three focus groups, each consisting of two-three participants in the organisation's target demographic that were not currently receiving formal care services.

Following the narrative sessions, the insights were layered over the original Value Proposition Canvas to test the accuracy of the initial hypothesis. The insights were reframed, compared to the initial set, placed into a 'Business Model Canvas' (Osterwalder & Pigneur, 2010), and compared to the existing business model, in terms of financial and organisational capability to execute the model. Fig. 4 provides an overview of the narrative process.

### **Customer Segmentation**

The organisation featured in this case study recognised the need to immerse itself in its market, and to question who its true customers and competitors were. A behavioural segmentation study was carried out to collect both qualitative and quantitative data relating to the needs, preferences, attitudes, behaviours and decision-making approaches of ageing Australians and their families. Over 90 hours of customer interviews took place in metropolitan and regional Queensland, New South Wales and Victoria, including 'High Tea Triads' (focus groups, typically with 3-4 participants), paired depth interviews, and depth interviews. The synthesised qualitative output informed the design of a quantitative data

collection approach that incorporated over 1,300 surveys deployed through both telephone and online methods. This staged research approach delivered a rich bank of qualitative and quantitative insights relating to the experience of ageing, as well as a segmentation model that clearly identifies and describes five unique customer segments and four unique 'influencer' segments.

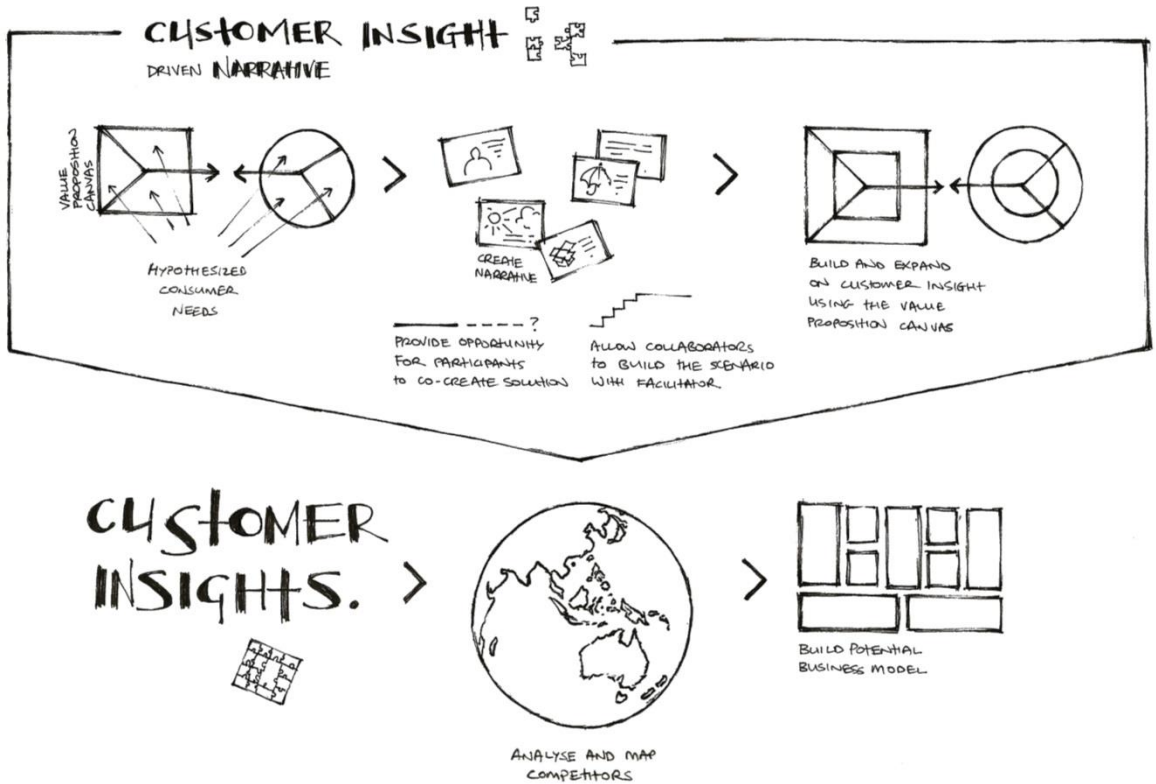

Figure 4 Narrative Process

### Design Focus Groups

The organisation also undertook customer journey mapping exercises and a series of three focus group typologies; Customer Journey Mapping

Workshop (1 session), Customer Immersion and Ideation Workshops (5 sessions) and Customer Co-Design Workshops (5 sessions).

The Customer Journey Mapping Workshop was attended by 20 internal and external stakeholders to the organisation, including staff members and subject matter experts. Through a series of activities and interactive sessions, participants created a large-scale visualisation of a person's experience of ageing, focusing on dimensions of the experience that were reported as being significant in the segmentation study findings. The goal of this workshop was to: identify the primary customer, secondary customer and relevant stakeholders; understand the needs and desires of the customer throughout each specific experience; articulate the channels in which the customer could be reached in terms of both potential interactions and platforms; unpack the experience, looking at dialogue, access, risk and transparency; identify the distinctive capabilities an organisation would require to operate in the space; and validate potential sources of revenue generation. Participants were encouraged to deconstruct and analyse the experience through the eyes of one of five identified customer segments and one of four identified 'influencer' segments. In addition to building empathy with the customer and uncovering deeper insights into the experience of ageing, the workshop was designed to identify opportunities for relieving pain points or delivering greater value; this was especially valuable in identifying white space for new business opportunities in the aged care sector.

Outputs from the Customer Journey Mapping Workshop informed the design of a series of Customer Immersion and Ideation Workshops. A proprietary segmentation algorithm and selection questionnaire was employed to recruit ten to twelve customers per workshop by segment, enabling the researchers to observe the workshop interactions on a segment-by-segment basis. Five dimensions of the ageing experience were explored (for example, 'Staying Connected'), one per workshop, through open questioning and a structured but informal conversation with and amongst participants. Two types of questions were included in the workshop facilitator guide; those that deeply explored the topic and those that opened up the ideation process by encouraging participants to consider new solutions to problems.

A period of analysis and synthesis of workshop outputs took place following the Customer Immersion and Ideation workshops and findings were incorporated into a bank of prospective solutions that would form the basis of potential new business models. A categorisation and filtering process was applied to narrow the solutions to those that most effectively responded to the customer pain points or opportunities and these solutions were explored in a series of Customer Co-Design Workshops. Participants were again recruited by segment, including customer and 'influencer' segments, and the approach to questioning was open-ended and exploratory. Large-scale visuals were used to describe the 'problem-solution' and to deconstruct and reconstruct the solution with the participants as active designers. As customers seek to further influence business, companies are no longer able to act autonomously in the design of new offerings (Prahalad & Ramaswamy, 2004). Engaging customers as active designers ensures that offerings are grounded in customer needs and allows the solutions to create mutual value for both the user and organisation.

## Findings

Once collected each mode of data was thematically analysed and coded for categorisation; segments of text were labelled in accordance to the categories they fell into, and codes were chosen to underpin the research agenda (Joffe & Yardley, 2003). Since the researcher had already formed theoretical ideas in regards to the data, it was deductively coded (Joffe & Yardley, 2003). Using theoretically derived themes allowed the researcher to replicate, extend or refute prior theories (Boyatzis, 1998). Following a thematic analysis the separate modes of data were methodologically triangulated, resulting in a set of two primary themes; value proposition for a customer-centric business model and customer focused value creation.

### *Value Proposition for a Customer-Centric Business Model*

Two sub-themes fall under this grouping. That is, the internal staff's ability to articulate the value proposition exhibited by the case study organisation, and whether they were familiar with the scope of work undertaken by the organisation in order to realign the value proposition to a customer-centric business model.

*Initial stages of research saw the first author conduct a set of interviews, mostly taking place prior to any staff exposure to the Design-Led Innovation methodology. The interviews revealed that in general, no internal consensus*

*in regards to the value proposition of the organisation existed. When asked to articulate the core value of the organisation interview participants typically displayed uncertainty in their answers, with one participant blatantly stating “I don’t think I can answer that because I haven’t been dealt in on that. I want to know what they came up with, even though my boss and good colleague thought of it”. Others who did respond to the question did so with uncertain terms. Typically, using inexplicit language such as “core value? Probably...”, and “probably not at the moment. I think coming in the core value was probably ...”.*

*However, many similarities did emerge in the themes of the responses, and as exhibited by the first quote and in the following, “somewhere in here you’ve got to understand your competitive market, where your point of difference is coming from. I’m not quite sure where in all of this that is tested”, there was an internal drive to attain or develop a better understanding of the organisation’s value proposition. This form of response didn’t convey the ignorance of participants, but rather that the organisation simply did not have a value proposition as an underlying driver for the business model at that stage.*

*Indeed, the organisation was undertaking a scope of work to identify their future customer, their needs, and a value offering that aligned to this customer. There was a clear internal understanding that the organisation needed to change, that the current methods of employing care would not result in positive organisational growth, “the question you should really ask is, do we do nothing or stick to our knitting? Do we explore the boundaries of opportunities and innovation? And I think we should be doing the latter, as, well, since there’s a real prospect”.*

*Perhaps not surprisingly, as the organisation set out to redefine and innovate its business model, staff exhibited a greater understanding of the value that the organisation wished to deliver to customers, and the image that the organisation wanted to develop and attain. In fact, the insights captured in customer segmentation as part of this scope of work proved to have significant applicability to business as usual. Other streams of work unrelated to the business model innovation were seen to constantly borrow and lean on these insights. When asked whether this work stream was valuable, one of the interview participants responded with “absolutely, if you’re talking about co-creation with customers such as the business innovation that’s just about to commence, the findings of customer segmentation present a great opportunity for creative thinking and*

*collaboration to respond with services that are better aligned with what people want”.*

### *Customer Focused Value Creation*

While there was a definite internal acknowledgment of the initiative to innovate the organisation’s business model, it was not evident, except to the individuals integral in the development, that this process was design-led. In fact, except for two outliers, interviewees strictly referred to design as the conceptualisation and development of physical or digital products and services (e.g. architectural and industrial design).

Regardless of the lack of familiarity with principles of design being utilised at a strategy level, all interview participants commented that the design-led approach to innovation resonated with the non-profit organisation, as it clearly established that the customer is the locus of value creation.

As demonstrated by the following quotes, all interview participants were not only well aware of the need for organisational change, *“the rapidly changing regulatory environment, the intent of the regulator or the government to be able to fund aged care, just the impact on GDP, it’s not going to be sustainable, so it has to change. So you’ve always got innovation ... it can either be incremental or a major step change ... if we’re not innovating then we’re out the back door, quicker than anything”*, but it was also evident that the change needed to be customer-centric, *“if you’re going to realise that you’re very existence needs to be predicated on change you need to go and talk your customer”*.

Regardless of the challenges outlined in the literature review that are associated with this sector, and as acknowledged by staff stating that *“the core business of [the case study organisation] has been dramatically constrained by a funding model that doesn’t have any variation in it”*, the overwhelming evidence demonstrated that *“it’s all about solving problems or challenging issues which your customers are facing and exceeding those expectations”*, which is central to a design-led approach to innovation.

## **Conclusions and Implications**

This research investigated potential drivers for change in a non-profit organisation that was facing multiple challenges in a fast changing dynamic environment. The design-led innovation approach to this investigation found that having an underlying social purpose was an effective means for

driving innovation. As the design-led approach to innovation was grounded in customer needs it was able to identify, articulate and communicate the need to innovate in response to the social problems occurring in the aged care sector to the broader organisation. However, to a large extent, in the traditional and conservative context of a non-profit aged care organisation, only the traditional purposes of design were seen to be valid. In line with Cox & Dayan's (2005) findings, the organisation lacked awareness surrounding the opportunities associated with the field of design.

While some of the key stakeholders within organisation were open to the potential of design in a business context, and some were in fact design champions, no real progress could be made in this avenue until the effectiveness of a design-led process was demonstrated. The narrative cycle was created for this purpose. Capturing deep customer insights demonstrated that design can unpack unexpressed customers' needs and develop clear new narratives. This design process generated a much deeper understanding and awareness within the organisation, creating more possibilities for designing appropriate solutions that address emerging customer needs.

As a non-profit aged care provider, the organisation faces the challenge of balancing the needs of its several stakeholders. The applicability of Design-Led Innovation in a non-profit aged care context has been under-researched, and it's applicability in addressing an organisation's agenda to create social value and competitive advantage simultaneously is unknown. Through the co-design workshops it was found that DLI can indeed identify and leverage opportunities for the creation of shared value. Furthermore, due to the social mission of the organisation the concept of shared value creation resonated strongly with its internal stakeholders.

The need for innovation in the public sector is, for the most part, heavily outlined in existing literature. Along with frameworks for approaching innovation, some literature exhibits case studies of organisations innovating due to similar drivers as those exhibited by the aged care sector. Most of these articles are theoretical in nature and only disclose a set of general principles and practices for practitioners to follow. No specific guide explicitly states the steps taken and methods utilised by an organisation, in and aged care context, in order to drive innovation. This paper therefore seeks to provide a detailed approach for non-profit organisations wishing to utilise design led innovation as a method for better understanding their stakeholders and redefining the value they offer to market. The next stages of the organisation's journey, which are currently underway, consist of

further development, prototyping and testing of the solutions developed through this approach. Future research should explore whether this approach to innovation is capable of sustaining momentum and moving beyond the conceptualisation of a solution to its implementation.

## The Value of Design for Customers in the Service Industry: Contributions and measurements

Ki Woong NAM\* and Bruce W. CARNIE

University of Leeds

*In the contemporary market, quality is no longer the key differentiator for a brand. Among the marketing activities available, design is arguably acknowledged as the most distinctive method for achieving long-term brand recognition. Unlike technology, design emotionally interacts with people, and it is not easy to emulate a compelling design identity that has been effectively established. Despite its well-recognised impact, companies still hesitate to strategically employ design. The main source of the hesitation may be rooted in the ambiguity of measuring design contributions. This is particularly true in the service industry where the impact of technology development is relatively lower. This makes it a suitable industry sector for investigating environments where design has a more significant marketing role. Two major forms of research are performed within this paper: the horizontal/spectrum understanding of value, and embedding design perspectives in the service-profit chain using SERVQUAL (SERVice-QUALity) measurements. This paper proposes a model that can quantify and visualise design contributions from the customer's perspective within the service industry sector.*

**Keywords:** Design value, service design, design value typology, measurement of value

## Introduction

Final grades are occasionally painful and frustrating to face; however, fair and effective assessments can help students to acknowledge their status and performance and then go on to improve and complete more difficult work. Likewise, the intention behind measuring business performance is to identify the current status of the business as objectively as possible. As a target of measurement, how a company can effectively design its offerings and systems is essential to surviving in a highly competitive contemporary market (Moultrie, et al., 2006). In other words, the system's design, products and services are essential for a successful business. However, despite well-recognised contributions, it is difficult to reveal the effectiveness of design. This is mostly due to the ambiguity surrounding design (Cooper and Press, 1995) and a lack of theoretical and empirical research (Moultrie et al., 2006; Moultrie and Livesey, 2010). In addition, Topalian urges researchers to cultivate 'novel means of communicating' by using language from a business perspective (Topalian, 2012, p.34). Therefore, it is necessary to investigate how design effectiveness can be comprehended and measured in a successful business.

How can design be comprehended in terms of its impacts upon the success of a business? Kaplan and Norton (1996) introduced a holistic, precise and long-term measurement tool for businesses. It has four different dimensions (i.e. financial; customer; internal business process; and learning and growth) that are referred to as the balanced scorecard. Moultrie, et al. (2006) proposed a tool for assessing design performance in SMEs (Small and Medium Enterprises). Their systemic approach to success factors, both the process and the product, enables them to identify key success factors in new product development processes and confirm design contributions.

However, unlike manufacturing industries, there are subtle differences between products and services offered by service companies. Swann (2002) argues that design influences people by using artefacts and situations that possess a high level of uncertainty. Assessing the output of design activities (e.g. auditing the system for higher productivity or profitable attention towards a new product) is arguably insufficient for comprehending critical issues within the service industry sector. It is necessary to contemplate the factors beyond outputs; in other words, how stakeholders perceive the value of having interactions in a business.

To determine the sources of design value (from a customer perspective) and the linkages between phases of their perception, this research uses the concept of value and service-profit chain. Research questions are based upon the SERVQUAL measurement tool proposed by Zeithaml, et al. (1990), who introduced five dimensions of measurable service quality (i.e. tangibles, reliability, responsiveness, assurance and empathy) from a customer perspective. The SERVQUAL measurement facilitates embedding design perceptions into service-focused questionnaires. It provides service-centric viewpoints and enables the categorisation of questions that consider gradually increasing emotional attachments. These design embedded questions are to be reviewed if the questions contain design audit elements and principles, as argued by Cooper and Press (1995). This paper describes the development of a tool that measures design value in a service company from a customers' perspective.

## **Research methodology**

### *Structure of the paper*

The measurement tool described in this paper aims to identify customers' psychological preferences. To achieve this aim, the research is divided into the following sections:

- 1) *Literature review (defining the value in this research)*. Primarily, the concept of value is critical to this research. The notion of value in customer perceptions was investigated.
- 2) *Building a conceptual framework*. Interactions within a value-creating network were identified based on how customers perceived value. Emphasising the profitability of customer retention also indicates how the conceptual framework can maintain a long-term business. In addition, there has been very little focus on determining and investigating how design influences service quality (Sangiorgi, 2009). Design for services becomes more significant since the focus of marketing and managing shifted in a human-centred direction. Thus, it is necessary to address the contributions of design beyond just its tangible aspects (Meroni and Sangiorgi, 2011).

- 3) *Creating a tool with design perspectives.* Four major dimensions of customer design value were identified and can be utilised for measuring the design value of a business. However, prior to scaling up the tool, one critical prerequisite should be confirmed—the independence of the proposed dimensions. This is important for two reasons: first, if one dimension is affected by others, it raises a major concern about tool’s practicality. The tool should suggest which dimension of design value requires focus or should be balanced to maximise invested resources from the customer’s viewpoint. The tool may fail to make these suggestions if others continuously modify the dimensions. Second, if one value dimension cannot be explained by the designated questions, it is possible that the design embedded SERVQUAL questions cannot represent each value dimension. A quantitative data collection was performed to confirm this prerequisite.
  
- 4) *Validating the tool.* Within the service industry sector, the food service industry (especially cafés) was selected as having characteristics typical of postmodern consumer behaviour and noticeable operationalisation of service aspects (for example, flexibility, artisan-focused and context-dependent nature) (Johns and Pine, 2002). Design in the service industry (starting with food service industry) is arguably worthy of investigation. This study employs a multiple regression analysis. The necessary information can be obtained through the following: Pearson correlation values, R squared values, regression coefficient values and its *p*-values. Pearson correlation and R squared values can confirm the hypothesis of the overall relationships between the proposed dimensions. Regression coefficients and its *p*-values can confirm the possibility of mathematising the relationships.
  
- 5) *Discussion, conclusion and findings.* Analysis of the quantitative data, contributions of this paper, limitations and future study directions were addressed.

### *Research survey design*

Questions about design value are based on the SERVQUAL measurements (Zeithaml, et al., 1990), but they are modified and classified according to design audit perceptions and design value dimensions. To

determine the statistical significance of utilising the proposed framework as a tool, this study performed a random survey to gather quantitative data. The survey questions were distributed online and through field surveys. However, there are two major methodological concerns in this research: overgeneralising survey responses and the relevance of customers' experience.

- 1) *Overgeneralising survey results.* To reduce the variation between companies within the service industry sector, the target was constrained to cafés. Due to its flexible and light capitalistic character, the café industry contains various aspects of post-modern consumer behaviour (Thompson and Arsel, 2004). Thus, investigating the café industry will be representative and less variable.
- 2) *Relevance of customers' experience.* An on-site field survey can minimise the distortion of experiences. This research also included an online survey to acquire a sufficient number of responses. This research attempted to reduce possible response distortions by asking for the date on which the experience occurred (5%–15/277 of samples indicated that their experience were older than 180 days).

The overall survey responses are shown below in *Table 1*.

Table 4. Summary of survey responses

	Sort	Result (Total:277)	
Nationality	Asian	146	52.7%
	European	24	8.7%
	American	107	38.6%
Gender	Female	159	57.4%
	Male	118	42.6%
Age	18 – 25	49	17.7%
	26 – 35	140	50.6%
	36 – 45	61	22.0%
	46 – 55	23	8.3%
	55 +	4	1.4%
Date of experience (within)	A week	149	53.8%
	A month	82	29.6%
	Three months	31	11.2%
	Six months	15	5.4%

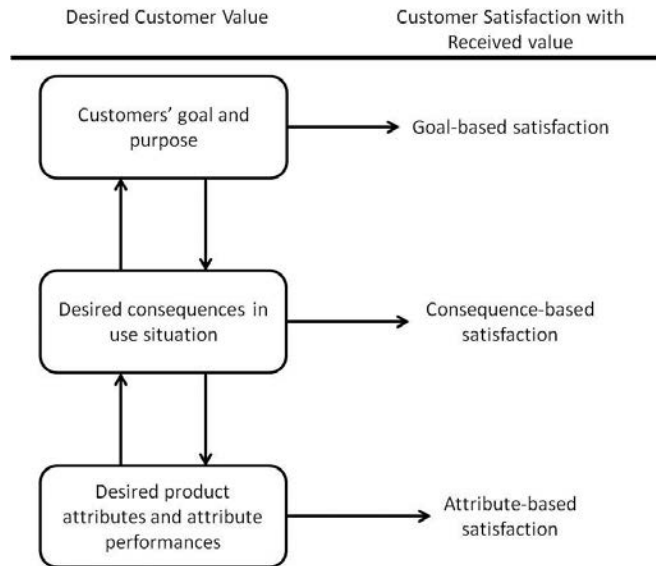

## Literature review

### *Definition of value*

A brand's value represents more than its positive financial output. From a marketing point of view, it can be a commitment to offer superior value to customers (Bruce, 2011). Pursuing and providing higher customer value in a consumer context is a key marketing activity (Holbrook, 1999). Value is an intangible element which stems from consumers' preferences about tangible aspects and pervades the overall procedure of purchasing (Wagner, 1999). Despite the ambiguity of the concept, it is proposed that a summary of customer values that encompasses contemporary issues and definitions as follows:

*Customer value is a customer's perceived preference for and evaluation of those product attributes, attribute performances, and consequences arising from use that facilitate (or block) achieving the customer's goals and purposes in use situations. (Woodruff, 1997, p. 142)*

This definition is inferred from what Woodruff suggested in the customer value hierarchy model in *Figure 1*. Given that this model is dynamic and embraces different levels of customer value, it explains value well and will contribute to future studies (Parasuraman, 1997). In short, customer value evolved from simple dimensions of interaction into multiple relationship behavioural factors.

*Figure 13. Customer value hierarchy model (Woodruff, 1997, p.142)*

Sánchez-Fernández and Iniesta-Bonillo (2007) classified two types of consumer value research: uni-dimensional and multi-dimensional. They argue that the former relies on customers' rational consumption behaviours and considers costs and benefits; the latter facilitates a broader analysis of value. In a sense, these dimensions may have various origins for evaluating value; it is worth investigating these dimensions to understand their relationship.

One of the pioneering pieces of research was based on the uni-dimensional approach (price-quality based) and was introduced by Monroe and Chapman (1987). They argue that perceived value can be aggregated with the acquisition value (maximum acceptable price minus actual price) and transaction value (reference price minus actual price). This view (Monroe, 1973; Dodds and Monroe, 1985) is restricted to the price-quality

view; it raises questions about the role of price in quality perception and other influencing factors relevant to the multi-dimensional approach. Zeithaml (1988) adopts Dodds and Monroe's model and modifies it to explain different levels of attributes. Given that customer perceived value consists of benefits (salient intrinsic attributes, extrinsic attributes, perceived quality and other relevant high level abstractions) and sacrifices (monetary and non-monetary prices), the customer perceived value can be defined as 'a customer's overall assessment of the utility of a product' based on the customer's perceived trade-offs (Zeithaml, 1988, p.14). The hierarchy of elements determines whether offerings fulfil customers' utilitarian product-based goals and was proposed by Zeithaml's (1988).

However, the uni-dimensional approach is often criticised due to difficulty encompassing contemporary consumer behaviour when using complex relationships (Yi and Gong, 2013) and its narrowed scope of product-only attributes (Sánchez-Fernández and Iniesta-Bonillo, 2007). In addition, understanding hierarchy and dimensions of value is crucial for encompassing variables in a model of business relationships (Ulaga and Eggert, 2005). Thus, the multi-dimensional approach was noticed for its understanding of contemporary consumer behaviour and the research stream of value, including uni-dimensional approaches as shown in *Figure 2*.

*The Value of Design for Customers in the Service Industry: Contributions and measurements*

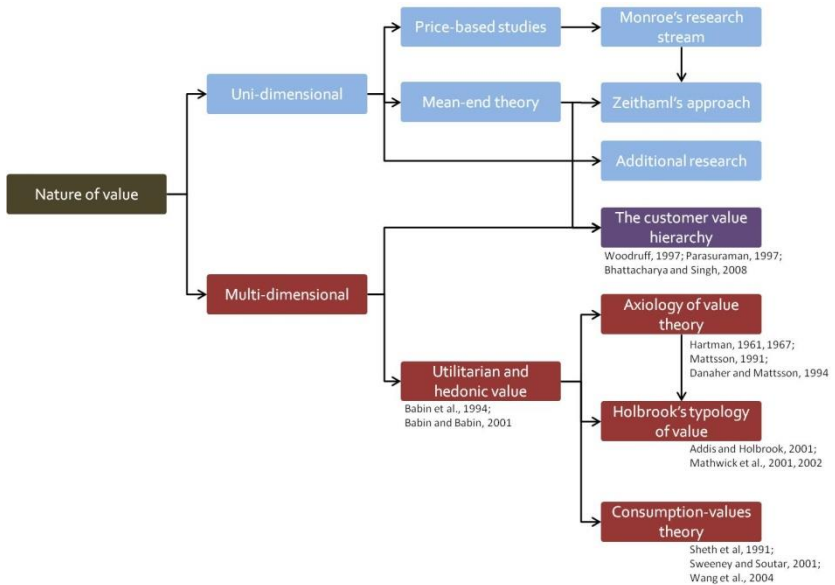

Figure 14. Research streams of perceived value (Sánchez-Fernández and Iniesta-Bonillo, 2007, p.430)

This research considers value as a complex, interrelated holistic output of what customers offer; therefore, multi-dimensional approaches (as seen in the above research stream) are reviewed. Multi-dimensional approaches posit that there are more than two factors (*dimensions*) involved in building perceived value. Within the literature (specified in Figure 2) the relationship between dimensions can be classified as hierarchic and non-hierarchic, as shown in Table 2. Due to its relevance to contemporary consumer behaviour and customer-centric viewpoint, this paper is focused on non-hierarchic relationships.

Table 5. Hierarchic and non-hierarchic relationships within multi-dimensional approaches

	Author(s)	Dimensions
Hierarchic relationships	Bhattacharya and Singh, 2008	End-state Consequence Attribute
	Hartman, 1961, 1967	Systemic Extrinsic Intrinsic (transformational)
	Mattsson, 1991; Danaher and Mattsson, 1994	Emotional Practical Logical
Non-hierarchic relationships	Woodruff, 1997; Parasuraman, 1997	Goal-based Consequence-based Attribute-based
	Babin et al., 1994; Babin and Babin, 2001	Utilitarian Hedonic
	Sheth et al., 1991	Functional Social Emotional Epistemic Conditional
	Sweeney and Soutar, 2001	Functional (Quality and Price based) Social Emotional
	Wang et al., 2004	Functional Social Emotional Perceived sacrifice
	Addis and Holbrook, 2001	Utilitarian Hedonic Balanced
	Mathwick et al., 2001, 2002	Playfulness Aesthetics Consumer Return on Investment Service excellence

Contemporary consumer behaviour changed after the era of ‘Fordism’. In Maslow’s hierarchy, the increased number of choices within a competitive market can be interpreted as being lower levels of need, which are already fulfilled basically. That makes consumers perceive the value of an offering in different ways than outlined by Maslow’s hierarchy of needs. In other words, what customers need is determined by various circumstances related to material abundance and does not concern fulfilling basic hierarchical needs. Therefore, understanding how customers value offerings in a non-hierarchic relationship can also explain contemporary consumer behaviour.

Holbrook argues the typology of consumer value using a holistic and non-hierarchic viewpoint (Holbrook, 1999). It is regarded as a sophisticated typology which explicates modern consumer behaviour (Addis and Holbrook, 2001; Sánchez-Fernández and Iniesta-Bonillo, 2007). Holbrook

describes the nature of consumer value (interactive, relativistic, preferential, and experiential; Holbrook, 1999, p.5) and the types of consumer value (extrinsic or intrinsic, self-oriented or other-oriented, and active or reactive; Holbrook, 1999, p.9). In Holbrook’s detailed explanation, extrinsic and intrinsic dimensions determine whether consumption is the ultimate goal of the customer. Self- and other-oriented values are classified based on whether consumption is for the consumer or purchased with consideration of others’ reactions in mind. If customers manipulate products or services either physically or mentally (e.g. driving a rented car is physical and solving puzzles is mental), value is situated to the active dimension. On the other hand, if customers are being manipulated by the product or services (e.g. feeling sentimental while watching a movie), value belongs to the reactive dimension. These dimensions are described below in *Table 3*.

*Table 3. A typology of consumer value (Holbrook, 1999, p.12)*

		Extrinsic	Intrinsic
Self-Oriented	Active	Efficiency (Output/Input, Convenience)	Play (Fun)
	Reactive	Excellence (Quality)	Aesthetics (Beauty)
Other-Oriented	Active	Status (Success, Impression Management)	Ethics (Justice, Virtue, Morality)
	Reactive	Esteem (Reputation, Materialism, Possessions)	Spirituality (Faith, Ecstasy, Sacredness, Magic)

This study employs Holbrook’s typology of consumer value as a key background theory for numerous reasons. First, Holbrook’s typology of value includes a holistic view of how value is perceived from offerings presented to us. Stakeholders within the value-creating network are comprised of groups of individuals who determine the value of offerings based upon their experiences within the network; it is crucial to consider the origin of perceptions through emotionally classified typologies. For example, Aspara and Tikkanen (2008, 2011) argue that positive personal association is significant for determining stock purchases—even in a highly financial-oriented relationship. Second, the aim of this study is to propose a tool that can explain how the value of a design can be measured and visualised. In order to achieve this aim, previously classified value dimensions are modified to include design in all its manifestations. By utilising Holbrook’s

typology of consumer value, the value of design can be classified in each of Holbrook's dimensions. Third, since awareness of social responsibility has increased since the era of mass production (i.e. Fordism), it is necessary to investigate the factors that determine human perceptions. In addition, solutions for socially responsible projects may be proposed through design (Cooper and Press, 1995). Thus, it may be critical to investigate how people think and the origin of their perceptions. Given that Holbrook's typology classifies psychological factors for the decision-making process of consumers, the result of assessing value through Holbrook's typology can present individual and collectively perceived value.

## Conceptual framework

### *Co-creation of value*

If value is perceived holistically and in a non-hierarchic way, as described previously, it is worthwhile to investigate how value is created and influences stakeholders. The emergence of new cultural boundaries has been caused by greater fragmentation, pluralism and older, weakened collective solidarities in contemporary markets; these have triggered change in consumer behaviour (Amin, 1994). Developments in modern technology have encouraged involvement by creating value from stakeholders who were formerly passive buyers or observers. The value of a brand (shop) no longer exists for one specific stakeholder but for every stakeholder who directly or indirectly influences it.

Since maintaining a business involves more complex relationships between stakeholders, some may argue that it can be impossible to satisfy every stakeholder within the network. Instead, they insist that focusing one stakeholder's value can maximise the overall efficiency of the resources used. However, in the contemporary market, it may be argued that the most significant stakeholder in maintaining business is not a single group or a single stakeholder. The central stakeholder, in terms of measuring any given value, can change as each value is measured and evaluated. For example, businesses that participate in Fairtrade® or "ethically sourced" content for their food products include logos on their packaging that is designed to increase awareness of responsible consumption. In the past, the value of everyday food stemmed from providing high quality food at low prices (consumer-centric value). Today, the value of everyday food in the contemporary market has the added dimension of social responsibility, which includes suppliers and local communities (multiple stakeholder value).

From a long-term perspective, considering multiple stakeholders within a network will provide agility in a business model and therefore allow the business to survive.

In addition, it is also important to consider multiple groups of customers within the value-creating network. Borja de Mozota argues that managers in process-oriented companies are being challenged to develop a solution that is applicable to multiple users (Borja de Mozota, 2011). Not only the providers of value, but also the receivers of value may be comprised of more than one group within a business network.

*Figure 15. The conceptual framework of sustaining a business*

*Figure 3* illustrates the conceptual framework of sustaining a business and how to determine this relationship. To maintain a profitable business, the series of activities expressed in the diagram (emergence of needs, created value, delivered value and perceived value) must keep circulating. Exceeded positive value enriches the business environment of a society and stimulates expectations for another transaction (Holbrook, 1999). Within these activities, Nam and Carnie (2014) argue that there are mutual relationships between stakeholders' needs and created values; delivered values; and perceived values. The development of information technology and the increase of social responsibility enable mutual relationships between those phases. Activities within the sustainable business may be classified as being a provider or receiver. Thus, the mutual relationship and the co-creation of value enhance the overall value of a network.

### *Conceptual framework for the service industry*

The aforementioned framework is relevant to the service industry for two reasons: it promotes mutual relationships between stakeholders, and it provides a continuous loop of value-related activities. First, the mutual relationships between stakeholders are particularly emphasised because of what service companies offer when an interaction takes place. For example, if customers are fully satisfied with employees' services, customers may show their trust and appreciation. Employees may also feel respected and well appreciated. This relationship can help to increase value of the network for both parties. Since design can intervene in the service experience of stakeholders (Meroni and Sangiorgi, 2011), the interactions of building service experiences also need to be addressed by investigating mutual relationships within the network. Second, the continuous loop of activities can be interpreted as retaining stakeholders. Retaining stakeholders, (customers in this research) is crucial to running a service-centric business because customers become more profitable as they remain in the business (Reichheld and Sasser, 1990; Aaker, 1996; East et al., 2013). Therefore, the conceptual framework in *Figure 3* is relevant to the service industry.

In addition to the relevance of the conceptual framework, the service industry is notable from the customer's perspective. Every industry should consider the service aspects of their businesses and understand that quality service is essential for maintaining a business (Daniels, 2012). Daniels also argues that the continuous growth of the service industry is highly dependent on efficient and systemic management. Due to relatively rapid changes in the service industry, companies are being forced to adapt to the contemporary market situation (Sheu et al., 2003). In addition, in the service industry, leverage based on design is increasingly significant due to the ubiquity of services provided. Cooper and Press (1995) also exemplified the importance of design in the service industry. They provided an example of the financial industry by identifying, from a customer's perspective, indistinguishable services between companies. Studies by Best (2006) in the service sector illustrate customers' potential ongoing difficulties in distinguishing the impact of design in a variety of service sectors.

The paradigm shift also encourages the creation of an appropriate methodological tool for understanding service design (Meroni and Sangiorgi, 2011). Putting design(er) at the core of creating solutions to customers, Manzini and Vezzoli (2003) describes characteristics of services as value adding product life cycle, offering final result and enabling platform. Adding value by service elements can be viable through customised solutions,

information & communication technology and specialised services (Meroni, 2008). According to Meroni and Sangiorgi (2011), design has changed definitions of value creation in terms of a service's interactive perspectives. These observations demonstrate changes in perceiving design for services. They urge the development of theoretical and empirical frameworks that can encompass the contemporary requirements of service design.

### *Contribution of design and its measurement*

In this post-Fordism era, consumer choice is significant and arguably increases the influence of design (Cooper and Press, 1995). As influence increases, the impacts and contributions of design (as a company's strategic tool) also become notable. Cooper and Press (1995) have classified the contributions of design as a strategic goal into three elements: securing a distinctive niche, surviving in a mature industry and competing globally. This can be achieved by various activities from stakeholders within the value-creating network.

Having established these activities, it is necessary to develop a suitably effective measurement tool. How can these activities' effectiveness be measured? It remains a challenge to assess the impact and contribution of design through a quantified method (Hands, 2011). In addition, when it comes to acknowledging design contributions, designers are still highly depended upon peer review or numeric business figures, such as sales increases, market share and reputation (Borja de Mozota, 2011). However, it can arguably be difficult to obtain measurement objectivity through peer reviews. Since numeric business figures are the outcome of company-wide activities, the contribution of design becomes blurred, and it becomes challenging to distinguish it from the company's overall outcome. Therefore, it is worth seeking the contribution of design in direct ways.

This paper aims to determine a framework of value(s) that are affected by design. The contribution of business activities, including design, drives the competitive advantage of a business/nation. Likewise, a business/nation requires a competitive advantage for their survival in this highly globalised and competitive marketplace. A value-creating network is arguably required to obtain such a competitive advantage for any given business/nation. This competitive advantage is derived from the activities of stakeholders within the value chain (Porter, 1990) in the sense that the perception of stakeholders towards the network is not circumscribed by financial benefits. Activities' contributions need to be interpreted holistically through the

concept of value. Given that design activities (whether they are micro- or macro-scale) aim to create value (Borja de Mozota, 2011), it is essential to understand the contribution of design through value.

When assessing whether investments in design are effective, Borja de Mozota explains three advantages of utilising the balanced scorecard: it provides a dynamic and long-term perspective; it is applicable to any design project or decision; and it broadens the design outcome of financial perspectives (Borja de Mozota, 2011). Given that the balanced scorecard includes the financial benefits of design, the objectivity of design investment (both financial and non-financial) can be realised. Moreover, the four perspectives (financial, customer, internal, and learning and growth) in the balanced scorecard represent the holistic view of a business's performance. However, there are some limitations when employing the balanced scorecard for investigating the value of the previously mentioned network (*figure 3*).

Since the balanced scorecard is a 'results-based' view of company-based activities it is difficult to include the causes behind each stakeholder's decision to remain within the network. In this paper, the key issue of assessing quantified results will be applied within the service-profit chain. Thus, relationships among co-created value, satisfaction and loyalty can be investigated. Furthermore, due to the dynamic character of the contemporary business situation, it is crucial to be agile in order to transform the strategic weight of stakeholders. For example, when there was no cognition of the corporate social responsibility, putting an 'ethically-sourced' sign or Unicef logo may not be as effective as it is today. It can be interpreted as the emergence of another significant stakeholder within the network, suppliers and local communities. In other words, even if the assessed value of a brand or a business is superior to its competitors, if it is mistakenly focused on stakeholder's superior value, the brand/business may not be able to offer superior value to stakeholders. It is essential to balance the relationships between stakeholders and the relative weight of their value perceptions.

## **Design embedded existing theories**

When design and other business concepts (e.g. organisation, reputation or strategy) are combined (Borja de Mozota, 2011) more efficient design contributions can be achieved. Thus, if design perspectives can be successfully embedded within aforementioned business concepts, it can

facilitate a distinct evaluation of a design's contribution. *Figure 4* summarises the output of this section: the overall layout is based upon the service-profit chain. How customers view the design value of the network has four dimensions (i.e. design as tool, goal, rank and help) and is determined by design embedded SERVQUAL questions. The SERVQUAL questions were modified to reflect design perceptions by selectively choosing design audit elements and principles (Cooper and Press, 1995). The present paper will investigate whether the design embedded questions can successfully quantify and visualise created value for customers. This section demonstrates how customers' co-created design value can be quantified and visualised.

*Figure 16. Summary of design embedded service-profit chain*

### *Design Value typology*

Although Holbrook's typology of customer value includes various aspects of value, some researchers argue that ambiguity exists between active and reactive values in Holbrook's typology (Leclerc and Schmitt, 1999; Solomon, 1999; and Richins, 1999). To dissipate the ambiguity between active and reactive value concepts, they can be combined as one dimension and named as shown below in *Figure 5*.

		Extrinsic	Intrinsic
Self-Oriented	Active	<b>Efficiency</b> <i>Tool</i> (Output/input, Convenience)	<b>Play (Fun)</b> <i>Goal</i>
	Reactive	<b>Excellence</b> (Quality)	<b>Aesthetics</b> (Beauty)
Other-Oriented	Active	<b>Status</b> <i>Rank</i> (Success, Impression management)	<b>Ethics</b> <i>Help</i> (Justice, Virtue, Morality)
	Reactive	<b>Esteem</b> (Reputation, Materialism, Possessions)	<b>Spirituality</b> (Faith, Ecstasy, Sacredness, Magic)

Figure 17. Holbrook’s typology of consumer value (clustered by four dimensions)

To reflect design perspectives, the four dimensions of value are interpreted as follows: design value as a tool, design value as a goal, design value as a rank, and design value as help. These dimensions can be quantified and visualised as shown in Figure 6. Its measurement may be calculated by determining the area of the blue, red and green diamonds on the figure below using the design value equation (see Figure 7). The diamond area can be used to investigate phases within the service-profit chain. If the diamond area can represent the co-created design value of customers, then the relationship between the diamond area and the next phase in the service-profit chain (satisfaction) may be examined by a single regression analysis. In doing so, one can investigate whether the co-created design value positively influences design satisfaction.

Figure 18. Example of measured co-created design value for customers

$$\text{Sum of total customer design value} = \frac{(\text{Tool} + \text{Goal}) \times (\text{Rank} + \text{Help})}{2}$$

Figure 19. The design value equation

### *The service-profit chain*

From a long-term perspective, network stakeholders should continuously be involved in activities that create value. Loyalty is essential for encouraging stakeholder retention. Although loyalty is driven by satisfaction, as shown in *Figure 8* (Heskett, et al., 1994), some may argue that satisfaction can directly impact the profit and growth of the network. Therefore, it is necessary to examine relationships between the phases in the service-profit chain.

Figure 20. The service-profit chain (Heskett, et al., 1994)

Customer satisfaction is one of the most significant indicators of customers' return business (Dube, et al., 1994). Spiteri and Dion (2004) identified the two types of satisfaction: transactional and overall satisfaction. To assess the long-term relationship, they suggest measuring the overall satisfaction derived from total experience because it is more relevant. In addition, Kumar, et al. (2011) insist that operation performance as perceived by customers need to be construed as a whole system approach, not as individual elements. Thus, customer satisfaction is defined as an overall assessment of future behavioural intentions; it considers what customers receive based on what a company provides (McDougall and Levesque, 2000).

As shown in the aforementioned service-profit chain, researchers also insist that loyalty is derived from satisfaction. It has been empirically proven that end-user loyalty, which could lead to customer repurchases, is more significantly derived from overall satisfaction than customer value (Spiteri and Dion, 2004). Although their practical research area is limited to the pharmaceutical industry in business-to-business situations, the results clearly indicate that overall satisfaction drives customer loyalty and overall satisfaction is driven by customer value created by the company. This result

supports the idea that co-created value does not directly affect stakeholders' loyalty. Instead, it is necessary to have a mediating phase for the design satisfaction of stakeholders. Likewise, other phases can be adapted to design perspectives, such as design loyalty and co-created design value.

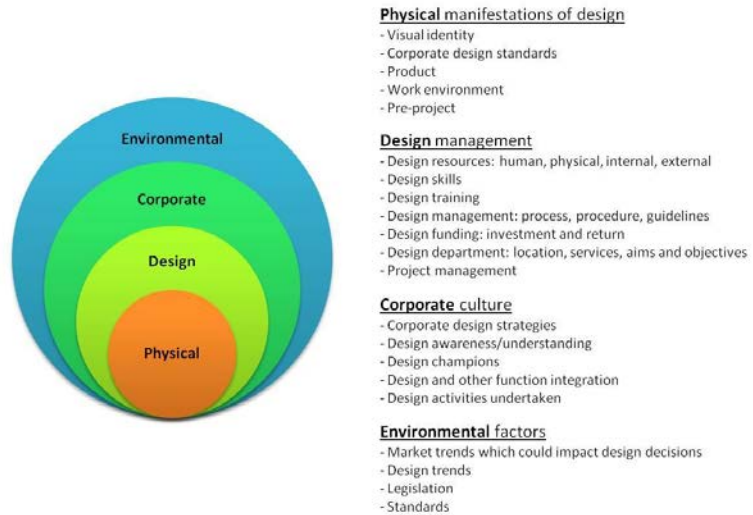

### *Design audit and SERVQUAL*

Cooper and Press (1995) argue that there are three levels to consider when a design is audited: the corporate philosophy and strategy; how the company operates; and how design function communicates. Later in their research, Cooper and Press extend this broad view to explain the four hierarchies of design audit (1995, p.214).

- I. Physical manifestations of design*
- II. Design management*
- III. Corporate culture*
- IV. Environmental factors*

By employing this view, design activities within a corporation can be clearly classified; thus, the design audit for functions within the company can be addressed. However, since the co-created value introduced in this paper consists of stakeholders who are involved in the value-creating network, it is necessary to investigate beyond corporate viewpoints to encompass the values of other relevant stakeholders.

Despite its business-centric restrictions, Cooper and Press's arguments can be understood as key factors of composing the value of employees and other stakeholders. Leadership, competencies, management and people are positively related to the loyalty of employees, which may stem from greater employee value and satisfaction in their work (Martensen and Grønholdt, 2001). These principles are already embedded in the hierarchy of design audit as shown in *Figure 9*. The SERVQUAL questions were selectively reviewed using the audit elements and principles to reflect customer perceptions. The modified questionnaire includes sections of satisfaction and loyalty for utilising the service-profit chain (please refer to the appendix).

*Figure 21. The levels that organisational design audits might address (Cooper and Press, 1995, p.214)*

Although co-created value stems from all stakeholders within the network, this study investigates customer perception to confirm independence as a prerequisite to the dimension of value. The questionnaire was designed to reflect four dimensions (i.e. design as tool, design as goal, design as rank and design as help) followed by the service-profit chain phases. By utilising the questionnaire, one can investigate how customers' value offerings, satisfaction and loyalty can be based upon these four dimensions. Given the aim of this paper, the focus is on whether the above framework is relevant to further studies investigating the holistic view of co-created design value across all stakeholders. Since customers are regarded as the major stakeholder within a value-creating network, this study researches customer perception to test this proposed framework.

### **Independence of value dimensions**

Each of the four dimensions in *Figure 5* is a discrete category and is individually affected by stakeholders. When a business requires strategic decisions to improve its performance, focusing on weak points within the value diamond model's blurred dimensions can further confuse strategic focus. To utilise the visual method shown in *Figure 6*, each dimension should

not be correlated. Thus, multiple regression analyses were performed to investigate any potential relationships between dimensions.

This study performs quantitative data analysis to confirm the independence of each dimension. Questions are designed in the seven-point Likert scale as the SERVQUAL measurement. By examining survey responses with the multiple regression analysis, one can calculate the relationship between one dimension and the other three dimensions and their impacts upon each other. This study employs the alpha level as 0.05, a seven-point Likert scale, and 0.03 as an acceptable margin of error.

## Discussion

Table 4 indicates moderate (correlation value; 0.3–0.5) and strong (correlation value; 0.5–1.0) relationships between the four dimensions. The following is the null hypothesis ( $H_0$ ) of the multiple regression analysis, using the assumption of a linear relationship between each of the dimensions:

*H<sub>0</sub>: One design value dimension is influenced by the other three dimensions.*

While R squared and adjusted R squared values can be disputed by having *F*-values with a significantly low *p*-value, the  $H_0$  of the multiple regression analysis *can be accepted* (see Table 5 for details).

Table 4. Pearson correlation value

		Tool	Goal	Rank	Help
Pearson Correlation	Tool	1.000	.512	.615	.507
	Goal	.512	1.000	.526	.310
	Rank	.615	.526	1.000	.385
	Help	.507	.310	.385	1.000

Table 5. Multiple regression analyses results

*The Value of Design for Customers in the Service Industry: Contributions and measurements*

	Set input y as Tool	Set input y as Goal	Set input y as Rank	Set input y as Help
R <sup>2</sup>	0.498	0.335	0.443	0.267
Adjusted R <sup>2</sup>	0.492	0.328	0.437	0.259
F-value	90.104*	45.808*	72.341*	33.140*
Std. error of the estimate	0.681	1.177	0.878	0.969

\*p-value < 0.001

However, to accept the hypothesis and formulate a relationship between dimensions, regression coefficients' values need to be reviewed. *Table 6* below demonstrates the regression coefficients values.

*Table 6. Regression coefficients of design value dimensions*

Dependent variable	Model	Un-standardised Coefficients		Standardised Coefficients	t	Sig. (p-value)	95% Confidence Interval for B	
		B	Std. Error	Beta			Lower Bound	Upper Bound

	Help	0.044	0.073	0.035	0.600	.549	-0.101	0.189
Rank	(Constant)	0.452	0.301		1.502	.134	-0.140	1.045
	Tool	0.527	0.071	0.430	7.400	.000	0.387	0.667
	Goal	0.229	0.043	0.281	5.322	.000	0.144	0.313
	Help	0.083	0.055	0.080	1.521	.130	-0.024	0.191
Help	(Constant)	1.259	0.325		3.878	.000	0.620	1.899
	Tool	0.498	0.081	0.423	6.180	.000	0.340	0.657
	Goal	0.030	0.050	0.038	0.600	.549	-0.068	0.128
	Rank	0.101	0.066	0.105	1.521	.130	-0.030	0.232

If one dimension can be explained by the other three dimensions, all coefficients are necessarily statistically significant. Some p-values (help dimension in the dependent variable: goal, 0.549; help dimension in the dependent variable: rank, 0.130; goal and rank dimensions in the dependent variable: help, 0.549 and 0.130) reject the H<sub>0</sub> of the regression coefficients below.

*H<sub>0</sub>: All dimensions are correlated and can be described by regression coefficients.*

Despite some positive relationships between dimensions, it is very difficult to describe the relationships between the dimensions. Due to the dispute of R squared, adjusted R squared values and the rejection of  $H_0$  of the regression coefficients, each design value dimension cannot be explained in terms of their relationships. Thus, each dimension is independent and should be measured separately.

## Conclusions and findings

This paper examined how stakeholders perceive value from the network that they are involved in and how those perceptions can be quantified and visualised. By first obtaining customer perceptions, it can be argued that customers determine the value of offerings through four measurable and independent dimensions (design as tool, design as goal, design as rank and design as help). The proposed model can be practically used to enhance global strategies in international business. For example, it is important to understand local culture in global business (Robertson, 1995). If survey results are grouped by cultural boundaries, marketing activities focusing on a specific dimension can be determined by identifying relatively important values for customers.

Given that the four dimensions are derived from psychological factors, these dimensions are arguably applicable to other stakeholders. Before performing any qualitative or quantitative research, it is necessary to review questions for other stakeholders to reflect the design audit elements and principles from Cooper and Press (1995).

However, the survey target is very limited when generalising and applying the proposed frameworks as a tool. Investigating other businesses within the food and beverage service section and selecting for various cultural backgrounds among customers can strengthen the reliability of the proposed tool. Furthermore, since the perceived service quality is determined by a wider social and organisational context (Meroni and Sangiorgi, 2011), other critical stakeholders will require clarification.

In future research, it is worth investigating the main stakeholders of the service industry and their interactions as they co-create value in the network. Also, it is necessary to follow-up on how the next steps within the service-profit chain (satisfaction and loyalty) can be influenced by the dimension of design value. For example, if the design value can be quantified (as shown in this paper), can the design value positively impact the next step (satisfaction)? Likewise can the created value phase in the

service-profit chain, modified to co-created design value, satisfaction and loyalty, be adapted for design perceptions (design satisfaction and design loyalty)?

Other stakeholder groups are as significant as the researched customer group for building co-created design value in the network. It is necessary to modify the questions to investigate other stakeholders' perceptions within the proposed framework. As a result, the co-created design value can be attributed to various stakeholders' perceptions. By doing so, design contributions in the service industry can be holistically recognised in a quantitative and visual way.

## Appendix (Survey question)

### Design as Tool

1. Products and Services from the (        ) Café are good value for money.						
Strongly Disagree						Strongly Agree
1	2	3	4	5	6	7
2. The (        ) Café is located in a favourable place and I like the atmosphere of the surrounding area.						
Strongly Disagree						Strongly Agree
1	2	3	4	5	6	7
3. The (        ) Café company has modern-looking equipment						
Strongly Disagree						Strongly Agree
1	2	3	4	5	6	7
4. The physical facilities at the (        ) Café company are visually appealing						
Strongly Disagree						Strongly Agree
1	2	3	4	5	6	7

5. Materials associated with the service (such as tables, sofa, and tableware) are visually appealing.						
Strongly Disagree						Strongly Agree
1	2	3	4	5	6	7
6. Materials associated with the service (such as tables, sofa, and tableware) match well with the overall atmosphere of the café.						
Strongly Disagree						Strongly Agree
1	2	3	4	5	6	7
7. I feel comfortable to staying / hanging around at the café using the tables, chairs, sofas, tableware etc....						
Strongly Disagree						Strongly Agree
1	2	3	4	5	6	7
8. I like the way the (            ) Café decorates the service materials (such as tables, sofa, and tableware)						
Strongly Disagree						Strongly Agree
1	2	3	4	5	6	7
9. I like the logo (or signs) of the (            ) Café						
Strongly Disagree						Strongly Agree
1	2	3	4	5	6	7
10. I like the interior of the (            ) Café						
Strongly Disagree						Strongly Agree

*The Value of Design for Customers in the Service Industry: Contributions and measurements*

1	2	3	4	5	6	7
11. I like the location of the (            ) Café, because it fits in well with the surroundings						
Strongly Disagree						Strongly Agree
1	2	3	4	5	6	7
12. I am willing to introduce the (            ) Café to friends, because they will also like the physical design of the (            ) Café.						
Strongly Disagree						Strongly Agree
1	2	3	4	5	6	7
13. I am willing to visit the (            ) Café again to enjoy the mood of the (            ) Café offerings						
Strongly Disagree						Strongly Agree
1	2	3	4	5	6	7
14. I will keep using the products and services from the (            ) Café, even if the price is increased. Because I like the design of the (            ) Café.						
Strongly Disagree						Strongly Agree
1	2	3	4	5	6	7

**Design as Goal**

1. Your main purpose of visiting the (            ) Café is,	
1	to buy products (foods and drinks) – take-away
2	to buy and enjoy products and services with friends or family
3	a business purpose (meeting with customers)

4	to spend time alone (reading books/magazines, studying, enjoying atmosphere)					
2. Considering your purpose in question 1, the design of the (        ) Café helps you achieve this purpose.						
Strongly Disagree						Strongly Agree
1	2	3	4	5	6	7
3. I feel comfortable and fulfilled, considering my purpose in question 1 by using the products and services from the (        ) Café.						
Strongly Disagree						Strongly Agree
1	2	3	4	5	6	7
4. I am willing to introduce the (        ) Café to friends who have the same purpose of visiting.						
Strongly Disagree						Strongly Agree
1	2	3	4	5	6	7
5. I will visit the (        ) Café again, because I trust that the (        ) Café will provide similar or better products and services than competitors.						
Strongly Disagree						Strongly Agree
1	2	3	4	5	6	7

**Design as Rank**

1. The (        ) Café is a trendy place with the most recent design consideration.						
Strongly Disagree						Strongly Agree
1	2	3	4	5	6	7
2. Other customers in the (        ) Café are similar to me.						

*The Value of Design for Customers in the Service Industry: Contributions and measurements*

Strongly Disagree							Strongly Agree
1	2	3	4	5	6	7	
3. I feel a sense of belonging in the ( ) Café.							
Strongly Disagree							Strongly Agree
1	2	3	4	5	6	7	
4. The ( ) Café's atmosphere reflects my characteristic							
Strongly Disagree							Strongly Agree
1	2	3	4	5	6	7	
5. I think other visitors also like the design of the ( ) Café.							
Strongly Disagree							Strongly Agree
1	2	3	4	5	6	7	
6. I am willing to introduce the ( ) Café to friends who are similar to me							
Strongly Disagree							Strongly Agree
1	2	3	4	5	6	7	
7. I will visit the ( ) Café again, because I trust that the ( ) Café will provide similar or greater products and services							
Strongly Disagree							Strongly Agree
1	2	3	4	5	6	7	

**Design as Help**

1. I can find design considerations for people with physical difficulties in the ( ) Café. (e.g. access ramp, ergonomic design)
---------------------------------------------------------------------------------------------------------------------------------

Strongly Disagree						Strongly Agree
1	2	3	4	5	6	7
2. I know that the ( ) Café uses ethically sourced ingredients and products, because of their display or logos in sign. (e.g. Fairtrade®)						
Strongly Disagree						Strongly Agree
1	2	3	4	5	6	7
3. I believe that cafés should operate in a manner that includes a diversity / range of customers and use ethically sourced ingredients and products.						
Strongly Disagree						Strongly Agree
1	2	3	4	5	6	7
4. I can recognise from the design of the ( ) Café that my consumption at the ( ) Café supports others mentioned in questions 1 and 2.						
Strongly Disagree						Strongly Agree
1	2	3	4	5	6	7
5. I think others also recognise the design of the café (design for those who have physical difficulties and using ethically sourced ingredients) at the ( ) Café easily.						
Strongly Disagree						Strongly Agree
1	2	3	4	5	6	7
6. I trust the ( ) Café will continue to keep improving or maintaining current design considerations						
Strongly Disagree						Strongly Agree
1	2	3	4	5	6	7

*The Value of Design for Customers in the Service Industry: Contributions and measurements*

7. I prefer to consume products and services like the ( ) Café, rather than other shops which have no considerations to their suppliers or consumers.						
Strongly Disagree						Strongly Agree
1	2	3	4	5	6	7

# Editorial: Design in the Creative and Cultural Industries in an Era of Disruption

Irini PITSAKI<sup>a</sup>, Alison RIEPLE<sup>b</sup>, Natalie NIXON<sup>c</sup> and Birgit JEVNAKER<sup>d</sup>

<sup>a</sup> Northumbria University; <sup>b</sup> University of Westminster; <sup>c</sup> Philadelphia University;

<sup>d</sup> BI Norwegian Business School

The creative and cultural industries (CCIs) include experiential services such as the performing arts as well as products that require exceptional levels of creativity in their development processes: examples are recorded music, fashion, books, art exhibitions and digital media. Many of these sectors have been disrupted by the development of digital technologies and the Internet. Yet there is comparatively little writing on the management of design in the CCIs. In these sectors design is not simply a means of communication or the way to create objects and spaces, but rather is a vital process in the generation of meaning and identity.

This track contains an interestingly eclectic mix of papers that examine the use of design in the cultural and creative sectors. Two papers focus on various aspects of design in the fashion industry, others examine the design of music production, the digital entertainment sector, and design as an aid to the creation of cultural products using museum residencies as the mechanism. Others focus on the creative process itself in, for example, creating identity or in managing the risk inherent in creative production.

In “Powers of design: a heuristic inquiry into the Victoria and Albert Museum’s Residency Programme”, Saskia Coulson and Louise Valentine suggest that there has been a considerable increase in the level of investment and engagement offered by British museums to the creative industries, evinced by a proliferation in the provision of residencies. Residencies offer the time and resources to innovate in practice, and can result in objects, events or services which benefit the host organization and participating individuals. Their paper reviews British residency programs to identify the main practical and strategic value offered by residencies and undertakes an in-depth heuristic analysis of the Victoria and Albert Museum’s Residency Programme, with emphasis given to the development and management of the service and its situation within the Museum’s wider organizational framework. This study contributes to a growing debate that

design can be employed as a way of thinking about the development of cultural products and services, and fosters a discussion on the agency of design within a cultural organization.

In “Studio design and the management of creative production”, Jonathan Gander and Alison Rieple discuss the design of recording studios and how this affects the management of relations within popular music recording projects. The creation of a pop song is a complex endeavor, requiring a large number of decisions involving highly subjective and contestable judgments. Organized in a flat structure and without established lines of authority this temporary assembly of people are faced with the challenge of making a product characterized by uncertainty over how to make it and what it will sound like once it is completed. Their paper is based on observation of the practices, and relationships operating in a recording studio, supplemented by interviews with the participants. Using a socio-material approach, the spatial organization and use of technological objects are included to produce a contextual analysis of how actions are organized and decisions taken. What emerges is an understanding of how the designed arrangement of the participants and the application of sound production and editing technology are used to manage the development of the song and confer decision-making authority upon the music producer. When the spatial organization of the participants is altered by the introduction of new technology and new spaces, the decision-making power of the producer is challenged and artist power is increased.

Jonatan Jelen and Mark Leal in “Omnipresent Access: User Perceptions in New Media Ecosystems” suggest that new technology has mostly altered the world in a pragmatic way – transportation and mobility, energy generation and distribution, transformation of natural resources into consumable products all changed human behaviors. Yet, information-centric technologies also alters the character of humans and consequently the ways in which they relate to systems, experiences, objects, and to each other. The authors argue that social media-related developments such as omnipresent access to streaming video services the past decade has been particularly disruptive, and may have altered consumers’ perception of entertainment altogether. Extending the existing framework of human-computer interaction with the novel human-centered research approach phenomenography, the authors undertook an exploratory grounded theory study with 8 participants to define constructs that capture the experience of consuming streaming video. This yielded five categories that could be used to conceptualize hardware and software development for future mobile

technologies, and also lead to the design and development of fundamentally different business models, digital experiences, and ecologies of coproduction.

The paper by Irini Pitsaki, Alison Rieple and Natalie Nixon “Design and identity formation in cultural organisations’ strategic performance” examines design as a contributor to the formation of identity, both within an organisation and externally among its clients. These concepts are strongly linked and constitute an element of strategic performance. They suggest that in the cultural industries, a clear and consistent corporate identity must be shared internally between the group of employees and externally; ideally, a cultural organisation, because of its non-profit, educational, ethical, etc. status, should see its identity perfectly matched with that of its audience. Organisational brand identity signals what the corporation is and does, which helps to build loyalty and attachment to the company. This is a deeply selective and interpretive process and one that plays a major role in strategy. In this paper, the authors critically review key texts on identity formation in relation to design and brand strategy; and use a case study of museums and galleries to arrive at a set of conclusions about the role of design in the articulation of a clear and distinctive identity for both cultural corporations and individuals interested in cultural products.

In “Three Methods that Creative Talents Could Learn from Designers: Empathic Observation, Group Brainstorming, and Rapid Prototyping” Jaewoo Joo and Soren Ingomar Petersen discuss how creative talents face a high risk of failure but have limited knowledge of how to manage it. Their research has identified that failure risk is successfully managed using three methods; identifying more accurate needs by empathic observation, generating more solutions by group brainstorming, and selecting qualified solutions by rapid prototyping. The authors suggest that creative talents should apply designers’ risk management methods to their creative tasks. “Designing Organisations in the CCI” written by Johan Kolsteeg and Frido Smulders, discusses how cuts in government budgets are forcing cultural organizations to reconsider their position by and decide how to avert the risk of these cuts. They are likely to search for new organizational constellations with new business models. Converting the cultural organization into a hybrid organization combining cultural as well as business values, is one of the options and a major challenge when preserving the cultural values that belong to the artistic core remission priorities. This paper investigates the application of the IDER-model, that combines design thinking and design related implementation theories that

take the potential conflicting value systems into account as well as a focus on the subsequent realization of associated organizational changes. The model explicated in the paper relates to the fundamental choices underlying the adaptation to external changes through hybridization. Based on this theoretical discussion the paper proposes an agenda for future research.

Finally, two papers focus on the fashion design industry. In “Co-creation and the Democratization of Fashion: investigating the case of UK based fashion design company Own Label”, Thorsten Roser, Robert DeFillippi and Julia Goga-Cooke, discuss how the fashion industry has always taken inspiration from the crowd. However, the fashion industry remains reminiscent of an oligarchy led by a small elite of high fashion designers dictating new trends and design from the top of the market. Only a small group of new up and coming fashion designers end up in one of the established fashion houses. Furthermore, in today’s economy and marketplace few consumers can afford high-end fashion attire. During the past decade co-creation has become an established new business practice to enable better front-end ideation, stakeholder advocacy and user customization. In this paper the authors focus on co-creation and the democratization of fashion based on a case study of Own Label. They conclude that such firms are likely to use hybrid models of co-creation to strategically position themselves in a highly competitive market. Further, co-creation enables a new market place for millennial fashion designers and millennial buyers thereby holding the potential to disrupt the market and lead to greater democratization of the fashion industry.

The final paper in this track also focuses on some of the difficulties to be found on the fringe of the fashion industry field. In “The Role of Networks in Fashion Designing: The Disconnect between Designers and Manufacturers in London”, Galina Gornostaeva, Alison Rieple and David Barnes have undertaken an empirical study of the role of networks in fashion designing in London. There is evidence that the relationship between new, small, fashion design firms and apparel manufacturing is one of the weakest points in the fashion production chain. Analysis based on interview data as well as a critical review of the relevant literature, suggest that these problems have two main causes: a) designers are locked-in to the retail-led, London-based networks, which are dominated by strong links with the design colleges and industry-related institutions; b) as a consequence of this, their relationships with manufacturers lack trust, reciprocity and knowledge exchange for the successful prototyping and scaling up of production to be achieved. Negotiation of constraints and specificities of designs are made more

difficult because of personal, cultural, linguistic, physical and organizational differences between the two fields, which create cognitive distance and incompatibility between the fields of fashion design and apparel manufacturing.

# Three Risk Management Methods That Creative Talents Could Learn From Designers: Empathic observation, group brainstorming, and rapid prototyping

Jaewoo JOO<sup>\*a</sup> and Soren PETERSEN<sup>b</sup>

<sup>a</sup> Kookmin University, Korea, Republic of (South Korea); <sup>b</sup> Design Quantification Lab at Center for Design Research, Stanford University

*Our interview of ten creative talents revealed that they face high risk of failure but have limited knowledge of how to manage it. We review how designers' manage New Product Development (NPD) and find that they successfully manage failure risk using three methods; they identify more accurate needs by empathic observation, generate more solutions by group brainstorming, and select qualified solutions by rapid prototyping. We suggest that creative talents should apply designers' risk management methods to their creative tasks.*

**Keywords:** *Creative talent, risk management, design, New Product Development, empathic observation, group brainstorming, rapid prototyping*

## Introduction

Art can be considered “Goal Directed Play” with the intent of “Making Objects Special” as to support ceremonies (Dissanayake 1998). According to studies of artists, deep human and philosophical issues inspire art, and the process of creating an artwork is a process of tinkering. Artists are inspired by other artists and their surrounding culture, and contemplate deep issues before and while producing their art pieces. Successful artists are trendsetters. They characterize and name problems, while designers solve them (Petersen 2011).

For most of European history, art and design have been considered the same thing, a craft. Until the renaissance (14th to 16th century), crafts were used to validate and promote religious institutions and rulers, fashioning architecture, furniture, weapons, clothing, utensils, jewellery, sculptures, and paintings. Wealthy patrons supported craftsmen and crafts were manufactured on commission. As art was separated from craft and the cost of art materials declined, artists produced pieces for the upper class and for themselves including self-portraits, still lives of objects, flowers, and food items, as well as landscapes. Abstract paintings did not appear until the beginning of the 20th century and most art became a commodity as the cost of reproduction fell. Art and craft, since their separation, have inspired each other, and since the industrial revolution, mass-produced goods have inspired industrial design. Today, art can be produced by anyone and anyone can label and sell what they produce as their own art (Crowdsourcing findings confirm this: [http://www.huffingtonpost.com/soren-petersen/what-is-art\\_b\\_1938274.html](http://www.huffingtonpost.com/soren-petersen/what-is-art_b_1938274.html)).

As arts become democratized, many creative individuals and their entrepreneurial ventures are characterized by enormous profit potential as well as huge market and execution risk. If they get the unique ingredients right, they can replicate the commercial success of Picasso, Madonna, Spielberg, and Jobs. Otherwise, an average American artist makes less than \$23,000 a year (U.S. Census Bureau 2008). Indeed, creative individuals’ revenue curve is best described by a power curve; a few earn substantial revenue, most earn nothing at all. Entrepreneurial ventures in the creative economy depend on a limited number of breakthrough ideas derived from a few individuals, as opposed to raw materials or properties. Private investment is virtually unattainable for these ventures due to a lack of tangible assets, effective and efficient processes, reliable metrics, and risk

assessment methods, making it impossible to construct a viable business case.

Different from creative talents, designers have developed their own methods to manage risk. According to Perks, Cooper, and Jones (2005), designers have changed their roles dramatically in recent decades. Relegated to being primarily stylists in the fifties, they are now contributing at a strategic level, responsible for the visual perception of corporations, user experience, and leading the design process in the twenty-first century. According to Von Stamm (2003), harsh competition has led to an increased emphasis on innovation as a crucial dimension of business strategy. In response, designers are undertaking a leadership role in innovation. They carry out a broad array of tasks, beyond those demanded from specific design activities. Scholars suggest that their responsibilities should expand to roles that support the entire New Product Development (NPD) effort. Such roles include interpreter, coordinator, and facilitator (Turner 2003). In addition, an increased understanding of customers' needs is becoming a prerequisite for successful innovation. The lack of useful market and customer information is driving designers to generate their own quick and dirty research. Therefore, it is argued that designers should not only embrace the traditional marketing tasks such as marketing research and marketing communication (Von Stamm 2003) but also directly interface with the marketplace to effectively understand and communicate with customers (Leonard-Barton and Rayport 1997).

In the present work, we aim to provide insights into how creative talents manage their risks. In order to achieve this goal, first, we reported on our interviews with 10 creative talents; secondly, we reviewed the contemporary effort that designers have made to reduce their risk in new product development; and finally, we conclude what creative talents could learn from designers.

## **Study about creative talents**

In order to understand what artists do, we conducted two studies, crowdsourcing and interview. First, we conducted a crowdsourcing challenge on the professional social network (LinkedIn) between August and September 2012. We applied the Six Step Co-creation Cycle method to the four groups (Creative Designers and Writers, Design Education, Design Research and Design Management Institute) and provided an open-ended question (Petersen 2013);

What characterizes good Art? Art can be considered “Goal Directed Play” with the intent of “Making Objects Special,” supporting ceremonies (Dissanayake, 2002). What do you think separate good art from bad art?

We collected in total 39 comments. Their comments reveal that not few creative talents mentioned the link between art and design. Here are a few specimen comments of the artists:

“The expression of the thoughts of the artist is successful when it engages both the maker and the viewer and creates dialogs of wonder. It is subjective and stimulating and seeks to enlighten and entertain”

“Art adapts to and reflects the values of the time, by speaking the language of the patron and by adjusting to the consensus of the most successful styles of the period, which, at the moment, happens to be design”

“Art and design are inextricably linked”

Second, we conducted interviews with 10 individuals who are presently working in five different creative industries. They consist of a music stylist, musician, movie producer, cameraman, painter, graphic designer, font designer, museum curator, healthcare designer and ceramic designer. We performed our interviews between September 2011 and February 2012, using a semi-structured open-ended interview instrument. The instrument contained the questions addressed in the application form for the Industrial Design Excellence Award (IDEA) from the Industrial Design Society of America (IDSA). Interviews, with durations between 45 minutes and two hours, were conducted in person, on Skype, or over the phone.

We typed and coded interviewees’ comments using the Concept Aspect Profile (CAP) (Petersen 2005). This profile consists of thirteen aspects of a concept or an idea including individual user in social context, user identity, user needs, user behavior, user activities, interface with offering, offering’s function, offering’s features, architecture, technology, planning, philosophy, provider entity. We tallied the total number of information segments for each aspect in order to compare creative talents and designers.

We identified the gap between art and design by comparing art concepts and industrial design concepts; industrial designers pay more attention to success indicators such as users' identity, needs, and behavior, while artists pay more attention to themselves and members of their own profession. This suggests that artists have opportunities to further excel by understanding their buyers more deeply. We believe that they can easily improve their market position by leveraging the methods developed in the

consumer product industry, beginning with the following three approaches: (1) positioning artwork, (2) managing risks, and (3) integrating art and business.

In addition, according to the interviewed artists, one has to be able to understand and share the vocabulary in order to appreciate an art piece. Thoughts and ideas are worthless unless shared—without impact, they have no relevance. Perhaps some of the more well-designed and innovative products of today are, in reality, a type of substitute art because, although functional, they may still be perceived as art.

## **Literature review about designers**

As designers' roles have changed from aesthetic specialists to the leaders of new product development, their efforts to improve the chance of succeeding in their projects are attracting much attention among researchers. In particular, researchers shed light on their efforts to improve the quality of the three tasks in the design process. These tasks include (1) identifying needs, (2) generating solutions, and (3) selecting solutions.

### *(1) Identifying needs by empathic observation*

Users or consumers are generally considered the experts on their own needs. However, they are sometimes unable or unwilling to explain their needs. They tend to either emphasize short-term problems by sacrificing long-term needs, or ignore their potential needs regarding radically new products because their insights into new products tend to be bounded by their own experience of currently available products. As Hamel and Prahalad (1994) argue, consumers generally lack foresight and, thus, being merely customer-led is dangerous. This implies that, when developing discontinuous (breakthrough) new products, traditional methods are insufficient to identify needs. As a result, it can be difficult for marketing to provide input and direction before a general product application has been established (Veryzer 1998). Further, questions remain concerning the role of customer input and market research in discontinuous (breakthrough) new product development (Wind and Mahajan 1997) as well as the relationships between market researchers and other key disciplines (e.g., Industrial Design, R&D) involved in the development of these types of products (Veryzer 2005).

To identify needs that consumers want fulfilled, designers invest tremendous effort. In particular, they attempt to understand users—not

indirectly through marketing research, but directly. For example, Matthing, Sanden, and Edvardsson (2004) said, "the consumers' service ideas are found to be more innovative, in terms of originality and user value, than those of professional service developers" (p. 479).

Recently, designers focus on ethnographic observation to identify consumer needs. One is. This method enables them to empathize with how users think and feel. For instance, Hamel and Prahalad (1994) and Leonard and Rayport (1997) claim that either obvious or unobtrusive observation methods lead to collecting and analyzing quality data (needs). Similarly, Kelley (2001) argues in his seminal book, *The Art of Innovation*, that observation is the first step in collecting data. More recently, business magazines have paid closer attention to the pronouncement made by ethnographers that such observation "provides a richer understanding of consumers than traditional research methods. Closely observing people where they live and work allows companies to zero in on customers' unarticulated desires (Ante and Edwards 2006).

## *(2) Generating solutions by group brainstorming*

After identifying user needs, designers often generate solutions through so-called group brainstorming. Although this method is widely used in practice, psychologists are reluctant to appreciate its value. According to Diehl and Stroebe (1987, 1991), for example, several studies have consistently shown that nominal brainstorming or the aggregated work of individuals working simultaneously but without contact with each other outperforms group brainstorming. Prior work has suggested three reasons that group brainstorming is ineffective (Shepherd et al. 1995).

The first reason is evaluation apprehension. Group members are reluctant to express their unpopular or politically incorrect suggestions or poorly developed ideas for fear of being judged or evaluated by others—group members or externals (i.e., managers). The productivity of the group declines when members start to worry about how others will respond to their ideas. The second reason is social loafing or free riding. Group members intentionally limit their contributions and rely on other group members to do the job. This often happens when the responsibilities are unclear or when individuals do not feel accountable for producing. A large body of research has found that when individuals believe that their contribution cannot be identified and appreciated, they invest less effort into the task. The last reason is production blocking, which occurs when group members have to wait for others to finish before they offer their own

ideas. While waiting, ideas may become obsolete or forgotten, or, in order not to forget, people concentrate on and rehearse their own ideas instead of participating and generating more and new ideas.

Sutton and Hargadon (1996) criticized the findings obtained from prior research by arguing that the studies use a single effectiveness (or efficiency) measure and fail to consider the context in which group brainstorming is used and to examine how and why designers use it. They performed ethnographic fieldwork with IDEO employees and demonstrated that group brainstorming serves many objectives rather than simply increasing the quantity of ideas. Similarly, Leonard and Sensiper (1998) argue that knowledge held in people's bodies and heads and their unarticulated knowledge is the basis of creativity and is not easily captured or codified. The process of innovation is both an exploration and a synthesis.

### *(3) Selecting solutions by rapid prototyping*

After generating multiple solutions, designers often use prototyping to narrow down the alternatives (Schrage 2000). A prototype is known to serve various roles. First, it clarifies the generated solution and facilitates communication among designers. Physical prototypes help elucidate the new product concept for the development team and others in the organization (Leonard and Rayport 1997). Alternatively, visual prototypes made by designers facilitate the evaluation of the proposed design. "The renderings and models produced through their efforts (with the help of other professionals such as clay modelers) are invaluable in assessing the desirability of proposed designs and their market viability" (Veryzer 2005, p. 25). Secondly, it becomes a source of feedback from users and designers. It helps in gaining reactions from potential users and, sometimes, is used to supplement traditional marketing research methods (Leonard and Rayport 1997). Physical activities involved with rapid prototyping help designers to better understand their own solutions as well. In fact, some design challenges can only be resolved and evaluated in the prototype stage, such as subtle detailing like chamfers, radii, textures, and materials. Prototypes also make the concept more memorable and, thus, real. As Nussbaum (2005) said "seeing ideas in working, tangible form is a far more powerful mode of explanation than simply reading about them off a page."

## Conclusion about creative talents and designers

In sum, designers have developed and revised their own unique methods such as empathic observation, group brainstorming, and rapid prototyping to enhance their performance in the three specific design tasks: identifying needs, generating solutions, and selecting a solution. Their unique methods have been developed and widely utilized in firms such as IDEO and P&G as well as documented and carefully examined in schools. As a result, designers successfully manage their risk and get involved in product development projects early.

While designers have made tremendous effort to manage risk (e.g., devise, test, and revise various methods in different stages of NPD), artists have changed themselves very little, appearing to be reluctant to adapt to changes in an art world and become more aware of business risks. Our interviews with 10 artists in various creative industries suggest that the concept discourse of creative talents differs significantly from that of designers. For example, we asked both creative talents and designers to explain their focus on various concept aspects while developing art/design concepts and compared what they emphasized. We found that industrial designers paid attention to users whereas artists paid attention to themselves. This suggests that creative talents can improve their commercial performance by shifting their foci from themselves to users or buyers.

Figure 1 Concept Attention Profile between creative concepts (art) and design concepts (industrial design)

We found from our literature review of designers that creative talents could further excel in their performance by considering their users. They could do so by leveraging three methods often used in the consumer product industries: (1) positioning on a market risk-execution risk matrix, (2) managing risks, and (3) integrating management with art.

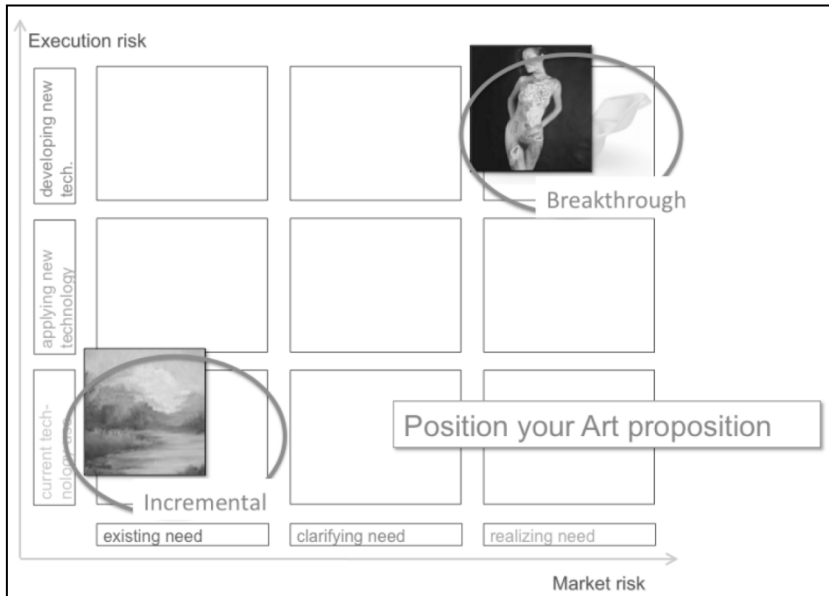

Figure 2 Matrix of market risk and execution risk

First, creative talents could position their artworks on the matrix of market risk and execution risk. Doing so enables them to understand what to pursue. For example, when they position their artwork at low market risk and low execution risk, their artwork will become commoditized, so-called, "me-too" products. However, when positioning their artwork at high market risk and high execution risk, they explore hidden user needs using radically new methods, suggesting that they pursue breakthrough innovations. Which strategy is better depends on contest, such as the artist's risk profile and the competition. According to a study of Mexican ceramics artists, low-end producers experiment more since they have nothing to lose. Artists in the middle range have something to lose and, thus, they are cautious and

refrain from experimentation. Artists in the top-end experiment the most, to remain on the cutting-edge. In general, top performing artists pursue innovative concepts with high market risk (e.g., non-established/little recognized topics) and high execution risk (e.g., unfamiliar topics, materials, and processes) (Dissanayake, 2002). One example is extreme body art: an artist surgically inserted an extra ear under the skin of his arm.

Second, creative talents should manage risks to stay relevant and competitive. Note that venture capitalists carefully select start-ups but they have to endure a waiting period of three to five years before a carefully selected investment provides a worthwhile return on their investment, because only one out of twenty ventures excel. Risk management of artwork involves diverse risks from loss or damage to commercial risk. For paintings, for example, commercial risk decreases while a painting’s value increases as the painting proceeds to the first sale, followed by sales from galleries and on to when critics and museums finally show interest. This suggests that painters need to pace cash flow to finance the entire process.

Finally, creative talents should integrate management with art creation. In the past, design has been shown to create the greatest value for organizations when it is integrated with management. For entrepreneurial ventures in the creative economy, creative professionals are one- man businesses.

*Table 1 Evolution of the role of designers in New Product Development (excerpted from Perks, Cooper and Jones 2005, p. 112)*

Period	Role of design in New Product Development
1800s	Business-oriented
1920s to 1950s	Specialist (e.g., durable goods)
1960s to 1970s	Professional (after WW2)
1980s	Brand dominated (e.g., Gucci, Ralph Lauren)
1990s	Sub-process of NPD (recession)
Early 2000	NPD process leader (supporting the whole NPD)

## Co-creation and the Democratization of Fashion

Thorsten ROSER<sup>\*a</sup>, Robert DEFILLIPPI<sup>b</sup> and Juliana GOGA-COOKE<sup>c</sup>

<sup>a</sup>London School of Economics; <sup>b</sup>Suffolk University, Center for Innovation and Change Leadership; <sup>c</sup>Own Label Fashion Company

*The fashion industry has always taken inspiration from the crowd (Nixon & Blakley, 2012). However, the fashion industry remains reminiscent of an oligarchy led by a small elite of high fashion designers dictating new trends and design from the top of the market. Only a small group of new up and coming fashion designers end up in one of the established fashion houses. Furthermore, in today's economy and marketplace many fashion savvy consumers cannot afford high-end fashion designer attire. During the past decade co-creation has become an established new business practice to enable better front-end ideation, stakeholder advocacy and user customization (Ramaswamy & Ozcan, 2013). Our paper researches co-creation and the democratization of fashion based on the case study of Own Label. Building on the co-creation framework of Pater (2009) we conclude that in practice such firms are likely to use hybrid models of co-creation to strategically position themselves in a highly competitive market. Further, co-creation enables a new market place for millennial fashion designers and millennial buyers thereby holding the potential to disrupt the market and lead to greater democratization of the fashion industry.*

## Introduction

The UK has become a seedbed for nurturing talent and fostering growth in the Creative and Cultural Industries (CCIs). In a highly transient economy companies are looking for new sources of innovation and growth, whilst seeking to offer new experiences and ways of engagement with customers. During the last decade co-creation has become an established new business practice, as well as a marketing and innovation management tool.

Digitization and co-creation allow firms to expand into new markets and to generate value beyond their initial core markets by directly involving co-creators across the value chain. The co-creation of design has been investigated and applied in many business contexts. In the creative and design intensive industries we can find examples of companies utilizing co-creation from inventive design of gadgets and household goods ([www.quirky.com](http://www.quirky.com); Piller, Ihl, & Vossen, 2011) to more complex products such as motor cars and other vehicles ([www.localmotors.com](http://www.localmotors.com); Ramaswamy & Ozcan, 2013). The past few years have also seen an increase in co-creation models in the fashion industry. For example, the co-creation of athletic shoes ([www.nike.com](http://www.nike.com)), t-shirts ([www.threadless.com](http://www.threadless.com)), men's shirts ([www.blanklabel.com](http://www.blanklabel.com)) and jewellery ([www.gemvara.com](http://www.gemvara.com)).

In this paper we explore co-creation in fashion design by investigating the co-creation practices of an innovative UK based fashion design company: Own Label ([www.own-label.com](http://www.own-label.com)). Own label organises regular open design competitions via an online platform and engages a diverse community of fashion co-creators. By studying the co-creation practices of Own Label we explore if such co-creation practices hold the potential to disrupt the market and lead to greater democratization of the fashion industry.

### *Aims*

Our aim is to contribute to previous co-creation research (Piller et al., 2011; Prahalad & Ramaswamy, 2004) by investigating co-creation in the context of the fashion industry and looking at the processes of creation and commercialization of designer fashion. We do this by looking into the approach of a company committed to enabling greater democratisation in the fashion industry in order to support up-and-coming design talent and to make designer clothing more affordable for fashion consumers.

Our particular interest is to look at how co-creation democratizes the fashion industry. We look at critical stages of the value chain across the fashion creation process to understand how different types of co-creators

are involved in the making of fashion. Ultimately, we explore the creation of value in the fashion industry and how co-creation influences this process.

Finally, we explore the tension in choosing either an elitist approach to fashion design that engages an elitist and closed club of experts in fashion creation versus engaging larger and more inclusive crowds, coalitions and communities into the fashion creation process.

## **Theoretical strands**

### *Democratization of Design Innovation*

*When I say that innovation is being democratized, I mean that users of products and services—both firms and individual consumers—are increasingly able to innovate for themselves. (von Hippel, 2005, p. 1)*

Von Hippel's (ibid. 2005) notion of democratization focuses on users as opposed to manufacturers of products or services. Our discussion extends this concept of democratization to include the participation of a wider variety of stakeholders in the design process. Our notion of democratization is more aligned with Chesbrough's (2003) view of open innovation, which reasons that in a world of widely distributed knowledge, companies cannot afford to rely entirely on their own in house expertise, but should instead engage with external sources of innovation. We similarly argue that democratization of design innovation benefits design firms by expanding the range and quality of design ideas from an expanded variety and number of participants in the design process. Because of advances in digital technology, it becomes easier for a wider array of people to participate in the design process, whether through submitting their own design ideas, evaluating the design concepts of others and making suggestions for their improvement.

Von Hippel (2005) observes the impact of digital technology on expanding the opportunities for participation in design.

*When the cost of high-quality resources for design and prototyping becomes very low - which is the trend we have described - these resources can be diffused widely, and the allocation problem then diminishes in significance. The net result is and will be to democratize the opportunity to create (ibid., 2005,p. 123).*

A further benefit of these democratizing digital tools is described by von Hippel is thusly:

*Democratization of the opportunity to create is important beyond giving more users the ability to make exactly right products for themselves. As we saw in a previous chapter, the joy and the learning associated with creativity and membership in creative communities are also important, and these experiences too are made more widely available as innovation is democratized. (ibid., 2005, p. 123)*

So the tools of democratization (low cost digital tools for design creation, dissemination and editing) are in fact making possible the creation of design communities composed of an array of stakeholders whose individual participants might not otherwise be able to co create fashion design. These digital tools and their facilitation of design communities (and crowds) provide the necessary technological and social resources for Own Label to enact its democratic model of fashion co creation.

*Democratization of fashion is often attributed to fast fashion, live broadcasts of catwalk shows, video streaming, twitter and photo sharing platforms, which indeed bring fashion closer to wider audiences rather than the lucky few. What we mean by democratization of fashion is the public being not just the audience but the judge as well...[...]...it is the vote of the public that decides what gets manufactured at Own Label. (Interview - Co-founding Director)*

### *What is co-creation?*

Co-creation is an active, creative and social collaboration process in which co-creators become active participants in the innovation process of a firm and thus in the development of new products or services (Piller et al., 2011). In the management and innovation literature co-creation has been associated with different meanings ranging from innovation with customers to mass customisation, co-production and emotional engagement (Roser, Samson, Humphreys & Cruz-Valdivieso, 2009). Indeed, co-creation can involve a broad range of stakeholders (Roser, DeFillippi & Samson, 2013). Co-creation goes beyond traditional market research, marketing and R&D approaches for soliciting user feedback. Co-creation engages customers and other stakeholders to participate in the value creation process and this opens up the boundaries of the organization to accommodate the needs and preferences of these customers and other stakeholders (DeFillippi & Roser, 2014). As such, co-creation holds the potential to enable firm growth

through innovation and business transformation and to foster industry disruption (Christensen, 2003).

Hence, in this study we focus on co-creation as a process nurturing creativity and the expansion of a company's innovation capabilities. More specifically, we define co-creation as an interactive, creative and social process that is initiated by the firm at different stages of the product development process (Roser et al., 2009). Co-creation may involve employees, partners, customers, crowds, fans, as well as other co-creators. Firms may utilize technology and Internet communities to enable the strategically orchestrated interaction between their co-creators across discrete activities of the firm's value chain.

### *Types of Co-creation*

Design industry scholars have noted the increasing democratization of the design process as the availability of collaborative technologies and related practices (e.g. crowd-sourcing, co-creation) enable customers and other stakeholders to participate in designing goods and services (Hofitzer, 2009). Co-creation can be conceptualized in terms of a range of practices that democratize how people and organizations engage with each other in one or more value creating processes. In co-creation both the project initiator and outside parties participate and engage in the specific value creating process with reciprocal influence of each party on the resulting activity. Different forms of co-creation imply different forms of democratizing these value creation processes.

Pater (2009) suggests that different forms of co-creation (and by implication democratization) can be characterized in terms of two distinct choices by co-creation project initiators: *Openness* and *Ownership*.

Openness refers to how external parties are chosen to participate in a given co-creation process. Some co-creation practices select participants based on particular criteria for qualifications and competency and only those parties are invited to participate. On the other hand, other co-creation practices use Open Calls where anyone can participate or respond to the typically Internet broadcasted call for co-creators.

Ownership refers to whether the outcomes (e.g. intellectual property) and challenges of designing and executing projects are owned by just the co-creation project initiator or by the contributors as well. Ownership choices have a major influence on the governance or management of the co-creation project. Further, Pater (2009) identifies four types of co-creation that reflect these combinations of choices as depicted in Figure 1.

**Figure 1: Four types of co-creation**

Source: Pater (2009)

1. **Club of Experts** co-creation creates value by selecting contributors who meet certain specific participation criteria such as technical expertise, or certification as a qualified vendor or expert source.
2. **Crowd of People** co-creation (crowd-sourcing) attempts to create value by drawing upon the Wisdom of Crowds philosophy that if you ask enough people and organizations for advice the more likely you will receive the best available solutions for your value creation challenges.
3. **Coalition of Parties** co-creation involves a selective group of independent organizations teaming up to share ideas, pool risks and investments. Each party brings specific assets or skills to the Coalition.
4. **Community of Kindred Spirits** co-creation typically consist of self-selected groups of people who have shared interests and volunteer to work on some common project.

In practice, co-creation is likely to be a hybrid combination of these more distinct forms of co-creation within diverse Business-to-Business (B2B) and Business to Consumer (B2C) contexts (Roser et al., 2013). Indeed co-creation may often involve a portfolio of these co-creation practices utilized according to the business strategy employed (DeFillippi & Roser, 2014).

### ***Co-Creation in Fashion***

Traditionally, an elite of influential designers, brand development agencies and fashion houses has governed the fashion industry. Digitalization has enabled ways of marketing and user involvement around fashion products including lead user marketing, fashion bloggers, Facebook fan pages, Pinterest and the like. Fashion design, however, is still governed by a relatively small elite. This ‘oligarchy’ creates design by innovating from the top of the market.

According to a 2014 European Union commissioned study, co-creation is ‘a revolutionary design approach where a multitude of stakeholders are actively involved in the design process. It goes beyond partnering with other companies, assembling multidisciplinary teams, or conventional user-designer relationships that might for instance apply to architects and their clients.’ (Dervojeda et al., 2014, p. 3). Co-creation is a crucial design trend, because it can change companies’ relationships with their customers dramatically. A customer not only buys products, but also meaningfully participates in the process by which those products are designed.

Potts, et al. (2008) describe fashion as a pure social network market, in which the choices of individuals are determined by the choices of others. Fashion choices are at one and the same time acts of copying and of very personal expression. Fashion allows individuals to create meanings and values – and status differentials in personal standing – by appropriating for their own purposes the image created by designers and labels. As a result of this social network market, co creation offers a technology-enabled method for aggregating the choices of prospective fashion buyers into a two way dialog with fashion designers and manufacturers, as illustrated by our forthcoming review of case studies of fashion co-creation (see below).

With ever shorter production cycles and global competition for brand recognition, however, fashion houses continuously look for new inspiration, new ways of organizing and innovation to gain competitive advantage. The past few years have seen an increase in co-creation models in the fashion industry. Most co-creation models in the fashion industry are enabled by a combination of technology with co-creation tools of competition, customization and collaboration, which have made it possible to co-create with one individual user, with a group of experts and with the crowd. Table 1 below outlines typical approaches to co-creation in the fashion industry.

#### **Table 1: Typical co-creation approaches in the fashion industry**

Co-creation with      Made-to-order has always been a fashion paradox. In the

the end user	developed countries it is still a signature of exclusivity and status. In less developed countries, where labour is cheap, it often is the default mode. Technology and online applications are enabling both small and big fashion houses to offer different degrees of customization, at different price points. A typical example is Indochino ( <a href="http://www.indochino.com">www.indochino.com</a> ), where the client gets the suit made to his measurements. Measures are taken either by a travelling tailor or the client who is provided with instructions and uploading them online.
Co-creation with the experts	Fashion collaborations are amassing rapidly among different arrays of experts. Frequently observed approaches include collaboration between large high street retailers and established high-end luxury fashion designers. For example, collaborations between H&M and Karl Lagerfeld, Alexander Wang and many others (see <a href="http://www.hm.com">www.hm.com</a> ). Other examples include co-creation between fashion and film, fashion and contemporary arts, fashion and technology, fashion and Nobel laureates, fashion and celebrities.
Co-creation with the crowd	This is an emerging model for fashion. It combines technology, voting competitions and fashion loving crowds who are looking for fresh and non-conformist mass culture. Competitions are not a new tool in searching for talent. Technology, however, makes it possible to engage co-creators as designers, decision makers, promoters and buyers across the value creation and design process. A common example of such co-creation are the designs produced by T-shirt company Threadless ( <a href="http://www.threadless.com">www.threadless.com</a> )

The key benefits of such co-creation for fashion companies include:

- Early trend-spotting and improved sensing capability
- Increased speed to market
- Lower risk of market failure
- Nurturing of loyal customer community
- High buzz rates and advocacy
- Sticky brands on a low budget
- Fast adaptation of production cycles
- More authentic and better customer experience and journey
- Cheaper high quality product for design oriented customer
- Low volume production at manageable cost
- Lower risk of overproduction and less waste

What is significant about co-creation in design intensive industries is the democratization of the process by which design choices are made. Traditionally, these choices have been dictated by the expertise (or aesthetic license, depending upon one's perspective) of a small elite of designers whose reputation enables them to set the standard for their industry. This elite designer driven perspective has been celebrated recently by scholars studying Italian industrial design, whose architect led and designer driven processes make little or no use of so called customer engagement to determine their design choices (Verganti, 2013). Verganti (2013) argues that only by relying upon the aesthetic genius of world-class designers can radical innovations arise in industrial design. The present study contrasts this elite designer driven perspective with a co-creation perspective that democratizes the processes of fashion design and selection.

The next section of our paper investigates how fashion company Own Label is making use of co-creation principles to generate business benefits and enable greater democratization of fashion creation.

## **Case study analysis**

This section outlines our methodology and analysis procedure. For better contextual clarity we will, however, provide a brief case description to give a flavour for the material our analysis is based on.

### *Case description*

Own Label is an online fashion co-creation company. The business was initially set up following a project-based collaboration between students from the University of the Arts and London Business School. The founders of the company were motivated by their belief that, consumers should determine what looks stylish and that the Internet provides the ideal platform to showcase the talents of rising designers. The company runs online fashion competitions encouraging co-creators to 'Join the new fashion democracy!' (Own Label website).

Own Label describes itself as 'a new channel for emerging fashion designers and creative talent' (ibid.). Fashion students and new designers submit their designs to the Own Label website in line with a specific fashion brief. A large community of affluent lead users and potential fashion customers vote for their favourite fashion designs. Those designs, which

attract the highest number of votes are manufactured in a limited number and sold online via Own Label's online store, as well as pop-up store events.

The mission of Own Label is 'to harness the creative talents of upcoming designers and provide them with a channel through which their designs can be seen by fashion conscious consumers' (ibid.). Further, Own Label's mission is to democratize fashion and give consumers input into which garments get made and to give fashion forward shoppers the opportunity 'to be the first to get their hands on the next big name designer of tomorrow' (ibid.).

*We aim to continuously improve our business model. Our online platform initially targeted students and design colleges, which builds sustainability at the micro level....[...]...the next stage will be to target applications from a broader audience such as young design entrepreneurs who may want to test the commercial viability of their designs...and young independent brick-and-mortar fashion retailers who may be looking to establish an online presence without the expense of developing a retail website. (Interview - Co-founding Director)*

On the one hand, Own Label aims to be a new channel for emerging fashion designers. On the other hand, they want to offer high quality designs (at competitively lower prices) to the 'fashion conscious consumer' for established brand names (Own Label website).

*Our idea is simple...fashion students and new designers submit their designs to Own Label in line with a specific brief...The Own Label community votes for their favourite designs. The designs, which attract the highest number of votes are manufactured in a limited number and sold online. (Interview - Co-founding Director)*

From a commercial perspective, Own Label is aiming to innovate a new market by creating a new channel for emerging fashion designers. Own Label differentiates itself by fusing concepts of exclusivity and co-creation in a professional format and by offering a range of designs, not just those which fit with a particular high street chain. The company's vision is that Own Label is where 'fast fashion meets couture or personal tailoring' (Own Label website). It's originality derives from the more democratic process employed in involving different kinds of co-creators into the value chain from the creation of designs to manufacture to commercialization.

### *Research aim and research interests*

Our key research aim is to examine Own Labels co-creation model in more detail. The following research interests guide our study:

- Learn what co-creation approaches are emerging in the fashion industry
- Study if there is a difference between theoretical and practical models of co-creation
- Draw implications on what co-creation means for the fashion industry participants
- Reflect on co-creation as a means to foster the democratization of value creation
- Reflect on co-creation as a strategic tool to enable organizational innovation and growth and its potential to bring about industry disruption

### *Research question*

How are the four conceptual types of co-creation outlined by Pater (2009) utilized in the fashion co-creation process employed by Own Label?

### *Hypothesis/Expectation*

In theory we can outline distinct modes of co-creation. In practice co-creation is likely to be a hybrid model consisting of a portfolio of different co-creation practices.

## **Methodological approach**

Our methodological approach is a qualitative case study with the active engagement of a founding member of the company to help us validate our findings (Denzin & Lincoln, 2005). Our iterative analysis focuses on the specific co-creation practices, as well as design co-creation process employed by Own Label. We examine the relationships and engagement process involved in Own Label's co-creation approach. We investigate what co-creators are involved and during what stages of the co-creation and fashion design process by focusing on critical transition points. We utilize the conceptual framework developed by Pater (2009) to analyse the data in hand. Our sources of data include both data stemming from a 1-2-1 interview, as well as studying the Own Label Website and community.

### *Data creation*

In April 2014 we conducted one 1-2-1 in-depth interview with the co-founder and acting director of Own Label. The interview process lasted 94 minutes and was facilitated by the lead author of this paper who is a highly experienced qualitative researcher. As topic guide for our interview we used a set of six previously validated questions relating to any firm's strategic co-creation choices (see Roser et al. 2009; Roser et al. 2013; DeFillippi & Roser, 2014). These questions help the researcher to explore (1) who is involved, (2) for what purpose, (3) where in the value creation/fashion design process, as well as (4) how frequent and (5) intimate the involvement of these co-creators is in the fashion design process is. Finally, we ask (6) what incentives are used to reward co-creators for their involvement in Own Label's fashion design process. In addition to this interview, we also utilise the information available via Own Label's website as contextual data to provide a more detailed description of the business case at hand.

### *Analysis procedure*

Whilst our topic guide questions resulted in very rich raw data, our particular interest here is to generate a focused and in-depth conversation with the interviewee focused on organizational practices and ways of organizing. Hence in a second step we then analyse the interview raw data by way of content analysis in order to identify and analyse the four types of co-creation outlined by Pater (2009). The aim of our analysis is to discover what co-creation types are involved in the process implemented by Own Label.

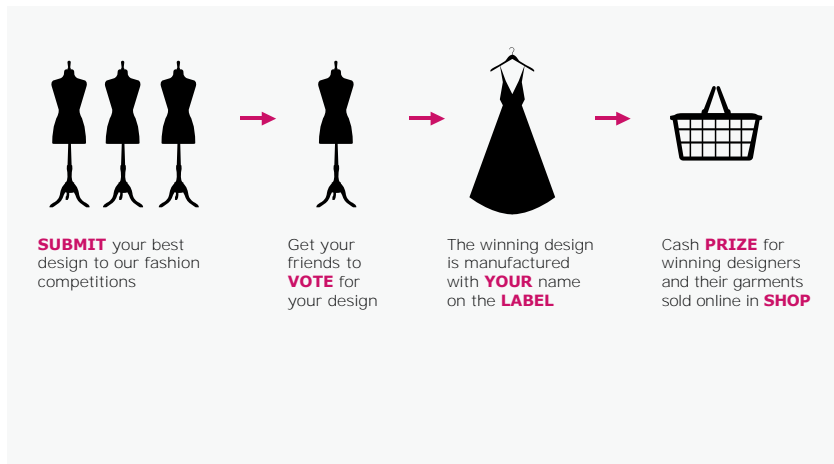

Based on these two steps in our analysis we create a value chain model reflecting the types of co-creation employed by own label across the fashion design process. In a third step we present the findings of our analysis to the interviewee in a 'reflect back' meeting. The purpose of this third step is to validate our view of Own Labels co-creation choices. The fourth and final step of our procedure is to interpret the findings of our analysis by relating them back to the conceptual model developed by Pater (*ibid.*, 2009; see figure 1).

Following our analysis procedure, we identify the most important sequential stages of Own Label's value creation. Building on the four types of co-creation by Pater (2009) we identify, which forms of co-creation are in play for each particular stage. Ultimately, this allows us to study Own Label's co-creation approach in relation to the democratization of fashion building on two core aspects of any co-creation process: *openness* and *ownership*.

## Analysis Findings

At first glance Own Label's fashion co-creation activities seem to follow a simple crowd-sourcing approach (see figure 2 below). The company posts fashion competitions in a specific section of their website. Fashion students and new designers submit their ideas in line with these briefs for the chance to win a cash prize. The top designs are displayed in the 'vote' section of the website to be voted for by the public. The most popular designs are then manufactured and sold online via their online store with the designers name on the label. As such, the company acts as an intermediary between fashion designers and fashion consumers offering a marketplace for exchange and engagement for both of them.

**Figure 2: Own Label user involvement approach**

Source: Own Label website ([www.own-label.com](http://www.own-label.com))

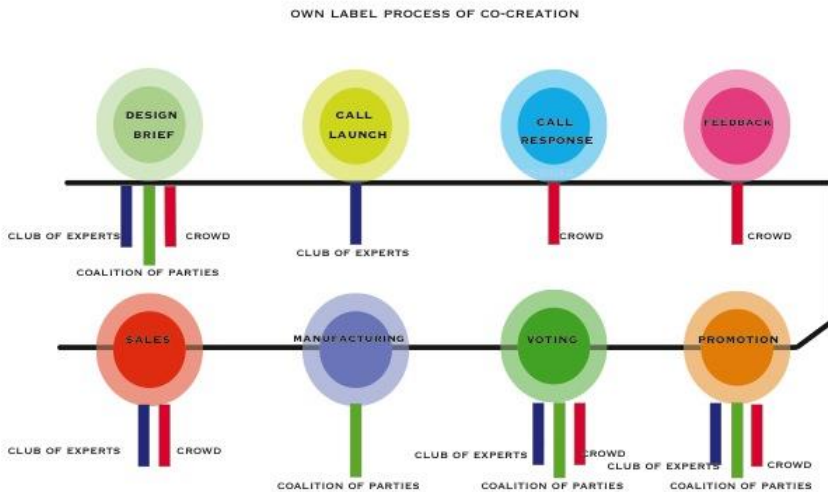

However, the company's business model also engages these communities in a broader co-creation process that goes beyond the mere *submit-vote-win-manufacture-reward-buy co-creation process*. Further, they maintain critical relationships with other stakeholders, such as retailers. For example, the company needs to ensure that the high standards expected by design fashion buyers are maintained. As such, the company sources from UK based manufacturers that also deliver to other high-fashion companies.

To implement their business model, Own Label has made a number of strategic co-creation design choices that involve both B2B and B2C relationships across a number of critical stages. The company utilizes a portfolio of different co-creation choices to enable the co-creation of fashion design. Whilst some co-creation activities are dyadic and face-to-face interactions others involve groups of people or crowds online.

### Openness

Own Label’s co-creation approach is a hybrid model that utilizes more than one type of co-creation across their fashion design process (see figure 1). According to the co-creation model put forward by Pater Strategy (2009) Own Label’s fashion co-creation process involves different types of co-creation across a number of transitions (figure 3 below).

**Figure 3: Own Label’s process of co-creation**

1. **Design Brief:** Own Label uses various practices to decide on the thematic focus of the brief:
  - a. Own Label team of experts decides the brief design based on forecasting trends and analysis (club of experts)

- b. Own Label collaborates with partner(s) on a particular brief. The partner can be another fashion organisation, like All Walks of Life ([www.allwalks.org](http://www.allwalks.org)) for the brief on Diversity, or a company from different industries, e.g. technology, print etc. (coalition of parties)
  - c. Own Label asks the community what suggestions they have on next brief (the crowd)
2. **Call Launch:** Own Label staff (club of experts) filters ideas for the design brief to select the most promising ideas. They issue the open call for submissions based on the design brief, with a deadline for submission response.
3. **Call Response:** Anybody (the crowd) can reply to the call and submit a design that corresponds to the brief, by uploading three pictures and completing a designer personal profile.
4. **Feedback:** As soon as the designs go online, the community (the crowd) starts commenting and giving feedback on style, fabric, colours, size. While these comments do not lead to an iteration of the design, they are valuable suggestions for the manufacturing phase.
5. **Promotion:** All parties involved take part in promoting the designs to their fans, friends and friends of friends. Own Label staff works with designers (club of experts) to generate content which feeds into the community blog, Facebook page, Twitter and Pinterest. The crowd is encouraged to spread the word via social media. If a coalition of partners is involved in the brief, they also take part in promoting the designs.
6. **Voting:** Voting period is announced by Own Label staff and lasts 4 weeks. The crowd votes to decide the top three winners. Own Label specialist team (club of experts) decides on the commercial viability of the designs, and the quality of the pattern to make the final decision. Own Label also chooses a 'wild card'.

7. **Manufacturing:** Own Label team is in charge of implementation. The collaboration in this phase is a coalition of parties, between Own Label, the winning designer and the tailors.
  
8. **Sales:** Own label team (club of experts) manages the sale and shipping of garments to end-users. The crowd generate marketing buzz via social media.

### *Ownership*

The intellectual property ownership rights stay with company as 'the project initiator'. Own Label is given exclusive licensing rights to use the winning designs during the production run and online sales via their website for up to one year. Any legal value creation and implementation responsibilities also rest with Own Label.

Designers are rewarded with exposure and feedback from the community. The winning designers receive a fixed cash prize of £200 pound sterling. In addition to prize money winners also get their fashion design work and designer profile featured on the Own Label website. Ultimately, being involved in such public fashion competitions is an 'apprenticeship experience' for the participants where they can practice and learn how to apply their own skills in a commercial environment and take design ideas to market. During the competition process, Own Label guides the participating designers in how to harness social media to promote their designs and reach their potential clients. At the end of the competition, Own Label also organises a crash course for the finalists on 'How to start your own label' (see Own Label website).

### *Democratization of Own Label's fashion design process*

In the view of the company's director Own Label provides a commercial platform for emerging designers to join an otherwise difficult-to-enter industry and marketplace. By the same token the company wants to make designer fashion more accessible to consumers.

*New designers or graduating design students face a limited number of options if they wish to pursue their dreams...[...]...The lucky few get taken on by the major high street chains, but for many who wish to build on their creative talent rather than be restricted by a corporate career it is extremely difficult to build a reputation...[...]...At the same time we live in an age where consumers are no longer loyal to a particular brand. Consumers are more inclined to mix expensive*

*branded designs with classic or vintage items. They throw together a variety of items in order to create a style, which is uniquely personal. Popular culture enjoys being part of the process by which creative talent rises out from the masses...[...]...Own Label hopes to play a part in the discovery of great new designers. (Interview – Co-founding Director)*

## **Discussion and outlook**

In this paper we explore democratization at the intersection of art and commerce. This may seem paradoxical. Yet, both socio-cultural and economic aspects of organizing can contribute to value creation in different ways.

There are many contrasting visions and experiences of what democracy means. Democracy is a continuum of possibilities rather than a specific state of social organizing. At one end of the spectrum, we may find a social movement where actors are fighting for freedom. At the other end, we may see calls for more open participation and involvement to enable greater opportunity for new talent. Democracy is an ideological idea, a state of mind, as well as cultural and social representation. As such, it is not a static term fixed by a true value, but a concept that co-evolves within an ever-changing society. The Internet and social media are further changing what democracy means and how it manifests itself in practice today. As such, we have to be open to variant and more fluid definitions of democracy and its multiple cultural manifestations in society and business. Specifically, one must consider the institutionalization of democracy in a commercial context where actors co-create new services and goods for new and emerging markets to serve their own communities.

From what we have seen, Own Label is not a grassroots uprising against fashion capitalism, rather it is a platform for new talent that may or may not contribute to an erosion of the established fashion elite in the future. Similar to many other young, up-and-coming fashion designers and community members, the company is itself a start-up venture. The company aims to support greater freedom and participation in the fashion design creation process by extending it to a wider audience of participants. This extension of the value chain is a strategic move by the owners of the business in order to create a new marketplace and commercial channels outside the traditional and established pathways to value. As with any democratic movement this can be a risky process.

The company seeks to utilize co-creation as a means to enable an opportunity space for both millennial fashion designers and fashion buyers. The firm aims to profit from providing and managing a creative and commercial space enabled by its technical platform and facilitated user interactions. Creating this space and technical platform requires time and resources, as well as the ability to manage commercial risks in order to exploit commercial opportunities. Whilst their commercial model is new, interesting and different, it may also need considerable refinement to make the company a dominant commercial player in a saturated fashion marketplace governed by price wars and brand competition.

Our case study has illustrated the complexity and diversity of co-creation processes and co-creation partners engaged during the various phases of the fashion design process at One Label. This complexity stands in contrast to the more simplistic conceptual models of co-creation employed to characterize a firm's co-creation practice. Our findings largely confirm our expectation that co-creation can be more usefully understood as a hybrid model in which a firm employs a portfolio of co-creation practices in relation to diverse co-creators within distinct phases of the firm's value creation and product development processes.

At a more macro level, our case study illustrates how a new generation of fashion design firms are disrupting the fashion industry by challenging the orthodoxies of the established fashion design houses. Presently, new entrant design firms such as Own Label are disrupting from below in that their initial market appeal is to an emerging segment of fashion buyers - most likely younger millennial generation buyers with distinctive sensibilities for engagement in their purchase decisions. These buyers are typically underserved by traditional fashion design houses due to their high priced luxury fashion offerings that provide neither the customization nor cost savings that appeal to millennial buyer sensibilities. It is such underserved customers that are the typical targets of disruptive innovation (Christensen, 2003).

Similarly, Own Label is drawing upon the design capabilities of an emerging generation of fashion designers (also millennials), who are accustomed to submitting their fashion design proposals (briefs) online in design competitions and are utilizing these design competitions to develop their own professional reputations and attract buyers to their designs. The fashion industry poses daunting employment challenges to young designers, who may not find it easy to acquire permanent positions in established design houses dominated by more experienced fashion designers and labels.

Design co-creation offers new avenues for young designers to participate in their industry and to acquire needed experience and recognition. Fashion design companies such as Own Label are utilizing their hybrid models of co-creation to strategically position themselves in niche markets, adapt faster to trends, as well as to shape new lifestyles. They keep users engaged to compete in a highly competitive market, to lower their design and innovation cost and to increase velocity of the design process itself. Digital technology, cost pressures and competing for brand equity in an increasingly transient and fast paced industry may further enable and foster design co-creation and strategic user involvement in fashion and design.

Taken together, democratization of fashion design is indeed a disruptive force in the industry and is impacting a new generation of designers, design firms and their buyers. It is far too early to forecast whether these co-creation focused fashion design houses will ultimately displace more established fashion design houses and the oligopolistic domination of fashion by the elite fashion designers. However, there is already evidence that new entrant fashion design firms such as Own Label are establishing new positions in the industry that can attract millennial designers and millennial buyers.

From studying Own Label and other co-creation examples we conclude that co-creation holds the potential to change value creation and by implication to disrupt the current market position of powerful fashion design houses. In a world where individuality and user-centred design and personalization are becoming increasingly popular, disruptive impacts may include the creation of new markets outside of existing hierarchies and power networks. The examples in this paper already illustrate disruption in the lower end of the fashion market (e.g. fashion company Threadless).

As we have seen there is no one size-fits-all approach to co-creation in fashion. Own Label's approach is primarily an example of co-creation in ideation, i.e. at the front-end of the innovation and value creation process. It is a question of when technology will also enable more co-creation across other parts of the value chain. Indeed, co-creation in the production process of fashion could become a particularly disruptive force for fashion companies. The recent developments in related design industries such as 3D printing technology provide a vivid example of rapid business transformation and the democratization of manufacturing in other markets.

In fashion creation the integration of augmented reality tools e.g. to take precise body measurements- has already become possible. From a strategic perspective the fashion industry should therefore encourage and adopt such

co-creation practices in order to stay abreast with innovation and new technologies. On the one hand, production cycles of fashion are getting increasingly shorter. On the other hand, diversity is increasingly needed and Own Label's approach has also shown good potential in eliminating waste and stock as a more sustainable way of using resources and producing fashion. Further, co-creation can create a platform for nurturing new talent enabling market entry for designers that will appeal to underserved markets with peripheral customers.

In summary, our case study explores the intersection between elitist fashion design creation and a more open and collective process. We study democracy as enacted in a space of tension between creative opportunity and challenge. As such, our work contributes to a broader understanding of democratization through co-creation in action.

In conclusion, for the future oriented fashion company co-creation is a way to experiment, test and develop new markets, brands and designs. Ultimately, the co-creation of fashion leads to a shift in requirements and fosters new business models. Looking into the future of an increasingly diverse and dynamic fashion economy, the democratization of couture and personalized on-demand fashion might just be a mouse-click away. In the words of fiction novelist William Gibson: The future is already here - it is just not evenly distributed (cited in *The Economist*, 2006).

# Powers of Design: A heuristic inquiry into the Victoria and Albert Museum's residency programme

Saskia COULSON\* and Louise VALENTINE

Duncan of Jordanstone College of Art and Design, University of Dundee

*There has been a well-documented increase in the level of investment and engagement offered by British museums to the creative industries, as evidenced by the proliferation in the provision of residencies in recent years. Residencies offer the time and resources to innovate in practice, and can result in objects, events or services which benefit the host organization and participating individuals. This paper will briefly review British examples of contemporary residency programs, identifying the overlapping and disparate characteristics of residencies, and provide an overview of various real-world practices to determine the main practical and strategic value offered by residencies to project stakeholders. Furthermore, this paper will offer an in-depth heuristic perspective of the Victoria and Albert Museum's Residency Programme, with emphasis given to the development and management of the service and its situation within the Museum's wider organizational framework. This study contributes to a growing debate that design can be employed as a way of thinking about the development of cultural products and services, and uses the concept of residency as a lens through which the traditional and emerging frameworks of design can be viewed and can foster a discussion on the agency of design within a cultural organization.*

**Keywords:** Residency, Museum, Design Management, Heuristic Research

## Introduction

From 2005 to 2010, there was a noted 40% rise in the number of freelance designers in the UK, with the total reaching over 65,000 (Design Council, 2010). This figure contributes to the 8.4% of the population recorded to be working in the creative industries in 2010 (Bakhshi, Freeman & Higgs, 2013). The Department for Business, Innovation and Skills and the Department for Culture, Media and Sport have advocated that the creative industries, totalling 5.6% of the UK GDP, are a critical area of growth in these current times of austerity (Kendall, 2011). Part of the increased investment arising from this position of strength can be observed in the way British museums work more strategically with the creative industries. Together, they create new partnerships to investigate the benefits arising from interdisciplinary exchange of resources and audience (Kendall, 2011), and construct 'hubs' for the advancement of professional creativity (Bishop, 2004). In turn, this has expanded the role of the museum from one of showcase to that of the patron and client (Pavitt, 2009).

These factors disrupt the foundations that influence organizational behavior, and have contributed to an increased interest into the nature of residencies for creative practitioners. The term *residency* can be found in a diverse range of disciplines, and within each of these areas, the definition of this term varies. For the purposes of this research, the term 'residency' is considered in the context of the cultural (specifically, museums and galleries) and the creative industries. In this context we propose that residency denotes a *provision of time and resources to innovate in practice, subsequently resulting in objects, events or services that the resident, participating individual and host organization benefit from.*

In a recent international survey conducted by the International Federation of Arts Councils and Cultural Agencies, 89% of the eighteen Arts Councils and Ministries of Culture from all continents reported that they provided support for residencies. It was also noted that less than half (38%) of the respondent organizations had recently conducted an evaluation of these residency programmes (Gardner, 2013). This reveals a tension between the intent and delivery of residency programs. Furthermore, the current discussion in industry journals criticizes programs for their lack of consideration in the preparation and provision of residencies (Gray, 2009). It is argued, therefore, that despite progress being made in terms of provision, there remains limited research conducted on the design and effectiveness of this service.

It has been noted that design thinking is key factor for a successful business (Martin, 2009), and there has been a marked proliferation of the use of design thinking in a wide range of contexts beyond what is considered the traditional field of design (Kimbell, 2011). This has filtered through to the cultural industries, which have seen a number of researchers exploring the use of design in the creation and development of products and services (Mitroff Silvers, Hamley, Trihn, Lytle-Painter, Ludden & Lee, 2014; Mitroff Silvers, Rogers & Wilson, 2013; Pitsaki, 2010, 2007; Pitsaki & Rieple, 2011; Rieple & Pitsaki, 2011). This paper contributes to this growing debate using the concept of residency as a lens through which the traditional and emerging frameworks of design can be viewed. We contend that Victoria and Albert Museum Residency Programme can foster a discussion on the agency of design with emphasis placed on the value design brings to the organization through a discussion on the four powers of design (Borja de Mozota, 2003, 2006). We close by indicating the impact of this research on a future design museum's strategy for engagement and participation.

## **A Panorama of Residency Provision**

The term 'residency' implies an idea of an individual rooted in a physical location or community, whereby the organization providing the residency supplies the resources to the individual in residence to create new work or resolve an existing problem in their practice. Currently, there is no one model in use, and the various frameworks employed in practice - which are shaped by the different missions of the organizations housing the programmes - lead to great variances in expectations and requirements. The landscape of residency provision is diverse: centers provide 'space away from their usual environment' and 'time of reflection, research, presentation and/or production', and can include individuals or collectives from the full spectrum of the creative industries, including designers, artists, writers, curators and academics (Res Artis, 2014). Residency programs can also be at the core of an organization, or be provided as part of a wider program.

There exist only a limited number of studies on the provision of residencies: these have primarily been conducted on a national level, and are aimed at gauging the importance of state-wide residency campaigns (EKOS, 2009; Hutton & Fenn, 2002; Stephens, 2001). These mainly quantitative research documents often report on the number of activities

provided and participants included, and tend to focus on the economic or social benefits offered by residencies to communities or geographic areas. In addition, there are several reports on residency case studies, and these have often been undertaken as part of a larger initiative of delivering similarly structured residencies to several organizations (Hercombe, 1986; Museummaker, 2011). These provide insights from the organization about the residencies, as well as their beneficial value to employees or visitors. Finally, there are also a handful of internal evaluation reports, often commissioned by the organization providing the program and only made available to those working in the institution. This means that what does exist contributes to an incomplete and insufficient critical debate on the subject.

To overcome the lack of academic discussion on the subject, and to understand the role of residency within the current practice of cultural institutions, we conducted a rigorous contextual review of existing design and craft residency practices in Britain. This contextual review of residency provision introduced the idea the residency practices can be categorized into three conceptual models: these models represent a scale of engagement between agency, individual, audience and industry, and have been titled the *Intramural Model*, the *Interpreter Model* and the *Industry Model*. These are illustrated in Figure 1 and summarized below.

*Figure 1 'Visual representation of the existing frameworks of residency provision'.*

The *Intramural Model* is formed on the basis that the resident is given time and resources away from social and economic distractions to develop new creative outputs or an exhibition. Examples of this model include Cove Park, a residency hothouse in the secluded area of Argyle and Bute in Scotland; *Maker-in-Residence* at the Barony Centre in East Kilbride (the self-

proclaimed 'Craft Town of Scotland'); or *Architecture in the Forest*, which provided a platform for sixteen makers to create an exhibition inspired by the Kielder Forest in Northumbria. This model of residency provision focuses on the notion that innovation is stimulated through the process of the creative practitioner working in seclusion, relatively free from any external influences which could impede the creative process. These characteristics are fundamental to any residency, and could be considered to be at the core of subsequent models.

In the *Interpreter Model*, the resident is viewed as the intermediary through whom the audience interprets creativity. This model is founded on the assumption that the resident can foster innovative audience engagement approaches within museums and galleries (Gray, 2009; Kendall, 2011; Morris, 2005) by reinvigorating the collection and adding a critical dimension to works or curatorial methods (Morris, 2005). The *Museummaker* project of 2011/12, for example, brought craft makers into museums around England in order to 'unlock the creative potential of museum collections' and to provide a contemporary perspective to the display of objects (Museummaker, 2011, p.3). This use of the residency as a catalyst for audience engagement has been developed in response to the shifts in focus in museums and galleries, since interest in these organizations has forced a change from the traditional static environment to open, participatory and accessible process-driven displays (Morris, 2005).

The *Industry Model* views the designer from a business-focused perspective. Within the field, these programmes expound the notion of a residency as a catalyst for innovation and enterprise within the designer's practice, as well as in the practice of the organization. It has been noted that those working in the creative industries are part of what is considered the *super-creative core* within the *creative class*, a social division which develops the economy through the advancement of ideas, technology and the production of creative innovation (Florida, 2002). However, actors in the creative class find their practice defined by the opposing rationales of economically-driven decisions versus creative aspirations, and it is accepted that an individual working as a creative professional must find a compromise between the two (Eikhof & Haunschild, 2007). Residency programs such as Cultural Enterprise Office's *Fashion Foundry*, the *Incubator* scheme at Cockpit Arts, and *Hothouse* provided by the Crafts Council, have noted this tension and devised programs which directly support new businesses in design and craft. There are also new models of residency provision emerging, as companies bring designers in-house for a specific purpose,

with the agreed trade-off that the residency will improve the designer's practice. This model can be explored in *Research Designer in Residence* program at the EMERGE recycling centre (in which the resident examines new forms of reusing materials); and the *Geeks in Residence* program facilitated by Sync (which pairs a designer with a suitable organization in order to facilitate knowledge exchange and skills development).

However, these models, which are arguably limited by the aim of the host organizations, cannot be applied to future museum practices. As the creative and cultural industries face increasingly complex challenges this must be reflected in the ways in which museums engage with all of their stakeholders. This has already been noted in the research aimed at audience development in museums and galleries. It is further evidenced by the change in museums, which no longer represent the ivory towers of sacred objects broadcasting information to visitors they once did, but have become sites for progressive methods of participatory audience engagement (Anderson, 2004; Hooper-Greenhill, 2011). Audiences have formed a critical voice which scrutinizes museums (Anderson, 2004), and in response, museums have had to give ground not only to maintain the financial support they receive but also to establish their role in the new society (Waltl, 2006). This paradigm shift has disrupted the cultural industries and necessitated a process of rethinking about 'the museum' as a concept, questioning the values and assumptions of museum professionals and those who engage with museums (Anderson, 2004). As expectations of service quality are generally rising, it is recognized that since what a museum provides is an experience, it can therefore also be included within the service industries, and as a result, it must work in partnership with stakeholders to achieve user satisfaction (Waltl, 2006). However, being audience-centred requires a complete understanding of the values and expectations of museum stakeholders, and research is critical in making informed decisions on programs which evolve with the ever-shifting dynamics of society (Waltl, 2006).

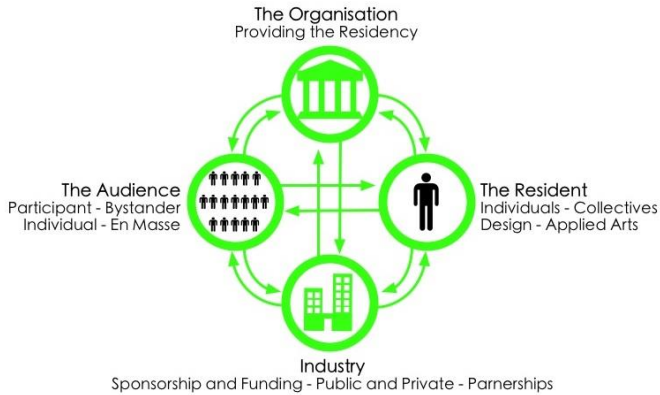

Figure 2 'A New Model for Residency Provision'.

As a response to this disruptive era in the cultural industries, a new model for residencies is required. Figure 2 above demonstrates the integration of project stakeholders into the concept of residency, and acknowledges the need to avoid a linear transmission of resources and information, since each element of the residency should be engaged in the development process. It is this model that will be applied to analysis of the V&A Museum Residency Programme, and which will provide the groundwork for discussion on the value of design to residency programs below.

## Design Thinking in Cultural Institutions

The fast-paced changes in conceptualizations of individuality and society are only slowly beginning to be reflected in the fabric of museums. Institutions have been criticized over this slothful development, and it is argued that museum practices could potentially be more responsive if human-centred design methodologies were introduced (Mitroff Silvers, Rogers & Wilson, 2013). Pitsaki (2007) brought scholarly attention to the fact that cultural product design is an amalgamation of the existing product, graphic, service, experience and cultural design frameworks. In addition, Pitsaki (2010) asserts that design can be used to define cultural organization performance by acknowledging design as the core of cultural product development and as a method to improve services and experiences offered by institutions. This theory is supported by case studies of internationally-recognized museums (SFMOMA, J. Paul Getty and the Queensland Museum)

who have used design thinking and design specific tools (e.g. rapid prototyping and customer journey mapping) to advance organizational practice through social design processes ( Mitroff Silvers *et al.*, 2014; Mitroff Silvers, Rogers & Wilson, 2013). Further still, Rieple and Pitsaki (2011) present a case for strategic design management in cultural products and services, stating that:

*[d]esign can create both a new vision of what the organization 'is' and reinforce and anchors its established 'essence' through the creation of artefacts and symbols that others interpret and use to shape what they do. It may also provide an important element in the implementations of strategy, through focusing on product or service functionality or the creation of emotional or affective bonds (p.2).*

Indeed, design is not only the subject of what a museum communicates to its audiences or how it communicates that information, nor is it simply a way to think about the way exhibitions are curated: rather, it is a way to frame the understanding of the development of cultural products and services, and as an approach to the strategic management of a cultural institution.

## **Methodology: Heuristic Research Placement at the Victoria and Albert Museum**

A six-month research placement at the V&A Museum in London offered the opportunity to gain some insight into the nature and phenomenon of a residency program through use of *heuristic research* (Moustakas, 1990). This type of research can be defined as the;

*search for the discovery of meaning and essence in significant human experience. It requires a subjective process of reflecting, exploring, sifting, and elucidating the nature of the phenomenon under investigation. Its ultimate purpose is to cast light on a focused problem, question or theme (Douglas & Moustakas, 1985, p.40).*

This placement was an opportunity to answer the research question; 'What is the nature and phenomenon of the V&A Museum's Residency Programme?' It allowed this researcher to be immersed in the museum environment and actively engaged in the events associated with the residency.

In addition, nine recorded conversations (the advised method of interviews in heuristic research) with eight individuals were conducted: this included fellow residents as well as those who participated in the residency program from different departments across the organization. The Museum's existing audience development research was scrutinized, and there was an opportunity to engage with visitors and extract the value that the residency program contributed to their Museum experience. This research identified and analyzed the value the program offers to the resident, staff and external networks, as well as the nature of the relationships created between these different individuals and groups.

Heuristic research is a six-phase investigation (Moustakas, 1990), although completion of the phases should not be the goal nor necessarily carried out in sequence, as this might lead to a mechanistic approach. Rather, the purpose of heuristic research is to be directed by feeling, to scope uncharted territory and develop the tacit knowledge of the primary researcher (Sela-Smith, 2002).

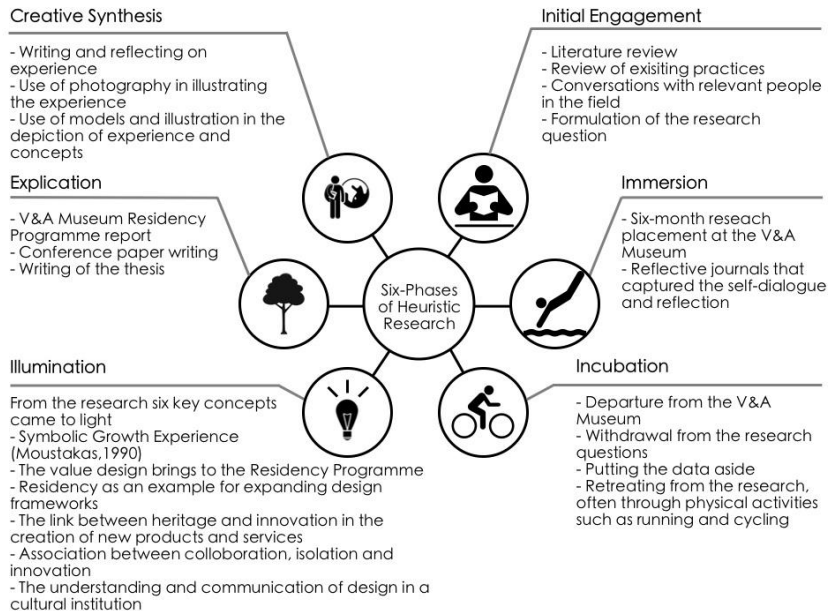

#### Six Phases of Heuristic Research:

- *Initial Engagement* is the discovery of the topic relevant to the researcher's personal values, and one that considers social meaning and significance of a particular phenomenon (Moustakas, 1994). The research question is then formed from the engagement with the subject through 'self-dialogue' and inner reflection on the part of the primary investigator (Moustakas, 1990).
- The *Immersion* phase is the point at which anything related to the question becomes raw material which offers insight into the understanding of the phenomenon. This includes a heightened awareness of one's interactions and environments, and the process includes spontaneous 'self-dialogue' (Moustakas, 1990).
- *Incubation* is the process of removing oneself from the intensity of the immersion phase: the researcher is no longer absorbed with the question, yet growth in understanding is still taking place. The incubation phase is a time of 'silent nourishment, support, and care that produces a creative awareness of some dimension of phenomenon or a creative integration of its parts or qualities' (Moustakas, 1990, p.29).
- The *Illumination* phase is the process that naturally occurs when the researcher is receptive to tacit knowledge and intuition, and is often described as the creative discovery. As Polanyi (1966) states, 'we

know more than we can tell' (p.4), and this is the phase in which the researcher recognizes the knowledge and understanding that has been discovered through the heuristic research process.

- The phase of *Explication* occurs when the researcher attends to their own thoughts to examine what has come to the surface in his or her consciousness, and to examine the layers of meaning that have presented themselves (Moustakas, 1990).
- *Creative Synthesis* is the final phase, and is achieved through tacit and intuitive powers when the challenge for the researcher is to present his or her insights on the core themes and their constituents revealed through the analysis of data (Moustakas, 1990). Often, this awareness (brought about through the research) is presented as a narrative depiction, but visualizations, poems, painting are also recognized forms of communication.

Figure 3 below illustrates these phases and their application to the research placement.

*Figure 3 'An illustration of the heuristic research process for the research placement at the V&A Museum.'*

## The Victoria and Albert Museum's Residency Programme

Derived from The Great Exhibition of 1851, the V&A Museum defines itself as the 'world's greatest museum of art and design'. The founders of the V&A placed creativity at its core, and viewed the institution as a hub for education, with a primary audience of designers and craft makers in addition to the wider public (Pavitt, 2009). The first Director of the Museum, Henry Cole, declared the institution 'a school room for everyone' (V&A, 2014), and since its inception, designers have played a prominent role in the establishment and development of the institution. They have always maintained a presence by working on V&A premises for most of its history: for example, the renowned designer and painter Godfrey Sykes was the in-house 'decorative artist', and managed the Museum's design studio from 1860-1866 (Marsden, 2013).

This fundamental organizational principal still exists, yet it is recognized that externalities will have an impact on the way this translates into the service the V&A provides.

*The V&A was conceived as, and continues to be, an engine room for the creative industries, but how does that conception translate into reality? What, one might ask, can a museum do that is relevant to a twenty-first-century economy? As we shall see, it can help designers by providing inspiration, learning, and access to technical expertise, and by giving them a showcase; it can create communities and networks of students, designers and manufactures; and it can influence public taste, thereby affecting patterns of consumptions and production. (Holden, 2007 cited in Pavitt, 2009, p. 93)*

This notion is further reflected in the Victoria & Albert Museum's Strategic Plan 2011-2015, which states that the objective of the residency programme is '[to] promote, support and develop the UK creative economy by inspiring designers and makers, and by stimulating enjoyment and appreciation of design' (V&A, 2011, p.12). This illustrates the continued interest the Museum has in maintaining a strong relationship with the design community, and also suggests that the residency is an essential part of the operational intent of the whole organization. If the residency is part of the business model, and 'the business model is like a blueprint for strategy to be implemented through organisational structures, processes, and systems' (Osterwalder & Pigneur, 2010, p.15), the residency therefore

becomes part of the strategic objective of the organization. This is crucial, as the research identified the prominence of strategic design in the process of planning and managing the Museum's Residency Programme.

The Victoria & Albert Museum Residency Programme has been running since 2008, and is an integral component to the Learning Department, assisting in creating a dynamic, creative museum. Since its inception, the Museum has hosted over twenty individuals or collectives working in the areas of design, craft, architecture and visual art. The programme offers residents the opportunity to develop new work, re-assess their practice or see work in different context by responding to and working with the V&A collections, using the Museum's resources to promote greater understanding of the creative process for the public. The Residency includes a research and development phase which enables the resident to consider new directions for their own work, as well as work with the collections and plan participative projects with the public. There is no expectation that a completed body of work is made during the residency period: however, the position is offered on the understanding that the resident allocates at least one third of their tenure to assisting the Learning Department in developing programs and events for visitors to engage first-hand with the process of creativity. Such activities include, but are not exclusive to: open studio sessions which allow members of the public to enter the residency studios and discuss the design process; workshops with invited school groups from primary and secondary schools from the London area (which can span two to four days at the Sackler Centre, but may also be broken up so that the resident works with the groups over two months); evening workshops with teachers or those working in higher education; leading activities during special events at the V&A (i.e. the yearly Sackler Conference).

The research placement coincided with two six-month residencies: a Games Design Residency and a Ceramics Residency. The Games Design Residency was the first of its kind hosted by the Museum: the resident was allowed six-month access to one of the residency studios at the V&A, with a further two-month production period in Dundee with the residency partners, the University of Abertay and the V&A Museum of Design Dundee. The production period was intended for a game based on the British Galleries of the V&A Museum and was to be developed as part of the residency. However, this expectation of a new design product is unique, as it is not normally required of the residency program. The Ceramics Residency was part of an ongoing residency program for ceramists located in the

Ceramics Galleries of the V&A Museum, and this program was specifically for an early career ceramist.

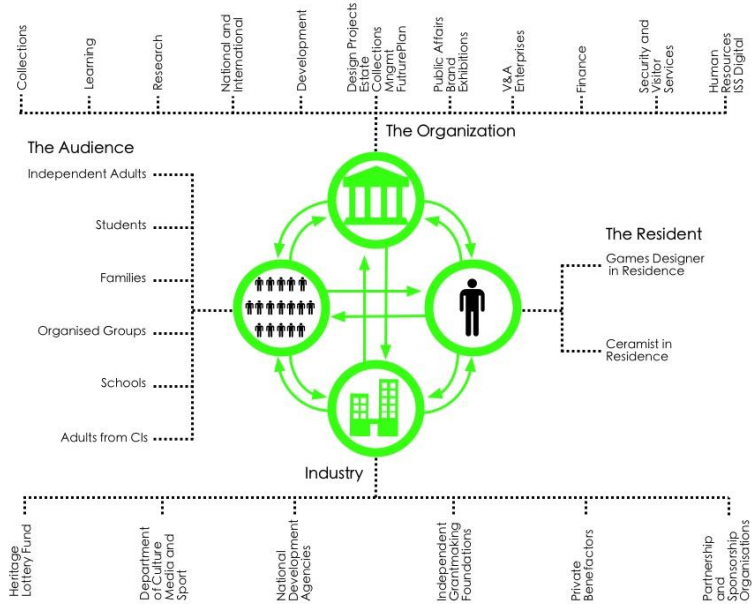

## Insights and Discussion

Using the residency model proposed, the research allowed for the complexity of the V&A Museum's Residency Programme to be mapped out (see Figure 4). In the illustration, the institutional departments of V&A organizational structure have been identified. As previously stated, the residency is situated in the Learning Department: however, the residents are allocated a curator from the Collections Department, and often have a lot of interactions with other members in different departments.

This model also illustrates the six definitions of key audience groupings as defined by the V&A Museum: independent adults, students, families, organized groups, schools and adults from the creative industries (Fritsch, 2008). This presents an interesting dilemma in thinking about the residency from a design perspective, as it becomes apparent from observing the residency programme that there are two varied *users* of the service. Firstly, the resident is a user who is given the opportunity to work within the institution and use the facilities and resources to develop new work, and secondly is the Museum's audiences in all categories. However, it is primarily the intention of the Museum to have the program as a means of attracting and engaging new audiences, who form the second group of users. The Museum's Residency Programme shares this tension, since although the resident is the primary actor of the service, in an echo of the *Interpreter Model*, he or she also becomes the conduit through which creative endeavour is communicated to visitors.

*Design For and Against Disruption: A heuristic inquiry into the Victoria and Albert Museum's residency programme*

*Figure 4 'A Stakeholder Map of the V&A Museum's Residency Programme using the New Residency Model'. This visualization offers insight into an alternative way of exposing the system and evaluating the design development of the residency.*

In this context, this residency views the designer in a similar way to other organizations who have shown an increasing understanding of the value of designers: namely, that the 'designer formerly seen as an external actor for the differentiation of the firm becomes an internal actor in the building process of core-competency through the differentiation of innovation process' (Borja de Mozota, 2003, p.93). As argued by Borja de Mozota (2003, 2006), there are four powers of design which create value in management, and these powers are the axes from which to evaluate the system of the organization; these are *design as differentiator*, *design as integrator*, *design as transformer* and *design as good business*. Using these four powers of design, the following is a discussion on the value of design transferred by the residency to the Learning Programme of the wider organization<sup>51</sup>.

<sup>51</sup> Due to brevity a full evaluative discussion of the research is not proffered in this paper. Instead it offers insight into how Borja de Mozota's (2003, 2006) four powers of design theory is

### *Design as Differentiator*

Hosting a designer to work in-house and engage with visitors is a source of competitive advantage for the V&A and can be considered a USP for the Museum. The program has been developed and is geared towards a customer orientation. It provides key audience groups with an opportunity to be a resident (and gain access to the Museum as a source of inspiration and development in their practice), or a visitor (to view a studio or speak with a resident to further understand the process of creativity). As one research participant explained in conversation:

*The residencies are an amazing opportunity to understand somebody's process or somebody's practice, and if we can get students experiencing that in the truest sense, then that's what we want them to be able to do. To come in and follow a similar process to what the designers are doing... obviously you can't completely replicate it, but it's allowing them to have that room to explore in a similar way to the way the residents are working with the collections.*

*(Conversation 5)*

As an approach to differentiation, design considerations exist in the election of an individual for the residency position; someone who is open to exposing their practice to visitors is at the forefront of the decision making process. As can be seen from the comment below:

*We need to have a balance between somebody who is an exciting practitioner and a practitioner of a high standing, because we are an international museum. We need good people and interesting people, but we also need people who are going to relate to our audiences, who are going to be able to communicate with them and who will give our audiences something interesting to engage with.*

*(Conversation 9)*

Having a resident present – visible and accessible – is perceived as vital in maintaining effective strategies in transmitting information from the Museum to audiences, specifically in providing an interpretation of the creative process. This is an existing objective. Yet, as design domains are expanding, and practice is morphing into new forms, the demand to have a

---

applied to the V&A Museum's Residency Programme, and we consider how this may make a contribution to the concept development of a new service for an emerging design museum.

designer who can communicate the general subject complexities of design to the Museum's eclectic mix of visitors becomes increasingly important. This knowledge, skill and capability may arguably have greater significance in future design, selection and delivery of a residency.

### *Design as Integrator*

Based on the notion of design as a resource that improves new product development (Borja de Mozota, 2006), the contribution made by a designer-as-resident to a Learning Programme, and the overall engagement program of the Museum, is crucial. They tend to work with staff in the Learning Department to develop products (i.e. talks, events, workshops and/or resources) that are intended for visitors to use and actively engage with the V&A building or the Museum's Collections.

At V&A London, residencies are always themed by a certain type of practice, and apart from the Ceramics Residency, there is never a repeat of a specific practice. For this reason, the resident can disrupt the thinking or actions of the institution, and this new perspective can assist in the development of product or service for the Museum.

*I have been here quite a long time so I feel like I know the collections, or you develop your own way of understanding them. But then you bring in another person, another way of thinking, another process, and it allows you to rethink it and not to get really settled in one way of looking at things, which could be really easy to do. But then, because you have four to five different people every year that are making you look differently at things, it really helps in that sense, and that is obviously going to feed through into everything else that we do. We also work with teachers as well in the V&A Sanctuary Programme. Quite often they are delivered by the residents, and that aspect is really important. It's opening up teacher's ways of responding to the collections and ways of thinking in relation to design [...] This gets them to think really differently.*

*(Conversation 5)*

Design as an integrator in this experiential context is as a relatively neutral facilitator between past and present creative practice; inspiring and teaching educators to see and understand alternative approaches to working in a contemporary fashion with the asset (that is the V&A Collections).

Another example of ‘design as integrator’ can be seen in the way a resident can offer value to the organization through the creation of a resource object (see Figure 4). The object depicted in this image is a ‘Museum Trail’ intended for families. The Trail was developed by the Ceramist in Residence, and is themed around the subject of focus for the residency; namely, the building’s architecture and the hidden histories of the Museum. There were 5,000 copies of the trail printed, and it is currently one of three permanent trail activities provided by Learning to the Museum’s visitors. Since there is no obligation for a resident to present an exhibition of the work they create while in residence, this resource object is quite unique inasmuch as it is an artefact designed by the resident but intended to contribute to the ongoing development of the Learning Department services on offer to audiences.

*Figure 4 ‘A Resource, The Undiscovered Museum: V&A Family Trail’, developed by the ceramist-in-residence during their residency tenure. This activity is handed out to visitors of the Museum, and the intent is for a visitor to use it to explore overlooked areas of the galleries’ architecture.*

V&A London is an organization with over 700 staff and 12 departments. Based on initial findings from this heuristic study, there is scope to further

explore the value of design as integrator in the residency program beyond the Learning Department and into other areas of the Museum. In particular, the application of service design and systems design in the wider organisational framework is an interesting and uncharted territory, offering a potential to further enhance the level of innovation in organizational practice and experiment with new internal collaborative partnerships nurtured through design.

### *Design as Transformer*

The application of design as transformer verifies the importance of strategic design in the process of planning and managing the Residency Programme as it is one of few parts of the Museum's program that is subject to change, and can reflect the interests of the external environment and fluctuations in the sociocultural landscape. For instance, the Games Designer in Residence project was one of the first of its kind: indeed, only the University of California in Santa Cruz had previously offered a residency to a Games Designer (Stephens, 2012). The Games Designer in Residence program attracted national attention, causing a media stir that saw it featured in *The Guardian*, *The Independent*, *The BBC Breakfast Show* and many more news and online reporting platforms. The residency was devised during a period of increased interest from the Museum on the subject of 'digital' arts. The V&A Museum is currently increasing their collection of digital artefacts, and in August 2013, they hosted a Friday Late Event themed to the internationally recognized digital game *Minecraft* (Reynolds, 2013). This residency is part of the Museum's public actions to reflect a notable change in the times, and to evidence the fact that the Museum is responsive to topical interests, a key feature in design as transformer (Borja de Mozota, 2006). This strategic approach to design management is further discussed in the extract below, in which the interview participant explains how the Museum's Learning Department pursues new residency opportunities to capture increased interest from the Museum's audiences and non-audiences alike.

*Strategically, the aim is always more visitors engaging with more residents, and I think there is just such a wealth of disciplines [...] there are loads of disciplines that we haven't even touched yet. I think we are a long way from running out, and I think strategically we want keep on supporting Museum priorities, be that a major gallery opening like Europe, or big exhibitions, or collecting digital like the*

*way the Contemporary Team is now collecting digital things. For example, the Exhibition Road Residency Programme... the second residency is going to be XXXXXXXXXXX, so strategically that is lining up with the way that the Museum's collecting interests are going, as well as being aligned to a big project, so strategically you are always trying to hit as many targets at once, and have one eye on the public program.*

*(Conversation 9)*

This evidences the strategic design of the V&A Residency Programme, in which it is intended to discover new disciplines in an effort to build relationships with potential new visitors whilst simultaneously capitalizing on what exist in terms of shared resources and audiences. Understanding this method of employing design as a tool for transformation in the residency program offers new insight into the development and delivery of this service, specifically in regards to managing an evolving programme.

### *Design as good business*

*I think the Museum gets a lot out of the residents. I think it gets good value for money... what they provide, compared to what it costs, seems to me good value.*

*(Conversation 6)*

The Residency Programme offers the Museum an opportunity for new information on a certain discipline of design to be integrated into the Learning Programme and the overall organization. The Games Design Residency offered further added benefits to the Museum in addition to the resident working within the institution. As part of the residency, the games designer was expected to create a new game inspired by the British Galleries, and these galleries were the first to be renovated as part of the Museum's renovation strategy, 'FuturePlan'. The Games Design Residency gave the galleries a new lease of life, since the game that was created was based on a William Morris' Strawberry Thief printed fabric which the visitors were encouraged to visit to see the designer's inspiration after they had had the opportunity to play to game prototype (see Figure 5).

The benefits for the Museum in this instance was the new game, which is good promotion for the British Galleries, and its production, which was good value for money as the resident was an early career games designer and the residency cost a fraction of the normal price of commissioning a game from

a games design company. It also allows for the V&A to increase brand value by supporting a future iPad game and entering into the gaming industry. By the same token, the resident capitalizes on the association with the V&A brand to increase product exposure. This system of patronage could be developed by the Museum with an exploration into other disciplines and the mutual benefits shared by organisation and residents. This research verifies this exchange between organisation and resident, an important element of any residency program and may be used for scrutinizing future advancements in a reciprocal and mutually supportive relationship.

*Figure 5 'A young visitor plays the Strawberry Thief game prototype during an Open Studio session at the V&A Museum of Childhood'. Next to the game is a book of the works of William Morris, and the image on the page is a representation of the printed fabric that inspired the game.*

### *Future Implications*

This research conducted at the V&A Museum in London is part of a doctoral project that is sponsored by a future museum, namely V&A Museum of

Design Dundee<sup>52</sup> (V&A Dundee, scheduled to open in 2017<sup>53</sup>). The doctoral study sits within a larger partnership between the University of Dundee and V&A Dundee and the residency research was initiated in 2010-12 by Duncan of Jordanstone College of Art and Design researchers drawing (in part) on their research (2005-10). The insights gleaned from the placement and the tacit knowledge developed by partnership research, offers an opportunity to contribute to the concept development of new products and services of an emerging organisation. This new knowledge will be delivered to the Sponsor as part of an ongoing knowledge exchange process. Specifically, the research aims at structuring a theoretical framework that will be able to inform the development of a new residency program.<sup>54</sup>

# Studio Design and the Management of Creative Production

Jonathan M. GANDER<sup>\*a</sup> and Alison RIEPLE<sup>b</sup>

<sup>a</sup> University of East Anglia; <sup>b</sup> University of Westminster

*This paper examines the design of recording studios in the management of relations within popular music recording projects. The creation of a pop song is a complex endeavor, requiring a large number of decisions involving highly subjective and often contested and contestable judgments. Organized in a flat structure and without established lines of authority this temporary assembly of people are faced with the challenge of making a product characterized by uncertainty over how to make it and what it will sound like once it is completed. The purpose of this paper is to understand how this is achieved. The study is based on observation of the practices, and relationships operating in a recording studio and supplemented by interviews with the participants. Using a socio-material approach, the spatial organization and use of technological objects are included to produce a contextual analysis of how actions are organized and decisions taken. What emerges is an understanding of how the designed arrangement of the participants and the application of sound production and editing technology are used to manage the development of the song and confer decision-making authority upon the music producer. When the spatial organization of the participants is altered by the introduction of new technology and new spaces, the decision-making power of the producer is challenged and artist power is increased. The management of creative projects is achieved through establishing spatial and material relations in order to overcome the challenge of making decisions between temporarily assembled teams engaged in tasks characterized by high levels of uncertainty.*

## **Introduction**

Project-based organizing is a common feature of production practices in the creative economy (Hodgson and Briand, 2013). A growing body of work is engaged with the challenging task of explaining how ideas are transformed into products, with studies on, for example, advertising (Moeran, 2009) film (Ebbers and Wijnberg, 2009), television (Antcliff, et al, 2007), computer games development (Cohendet and Simon, 2007), popular music (Lingo and O'Mahony, 2010) and the performing arts (Sedita, 2008). Shared across these studies is the attempt to account for how these temporary and uniquely assembled creative projects manage what are termed the nobody knows and infinite variety conditions of creative production (Caves, 2000). Namely the requirement to co-ordinate a range of protagonists with differing, possibly inimical interests, in a highly uncertain production processes to create products with largely aesthetic, ambiguous qualities (Caves, 2000; Townley et al, 2010). The contribution of this paper to the examination of these questions is to include the role performed by the physical setting of the project, the rooms, spaces and material objects with which and through which the management of a project is carried out (Callon et al, 2002; Latour, 1992; Orlikowski, 2007). This analysis of the socio-material design of project relations produces a different portrayal of their construction and reproduction and offers an alternative explanation for how creative projects are managed.

## **Managing creative projects: by fiat or finesse?**

A commonly proposed explanation for how creative projects are organised and managed is based on the use of contractual power supported by economic capital (Tschmuck, 2009). This application of contractual power is frequently justified by the conflicting interests of art and commerce, between the aesthetic approach of the artists, and the market orientation of the record label (Stratton, 1982). Though arguably overdrawn (Jeffcutt and Pratt, 2002) and undeniably something of a cliché (Frith, 1991), the emotional character of the project (Svejenova et al., 2011) plus differences in experience, attitude and resources have the potential to create conflict. However, the application of contractual power to overcome such contests should they arise is of questionable effectiveness. High profile cases such as those involving George Michael and Prince attest to the ability of artists to resist if not the letter of the contract then its spirit and in so doing weaken the commerciality of their product (Stevenson, 1994; Till, 2010). Further examples of the failure of contractual power feature bands such as My Bloody Valentine and Guns and

Roses, who took years to complete their albums and cost large unplanned sums of money in the process (Leeds, 2005).

Given the weakness of contractual power over creative projects, accounts that focus on the skills of the project manager offer a more promising explanation for how these difficulties of producing creative product and organizing creative individuals are overcome. In these studies, the project manager is described as a highly skilled individual able to weave together different interests (Simon, 2006) and judiciously resolve conflict (Lorenzen and Frederiksen 2005). In the case of popular music the project manager is the music producer. These, mostly freelance individuals, are hired by record companies to create musical product from their artist or group's demo (demonstration) song and deliver a marketable product to the record company.

Existing research into the project management practices of music producers reveals how they handle the ambiguities and emotions present in creating musical product by fostering generative relationships, building creative capacity and generally acting as a broker for the different ideas and perspectives that surround the decision making process (Hennion, 1989; Horning, 2004; Lingo and O'Mahony, 2010). However, though this work advances our understanding, there is a danger that the management of these creative projects is portrayed as an overly social and cognitive achievement. Framed by analysis that describes and explains the work of the creative project without sufficient attention being paid to the contribution of the physical environment and material objects through which, and in which, the project, and the skills of the project manager are carried out. The spatial arrangements of people and the objects they engage with to complete their tasks are key to understanding how organizing occurs, as organizing is fundamentally a practice of boundary drawing and role allocation (Hernes, 2004; Clegg and Kornberger, 2006). An indication of the potential value of including the role of material objects and spatial arrangements in the analysis of the management of projects can be seen in Lingo and O'Mahony's study when the authors discuss access to what is called the talk-back button – a switch that enables those in the live or performance room/booth to talk to those in the control room. They describe how the producer controlled access to the button and thus restricted the amount of open challenges that could be made on their decisions. Enabling the music producer to manage the conversation and effectively end debates, or at least restrict them. The button's part in the recording project's operation is revealing and suggestive, for it brings into view other objects and materials of the studio. What of the

organization of rooms in the studio, the computer displays, recording desk and audio software, the microphones and speakers? What part do they play in explaining how the project is organised and the project manager exercises his/her skill? Exploring these questions and identifying previously implicit or silent contributions of the material world to the management and organization of complex projects is the objective of this paper.

## **Research method and approach**

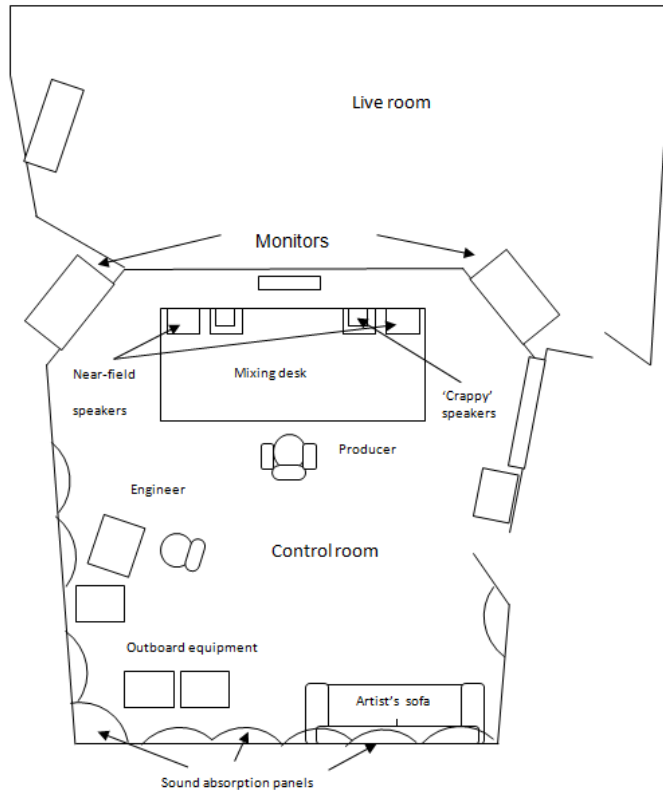

Including the material in an analysis of human interaction requires treading a fine line between two extremes, social-constructivism and technological determinism (Leonardi and Barley, 2008). Between the treatment of the material world as a set of tools to be manipulated by their users, and its opposite, gifting the object agency and thereby transforming the user into its tool. Both perspectives obscure interesting relationships between actions, the people who do them and the things they do them with. A socio-material approach offers a way of analyzing these relations between people and the objects that accompany their work by avoiding privileging either humans or the material world and treating them as mutually constitutive (Orlikowski, 2005; Suchman, 2007). In this orientation, the study of organizing requires conceptualising human relations as designed heterogeneous associations where the doing of an activity is an inseparable part of the material arrangements through which the doing occurs (Schatzki, 2005). Research informed by a socio-material perspective on human agency therefore needs to study actors, such as the producer and musicians of the recording project, as hybrid entities that achieve their agency by their position within a network of relations between other people and objects (Latour, 2005).

In addition to the richer picture of how organizing and the skills of management are carried out, a human-material perspective is well-equipped to examine the effect of the introduction of new technologies to working relations in an industry. This is because the constructivist view that it is people's interpretation of technological objects that is important has the effect of removing the technology being examined from the study of its effect (Markus and Silver, 2008, Orlikowski, 2009). While a technologically deterministic perspective focus reduces the ability of the analysis to consider the contest for power that follows the new outcomes that are made possible by new technology. A socio-material approach argues that the social and the material are intertwined and by examining the relations of people as a fusion

of the material and the social we are better equipped to address the question underlying study of technology – how it “works” (Leonardi, 2012).

Data were collected using a combination of participant observation (Gold, 1997) and semi-structured episodic interviewing (Flick, 2000). During the recording project the researcher visited the mid-sized professional recording studio in London where the project was taking place and sat at the back of the room while the engineer, producer and artists performed, recorded and mixed the song. To support notes taken during the sessions, photographs were taken and layouts of people, objects and rooms were made. A total of 5 hours of observation were supplemented by 24 interviews with music producers, engineers and artists. This mixing of observation with in-depth interviews allowed the researcher to situate the practices being described and witness human-material relationships that could sometimes be missing from the interviewee’s accounts of what they do and how they do it. Through this combination of observation, visual records and transcriptions of in-depth interviews, themes emerged from a step-wise coding process that identified and explained the composition and character of the various relational arrangements between the protagonists.

*Figure 1 Schema of the commercial recording studio layout*

## **Separation and control: the physical layout of the studio**

Studios are divided into two connected rooms, the live room and the control room. The live room, where the artist performs is a highly managed space involving intense scrutiny of the occupant. Recording involves dividing the song into individual or performances or tracks (percussion, guitar, vocal etc.), which are then subjected to scrutiny, adjusted and changed, before being recombined (mixed) to reform the song. In the process the artists are separated from each other, and indeed from the song as a whole, in order to provide the producer with the means to adjust and change the performance.

To obtain 'clean' capture of the individual performances, performers are placed close to the microphones often with additional screens placed round them to prevent the reflections of the room being captured. This is because if the microphones picked up reflections of the room, or the sound of other instruments, then it makes the later manipulation of the recorded performance more tricky as changes made would not only affect the instrument's sound, but the other sounds that have been recorded. Performers described the live room as 'clinical' and 'imposing', with red lights to indicate action, and an ever present concern that a noise (the creak of chairs/the knock of an instrument on a microphone stand) or a slight error in a note would make it onto the recording and contaminate the material. The live room was not viewed as a creative, expressive place:

*It's fun when you are performing (live), and fun when you are rehearsing, and then not so fun in the recording studio (artist)*

While the live room, where sound is discrete and the musician performs is a space of discipline and capture, through the observation window and into the control room and the producer, a very different organizing logic is in operation. The control room with its angled walls and carefully positioned speakers, or monitors, manages the reproduction of sound within the space, not to isolate and capture single instruments but to facilitate analysis of the sound of the performer during recording and when it is mixed with other tracks. Unlike the performer, the producer is faced with as a range of monitors that enable them to hear different representations of the sound. The control room is thus a place of analysis and decision making and the live room one of performance. This was demonstrated during observation and in the accounts of the protagonists of how disagreements between the artists and the producer over the quality of the performance were resolved. In these instances producers called the performer into the control room and organised A/B comparisons between different tracks or between tracks with different sound effects:

*If they rebel and I believe they are wrong, I'll play it to them and I'll show them and they'll go, "Okay. Yeah, I can see that". (producer)*

This use of the decision making properties of the control room is part of the spatially constructed power of the producer. In the control room they can hear all the tracks as they are recorded, identify desired changes and formulate an argument before bringing the artist out of the live room to

secure their agreement. A further spatially mediated aspect of the control rooms adds to this control over production decisions. There is a specific 'sweet spot' in the room, an area of the room where the full range of frequencies can be heard. Though the boundaries of this sweet spot vary, it is focused on the centre of the mixing desk where the producer's chair is positioned. Outside this zone, variations in sound were marked. One producer described walking around a studio he was about to work in to see when different frequencies were 'lost', not audible in a particular part of the room. This means that one's ability to evaluate the song and thus participate in decision making is not equally distributed around the room. All spaces are not equal. This is epitomised by the case of the studio couch. Each studio invariably has some kind of large couch placed against the back wall, and this is where visitors and musicians if they want to listen to the recordings, sit. However, sitting here changes one's experience of the sound of the song, as a producer described:

*Downstairs in Studio 1, if you sit on the couch there's lots of bass, because the room's tuned so when you are sitting at the desk you hear what's right. So when musicians come in and sit at the back they go "Wow, that's a lot! Bass is a bit loud isn't it?" So you have to say, you know, "It's fine".*

So not only is there a role creating spatial division based on sound management between the live room and the control room, but there is a further division of agency within the control room itself. An additional example of separation and control, with artists and other project participants being physically separated from the representation of sound needed to make judgments about the quality of the performance or the emerging mix.

The spatially mediated division between performance and analysis, live room and control room, sees the producer engage in intimate social management of the artists. It is a position that allows producers to be either very demanding, describing themselves as a task master, and or encouraging and supportive, with producers saying they sometime lie, say a performance was good but could they try it one more time? The pursuit of the desired performance can take many hours with musicians playing their section again and again. This requires endurance on the part of the performer but also on those listening:

*There's nothing worse than listening to drums on their own. It's the most soul destroying things in the world. No matter how good the drummer is...it is boring. (artist)*

The response of many artists in these situations is to flee the control room to recreational spaces in the studio where pool tables, table football, TVs and computer games help occupy their time until the producer recalls them to the live room. These distraction spaces within studios thus help to separate and organise the participation of the project participants. From the different treatment of sound in the live room versus the control room, to the studio couch and the pool table, the picture that emerges is of a spatially mediated performance of decision making and control. The next section considers the contribution of some of the objects inside the studio, the recording desk, musical software and the speakers to the operation of the producer's project management skills.

### *Fixing it in the mix: Sound and decision-making*

Once captured, decisions over which tracks to use and how to use them are made using a judgement on how something *will* sound once it is adjusted, given sound effects or placed within the range of tracks that will eventually make up the song. An example of this was provided when a backing vocalist was brought in by the producer to contribute to the song. The lead singer of the band described the performance as poor and unsuitable for the song and was surprised to hear the producer congratulating the singer. Once the singer had left, a discussion between the artist and producer over the quality of the recorded track followed. To resolve the issue the producer demonstrated how, by adding an effect to the voice and then placing it in with the rest of the recorded track, the contribution was actually very suitable. To the astonishment of the artist: 'I could have fallen off my chair, he just understood this guy's voice and how it could fit into the song'. This 'fix it in the mix' judgement heuristic restricts the ability of artists to make quality decisions during the development process. It also enables the producer to cut short debates amongst the project participants when there is a risk that they are turning into disagreements that could damage working relations, an ever-present danger in 'projects of passion' (Svejenova et al, 2011).

Unable to hear the sound as the producer can, uncertain how the performance will be changed with sound effects and unclear how the track will fit with the whole song, the artists appear enrolled in the producer's systems of calculation and measures of quality. This is the case with the

judgement over the timing and rhythm of their performance. Without the other members of the band providing the means to keep in time with each other, the performer is supplied with a click track by the producer. Set to the desired tempo, a noise is sent to the performers headphones to allow them to hear a tempo beat out during their performance. Though editing software is available to make adjustments to the timing and tempo, if the musician is too far out then the adjustment may be noticeable. The use of click tracks helps transform the music of the artists into raw materials for later manipulation by the producer. As it allows the different tracks to be lined up and merged together, a task made extremely difficult or impossible if there are variations in tempo. In this sense the performers perform the agency of the producer. Their provision of unadulterated, rhythmically disciplined recordings of elements of the song allows the producer to make changes to the sound and arrangement of the song. It also transfers the timing judgement of the artist to that of the producer. The resulting power was used by producers to sculpt the sound characteristics in the desired fashion, as the producer described: 'These parts are great, now we can move onto making them sound how we want'.

With the tracks having been recorded in the required 'clean' way, producers can apply a very wide range of sound effects and treatments to change the sound of the overall song into its desired form. This control can be exercised in different ways. In extreme cases, sound qualities can be imposed. Here is one artist describing what can happen:

*"Oh well, you're in an Indie band" [the record label managers would say], so they would go and listen to that week's crop of top bands like Lush or Ride and that's who you'd sound like at the end of the session, whether you wanted to or not.*

In other cases producers explained how they would carefully try and balance the requests of the record company to make a commercially suitable sound while also ensuring that the artists still feel it is their song with their musical or cultural values:

*Obviously, if you try and make it blatantly pop and not in the direction the band wants to go in, then they'll resist that. So it's a question of bringing in some of their personality and yet delivering to the label what they need.*

Another contributing object to the producer's decision-making abilities is the range of monitors or speakers in the studio. These speakers can be used to defend the producer's choice of sound treatment if questioned. During the mixing session the artists questioned whether a particular track favoured by the producer was the best. In response the producer fed it through the large speakers, and in comparison to the smaller sound of the desk speakers that we had previously been listening to, the sound of the track was indeed impressive. There were large smiles all around the room and the producer carried on. Other producers described using the pleasurable effect of volume on visiting record company managers who were reassured that progress was being made once they heard the mix at high volume through the wall speakers. Another type of speakers provided a way of connecting the studio and the product creation process to the outside world. These were universally referred to as 'the crappy speakers', with one producer describing how the foam the object was resting on was probably worth more money than the speaker itself. These cheap speakers were used to test whether the designed sonic qualities of the song survive when the sound is reproduced by the poor quality speakers in a phone, car radio, or computer.

Observation reveals that the management of a popular music recording project clearly involves the spatial design of acoustic spaces and relationships supported by various objects that help discipline and divide roles between the creators of the music and the producer of the song. This, plus the accompanying 'fix it in the mix' decision heuristic gives the producer a privileged ear on the emerging song, granting decision-making power to ensure that the song has sufficient commerciality by being comparable with genres or with currently successful music. Yet the sites of this spatially enabled project management skill are under threat. The availability of less expensive digital recording software and reduced industry revenues following the digitalization of music product (Leyshon, 2001), is connected to the closure of some well-established, large studios closing (e.g. Townhouse in London, and the Hit Factory in New York) and the appearance of new spaces in which to manage the recording project – the project or home studio (Leyshon, 2009).

### *Project studios and the 'eye versus ear' contest*

Project studios preserve or attempt to preserve the division of space of the commercial recording studio, there is a control room with a mixing desk, computer with editing software and various sound effect modules, and a live/performance room. However project studios are a world away from the

red lights, heavy sound proofed doors, acoustically treated rooms and banks of blinking lights and dials of the commercial studio. Their domestic location or simply the amount of time spent in the room by the producer, results in a much more informal, personalised spatial design. Studio rooms are reached not by going along hallways lined with gold discs, and signed photographs of music stars as is common in commercial studios, but uncollected post and children's drawings. These symbolic differences help shape the relations between the artist and the producer, which, depending on the performer, was viewed by producers as a help or a hindrance. Sometimes the relaxed space helped improve the performance of the artist, and on other occasions the producer missed the formality of the commercial studio that could be used to usefully 'intimidate' the artist and 'keep them on their toes'.

Though there is a superficial similarity in layout, constraints on space available and the construction of the rooms are different and this introduces a physical difference to the organization of tasks within a project studio. In project studios the performance room is very small, usually space enough for only one person, and has a small door with a window in it to connect to the control room. The control room walls are not angled and the room is not tuned to provide an even representation of sound frequencies. The performance room connects directly with the control room and this, plus its confined nature, means that the performer crosses the boundary between performance and analysis by simply opening the door and stepping out. In some instances the boundary is completely abolished, with the performer playing their instrument in the control room connected to the amplifier that sits alone in the performance room. The microphone picks up the sound from the amplifier and returns it to the producer and artist in the control room. The spatial arrangement of people and sound has now been reconfigured. The producer and the performer are joined and with the absence of a sweet spot, can hear the same sound. In this way the artist joins the producer in the inspection and evaluation of their performance and sound.

A further challenge to the division of judgement during the project involves the visual representation of sound produced by software packages such as Pro Tools. Visualized sound in the form of gridlines, curves, colors and graphs provides a challenge to the subjective, aural judgments of the producer. The forensic level of detail enabled by digitally representing sound can reveal previously undetected errors, or slight deviations from pitch and timing that were not picked up by the ear. The producer, perhaps mindful of the challenge to his decision making authority, warned the artists not to let the software influence them as attempts to increase accuracy could

sometimes lead to the performance sounding 'rigid' or 'lifeless'. Something he did a number of times when artists asked to see the screen to see if they were out of tune.

In the tighter space of the project studio, the lack of distraction spaces (e.g. ping-pong tables), and a blending of performance and analysis in the less delineated control and live room configuration, combined to enable the artists easier access to the computer screen's visual representation of sound. Producers described facing such graphically supported queries over their decisions and responded by denying the validity of the information: 'I don't look at the screen to tell me that it's right. If I hear it is wrong, then it's wrong and I don't care what the screen says'. Some producers described turning off the screen if they saw the artists looking at it, though because digital files are portable and the software to read them is relatively inexpensive, artists could take the recordings home and analyze the performances themselves. The genie is out of the bottle, and the means to challenge the 'golden ears' of the producer is always available.

## Conclusion

This research has explored some of the spatial and material relations through which the complex task of project organization within a creative industry is achieved. Observation of how popular music product is created has revealed how the design of physical spaces of the project help assign identities and associate them with particular practices that then enact the relations between the occupants. A range of new participants in the creative production project have been identified, the enrolment of which aid the management of the project - the tuned control room with its producer's chair and artists' couch, the ping-pong and table football tables, the red light, the crappy speakers, and the gridlines, curves, and dots of sound on a computer screen.

What becomes especially clear when reflecting on these findings is the importance of the body in the construction of agency (Reckwitz, 2002). The studio is an arrangement of bodies, of placing people in particular areas within the studio that are configured materially and symbolically with particular roles. The design of the studio thus enables a rapid formation and delineation of roles between the project participants, a facility that is extremely useful for temporarily assembled teams, working together without an established hierarchy in limited duration projects. The regulatory effects of space are also a benefit when the roles within such creative projects are fluid

and overlapping. The producer manages the budget of the project that is funded by the record company and paid for by the artists. The product is made up of the music performed by the artists, and the sound created by the producer. This blurred set of responsibilities and contributions when combined with the 'nobody knows' and 'infinite variety' characteristics of the process and product, endangers the project. In these circumstances the specialised circumscription of roles offers a way of organizing interactions and stabilising relations necessary for successful project management in the creative industries (Hernes, 2004). The importance of this embodied view of agency is demonstrated when the action moves to project studio spaces. In these more constrained spaces the squeezed design of the studio, the occupational jurisdictions of the producer and artist 'overflow' (Callon, 1998), and relations are reconfigured. In this situation producers needed to work much more collaboratively with the artists, though still used the 'fix it in the mix' rationale to forestall decisions and then ask the artist to come back once he had finished – to hear the final result. The increasing use of artist-producer credits on songs is recognition of these overlapping identities enabled by the different spatial and material settings of their relations.

A further insight into the management of creative projects concerns the particular skills of the project manager of creative products. As mentioned previously, accounts of these highly skilled individuals focus on the important activities of connecting or brokering between disparate people (Lingo and O'Mahony, 2010), sense-making (Simon, 2006) and establishing common grammars of interaction (Cattini et al., 2011). In addition to suggesting a more spatial and material, rather than cognitive, conceptualisation of how these outcomes are reached, this paper extends these tasks beyond the project to include the market. Producers broker, sense-make and establish common grammars not just between the project participants but between the project and the market, between the creators and the consumers. This is achieved by transforming the music of the artists into 'raw materials' so that sound creation and management techniques can be applied and the market qualities of the song established. That the preservation of the designed qualities of sound when released into the market was achieved with the aid of the crappy speakers, is a useful reminder that seemingly humble objects used within organizing can have a key role to play.

Also important to the successful management of creative projects is the way decision-making is organized. As Lingo and O'Mahony (2010) observed, the skill of the project manager lies in how they absorb challenges to their decisions or judgement. Though under greater pressure when carried out in

the project studio, this research has identified how the positioning of the actors during the production process reduced the frequency of such challenges. The division of performance from evaluation, the use of distraction spaces and appeals to the holistic nature of mixed sound waves supported the producer's use of a 'fix it in the mix' approach to manage the terms and times of debate. Creative project management involves punctuated decision-making process where, at appropriate times, producers structured reviews of the emerging work, organizing the remit of decisions with A/B comparisons and demonstrations of before and after versions to illustrate the outcome of their sound effects and mixing decisions. In this way the infinite variety of song qualities, the wide variety of views and the uncertainty of outcomes are accommodated without the project losing its way under numerous challenges, disagreements and returns to earlier versions.

Recognition of the importance of special configuration and material-human relationships reveals and identifies the possibility of change. For if the arrangement alters, then the practices and management control of decision-making also alters. In the popular music industry the use of project studio spaces and the accessibility and prevalence of digital audio software that enables sound to be portable and visually represented has increased the strength and frequency of challenge to the punctuated decision-making model of project management. Overflows of information - sound and image, empower the artist and bring them into the decision-making process. This was the case when artists used the objective systems of calculation exhibited on computer screens to rival the producer's expertise in an 'eye versus ear' contest that challenged the producer's authority and ability to restrict and constrain debate over product quality and process. In this way the skills of the creative project manager are revealed to be inseparable from the spaces and technologies that are part of their decision making and organization.

This account of the spatialised and socio-material management of music projects has implications for the study of other cases of creative project based organizing. The production of apparel designs, films, musicals, theatre plays, and radio and television programmes, all involve the use of designed spaces to organise and distribute roles and responsibilities. How does the enactment of these spaces and the human-material relations that occur within them stabilize relations and enable the management of decision-making under conditions of high uncertainty? How are changing technologies reforming these relations and what practices change as a result? Creative projects take place somewhere with some things. Research that incorporates these

participants when analyzing the management of creative projects will be richer for their inclusion.

# The Role of Networks in Fashion Designing: The disconnect between designers and manufacturers in London

Galina GORNOSTAEVA<sup>\*</sup>, Alison RIEPLE and David BARNES

University of Westminster

*This paper is an empirical study of the role of networks in fashion designing in London. There is evidence that the relationship between new, small, fashion design firms and apparel manufacturing is one of the weakest points in the fashion production chain. Analysis is based on our interview data as well as a critical review of the relevant literature. We propose that these problems have two main causes: a) designers are locked-in to the retail-led, London-based networks, which are dominated by strong links with the design colleges and industry-related institutions; b) as a consequence of this, their relationships with manufacturers lack trust, reciprocity and knowledge exchange for successful prototyping and scaling up of production to be achieved. Negotiation of constraints and specificities of designs are made more difficult because of personal, cultural, linguistic, physical and organizational differences, which create cognitive distance and incompatibility between the fields of fashion design and apparel manufacturing.*

## **Introduction**

This paper is an empirical study of the role of networks in fashion designing. Despite the vast literature on the issue (Caves, 2000; Gereffi, 2001; Scott, 2002; Crewe, 2004; Crane and Bovone, 2006; Dunford, 2006; Evans and Smith, 2006; Currid, 2007; Hauge, Malmberg et al., 2009; Guercini and Runfola, 2010; Jansson and Power, 2010; Entwistle and Rocamora, 2011), the relationship between new, small, fashion design firms and apparel manufacturing is poorly researched. There is evidence though, that this is one of the weakest points in the fashion production chain (Karra, 2008). We have undertaken interviews with small fashion design enterprises and apparel manufacturers in London in order to understand how they interact. In this paper, based on our interview data as well as a critical review of the relevant literature, we develop theoretical propositions concerning some of the underlying causes of the problems these two groups face. We are particularly interested in the obstacles to the creation of sustainable production chains that would enable the potential of fashion design talent to be achieved.

In the UK, there is evidence that young, independent, fashion design businesses are not growing as effectively as they might be. The high-end fashion sector sees anywhere between an estimated 20 and 50 new UK designer/wholesale labels looking to break into the market each year. Some designers have achieved £2 million p.a. turnover within four years of their label's launch. However, this high growth is only achievable by approximately 10% of designer labels (DCMS, 2013). Some commentators acknowledge the disparity between the international visibility of the fashion industry and economic returns (McRobbie, 1998) and raise the question: Why do so many of the most talented designers go bankrupt within a few years of leaving college?

We propose that this has two main causes. First, they are strongly embedded and possibly “locked-in” (Wenting and Frenken, 2011) to the retail-led, London-based design networks, which are dominated by strong links with the design colleges and other fashion industry institutions. And, second, as a consequence of this, their participation in manufacturing networks and relationships with manufacturers, whether British or international, lack the necessary levels of trust, reciprocity and knowledge exchange for prototyping and scaling up of production to be achieved effectively. This limits the ability of independent designers to grow and develop their business.

## Methodology

This study is based on in depth interviews/case studies, which involved 5 fashion designers, 5 apparel manufacturers and 1 PR agent in London. It explores the relationship between small independent fashion designers and the manufacturers of fashion goods with references to other stakeholders in the fashion industry. The case studies help to highlight a broad range of practices concerning the processes of establishing a designer business and operating in the industry, displaying the role of links between designers and manufacturers. The role of other actors, such as customers, suppliers, rival/competitor firms, universities, public and private sector organisations, etc., in the formation of specifics of the axis designer-manufacturer is discussed as well. We reveal how small independent designers are at a disadvantage in the way they seek to establish and maintain their relationship with manufacturers.

The following sections combine literature and interview material to describe the London fashion and apparel manufacturing fields and interaction between the two.

This paper is structured as follows. First, we review the literature relating to: institutions, fields and networks; the field of cultural production; fashion designing; the fashion production chain. Then we describe the logics of activities and networks typical of designers and those of manufacturers. Finally, we discuss the problems they face in interacting effectively.

## Review of literature

### *Fields and networks*

In this paper we are interested in the relationship between fashion designers and manufacturers, which we suggest, despite being parts of the same production chain, belong to different fields: the fashion design field and the apparel industry field. A number of authors (e.g. Bourdieu, 1984, 1993; DiMaggio and Powell, 1983, 1991; Meyer and Rowan, 1977,1991) discuss the notion of field – a construct which describes the institutionalised orders in social relations and the bounds of a group according to their commonalities of ideology, language, behaviours and so on. Bourdieu's (1984, 1993) contribution comes from his bringing together in an integrated way the individual, with social structure, and power relations. Institutionalists and network theorists share many of Bourdieu's views on the notion of field (Dobbin, 2008). Institutional theories focus particularly on

how organized groups of actors gather and frame their actions vis-a-vis one another (Fligstein, 2008). Implicit is the idea that actors within different fields approach the world in very different ways. Such approaches or logics shape behaviour and, when reified, provide the institutionalised context within which interactions take place.

In the case of the fashion industry, one can discern a field of designers that includes a number of different genres or sub fields and a manufacturers' field, which includes different actors and involves different institutions. The embeddedness of various actors within a field means that contacts are more frequent, making communication, knowledge sharing and learning more possible. It also means that the effective relations between members are greater, and correspondingly the relations between members and non-members are less influential.

One important reason underlying the ties that are to be found within a particular field, is homophily: "the principle that a contact between similar people occurs at a higher rate than among dissimilar people" (McPherson, Smith-Lovin et al., 2001, 416). Crucially, homophily or cognitive proximity results in a higher level of trust, shared understanding, and interpersonal attraction than would be expected among less similar individuals (Ruef, Aldrich et al., 2003; Phillips, Tracey et al., 2013).

Homophily explains why the embeddedness in a specific field leads to the sharing of tacit knowledge and the creation of institutional logics. These, in turn, further shape actors' behaviour and reproduce the field (Dacin, Goodstein et al., 2002; DiMaggio and Powell, 1983, 1991; Tolbert and Zucker, 1996). The interplay and overlaps between different fields is an area that is increasingly being researched by new institutional theory scholars (DeFillippi, Grabher et al., 2007; Delmestri 2009).

The effects of homophily are well understood in respect of the various creative industries, including fashion. The literature emphasises the role of the cognitive proximity in the rapid transfer of knowledge between firms: once a firm has been able to capture information from 'outside', cognitive proximity among firms favours its diffusion.

Firms can, thanks to cognitive proximity, activate the observation of new products (and processes), giving rise to the mechanism of variation as firms have enough innovative capabilities to be able to follow an innovative-imitative strategy (Aage and Belussi, 2008). Cognitive proximity stimulates communication and learning between sectors, firms and individuals. Inter-sectoral linkages between two related industries such as, for example, music and fashion, therefore, are more likely to produce meaningful synergies and

spillovers than two unrelated industries (Boschma and Iammarino, 2009; Hauge and Hraacs, 2010).

There is also a substantial body of work showing that social ties and competence in building suitable personal networks of contacts play a key role in business/financial success (Baron and Markman, 2003; Jack, Rose et al., 2010; Phillips, Tracey et al., 2013).

The negative effects of homophily are also well described. There is a substantial body of literature that analyses the effects of institutional lock-in and strong 'relational proximity', which describes the amount and strength of communications between agents (Rice and Aydin, 1991; Da Silveira 2011). Such proximity explains the 'weakness of strong ties' (Amin, 1999; Amin and Thrift, 1994; Grabher, 1993; Granovetter, 1985; Uzzi, 1997) in which relationships within the field act to exclude relationships outside it. This literature suggests that there is a need for actors strongly embedded in cognitive fields to forge ties with their wider environment in order to prevent network closure and self-referential behaviour.

In addition to relational ties, logics and cognitive proximity, there is another important aspect of the institutional environment, which influences the character of the networks. The important aspect is the striation of the field: there is a centre and a periphery. These have different powers and play different roles in the reproductive and innovative processes within the field. Usually the periphery consists of new entrants who are seeking to establish themselves in the field, those who did not manage to succeed in being accepted by the core, and those who have deliberately chosen to distance themselves from the established rules and logics of the domineering core (Cattani, Ferriani et al., 2013).

The field is characterised by field-related capitals made of economic, cultural, social and symbolic capitals. Symbolic capital is only the credit and authority bestowed on an agent by recognitions and possessions of the three other forms of capital. The value of one form of capital is therefore highly intertwined with that of the other forms of capital (Entwistle and Rocamora, 2006, 2011). One form of capital can be transformed into others with different degree of probability (Pret and Shaw, 2012).

In the next section, we move on to discuss the specific nature of the product in fashion design, which, we argue, determines how the two fields of fashion design and apparel manufacturing interact.

### *The nature of fashion design product*

The cultural economy in general comprises those economic activities in which symbolic and aesthetic attributes are at the very core of value creation. Competition in these activities shifts from the 'use-value' of products to the 'sign-value' embodied in design and branding (Du Gay, 1997; Lash and Urry, 1994; DeFillippi, Grabher et al., 2007). The cultural economy involves craft and design industries such as clothing, fine furniture or jewellery (see, for example, Hirsch, 1972; Power and Scott, 2004; DeFillippi, Grabher, et al., 2007; Scott, 2010).

Fashion designing has been described as a hybrid form of cultural work (Hesmondhalgh, 2002), in that it is directed at the creation of products with both symbolic and utilitarian value. Fashion design has always been more linked to an economically valued production system than art or literature (Currid, 2007). However, the designing process in fashion is, in most cases, a creative act, a process of innovation or R&D, which determines the product's image, its symbolic form, which defines its distinctiveness and success (Storper and Christopherson, 1987; Crewe, 1996; Rantisi, 2002). Literature on creativity suggests that the production of creative work involves the re-assembling and re-arranging of pre-existing materials, practices and influences. In order to produce creative work successfully individuals have to operate within a network of interpersonal relationships. Social networks provide the fabric through which individuals may tap novel information for creative problem solving. Some authors suggest that creativity 'is all in your social network' (Brass 1995, p.94).

Creativity is a process which results in novel product which has to be accepted as tenable, useful or satisfying by a group at some point in time: it has to be legitimised (Cattani, Ferriani et al., 2013). Legitimation of creative work is simply not possible without a social network. Some authors (Csikszentmihalyi, 1988; Cattani, Ferriani et al., 2013) suggest that this 'networked' nature of creativity can be better understood considering the relationship between three institutional subsystems: the *individual*—i.e., the person who serves as the source of variations to the field; the *field*—i.e., the people (peers, critics, professional organisations or users) who are entitled to make decisions as to what should or should not be included in the domain; and the *domain itself* - i.e., the norms and rules of a recognized area of action (painting, music, fashion, etc.). Networks function as a tool for the talent recognition: in highly competitive areas, it is always necessary to affirm one's worth and to demonstrate the qualities needed to perform the work. The group functions as a kind of mirror that reflects the skills of

members and only the membership is the guarantee of the reputation of those who participate in the group (Lipovetsky, 1994; Aage and Belussi, 2008).

Legitimation in fashion design deals not with the idea of the product but with the product itself with demands for high quality in materials and craftsmanship, as well as fit, durability and performance. These can become part of the symbolic attributes of the brand or designer label but can also be seen as utilitarian characteristics of the product. Achieving utilitarian value in fashion design demands craftsmanship, rather than creativity, and manual rather than intellectual work. Goods are therefore produced (often) and reproduced (almost always) by completely different actors, which constitute different field - the field of apparel manufacturers. Though the 'depth' of the cultural economy that covers the entire 'cultural production chain' necessary for a particular cultural output is well recognised (Jayne, 2005; Pratt, 2005), cultural theorists seem to consider apparel manufacturing to be inferior to, and analysed separately from, the fashion designing process. Indeed, this is an example of institutionalised logics that arguably permeate the whole field of cultural theory and which perpetuate some of the institutional gaps that we describe in this paper. For example, at fashion shows, which are important legitimating institutions in the fashion field, the illusion of fashion as art is elevated and the effort involved in 'making' is obscured (Skov, 2006; Skov and Meier, 2011). However, manual work is an intrinsic part of creation and legitimisation of fashion products. It starts from the production of samples and limited collections of clothing, which are then demonstrated in showrooms, at fashion weeks and trade shows. The apparel designing process involves idea generation, experimentation with materials, cuts and themes, testing the production through the manufacture of samples, refinement and final decision-making (Rieple and Gander, 2009).

The production of a prototype and samples, which are the iterative translation of an idea, sketch, or drawing into a pattern/palette, which can demonstrate 'wearability' and quality, is a crucial aspect of fashion designing. Significant skill is involved in this making process. The designer has to communicate the idea to the manufacturer, but, as we demonstrate below, the manufacturer speaks a different 'language', especially in London, where the design emphasis tends to be on artistic quality. A complicating factor is that power lies usually with the retailer/fashion brand and in many cases with the manufacturer, but in very few cases with the designer.

The hybrid nature of the fashion design product suggests that there are two fields and two domains involved in its creation - the first related to the

fashion design and the second - to apparel manufacturing. The rest of the paper concentrates on the contradictory nature of these two fields/domains and characteristics of their interaction. Qualitative interview data is used to illustrate this.

## **Findings and discussion**

### *The fashion field in London*

As has been shown above, a vast literature is devoted to the description and analysis of the world of fashion. Concentration of fashion in major cities - Paris, Milan, Florence, New York, London - directed this research on the identifying the connections not only within the field but also with the wider set of urban actors and environmental patterns.

In the midst of fashion cities, London is identified as the best place to find raw talent in the world (Evans and Smith, 2006). Our interviewees (*Interviewee 1*) confirmed this:

*Paris is all about established brands and hierarchy, New York is all about business and profit, but London is for young designers, here we are helped and nurtured.*

Much of that creativity comes from the diverse cultures and energy that emerges from the specialist colleges and the 'street culture', which is a feature of London, and which is reflected in its distinctive designer fashion industry (Evans and Smith, 2006; McRobbie, 1998; Malm, et al., 2009; O'Barne, 2009). The fashion field in London has become highly institutionalised over the years (Pratt, et al., 2012). The processes of product creation and especially its legitimisation are strongly influenced by the amalgam of educational, professional and public institutions and organisations. Apart from 'traditional' fashion crowd of designers of various ranks, multiple cultural intermediaries (fashion editors, stylists, photographers, journalists, bloggers), models, celebrities and buyers the fashion field in London includes fashion colleges' academics and officials from industry and public/collective organisations. The fashion field's core actors are involved in the legitimisation processes of the selection and promotion of fashions, they control the dissemination of fashion through global media (Entwistle and Rocamora, 2011; Purvis, et al., 2013). The legitimisation of collections happens at events such as fashion weeks, fairs, and trade shows as well as celebrations of a fashion designer or *maison*,

opening of new flagship shops, film festivals, galas, which have the added significance as social institutions for the controlling elites of global fashion culture (Gilbert 2000; Entwistle and Rocamora 2011; Pratt, et al. 2012).

In London the fashion field's core includes Fashion Colleges (Central Saint Martins, the Royal College of Art and the London College of Fashion), many of which were established and gained power at the end of 1980s, and the British Fashion Council (BFC), established *in* 1983. They hold strong legitimising powers and contribute to the particularities of London's fashion domain known internationally by its appreciation of artistic value. Though worldwide fashion is now close to being a form of modern art, where experimentation, multiple disciplines and the absence of aesthetic rules dominate (Aage and Belussi, 2008; Lipovetsky, 1994), this is especially true for the London fashion industry, which is considered to be highly innovative and rather experimental. The fashion designer is celebrated as auteur, as an artist. Fashion schools teach fashion starting from its creative side, pushing students to express and experiment with their creativity as much as they can (Pratt, et al., 2012). Fashion/Art schools impose their own disciplinary vocabulary upon their subjects and this involves negating or dislodging the informal cultural practices, for example those associated with the street (McRobbie, 1998; Pratt, et al., 2012). In the London fashion field cultural value far outweighs any immediate financial gain, although the hope for designers entering the field is that the symbolic status they accrue will at some point in time, translate into financial success (Aspers, 2001, 2006, 2010; Aspers and Skov, 2006; Entwistle 2002, 2009; Entwistle and Rocamora 2011).

The networked nature of fashion designers' activities is relatively well researched (Aage & Belussi, 2008; Malem, 2008; Malem, et al., 2009; Wenting, 2008; Wenting, Atzema et al. 2008). Entry routes into the fashion field are characterized by whom you know. Social networks are especially important for independent designers as they allow access to knowledge and resources. The activities of independent designers are organised by projects and careers are flexible, it is therefore essential to rely on a large network of relationships to maintain continuity of work and to be able to move from one engagement to another. Mobility of personnel also spreads information on trends (Aage and Belussi, 2008). The agendas of the fashion domain as cultivated by the educational institutions are reflected in the types of networks that graduated designers establish and sustain. They maintain, for example, strong relations with the art world. In the networks they share with artists, designers obtain a large part of their creative inspiration (Pratt,

et al., 2012). London designers happily produce work for theatres, TV shows and commercials maintaining the overlaps between the fields of fashion design, music and cinema.

The homophily of the fashion field partly can be explained by the origins of many designers from middle class families, with parents being important investors in their children's cultural, social and financial capitals through funding their education, collections, apprenticeships, placements, labels and boutiques. This homophily is also maintained by homogeneity of the cultural capital reproduced by educational institutions. Getting educational credentials from London's art-oriented fashion schools, which are highly valued in the field, has become a strong contributor to the symbolic capital, which young designers are eager to build. Along with justifying the artistic ethos of their products the educational institutions and the BFC, which has strong relations with the fashion schools, encourage young designers to legitimise the best of their products by participating in fashion weeks, trade shows, etc. and to be noticed by established designers and fashion houses. The BFC, for example, organises many awards for emerging designers that offer the chance to present their own collection at the Fashion Shows. Therefore, the circle of cultural reproduction becomes absolute.

Students with a degree from the London fashion schools are already well inserted into the system and have a strong social capital of particular type - peers and teachers who often are fashion designers themselves, - on which they draw during their career (Pratt, et al., 2012). As one of our interviewees (Interviewee 2) described:

*There are strong links between educational institutions and independent fashion designers in London: first many students from colleges work as apprentices in designer firms, and second, designers often teach part-time in the colleges when the workload at the firm is low or not existent.*

Thus, both social and cultural capitals are easily maintained and reproduced (Pratt, et al., 2012).

The organizational ecology of networks of creativity and design is complex and conventionally conceived as *bi-polar* (French, et al. 2004). On the one hand, there are large organizations, with strong designer groups, who wield significant amounts of market power and control - the centre. On the other hand, there are small, fledging independent designers, often recent graduates from fashion institutions, who attempt to "go it alone" (McRobbie 1998), and often contribute very little into the economic success

of the industry expressed in volumes of GDP, employment and exports - the periphery (French, et al., 2004). Though also true for the Paris, Milan and New York designer fields (Rantisi, 2004; Wenting and Frenken, 2011) this is more complicated for London, which is lacking strong designer houses with high margins (Lane and Probert, 2004), though it is possible to list Burberry, Barbour, Paul Smith, Vivienne Westwood and Stella McCartney, among others, as exceptions to this rule.

Many of the small scale, independent fashion designers belong to the periphery of the fashion field with a rather precarious role in the industry. Their world is characterised by high levels of financial insecurity, under-insurance and a self-exploitation, as well as a need to have additional creative and non-creative jobs to compensate for the absence of steady income (Evans and Smith, 2006). There are a few rebellious mavericks at this periphery, which try to ignore the 'rules of the game' (Rieple, et al., 2013). For example, one of our interviewees (Interviewee 3) emphasised:

*I abandoned my course at fashion school because I did not want to 'make products for particular niche of customers' as the tutor required. Such restrictions did not fit my creativity, I preferred to be free from 'the system' and do my own thing.*

Other research (Rieple, *ibid*) reports the cases of designers trying to ignore the opinions of their peers, or buyers when designing. Others do not believe that fashion weeks help in the development of their carrier. Some of our interviewees reported that winning an award was important for their CV, however, it did improve their chances of business success (Interviewee 4). As other researchers have explained (Skov and Meier, 2011), if a designer has a company at all, it is such a small business that it cannot handle the steep increase in orders if they suddenly arrive as a result, for example, of winning an award. This demonstrates a well-known phenomenon of the delinking of contest/legitimisation and business success (Skov and Meier, 2011).

To summarise, the independent designers may serve as agents of change in the domain of fashion, they prefer to operate in non-hierarchical structures, they are adaptive in nature and prefer little bureaucracy (Vandeveldel and Van Dierdonck, 2003). In contrast, the field of apparel manufacturing has a very different structure. In the next section, we highlight some of the profound differences between the two domains.

### *The apparel manufacturing field in London*

Manufacturing is often considered to be responsible for just 'a simple input' into the symbolic fashion product (Hauge et al., 2009). What is emblematic is that almost no industry commentators from within the fashion field include manufacturers in their descriptions of the fashion industry. However, without this input, as we noted above, this product cannot be made, legitimised and reproduced.

There were around 8,500 jobs in designer fashion manufacturing in London (50% of total in the UK) in 2010 (DCMS 2013). In London, the industry is dominated by many small CMT (cut, make and trim) units embedded within ethnic economic enclaves, dominated by minority communities in the northeast and east of London. They are associated with the Bangladeshi, Turkish, and Greek communities of Tower Hamlets, Newham, and Hackney, and with the Turkish and Greek Cypriot communities of Islington and Haringey (Evans and Smith 2006) and, as we found, with new groups of migrants from eastern Europe. Ethnic minority owners in Britain are prominent in the industry, constituting around a third of owners (Lane and Probert, 2004). The industry also has relied strongly on home workers (Heyes and Gray, 2001; Warren, 2003) and is characterized by small highly flexible and responsive production units employing poorly paid, often immigrant labour with often low educational standards (Rath, 2002; Ram, et al., 2004). Profit margins for CMTs are low and, thanks to off-shoring, many firms are left with only small orders for sample runs and stock top-ups on the basis of an ability to produce and supply relatively quickly to high-street retailers and brands. Only for these types of production are buyers willing to pay a 'London price' (Evans and Smith, 2006). The majority of CMTs have inadequate financial capital and managerial networks for growth and development (Evans and Smith, 2006).

The field of apparel manufacturers therefore, includes very different people with different value systems. This is emphasised by studies, which describe a 'low-road' model of growing informalisation in the industry in global city locations, with firms attempting to cut costs through the implementation of poor working conditions, home-working and transgressing the law on minimal wages, immigration and social benefits (Bonacich and Appelbaum, 2000; Evans and Smith, 2006; Ross, 2002; Scott, 2002). Apparel production units have typically arm-length contractual relations with buyers among which the most important are considered to be large supermarkets and retailers.

Commentators (Evans and Smith 2006; Rantisi, 2004; Scott, 2002) have noted that the cities with high concentration of design provide manufacturing firms with an opportunity to include 'creative' activities in their work portfolios such as own-design and own-brand production. This has come about as a result of increased demand for more expensive quality fashion items, and governmental policies that focus on promoting fashion content and greater interaction between designers and suppliers (Panayiotopoulos and Dreef, 2002; Crewe, 2004, 2008; Crewe and Forster, 1993; Evans and Smith, 2006). Significant research has been conducted on the extent to which firms have been able to realise this opportunity and upgrade their production into higher value and more 'creative' design-oriented activity (Bair and Gereffi, 2003; Gereffi, 1999; Evans and Smith, 2006). Commentators point out that the upgrading strategies the firms adopt are connected to wider public policy discourses elevating the importance of creative industries in London, whereas others believe that they are a reaction to the power of major buyers and retailers (Evans and Smith, 2006).

In London various industry and public institutions have been involved in promoting and stimulating the link between designers and apparel production units. They include: UKFT, London Chamber of Commerce, and other specifically focused and often publicly financed organisations, some of which disappeared over time, e.g. the London Fashion Forum, the Fashion Capital web portal, the London Apparel Resource Centre, the Centre for Fashion Enterprise funded through the LDA's Creative London initiative, the Cutting Edge initiative (Evans and Smith, 2006), DISC (Designer-Manufacturer Support Centre).

Manufacturers, we interviewed, complained about the ethos created around the increased importance of fashion, related in their mind with power of buyers/retailers who dictate low purchasing prices and demand high quality and tight delivery times. Interviewees also complained about the idea of fast fashion in general, which disrupts their operations (Interviewee 5):

*'In older times people were wearing clothes longer and did not have so many of them and this is the right attitude to clothing and it's how industry should operate.'*

As we suggested above the domain for apparel manufacturing is very different from that of fashion design. It contains such hallmarks as clear tasks, costs reduction, a focus on profit margins, volumes at the requested

time, organizational recognition, and the reduction of waste and scrap (Vandevelde and Van Dierdonck 2003). Manufacturing is usually overwhelmed with keeping operations going and tends to sacrifice long-term concerns to the needs of the moment (Szakonyi, 1998). Its central point of attention is the process. Manufacturing is output-oriented, trying to realize economies through volume and mechanistic structures (Ginn and Rubenstein, 1986).

### *The interface between the two domains*

The material discussed above confirms that there are significant differences between the fields and domains of fashion design and apparel production. Indeed, design and manufacturing run the danger of developing separate self-contained societies (Dougherty, 1987). The design-manufacturing interface was investigated in the limited number of studies (but see Ettlíe, 1995; Ettlíe and Stoll, 1990; Hales, 1986; Lawrence and Lorsch, 1967; Vandevelde and Van Dierdonck, 2003). The literature suggests that the separation of designers from manufacturing is damaging for the industry (Kincade, et al., 2007). The problems of the gaps in interaction between fashion designers and manufacturers in London are described in the detailed study conducted by Karra (2008). Product designs that take no account of manufacturing constraints risk higher production costs, lower production quality and longer times to market (Da Silveira, 2011). The literature suggests that to overcome these difficulties designers and manufacturers have to work closely together, preferably being physically co-located (Swink, et al., 1996). The design knowledge of how to develop new products technically must be cross-fertilized with manufacturing knowledge on how to adequately produce the products (Vandevelde and Van Dierdonck, 2003).

British apparel manufacturers have appeared not to be interested in producing for art school trained designers: there is wariness and suspicion on both sides. Instead, there is a preference for the production of more functional clothing that is quite different from the ethos of fashion design. Apparel manufacturing is a slower and more utilitarian mode (McRobbie, 1998) and that is a characteristic of the beliefs and values in the manufacturers' field. Indeed, many CMT firms reported difficulties in working closely with fashion designers. The size of orders received is often very small, ensuring payment can be a problem, and they are not believed to be realistic when it comes to costs (Evans and Smith, 2006; McRobbie, 1998).

When these are added to potential resentment at the implied differences in status (McDonough, 1984), it is not surprising that there is a 'them vs. us' attitude, helping to maintain and even increase barriers between the fields. Manufacturers are outside the designers' creative (and commercial) networks. Designers, opinion formers, the press, stylists, PR agents, sales agents and retailers rarely see manufacturers as partners. Manufacturers are not in either the social or the ideological networks of the fashion designers, retailers and intermediaries in the fashion field. Designers generally, particularly those in micro businesses, view manufacturing relationships as problematic and tense (Karra 2008).

British clothing manufacturing firms generally compete on price, rather than on excellent design, and their large retail customers usually employ their own design teams. They attach a relatively little importance to design and little respect to the unique designing skills. One of our manufacturing interviewees (Interviewee 6), when asked whether he intend to employ a designer, said:

*There is no need in this. If I decide to add designing services to the activities of my CMT I can do designing myself. Over the years of working with fashion designers I leaned from them, it's not a big deal, I can do it myself if necessary.*

Additionally, independent designers are not rated well on their technical and commercial understanding (Lane and Probert, 2004). One manufacturer (Interviewee 7) told us that it is not right that designers spend so much money and time on participation in fashion weeks rather than investing in production.

Separate views and values lead to a misunderstanding of one another's goals, capabilities (Gupta, et al. 1985) and solutions. Different fields create their own technical languages and systems of meaning. Another cause of language problems is almost inherent to the evolution from idea generation to new product in production. Communication about objects that are intangible or non-standardized is extremely difficult. The more abstract the information, the more difficult it is to exchange the information between people with a different views, activities, background or interest (Vandeveldel and Van Dierdonck, 2003). Moreover, organizational structures, and different institutions involved in the formation of different fields and domains may strengthen cultural differences, for example, rewards that stimulate the members of different fields to maintain their own value

system, e.g. winning an award to participate in the fashion week (Vandevelde and Van Dierdonck, 2003).

In the UK, and in London specifically, differences in ethnic culture, education, training and background can add to the difficulties of achieving symbiosis and understanding between different cognitive fields (Vandevelde and Van Dierdonck, 2003). Manufacturing staff often have poor spoken English language skills. One of our designer interviewees (Interviewee 1) reflected:

*No, I don't consider people who make cloths for me at CMT firms to be members of my social network, they cannot become my friends. They are usually much older, and they are mainly immigrants and there is a language barrier in communicating.*

It is difficult to overestimate the importance of finding a suitable manufacturer for the independent designer. The production of samples and collections for fashion weeks and trade shows are extremely important for the legitimisation processes that the independent designers are involved in. All our designer interviewees emphasised the importance of finding the right manufacturer. Search usually relies on word of mouth and recommendations from other designers or by rather haphazard trial and error process. However, errors, when they occur can have devastating results. One of our interviewees (Interviewee 8) described her search for a manufacturer for her second collection:

*I visited the manufacturer in person and he agreed to produce my collection. However, when the order arrived I realised that the quality was poor and my target price could not be achieved. In fact, few people would even buy a product of this quality. My collection lost a substantial amount of money. Moreover, I could not represent the collection at the London Fashion Week that year.*

This was just one of the consequences of lack of integration between the fields and domains of fashion design and manufacturing. All of our manufacturers and designer interviewees were critical of each other: there is a mismatch in expectations, lack of understanding of each other's business operations, workflow, and financial restrictions (Karra, 2008).

## Conclusions

In this paper we have described a profound gap between the fashion design and the craftsmanship/production fields, despite policies directed to create designer-oriented manufacturing (Malem et al. 2009). This gap can be described as a division between art and commerce, between fashion as 'art' and fashion as 'rag trade' (McRobbie, 1998), where art and creativity carry greater symbolic and cultural value than commerce. This gap is emblematic of the British and London fashion industry, as it is currently constituted. This is not helped by institutions such as fashion schools and industry organisations, which do not emphasise the craft 'know-how' and production aspects of the industry (Pratt et al. 2012).

At the same time, many commentators emphasise the paradox that despite their reputation for innovativeness many of the businesses within the London fashion system seem not able to profit from it. This makes it hard for young designers to become successful businesses. We argue that this is because the fashion and manufacturing industries are both trapped by the 'cognitive distance paradox' with no straightforward answer of whether to couple or de-couple creative and routine work (DeFillippi et al., 2007).

There are different types of production chains and national and global production networks in the fashion industry, typical of different countries. These different types are embedded in powerful historical and institutional legacies. These types are, for example: the "umbrella holding" company in France, the "flexible embedded network" in Italy, and the "virtual organization" in the United States (Djelic and Ainamo, 1999). Each of them assigns a specific role for independent fashion designers and for manufacturers in organisational structures of fashion industry (Djelic and Ainamo, 1999). British fashion industry network is closer to the American model than to any of European ones (Lane and Probert 2004, 2009). Only in the Italian model designers and manufacturers exist in some symbiosis, where craft skills coupled with short and flexible production chains (Dunford, 2006; Pratt et al., 2012). For example, in Florence fashion companies are composed by the creative office and the company's factory, where designers and stylists, developers and craftsmen work together on making of the prototypes. Once they are developed, products are made locally by dense networks of small businesses (Pratt et al., 2012).

British policies directed on upgrading businesses to work for a high designer end of apparel manufacturing tend to be based on this 'Italian' model that ignores the inherited path development of this industry in the

UK. It may be useful to consider more closely the possible ways of and the possible policies directed on integration of fields and domains in fashion design and apparel manufacturing. Our study is an ongoing one that in the future will examine in more depth the structure of and institutionalised gaps between the manufacturing and design fields within the fashion industry. From this, we hope to develop propositions on ways of dealing with the gaps between the different fields and domains.

## Design and Identity Formation in Cultural Organisations' Strategic Performance

Irini PITSAKI<sup>\*a</sup>, Alison RIEPLE<sup>b</sup> and Natalie NIXON<sup>c</sup>

<sup>a</sup>University of Northumbria; <sup>b</sup>University of Westminster; <sup>c</sup>Philadelphia University

*In the present research, we examine design as a major contributor to the formation of identity. We refer to two notions of identity: one within an organisational context, and another, which exists externally among the clients. We show that these concepts are strongly linked and constitute an element of strategic performance. Furthermore, we suggest that in the cultural industries, a clear and consistent corporate identity must be shared internally between the group of employees and externally; ideally, a cultural organisation, because of its non-profit, educational, ethical, etc. status, would like to see its identity perfectly matched with that of its audience. Organisational brand identity signals what the corporation is and does. Therefore, it provides reasons to be favoured by clients and helps to build loyalty and attachment to the company. This is a deeply selective and interpretive process and one that plays a major role in strategy. In the present paper, we review key texts on identity formation in relation to design and brand strategy; we describe a case study of various museums and galleries; and finally, we arrive at a set of conclusions about the role of design in the articulation of a clear and distinctive identity for both cultural corporations and individuals interested in cultural products.*

**Keywords:** Design, Identity, Cultural Organisations, Audience

## Introduction

In our previous paper, “The Strategic Role of Design in Cultural Products and Services” (Pitsaki & Rieple, 2011), we undertook a critical review of the literature pertaining to the strategic use of design within the cultural industries. Our main aim was to develop a better understanding of how design can aid the development and implementation of strategy, and to introduce an extensive list of generic strategic applications of design in the cultural sectors, in an attempt to create a more systematic approach to design in relation to strategy. There currently exists sufficient literature on the subject. However, experts hold diverse perspectives that often obscure and hinder rigorous developments in the field. For this reason, in our subsequent paper, “Design in Strategy: the Case of Cultural Organisations” (Pitsaki & Rieple, 2013), we took our focus on design and strategy a step further: we suggested a distinction between design as a vehicle and set of methods that facilitate strategic decision making AND design as an integral part of strategy and its implementation (“design FOR strategy” as opposed to “design IN strategy”, respectively). Furthermore, we created a core-list of “design IN strategy” applications and tested this approach through a museums case study with a strong practical focus.

During the process of our research, “identity” came up as an important concept referring to two particular entities: a) the intention of a corporation to define a number of distinctive characteristics that describe what the organisation is, what it does and how, and finally, which communicate those facets to its clients; and b) as something shared by a group of clients with common values, tastes, interests, and beliefs, among other elements. The interconnections between the two notions of identity (corporate and among a group of individuals/consumers) are noted frequently in the literature. As in previous cases, we hope in this paper to take an extra step, by discussing the role of design in bridging the gap between the two notions we’ve identified. In addition, we consider the strategic aspects of this role, which leads us into a territory of strategic brand management and particularly, one of corporate branding mirrored to match consumer behaviour and identity. Hopefully, in the pages that follow, these interconnections will become eminently apparent.

At this juncture, we would like to discuss some of the main concepts we used and how we approached them. We define ‘Strategy’ as ‘a set of actions through which an organisation ... develops resources and uses them to deliver services or products in a way which its users find valuable, while meeting the financial and other objectives and constraints imposed by key

stakeholders' (Haberberg & Rieple, 2007). We believe that successful strategies provide an organisation with some quality that is unique, or at least rare, and which makes consumers want to buy its goods or receive its services (for example, those of a corporation that made the strategic decision to invest in innovation or to develop a strong corporate brand identity).

Furthermore, we define an 'organisation' as 'a group of individuals, a social arrangement that has a particular structure and is managed to meet collective and personal goals'. The structure of the organisation determines performance and defines the relationships between individuals and the tasks that they perform in order to achieve these goals. Organisations both affect and are affected by their environment. In a commercial setting, the internal environment of the organisation affects and is affected by the external environment. For example, the corporate brand identity shared among the group of employees influences and is influenced by the perceived or shared identity between the clients.

For the purpose of the present research, we establish that a clear corporate identity formation process works in a similar way as does that among a social group or a group of consumers. In addition, we examine design as a key contributor towards this process. Identity formation is one of the most relevant aspects, frequently considered in connection with cultural organisations and the audiences whom they target. For example, in the fashion industry, one function of design is to facilitate the expression of an identity around the creator (the designer) and the buying community. Consumers need to feel that they belong to a group of like-minded individuals, with similar aesthetic tastes; the selection of the products of a strong brand makes explicit what they share in common. Also, one of the benefits of attending fashion shows is the sense of witnessing a special performance or occasion, enhanced by interactions with the 'star' and the other spectators; design then becomes a 'platform' for the exchange of a meaningful experience. These and other aspects are considered in our research, in the particular context of a cultural organisation, a museums group. Museums and galleries form an important cultural sector and the way identity operates therein is equivalent to its development in other cultural sectors, such as publishing houses, galleries, art foundations, theatres, and more. Design is not sufficiently discussed in these contexts, and we believe this gap represents an interesting challenge and unique opportunity to manifest the strategic value of design for such organisations.

## Methodology

Our methodology combined findings from our previous research, an extensive literature review, and analysis of a case study on a group of UK-based museums and galleries.

### *Literature review*

Our literature search was as follows: in addition to books, we systematically and purposefully searched for papers that contained specific keywords, narrowing our search to academic papers or essays with these explicit references. For the search, we used EBSCO's Business Source Complete and Art Full Text databases as principal sources, supplemented by Google Scholar. These sources include all the major business journals, as well as the majority of contemporary design-focused journals. A small number of other relevant journals, such as the *Journal of Design Research* and *Design & Culture*, which do not appear in these indices, were searched separately.

We used sequential Boolean search terms in 'all fields' and identified a number of relevant papers published between 1992 and 2013 (in total 182, which we then narrowed down to 93). Our search terms took shape in various combinations: *corporate identity*, *brand identity*, *business strategy*, *strategic management*, *competitive advantage*, *product design*, *design management*, *cultural industries*, *museums management*, and *culture*. In addition to these terms, we looked for papers that contained 'design' in combination with the specific cultural sectors that we are interested in (e.g. museums and art galleries). Searches like 'design strategy and cultural industry' or 'museums and competitive advantage' yielded no results, and we often had to fall back on our own knowledge of the fields to bridge these discrete bodies of literature.

To summarise the principal finding of our literature review, we might say that design is described as a means of communication which makes the organisation's values and strategy more visible and more easily communicated to consumers and employees alike. Design allows for a physical, tangible manifestation of strategy, both externally and internally. Externally, this occurs through the creation of products that serve the communications, advertising, or websites that put the strategy into practice, and through the visual expression of the values of the brand. Internally, it allows the strategy to be more easily communicated to employees through its expression within internal communications, the use of spaces, and the

way processes and briefs are explained (e.g. in the management of design recourses and the brand).

There were some intersections between these two perspectives (internal v. external) and the potential gaps between them were particularly interesting to us. Therefore, we considered the specific literature and discourses described below.

### *Corporate Identity and Design*

Corporate identity is often viewed as a relational concept constructed in the interface between strategy, organisational culture, and image (Hatch & Schultz, 2001). In this process, managers focus their efforts on 'reducing the gaps between top management vision for the company, its culture referring to 'internal values, beliefs, and basic assumptions that embody the heritage of the company and are manifest in the ways employees feel about the company they are working for' and the image as reflected in the views of its various external stakeholders', including the consumers (Gyrd-Jones & Rygaard Jonas, 2014). Furthermore, in the literature, we often see a discrepancy between identity and image: while identity is described as a set of distinctive characteristics, defined internally and projected externally, it is still a 'desired' projection rather than the real 'image' perceived, accepted and shared by individuals.

Cheng, R., Hines, T. and Grime, in their paper, 'Desired and perceived identities of fashion retailers', show that although there are some similarities, considerable gaps exist between the desired and perceived corporate identity of organisations. The paper concludes by giving practitioners better insight into the gap between desired and perceived identity with a view towards improving strategic interventions (Gyrd-Jones & Rygaard Jonas, 2014).

In this communicative process of identity projection and interpretation, the role of design is to interpret and capture the set of unique characteristics of the corporation, translate them into physical manifestations of 'who the corporation is', and put them at the disposal of individuals in order to express their own views on it, share it, or reject it. Concretely, the physical manifestation of corporate identity through design outputs involves the creation of products, retail environments, graphic communications, digital media, imagery, and clothing, among others.

KL Keller (2003, 2013) offers a perspective of this communicative – interpretative process, expressed in a model of four simple steps for

building a strong brand<sup>55</sup>. Each step corresponds to a fundamental question that customers invariably ask about brands and, therefore, corporations need to answer about themselves when they build their brands or define their identity. These are:

1. Who are we? (brand identity)
2. What are we? (brand meaning)
3. What do customers think about us? (brand response)
4. What kind of associations and how much connection would customers like to have with us? (brand relationship)

We consider this model to be integral to the internal and external identity formation process, and for that reason, we have chosen to discuss it in connection to our research. For the purpose of the present work, we were particularly interested in considering each of the components of the model and the role design plays therein. The following are the principal outcomes of our reflection:

### *1. Who are we?*

KL Keller describes brand elements as core attributes of corporate identity. Concretely, he says that logos, slogans, names, and, generally, the basic physical aspects of the brand are important in building *Awareness*, which is defined as the ability of customers to identify the brand in diverse circumstances. We believe that design determines these elements and, through sensorial stimulations (visuals, sounds, touch and smells), answers the question 'who are we?' Moreover, this is communicated among employees, constantly reminding them what the corporation is about, and becomes the means for the expression of a common belief and understanding of the brand. It is logical to consider that an identity that is first internally shared and understood will be better expressed and therefore, more accurately perceived by customers when projected externally.

Gyrd-Jones & Rygaard Jonas (2014), in their paper, 'Where is the Brand? Multiple Level Brand Meanings in Retail Brands', describe a case study of a retail business that reviewed and re-established its corporate identity internally, as well as the connections with clients and relationships resulting

---

<sup>55</sup> We are aware of the work of authors, such as Gyrd-Jones & Rygaard Jonas (2014), that distinguish between corporate identity and brand identity. However, in the context of this research we decided to treat those as equal, because the formation of a corporate or brand identity operates in very similar ways, and was exactly this process we were interested in.

from the sharing this identity externally. 'The internal branding strategy chosen to change behaviour had a cross-functional perspective, integrating HR and marketing. The goal was to make work communities see their identity as a team and their practices in a broader context, i.e. the brand identity and market development. Visible artefacts as clothing, interior design, assortment and written, rule-based change in work processes were central HR tools' (Gyrd-Jones & Rygaard Jonas, 2014). In this example, we see design outputs such as uniforms (clothing), environments and furniture (interior design), and graphic communications (written documents), becoming key tools used by HR to drive the dissemination of this redefined corporate identity.

## *2. What are we?*

In Keller's four-step model, this question corresponds to brand *Performance* and *Imagery* (the latter being the intangible aspects of the brand and how people think about it in abstract terms). *Performance* denotes the 'design and delivery of products that fully satisfy customers' needs and wants, and is a prerequisite for successful marketing, regardless of whether the product is a tangible good, service or person. [...] Brand *Performance* relates the extent to which the brand satisfies utilitarian, aesthetic and economic customer needs and wants in the product or service'. In other words, brand *Performance* is all about the successful design of products, which depends on the work of designers and their teams: the way they interpret the needs and wants of the users, bring them into focus, and deliver products that hold value for both the clients and the corporation.

## *3. What do customers think about us?*

This is answered through the definition of customer *Judgments* and *Feelings*. *Judgments* have to do with the perceived quality, credibility, consideration and superiority of the brand. Design contributes to most of these by guaranteeing quality and superiority (e.g. properties of luxury). *Feelings* refer to individuals' emotional responses, such as fun, excitement, security, social approval, and self-respect, among others. Once more, design can influence people's sensorial, aesthetic, and emotional responses, and therefore acts as a catalyst in the process of emotional exchange between the brand and its followers.

#### *4. What kind of associations and how much connection would customers like to have with us?*

The final step of the model focuses on the level of identification (as associated/shared identity) that the customers have with the brand. Brand *Resonance* is its main component and refers to the nature of the relationship and the extent to which individuals feel they are 'in sync' with the brand. *Resonance* is characterised in terms of the intensity and the depth of the psychological bond that customers maintain with brands. In the example of a luxury brand or company like Apple, we see design serving a primary driver of strategy based on achieving solid bonds with individuals. *Resonance* is achieved via high-quality, unique, inimitable, and innovative products, and results in customers feeling special, or privileged, when they purchase and possess them.

To conclude, we see Keller's model as one that describes the phenomenon of moving from internal brand identities to the collective external customers' identities. As previously mentioned, we consider this model integral to both external and internal perspectives, which is what makes it such a useful tool for the exploration of practice in the context of our research. Specifically, the model's four steps and the ways design relates to them support our understanding and development of a practical view of the identity formation process at the early stages of the research (literature review). We used this perspective to draft our case study questionnaires and to enhance the analysis of the interviews. Within a broader scope of researching the reality of a museums group, based on this model, our previous research, and the literature review, we were able to ask questions that directly answer to the strategic importance of design.

We would now like to introduce the museums case study and offer some insight into our interviews with professionals in the sector.

## **Case Study**

Based on the findings of our previous research and those yielded by extant literature at this stage, we drafted questionnaires and conducted interviews with two senior managers, a curator, a designer/design manager, a project manager, the Marketing & Communications Officer, and a researcher who had been investigating the circumstances of the organisation for about two years. They all work for a North-East English museum group (Tyne & Wear Archives & Museums, comprising 12 venues, and attracting 1.5 million

visitors per year). The interviews were focused on design and branding, and on how projects were managed strategically. Questions included:

- What does 'design' mean to you?
- How is design linked to the various strategic aspects of your work within the organisation? (e.g. the brand concept, corporate identity and the missions of the museum).
- How can design serve or influence the vision of the museum (strategic direction of the group's individual venues/brands and expression of a distinctive or common identity)?
- What are visitors' expectations, and how can design be used to meet them? (e.g. ability to manage design as a means that facilitate a dialogue with individuals).
- How central is design to the brand identity at both the project and corporate levels? (e.g. design used as a core element in the search of a clearly defined identity).
- How can design serve or affect the role the museum plays in the formation of identity of your audience? (e.g. do employees perceive design as a vehicle for engagement with the audience and identification with the brand?)

In answer to these and other questions, our participants shared with us the following observations:

*Marketing & Communications Officer.* 'Design is about yielding aesthetically pleasing, easily accessible, and useful outputs for the audience. Design reflects the values of the brand and essentially materialises them for specifically targeted groups. It also helps to make the offer interesting, by encouraging people to be part of the brand, lending consistency, enhancing brand recognition, and allowing people to develop positive associations with it. As an example of how this affects my work, take the recent capital development and renovation undergone by one of our museums. Initially we built our design approach by contacting marketing research firms in order to define who the target audience was and consult on the image we should reflect. In the future, we would be very interested in exploring the following aspects:

- **Internal Design and Brands management** – looking at the brand system of the group or hierarchy in order to establish brand values for the TWAM brand and also for the 10 venue brands (9 museums/galleries and the archives) and mapping how these might align with corporate, venue, and stakeholder objectives. Working with our internal staff and stakeholders to establish what the perceived corporate identities are with a longer-term view in order to develop and communicate values that match objectives and which will be embraced by staff.
- **External Design and Brands management** – this should involve exploring how TWAM’s audiences (public) perceive TWAM’s brands and their corresponding corporate identities – particularly the venue identities, but also the overarching TWAM brand. This would indicate whether the audience’s perception matches the internal brand values and corporate objectives.

Establishing better coordination between internal brand expressions and external brand image would bring tangible benefits to TWAM by helping us align our stakeholders’ objectives with our own, and by allowing us to determine whether our brands and branding systems are working effectively. This is particularly crucial to our organisation, at a time when public funding is severely limited, forcing TWAM to make sure it is using its resources efficiently and effectively, in order to maximise performance and ensure that both internal and external audiences are being served.

Having a unified approach towards design and branding systems is an integral component of achieving a sustainable and quality museum service. Brands that are more clearly and consistently expressed, both internally and externally, can help us build greater confidence in our museums and galleries. This is important for stakeholders and the public – their attachment to our brands will ensure repeat visits but also, during a time in which museums are striving to be more commercial, this step will also help sell the museums’ products and services, and ultimately, raise revenue’.

Manager A: ‘We recently went through a complete renovation of the museum, for which we outsourced the design services to London-based agencies. There are projects that we can only carry out working with internal designers, because that allows for better planning of the work and more effective exchange of ideas and expression of our identity. However, internal designers can easily grow too accustomed to a venue, and so in

many cases, it's preferable to bring in a new, fresh approach. I believe that designers play an important role in our processes, because they actually execute the ideas we hope to get across, and they help us develop the narratives we wish to tell through the exhibited collections. I like getting designers involved from the initial concept stage. Designers can explore a question and tell us what we might do differently. Innovation can happen "when the sky is the limit" and designers can help in that by suggesting innovative ways to access objects. Every organisation has certain pre-set principles, but instead of telling every story an object could possibly have, we should try to tell the story that best matches our particular organisational principles (i.e. the principles of the corporate brand and identity). Museums should help people to understand their place in the world, and define their identity; design is integral to how they access and experience the museum's cultural offerings. Design also serves as a bridge between what the curator intends to share, and how people experience it or engage in a dialogue with it. This has become very obvious in interaction design'.

Manager B: 'Design adds professionalism and makes everything more appealing. Web design has become crucial to what we do and how we engage people. There is a shift needed in the way museums learn about people's interests and what museums stand for. Museum strategy is moving towards more inclusive approaches where the public shapes ('designs') the exhibitions. Our office's role is to co-design the museums' offers with the community. Therefore, user-centred methods that are regularly applied in design fields can help us better discover what local communities need. Museum visitors expect to acquire knowledge and have enjoyable experiences. Design can make these experiences more inspiring. A heavier focus on design would mean a greater focus on experiences that are developed more holistically'.

Design Manager: 'Design makes our strategy visible, and therefore it is crucial that it is managed in a consistent way across the various projects that we take on simultaneously. Consistency also has to do with the budgets allocated to different projects; in these times of austerity and diminishing returns, low budgets can have a significant impact on the quality and scope of design, often forcing designers to be ever more creative, in keeping with the age-old axiom "doing more with less". This attitude has a major impact

on strategy implementation and normally results in less efficiency and poorly communicated brand identity’.

*Curator.* ‘Design means many different things to me: 2D graphics, 3D displays and products, branding and logos, the specific atmosphere you create in a determined space, the coordination of all these and, ultimately, the entire experience of the exhibition altogether: the meaning of what is displayed, the messages that the visitors perceive and what they generally derive, the quality of information and how accessible it is, the notion of breaking cultural barriers. Design is absolutely crucial to our work as curators; if it goes wrong, all our efforts could be wasted or completely compromised. Meetings with designers should take place in order to achieve good understanding. We need to engage with them closely, and ideally, they should grasp very quickly what we are trying to achieve and what our main idea is’.

*Project Manager.* ‘{...} In the context of this specific exhibition, design underpins the entire process at all levels of the project. It is a kind of framework that helps to define the theme and various aspects of what we want to achieve. It also has to do with practical issues, like bringing in the designers and giving them a brief about how the exhibition should look. In our most recent project, designers came in towards the end of the process, mainly due to budget limitations. Design encapsulates the creativity that should be brought into the process early. It makes things relevant, appealing, and fresh to the audience. It suggests something unique and brings about a context that encourages people to get involved. Visitors expect to get inspired and become enthusiastic about their experience. In that sense, design should challenge, respond to, and surprise visitors, suggesting a meaningful journey and making them want to be part of it’.

The findings from our interviews added new perspectives and confirmed several of the pre-established functions of design and its link to strategy and identity formation. In the following section, based on the insights of the interviewees and their contrast with prevailing views from the literature, we offer some conclusions about design and identity formation in cultural organisations’ strategic performance.

## **Conclusions about strategic performance**

Following up on our theoretical discussion of the role of design in the formation of brand identity (and identity shared with customers/consumers), we wanted to explore these aspects in practice. We were interested in confirming whether professionals at cultural organisations think that the expressions of brand identity should also take place internally and whether they apply this belief in their day-to-day performance. In addition, we wanted to understand what design means to them and to what extent they see and use it as a key element of identity formation (e.g. the identity of the products/projects and organisations they work for). In light of previous experience, and also because we interviewed employees with different specialisations (senior managers of creative projects, curators, design and programme directors), we expected to capture very different perspectives. In addition, we were prepared to listen to ideas that refer to design or branding without the interviewees actually being aware that they were talking about these; they could refer to design in the way we define it in the design management discipline without realising it, perhaps because they lack the necessary theoretical background or are not familiar with design management and branding concepts and principles. For example, in the abovementioned transcriptions, we read testimonies about the 'organisational principles to be followed in any project'. We believe that these principles refer to corporate or brand identity, although such terminology is not explicitly used by the interviewee. Furthermore, in the cultural industries, discussing marketing and branding is often avoided; arts professionals often consider marketing to bring about a commercial perspective that clashes with a pure notion of art and its purpose. Consequently, we had to read between the lines of the transcripts. In that sense, the analysis of the interviews was challenging and involved contrasting knowledge from various fields – mainly design management, project management, marketing, cultural management and curation – with the responses we received.

More specifically, with respect to the outcome of our research, we might say that design in association with strategy aims to create distinctive products, services, and experiences which deliver value. In addition, it serves to make this value difficult to substitute or imitate. In that sense, 'design is a strategic resource that can shape the offer and the organisational or product identity. Furthermore, it provides tacit guidelines that shape employee behaviour and ensure coherence in the organisation's offer' (Rieple & Pitsaki, 2011). These strategic approaches to design apply to most sectors,

and can be contrasted with applications that are likely to be central to the cultural industries. It is relevant to note that we consider museums to be an important category of cultural organisations and one which is highly representative of a generalised reality in the cultural sectors. When it comes to the active use of design as a strategic tool, museums, galleries, and art foundations are comparable to publishing houses, music production companies, and theatres. Among cultural organisations and in relation to identity, we find fashion enterprises to be the one category that uses design in a more advanced and sophisticated way. In other words, professionals in the fashion sectors are more aware than those in other cultural sectors about the importance of design as key element of identity formation, and consequently, more aware of its strategic performance. Therefore, museums remain an intriguing and interesting area to investigate.

Below follow some conclusions yielded by our research on design, strategy, and the cultural sectors:

**Design is a means of developing identity and, therefore, represents a key strategic tool for cultural organisations.** Through aesthetics, function, communication, and the capacity to keep an offer connected to the organisational principles or brand elements, design allows individuals to share their values and to see their own identity reflected through the brand. It therefore leads to stronger bonds and a steady exchange between them and the organisations behind them (Pitsaki & Rieple, 2013). 'Design shapes an organisational or product-group identity or brand so that employees and consumers alike understand what the organisation is about (Kuksov, 2004)'.

In this paper, we are particularly interested in underlining the importance of design as a contributor to strategic performance, and in demonstrating that it can't be treated as an attribute external to the cultural offer. Indeed, design is a core element of any kind of tangible or intangible value delivered in the cultural sectors. **It is itself a significant strategic resource that delivers economic, symbolic, aesthetic and functional values and that therefore should be aligned with the stakeholders' main objectives.** In the cultural sectors, the search for coherent competitive advantages becomes more and more imperative. Trying economic times and spending cuts call for a more strategic focus on the ways in which cultural organisations operate. Design can play an important role in this circumstance.

The interviewees admit that design makes the museum's offer more attractive and likable; facilitates a long-lasting relationship and dialogue between the museum and its visitors; and enables more meaningful interactions between the brand and its audience. Furthermore, our interviews confirmed that design within the cultural industries is often perceived as an element of quality and innovation. This notion was also confirmed in the literature: Cooper & Evans (2011) show that design is a differentiation factor and delivers value through aesthetics and innovation. Therefore, it **should be implemented as an integral part of the organisation's strategy** (Pitsaki, 2013). Furthermore, as one of our interviewees, the researcher, suggested, 'Design is integral to how we tell stories and how we interpret things, and it becomes even more relevant when we use technology, because it allows people to more directly interact with exhibits or archives. Design is connected to the museum's essential function, in the sense that it engenders dialogue about identity, and allows people to reflect on and feel proud of an effective exhibition. Design shapes the exhibition by playing a role in people's emotions and empathetic faculties'.

In addition, **design proved to be a key element of identity formation and communication**. Through their choices, people share the museum's identity and can potentially become part of it. Design is a key component to both the processes of forming identity (e.g. the brand) and sharing it (e.g. aesthetic value, cultural content, meaning, etc.). Therefore, it should be managed within the context of an institution's strategic goals. Part of TWAM's strategic plan indicates a mission to 'help people determine their place in the world and define their identities'. Through their cultural offer, museums narrate true stories, educate people, and shape people's aesthetic tastes values. This is clearly reflected in TWAM's vision, as well as in its strategy. Moreover, this vision should be manifested first and foremost in the way the organisation establishes its own identity, its corporate brand (TWAM) and its individual brands (12 venues/museums).

**Furthermore, design is a significant contributor to brand consistency and coordination**. In the lifetime of a brand, constantly changing external factors and general management decisions can jeopardise the stability of identity and the projection of a clear image thereof. Consequently, it is necessary to carefully manage the brand in order to achieve consistency in all core elements and communications. Design contributes to the strategic management of the brand by ensuring parity across different brand levels, such as the corporation and the product levels. Furthermore, the

coexistence of several brands in any cultural organisation makes their management and alignment with strategic aims somewhat complex. For example, in the case of TWAM, there is an institutional brand, 12 venues / museums brands, and several exhibition brands. More specifically, moving from top to bottom in a brand hierarchy, we find the group brand (TWAM), the corporate brand (the Discovery museum), the product brand (the exhibition), and the artist or exhibit brand (a specific artefact relevant enough to constitute a focus of the museum's marketing communications, (e.g. the bulb of Joseph Swan). Therefore, every curator or project manager should consider how the specific exhibition connects to the museum's overall brand (the Discovery) or the overarching institutional brand (TWAM), and should carefully incorporate the elements that make the exhibition part of a clear vision, as previously defined by the organisation. In brand hierarchies and architecture, design acts as a visual and content connector between these, facilitating coordination, and enhancing the fulfilment of the strategic aims across all brands and at all identity management levels.

To conclude, we might say that design is a strategic resource for the formation of a clear identity, and it should always be managed in a way that reflects this strategic importance. A good model for design management is needed in order to bring about the corresponding contribution to cultural organisations identity and how individuals connect to it. Design is an indispensable part of what the organisation does and stands for. Finally, the present paper has aimed to introduce an approach that bridges the gap between the business and cultural perspectives.

## Designing Organizations in the CCI

Johan KOLSTEEG<sup>\*a</sup> and Frido SMULDERS<sup>b</sup>

<sup>a</sup> Utrecht University of the Arts; <sup>b</sup> Delft University of Technology

*Drastic cuts in government budgets will force cultural organizations to reconsider their position by initiating internal discussions on how to avert the risk of these cuts. In order to avoid gradual withering of their proposition, cultural organizations will increasingly search for new organizational constellations with new business models. Converting the cultural organization into a hybrid organization combining cultural as well as business values, is one of the options and a major challenge. There seems to be pressure on preserving the cultural values that belong to the artistic core. This paper investigates the application of the IDER-model, that combines design thinking and design related implementation theories that take the potential conflicting value systems into account as well as a focus on the subsequent realization of associated organizational changes. An additional challenge is to realize the new structure in a way that it stays flexible as were it of a prototypical nature. Based on this theoretical discussion the paper proposes an agenda for future research to generalise our findings. The model explicated in the paper relates to the fundamental choices underlying the adaption to external changes through hybridization.*

**Keywords:** Hybrid organizations; creative organizations; design thinking

## **Introduction**

The position of cultural institutions is currently under discussion from various angles. From a cultural-sociological angle, they are encouraged to actively redefine their position as bastions of imagination in an increasingly flat, instrumentalized and neo-liberal society (Gielen, 2013). From that neo-liberal angle, the culture-political discourse in the Netherlands pushes subsidized cultural organizations into the direction of cultural entrepreneurship and increase of self-generated income, i.e. ticket sales and sponsoring, as a solution to the financial problems that follow from the government's reduction of subsidies for arts. In these debates, the structural elements of cultural organizations seem to remain undiscussed. Gielen foresees institutions to pick up new and urgent culture-societal responsibilities from within their traditional structural and regulatory confines. Also, the culture-political discourse surrounding entrepreneurship doesn't automatically promote a fundamental organizational discussion (Kolsteeg, 2014).

Still, by interpreting the term entrepreneurship beyond its intended aim of merely financializing existing operations, some, but few, organizations move in the direction of re-evaluating their business model and developing new public-private, "hybrid" organizational structures. Examples are found concerning the combination of public libraries and commercial bookshops, cultural foundations that start separate, for-profit ventures to realize commercial offers for new target groups and museums mediating commercial activities for artists, such as artistic interventions. The underlying reason cultural organizations have difficulties in building new business or hybrid organizations is because the value system belonging to their cultural core diverts too much from the value system as dominant in business. There is no experience with this type of process and there is no institutional bedding in which such fundamental experimentation is appreciated. A strategy of hybridization seems a promising avenue for adaptation, considering the above mentioned discourses. However, the literature doesn't tell how organizations could change and transform into a hybrid organization, hence the subject of our paper. We aim to present a potentially interesting model that could explicate and address possible dilemmas encountered in organizational redesign and that could be of help in making such a transition.

First we will focus on what hybrid organizations are and some of the challenges these atypical organizations could encounter. We will discuss hybrid organizations and possible obstacles as found in literature and

elaborate on the essence of the dilemma encountered in the cultural sector. Then we will introduce the IDER-model and finally apply this to the situation of an imaginary organization in the cultural sector that aims to make a transition towards becoming a hybrid organization.

## Hybrid organizations

As indicated earlier the transformation of cultural organizations from an organization with one specific goal and associated operational processes to an organization with multiple goals and operational processes is suggested to be one of the promising strategies to adapt to changed external circumstances. A 'hybrid organization' understood in this paper is an organization that simultaneously operates in the public and the private sectors, hence combining 'different activities and revenue streams, different values and cultures and different modes of governance.' (Brandsen, Karré, & Helderma, 2009, p. 4).

There are barriers and risks to realize the hybrid organization. Among these risks are financial risks, risks involved with combining different organizational cultures and risk, experienced at the political level, of losing control. Looking at hybridization of organizations (in a non-cultural context) Brandsen et al. find however that "some of the supposed risks do not necessarily materialise and opportunities may be salvaged" (Brandsen et al., 2009, p. 3) if proper conditions are met. These conditions pertain to resistance to pressure at cultural level, and an institutional effort to create a framework "against which the financial performance of organizations could be judged" (ib.).

Tensions in processes of hybridization do not tend to threaten 'the structural integrity or quality of the provided services', is a point made by Karré & In 't Veld (2007, p. 200), who suggest the discussion on hybridization should focus less on the acceptability of hybridization as such, and more on how positive effects can best be effectuated, and how negative effects can best be limited. Among the factors that can make a process of hybridization into a success, Brandsen et al. found a sound professionalism that makes an organization 'more resistant to the pressures of hybridization at the cultural level' and the existence of clear generic guidelines concerning the administrative handling of diversified funding streams' (id.).

Successful combination of organizational cultures, modes of governance and underlying value systems, it seems, requires careful approach of cultural organizational differences, realistic - not overrated - estimate of risks, clear

financial agreements and a 'let's do it'-attitude. So for hybrid organizations to be successful, one needs to keep a clear eye on all the differences settled within the various parts of the hybrid.

## **Cultural organizations in transition**

For the cultural sector we follow the definition of the hybrid organization posited by Brandsen et al. (2009) and understand a hybrid cultural organization as an organization that simultaneously operates in the public and private sectors and simultaneously operates different operational processes. An important addition to this definition is that a hybrid organization combines, as quoted above, not only different 'activities and revenue streams', but also 'different values and cultures and modes of governance' (Brandsen et al., 2009). Also Mommaas describes hybridization (in this case in the context of cultural clusters) as moving 'beyond conventional subsidy-based coalitions towards hybrid, public-private models, based on a mixture of resources and management relations [...]' (Mommaas, 2004).

The combination in cultural organizations which is encountered more often, that of a financial model based on diverse (i.e. institutional and private) sources of income, does not make such an organization hybrid in this definition. Instead, successful hybridization needs to be found on the level of integration of cultures and values that are traditionally experienced to be distinct: values related to the artistic core of an organization, and values related to the process of economic transaction, embedded in a conducive culture-political context.

## **Obstacles seen from a theoretical perspective**

As stated above, hybridization of cultural organizations remains a rare phenomenon, which is not surprising knowing that these organizations have typically a limited size and a small amount of associated resources. An analysis of strategic documents of Dutch cultural organizations shows that they all describe pragmatic partnerships with organizations inside the cultural sector, while cooperations with private organizations outside the cultural sector are virtually absent (In 't Veld, Gerdes & Gooskes, 2012: 29). Cooperation is not the same as hybridization, but they both pertain to finding a productive 'interaction' between, or better a transcendence of the dichotomy between artistic and economic values.

The inhibition for cultural organizations to open up to a non-cultural context is inherent to the current culture-political discourse. Based on research done in the Netherlands by Kolsteeg (2014) we identify following issue. The process of strategy formation in cultural organizations is predominantly based on the values of artistic identity and network position, which affects strategic deliberations on topics such as growth and development. The government introduced the term entrepreneurship in the culture-political discourse as a financial strategy that hardly addresses values like risk-taking, creativity an artistic identity, values which are traditionally strongly represented in cultural organizations. As cultural organizations attempted to relate to entrepreneurship, it became a discursive topos, removed from the cultural organizations' true concern: their artistic development.

Kolsteegs research illustrates how innovative entrepreneurial behaviour in the cultural sector is in fact systemically inhibited. An additional element is that the moments in which cultural practitioners are held to define their cultural/economic position vis à vis their subsidisers are relatively scarce. This is different in the for-profit creative sector, arguably the forefront of creative and organizational innovation. Here, the practitioner is held to continuously explicate the creative/economic balance in the daily routine of interacting with clients. For-profit creative firms tend to experience the relationship with their context as enabling to tactically overcome the dichotomy of creative and economic values. Here, we see a field where innovation and entrepreneurship lead to, among other things, innovative organizational constellations (network organizations, project organizations, to name but the most obvious ones) that are recursively related to the context in which they are embedded (Scott, 2006: 4). The institutional context of cultural organizations contributes to the lack of entrepreneurial and cross-over activities and furthers organizational rigor. So obstacles for hybridization can at least be found in an equivocal culture-political discourse which does not adequately define the relationship between cultural and economic values and a lack of routine in cultural organizations to define their artistic-economic identity. Hybridization, understood as a combined public-private organizational constellation around a cultural-economic core activity, needs to break this discourse in order to successfully combine cultural-economic values.

## **Examples of hybridization in the cultural sector**

Hybridization of cultural organizations is a relatively new research subject. A preliminary conclusion from research conducted in 2010 among a (relatively small) sample of hybrid theatres in Finland is that hybrid theatres (here understood as private theatres with public ownership) showed that these theatres more resembled public theatres than private ones, in that 'norms and practices related to public governance, like using permanent employers instead of temporary ones, are more easily adopted to the theatre's activities'. (Ruusuvirta, 2013: 234). Mixed-owned theatres are not independent from the public sphere nor are they fundamentally autonomous and 'in control of their own affairs', making it hard to understand what the advantage of hybridization is. Basically, the tension between cultural and economic value systems is captured in a discursive compromise, instead of capitalizing on strong points of the public and private constituents, for instance the fact that private theatres tend to be more efficient than public theatres.

In the Netherlands several examples of business diversification that point into the direction of hybridization present themselves. A well-known example is forming constructions that improve real estate exploitation for example of a private museum housed in a municipal building, or museums or theatres developing hospitality activities as a side business. Also, there are examples of organizational "ramification": subsidised cultural organizations developing commercial (side) products, for which they set up a new organizational entity. One step further into the direction of hybridization is a combination of separate organizations in the same creative field, found in the example of a municipal library that rents out space to a bookshop.

In general, the existing examples in Holland and Finland suggest that the cultural municipal paradigm is the most dominant one when thinking about innovation of organizational form. They are strategies to secure the cultural offer in a city and rescue exploitation of existing organizations, with the cooperation of the local administration. Observed hybridizations are restricted to the financial operational area of cultural organizations and tend to lack a fundamental redefinition of the relationship with the context. They don't fundamentally address issues pertaining to for instance the organization's societal position or the essence of the cultural product they present. They reflect the characteristics, nor do they describe a new cultural offering in relation to societal discourses.

We suggest it would make sense to frame hybridization in this discourse and investigate whether a fundamental process of redesign and reorientation is imaginable that allows a reassessment of the relation between cultural and economic values in which the underlying discourse of arts support, which at least in the Netherlands keeps artistic-creative elements separate from political-economic ones, is problematized leading to a perspective of artistic-economic identities. Such an angle would lead to a designerly approach of the need for change, taking internal and contextual circumstances as equally important drivers for change and 'co-evolution', to coin Lewin and Volberda (1999). The reason to evaluate hybridization of cultural organizations from the designerly perspective is:

The combination of public / subsidised and private / commercial activities is positioned as a logical answer to both the culture-political discussion on, and financial consequences of the retreat of government support, and the societal-political pressure on the cultural sector to establish stronger relationships with non-cultural sectors. The development of solutions for this problem seems to involve sensitivity for underlying discourses on the relation between culture and economy, and sensitivity for traditional institutional roles and responsibilities. One could identify these elements as variables in a design process. The question discussed in the following paragraph is how the societal repositioning of cultural organizations can be understood in terms of the IDER model.

## **Problem statement**

Cultural organizations are challenged to develop new organizational constellations that can secure the future of their artistic mission. Hybridization is observed as a potential strategy to avert the risks faced. Cultural organizations are however inhibited to explore this by the dominant cultural value in strategy (Kolsteeg, 2014) and their traditional operational routines (Ruusuvirts, 2013). The development of organizational innovation that transcends traditional cultural/economic routine and brings organizations from the conceptual level to realization, poses a fundamental design challenge.

## **The IDER-model**

The recent application of design thinking to many situations is received very well in business because it seemed to be of help to break out of present

settings, small alleys of thinking and repetitive ways of acting. Liedtka and Ogilvy (2010) pointed at the differences between traditional managerial attitude and a designerly one (Figure 1).

	BUSINESS	DESIGN
<b>Underlying Assumptions</b>	Rationality, objectivity; Reality as fixed and quantifiable	Subjective experience; Reality as socially constructed
<b>Method</b>	Analysis aimed at proving one "best" answer	Experimentation aimed at iterating toward a "better" answer
<b>Process</b>	Planning	Doing
<b>Decision Drivers</b>	Logic; Numeric models	Emotional insight; Experiential models
<b>Values</b>	Pursuit of control and stability; Discomfort with uncertainty	Pursuit of novelty; Dislike of status quo
<b>Levels of Focus</b>	Abstract or particular	Iterative movement between abstract and particular

*Figure 1: Comparing business and design attitudes (source Liedtka and Ogilvy 2010).*

Thinking out of the proverbial box for identifying new avenues, blue oceans and attractive horizons brought design thinking inside the business discourse. On the other hand this univocal use of design thinking received some mixed feelings in the design research community, in terms of, ‘this is our territory’, we know this best, etc. However, the design community could also see this as an opportunity and help to explore unknown design territories. The application of design thinking beyond its traditional field of application could bring essential contrast that leads to additional perspectives on the field of design research. One of such perspectives is to describe the original organizational context of where design thinking had its roots, namely the context of industrial product development (Smulders, Dorst & Vermaas, 2014). In that particular context one could observe that after design has delivered the concept for a new product a phase of product and process engineering prepares that concept in such a way that it can be produced, transported and sold to customers, that is, to be realized. The engineering activities form the bridge between the concept from the D-phase and the operational processes like purchasing, production, logistics and sales in the R-phase. Engineering in its widest sense validate and consolidate what ever comes out of the D-activity and this goes beyond the product only. Also all other operational processes that need to undergo any form of adaptation need to go through an ‘engineering’ cycle. According to these authors, the end result of the product innovation-cycle is not so much

only a new product on the market, but an adapted socio-technical reality covering all organizational processes including the adapted processes related to the customers. This in a sequence is first Design, then Engineering and finally Realization of what has been developed, hence DER.

Although ideas could come from anywhere, in most models of product innovation there is also a phase preceding the actual design of the concept, namely the front end of innovation. During the front end, often referred to as fuzzy front end, market research, market analyses, need assessment, etc takes place. Smulders et al. refer to this as Initiating phase and in concordance to the literature this phase covers the work aimed at scoping the upcoming innovation activities and typically ends with a project brief. Seen from this perspective the full-fledged cycle that surrounds the actual design activities reads like IDER. As one IDER-cycle already results in organizational change (Smulders, 2006; Junginger, 2008), be it minor, then many IDER-cycles over time may result in a totally different company. Think of the organization of Apple thirty years ago with the Lisa and now with the wide spread of market propositions.

For the argument developed here we need to go one level deeper into these phases and describe these as socio-technical systems. In companies that are to some extent healthy and profitable, a certain routine level must have been reached in all of these phases. The application of all these routines will result in the regular development of new products and new business. In other words, they know what they should do to initiate, design, engineer and realize new products. And 'they' here stands for series of disciplinary and specialized actors, in the fields of marketing, consumer research, formgiving, electronics, software, mechanical, moulding, processing, assembly, etc. For a company like e.g. Cannon-Océ, these easily amount to 300 people that all have their own discipline related contribution to the various IDER-phases. So 300 people that are responsible for renewal of the product portfolio and not just have their disciplinary routines, but also their interdisciplinary (boundary crossing) routines. The latter sets of routines are a necessary prerequisite for interdisciplinary coordination and synchronization (Smulders, 2006). In total, one should see the respective I, D, E, R routines as (specialized) capabilities that in a combined matter enable an organization to innovate and adapt to changed external circumstances.

At least, as far as they concern the development of new business propositions. Good to realize that each of these capabilities is much wider than just the dominant activity. For instance, the engineering capabilities

not only cover the making of calculations, the detailing of the design but also cover the planning of the production ramp-up in the R-phase. Even so, the purchasing of materials, outsourcing of injection moulded parts, the division in sub-assemblies, layout of production and assembly lines, etc. Also the I, and D activities cover a total set of integrated capabilities that together stand for respective 'initiation' and 'design' work. Finally, these IDER-phases are not just separate steps with hard transitions that end the former and start the next phase. To a large extent, these phases overlap and slowly fade away as progress moves on towards final realization (Authors, 2014). The problematic element of embarking on more disruptive forms of innovation could be found in missing capabilities and knowledge structures to bridge between the conceptual idea and the realization (Authors, 2014), that is, there is no 'engineering' knowledge in its widest sense.

In the next section we will map the IDER-model over the problem as introduced earlier in this paper.

## **The CCI's challenge through the lens of IDER**

The first section of this paper described the problematic situation of the cultural organizations within the Creative & Cultural Industry (CCI). It foremost illustrated that these organizations have trouble to adapt to the changing environment. This is not to say, that these organizations don't adapt at all. Of course, they made many changes to buildings, the programs they offer, the quality of the programs itself, etc. They are surely capable to do that. In terms of the IDER-model, these adaptations are better indicated with the lower case letters 'ider', illustrating that these changes are variations within one and the same frame. These minor adaptations made it possible for these organizations to keep fulfilling their cultural function in a more or less stable environment. Now the world is different and in order to survive larger adaptations are necessary. This raises the question as posed in the introduction, do these organizations have sufficient capabilities, meaning, do they possess the right IDER-capabilities for transforming their organizations? It is at least questionable, whether deployment of their present ider-capabilities will make it possible.

For CCI-organizations to deploy a sustainable hybrid organization, two things need to be taken into account. First, there is the transformation from non-hybrid to hybrid, and second there is the successive adaptation to again changing external influences once it has become a hybrid organization, meaning in parallel to making the transformation it also needs to build up

sufficient innovative capacity to become sustainable. Although we limit our focus to the first, we will apply a product innovation cycle as a carrier to realize that transformation. The product innovation cycle as by itself helps to change the conversations (Ford, 1999; Smulders, 2006) and by that changes the organization to the hybrid state.

### *I = Initiating the hybrid organization*

As said, the initiation process aims to create an understanding of the task related to the upcoming innovation process including the possible changes and adaptations to the present socio-technical reality. In the case of hybridization, organizations need to make sure they do realize what the consequence of such an innovation process could be and subsequent make sure to structure the remainder if the IDER-cycle accordingly. Hybridization must be understood in relation to - or as a consequence of - product innovation. Cultural organizations have a routine in developing products inside the traditional cultural paradigm, but need to be challenged to develop products in a new hybrid artistic/economic framework. Initiating a new product life cycle here refers to initiating a new product-type life cycle. A routine needs to be developed in creating a cultural/economic proposition including its associated processes without cannibalizing its present processes and thus create the hybrid organization.

The constituents of the hybrid organization bring along their own position and products additional to the present position. The new organization needs to 'negotiate' a position in a creative network and the relation with the institutional context needs to be reformulated. Whether the organizational form is designed to be permanent or temporary is not relevant since change is the constant and not stability.

Initiating the hybridization by the identification of a potentially interesting cultural-economic proposition is an innovation process in itself aimed at framing the scope of the actual innovation process that is initiated. Because of its possible disruptiveness such an 'I' requires a large scale, open design process which in itself perhaps contains an IDER loop, resulting in a paradigm for the subsequent organizational innovation that will follow and a validated direction for further development. Figure 2 aims to illustrate that in each IDER-phase there is a dominant way of working that includes also activities that are typical for the other three phases. Meaning, within I-phase there is also D, E and R activities. The scope of what these activities however, becomes increasingly smaller until the final details of socio-technical routines are being set.

Figure 2: The nested processes of the IDER-model (based on Authors 2014)

Being an open process, the identification of the right partners by engaging in various types of open discourses and way-finding search processes resembles very much the fuzzy front end of product innovation. Social activities as ‘dialogue mapping’ in which the actors aim to create coherence among the culturally diverse backgrounds (Conklin 1995) might be of help in identifying common ground. Once an interesting direction is identified the first contours of a promising new concept might lure at the horizon. At the same time new or changed conversations are initiated. Such a strong feeling can be seen as the validation of the direction chosen and points towards the readiness of the transition to the ‘D’ phase in which the concept for the future hybrid organization including the associated cultural-economic propositions are further designed and validated.

To finalise the I-phase is to create a project team of organizational actors, possible partners, budget and a clear assignment.

### *D = Designing concepts for new proposition and the hybrid organization*

The aim of the D-phase is to validate the frame that represents the future hybrid organization including its first set of propositions. Further piloting and collaborating with partners is of key importance. Inside this cultural – economic paradigm propositions can be (further) framed. For this, co-creation seems to be the most logical way to go. The role of design in cultural product development has been discussed by Pitsaki et al. (Pitsaki et al., 2010) in relation to the multidisciplinary aspect of the cultural experience. Taking the visitors’ perspective, or the visitor as the ‘center of

gravity around which all activities take place' (id.) is a basic element that influences not only the cultural good itself, but also marketing and management. In design literature this is often referred to as user centred design.

The concept of the proposition needs (at some point) to be accompanied with the concept for the future hybrid organization and its processes. Not necessarily all this need to be ready at the same time, but it needs to be understood that such for that part of the new socio technical reality also a concept is needed. Like during initiation, the concept also needs to have a certain credibility or validation. Is this really what we are going to bring towards realization? Is this what is going to help us in compensating for the lost revenue streams from the government? Probing such hypothesis with future partners and future customers could bring such validation. In fact prototyping the new business with some sort of minimal viable product (Ries) offer might provide huge learnings and insights that help to identify possible flaws of the concept on one hand and ways to 'robustinize' the whole concept on the other hand. Here the actors are involved in reflective conversations with reality and where they must maintain a 'double vision' (Schön, 1983: 164). An open perspective aimed at opportunities to change the concept and an engaged perspective to increase its coherence at deeper as well as broader levels. The stories resulting from these experiments equally help to further strengthen the changing conversations and enriched vocabulary as part of a new language (Lloyd, 2000). In fact, what happens during probing and prototyping is running quickly (not dirty) through an E and R phase to foresee what becomes important if we move full towards engineering and realization. Finally it needs to be said that, if necessary here a possible necessary change to the buildings of the cultural organizations need to be initiated by involving an architect.

### *E = Engineering the proposition and the hybrid organization*

Now the hybrid business concept and its propositions have reached the phase in which becomes dominant a process of rational problem solving and thus of engineering. This happens once we have a good and well supported feeling of its potential success as well as the areas that deserve extra attention during this phase. Here the collaboration with business partners becomes much more intense and requires formal engagement. They might contribute to the detailing of the business processes in such a way that efficiency leads to profit. They know how to value customer experiences into prices, they know how to create customer value by 'tweaking' the

business model. Also contracts are being detailed in this phase and structural changes to buildings are being made. The latter might of course go through its own IDER-cycle with the involvement of an architect and builders.

The engineering phase for the kind of business thed here covers lots of testing and refining. Almost in such a way that the organization and its propositions seamlessly transform to the realization phase.

### *R = Realizing the hybrid organization and its proposition*

As mentioned there could be a seamless transition from the E to the R phase. However, during all these transitions it is of prime importance to keep on paying attention to the socio-dynamics of the people involved. People do want to change, but don't want to be changed. So keeping an eye on opportunities to support the actors in their change process is important. But as we mentioned earlier, the whole process of realizing the hybrid organization must not end up with the new organization casted in the proverbial concrete as to remain flexible enough to adapt to new external challenges. In fact, the realization of this first new situation must be seen as the initiation of the next IDER-cycle. Meaning, if organizations successfully transformed themselves into hybrid forms, then they need to be able to innovate starting from that new hybrid organization. If not, then eventually the cultural organization will still find its 'Waterloo'.

## **Conclusions**

We have suggested organizational hybridization as a possibly viable strategic avenue for cultural organizations faced with the challenge to redefine their societal, artistic and financial position. We have described how the culture-political discourse poses systemic barriers for cultural organizations to develop cooperation outside the cultural domain, let alone fundamentally jeopardize their artistic identity. Our first conclusion is that in order to further cooperation and hybridization, the administration needs to allow an innovative entrepreneurial context.

Negotiating a position in a creative network and a new relation with the administration introduces this administration as an actor in the design process. This requires the administration to abandon the unilateral focus on a control responsibility and investigate the possibilities of trust (and regulatory safeguards) as a driver for the innovation of organizations, and subsequently of the relationship between the cultural sector and its

contexts. The administration could for instance be a 'broker' for the establishment of new product/organization combinations.

This article proposes to understand organizational hybridization as an iterative process in which all stakeholders (local administration, audience, the arts) share responsibility. Our conclusion is that since the IDER model allows for sensitivity for design-phases as socio-technical constellations connecting to existing inherited innovation routines in the organization, hybridization understood along along this model leads to a process that acknowledges the relationship between organizational form, cultural product design, and clear artistic-economic positioning of the organization. Once inside a new cultural-economic paradigm, a hybrid organization can routinely produce and innovate cultural goods and services.

# Omnipresent Access: User perceptions in new media ecosystems

Mark LEAL<sup>\*a</sup> and Jon JELEN<sup>b</sup>

<sup>a</sup>Parsons The New School For Design; <sup>b</sup>Parsons The New School For Design

*Technology has altered the world mostly in a pragmatic way - transportation and mobility, energy generation and distribution, transformation of natural resources into consumable products all changed human behaviors in that we adopted and adapted in order to harness the obvious potential of such progress in evolutionary speciation. Yet, the nature of information-centric technologies is paradigmatic in that it alters the character of humans and consequently the ways in which we relate to systems, experiences, objects, and to each other. It is therefore of utmost interest to investigate to what extent such impact occurs with the advent of yet another aspect of information-centric technological ingenuity. The past decade under the dominance of social media-related developments such as omnipresent access to streaming video services has been particularly disruptive. It may indeed have altered consumers' perception of entertainment altogether. Extending the existing framework of human-computer interaction with the novel human-centered research approach phenomenography, an exploratory study was conducted with 8 participants to define constructs that capture the experience of consuming streaming video. Grounded theory-based analysis of recorded interviews yielded five categories of variables that describe the nuanced experiences of participants. These in turn could then be composed not merely to conceptualize hardware and software development of upcoming mobile technologies, but could lead to the design and development of fundamentally different business models, digital experiences, and ecologies of coproduction.*

## **Introduction**

In October 2013, the Dell Computer company announced another tablet computer, the XPS 15, complete with an “HD+” display capable of showing high definition programming streamed wirelessly through Wi-Fi and over cell phone data (Whittaker, 2013). This tablet adds to the myriad of devices on which to consume streaming video including televisions, cell phones, video game consoles, computers, and other mobile devices. Also, Amazon recently released “Alpha House” and “Betas”, two originally scripted comedies made available through the Amazon Prime Instant Video service (Lewis, 2013). Amazon’s strategy to release originally scripted programming is a response to the success of the online media company Netflix, who have aggressively developed original content. With a data connection, these streaming video services are made accessible through desktop and mobile devices from anywhere and at any time. This convergence of technology and digital content embodies the growing presence of ubiquitous computing. Ubiquitous computing is commonly referred to as a post-desktop paradigm for computing (Galloway, 2013). It includes any combination of networked, mobile, embedded, location- and context-aware technologies (from GPS to RFID to sensors and smartphones) that can support “anywhere, anytime” communication (Galloway, 2013). Consumers of streaming content now possess “omnipresent access”, or the ability to consume a vast and rapidly changing library of content any time and in any place. Much research has been conducted in the field of human-computer interaction (HCI), but what qualitative effects does omnipresent access have on streaming video consumers’ lives? How do these experiences inform the design of future streaming experiences? The purpose of this pilot study was to explore the human-centered experience of accessing streaming video on mobile devices. Extending the abundant research devoted to usability and technology focused systems, this study uses the framework of phenomenography to understand and find meaning from experiencing “omnipresent access.”

## **Human-Computer Interaction**

Human-Computer Interaction (HCI) is a vast field of research that spans from the 1970s until today. HCI has become an umbrella term for a number of disciplines including theories of education, psychology, collaboration as well as efficiency and ergonomics (Hinze-Hoare, 2007).

*Figure 1: HCI Components*

Alan Dix, Janet Finlay, Gregory Abowd & Russell Beale (2004) define HCI as the discipline that involves the design, implementation and evaluation of interactive systems in the context of the user's task and work. HCI encompasses three components: the human, who is the user trying to complete work using the technology; the computer, which is any technology ranging from desktop computers to large-scale computer systems, a process control system or an embedded system, which could include non-computerized parts and other people; and the interactions which are any communication between a user and computer either direct or indirect (Dix et al, 2004, pp. 4 & 125). HCI research usually aims to create a more usable system by creating interaction frameworks such as Norman's model of interaction (Dix et al, 2004).

### **Norman's Model of Interaction**

1. Establishing the goal
2. Forming the intention
3. Specifying the action sequence
4. Executing the action
5. Perceiving the system state
6. Interpreting the system
7. Evaluating the system state with respect to the goals and intentions

There is an abundance of HCI theories related to usability, however it has been shown that "HCI theories are not yet fully established and that the discipline is highly fragmented, making it difficult to characterize a single method of approach or even a set of accepted principles" (Hinze-Hoare, 2007). Furthermore, HCI research that is related to usability tends to neglect the cultural and emotional experience of the human using the technology. Ann Galloway (2013) writes that HCI research has long brought together the

social and the technical, although cultural interest and methods are most often used in the service of technological development and implementation (pp. 53). Leading HCI researcher Alan Dix et al (2004) state, “An understanding of the capabilities and limitations of the human as information processor can help us to design interactive systems which support the former and compensate for the latter” (pp. 55). Galloway (2013) writes that the outcomes of HCI studies and research come down to whether researchers privilege the technology or the people who use it (pp. 55). More HCI researchers need to conduct studies that privilege and accommodate human’s cultural and emotional interactions with technology. Reeves & Nass (1996) argue that individuals’ interactions with computers, television, and new media are fundamentally social and natural, just like interactions in real life. Reeves & Nass (1996) continue, “By understanding the social and natural interactions with media, then there are a number of unexpected ways to improve the design of media” (pp. 8). Reeves & Nass also point out that people are not evolved to twentieth century technology and “the explanation of how that interaction works will depend on the psychology of the people who use them, not just the technology per se, nor the industries that make the appliances and produce the content” (pp. 12).

## **Phenomenography**

In order to explore and interpret the cultural and emotional meaning of experiencing technologies and platforms that deliver streaming video, we chose to use phenomenography as a method to understand the nuances of the lived experience. Shanna Daly, Robin Adams, & George Bodner (2012) describe phenomenography as an interpretive, qualitative research approach used to capture the variations that exist among differing understandings of the same particular aspect of the world and reveals the critical components that comprise that variation. Ference Marton (1981) also stresses phenomenography as a tool to reveal the qualitatively different ways of experiencing various phenomena. Marton (1986) further strengthened his view of phenomenography stating, “a careful account of the different ways people think about phenomena may help uncover conditions that facilitate the transition from one way of thinking to a qualitatively ‘better’ perception of reality” (pp. 33). Daly et al (2012) share this view stating that the value of using phenomenographic methods is the ability to create a landscape view that encompasses diverse perspectives that distinguish critical features of this landscape of awareness while

simultaneously highlighting the relationship among these variations (pp. 193). The outcome of phenomenographic research is to create a categories of description depicting the different ways in which a certain phenomenon is experienced and the logical relationships between them.

Phenomenographic research has been traditionally used within the study of learning, however it is increasingly being utilized in the professional and business world to uncover customer insights. In a recent Harvard Business Review article, authors Madsbjerg & Rasmussen (2014) state that CEO's see a lack of customer insight as their biggest deficit in managing complexity (pp. 82). Madsbjerg & Rasmussen (2014) observe that a growing number of organizations globally have begun to apply sense-making (phenomenography), having recognized that "it can help solve some of the toughest business problems, such as finding new growth, winning in new markets, and capitalizing on cultural change" (pp. 88).

## Methodology

### *Procedure*

Phenomenographic research requires qualitative interviews and observations in the Grounded Theory-tradition. Grounded Theory interprets a multitude of language and paralinguistic-based subjective impressions until it reaches "saturation", i.e. the categories start emerging from the interviews as repeating themes.

We conducted our interviews over three weeks at three sites: the Elmer Holmes Bobst Library at New York University, the Eugene Lang College at The New School, and the Directors Guild of America in New York City. Participants were asked to list the devices they use to watch streaming video and to verbally respond to the following questions: Why do you watch programming online? How does it feel to watch on a mobile vs. a non-mobile device? What does having access to programming on multiple devices mean?

Finally, we asked each participant to send us a digital photograph of their "natural viewing environment," or where they typically watch streaming video to enrich and triangulate our understanding of their verbal responses.

### *Criteria and Collection Procedures*

We took an interpretive approach to this study, maintaining an open framework with no specific end-point in mind. Participants responded directly to questions, but veered off from the experience of streaming video

itself to more specific content that they enjoy. Phenomenography requires openness as every response is relevant and that most participants will have different words for similar experiences.

The methods to collect data were recorded interviews, note taking, and photo-study. Transcribed interviews are useful to document the participants' lived experience and the recorded responses are used as a reference to develop themes. Interviews were recorded with Smart Voice Recorder developed by Smartmob Development, a voice application enabled by a tablet computer. By taking notes and listing the devices they use, more accurate reports about their viewing habits and how those habits correspond to their chosen device could be documented. Participants were instructed to take pictures of their "natural viewing environment", which is defined as where participants typically watched streaming video. By asking each participant to send a photo, we hoped to gain an understanding of how their physical environment contributes to their experience of omnipresent access. The photo-study not only helps to further build the context of their experience but can also illustrate their viewing habits in a more literal way.

Finally, a "Research Protocol" printout of the research questions was used to record participant responses.

### *Analysis Procedure*

Data were analyzed in three different ways. Participant responses were summarized and transferred visually via mind maps. According to Hanington & Martin (2012), mind maps can "provide a means to visually represent their unique thinking patterns in a nonlinear, visual way" (p.118). In how this is relevant to qualitative research, Hanington & Martin (2012) continue, "it allows us to summarize and test assumptions, make and break connections, and consider alternatives while we shape the data into meaningful themes and patterns" (p.118). An example of one participants' mind map is illustrated in Figure 1.

Secondly, participants' photos were analyzed against their responses to determine if their unique experiences were manifested in the photos. Hanington & Martin (2012) state that photo-studies "Can lead to unique discoveries about users, their behavior, and priorities" (p.134). Hanington & Martin (2012) also appreciate the exploratory nature of photo-studies stating "Patterns and themes might emerge across an inventory of several photos from multiple participants, providing insight for design implications" (p.134). Finally, all photos were combined into a collage and analyzed in a

photo-study to identify similarities and whether the identified themes are manifested therein.

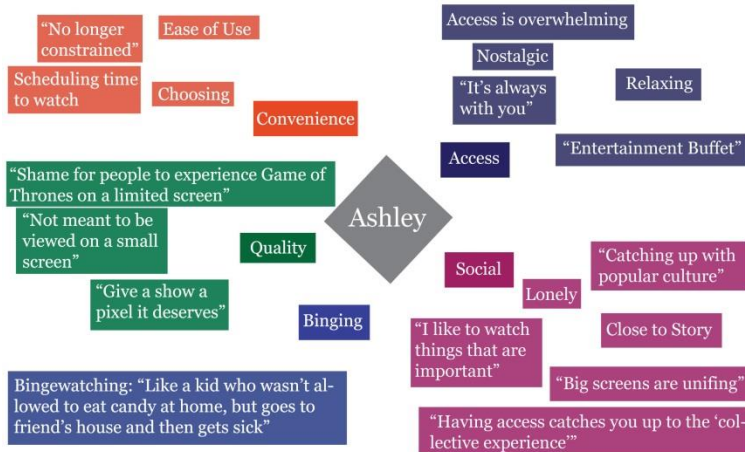

Figure 22: Mind Map from Interview

## Results

Participants were asked to name the devices they use to watch streaming video. Brands of the devices were not recorded, and were bracketed out of the research. Most of the descriptions of the devices are self-explanatory; however the notion of “Streaming Box” was separately defined as a digital media device that is mainly used to stream services such as HBO GO, Netflix, etc. A “Streaming Box” is usually connected to an external computer monitor or television fitted with inputs for the device. A distribution of devices between participants is illustrated in Figure 2:

Figure 2: Devices Used to Consume Streaming Video

From the eight recorded participant interviews, 43 significant statements were chosen for coding. Each significant statement was analyzed for its formulated meaning, and all related meanings were clustered and arranged into 5 thematic categories.

Table 1: Categories of Description

Theme	Description
Convenience of Access	Always on connectivity enabled by the internet allows anywhere/anytime access to content libraries on mobile devices
Control and Agency	Users have more control over their schedules and can adopt market offerings with greater ease
Social Adaption and Cultural Adoption	Social viewing is being redefined in the age of omnipresent access as users are able to more actively participate in and easily discuss popular culture.
Quality and Value	Users feel they are receiving greater value from always on/always connected devices and place quality on bigger devices over smaller ones
Addiction	Users are able to consume enormous amounts of content on a seemingly endless supply of material

### *Theme 1: Convenience of Access.*

All participants quickly cited convenience as a reason to watch streaming video on multiple devices. One participant described multiple access points as “freeing” because “you are not tied down like with broadcast television”. One does not need to be in front of a television at a particular time to consume what they want to consume. One participant praised the convenience of mobile streaming services that “enable long-tail access to a wide database of choices.” All participants stated that accessing a vast library of content at your fingertips in your own home is far more convenient than taking the time to travel to a movie theater or to a video rental store to attain a physical copy of a show or movie. One participant enjoyed downloading a copy of a television show to watch on the subway as he traveled. Two participant photos illustrated convenience as one participant would watch a show in the bedroom and physically take their laptop with them as they went to their kitchen. The convenience of omnipresent access frees you from delaying consumption and enables multitasking.

### *Theme 2: Control and Agency.*

Most participants felt empowered by the ability to choose their viewing schedule, whereas in the past, as one participant stated, “I would have to wait for a show to start, but now I can start it whenever I want.” The fact that streaming video is something that you have to choose makes participants feel that they were in control of what they were consuming instead of having to wait for a scheduled show to start. “Flipping channels is a thing of the past” said one participant. Traditional television and movie theaters have strict schedules that they need to plan their life around. One participant response noted the difference stating, “Watching TV is passive and new media is active.” When asked about the meaning of having access, one participant stated: “watching a show is now personal to you... I watch to relax.” Economic agency was also apparent as one participant offered, “other traditional mediums require you to pay [more] for access to what you want, so I feel like I am getting a greater value with Netflix” while another agreed stating, “I’m getting more for my money.” Photographs submitted by participants illustrated control and agency by showing how participants who mainly watched on their laptop or mobile device controlled where they watched. A few photos showed participants away from home, scheduling their viewing around work and school, rather than needing to be at home at a certain time in order to watch what they want.

### ***Theme 3: Social Adaptation and Cultural Adoption.***

Consuming media has always been a social phenomenon, but not to the scale as it is today. Participants described how they are adapting to new social interactions enabled by omnipresent access. One participant stated, "Access enables interconnections" and "One day, you might be able to see what people are watching in real time on social media websites, and privacy will be very important." However, one participant is weary of such connectivity by reporting "People may see you watching in public [on a mobile device] and ask questions [...] I want to avoid that." As screens become smaller, social viewing lessens. Mobile screens cannot accommodate multiple viewers, and one participant noted that "big screens are unifying." Although multiple viewers may not be able to watch on a single mobile device, others are watching on their own devices during their own schedule. One participant felt it was her duty to "catch up to everyone else" so that she could feel a part of the group. This participant also stated that omnipresent access enables her to catch up to the current state of the viewing culture stating: "I feel left out when I have to not hear a conversation about Breaking Bad." Participants placed high value on social viewing with one arguing, "You tend to communicate with people at the theater non-verbally while watching, but you cannot do that with mobile devices... I'd like to see a way to continue that at home." One participant photograph illustrated how mobile devices and laptops ease the act of sharing content with others, but it also showed that it can take greater effort.

### ***Theme 4: Quality and Value.***

Participants stated strong opinions related to the quality of the viewing experience on mobile devices and the perceived value that they receive by participating in online subscription services. Screen size was a major factor in determining their quality tolerance. Participant responses about quality varied including, "[your device] should give a show the pixels it deserves", "The bigger, the better," and "Small screens on mobile devices take away from overall experience." Participants felt that they were receiving value from new media streaming services as one participant stated, "It's an easier, faster experience." One participant described how an online video subscription is a great value stating, "New media helps you save money by preventing you from going to the theater." Another agreed stating, "Other traditional mediums require you to pay [more] to access what you want." All participants had a sense that the content available online was better than

what could be accessed by television broadcast, with one participant arguing “TV can be brainless entertainment.” One interesting observation is that although every participant owned some version of a smartphone, all participants stated that they do not prefer to watch their favorite movie or television program on a smaller device because it lessens their overall viewing experience.

### *Theme 5: Addiction.*

Some participants who reported to be avid users of streaming services gave descriptions of video consumption that closely resembled descriptions of addictive behavior. Binge watching was something that all participants stated to be recently engaged in. One participant described their content binging as “Needing to get my fix” and another said that having constant access enables “Instant gratification.” Another participant described constant viewing on multiple devices as having “momentum.” One participant described how new media viewing mirrored her experiences at the movie theater stating, “There’s something perfect about getting popcorn, sinking into your chair, watching 10 minutes of previews, sipping your coke, and getting lost [...]. I think we still have that: we still get the *rush*. But, we get it for hours at a time” One participant who watches programming at home and at work admitted she may be addicted to streaming media, and the photograph of their desk illustrated how she views programming at work in her cubicle.

## **Discussion**

Human-computer interaction studies have traditionally focused on the practical and the rational, i.e. the pragmatic aspects of usability, where streamlining work paths and technology efficiency are the main outcome from such research. Phenomenography can be introduced as a tool for achieving human-centered designs in non-design contexts. This pilot study with eight participants developed five themes that help to elucidate the experience of possessing constant and diverse access to streaming video on multiple devices, herein described as “omnipresent access”. Through understanding the user perceptions of omnipresent access, we as designers and design managers can direct the adoption of new technologies through a re-design of the digital experience. Designing for the social and cultural values of the user will inevitably inform the design of the service and/or platform for viewing streaming video.

Participants' feelings towards possessing "omnipresent access" were overwhelmingly positive. All participants stressed the importance of choice and that entertainment selections before the availability of streaming media was limiting as constraints of schedule, length, and location determined the participants' capability to consume. They now have the choice to be entertained on their schedule, however long they like, and where they prefer. This capability suggests that participants are enjoying new agency in their lives; discovering video becomes more of an active experience for the user who are enabled by convenience, rather than be controlled through scheduling or barriers to entry. Mobile devices facilitate consumption and are capable of replacing traditional devices to watch programming. It is this very *adaptation of users* to the newly created contexts and capabilities both socially and financially, rather than the traditionally assumed *adoption of the technology and adaptation to the needs of the users* that intrigues us.

The two themes that were also of particular interest to us were *Social Adaption and Cultural Adoption* and *Quality and Value*. We believe that these themes are not only of interest to HCI researchers but also design managers, who have a vested interest in designing experiences that take into consideration human insights and perceptions to increase adoption of technologies that require constant interaction. The theme of *Social Adaption and Cultural Adoption* tells us that users desire access to streaming video as a means to connect with others through popular culture and though personal interactions facilitated through technology. The feeling of "always being connected" not just alludes to the technology, but the person themselves. Design entrepreneurs should be aware of these insights while developing business ecosystems that leverage value propositions that place importance on social viewing or interactions with streaming video. User perceptions related to *Quality and Value* help us to understand that as the quality of video increases, the willingness to view such programming on a smaller screen decreases. This theme also shows that users are conscious of the opportunity cost of streaming video to their personal devices versus watching programming through broadcast or at the movie theater. These themes extend beyond traditional usability research as these insights should inform the journey of the digital experience before the development of the platform and usability testing.

Human-centered design approaches have been proven to bring value to businesses by uncovering and highlighting human behavior. Understanding how humans behave within technology ecosystems can inform the design of a new ecosystem. Digital media companies should be aware of how

streaming video consumers perceive their viewing experience as it affects the users' willingness to continue viewing, what they would prefer to view, and how they choose to watch. The themes mentioned are descriptive of the consumer's tolerance to quality on a mobile device, the social adaptations of consumers, and how a convenient viewing experience can facilitate customer loyalty. The findings in this study also suggest that consumer perception of traditional viewing is shifting. "Omnipresent access" to content is becoming the preferred method to consume.

## For Further Research

There are several opportunities for further research to be conducted from this pilot study. Design incorporates insights from human experiences, cultural contexts, and economic environments. This research aids in identifying a few social, cultural, and economic attributes of the human experience of consuming streaming video as well as their perceptions related to financial decisions. Although these insights are not novel, we have identified two themes that could be expanded upon through quantitative analysis. A questionnaire could be formed related to social and cultural experiences in new media ecosystems that could inform the design of digital experiences. There is much room for testing these themes in larger qualitative studies in different cultural environments. Testing related to social viewing on mobile devices is limited and we envision a series of tests being conducted that develop a more solid understand of how the desire for social viewing affects the user's willingness to adopt new technology. The perception of what is a quality experience is varied among participants so we recommend testing different designed digital environment to discover user's tolerances for screen size and picture quality and how it affects the adoption of new technology.

Lastly, the notion of "omnipresent access" does not simply involve streaming video over the internet. We briefly touched on the fact that users perceive that their lives are drastically altered though ubiquitous computing and we posit that this perception reaches further into their lives. Omnipresent Access has enabled not only the rapid consumption of media, but rapid production of ourselves into an interconnected web of hyperactivity connected to everyone, all the time, and at any place. We believe a study can be conducted that explores the process and perception of an omnipresent, hyper-production of ourselves online and how that reality affects users' lives in the physical world. Those insights could serve as

a foundation to design transformational experiences that bridge the digital and physical worlds.

# **Editorial: Social and Sustainable Design Management: A brave new era**

Rita ALMENDRA and José VICENTE

Social and sustainable design emerged during the last century as a brave new field, committed to answer the urgent needs of humanity. Due to its relativity newness, there is a lack of definition about its territory, scope and practices. This is demonstrated by the multitude of terms and expressions used to describe almost similar methods and approaches. Some of these relate to collaborative work with social sector organizations and others to designer's own initiatives to help society face the most complex social, environmental, cultural, political and economic challenges.

Social design and sustainable design are intertwined since both advocate a change of paradigm. Human well-being is a common goal to both social design and sustainable design. There is no sustainable design without balancing social/individual/ cultural dimensions with economic and environmental ones. And social design can be seen as assuming sustainable design principles and translating them into practice with a specific focus on social issues.

Both possess in their DNA high levels of responsible and ethical commitment. Nevertheless there is still much to be discussed:

Are the outcomes of responsible design (either social or sustainable) still creating more damage than good? How can we reduce that damage? Do we have enough information to take the correct decisions? Is our focus too narrow? Are we, designers and other stakeholders, ethically determined and motivated? Do we manage the design process with a human-centred approach? Do we know how to involve the communities, leading to real partnerships processes, and not designer dictatorial ones? Are there paths that lead to greater accountability and involvement of all stakeholders, namely designers? Can we promote local development combining design with other disciplines? Can we promote commercial success with responsible design? Can we create a responsible design without a commercial success? Do we have the best measurement tools? Or even better, are we measuring the right things? Should we focus on qualitative human well-being metrics? And, finally, is our design education on social

and sustainable design and design management enabling the development of a solid and newer praxis?

Without revealing the end, its fair to say that the discussion around these subjects leads inevitably to the understanding that the sophisticated complexity of this area demands high levels of empowering and knowledge of the designers, alongside with awareness, motivation and ethical determination of all stakeholders.

Can we manage a brave new era towards sustainability?

## Socially Responsible Design or ‘Bear Favours’

Anders HAUG<sup>\*a</sup> and Jacob BUSCH<sup>b</sup>

<sup>a</sup> University of Southern Denmark; <sup>b</sup> Aarhus University

*Since Victor Papanek in 1991 addressed the social responsibility of (industrial) designers, a plethora of books and papers on aspects of socially responsible design has emerged. However, this literature is far from having solved the environmental and social problems faced by the world today. In this vein, this paper focuses on a major problem for many socially responsible design initiatives, namely that, although they may be the result of the best of intentions, many of these involve a danger of doing unintentional harm. On this basis, the paper raises the question ‘how to avoid that socially responsible designs end up doing more harm than good?’ The question is addressed by defining the different levels of uncertainties associated with such projects, and by arguing for a consequentialist ethics to govern socially responsible design in the future.*

**Keywords:** *Socially responsible design; sustainable design; design ethics, uncertainties; design management*

## Introduction

Victor Papanek (1991) was one of the first to address in detail the social responsibility of (industrial) designers. Since then a plethora of books and papers on aspects of socially responsible design has emerged. Examples of design philosophies with the purpose of improving the wellbeing of humans and/or the environment include design activism, design ethics, ecological design, environmental design, environmentally sustainable design, environmentally conscious design, emotionally durable design, ethical design, green design, nudging, responsible design, social design, sustainable design, triple bottom line and welfare design. More terms that denote socially responsible design approaches exist, and such new 'names' may even be invented, as we write this paper. However, it has been argued that this literature is far from having solved the environmental and social problems the world faces today (e.g., Stegall, 2006; Fuad-Luke, 2007).

This paper focuses on a potential problem of socially responsible design initiatives, namely that, although they may have the best of intentions, many of these may overlook a danger of doing unintentional harm — in part because of having too narrow a focus and because of starting from socially responsible theories unapt for the complex environment in which design takes place. This kind of problem is captured in the fable 'The Bear and the Gardener'. The fable is of eastern origin and was introduced to western readers by La Fontaine at the end of the seventeenth century. In brief the story describes how a solitary garden lover (gardener) encounters a lonely bear with whom he strikes up companionship. In return for food, the bear is given the responsibility of keeping flies off the gardener when he naps. At some point, the bear is unable to drive off a persistent fly, which in turn compels the bear to use a stone to crush it. However, in doing so the bear unintentionally kills the gardener as well, as the fly came to rest upon the gardener's head. In this paper, we argue that designers and decision makers in their eager to solve societal problems may overlook important consequences of their solutions and, therefore, risk to do more harm than good — in this paper referred to as 'bear favours'. To address this issue, the question raised by this paper is 'how to avoid that socially responsible designs end up doing more harm than good?'

To address the question in focus, this paper first provides a brief resume of the history of socially responsible design. Next, the paper uses the literature to illustrate how several socially responsible design initiatives have failed or at least have been questioned in relation to their overall benefits. Hereafter, the paper uses an uncertainty perspective for explaining why

well-intended designs sometimes may fail to deliver the expected effects or have unforeseen side effects, which in some cases imply that they cause more harm than good. Next, the paper addresses ethics in relation to socially responsible design. Finally, in the discussion and conclusions section, the paper places socially responsible design in an ethical framework, on which basis the consequences are pointed out in relation to future socially responsible design.

## **A brief resume of socially responsible design**

The idea that design practice needs to display social responsibility goes back a long time. For example, the English artist, writer, and textile designer William Morris (1834-1896) together with the English Arts and Crafts Movement championed traditional craft production as opposed to division of labour — not only because he believed that this manufacture method led to superior quality products, but also because of the well-paid and honourable employment that he believed craft production provided (Gorman, 2003). In America, designers began to consider social responsibility in the 1930s and 1940s, when, according to Whiteley (1993), the first generation of American industrial designers (including Norman Bel Geddes, Henry Dreyfuss, Walter Dorwin Teague and Raymond Loewy) were trying to justify their practice in terms of contributing to a better world by making products more efficient, easier to operate and more user-friendly. However, some of the downsides of mass production became evident and were criticised in the 1950s, for example, concepts like 'planned obsolescence', which was addressed by Vance Packard (1957, 1960).

A radical critique of the practice of design was forwarded by Austrian-born US-based designer Victor Papanek in 1971 in the book 'Design for the Real World: Human Ecology and Social Change'. This book is widely understood as the seminal text of twentieth-century 'design activism' (Clarke, 2013). In this book, Papanek argued that designers do harm because of their function in supporting over-consumption. Instead, Papanek presented the idea that designers and other creative professionals have a responsibility to cause real change in the world through good design, for example by designing for people's needs rather than their wants. This paternalistic approach requires that the designer is to decide what is (morally) right for people. The topic of 'design activism' has been of growing interest for researchers throughout the past decades (e.g., Thorpe, 2008; Faud-Luke, 2009; Julier, 2013; Markussen, 2013). Generally, design activism

is defined to describe the central position of design in relation to: (1) promoting social change, (2) raising awareness about values and beliefs (for example, in relation to sustainability), or (3) questioning the 'negative' role of consumerism on people's everyday life (Markussen, 2013). However, despite the great attention towards socially responsible design approaches, Papanek's agenda is far from being systematically embedded in design education and practice (Boks and Diehl, 2006; Ramirez, 2006).

It was not until the mid-1980s that environmental problems became widely recognized by scientists and intellectuals, and social and environmental concerns were conceptualized on a larger scale and introduced to the public (Er and Kaya, 2008). An important event in this area was the 1987 report 'Our Common Future' by the Brundtland Commission (formally known as United Nations' World Commission on Environment and Development) that positioned 'sustainable development' as a necessity to guide all future human endeavours (WCED, 1987). An oft-quoted definition in the report is that sustainable development concerns the "development that meets the needs of the present without compromising the ability of future generations to meet their own needs." Soon after, in 1989, the United Nations Environment Program (UNEP) began the work of identifying and implementing solutions to prevent pollution, and from the early 1990s, industrial designers increasingly focused on cleaner production and began to pay attention to reducing the negative impacts along the entire life cycle of a product (Keitsch, 2012). A central element to this development was (and is) the centrality of the so-called precautionary principle, which advises that lack of evidence about the outcome of an action is not in itself a reason for not taking precautionary measures. An often cited formulation of the precautionary principle is the formulation found in the 'Rio Declaration on Environment and Development' (or 'Earth Summit Declaration') from 1992: "In order to protect the environment, the precautionary approach shall be widely applied by states according to their capabilities. Where there are threats of serious or irreversible damage, lack of full scientific certainty shall not be used as a reason for postponing cost-effective measures to prevent environmental degradation" (UN, 1992). In the context of the bear and the gardener, the precautionary principle would advise the bear that the stone should not be dropped, on the grounds that there would be inconclusive evidence about the effect of dropping it (assuming that the bear was acting out of ignorance).

Since the 1980s a number of approaches that deals with environmental and/or human problems have emerged along with the increased awareness of

environmental and humanitarian problems. A central discussion in relation to such approaches is the role of the market when facing the challenges of environmental and humanitarian problems. The argument of the need for more radical approaches than those, which can be accomplished in corporation with companies, echoes the agenda by Papanek, namely that socially responsible designers must organise their interventions outside the mainstream market. A counter-argument is that it is not per se impossible to make progress inside the market mechanisms (Cole, 2012). However, it is widely agreed that the world will continue to face environmental and humanitarian problems, perhaps at an accelerated pace, in the 21st century (Stern, 2006; Er and Kaya, 2008; Chapman, 2009). This message was further emphasised on March 31, 2014, and April 13, 2014, when the Intergovernmental Panel on Climate Change (IPCC) issued its second and third working group reports respectively. According to these reports, CO<sub>2</sub> emissions have been continuously increasing, resulting in climate changes that need to be reacted upon quickly and dramatically, if humanitarian disasters should be avoided (IPCC, 2014, March 31; IPCC, 2014, April 13). Given the negative development in more than two decades, during which the main focus has been on making progress inside the market mechanisms, it appears unlikely that such initiatives alone are enough. In worst case, they may give us the illusion that we are actually solving the problems at hand and thereby take away the focus from doing what is necessary.

## **Critiques of socially responsible designs**

During the last decades, various socially responsible designs have been implemented. Many of these, however, have had minimal effect on a global scale, and some have even been questioned as to whether they are in fact doing more harm than good. Table 1 shows a small selection of the initiatives, the benefits of which have been questioned. It should be emphasised that it is not our purpose to assess if these criticisms are justified or not.

*Table 1 Examples of possible problems of socially responsible designs*

Initiative	Promoted as	Critique of initiative
Urban agriculture	A means to reduce negative effects of food transportation.	Allocating metropolitan land to agriculture results in lower urban density levels, which results in longer commutes, which is far more energy intensive than food transportation (Glaeser, 2011, June 16).
Green roofs	A particularly	Rainwater runoff from green roofs transfers the

	convenient way of making buildings sustainable.	pollutants seized by urban vegetation from the atmosphere to the surrounding environment (Speak et al., 2014).
Electric vehicles	A less polluting alternative to combustion engine cars.	Electrical vehicles do not have a much lower global warming potential, but exhibit the potential for significant increases in human, water and soil toxicity (Hawkins et al., 2013).
Biofuel	A means to reduce fossil fuel need and pollution.	<i>The increase in the production of some types of biofuel may threaten biodiversity</i> ; some types of biofuels demand more fossil energy to produce than the fossil energy saved by using them (Groom et al., 2008; Pimental and Patzek, 2005).
Bio-degradable products	A means to reduce environmental impacts of waste.	Biodegradable products may not be more environmentally friendly when disposed of in landfills because of the methane gas they release when they degrade (greenhouse effect) (Levis and Barlaz, 2011).
Vegetarian products	A means to promote animal welfare and minimize environmental impacts.	The switch to vegetarian products implies an enormous need for palm oil and soya, resulting in massive carbon dioxide emissions, placing animals on the brink of extinction because of the need for plantations, and involving a heavy use of pesticides that contaminate ground soil and water (Audsley, et al., 2009; McCutcheon, 2013).
Vegan clothing	A means to minimize the need for (polluting) animals.	Vegan leather and faux fur creates toxic discharges that contaminate local air, water and soil; plastic-derived products are not fully biodegradable, leading to waste issues (McCutcheon, 2013).
Using less or more natural materials for packaging	A means to become more environmentally friendly.	Cutting back too much on packaging or using recycled material can result in damaged products during shipping because of smaller durability, which implies wasted energy and natural resources; the production process for a paper shopping bag, as compared to a standard plastic bag, demands more energy and water, and it releases more greenhouse gases (Porter, 2013).
Fish farming	A means to take off the burden on wild fish stocks.	Fish farms increase the spread of diseases and parasites in the wild ecosystems (Krkosek, 2010).

## Uncertainty in socially responsible design

As shown by the examples in Table 1, it seems that sometimes socially responsible designs fail to produce the intended effects and/or have unforeseen negative side effects. This phenomenon may be explained by the uncertainties related to the effects of any solution. If such uncertainties imply that solutions are chosen, which turn out to do more harm than good, we have what we in this paper term 'bear favours'. In order to frame this discussion, we shall first introduce a few definitions that will allow us to pinpoint the ways in which 'bears-favours' may originate and the likely causes and conditions of origin. These definitions will also help us in our discussion of the relevant ethical aspects pertaining to different cases.

The first definition focuses on defining the type of processes that can produce negative effects. In this context, a distinction can be made between impacts on humans and the natural environment, and another overall distinction can be made between the phases in the lifecycle of a product, building or service — i.e. 'before use' (manufacturing, transport, etc.), 'during use' (energy consumption, health issues, etc.), and 'after use' (disposal, recycling, etc.). These two distinctions produce six dimensions that are to be considered to gain a full understanding of the effects of a design. This is illustrated in Figure 1.

*Figure 1 Dimensions of socially responsible design*

The second definition concerns a distinction between focus and side effects, and one between direct and indirect effects. Focus effects refer to the effects that a solution aims to achieve, while side effects refer to other positive or negative effects. Direct effects refer to the actual effects of a solution, while indirect effects refer to the lost effects of another solution that the chosen solution takes the attention or resources away from. Using these two distinctions, four types of 'bear-favours' may be defined:

- 1) Negative direct focus effects: Aiming to achieve an effect in one area, but eventually doing more harm than good in this area. For example, using more fossil energy to produce biofuel than the saved fossil energy as a result of using the biofuel.
- 2) Negative direct side effects: Aiming to achieve an effect in one area, but by doing so, doing harm in another area. For example, using less packaging material to save resources, but in effect causing more products to be damaged, and thereby wasting other types of resources, as well as causing troubles for individuals and companies.
- 3) Negative indirect focus effects: Aiming to achieve an effect in one area, but by doing so, blocking for more efficient initiatives in this area. For example, focusing on certain types of alternative energy sources at the expense of more efficient ones.
- 4) Negative indirect side effects: Aiming to achieve an effect in one area, but by doing so, blocking for initiatives in other areas more in need of attention. For example, every time funds are given to sustainable initiatives addressing one area, at least in principle, it is at the expense of using these funds on initiatives addressing other areas, which some may consider to be more important.

These four dimensions are illustrated in Figure 2.

Figure 2 Types of negative effects of socially responsible initiatives

The third definition concerns the notion of risk, and it may help us understand why initiatives that produce undesired effects are carried out. According to Hansson (2004, p. 10), there is a tendency to use the concept of risk to denote any of the following: 1) an unwanted event that may or may not occur; 2) the cause of an unwanted event which may or may not

occur; 3) the probability of an unwanted event which may or may not occur; 4) the statistical expectation value of unwanted events that may or may not occur; and 5) the fact that a decision is made under conditions of unknown probabilities. It is not our goal to decide between each of these suggested usages that Hansson found in the literature, but it should be highlighted that risk, as it pertains to actions and their impact, can originate both in cases where the probabilities of different outcomes are known and in cases where they are not. Furthermore, for any action that is carried out, there is always a chance that outcomes different from those expected might occur. Some of the causes for this will be within our range of knowledge (safe range of prediction) and/or control, but some will not be. Because of the probability that can be assigned to each of these outcomes, there is a risk connected with the action, namely the risk of an outcome that was not intended by choosing that action. In worse cases, we may have a grasp of the possible outcomes of an action, but have no idea about the probabilities of the outcomes. In fact, there may be even worse scenarios, namely those where we do not have a full grasp of the possible outcomes of an action that we take. In those cases we do not know whether we have taken every possible harmful outcome into consideration (Sahlin and Persson, 1994). Although it may seem that such actions would be few and far between, it takes little imagination to recognize that in fact many if not all of our actions have uncertain outcomes. The causal chain initiated by any action stretches out in time, i.e. into the future where we (sometimes) have absolutely no clue what the long-term effects of any action might be.

In summary, there is a distinction between decisions (to act) under risk, i.e. those situations in which the probabilities of different outcomes are known in advance, and decisions (to act) under uncertainty, i.e. those situations in which the probabilities of different outcomes are unknown. According to Altham (1984), the ethics of risk cover both. In the context of socially responsible design, five types of uncertainties may be derived, as illustrated in Figure 3.

The first uncertainty refers to the decision as to which problems are most relevant to solve. Recognising that we have only limited resources, or that we are willing to invest only a certain amount of resources, a prioritization needs to be made. This kind of prioritization is obviously extremely debatable and raises issues such as how to prioritize short-term versus long-term effects and which people deserve attention the most. The risk of this uncertainty is that it may result in decisions that address certain areas at the expense of others, which we may later discover to be in more

need of attention. It may also result in favouring present or nearby present (in time) people over future people (Parfit, 1984). The second uncertainty refers to the knowledge as to what are the different means for addressing a problem. The risk of not knowing the full set of possible solution types is that less efficient means may be chosen at the expense of more efficient ones because the decision makers were not aware of their existence and therefore did not investigate. The third uncertainty refers to the direct effect of particular solutions. The risk of this uncertainty is that inefficient solutions may be chosen at the expense of more efficient ones. The fourth uncertainty refers to the total effect of particular solutions. The risk of this uncertainty is choosing solutions with negative side effects in the form of new problems on a similar scale as those they solve. The fifth uncertainty refers to the problem of comparing the total effects of different solutions. The problem of this uncertainty is that it involves a prioritization as to which positive effects are most desirable and which negative side effects are most tolerable — i.e. there may not be a general consensus about this issue, which can make it difficult to implement such initiatives. Thus, such uncertainties may imply be that solutions needed are not implemented in order to avoid what some perceive as being unacceptable negative effects. However, given that the problems probably cannot be solved without anybody having to pay a price, the emerging question is how we can make such decisions? This is to a large extent an ethical issue, which the subsequent section starts to address.

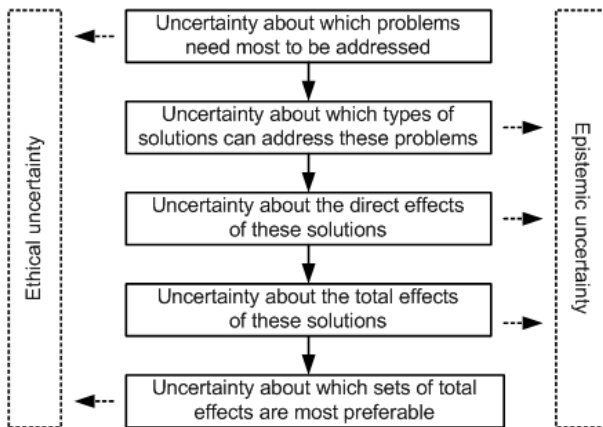

Figure 3 *Uncertainties in socially responsible design*

## **The ethical aspect of socially responsible design**

According to d'Anjou (2010), ethics in the design disciplines has essentially been articulated around notions that from an overall perspective correspond to Kantian (deontological ethics) and Aristotelian (virtue ethics) perspectives, where the Kantian perspective is the most common in relation to professional codes of ethics and practice. D'Anjou, in turn, argues that Sartre's view of ethics has to be seized as a possible foundation for design ethics. Although we sympathise with d'Anjou that it is unlikely that the solution of the deepest moral dilemmas may be forthcoming, we do believe that there is more to say, and that granted a more consequentialist oriented perspective, we can also make headway towards making better-founded moral choices in design. Broadly speaking, consequentialist ethics is based on the assumption that the morally right choice is the choice with the best outcome. This stands opposed to an Aristotelian view according to which a morally good choice is made when it is a product of good moral character, and opposed to a Kantian perspective according to which a morally good choice is a choice that is made out of regard for 'the moral law' (based on his idea of the categorical imperative). Which moral theory is chosen as the starting point is crucially important to define how we understand ethical responsibility in a design context.

The examples in Table 1 make vivid that in many cases the attempt to obtain outcome goal with ethical consequences of one kind has ramifications for an ethically important goal of a different kind. That we do have coexisting and sometimes conflicting ethical aims is not new, but it is not immediately transparent in neither an Aristotelian, nor a Kantian or a Sartrean view of ethics. On the other hand, a consequentialist ethics neatly captures our predicament as moral agents with multiple moral responsibilities and goals. Consequentialism is the ethical theory that tells you that the moral goodness of an action is a function of the consequences of that action. Consequently, the morally best action is the action with the best outcome. However, this generalised formulation does not define 'the scope of relevant outcomes' and what constitutes a 'best outcome', i.e. what the moral measure should be. In the variety of consequentialist theory being discussed, we find different candidates in the history of philosophy, for example Mill's utilitarian theory, which advise us to maximise utility, implying that the goodness of an act becomes relative to its effect on the total happiness: "actions are right in proportion as they tend to promote happiness; wrong as they tend to produce the reverse of happiness" (Mill, 1861/1979, p. 7), with happiness roughly defined as pleasure and absence of

pain. A related but more recent concept is that of wellbeing, sometimes understood in terms of 'quality of life'. From modern positive psychology we find the vocabulary of preference satisfaction, or simply satisfaction, measured on a scale from e.g., 1 – 10. In economics, outcomes are weighed against one another in terms of monetary value. Indeed, one of the major obstacles for modern economics is setting values for such diverse outcomes as environmental catastrophes, species extinctions, the pollution of a lake, and quality human life years.

It is apparent that there are significant challenges inherent to the view in terms of selecting a common measure for ranking outcomes against one another. On the other hand, the view both has the welcome consequence that it allows for ethical thinking in economic planning, but it also allows us to navigate ethically, when it comes to evaluating the moral goodness of certain design strategies over others, although those strategies have potentially multifarious outcomes with impacts on different aspects of human life and the environment (see, for example, Broome's (2012) discussion of discount rates in relation to environmental problems).

## Discussion and conclusions

Acknowledging that when we decide on which actions to carry out, there is a probability that the outcome of our actions is different from what we expected, which raises immediate questions about what the threshold of probability should be for deciding whether to carry out an action or not. This issue pertains to the level of evidence that is relevant to what the consequences of choosing a particular action are. Furthermore, depending on the badness of the possible outcomes of an action, it also raises the ethical question of what the threshold should be on the probability of a very bad outcome, in order for us to abstain from carrying out an action. The situation of course becomes worse, if it is admitted that for many, if not for all, of our actions there is a level of radical uncertainty, which means that we are never in a position to know if there is a possibility of a very bad outcome for all of our actions — and if that is case, what is the rational response?

When a design is aimed at achieving a particular good, or a good of a particular kind, the idea, generally speaking, is that by implementing one type or novel kind of design over another, we are likely to achieve a better outcome with regards to this perceived good than we would be by implementing the other kind. The goodness of a design, so to speak, in this picture is a matter of the good consequences that it brings about. As

highlighted above, the ethical theory that mirrors these assumptions is consequentialism. According to consequentialism, whether a particular design strategy or design is the morally right one, is determined by the actual outcome of that strategy. But, as we have been considering so far, any outcome is governed by some degree of risk — be it either in cases where probabilities of outcomes are known in advance or in cases of uncertainty. Thus, the right design strategy to initiate at any given point in time must be decided upon by the expected outcomes of implementation. This expected outcome is a function of the probabilities of possible outcomes. In cases where we can carry out a calculation of this kind (where the estimated probabilities are known), we can weigh the expected risk of a design against the expected benefits, granted that we have a way of quantifying outcomes, i.e. in measures of utility, wellbeing, money, etc. In traditional economic fashion we may conduct a cost benefit analysis of the situation.

First and foremost, the consequentialist approach requires calculations of good versus bad outcomes, together with a fairly fine-grained ranking of possible outcomes. These kinds of calculations require much information — a pressing issue is therefore the extent to which information of the required kind is available? Lack of information is one way to interpret the story about the bear and the gardener — i.e. the bear's actions being a result of the bear being epistemically limited or incompetent but not necessarily ethically incompetent. The bear, in many ways like us, has limited information as to the state of the world and as to which actions, brought about at any given time, have which effects. That fact that we are epistemically imperfect means that we have to rely on educated guesses and that we have got to take precaution when the situation calls for it. In the case of the bear, it might be that the bear had simply no experience with rocks and soft creatures (indeed with rocks and the effects of bashing them against surfaces at all), and thus had no clue of the impact that it brought about. When we are interested in socially responsible design, we are interested in designs that are precautionary in nature and which we consider likely to decrease the probability of (or to stop) developments towards certain undesirable outcomes or in other ways to contribute to an individual or a common good. In situations like these, we are (ideally) working with a well-defined value set — one that supports the ethical dimension of our design. Furthermore, we are working on the assumption that we are adequately informed about the causal mechanisms that underlie the processes that we

wish to manipulate, so as to make likely the wanted outcomes on the basis of the suggested manipulations.

However, if we keep the distinction pertaining to our epistemic situation separate from the normative requirements that pertain to realizing certain outcomes, we do not get the full picture. One thing is the norms that direct us towards realizing certain attractive goals, another thing is the norm that requires us to gather evidence of the, at the point of decision-making, unforeseen consequences of doing so. The adverse effects that any project aimed at a positive outcome may bring about, may, on the whole, make the very project one that we should abstain from engaging in. Also, cases with the absence of significant evidence, but with a possibility of a very negative outcome, are ones that we perhaps should not engage in, as advocated by for example the precautionary principle. However, when using the precautionary principle to minimize the probability of a harmful event, precautions should never be excessive. If so, there is a danger that the response to a perceived and plausible threat might be simply to ignore it. Of course this would not constitute an ethical action. In other words, not being willing to make sacrifices is not a valid excuse for not solving the enormous environmental and humanitarian problems we face. Finally, in cases where we have spent time to uncover the potential risks of a project, we are able to weigh risks and benefits against one another in ways that are, everything else being equal, more responsible. The key point here is evidence gathering and weighing in relation to the potential gravity of positive and negative outcomes that projects may have.

Socially responsible design is premised on the assumption that the values, which we have identified and seek to promote, are in fact the right ones to promote. But, of course, it is a rare occurrence that the benefits of a design can be harvested without any negative costs — and not all values can be put on the same scale, for example, the value of living a stress-free life, enjoying the benefits of beautiful surroundings, and the freedom to practice ones religion of choice or the religious value assigned to a plot of land. Furthermore, since the decisions carried out often have consequences way beyond those relating to the decision makers themselves, there are a number of moral questions that immediately present themselves in this connection. If a cost benefit analysis is carried out, and the benefits of a design is considered to outweigh the possible costs (i.e. the risk of harm), there may still be a problem if the harm befall a number of people who are not involved in the decision to implement the design in question —implying that we are putting people in possible harms without their consent. If

people, who are not decision makers, are potentially negatively affected by a design, they only carry the risk of the project without any expected benefit from it, which can pose a moral wrong (Altham, 1984). This is an issue that should be considered especially in situations in which potential 'bear favours' take on the form of indirect consequences, as this type of consequence is the one that we are most likely not to take into consideration.

When we isolate one aim, as the one to promote, or isolate a possible outcome as the most important to avoid, we are in serious risk of aiming blindly. However, often when we are interested in enhancing the good for that population overall, this at the same time decreases the goodness for particular individuals of that population, which again raises the issue as to how this should feature in a consequentialist ethics for socially responsible design? Such solutions include making the harmed persons' interests count relatively much, compensating the harmed persons in other ways, or choosing solutions implying that the ones with the highest living standards make the greatest sacrifices. If, on the other hand, we do not allow the goodness of the population to happen at the expense of someone inside or outside of that population, we can ask ourselves if it is possible at all to solve the problems at hand.

In summary, the discussion may be reduced to three overall arguments: 1) understanding the defined five types of uncertainties in socially responsible design is crucial for being able to choose the 'right' solutions and avoid choosing 'wrong' ones; 2) a significant explanation for the lack of results of socially responsible initiatives in recent decades is that we seek solutions with minimal negative harm to anyone (often economic or lifestyle related), and in this way we end up with solutions that are incapable of solving the environmental and humanitarian problems we face; and 3) a consequentialist ethics may help us to implement solutions that are undesirable to some people, but necessary for solving our environmental and humanitarian problems. Failing to recognise these messages may in effect imply that in our quest to make the world a better place we eventually end up doing more harm than good — either by unintentionally doing harm because of failing to deal with uncertainty issues, or by not doing what is needed in a long-term global perspective because of protecting certain interests or having a short-term perspective. In either case, although there are good intentions behind such actions, the results are 'bear favours'.

## Achieving Responsible Design Within the Commercial Remit

Norman STEVENSON<sup>\*a</sup>, Vicky LOFTHOUSE<sup>a</sup>, Debra LILLEY<sup>a</sup> and Alistair CHEYNE<sup>b</sup>

<sup>a</sup>Loughborough Design School, Loughborough University; <sup>b</sup>School of Business and Economics, Loughborough University

*Drawing on findings from research conducted in the UK and Ireland, this paper discusses what is required for responsible design goals; such as sustainable design, inclusive design and socially responsible design; to be addressed more widely within industrial design consulting. It posits that achieving an impact ultimately centres on commercial success, and to effect a positive change on society's greater needs, therefore, design consultants must create persuasive and appealing solutions which meet the demands of the commercial context, and which fall within the expectations of the client and market. The paper explores the individual designer's motivation and sense of responsibility to address society's needs; along with the set of challenges facing the management and pursuit of design practice towards those goals. From this, a series of areas with potential to improve the spread of responsible design are highlighted; including: empowering designers to argue cases more effectively; increasing the design consultant's sense of responsibility and intention to act; and improving the demand, recognition, and value these goals receive. The paper concludes that the success of commercial responsible design requires more sophisticated understanding, metrics and examples, which have greater relevance to business goals and the full set of participant parties.*

## Introduction

Since its origins, industrial design has been dependent on industry for its *raison d'être* (Heskett, 1980; Sparke, 1983; Meikle, 2001); however, since the mid-twentieth century, concern for the designer's role and tensions between serving commercialism or society have been evident, not least of all from designers themselves (Sparke, 1987; Whiteley, 1993). Author's such as Papanek (1971), Whiteley (1993) and Pirkel (1994) advocated industrial design's potential to have greater impact on larger societal issues; such as environmental concerns, ageing, disability, social inequalities, poverty, and diminishing quality of life. Recent growth in the awareness and exploration of these topics has reinforced the call for designers to exercise a positive influence beyond commercial goals. Ageing populations and the increasing number of older users are demanding that designers incorporate inclusivity and the needs of a wider population in their work. Similarly, the increasing importance assigned to social and environmental welfare, suggests that future designers will in part be required to refocus design more towards quality of life, sustainable systems and socialisation (Cooper et al., 2009; Lasky, 2013). However, while consultancies such as IDEO, Frog and Fuse Project have taken up the challenges to various extents, research has shown that for the most part larger societal issues are still extraneous to the daily activities of most industrial designers (Dong & Clarkson, 2007; Andrews & Robbins, 2010; Stevenson, 2013). This dulled response, and the misalignment between expectations and action, begs for further understanding as to:

- why more responsible design activities are not occurring;
- and what is required to bring about wider uptake.

This paper aims to address these queries with regard to industrial design consultants by presenting a discussion of the influences and challenges composing their circumstances.

### *Research Background and Methodology:*

The discussion presented in this paper is based on the findings from an EPSRC (Engineering and Physical Sciences Research Council) funded doctoral research project which investigated what affects industrial design consultants addressing more responsible design goals within their commercial remits. The research was undertaken in the UK and Ireland and consisted of two main studies. The first was an explorative workshop which ran as part of a national seminar organised by the Sustainable Design Network. 19 participants from academia and design practice were involved; including 3 leading authors in

the research field. Activities were primarily based around group discussion and were supported by a set of tools, including prompt cards and personas, developed from an extensive literature review. The second, and primary research study, consisted of a series of semi-structured in-depth interviews involving a total of 31 participants comprised of:

- 22 industrial design consultants; of which, 18 were managing directors, directors or sector managers; and 4 were senior or lower-tier designers
- 4 leading academics in the research area
- and 5 design-related strategic consultants.

The activities from both studies were recorded and transcribed in preparation for analysis in NVivo software. The data analysis process involved four stages: a line by line initial coding of the data in place; course coding into provisional groupings; fine coding using descriptive and thematic coding; and clustering to form constructs and themes (Boyatzis, 1998; Ezzy, 2002; Saldaña, 2009). The findings provided a thorough representation of the circumstances surrounding designers undertaking responsible design, and were formatted as in-depth portrayals of: the product creation context; the system of determining factors; and the antecedents to an individual's responsible design behaviour (Stevenson, 2013). This paper draws on the research outcomes to discuss the prospect of industrial design consultants undertaking responsible design more widely. It explores the realities of commercial product design and the challenges they raise, with the aim of informing efforts towards responsible design action and its management.

### *Responsible Design*

This discussion centres on the notion of 'responsible design', which is used to signify design that aims to incorporate broader societal issues; such as our ageing population, environmental crisis, diminishing quality of life and social inequalities. The term encompasses the key design movements directed towards those topics; including sustainable design, inclusive design and design for social responsibility, and is intended as an umbrella term for succinctness. It was also adopted to avoid the separation of the different goals; as there is no reason, for example, why sustainable design would not also aim to be inclusive. 'Responsible design' is used in this paper as a single descriptor to represent the potential for design to have a greater impact across the goals, and is intended to represent: *design which effects a positive change on the greater needs of society.*

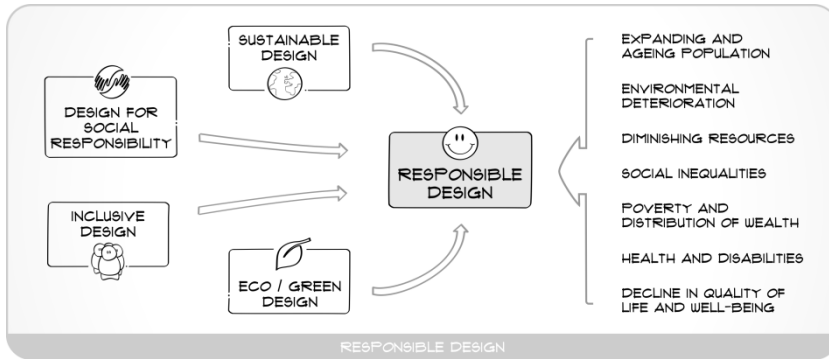

Figure 1 Explanation of responsible design

## The Demands of Commercial Product Design

Through the course of the research project, it was evident that a design consultant's potential to effect positive change centres on the products they design. Although designers can inspire or educate with the concepts or processes they generate, a positive impact ultimately rests on them contributing to more responsible products and services being produced, bought, and used; and as such, their efforts and success are firstly subject to the demands of commercial product development. The following section examines this to set the scene for the discussion that follows, and also to outline the key requirements that responsible design will need to overcome if it is to have effect.

### *Design Selection*

The basic and foremost requirement is for the consultant's (responsible) design to be selected by the client. It was obvious from the research that to achieve this, a proposal must appeal to the client, and their ideas of what is appropriate for the market. It must also be manufacturable and saleable within suitable costings; and moreover, it needs to be the best option in contention according to the priorities of the project. Such priorities include numerous factors as diverse as whether the product is on brand, to whether it has a sufficiently strong feature set in comparison to competitor products. However, the research participants explained that these details are not always apparent upfront, and that in many cases clients only find the means to communicate their preferences once they have something to react to. On the

other hand, participants also described how some clients will know exactly what they want, but in so doing are unresponsive to alternatives.

Ultimately, design selection comes from the client side, and as such, their interests and objectives constitute the crux of the process. Each aspect of a design proposal will need to appeal to the selectors and be recognisable to them as something of value, if it is to be chosen. The success of responsible design, therefore, is primarily dependent on gaining the client's approval, and will require design consultants to present persuasive proposals that are not only within the expectations of the brief, but which are competitive with other directions. It was also evident from the research, however, that at the core of consultants' actions is their wish to satisfy clients in order to maintain and grow their own business, and the work they present is unlikely to put that objective at too great a risk. In cases where the client has not assigned explicit priority to responsible design goals, therefore, consultant's may not wish to push for it.

### *Production*

Following its selection, a (responsible) design proposal needs to then survive through development with its intention intact. The research revealed that this is no mean feat given the array of potential influencers along the way; many of whom often have greater impact than the design consultant. Respondents stressed how procurement teams, for example, whose decisions are often dominated by cost concerns, can have a significant impact on the final version of the product produced. Similarly, manufacturers, or sales teams along with the background histories of previous projects, can have dramatic influence on a proposal's development. One design director explained:

*You talk about sustainability; materials from polymer to metal are getting changed ... We could do a lovely eco indicator and just tell them where to spend their time on materials, we could do all these -; but the Chinese manufacturer will go 'well, I've got this grade material' or 'I'll just use this reground material over here' ... It's still 'wild west'-like in these areas, however hard you try.*

Ultimately, the (responsible design) proposal needs to reach production if it is to have impact, and this is dependent on company decision-makers and financiers approving the investment required for tooling and manufacturing. Research participants emphasised that this can be substantially larger than the design and development budget, particularly where third party

manufacturers are involved. As such, the decision to go to production is a key *go-gate* in the process, typically driven by evaluations of costs, market opportunities, viability and risk; with the main assessment tending to rely on quantifiable measures. In simple terms, the (responsible) product will need to be recognised as sufficiently beneficial to business goals and potential profitability if it is to be taken forward. Both direct and indirect benefits are relevant, and in this regard, CSR (corporate social responsibility), brand image and customer opinion may gain importance for supporting responsible design proposals. However, these are relatively minor enablers. If deeper responsible design impacts are to be achieved, larger changes to product offers will need to gain approval, which will demand ample backing to gratify business evaluations.

### *Availability to the Market*

A further basic requirement is for the (responsible) design to actually reach the market. Where a client company is reliant on third party retailers and distributors, those parties will have to consider the product something they can sell and gain profit from if it is to be held in stock and gain 'shelf space'. The respondents explained that this depends on the product offer and price mark-up, but more significantly, on the retailer's perception of their customers' requirements and whether they feel the product will appeal to them. Participants stressed that it is not unheard of for retailers to have direct involvement in the design process, and they may even be the decider in whether a product is actually produced. One design director explained:

*... so the retailer might say 'sorry we're not going to accept your design, you may well think it's wonderful, but I don't think it'll sell'. ... so you've not succeeded in designing a [successful] product if a retailer isn't accepting it ... they've a lot of power.*

This serves to emphasise that achieving more widespread responsible design hinges on collective action and on an alignment of several perceptions from parties across the process; including customers, users, retailers, manufacturers, consultants, design firms, and the various members of the client company. Without a shared interest and willingness to embrace responsible design goals across all these groups, attempts towards it are unlikely to progress.

### *Purchase, Use and Engagement*

Finally, once a (responsible) design reaches the market, it should to be acquired and used, if it is to have effect. Although markets can be influenced; and possibly lead to some degree; each sale rests on a purchasing decision from a customer. This decision can incorporate aspects such as price, performance, features, ease of use, semantics and aesthetics; as well as the influence of trends, advertising, competitor products, and the psychology of the individual. Participants stressed that while designers can play a significant part in the lure of a product, many of the elements affecting purchase decisions can lie outside their influence (particularly if they have only a partial involvement in the product's development).

For a product to have any real impact on responsible design goals it should ideally be used for an ongoing period. Reasons for owning products, however, have multiple facets; including personal rewards; outward expressions; or even notions of identity (Barthes, 1972; Whiteley, 1993; Molotch, 2003; Sudjic, 2009). Moreover, many of these drives and desires are susceptible to regular change; not least of all due to the shifting influences generated by commercial industry. Business prospects often depend on this turnover of products, and clients typically commission consultants for the very purpose of helping to generate alternative options and new desires. If people's satisfaction persisted, or was based on sufficiency, and if products could last, and industry could blossom regardless; expectations of ongoing product engagement could be directed more towards the designer; but unfortunately, this is not the situation. Instead, responsible design will have to find a way to fit within the commercial context, and to satisfy the requirements it poses.

Figure 2 summarises graphically the requirements to achieve responsible design commercially, as discussed above.

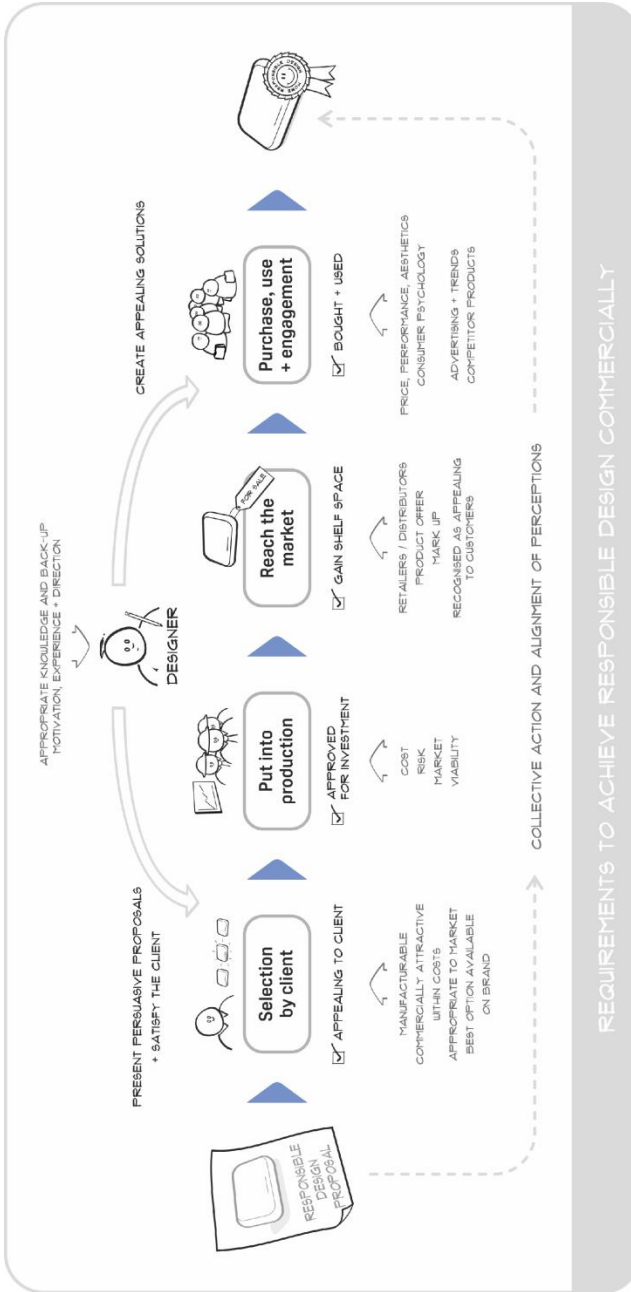

Figure 2 The requirements to achieve responsible design commercially

## **Achieving Responsible Design Commercially**

The product development milestones described above outline the vital steps for a product to gain success, and they indicate what is required if consultants are to have effect, regardless of whether the goal is responsible design, sustainability, or promoting a preferred styling direction, for example. The distinct difference, however, is that certain goals; such as those related to aesthetics or usability; often align more easily with business objectives and commercial success. Those goals relate well to attracting the purchaser; they have a perceived value more readily recognised by the various parties involved; and they are also more central to why design consultants are typically commissioned. For responsible design goals to be regarded in a similar manner, products would have to be considered attractive and commercially viable because they are responsible. The research indicated this is not the case, and that it would require significant change in the mind-set and perceptions of not just consumers, but of each of the parties involved in the product's creation (clients, manufacturers, retailers and designers). Participants stressed that given the motives currently driving product production and purchase, this is likely to be a slow change, and it is improbable that responsible design will become a dominant driver. Instead, it was clearly apparent that if responsible design is to achieve greater success (within a profit-oriented system) it will need to do so in addition to being commercially attractive and meeting the milestones above. As such, achieving the goals should be at little or no additional overall penalty, and preferably with added benefits for the client's business. Extra time or cost incurred would need to be justified by demonstrating the opportunity for return, and the overall design proposal will need to be sufficiently appealing from a business perspective.

Another point raised in the findings is that if responsible design is to occur, it either requires clients to accept it; or alternatively, for the designer to operate stealthily and possibly circumnavigate any need for persuasion. The latter approach, however, seems limited in its reach and unsuitable to longer-term action as greater impact on society's needs requires more weighty changes in products, which is unlikely to be achieved unbeknown to the client. Any significant movement towards more widespread responsible design, therefore, will require clients to share in responsible design concerns; or at least be receptive and then persuaded of their importance. The consultants interviewed explained that all too often, however, a client's approach to product creation is heavily dominated by comparison with competitors, or considerations of cost, price and features. As such, justification for responsible

design approaches will also need to overcome existing mind-sets, and the resistances to change and risk which the respondents stressed occur. Central to this persuasiveness is the need for sufficient back-up, but participant consultants expressed that there is a lack of supporting evidence or suitable metrics to help underpin proposals and to help them persuade clients. One director provided the following explanation which summarises well the overall difficulties:

*... there are probably far too many designers who just don't get it at all, in terms of their responsibility for the downstream impact of their actions. But for those of us who do get the responsibility ... there is a duty there to push and nudge and try and get better behaviours. But there's a very crystal clear line which is that when we've tried pushing - it can be as simple as trying to not paint phones - we'll just hit a brick wall because the knowledge about the impact is too fuzzy; you're not quite sure what the recovery value chain looks like and so you're asking your client to potentially compromise the immediate saleability of their product in order to take a very long, odd, uncertain bet that somebody in the future might actually benefit from that. Now that kind of choice will never be won. That's just a dumb choice.*

It is clear from this that if responsible design is to progress in the commercial sector it needs to relate to the workings and objectives of that sphere. It is understandable, therefore, that there is often a focus in the literature on the commercial benefits afforded by the different approaches; such as how inclusive design broadens available markets, or ecodesign provides cost benefits (Tischner & Charter, 2001; Dong et al., 2004; Bhamra & Lofthouse, 2007). However, it was apparent from the research findings that more appropriate and reliable information is still required in order to support any significant change.

## **Motivation to Undertake Responsible Design**

The individual designer's interests and motivations constitute the main determinant in whether they will pursue responsible design goals as part of their design activities. Ultimately, if responsible design is to be enacted to a greater extent, it needs to be an intrinsic part of designers' thinking and intuition, as well as their methods for understanding problems, posing solutions, and making judgements and evaluations. It was evident from the research participants, however, that they hold clearly different views on what

constitutes a contribution to society's needs. Some appeared to only regard the segment of society they themselves belong to; while for others, reducing annoyances, or adding beauty and convenience to peoples' lives was felt sufficient. Some, however, saw their role simply as serving their clients' needs: *'I see my job as helping my clients achieve what their objectives are - trying to do it in the best way from a design point of view'.*

Such outlooks may be due to how challenging it is to pursue responsible design goals; but they also suggest a possible shortfall of awareness, knowledge, interest or connection to the topics. It was clear from the research that overall design consultants act predominately in response to the requirements of their clients and those of the design firm they work for. Despite their drive to push boundaries, a consultant's outlook is affected significantly by what they are led to prioritise, and what is expected of them in their role. One designer explained:

*As a working consultant, I am ultimately reliant on the philosophy of the company; the design consultancy, that I work for. ... [As a consultant] your ambitions are always mitigated by your responsibilities to the client's perspective.*

The research demonstrated that responsible design goals typically occupy a low priority in the commercial setting (if at all), and it was apparent this has a large influence on designers' motivations to undertake them. Even when consultants are willing to challenge briefs or question assumptions, they still tend to do so for the good of the product and ultimately, for the good of the client. But responsible design hinges on other interests, additional to those of the client, also being represented.

Levitt and Dubner (2005) highlight that humans respond to incentives, and it is pertinent to ask why design consultants would take on responsible design, or what their incentives are for addressing it? Where clients make requests for it, there is an easy response; however, the research indicated that this is rare, and it is curious why designers would try to take it on in those other cases, particularly where it is not at all valued by the client. Moreover, there are ample avenues facilitating consultants to turn a blind eye or abdicate responsibility; such as role morality, or the immunity afforded them by acting as a consultant (Gibson, 2003; Owens, 2006; Stevenson, 2013). The research findings indicate that most uptake of responsible design (outside of legislative requirements) seems predominately driven by designers wishing to gratify their own personal values and altruistic or prosocial tendencies. They pursue it because they have sufficiently strong feelings that it is the right thing to do.

In their theories on altruistic behaviour, Schwartz (1977) and Geller (1995) propose that prosocial actions originate from an individual actively caring; and that they are driven by awareness of the consequences of their actions, and their ascription of personal responsibility for those consequences. The research findings demonstrated that this motivation varies greatly with each designer. It was also apparent that their motivations to enact responsible design are not only dependent on character, background and experience, but also the social norms and interactions that inform their ideas and values (Stevenson, 2013). These external influences are relevant both because designers function as part of a larger product creation system; and also because they plug into the social context and zeitgeist to inform their designing.

A central part of this is the value and priority responsible design goals receive in comparison to the other aspects of product design; such as aesthetics, novelty, innovation or use of technology. This also relates to what is considered 'good design', and links to the various evaluators of design; from awards, to advertisements, to the media; each of which contribute to informing designers (and the other parties involved). Unsurprisingly most people; especially designers; are seduced by the more desirable aspects of design, such as aesthetics or new technologies, and accordingly these attract more attention and appreciation. Furthermore, in many sectors; for example consumer electronics; those more desirable facets tend to be the primary reason for a product existing at all. Either way, it is unlikely that responsible design will trump aesthetics, brand or technology in what people favour. Its success, therefore, relies on designers being sufficiently motivated, not only to overcome restrictions and challenges, but also to overcome their attraction to the other more 'desirable' facets of design enough to incorporate it as an additional objective.

The key issue is the balancing or resolve of the multiple requirements of each project, and to what extent the needs of a broader society are included. How responsible design goals are incorporated into the designer's thought process is central. For example, if the goals are at a foundational level in how the designer approaches a design task, there is the potential for a more fundamental impact than if they are an ancillary consideration later in the process. This highlights the importance of nurturing responsible thinking as early as possible in an individual's development (even before they are directed towards design).

Reflecting on the research, however, it was discernible that there is a shortfall of external influences effectively promoting responsible design in the

commercial setting. Many of the mechanisms that do exist; such as conferences and publications; rely on voluntary uptake (requiring a pre-existing interest or concern) or tend to occur more in the academic sphere, which is typically apart from professional practice. In the documentary film 'Objectified' (Hustwit, 2009); Valerie Casey, while discussing the formation of The Designers Accord, relates an anecdote of discovering a toothbrush they had designed washed up on a holiday beach in Fiji. Without comparable moments of realisation and cause to redress, it is questionable whether many designers will contemplate or revise their standpoint, particularly because they do not often have the time or capacity to monitor and review their own broader situation. This is worsened by the fact that the majority of drivers in their daily working lives direct them towards business targets, and there is little to direct them towards prosocial concerns.

One possible disruption is the waves of younger designers graduating from design courses with an increasing regard for the topics. Educators have a crucial influence in the early stages of a designer's development; however, their impact can dwindle as a career progresses and as the designer's views alter with the complexities of the commercial world. While it is fair to assume that the growing attention responsible design topics receive in education will aid progress, it is also important to identify that without ongoing reinforcement, those ideals may not survive in a commercial setting which responds differently than the university institution. The research identified that where a personal interest does exist, it is important to sustain it. Motivated designers will need to gain a level of belief that progress is possible, or that the goals are achievable in some measure. One consultant designer commented: *'I want to make sure I'm toiling away in an area that's going to make a difference'*. This relies on the availability and communication of evidence which demonstrates progress and positive outcomes. Moreover, the topics need to sustain their importance. There were warning signs in the research that if designers perceive responsible design goals as transient topics, they will be cynical or slow to give them real consideration.

On the other hand, the topics have only been identified relatively recently, and it was also apparent from the findings that a greater understanding and knowledge needs to be established if responsible design goals are to receive consultants' further attention and application. Participants were quick to highlight the need for clear, consistent, and useful guidance which is appropriate to how they work; and more importantly, which they can have confidence in. Professional, or regulatory bodies are one potential anecdote. Were they in force, they could provide guidance and precedents for what is

expected from designers while also offering a conduit for imparting the required knowledge and information, once it is generated. In the UK, however; despite recent progress in the growth of BIDA; there is as yet no significant influence from this direction. As such, the main onus remains on the individual designer and their personal drive or altruistic motivations.

## Potential Leverage Points

Reflecting on the outcomes of the research, it is possible to identify a set of opportunities or leverage points to potentially improve the uptake of responsible design. Many of these require further investigation to be effective, and as such, they also represent potential areas for future research.

A first consideration would be to look at increasing designers' motivation and intention to address larger societal issues. Improving their awareness of the topics is an obvious point of departure; however it is widely accepted that an increase in knowledge alone does not directly lead to pro-social behaviour (Grob, 1995; Kollmuss & Agyeman, 2002; DEFRA, 2008). Instead, it is the designer's overall sense of responsibility which is crucial. Behavioural theories advise this will depend on personality factors and an individual's altruistic tendencies (Schwartz, 1977; Hines et al., 1987; Geller, 1995), and further exploration would be beneficial to understand how these may be influenced. The designer's motivation to act is also affected by their sense of enablement; their past experiences; and the social norms and incentives that inform them (Triandis, 1976; Bagozzi & Warshaw, 1990; Jackson, 2005). One key opportunity therefore, is the general recognition the goals receive, and more importantly the value assigned to them in comparison to other design objectives. In addition, stronger demonstration of success through case studies, clearer knowledge and suitable metrics would also support a greater sense of being able to have effect; while also aiding designers to recognise when opportunities do exist. Disseminating this understanding to practicing designers in a mode appropriate to their needs is also a challenge requiring more attention.

Another main avenue of approach is to help increase the demand for responsible design, both from the consumer, and the client. This begins with identifying and marking existing interest or support more clearly. It would also include finding better ways to communicate in business terms what is to be gained from responsible design. Success in this area likely relies on providing suitable metrics or measures to demonstrate effects. More importantly, responsible design could be better enabled by encouraging designers not just to

enact what is required of them by their clients, but to assert greater leadership, particularly towards societal issues. The topic of role assertion is a complex area, which has had little exploration in relation to this subject. At a basic level, however, improving the designer's potential to influence their clients would again benefit from broader availability of case studies and other forms of evidence to back-up arguments. Progress towards industrial design's professional status would also improve the designer's credibility, and by extension their possibility to have greater influence.

## **Conclusions**

Achieving responsible design impact ultimately centres on product outcomes, and to effect a positive change on society's greater needs, design consultants must create persuasive and appealing solutions which fall within the expectations of the client and market, and which meet the demands of the commercial context. The success of commercial responsible design relies on more sophisticated understanding, metrics and examples, which have greater relevance to business goals, and the key participant parties. If it is to gain broader uptake, designers require consistent knowledge and guidance, which is appropriate, and which they can have confidence in. In addition, responsible design's success is critically dependent on designers' awareness and motivation to take on the topics; particularly their assertion of responsibility towards the larger consequences of their design work; along with their willingness to recognise and avail of the opportunities that do exist.

## Designing For or Designing With?

Helena KRAFF\* and Eva Maria JERNSAND

*A major challenge for social design is related to roles, and the relationship between designers and those that a design proposal is intended for. Human-centred design processes are supposed to start with the people we are designing for. However, by using the phrase “designing for” instead of “designing with”, it is implied that something will be delivered, rather than created in collaboration. Similarly local stakeholder ownership is often highlighted as important. Yet, the underlying framework is most often set by a design team: it is they who set the topic, own the tools, and therefore have control and power over the process. It needs to be recognized that by doing so, alternative views might be pushed back, and we might not notice what topics are left out or who is being excluded. The purpose of this paper is to contribute to a more nuanced discussion of social design by problematizing the concepts of local stakeholder ownership, roles and power. This is done through a critical reflection of the authors’ own active involvement in a social design project in Kisumu, Kenya.*

**Keywords:** *Social design, participation, roles, process ownership, critical reflection*

## **Introduction**

*For about one and a half year we worked with a social design project in Dunga beach, Kisumu, Kenya. In the process local organisations and residents participated in the development of ecotourism concepts, products and services. When reporting the project we have highlighted the positive aspects of working in a participatory manner, and how this allowed for a democratic and transparent process, however after a while this rather optimistic focus started to feel uneasy. We wondered if we weren't merely justifying already pre-set assumptions, and at the same time suppressing the complexities and challenges that we knew were there. Further the aim of the process in Dunga had been to reach local stakeholder ownership, but since the underlying framework was set by us as researchers, and since it was we that owned the tools, did that not mean that we had been working against this goal?*

In the same way as in the reflection above, other scholars have acknowledged challenges related to social design, for example that “the ideas behind it are rarely discussed critically” (Steen, 2013, p. 16), and that even though user involvement is seen as crucial, it is treated as unproblematic (Bödker, 2006). Also, since projects often involve underprivileged communities (Lasky, 2013) that might not have appropriate social safety nets, there is a need to move away from traditional “consultancy models” (Botero & Saad-Suulonen, 2013, p. 9). If the results of projects are to alter living situations, questions need to be posed in regards to how the population in question will be affected. Will they win or perhaps even lose out (Hamdi, 2009)?

The purpose of this paper is to contribute to a more nuanced discussion on social design, by problematizing the concepts of local stakeholder ownership, roles and power and at the same time being aware that we will only be able to discuss a fraction of the complexities that these concepts entail. First we present an overview of the current discourse on social design, with an emphasis on challenges and tensions, as acknowledged by scholars in and outside the field. This is followed by a description of the empirical case, which is then used to critically reflect on our own involvement in the process. Finally, we conclude by discussing areas for further exploration.

In order to critically reflect on the empirical case, the methodology used is a problematization approach (Alvesson & Sandberg, 2013). The aim is to question and see beyond the dominant and already established, to challenge our “theoretical position” (Alvesson & Sköldbberg, 2000, p. 246), as well as to reflect

through alternative and opposing theories. By turning our gaze to the researchers' person, the research community as well as to society as a whole, the empirical material is reflected upon on multiple levels (Alvesson & Sköldbberg, 2008).

## Theoretical framework

Social design projects, where local stakeholders are involved in the process, have their roots in participatory design practices. In 1971 the first major conference on participatory design was held in Manchester, where for example Nigel Cross (1972, p. 6) expressed an urgent need of methods for citizen participation in design and for architecture and planning, as a way to eliminate "many potential problems at their source". At about the same time participatory design emerged in Scandinavia, where industrial workers were involved in the development of their workplace (Ehn, 1993; Björgvinsson, Ehn & Hillgren, 2012). Participatory design was then founded on two principles: The first dealt with democracy and the notion that the actors influenced by a design should have a say and be involved in the process (Björgvinsson, Ehn & Hillgren, 2012). The second was that the industrial workers' professional skills were seen as an important contribution for successful design solutions (Ehn, 1993). As Ehn (1993) points out, it was not only the workers that were seen as participants but also the designers, in a process entailing common efforts and mutual learning. The breakthrough of participatory design was connected to the introduction of a "design-by-doing approach", where prototypes, mock-ups, and scenarios were used (Ibid, p. 58) that enabled workers to "express in action" what might not be possible to state merely with words (Ibid, p. 67).

Since then participatory design practices have evolved and moved from focusing mainly on workplaces towards being "increasingly engaged in public spheres..." (Hillgren, 2013, p. 76), through projects all over the world (Bason, 2013). This includes projects within for example, health care, education, crime prevention, and community development. Focus has also moved from being mainly set on products, toward a focus on designing for "people's needs or societal needs..." (Sanders & Stappers, 2008, p. 10). As a result of this development there has been "a growing interest in design for social good..." (Bason, 2013, p. ix) with conferences, doctoral courses, exhibitions, and academic as well as non-academic publications discussing the topic. This has also led to the emergence of an abundance of terms, such as *interaction design*, *service design*, *transformation design*, *design for social innovation*, *socially responsible design*, *human centred design (HCD)*, *empathic design*, *public*

*interest design* and *social impact design*. Common to all of these terms is the participation of concerned stakeholders, although they differ in their approaches. Sanders (2006, p. 5) see a division between a user-centred and a participatory approach. The former is characterised by an expert mind-set, where the involved stakeholders are seen as subjects, informers or users, and where the designer designs “for people”. The latter is a participatory approach where participants are seen as co-creators throughout the process and where focus is on designing “with people”.

In this paper social design is used as an umbrella term for all of the above-mentioned types of participatory design practices. The following section gives an overview of challenges acknowledged by scholars within the field of design, as well as challenges acknowledged by Nabeel Hamdi, from the neighbouring field of participatory architecture and planning. Further the criticism raised by scholars from social geography, social anthropology and political science in regards to participatory development is highly relevant to social design, which is why this is also brought into the discussion.

### *Tensions and challenges - as seen from the field of design and neighbouring fields*

Scholars and practitioners within the field of design have pointed out challenges related to the complex nature of social design projects. Bödker (2006, p. 5) mentions a “lack of reflection or reflexivity on behalf of designers...”. At the Social Impact Design Summit in New York in 2012, a main goal was to explore challenges and issues in the field. In the resulting White paper, it was proposed that designers need to “tread sensitively” in order not to provide communities with “ineffective or inappropriate efforts, or even creating real harm” (Lasky, 2013, pp. 22-23). At the same time it was acknowledged that there is a lack of “standards and ethical guidelines” (Ibid, 2013, p. 6). Further, Otto von Busch (2013) pinpoints some crucial challenges in regards to participation, which are interesting to explore further: Who is included and who might be excluded? Who benefits? Does everybody want to participate? And for whose interest are we as designers working for?

A major challenge that has been on the agenda for a long time is the notion of roles and the relationship between designers and those that the result of a project is intended for. In the 1970's it was argued that we need to “blur the current distinctions between ‘designer’ and ‘user’” (Cross 1972, p. 6), or even reverse the roles (Roy, 1972) since “participation in any radical sense is about giving all the people access to the tools, resources and power which have been the jealously guarded prerogatives of the professionals” (Cross, 1972, p. 11).

Banham (1972, p. 18) mentioned that when people can “invent their own rules of the game, then I think design participation is getting somewhere”. This can be seen as an early attempt to allow process ownership to be with the users, however we could question how much has really happened since then. For example in 2011, Steen (2011, p. 55) mentioned that it is easy for designers to interpret projects narrowly, stay within their own comfort zones and “privilege their own ideas and experiences, over users ideas and experiences”. In 2013 it was argued by Staszowski and Winter (2013) that we need move away from the user-centred approach where users are seen as subjects. Further a common goal with participation that involves local communities is to aim for local ownership however, Jégou Delétraz, Massoni, Roussat, and Coirié (2013, p. 141) point out that even though users might be highly involved, it is mainly the designers that “interpret and transform the results/.../into ideas and vision”. This indicates that if we are to move away from a user-centred approach we need to adapt our mind-set and see the potentials of a “dynamic exchange of knowledge”, (Amatullo, M. in Lasky, 2013, p. 22) where the process is “seen as a two-way street, where we learn from each other...” (Amadei, B. in *Ibid*, 2013, p. 22).

If we look to the neighbouring fields of participatory architecture and planning, Nabeel Hamdi has highlighted challenges similar to the ones discussed by design scholars. Hamdi (2010, pp. 85-86) sees a need to “reflect more thoroughly on some practical theories that underpinned it all – to get up to date with some of the latest thinking on the strengths and pitfalls of participation, before moving on”. He also mentions how colleagues sometimes feel uneasy about their presence in a community. They wonder what roles they are actually playing, when to intervene and when not to, and if “intervening can become interfering” (*Ibid*, 2010, p. 85). Hamdi raises the issue of roles by not calling himself an architect or planner, but a development practitioner, a title that includes everybody: people, inhabitants and communities. Likewise, he quotes Rose Mulokoane of the South African Federation of the Urban Poor (FEDUP), saying: “Don’t call us beneficiaries. Don’t call us end-users. We want to be your partners” (*Ibid*, 2010, p. 92). Further, referring to John Gaventa, Hamdi (2010, pp. 85-86) sees the need to view participation not as an invitation but as a human right, by “[e]xtending the concept of participation to one of citizenship...” (see Gaventa, 2004, p. 29).

So far we have discussed challenges as seen from within the field of design and from the neighbouring fields of architecture and planning. If we broaden our view and look beyond these fields we find harsh criticism that challenges the whole concept of participation.

### *Tensions and challenges – as seen by scholars in other fields*

Outside the field of design, scholars in for example social geography, social anthropology and political science have raised criticism towards participatory practices and participatory discourses generally and to planning and development projects that deal with social and economic marginalized groups in particular (Cooke & Kothari, 2001). The critique is often targeted at Participatory Rural Appraisal (PRA), which has many similarities with social design, for example in regards to the methods and tools used to reach participation.

It is argued that participation has “become an act of faith in development, something we believe in and rarely question” (Cleaver, 2001, p. 36), and that project workers are “naive about the complexities of power and power relations” (Cooke and Kothari, 2001, p. 14). It is not enough to merely analyse project activities, rather focus needs to be put on “power dynamics, on patterns of inclusion and exclusion” (Cleaver, 2001, p. 54), and participation needs to be linked to bigger issues such as democracy and anti-imperialism (Mohan, 2001). Cooke and Kothari (2001, p. 15) see a lack of rigorous and critical self-reflection, but at the same time argue that “authentic reflexivity requires a level of open-mindedness that accepts that participatory development may be inevitably tyrannical, and a preparedness to abandon it if this is the case”.

It is mentioned that project facilitators from the outside shape the direction of processes, since it is they who “own the research tools, choose the topics, record the information, and abstract and summarise according to project criteria of relevance” (Mosse, 2001, p. 19). The risk with this is that the local communities that are involved might shape the way they “construct their needs” in order to be able to take part (Mosse, 2001, p. 20). Also the nature of participatory projects enable project leaders to step back and act merely as facilitators, which means that the responsibility of the results are moved from the development agency to the people that participate (Henkel & Roderick, 2001).

Further, it is argued that the notion of empowerment is treated as unproblematic, that it is “often unclear exactly *who* is to be empowered...”, if it is the whole community, individual persons or certain marginalised groups (Cleaver, 2001, pp. 37-38). Community empowerment might not actually mean that everybody is empowered since “some individuals or groups have the skill or authority to present personal interests in more generally valid terms, other do not” (Mosse, 2001, p. 21). Instead, according to Kothari (2001), participation can lead to that already strong groups gain even more control. It is even questioned if participation really leads to empowerment at all, since even

though participants “draw their own maps” during a workshop, the underlying framework where it is decided that a map is suitable for depicting local needs, has been decided by outsiders (Henkel & Roderick, 2001, p. 182). It is also mentioned that participatory projects often carry symptoms of ethnocentricity, with a language including terms such as community and local people, that stem from a “colonial anthropology”, where distinctions are made between “‘them’ and ‘us’” (Cooke, 2001, p. 105).

The above discussion highlights participation as highly problematic. Mohan (2001, p. 167) however, do mention an exception to this negativity, a Village Aid (VA) programme that went “beyond participation” since it was the local community that set the framework whilst the outside agencies took on a responsive role (Village Aid, 1996, p. 8, see also Mohan, 2001, p. 167).

## **Description of the empirical case**

The empirical case addressed here has been funded by Mistra Urban Futures (MUF), an international centre working with sustainable urban development. MUF has a Local Interaction Platform in Kisumu (KLIP), where researchers and PhD students from Jaramogi Oginga Odinga University of Science and Technology, Maseno University and the University of Gothenburg work in a transdisciplinary manner with the aim to produce knowledge and practical results through cooperation between academia and society. The overall theme of sustainable urban development has been narrowed down to two focus areas, of which one is ecotourism.

Kisumu is Kenya’s third largest city, and face challenges such poverty, poor waste management, and an underdeveloped infrastructure. Researchers within KLIP have identified ecotourism as a possibility to “enhance environmental conservation, promote preservation of cultural heritage as well as to provide an alternative source of sustainable livelihood” (Hayombe, Agong, Nyström, Mossberg, Malbert, & Odede, 2012, p. 158). Through KLIP, connections between researchers and the county government have been initiated, and research is seen as an important influence on policy.

Researchers at KLIP have identified potential areas for ecotourism development, one of which is Dunga Beach, situated about six kilometres from Kisumu city. In Dunga the majority of the inhabitants belong to the Luo community, and the languages spoken are mainly Dholuo and English. Due to its closeness to Lake Victoria, 80% of the community relies on the lake for their income, working as fishermen, fishmongers, boat builders, and related jobs. However, the state of the lake is a cause for concern due to the decrease in fish

stock caused by overfishing, pollution and the infestation of the water hyacinth. This makes it crucial to find alternatives for livelihoods, and ecotourism is seen as an opportunity to do so.

In the early 21st century two community members from Dunga found an interest in ecotourism after attending a workshop organised by the Ecotourism Society of Kenya. They saw an opportunity for Dunga to develop and decided to start a local tour guide organisation, a group that has now grown to include 16 members from the community. In Dunga there is a community-elected Beach Management Unit (BMU) in charge of land allocation, which works to improve the general situation of the community. There is also the non-governmental organisation (NGO) Ecofinder Kenya that focuses on education and conservation regarding the lake, its adjacent wetlands, and the village.

The fieldwork was carried out over a period of one and a half years, with twelve weeks spent in Kisumu spread over four occasions. Our key contact and closest collaboration partner was the tour guide organisation. Residents from the community participated in three workshops in the initial stages of the process, which focused on mapping of stakeholders, the identity/identities of Dunga and hopes and fears of ecotourism development. These were combined with an available project space at a central location in Dunga, including a project wall and a suggestion box. Four public presentations were also held, and three reports have summarised what was going on in the process. The reports included issues and ideas that had been generated through the participatory workshops, our interpretation of the place, as well as theories and inspirational examples on tourism development. Further, in order to develop some of the ideas, four workshops were held with the tour guide organisation (one of them conducted over a period of three days). In most of these workshops, two or three community members attended as well as local craftsmen or craftswomen. The workshops resulted in for example, a signage system, a recycling point and a test of two full day tours, one with national tourists and one with international. The tours included fishing, cooking local dishes, stories of the local culture and making craft products of water hyacinths. In addition to the tour guides, local restaurants, craftsmen and women and members of the community took part. For example, a community elder participated as a storyteller.

The research material also included meetings, observations, questionnaires and informal talks in Dunga. Also comparative studies, and interviews with local and regional tourism officials were conducted. At the end of the process, we interviewed the local organisations and members of the community to inquire how they had perceived the process and the activities in it.

## **A critical reflection of the empirical case**

### *Working with a pre-set framework*

One of the reasons for working with Dunga was that they had a local tourism business in place, where the tour guide organisation worked actively with ecotourism development. This meant that ecotourism was not a concept that was introduced by us as researchers. However we failed to problematize our definition of the concept, taking for granted that our interpretation of it and that of the tour guide organisation coincided. Apart from our view on ecotourism we also brought in the concept of participation, and our pre-set assumptions that participation is inherently good, suitable for any context, and any purpose, in this case to develop ecotourism in Dunga. Referring to Cleaver (2001) it was something that we believed in so strongly, that it did not even occur to us to question it.

In initial meetings and a workshop with our key contacts in Dunga, issues such as appropriate ways to involve residents, if it was okay to take photos in the village and how these photos would be used were discussed. However, these issues could be seen as minor, whereas the overall framework of participatory ecotourism development had already been set by us as researchers, and was not discussed.

Further, we failed to consider if the concept of ecotourism was accepted by the whole community, and we did not take the time to explore what they felt, thought or knew about the concept. Instead, the topic in one of the first participatory workshops where residents participated was identity, which was considered a basis for ecotourism development, and since this choice derived from our already pre-set framework, we could argue that this topic was imposed on the participants. In other words, we the researchers, as Mosse (2001, p. 14) mentions, intentionally “shape[d] the direction of the process”. Thus what could very well have happened was that the people of Dunga felt the need to “construct their needs” (Ibid, 2001, p. 20) in order to be able to participate in the project.

Here we can question what would have happened if we had started without our set agenda of ecotourism and participation. What if the process had been held open initially, so that the residents and local organisations could have shaped the project according to their needs and desires? What would have happened if we had been there to support residents and local organisations in charge of their own process, right from the start? Or what if we had not been there at all? Would other actors then have taken over, developing the site with

their own goals in mind? Did we create harm through our efforts, a possibility suggested in Lasky (2013), or did we prevent harm?

### *Local process ownership?*

By working in a participatory manner, we hoped that the process would strengthen the community and local organisations, thus enabling them to feel that they had ownership of the process. Nevertheless, even though it was what came forth during workshops that established the content and direction for coming activities, and even though the set-up of the workshops was changed after discussions with the tour guide group, these changes were negligible, such as number of participants, venue and schedule for the workshops. It was we researchers that chose the main topics, elaborated upon, and designed the workshops, which all went in accordance with the project frame (Mosse, 2001). Taking a critical stance here, we could say that even though the workshops and activities were participative, the framework of the workshops was not (Henkel & Roderick, 2001).

The ideas that were taken forward were those that had come up in workshops, informal discussions and interviews with the local organisations and residents, however, the information gathered from all these activities was filtered through us as researchers (Mosse, 2001). When we presented the ideas in for example a public presentation in Dunga or in the written reports there were certainly aspects and ideas that did not make it in there. Some views that were presented and documented stemmed from our own assumptions on how things should be, without having discussed our interpretations with the other people involved.

The process was somewhat taken over by the local organizations, which took initiatives to take several ideas to implementation such as for example a cultural event and an improvement of the entrance to the beach. However, because of our established framework, and the fact that we owned the tools and designed the activities, local ownership was not established from the start, which led to an unequal distribution of roles.

The above discussion is connected to the issue on how much time local stakeholders are able to put in to the process. The tour guide group did not have the means to engage in the process to the same extent as us, for example they sometimes (most understandably) had to leave a workshop to cater to tourists. Since us as researchers got paid for the time in the project whereas the members of the tour guide group did not, we were the ones that could spend time analysing and interpreting the material.

### ***Power relations and empowerment***

Cooke and Kothari's (2001) opinion that project workers coming from outside are naive about complexities of power is also relevant to discuss here. Our main choice of partner, the tour guide organisation, was well established in the community and had a strong position. Yet, looking back, it was easy for us as outsiders to work with an already established group that was engaged in a notion that matched our pre-set framework. But, what about other groups, such as fishmongers, boat builders, women, poor or socially excluded? What would have happened had we chosen one or several of them as one of our principle partners? Who is to be empowered, as Cleaver (2001) probes? Some groups, according to Mosse (2001, p. 21), use their "skills and authorities" for their own interests, while others do not, and who are we to judge? It is safe to say that issues of power were not integrated enough in the process in Dunga. As outsiders we did not have sufficient insight to the power relations in the village, nor did we have the theoretical knowledge, we were in regard to this issue mere generalists.

Another power relation is the ethnocentrism that comes with projects where people from western countries work in developing countries, and where distinctions between "them" and "us" are easily made (Cooke, 2001, p. 105). There are situations where we need to "tread sensitively" (Lasky, 2013, p. 22) in order not to perpetuate or exacerbate ethnocentrism. An example is the use of terms, such as "local people" which according to Cooke (2001) stems from colonial anthropology, or attempts to impose our own customs and practices on other people. The example above on written reports and public presentations in Dunga is such a case where there is a risk that we as outsiders use our own understanding and culture to interpret the material produced in workshops and discussions.

## **Concluding discussion**

A major challenge in social design is related to roles, local stakeholder ownership and power. These issues have been on the agenda since the 1970's, when it was stated that we should not separate the roles of designers and users, and that people should have access to tools, resources and power (Cross, 1972). However, these issues are still with us. It seems as though we are stuck in a way of working, where the acknowledged needs of moving away from user centred approaches and consultancy models (Botero & Saad-Suulonen, 2013, p.

9), toward processes of dynamic knowledge exchanges (Amatullo, M. in Lasky, 2013, p. 22), are and will be unobtainable if we continue to approach social design research the way we do today.

We must engage in a critical discussion on social design to a greater extent, open up and discuss when and why we feel uneasy about our roles when engaging with communities, and doing so through the lens of the harsh critique towards participation. This was the aim of the empirical reflection, which shows that even though our goal was to reach local process ownership, the distribution of roles was not equal. It was mainly we, the researchers that steered and owned the process. This can be seen to be due to two main reasons; the processes started with a pre-set framework set by us as outsiders, and it was us that owned the tools and filtered the information. However, this merely acknowledges the critique towards participation and in order to move forward the discussion needs to broaden further.

Firstly, to attain real partnership we must go “beyond participation” as suggested by Mohan (2001, p. 167) and move away from the concepts of participation and social design. Participation can be seen to imply that people participate in something set up by someone else, and social design has the connotations that we are doing something for a social good, where we are there to help *them*, rather than creating in collaboration. This means that these concepts hinder us from ever seeing beyond the roles of user and designer, which in turn will also hinder local process ownership.

Secondly, there is a need for fundamental changes in the way projects are organized between stakeholders. Frameworks are today often set before local communities are involved due to time limits, efficiency aspects and pre-set conditions from organizers and funders. However, this does not cater for a sustainable continuation if the ownership then lies on those who initiated the cooperation. Support structures that allow for collaborative ways of setting up frameworks are needed so that partnerships are reached from the start, and where there is an equal distribution of management. All stakeholders involved need to be given the means to participate on equal terms, both in regards to how much time can be devoted, and how and when to share knowledge. For the case in Dunga the setting up of the project should have been open for the community to shape as they thought was appropriate, in collaboration with us, instead of us acting as project leaders. Further, since large parts of the framework were set up beforehand, and we were engaged in action research, it caused a sense of urgency to reach practical results quickly. Under such conditions, there is a risk that complex ethical issues will not be given the attention it deserves. Support structures are therefore needed to enable active

and continuous work with democracy, anti-imperialism (Mohan, 2001), power dynamics, and patterns of inclusion and exclusion (Cleaver, 2001).

Lastly, due to the complexity that participatory projects entail, we should seek knowledge from and engage with scholars and practitioners from other fields, who have expertise in areas where we can ever only be generalists. It requires us to associate with people that are critical toward participation, in a discussion where we continuously view our core concepts critically, always being open to, if, when and how participation could be tyrannical.

## Design Approaches to Creating Social Metrics

Rebecca LINDSAY\*

University of Dundee

*SME's and societies face complex problems to maintain and sustain economic and societal growth within the current economic environment. Resilience, innovation, sustainability and diversification are capabilities required by emerging and established businesses to nurture growth and productivity (Scottish Enterprise Rural Group, 2008; Thackara, 2005). Within the process of evolving and honing these capabilities, lies a business opportunity to engage a deeper level of understanding and appreciation of values intrinsic to both community and business beyond Gross Domestic Product (GDP). The prospect of design contributing towards the development of new approaches for value identification in order to support the development of social cohesion as a model, leading to community prosperity and economic growth (Stiglitz, 2009), is now a realistic and compelling one. Although initial attempts have sought to address such complex endeavours, these have failed to articulate a generic set of criteria that span both the societal and financial aspects; they tend to fall to either side of the divide. By bringing together reports and literature from a wide platform inclusive of Oxfam and Carnegie, HPI, NEF, GNH, and incorporating the strategic use of design into workshop developments, the paper discusses research in progress that 'identifies and presents values and philosophies that lie beyond GDP'.*

**Keywords:** Communities; Shared Values; Business; Prosperity

## **Introduction**

This paper considers how design can contribute towards the development of new approaches for value identification, through newly co-designed indices encompassing value, growth and prosperity.

Using this approach greater insights can be brought to the debate around sustaining and supporting prosperity and growth to occur for both businesses and communities. This paper focuses on Scottish rural SME's and communities.

The Scottish economy is largely supported by its SME sector (small to medium enterprises) composed of business and companies with 0-250 employees (The Scottish Government, 2013. European Commission, 2012). Scotland has some 343,105 SME's operating within the private sector providing employment for 1.1 million individuals across the nation, (one fifth of the populous) (The Scottish Government, 2013). However, although providing consistent and valuable input, the SME sector is an undervalued and often hidden asset within the Scottish Economy (The Scottish Government, 2012; OECD, 2013; Ester & Phipps, 2013).

SME's exist within communities which are inherently complex to navigate, i.e. they have underlying wicked problems (homelessness, hunger, poverty, crime, unemployment, isolation) which compound and complicate strategies for development and sustainability. As a result they face a complex set of factors in maintaining and sustaining economical and societal growth within the current financial environment. There are many barriers in development, including financial pressures, legal complexities, resource capabilities and resource availability (OECD, 2013). Furthermore, the components and capacities available and required to address the needs and issues in each location are not necessarily replicated across different rural communities.

Recent years have seen values become more integral to decision and policy making structures and are now being approached by a plethora of experts and researchers from a wide and varied field base. The past 7 years have seen a flood of information and data surrounding new and innovative approaches towards considering values beyond GDP. At a global level a categorical shift has occurred towards generating a fuller appreciation and understanding of more than what the financial actions of a nation can provide.

### ***1. GDP: A Different Measure of Value - Economic***

It is clear that measuring GDP is very effective as a narrow measure of the financial environments occurring both locally and globally, however this alone cannot provide insight into how we generate more cohesive and thorough responses towards assessing prosperity and wellbeing. We can already see

business promoting and extending their values, and there is a unique and fresh opportunity to interlink business growth with creating positive societal impact. This situation offers opportunities to consider the weaknesses and strengths of GDP, and how development of comprehensive, socially aware indices, methods and metrics might compliment and support a more holistic perspective of prosperity.

Designed by Simon Kuznets during the 1930's, GDP offers companies, nations and governments opportunity to assess and compare growth, failure and stagnation. As a uniform metric it provides an appreciation of both internal and local financial situations and supports globalised comparisons (Kuznets, 1934). GDP is a quantitative method for statistical analysis of finance but it does not have qualitative capabilities. For instance it does not take into account societal aspects of life such as voluntary work, quality of life experienced or the quality of goods being exported and created. Nor does it consider the impact and ramifications of wars and disasters beyond the repercussions which effect finance, (events such as these cause an un-natural influx in levels of GDP) (Picketty in Clark & Domokos, 2014; Picketty in Moore, 2014).

GDP has been continually scrutinised since its inception accruing a position of value and meaning that is outwith its original domain. Globally it receives consistent criticism regarding its inability to effectively represent the societal realities experienced (Danson and Trebeck 2011; Gauntlett, 2011; Fitoussi et al, 2009; Schmuecker and Wallace, 2012). It has accrued value and meaning that far outreaches its original task.

It is not only politicians, governments and academics that are aware of the importance of values. Big businesses and multi-nationals which are purely profit driven are recognising that the adoption of certain values 'humanises business' and can create positive financial and societal results. As opposed to the 'Price War' and undercutting environment that was previously present, the past few years, these giants of commerce have migrated towards patterns more of societal benefit to ensure market longevity, for example, Sainsburys 'Living Well for Less Campaign endeavours to engage with its customer base through appreciating their values and needs. By becoming more socially aware, environmentally friendly and sustainable along with engaging in activities supportive of educational programmes, culture, sport and the eradication of inequality, these institutions are engaging with society at newer and deeper levels.

## ***2. Beyond Economic Measures: Happiness and other Studies***

Since the creation of GDP, calls have been made for further consideration to be given towards alternative measures to reflect the multi-faceted aspects of societal wellbeing. Simon Kuznets, GDP's inventor, gave cautionary warning to the American Cabinet in 1934 emphasising that national welfare could not be inferred through assessing and measuring national income alone.

Robert Kennedy, 1960 and more recently Joseph Stiglitz (2009) supported this perspective, considering the implications of GDP to be lacking and inappropriate for assessing the prosperity and wellbeing of humanity.

*Gross domestic product (GDP) is the most widely used measure of economic activity. There are international standards for its calculation, and much thought has gone into its statistical and conceptual bases. But GDP mainly measures market production, though it has often been treated as if it were a measure of economic well-being. Conflating the two can lead to misleading indications about how well-off people are and entail the wrong policy decisions (Stiglitz, 2009).*

The concept of assessing happiness to provide alternative insights towards societal wellbeing has been underway for over the past 40 years. The term 'Gross National Happiness was coined in Bhutan in 1972 by the Fourth King Jigme Singye Wangchuck. This term supports the legal code of 1729 which states that: *"if the government cannot create happiness for its people, there is no purpose for the government to exist."*

Subsequently, The Centre for Bhutan studies worked towards the development of an indice capable of acknowledging contributory factors of Happiness into policy making structure. This culminated in the creation of the first Gross National Happiness Survey initially undertaken in 2010. Bhutan are not isolated in their endeavours to develop complementary and alternative methods to assess wellbeing and prosperity beyond GDP. Prior to 2003, studies and indices which gave consideration to this and similar factors were generated globally at a slow but consistent rate. Since 2006 at least 1 new indice, metric or institution has emerged yearly to provide insights into mechanisms appropriate for determining and understanding wellbeing and prosperity. Figure 1 shows a table overview of the developments which have occurred in this field over the past 33 years.

Year	Activity
1980	World Database of Happiness
1981	The World Values Survey
1984	The Centre for Sustainable Economies
1986	The New Economics Forum
1989	The Centre for Sustainable Community Development
1990	HDI - Human Development Index
1995	The Genuine Progress Indicator
1998	World Database of Happiness Website
1999	GNH - Bhutan - 1st Survey
2003	The Global Footprint Network
2006	The Social Impact Forum
2007	Oxfam Humankind Index launched
	Global Peace Index - IEP
	Legatum Prosperity Index
2008	Gross National Happiness Report
2009	The Institute for New Economic Thinking
	The Institute for Economics and Peace
2011	Better Life Index - OECD
	First World Happiness Day
2012	Sustainable Development Solutions Network
	Social Progress Imperative
2013	Social Progress Index
	World Happiness Report (SDSN)

*Figure 1. Societal Engagement with Alternative Assessments.*

Each of these institutes, reports and metrics are part of a progressive global endeavour moving towards comprehension of the needs, wants, drives and sustainability of modern society. Collectively, this information provides a richer view of societal needs, identifying areas where concerted effort for change is required.

These endeavours support an inclusive and holistic overview of a wide range of societal aspects. They attempt to consider appropriate responses in order to combat global 'Wicked Problems'. These works support and facilitate a greater understanding and appreciation of unseen and unheard needs and wants of people, aiming to assist in the creation of a prosperous economic structure beneficial for both community and business development.

These activities allow for important key factors such as those that contribute towards the ability to live well, to be taken into consideration and understood by potential external and internal factors of influence, such as local council constabularies and larger governmental bodies. Rather than reliance on GDP as the key and sole indicative measure of progression within societal structure, these indices take a more holistic approach enabling foresight when determining potential effects of new policy shifts. It can be argued they consider unseen values and drivers which support community development and long-term sustainability.

### *3. Design Approaches to Wicked Problems*

Communities across the globe have evolved into heterogeneous systems, which are also home to a plethora of social, environmental and economic instabilities and inequalities. Often referred to as 'Wicked Problems' (Rittel & Webber, 1973), these issues are structurally un-definable, containing multiple co-related factors. A scaffolding of interlinked, yet individual problems of equal complexity supports them. Attempts to define and understand issues within these areas often bring further revelations pertaining to complex underlying problems that require attention.

These wicked problems have challenged and destabilised the environment of trust previously experienced across the public towards businesses and governments (Porter & Kramer, 2011; Fox, 2013). If this effect is to be reversed there are necessary actions to be taken towards strengthening and building relationships. One such action includes implementing an eco-system supportive of shared values. Through nurturing a deeper understanding of the value systems that both drive and constrain business and community structures, arrives the potential to develop and establish approaches for creating necessary, supportive and assistive mechanisms.

### *4. Understanding Value(s)*

'Value (s)' is an ambiguous term with multiple inferences and meanings. The OED provides definitions inclusive of our capability to appreciate varying life factors in relation to their impact and effect upon our wellbeing.

To elaborate, the opinion of this paper is the following:

Value(s) are :

- Intrinsic to life giving context and support to our actions and reactions.

- Grant meaning and guidance across situations we face, in rationalising our actions and decisions, or providing grounding and scope to re-evaluate
- Negotiable and considerate towards accomplishable compromise
- Influence behaviours, attitudes and response mechanisms
- Form the ideals from which we shape our lives.

Values are built and refined through time and experience, influenced by multiple factors and in return effecting multiple factors (Schwartz, 2005; Schwartz, 2009). Some are shared throughout communities and cultures, whilst others are individually determined from our own perspectives (Schwartz, 2009). Emotively descriptive, they can be determined and vocalised both through singular terms, and structured statements. They enable us to position ourselves and actions across a wide variety of events, situations and day - to - day life.

Within the context of business structures, values play a similar role, guiding and defining standards for forming approaches and plans. They are the principles that sustain and give foundation to strategies for present and future action. Collective values such as those found across communities provide an umbrella perspective of social structure, goals and ideals. Schwartz describes them as "Universal Organisation of Human Motivations" (Schwartz, 2009). Appreciating values has provided insight towards both individual, and collective actions and responses providing insight around facets of evolution within societal construct (Schwartz, 2009).

### *5. The Applicability of Co-Design in Business*

Businesses can contribute to both economic and societal growth through shared values, creating positive social impact in local areas thus allowing new opportunities to arise (Porter & Kramer, 2011). The strategic implementation of design methods provide opportunity to instigate these steps, supporting the generation of co-developed, self-sustainable support mechanisms for future resilience and prosperity.

Design interventions can enhance the experiences and potential outputs created through collaboration between businesses and communities through knowledge exchange (Follett & Marra, 2012). Societal problems are context related to their communities and local environments. The most constructive approach towards tackling these issues is to directly engage with the people who live there (Day & Parnell, 2003). Community members are privy to knowledge that can offer invaluable insight towards potential resolutions (Arias et al, 2000).

The long term benefits of utilising design to construct new and innovative processes to address these complexities allows consideration and positive action to be driven around issues of economic and social contention; the promotion of business generation, societal security and long term recovery. It is perceived that without embracing a new approach towards these aspects of society, the world economic structure will not achieve a full or lasting recovery.

Through developing a deepened understanding and appreciation of the multi-faceted value structures which are inherent to community and business eco-systems; businesses and companies can pro-actively involve themselves in not only regenerating the larger economic structure, but create a stabilisation within local economies. If businesses can engage mindfully and integrate themselves into their supporting local eco-system, there is the potential for profitability to occur both socially and financially.

Design approaches are being implemented globally to instigate and support business growth, societal improvement and social innovation (Thackara, 2005) creating environments of shared values across community and business eco-systems. We now see systematic shifts from traditional and conventional business practices towards newer models that incorporate more socially responsive ideals, beneficial for both company growth and societal benefit.

The revolution which occurred across Design as a practice has allowed it to develop from purely production line output to a 360 degree encapsulation of process, which when implemented correctly enhances the potential for success with endeavours. Furthermore, design has emerged as *"a key tool for analysing, evaluating and visioning future company developments for change"* (Follett & Marra, 2012).

Over recent years the field of design has seen an upsurge in the utilisation of participatory and co-design methods. It is no longer sufficient to accept a brief and produce an output without first engaging and interacting with stakeholders to determine their needs and wants. The public are impacted both positively and negatively by ongoing developments, design methods offer the capabilities of garnishing deeper understanding, engagement, co-operation and support when implementing change.

## *6. Design Thinking*

Co-Design is an approach applied by designers which encourages and supports the development and delivery of resolutions through engagement with the stakeholders involved.

It is a mechanism which supports the creation of shared understanding and shared languages to occur around proposed service/project/area's. The

concept is pinned by a belief in generating successful outcomes through direct user involvement. Through engagement with 'users' designers are enabled to support them throughout the design process from the 'fuzzy front end' towards a clear outcome which they themselves have had an active and key role in generating. It supports users to design their effective, desired outcomes driven by their needs and wants, with the designer taking a more supportive, facilitative role. It is a Human-centred process which places ownership of process and output into the hands of the stakeholders.

Engaging members of communities with models that support active participation, allows exploration surrounding pre-conceived assumptions and unknown areas. Members of communities are host to 'unconscious knowledge pools' (Day and Parnell, 2003); they have an awareness of the day-to-day facets that create challenges within the social, economic and environmental layers of their societies (Day and Parnell, 2003). The complexity and variability of social problems are too great for any one individual to tackle independently, but through utilising resources, knowledge, skills and experiences, a richer perspective situations can be obtained.

### *7. Envisioning Value(s)*

To determine the complexities of community and business relationships is a long standing need. The revolution of design from product to experience focus, supports and enhances the value and impact of Knowledge Exchange and re-focuses attention into the stakeholder pool. Design has emerged as a leader within the fields of Social Impact, supporting its workers in development of processes considerate and responsive to the needs and wants of stakeholders. If it were to integrate the responsibilities of values into the process, it may enable a stronger and more responsible attitude towards engagement and positive impact to occur. The past years have seen rise to transitions within westernised societies, the tipping points of engagement, understanding and empathy have been glimpsed. Design approaches are leading the interactions possible and supporting potential avenues of success.

To explore and evolve methods for value extraction a workshop was developed to consider effective methods for 'Value Identification' from a design-led perspective. The intended benefit for participants at this initial stage of exploration was to develop an understanding of their practice or research network and then determine a wider context of the potential value(s) their work may have.

The 8 hour workshop was undertaken with 15 Master of Design for Services students. It aimed to support investigation and development of methods and tools to identify values and drivers. The Workshop was broken into 6 stages,

rotating between group and individual activities. As shown in Figure 2, the stages of the workshop were as follows;

Stage	Type of Work	Purpose	Core
1	Paired	Exploration of the benefits of 'Boundary Objects' (Griesemer, J & Star, S. 1989) discerning individual values	Active Listening
1.5	Group	Generating an overview of the 'collective whole'	Clustering and Conversing
2	Individual	Creating an overview of the stakeholders involved/influential and linked to work. Working through a primary, secondary and tertiary system of impact.	Reflect & Disseminate
2.5	Group	Sharing and considering stakeholders from a collective perspective	Discussion
3	Individual	Considering the drivers and values of the stakeholders who may be involved.	Reflect & Disseminate
3.5	Group	Sharing and considering stakeholders values and drivers from a collective perspective.	Discussion
4	Individual	Synergy Alignment. Identifying areas where individual values may co-exist with stakeholders, and areas where conflicted values structures might occur.	Reflective practice to enable identification of potential actions.
Stage 4.5	Group	Considering the wider group perspectives, determining areas of strength and weakness within a project and discussion around positive actions to make.	Discussion & Mapping
Stage 5	Group	Ideation surrounding positive impact assessment and measure. Lasting legacy.	Ideation, Future Casting, brainstorming, Mapping, Timelines
Stage 6	Group	The integration of terminology and language used to initiate generation of a collective manifesto	Discussion. Shared Perspectives. Group formation.

Figure 2. Workshop Development

When considering values beyond financial output, it was important that the process embraced the occurrence of both reflective thinking and knowledge exchange.

Early findings provide a start point for guiding development and dissemination for potential avenues of exploration within community and business structures. The workshop revealed that effective methods for identifying values were predominantly collaborative activities as opposed to individual. The methods which promoted discussion and questioning supported and enhanced individual exploration and self-reflection.

Each stage focused development and exploration around varying types and perspectives of values.

Stage 1 which was an active listening, object based conversation activity generated findings (Figure 3) of individual value(s) being situated around the following areas:

Learning	Connections	Creating	Drivers	Emotion
Guidance	Stories	Balance	Family	Bravery
Support	Culture	Beliefs	Friendship	Courage
Challenges	People	Hobbies	Memory	Connection
Skills			New	Thoughtfulness
Development			Environments	Openness
Life Experience			Experiences	Need
Reflection			The Past	Love
Practice				Time
				Tradition
				Curiosity

Figure 3. Individual Value Exploration

Through a multi-layered mapping activity Stages 2 through to 4 explored the values and drivers of stakeholders and designers from both individual and group perspectives. Primary findings showed similarity between both parties, (Designers and Stakeholders) (Figure 4.) This is to be revisited a further 3 times over a 9 week period to determine and assess where assumptions were both correct and misplaced.

Drivers of Stakeholders	Designers
Mutual Inquiry	Reciprocated give and take in relationships.
Idea Exchange	Generating positive change in self and others.
Participatory Engagement	Building Empathy
Opportunity	Supporting Communication.
Creating something meaningful	Hearing Voices
Love	Employment
New ways of Working	Curiosity
Increased Equality	Desire to create change
Learning	Willingness to help
Collaboration/ Networking	Travel
Replicable Model Generation	Opportunities.
Self Promotion and Growth	Future Collaborations
Satisfaction	Network Generation
Trust Development	Kindness
Similar Values and Directions	Being able to help
Knowledge Exchange/ Sharing	Impacting the Workforce
Evidencing and Sharing Stories	Making a difference for people
Best Practice	Improving Engagement.
Money/ Promotion/ Power/	Improved quality of service
Security	Changing Interactions
Experience	Generating awareness of issues
Sustainability	
Alleviate workload	

Figure 4. Identifying Drivers and Values of Stakeholders and Designers

Stages 5, was a group activity focused upon future outcomes and measures of success. The students developed short presentations documenting their current perspectives of what might create a successful outcome. These will also be developed in future workshops over a 9 week period. There was however discernible benefits gained through group discussion around successful outcomes and lines of action to take forward.

The final aspect of the day, (Stage 6) culminated in the generation of a collective manifesto considered emotional terminology that the group had verbalised throughout the discussion phases (Figure 5.)

These were:

Emotion Based	Activators
Thoughtful. Kindness. Inquisitive	Knowledge. Experience. Sharing.

Shared Values. Realisation Unique. Inspiring. Equality. Positive Effect	Skill building. Opportunity. Impact Conversations. Networks/ Connections Self development. Recognition Inspiration
-------------------------------------------------------------------------------	-----------------------------------------------------------------------------------------------------------------------------

Table 5. Emotional Terminology and Drivers

## 8. Conclusion

A prosperous financial situation does not guarantee wellbeing or happiness of individuals or communities. The complexities of life are subjective to the opinion and perspective of those involved, encompassing both physical and psychological aspects to provide a more three dimensional outlook. Finances constitute a complimentary factor within the overall picture, and the numbers are require to be seen in perspective and viewed in balance with the experienced quality of life of citizens.

The task of understanding and defining values into comprehensible and comparable indices brings with it complexities. Values are determined by both physiological and psychological factors that are responsive to and effected by life situations and perspectives. Like any design opportunity, this task requires both macro and micro exploration to identify methods which can provide quantifiable measures of assessment sympathetic and responsive to the communities involved.

To enable the generation of a matrix to support a synergistic response to occur, promoting and enabling the development of a human-centred focus; primary actions require to address effective dissemination and consideration of current methods of value assessment from a diverse range of fields inclusive of societal endeavours, social science studies, anthropological endeavours and design thinking approaches. There is considerable opportunity to expand, enhance and develop our appreciation of the concept of value(s) from understanding how, why and where they develop; what impact they carry across into daily lives and behaviours; causes and ramifications of fluctuations in the collective perspective; their formation and development and resulting influential control.

This ongoing research aims through a design thinking, co-design approach to continue to discern processes and methods for uncovering the needs and values of businesses and their communities as they develop and evolve within the current economic and political climate.

# Moving Beyond the Consultancy Model: Strengthening Design Approaches for Public Good

Sarah DRUMMOND<sup>\*a</sup> and Trevor LAKEY<sup>b</sup>

<sup>a</sup>We are Snook Ltd; <sup>b</sup>NHS Greater Glasgow and Clyde

*This paper considers both the positive and negative implications of this business model from the perspective of both the public sector client and a design agency while proposing new forms of partnership models for design to be used as a catalyst for the development of new products and services that may arise from a co-creative process. We consider the need for new forms of partnerships and processes to evolve between commissioned design agencies and statutory public bodies that allow the space for design driven innovation to flourish, and explore what skill sets are needed to maximise the impact of partnerships working. This paper is a collaborative piece between the public body client and appointed design team centered around the appointment to work on a six month mental health project. The project utilised service design methodologies to co-design future services that young people would like to see in the Greater Glasgow area. In the conclusion, proposals are made for new models specifically derived from the experiences of the six month commissioned project and a criteria of conditions for the commissioning of design teams from experience of both embedding design inside organisations and commissioning design teams from the perspective of a statutory public authority. Our core intention is to inform the reader and develop debate and insight around the management of design within the public sector, crucially, from both the client and design agency perspective.*

## **The Consultancy Model**

In recent years there has been a development of high profile organisations within both the public and private sector 'embedding design' within their organisations. However, design is still largely commissioned under the consultancy model.

Typically in today's procurement landscape, although there are shifts taking place, procurement calls are largely focused on the delivery of pre-articulated outputs from a public body or local authority institution. This often means calls are weighted on cost and the process to tender can often leave design teams without a full understanding of what is required for a successful outcome.

In many circumstances within procurement, relationship building can take place before a call to tender and this process can be seen as a formality with a consultancy, however, the personnel who will be closely involved in the project, in many cases, are not able to make the final procurement decision or have an in-depth input to the design-brief set for public tender processes.

There remains today, despite calls for more open forms of procurement and support of SMEs (Nesta, 2007), a large focus on the 'solution' in procurement. This often takes the form of design briefs asking for service or product developments in the form of new apps or websites to counter modern developments and not considering the full series of service needs from users and providers throughout the whole system.

Particularly in the case of digital development for service re-design, there is more focus needed towards developing platform standards, data streamlining and business processes developed to continue to implement a service proposition over time than a quick fix 'solution'.

We are now seeing the design brief evolve (Hands & Murphy, 2012) to allow for more open, participatory forms of design. However even this progression to commissioned problem identification and articulation is often considered as research. Further development is still required to consider how to procure expert skills from the private sector to drive forward work streams post commissioned work.

The consultancy model, considered as an 'outside' approach usually takes the form of a design consultancy delivering solutions and insight to public sector bodies commissioned by public tender. In many circumstances

this brings obvious benefits including kudos, specialist expertise, i.e. technical knowledge and a fresh perspective.

However, this approach is not without barriers for both the commissioner and public authority and the design consultancy. The core issue is in moving from insight and proposed design solutions into working prototypes and usable products. This brings frustration not only for the design team, but also the client who has commissioned the original work and cannot create the budget or remit for the work to be continued by the team who has developed the knowledge from the initial research (see Figure 1).

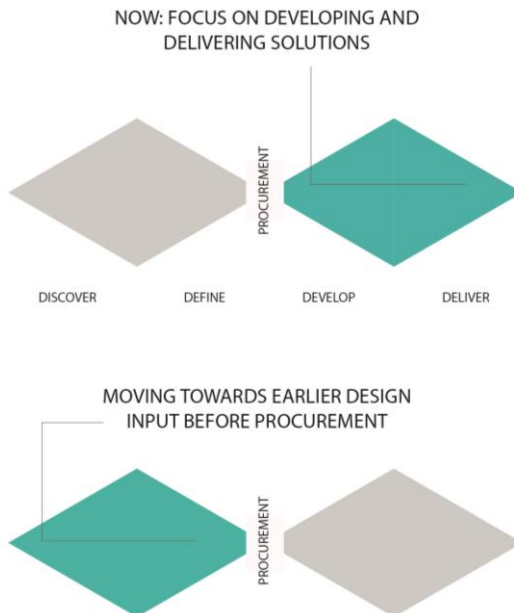

Figure 1: Project 99 (2014), Double Diamond process in relation to procurement

## Commissioning Design

There is growing interest within the public sector in adopting design approaches to service change (Mulgin, 2013), driven by the need to address complex societal challenges within the constraints of highly pressured public finances. Well-recognised drivers such as an ageing population and the growing burden of chronic diseases mean that methodologies that yield deeper insights into the experiences of service users, help shift inefficient

practices, redesign key service elements and capitalise on new opportunities have a vital role to play. A number of key aspects of public policy discourse have in recent years also added to the impetus for a more people-focused approach to public service delivery, including in Scotland the Christie Commission (Scottish Government, 2011) and NESTA's People Powered Health Programme.

However, adoption of such techniques is still relatively novel and there are significant hurdles to overcome in seeing their effective utilisation in the public sector. The most powerful of these is that they represent a positive challenge to traditional power balances that have governed the delivery of public sector services for some considerable time, by placing the experience of service users at the heart of redesigns and innovations. At its best, service design gives voice to protagonists whose experiences may have been fairly marginal to-date. Linked to this is a set of expectations built up around commissioning processes that tend towards setting out in advance what the deliverables will be, and specifying this with some precision in the contract specification. With the level of public scrutiny that all public sector spending attracts, being prepared to go with the flow of open-ended processes, and being primed to respond to potentially significant critiques of current practices takes a degree of confidence and courage. There's a chicken-and-egg dimension in addition, in that an in-depth understanding of the strengths and limitations of service design approaches is only likely to be generated by hands-on involvement. As Mulgan (2013) notes:

*'...few signs of public services building up the capacities needed to be good commissioners of design.'*

## **The commissioned Mental Health Project**

An emerging understanding of commissioning Service Design can be seen in Project 99 (2013), focused on exploring internet based approaches to support youth mental health in the Greater Glasgow area. The project undertook a co-productive approach to research and develop future strategies, products and services focusing on young people, social media and how this impacts on their mental health and well-being. This was undertaken by a prominent design agency, leading youth charity, foremost mental health charity and the client, a statutory public body.

The public statutory body and its local partners were looking to establish a time-limited development project to explore the potential of the internet, social media and mobile technologies to promote better mental health and

wellbeing for young people. A commissioned partner or consortium of partners was sought to collaborate with GGCNHS and its local partner agencies in developing a collaborative programme with local young people, aged between 15-21. A focus was put on participatory methods with young people, with an intention to co-produce a number of multimedia resources and guides to the internet and mental wellbeing. The project was aimed to guide longer term developments in the youth mental health sphere in the wider health board area.

The origins of this work span several years, and grew out of two linked processes. The first of these was a formal Health Board led policy development process, drawing in multi-agency partners, that created an overall strategic framework for addressing the preventative and early intervention aspects of child and youth mental health. One particular priority to emerge from this process was the need to expand the range of communication and dialogue approaches being utilised. The second strand was a more informal exploration, conducted via the professional networking activities of a small number of colleagues - often using social media channels - to discover and connect with an international body of innovative practice in mental health fields. This latter activity provided sufficient evidence of digital innovation in the health sphere to build a case developed to attract Health Board investment in a programme of exploration.

The commissioning method adopted was the traditional model of competitive tender, in line with the Board's Standing Financial Instructions (SFIs), which are designed to ensure compliance with relevant national and European procurement legislation. The Health Board's Procurement Team played a crucial role in this stage and remained an active partner throughout the tender, selection and award stages.

Several aspects of the contract specification, however, lent themselves to a more collaborative approach from the outset; a co-production approach with young people was an integral element of the specification, as was a requirement to draw on the resources and expertise of a network of local partners. These were brought together in the form of a project steering group, including colleagues from health, local authorities and the voluntary sector.

Drawing in the knowledge and connections of this network of local partners was a crucial element of the approach - for example being instrumental in identifying within a relatively short timescale a shortlist of potential youth agencies, then continuing to support young people's

participation, for example via the network of youth workers already in place in the participating youth projects and initiatives.

Above all, upon award of contract to the successful three-agency consortium, significant early work was put in to build up relationships among the commissioners, contract holders and the multi-agency steering group partners, in the testing of expectations and assumptions and to establish ground rules and share insights. Some key elements of the eventual suite of final outputs were shaped collaboratively through this kind of dialogue, such as the concept and overall outline of the “digital assets map” (Project 99, 2013)

## **The project process and outcomes**

Across 2013 the consortium worked with youth agencies across Glasgow undertaking a series of co-design workshops with young people, providing them with bespoke design tools that allowed them to visualise and put forward a range of ideas on how to improve mental health services.

As a dual process, the interaction with these groups of young people was analysed for insights on the various types of support needed and the preferred format for communication and form of services.

In order to gain a deeper understanding of young people’s needs, one-to-one interviews were undertaken where their journey was mapped through a variety of health and youth services they had interacted with in order to understand points in their lives where more support was needed and in what format.

In addition to field work, desk research was undertaken to build a service map of existing resources and platforms (both specifically designed to support mental health and existing digital tools) which were later aligned to a service map. The objective of this service map was to support health professionals and relevant stakeholders working in the mental health sphere on how to use these tools in the support young people’s mental well-being.

In addition to this qualitative work, a survey of young people’s social media habits was produced collating over 600 responses and the results later analysed to understand how young people were accessing the internet, (how, when and what for) to inform design solutions.

The process was a blend of researching existing needs and then presenting these needs back to young people in a safely designed space to develop early stage ideas and directions for improving the Health Board and

wider stakeholders' ability to support young people's mental health both inside and outside of the health care system.

Through this open innovation process, the groups of young people were always given the freedom to develop elements of the project as they wished. This resulted in a non-commissioned piece which became part of the wider report. This took the form of a self-developed manifesto for mental health by young people, which the design team developed into a series of visuals for final presentation back to the health board.

From the tender process, outputs also included the development of a youth guide to mental health and well-being. This took the form of an animated GIF youth guide which included animations of advice regarding to stay mentally well and recommendations by young people on what to avoid online.

The final report contained all of the above and an overview of wider insights gained during this research and development project, outlining potential opportunities for future exploration.

The final outputs (report, service map, wider research) (see figure 2) were presented back by the commissioner, appointed consortium, the design team and the group of young people.

Figure 2: Project 99 (2014), Executive Summary: Overview of outputs

These outputs and presentation have been re-presented at various mental health conferences in Scotland and released online. It is important to make a distinction between outputs and outcomes at this stage. The wider outcomes included transferral of knowledge and engagement of the young people, giving the groups the opportunity to have a voice. Often the

commissioning process focuses on outputs with these as tangible deliverables. In this process, outcomes are left to the side and are an affordance of the core delivery of outputs.

The report and supporting work highlighted the importance to recognise the need for the health sector to build both new and adopt existing digital platforms to work with young people in managing their mental well-being at all stages of their journey.

The outputs from this project are both hard and soft. Solid service proposals are contained within the report but the issue remains that to reach this stage to develop ideas a series of concurrent workstreams require development to make this a reality.

These include social media and data governance developed to allow for the solutions to exist, an education in the possibility of internet-based tools for the wider health sector and a change in mindset that digital and internet-based tools can be used positively to support young people.

## **Beyond Project 99**

A consideration for highly innovative programmes such as Project 99 is that in order to achieve impact and forward momentum, it is necessary to undertake significant internal development work within the commissioning organisation, as there are often major barriers to overcome. These can be a combination of technical, cultural, financial and political. Even if such negotiations are fruitful, they can typically be very human resource intensive, time consuming and requiring of compromise. It may also be necessary to conduct negotiations with a range of additional key partners - increasingly important given the drive towards further integration of public services, such as with health and social care (see Figure 3).

The time taken on internal processes, and the necessary semi-visible nature of much of this effort, can in turn place strains on the positive dynamic with external service designers, participating service users and wider stakeholders. In the case of Project 99, the focus on digital communication technology, and particularly social media presents particular challenges, given the need for the NHS to work through issues such as information governance, data security, patient confidentiality, staff conduct and management of organisational reputation issues. The concept of co-designing health services directly with young people is also a far from commonplace practice, despite many years of policy imperatives focused on patient involvement.

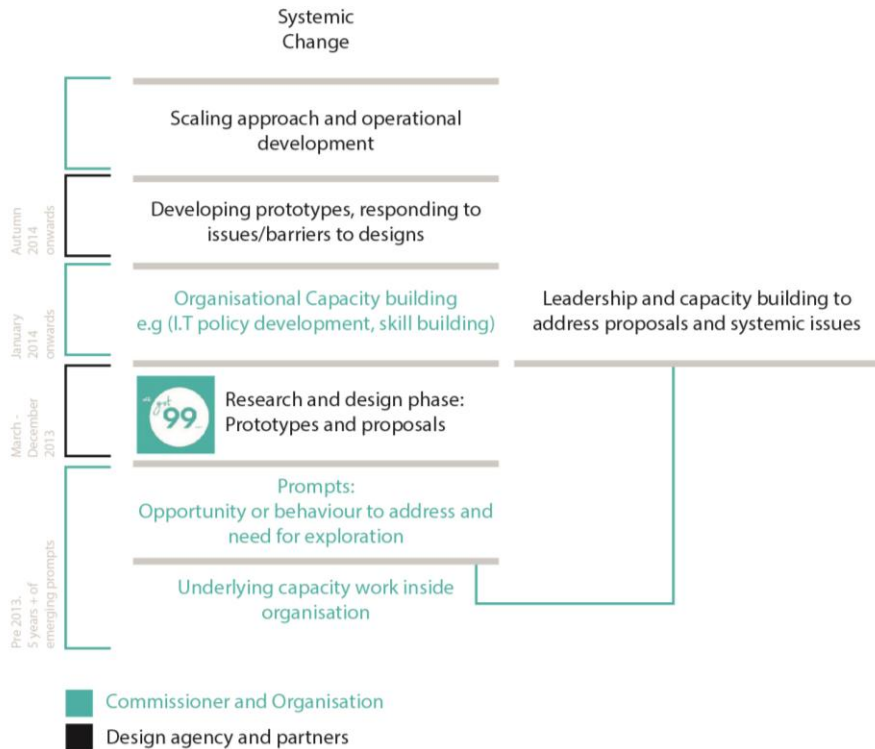

Figure 3: Project 99 (2014), Internal development and challenges commissioner perspective

What greatly assists in working all these issues through, and in preparing and securing resources for follow-on stages of development is the ability to connect with like-minded colleagues in other public sector agencies, to be able to share experiences and resources, and to be able to illustrate the potential benefits that can accrue from adopting a service design ethos. Also crucial, but very challenging, is the need to maintain a dynamic link with representatives of service users and involved communities throughout any negotiation of next steps and ‘mainstreaming’. The challenge comes particularly from a potential disparity of expectations around the pace of change, and from lack of investment in the practical requirements of such on-going involvement.

Finally, the ability to explore and select from a wider palette of options in terms of investment and commissioning arrangements needs to be taken on board, if the maximum benefit of service design is to be harnessed for the benefit of more effective public services. Initiatives such as the Scottish Government's support for use of Public Social Partnerships is one example among many that needs to be given more widespread consideration. (Scottish Government, 2011)

## **New Models of procurement and partnership in design**

*"...A design team should be involved at the earliest stage of commissioned work with internal teams using design tools to help explore and shape the requirement prior to any procurement being established. This avoids the risk of 'getting the right answer to the wrong problem'." (Policy Connect, 2013)*

This project highlights the benefits of an open research approach which allowed for the use of co-creation tools to steer the direction of the outcomes and open up wider work streams that may need taken forward in alignment to produce 'outcomes' that were not recognised at the commissioning process.

In order to commission projects of this type that adopt an open innovation approach, we need to extend the knowledge of open innovation approaches within the public sector and set up the proper conditions for both internal and external understanding of potential outcomes.

There are several models we outline that we do not intend to be taken as isolated solutions but should be recognised, if adopted, as complementary to one another.

*"Social labs bring together a diverse group of stakeholders, not to create yet more five-year plans, but to develop a portfolio of prototype solutions, test those solutions in the real world, use the data to further refine them, and test them again. Their orientation is systemic—they are designed to go beyond dealing with symptoms and parts to get at the root cause of why things are not working." (Hassan, 2014)*

There has been an increase and general recognition of Social Labs that utilise elements of design (co-design, visualisation, prototyping methods) and social science, and the collaboration of stakeholders to explore solutions to problems facing society.

We believe an embedded form of social labs could begin to extend the understanding and create the framework for open investigation into procuring scaled solutions and multiple work streams that align to tackle systemic issues.

It could be said that embedding design tools and capacity into an organisation could support the development of smart procurement that allows open investigation of a subject domain and guides articulation of procurement documentation. As NPRU (Nesta, 2007) points out, this could combine early supplier involvement with outcome-based specifications allowing suppliers to learn more about the underlying problems that procurement is attempting to address.

Following on from this a wider recognition and development of policy around Innovation Partnerships (Taylorwessing, 2014) could be adopted. This would allow the commissioning authority and supplier to work closely together to develop iterative work plans, with the authority purchasing the results or entering into a formal partnership with the organisation to develop proposed projects post investigation period.

## **Design focusing beyond solutionism and towards platforms for co-production**

A fundamental shift in the way needs are met and services are delivered requires a fundamental realignment of the relationship between the community and the services they use. Co-production and co-design approaches can play an important part in this shift of approach, but to succeed, significant attention must be focused on the practicalities of enabling community participation. Public services and their partners, including service design agencies, need to actively work to address perceptions, capacities, potential barriers and above all to invest in the time and energy required to make community participation a serious part of the mainstream effort.

For example, as the recent Royal Society of Edinburgh investigation of digital inclusion in Scotland (Royal Society of Edinburgh, 2014) revealed, there are still many people in Scotland - and elsewhere in the UK - who are not digitally connected. Almost one in five Scots live in postcode areas

where most of their neighbours are unlikely to be online. As this report, and allied work shows, digital exclusion is not simply about lack of access to connection or equipment, it is as much about skills, confidence, cultural norms and whether one perceives a net benefit to the effort of getting online.

In the instance of the project we discussed, recommendations highlighted a need to develop co-production based platforms and forums for continuing knowledge between commissioner, design team and service user. The design team recommended that the Service Map be turned into a live site for knowledge curation and a series of recommendations on where and how internet based tools are being used to support young people by the whole community. In addition, an ongoing networking and content building role for the site on and offline was specified. This form of output considers not only 'service users' but a multitude of needs for the health sector that may have not been articulated in the original tender specification.

Supporting communities through practical initiatives that build skills and confidence is therefore crucial, as is designing engagement processes that are responsive to the needs of respective communities, such as addressing potential financial or childcare barriers to participation, and avoiding off-putting jargon. Above all the biggest shift is attitudinal, from commissioners and service providers - moving decisively away from viewing communities only as passive consumers and instead seeing them as bringing a huge wealth of experience, aspiration and ideas that can drive change.

## **Blend a range of skills and approaches**

*"Good designers recognise that their skills only become useful when combined with other complementary skills." (Mulgin, 2013)*

Extension of knowledge and understanding by designers and commissioners is needed through education and case studies to highlight new forms of design processes from service design and open innovation to work with authorities to consider the complexity of building new services and products. This a movement from focusing on the solution to the development of knowledge across an innovation process. In addition to this, larger consortiums of both internal and external expertise are required to complement knowledge of past research and existing infrastructure. The building of multi-disciplinary teams is needed to develop work streams and solutions that can be continuously developed over time and fit within the

existing system infrastructure and recognising where there may be need for training or capacity building.

## Conclusion

While there is a growing body of work using co-production principles across many facets of the public sector, this still represents a small proportion of the overall effort of service commissioning and development activity. Moving from innovative case studies through to creating a more mainstreamed approach will take considerable effort. However, there are positive initiatives underway to boost this approach, such as the Scottish Co-production Practitioners Network, and the wider UK network.

A successful design-client relationship works when other systemic issues are identified as part of a larger work package and are carried through in procurement. Therefore, we recommend that statutory authorities invest further in the development of co-production based commissioning and work closely with service users, communities and design teams in the initial stages to specify clearly the desired outcomes from a commissioned piece of work.

A strong focus on outcomes can set the compass points to a clear destination for a project, while allowing the client, service users and design teams to adopt an iterative and exploratory approach to determining how they reach the desired destination. Use of such an open and creative procurement process, also allows the design team and service user to develop their own maps and guides, producing the type of outputs they feel best articulate the most important focal points of the project. This avoids the constraints of pre-determined route maps.

To set the framework for such an approach, a preliminary investment, recognising the benefits of design-led approach to innovation, should fund a foundational procurement exercise which allows identification and co-production of this set of outcomes. This may also identify the need for the procurement of a wider range of work packages that not only explore how the desired outcomes might be achieved, but then provide the funding for communities to be engaged in co-producing the services developed, ensuring momentum is maintained post project and that knowledge is embedded in the system.

This is no easy task and further research is needed into what practices and systems might embed the design approach and maximise the benefits of the social lab. However, this paper highlights the need for commissioners

to think beyond setting specifications for the procurement of narrowly defined and specified work packages and projects, with prescriptive emphasis on output over outcome. A wider perspective allows consideration of the range of supporting workstreams and future developments required within the organisation, to embed project learnings and the transferral of knowledge. It is our hope that this open approach to producing design briefs, with service users and designers involved earlier in the commissioning process, will help the procurement and tender process to evolve, increasingly leading to a systems-led model with a focus on the best outcomes for communities and service providers.

The project discussed in this paper might be considered a 'breaching experiment' (Sniggle, 2014) in that it has tested the ground for the development of these theories in practice. The value of the approach and the potential impact, both in terms of outputs and outcomes, has been recognised at a senior level in the client organisation who are now considering the development of new workstreams to take the project to the next level.

## Where the Social and Sustainable is the Territory

Liam FENNESSY, Soumitri VARADARAJAN\* and Judith GLOVER

RMIT University

*The contributions that industrial designers can make in achieving greater degrees of sustainability in the sectors that design serves are sizable. However the greening of product manufacturing has been largely transferred away from the remit of design and into technical and managerial areas within the manufacturing construct. This paper reflects on a decade of privileging the “social and sustainable” as core to the professional and pedagogic construction of industrial design in an undergraduate degree program in Australia, and the two decades of theory for sustainability in design that has informed it. The paper charts the modes and intensities of theory in this domain and describes the issues of design for sustainability as a technical, managerial or moral discourse for design within undergraduate industrial design education. In discussing the transitions of theory in design for sustainability the paper points the way toward new forms of social and sustainable design management and leadership as a possible future trajectory for industrial designers that look to direct their work towards environmental and social concerns.*

## **Introduction: The Social and the Sustainable in Industrial Design**

For the past two decades sustainability has sat as a core negotiation in the professional and pedagogic construction of industrial design in the undergraduate degree program that the authors locate their work. As notions of sustainability have matured inside design discourse opportunities have emerged and been played with to test the efficacy of meanings of design that privilege the social and the sustainable. This exploration of how industrial design deals with issues of environment constitutes a really fertile space for the navigation of complex systems and implications that presents industrial design education with a useful set of models for managing the structuring and conduct of design activity. Sustainability in this context is treated as an agenda for intervention in entrenched social and technical practices through design. Industrial design is treated in a similarly open way, in that we define it as a socially engaged and negotiated creative practice of campaigning for dematerialization, envisioning plausible futures and the proposition of self-sustaining social entrepreneurship ventures. This work draws on theory from the sustainability domain, but applies it in perhaps less direct ways than the theories themselves suggest. This is not some misapplication of theory, but rather a re-figuring of ideas to fit the particular circumstances of a disciplinary context that is in reality quite different from what the discourse from sustainability and design management present.

Increasingly the role of the designer in the sustainability domain in the context of design education is less about materiality and the manufacturing aspects of a product, and more about the social life of products within in complex systems of products, technologies and users. Established technical methods such as life cycle assessment while informing the ways in which designers do what they do have migrated from the remit of the designer to become quasi-managerial discourses in their own right undertaken by expert service providers that work alongside or after the procurement of design development processes. Other methods such as eco-design strategies and life cycle thinking are readily absorbed as methods for design and provide useful ways in which the uncertainty that designing can produce can be mediated.

The transitions of sustainability methods and discourses inside industrial design education discussed in this paper have produced a diversity of approaches that can be drawn on for particular kinds of design investigation. Projects undertaken by the authors over the past decade span technical product design, sustainable interaction design, social design inside the

community sector, social innovation and service design, envisioning and product-service systems design. Out of this the potential of new forms of design management and leadership are becoming visible in the career trajectories of graduates – as they position themselves as particular types of advocates and activists within design, business, research and educational communities.

Like in many education disciplines Industrial Design in Australia carries with it the shadow of old meanings of practice that are successively layered with the inclusion of new concerns, but rarely discarding the old modes. Developed initially through the global British Schools of Design movement in the last decades of the 19<sup>th</sup> century, Australian industrial design (or industrial arts) was remade and remade again in response to the reformation of European and North American design industries in the post war periods in through adopting elements of the curriculums of the Bauhaus and HfG Ulm Schools (or their North American interpretations). Central to the development of the profession was an accepting of the role of industrial design as a professionalised means of activating consumption, without being seen to champion it in a gratuitous manner. Seen as a key mechanism for economic resilience in the mid 20<sup>th</sup> century this notion of the role and meaning of design set in motion an educational response inciting continual material consumption and thus building manufacturing capacity and qualities of material appreciation in a consuming public through formal design capability. This discourse is still very much alive but actively problematized through the inclusion of sustainability in the formal education of industrial designers.

Undertaken as a process of collectively reflecting on the various tensions and transitions of meanings in the practice of sustainability inside industrial design education this paper attempts to position pro-sustainability strategies used in design as discourses that sit within an enlarged discourse of design management. It does this by returning to the theory that we have used inside our teaching and to figure it against the contextual particularities of industrial design in Australia. What emerges through this reflection is an account of how design in the university context uses the systematic nature of sustainability theory in a robust but overtly moral way, not to produce professional designers that are necessarily able to directly apply these theories inside a manufacturing concern or consulting practice, but rather as a significant component of their moral, civic and importantly managerial development through design.

## Contemporary Sustainability Theory

With the emergence of the need for industrial design to properly attend to the environmental and social implications of its capacity to proliferate material things the discourse of sustainability has largely been about reducing environmental impacts of manufacturing and consumption patterns. Generated from, and located within, the research interests of academics in design and affiliated disciplines, this pressure to confront the un-sustainability of 'normal' design practice has manifested in a series of iterations of design for sustainability that have significantly influenced the nature of the work of the authors and the professional preparation of their students.

Concepts, methods and tools for Sustainable Design developed from early eco-design or eco-efficiency approaches of the mid to late 1990's. Initially referred to as Design for Environment (DFE) or cleaner production (Lewis, Gertsakis, Grant, Morelli, & Sweatman, 2001) these approaches evolved to include discourses from manufacturing engineering and management, social science and public policy. The early work done in the late 1990s into eco-redesign and eco-efficiency (Lewis, Gertsakis, Grant, Morelli, & Sweatman, 2001; Roy, 2000; Ryan & Fleming, 2004) was extended by emerging discourse from Product Service System (PSS) approaches in the early 2000's (Roy, 2000; Mont, 2002; Ryan & Fleming, 2004), and more recently to considering aspects of behaviour change (McLaren, 2008). With the emergence of each approach a new body of theory and method leveraged and complimented the previous.

This changing of concepts and methods reflects the recognition by designers and researchers of the increasingly complex nature of dealing with the environmental implications of designing, and highlighted the transition from design offering creative and propositional processes to deal with environmental challenges to design strategies becoming managerial toolkits aimed at limiting the potential environmental risks of otherwise naïve design decision making. As such, initial strategies focusing on individual product elements expanded to total-product, industrial and business systems (PSS and triple bottom-line approaches).

Through this work designers and theorists alike have come to understand sustainability as a series of interactions in complex and contextually contingent systems of the social, the environmental, the economic and the political. This has ultimately led to the combination of technical, managerial and social science discourses with design processes

and the development of behaviour change models – all of which locate the sustainability agenda as a particular form of design process management.

Early approaches in the Design for Environment (DFE) domain tended to focus on issues pertaining to an individual product where an analysis of impacts could be determined and improved through various strategies such as reducing impacts of production and use, toxicity, energy efficiency and waste streams (Lewis, Gertsakis, Grant, Morelli, & Sweatman, 2001; Roy, 2000; Ryan, 2004). Life cycle analysis (LCA) became a way of objectively quantifying and bench marking a products performance across its life-cycle and has since evolved to be a technical service in its own right and a set of tools that are commonly deployed inside design process from problem identification methods to tools inside design software. This contributed to developing the need for designers to consider their decisions across all life-cycle stages of a product under design rather than a traditional focus on the manufacturing and use phases up to warranty (Lewis et al, 2001). In the early 2000s Design for Sustainability (DFS) gained momentum building on the numerous DFE strategies and eco-design tools (Pardo, Brissaud, Mathieux & Zwolinski, 2011). DFS expanded the scope of engagement in sustainability via the approach of People, Planet, Profit that mirrored the triple bottom line approaches used in the business and sustainable development fields. The triple bottom line structure and systems focus of DFS assisted in moving away from strict product-orientated DFE approaches to incorporate understandings of stakeholders and business development (UNEP, 2009).

Design as a strategy for dematerialisation emerged soon after with the prospect, the beginnings of legislation for, and the voluntary implementation of Product Stewardship and Closed-loop systems that promoted or enforced take-back schemes and extended producer responsibilities. Making companies responsible for resources consumed and wasted across the whole of product life-cycle (Mont, 2002; Ryan & Fleming, 2004; Frankl, 2005; McLaren, 2008; Lewis, 2005; Toffel, 2002) Product Service Systems (PSS) flagged the proposition for design that material and energy flows could be de-coupled from economic growth, and in doing so elevated the managerial discourse of sustainability from being concerned with robust and accountable processes to being strategic and holistic in intent. PSS approaches advanced the investigation of products and systems thinking by exploring how efficiencies can be achieved (and innovation introduced) by looking at the potential for the products function to be delivered through service schemes or leasing options rather than through

traditional product-user-ownership (Manzini and Vezzoli, 2002) (Mont and Tukker, 2006) (Morelli, 2006) (Roy, 2000) (Vasanthaa, Roya, Lelahb and Brissaud, 2011). Tukker and Tischner (2006) describe PSS outcomes as 'a mix of tangible products and intangible services designed and combined so that they jointly are capable of fulfilling final customer needs' (p. 1552).

Models for PSS became a mixture of product design and development processes, environmental or sustainable design strategies and tools, systems and service design thinking. Vasanthaa, Roya, Lelahb and Brissaud (2011) in a review of PSS models and methodologies identify three common themes '...namely the development of innovative business models, the integration of products and services into a unique offerings and extending services to increase the value realisation of products. These observations show that PSS design should focus on integrating business models, products and services together throughout the lifecycle stages, creating innovative value addition for the system' (p. 639-640). PSS offered a way for companies in developed nations to innovate through product/ service mixes as well as develop more efficient solutions that helped companies compete with the lower labour costs of developing nations manufacturing. These models sat well in places like Australia that saw a shift from manufacturing as the backbone of their economies to becoming Service economies.

In the last decade a new set of theories and methods have added to Eco-efficiency and Systems thinking approaches by looking at the role of people and their behaviours and beliefs. Loosely known as Behaviour Change, Moloney, Horne and Fien (2010) give a comprehensive summary of the methods and concepts relating to the field, which derives its epistemology from areas such as the Social Sciences, Design, Business and Marketing (Barr, Gilg and Shaw, 2011), (Peattie and Crane, 2005) (Peattie and Peattie, 2009). Conceptual and methodological approaches within this field can be divided into two key approaches each with an emphasis on either the micro or macro sociological. The micro-sociological concerns an individual's motivations, beliefs and behaviours 'that influence or shape what goes on inside a person's mind, such as awareness, knowledge, values, attitudes, behaviour, rational thought processes, emotional states and entrenched habits. These vary between individuals and within an individual as a function of life stage and context.' (Moloney, Horne and Fien, 2010, p. 7615) The macro-sociological, has an emphasis on how 'External variables are located in the physical, social and discursive environments in which a person lives.' (Moloney, Horne and Fien, 2010, p. 7615).

The macro-sociological focuses less on individual responsibility and more on the way an individual is a socially constructed being affected by external forces and systems. Behaviour change approaches inside design are not benign or merely analytical activities that look to understand the particular phenomena of a change in ways that a socio-technical practice is undertaken. They are approached instead a means of finding the right levers to pull to induce a strategically defined change. Often these levers come in the form of a purpose-designed product, service or process but the intent is to manage across a population of consumers or users the transition of one form of practice to a potentially less environmentally impactful one.

The focus on environmental strategies for limiting the potential negative impacts of design decisions has over the past two decades has produced a raft of tools and methods for designers and for those that procure design services in product development and manufacture. Early on Ryan & Fleming (2004) published 'The Six Strategic Principals of the New Eco-Innovation Paradigm' and summarise the totality of research and practice into various sustainable design thinking up to then. Their principals comprised of 'Valuing prevention, Preserving and restoring 'natural capital', Life-cycle thinking (closing system cycles), Increasing 'eco-efficiency' by 'factor x', Decarbonising and dematerialising the economy and Focusing on design – of products and product-service' (p. 30). While continually changing, the types of Sustainable Design tools available for designers are largely DFE oriented and tend to focus on eco-efficiency, analysis and problem identification. What is important to the authors is the widening of DFE and Sustainable Design strategies to account for business and stakeholder needs and influences in the decision making process. Mont and Tukker (2006) describes this as

*...the need to link hard and soft issues such as technology and sociology, products and services, and to view existing environmental problems from a systemic perspective... the development of multidisciplinary approaches that require inputs from a broad range of disciplines, such as economics, management, environmental studies, sociology, psychology, product design and engineering. (p. 1451)*

The trans-disciplinary nature of the expanding field of design in the sustainability domain is reflected in the structure of the Life-cycle management (LCM) frameworks that have emerged recently to deal with the increased complexity of attending to sustainability in business practices.

In strategically managing a company's shift towards a holistic model of Sustainable business and production, LCM describes a whole of business approach categorised into three main areas: Organisational Aspects that include environmental strategies, decision making and capacity development process and the structure and responsibilities of the organisation; Internal LCM Projects involve product design and development, business operations, supply chain and environmental management systems, and End-of-life management; and, Environmental Profile which is made up of various forms of communication including environmental product declarations, standards, sector level requirements, Environmental reports, life cycle studies, Stakeholder relations and communication strategies to build networks for change (McLaren, 2008). As explained by McLaren (2008) LCM is

*'...the systematic application of life cycle thinking in business practice with the aim of providing more sustainable goods and services. It involves the development and implementation of a product-oriented management system; this seeks to improve the sustainability of an organisation's product portfolio(s) across the entire life cycle and value chain.'* (p.1)

In many ways LCM frameworks mirror the approaches used by the authors in their teaching and describes a general trend in Sustainability strategies that require a multi or trans-disciplinary approach and an understanding of social and behavioural systems that sit behind the technical systems of a product. A three pronged approach of **Eco-efficiency, Systems Thinking and Behaviour Change or Management** constitute a multi-strategy approach to design-led projects in the sustainability field and allows for a capture of variations between types of problems, categories for consideration and strategies that might be deployed as a way of mapping a problem, designing a solution and managing its implementation and effect.

### *Sustainability in the workplace*

RMIT University, and particularly the work of the Centre for Design has been a significant location for eco-design discourse in Australia for the best part of 20 years. Under the leadership of Chris Ryan in the latter half of the 1990s the Centre saw itself as a "catalyst(s) for change, a way of shifting the terrain of competition for new product development"(Ryan, 2003, 10-12). The Centre pushed the idea of "Eco-Redesign" through a widely distributed video, courses and training programs and presented eco-redesign as a

definite process that designers could undertake in redesigning products to make them more environmentally efficient. This push linked universities and design consulting firms with product manufactures to do some exemplar projects in the areas of household appliance design and early product distribution and recycling station product service system design. With hindsight we see that while the Eco-Redesign movement with Government funding was being developed as a future way of design practice Australia's manufacturing base was at the same time shrinking both in total scale and in diversity. The decline in the local manufacturing sector gathered significant pace over the past decade as companies off-shored their manufacture in response to a stepped reduction in import tariffs and the development regional trade agreements. As opportunities to practice eco-redesign in local mass-manufacturing contexts were diminishing design began to privilege a discourse of making one-off artifacts or using design for new product development (NPD) rather than redesign. As a result Eco-Redesign strategies were used less directly than initially devised and often as an ideological or intellectual aspect in the conceptual stages of design.

The Australian situation is itself perhaps unique in that design has had to wear three hats in the sustainability agenda: the eco-design or DFE hat for theorising and seeking to optimise design processes inside a product manufacturing construct that was premised on a scale of mass supply; the designer-maker hat that limited volumes of production and controlled all aspects of manufacture, and thus by-passed the need for managing run away environmental impacts by limiting supply ; and, the design innovation hat that worked in a way that either did not use or did not have precedents from which define appropriate courses of action. Perhaps because of this shift in the nature of industrial designs engagement away from a practice of re-design to one of design and innovation evidence of the 'stickiness' of eco-design or sustainability as explicit in the curriculums of design schools was fairly limited in the early years of the millennium (Ramirez, 2006). In the years since sustainability as a central discourse is perhaps more evenly spread across Australian industrial design education providers than it is was and broader notions of sustainability are now common in the professional work of design graduates.

Industrial design has long positioned itself as a profession that would react to design briefs set by a client. This approach to the ways designers worked created quite sensibly a format by which engagement with sustainability would be an activity of redesign or incremental improvement thus setting the framework for methodological conduct for sustainability

approaches. Two critical things happened that limited the impact of design for sustainability in this vein that from inside design are quite clear but perhaps opaque from the outside. The first is that industrial designers that engaged closely with manufacturing realised that affiliated fields, such as engineering and environmental management, had taken up the challenge and put in place systems that solved many of the eco-efficiency problems that had previously made manufacturing wasteful.

The second was that these systems for greening the making of goods were rapidly transferred through various supply chain compliance requirements to the very performance of the goods made. When engineering adapted methodologies of manufacturing practice, such as Total Quality Management (TQM) and value engineering, to include issues of pollution and other waste streams new specializations of engineering that could incrementally transform product manufacturing towards more environmentally appropriate practices were created. That 'big industry' would not be needing designers to work on the eco-redesign of their products was largely ignored by its devotees both inside and outside of industrial design - a pattern of being repeatedly rendered irrelevant that plays out frequently as other technical and managerial professions adopt and adapt design concerns formed through designs ability to link the social, technical and contextual in order to tackle problems and to propose alternatives.

For instance in Japan eco-design became a subject within mechanical engineering quite early on and big industry began to build eco-redesign as a key component of best practices. In France and other European countries legislative reform produced a new form of compliance that required all involved in the product design, manufacture and procurement process to develop new systems for management.

The emergence of ISO 14000 and Total Quality Management (TQM) effectively removed the imperative for industrial design to carry the burden of decisions as advocated in the DFE and DFS discourses of the last decades of the 20<sup>th</sup> century and marks a significant departure of eco-design discourses as having centrality in industrial design curriculums. While marking a loss of potential agency in the determining the net implications of things designed this migration from a set of design strategies to a fully fledged system of checks and balances inside the mass manufacturing construct opens new opportunities for design in the sustainability domain. This we see in the growth of a considerable environmental business and public sector in Australia. However, with "green jobs" being identified as

one of the most significant growth areas in the transition from a high to low(er) carbon economy, very few of the design jobs with this growing field of work really require designers to use the eco-design tools and methods that they might have acquired through sustainable design theory or practice while at university. Typically these jobs sit inside the services sector and offer auditing and technical expertise that get utilised alongside or after the engagement of design.

Critical to these shifts in the meanings of sustainability in design has been the disjuncture between the discourse for (and from) design and the actual boundaries of responsibility for environmental decisions inside the professional domain of design for manufacture. Two decades of systematising design processes for greater eco-efficiency has shifted many of the hard and analytic negotiations that designers and other specialists initially tasked themselves with to other professionals in the engineering and logistics domains of product manufacture. Similarly much of the theory and theorising in the design for sustainability space have been undertaken from disciplinary positions outside of design – social science, business, engineering and environmental management. While design inside the university context has readily accepted and actively developed these ideas into their ways of thinking and teaching design it ought not be assumed that such an adoption necessarily presupposes an intention for application outside of an educational context. Systematic approaches to sustainability inside the teaching of creative practice - be they commercial, clinical or technical in their focus - provide on one side a means by which design decisions can be subjected to various methods of validation and management, and on the other an ideological dimension that can be used to carry forward design in innovative and contextually sensitive ways.

The sustainability imperative inside industrial design has thus split – producing two distinct orientations; sustainability as an ideological or moral discourse encountered through design and sustainability as a managerial discourse for design. Inside industrial design education the latter is not possible without the former: the former feeds students into the latter. It is in this former, the ‘moral’ territory, that the notion of the ‘social and sustainable’ is worked on by students and teachers keen on inhabiting the space of design activism. By its very nature this produces a kind of design engagement that looks at sustainability as a community engaged activity. Researchers within university contexts find a ready ecology of enthusiasm and energy for particular service design and social innovation projects that have an activism flavour. While it is easy to recruits students into

sustainability from an ideological and moral standpoint, those who enter in this way may develop a position that is in opposition to big business and that finds difficulty with industrial designs underlying consumptive agenda.

University communities with a sustainability bent thus present students with two pathway choices; one leading towards advocacy and another towards realizing sustainability through technological innovation. This latter pathway contains within it notions of product management and stewardship within the framework of an engagement with the notion of best practice in business. This pathway potentially leads out of design, and the other leads forward into an integrated practice of sustainability and design. As a consequence the existence of a robust Industrial Design practice within the corporate ecosystem of sustainability in Australia remains unclear. The capability development for sustainability within design however continues on.

## Conclusion

Once a fairly isolated concern sustainability as a central intellectual pursuit inside industrial design is evidenced in a rise in publications about sustainable behaviour change from a design perspective and the ideological orientations of students that seek to develop careers in industrial design and its variants. Although often not explicitly defined as such sustainability discourses inside industrial design education and practice are by their very nature discourses of design management. The “ability” to “sustain”, or more precisely the “ability” to reduce the probability of “un-sustainability” if positioned as a method of management for design provides powerful ways of structuring and planning an approach to design and opens out and leaves space for a diversity of meanings to be made through practice inside the design-sustainability negotiation. The two decades of development of systematic approaches for design to be less un-sustainable than it might otherwise be have however produced a dilemma for proponents of sustainability in ways similar to the dilemma that design management negotiates: that designers and design discourse frequently shift the boundaries of practice to reflect the meanings of design that both derived from actual practice and that are desired from future practice. The problem thus confronted by the university academic compelled to prepare professional designers with sustainability capacity is the divergent nature of a knowledge ecosystem and the disjuncture between the theoretical and its application inside design practice.

The application of theory from eco-design, LCM and more recently behaviour change has found its way into design education and design research practice within the universities. While this work is often significantly focussed upon technical innovation the ability to function within and amplify the domain of sustainability within what we refer to as the management discourse of design is slowly gathering momentum. Design for Sustainability sits alongside User Centered Design as foundational design methods subjects inside the RMIT undergraduate industrial design program. Students undertake design theory and methods courses in sustainable service design, consumption studies, social design and design activism, and are presented options to undertake sustainability and social innovation focused design studio courses. Studios see students and staff frequently engaged in collaborative projects with research groups such as the Victorian Eco-Innovation Laboratory and the Centre for Design, and international sustainability networks such as LeNS and DESIS as well as local service and product making firms that see a sustainability agenda as core to their business operations and development.

In the final honours year of the program about a quarter of all students undertake year-long design research projects that deal explicitly with environmental and social innovation concerns. The prospect of industrial design being able to break into the other side of sustainable management inside the services sector has been extended through the development of a new double degree program with Sustainable Systems Engineering. In a similar way, but aimed at tackling design for lean processes inside the manufacturing domain a double degree in Industrial Design and Mechanical Engineering has also commenced. Through this combination - of locating sustainability as both a technical and managerial practice and as a critical topic for socially negotiated creative practice -the potential of establishing a significantly diverse design-sustainability-management capacity in our graduates is promising.

At this juncture the future nature of application of sustainability inside the formative education of industrial designers remains fuzzy. Changes to the design and manufacturing sectors continue and the industrial design profession in Australia seems to becoming more resilient in the ways in which deals with uncertainty. However, in positioning these discourses as discourses of design management within the formative development of design professionals provides an opening for the crafting of design capability

that is robust in its ability to plan and evaluate new courses of action inside a rapidly changing manufacturing and services sector.

# Application of Patina for Product Sustainability

Yeon H. HWANG<sup>a</sup>, Jai KIM<sup>\*b</sup>, Zoe KANG and Song HWANG

<sup>a</sup>Yonsei University; <sup>b</sup>Sungkyunkwan University

*Affluence in the mass production-mass consumption era has resulted in the fast consumption of products. Fast consumption leads to product waste with short life cycles, and these short life cycles have raised environmental concerns. Sustainable design has thus emerged to cope with these environmental challenges. Despite the concerted efforts in sustainable design and, further, sustainable consumption, the product life cycle has remained short; products have recently been short lived long before their due life cycles. These short life cycles at least partly hinge on the durability of the products' relationship with their users. This study is an attempt to address sustainable consumption by forming ongoing relationships between users/consumers and products. To enable products to have a longer life cycle, we are proposing the concept of patina in product/product-service design. Patina enables a product to be more valuable to its user as time goes by. We utilize a case study as a method to explore the concept and the applications of patina in design. Various cases dealing with patina have been analyzed. Based on the above analysis, we suggest various types of patina and the implications drawn from each type of patina. The understanding and application of patina can help to prolong the life of a product and is a critical element for designing a sustainable product.*

## **Introduction**

Society has long engaged in both massive production and indiscreet massive consumption, which has resulted in the environmental impacts including an unfathomable amount of waste, serious depletion of resources and significant environmental damage from waste products. For the past 40 years, designers concerned about the gravity of the problem have criticized consumers' mammonism and extravagant consumption and endeavored to pursue sustainable design. These designers have successfully approached technology, function, use and material for product design, devising sustainable designs using eco-friendly materials (Blevis, 2007), while sustainability from the consumers' perspectives has not been investigated much.

Traditionally, people have long cherished products with intrinsic value, although they live in a highly-industrialized society with material richness by massive production and consumption. As time passes, attractive products purchased even a short time earlier are treated badly and disposed of, frequently before the end of their physical life span. The reason why consumers are willing to discard products so soon and replace them with new ones is mainly because these consumers can easily get bored of them. Due to the consumer's indifference and reckless usage, products that fail to gain status as a favorite with the consumer are generally devalued and thrown away before the end of their life span (Chapman, 2005). Therefore, in the current consuming circumstances in which products are easily consumed and deserted, sustainable products can be identified by the relationship between product and consumer. That is, the long-term intimate relationship between consumer and product is strongly related to the product's life span and has great influence on sustainability. Thus far, product sustainability has sought physical and superficial durability, but it is now necessary to build up metaphysical durability. In this regard, many research focused on product and consumer relationship for sustainability; Jung(2010) suggested ways to promote sustainable interaction design to promote users' attachment to artifacts, sustainable behaviors, Hanks et al.(2008) explained the qualities of objects being cherished, and Spangenberg(2010) distinguished design for sustainability from eco-design and emphasized the effects of satisfier efficiency and sustainable consumption.

With this study, we try to identify ways to be able to extend the life span of products and strengthen sustainability by focusing on consumers who make decisions to purchase, use, and dispose of products. We suggest that

patina can meet consumers' personal needs and reinforce the relationship between product and consumer, thus enabling durable use and retention of products.

## Skeuomorphic design

As 'analogue' has been replaced with 'digital', skeuomorphic design has appeared in order to increase consumers' intuition and understanding. Skeuomorphic is from the Greek '*skeuo*', which means 'vessel' or 'tool' and '*morphe*' meaning 'shape'. Skeuomorphic design means 'duplicating the design of the shape and features of an original tool'. Examples include light bulbs shaped like candles or a chandelier, and tire wheels reflecting wooden wheels; skeuomorphic designs keep the metaphoric shape of the original and apply it into the design, although not necessarily due to developments in materials and technology (Gessler, 2012).

Keeping pace with technological development, therefore, skeuomorphic design provided consumers with a metaphor that explained why the artifacts changed in shape and helped them accept brand new goods or new technology with ease. When the skeuomorphic design is applied to new and innovated goods, users will be able to analogize the time and experience of the goods they use so that they will accept new products without adverse reaction and become accustomed to them. This merit in skeuomorphic design is that it provides intuitive data to consumers and reinforces affordance and usability. Transferring the feeling of using analogue products to digital products enables users to increase their intimacy with the products. Without any information on an e-book, if we apply the skeuomorphic design shape of a book containing a complex of data, readers can instinctively realize how to turn a page and use the index; also, they assimilate just as do when they read an analogue book. Maintaining the feel of an analogue device lets even users who are not accustomed to smart phones readily accept e-books. Since the skeuomorphic design is an intuitive tool relying on vision, it helps the user to sense the user interface (UI) with ease, even if the user has never before encountered an online arena. In addition, the familiarity of this tool helps users to obtain information and use brand new products without difficulty so that their intimacy with the products increases, regardless of the users' age, gender, or nationality (Coyne, 1995). Despite these diverse advantages, however, skeuomorphic design still leaves much to be desired since it has not contributed a lot to

forming a relationship between product and consumer, or to extending products' life span.

## **Flat design**

Flat design, as the name implies, means a simple design with the application of flat style without any specific effect. It emphasizes the definite appearance that excludes useless design factors and makes the most of simplicity and intuition. Flat design has vestige of analogue images and this is its difference from skeuomorphic design, which may appear boring and old-fashioned. Thus, flat design can be regarded as modern and trendy. Discarding the heavy images of skeuomorphic design that provide overflowing information and too much explanation, flat design emphasizes simplicity and intuition, thus allowing more freedom for analysis in order to let the users feel orderly.

Skeuomorphic design has been criticized in particular for the icons of applications that reflect the shapes of the devices; it became difficult to achieve consistency in the look and feel. The need for flat design has consequently increased. Flat design reflects the modernism and tidiness of digital devices to the users who have grown weary of the analogue's familiarity and it lets them feel unity with their products. At first, this simplicity limited the flat design in information delivery; however, flat design not only improved weaknesses by using typography, but also gradually provided consumers with advantages, including exact information about applications, which emphasized symbolic images and created identity. Flat design containing diversity and flexibility has been used longer. Additionally, as skeuomorphic design has been criticized for its lack of fundamental introspection on the new environment and new products, flat design has become more highly valued. This may mean that the metaphor of skeuomorphism, related to facilitating connections between people's physical world and digital world, is no longer necessary. A design with a musty analogue metaphor is not needed by consumers who have already become familiar with the digital world and its new products, and flat design is becoming more powerful because the most users have not experienced the products motivated by the current skeuomorphic design. This likely creates concern about the difficulty of transmitting the experience. In addition, a new UI design was needed that incorporated necessary functions, easily performed in simple digital format, as convenient manipulation in analogue is difficult on a digital screen. Thus, there was the

need to eliminate useless layers and components. In the rapidly changing digital circumstances, as both the diversity and complexity of digital devices are getting increased, a fast, intuitive, and effective design was required and it evolved into the flat design. This change has created the optimal environment for interaction between humans and computers. This change also focused perception on each element as a design element a palpable purpose. Flat design contributed to decreasing the perceptive complexity and increasing the digital product-user interaction. However, it has not influenced the relationship or intimacy between products and consumers.

## **Digital Patina**

The general understanding of Patina is usually a green film formed naturally on copper and bronze by long natural exposure or artificial treatment (with acids); a patina is often valued aesthetically for its color (Webster Dictionary).

Patina originally signaled its owner's symbolic social status, background, and historical legitimacy. Since the Industrial Revolution in the 18<sup>th</sup> century, mass consumption of the massively produced products has become the norm. Yet, such massiveness in consumption began to fade and finally vanished (McCracken, 1996). Classical goods and styles were regarded as outdated, while new styles came with the best technology and applications. People kept shopping in order to keep up with the trend. Therefore, they put novelty before tradition and memory. People began to tend toward ostentatious consumption, and continuously obtaining new products became a symbol of wealth and social status rather than owning material or products indicating social position (Braudel, 1973). Consequently, people purchased goods and utilised them in order to distinguish themselves from others. They tried to gain social status with these behaviours (Braudrillard, 1991). Patina had lost its role as the symbol of incumbent social position. In digital era, patina has been newly endowed with meaning as the users' trace which has personal value or a distinctive shape formed by interaction between product and user. Users personalize products to invest their own value into them by transforming the products, specialising their uses or accumulating use traces on them. By the flow of time and repeating usage of the goods, the users' personal and social identity is potentially accumulated on products. Thus, the patina of products can be defined as the change or influence accrued in the products, users or surrounding environment by means of the process of repeated interaction between

people and products (Lee & Nam, 2013). The users enter into a close relationship with the products through this patina and come to get emotional affection to the products (Straw, 1998). The meaning of digital patina has evolved to include the feature of relationship and quality being constant over time, or the life span of the product. (Pelletier, 2005). That is, through the patina, which is the trace of consumer use left to indicate ownership while consumers are using the goods, specific goods endow identity with social meaning and these products have more value via interaction as time goes by. The relationship between product and user evolves so that the product becomes more meaningful, and consequently obtains psychological and emotional durability that keep people from easily discarding it. In particular, patina has more meaning in digital products. Digital products such as websites, applications, and smart phones are not aging in the same way as other products. In contrast to analogue products that become battered as time passes, digital products have a tendency to not easily age or wear out, which means they stay good as long as a specific technology or product dominates the market; consumers exchange them only for new or radical technology development or if significant advances in convenience are introduced. Additionally, digital goods are ethereal and have no materiality, while analogue products have real weight and texture. Digital products make it hard to create an emotional experience and cannot induce emotional connections such as affection, while analogue products create that emotional connection by means of interaction and enable the consumer to experience the product with all five senses. Therefore, analogue products are rather far from the goods that arouse something emotionally valuable and desirable to retain for a long time, so they are humbly consumed and end up being discarded. The life span of digital products depends not on physical durability but on the users' personal and social meaning for the products - their relationship with products and emotional affection for them. Therefore, patina in digital arena is significant as a means of inspiring analogue feelings about a digital product. Digital patina solves the non high-tech and non-publicized digital products' problems by inspiring something that was regarded as insignificant but contained high value; thus, digital patina can eliminate clumsiness and inconvenience (Pelletier, 2005). In addition, digital patina provides more value over time by connecting analogue emotion with imperishability and aplastic nature of digital products. Digital patina bestows vitality to digital products by transmitting the more psychological effectiveness than its original function, and it arouses sympathy and increases the sustainability

with intimate emotional relationships between consumers and products. Due to the trace of users' interaction with the products, the products become meaningful, symbolic and more beautiful (markboulton.co.uk, 2012). As they get aged, they become more useful. The close interaction that is at first an unfamiliar experience turns to intimacy and affection for the digital product (Pelletier 2005). Like this, the digital patina, including the products being produced for a long time, the trace of interaction between and among users, and the beauty of aging, contributes to forming the relationship between consumers and products; it inspires added value in the products and expands the products' life span. That is, it increases sustainability consumers intend to retain the products longer.

In this study, in order to materialize the concept and character of patina, we search for patterns of patina and its application in detail based on smartphones. Smartphones are usually located near at hand or in hand with the switch on and are more frequently used than any other devices. Besides, they are also used as camera and MP3 player and for access to the Internet and e-mail; they involve diverse interactions. Smartphones are among the most suitable products for researching patina as they are the devices with the most abundant accumulated trace from use both hardware(physical) and software(digital).

## **Classification of Patina**

As consumers make use of the products, the remaining patina on the products can be classified by various patterns depending on interaction among products, period of interaction, and type and location.

Lee & Nam (2012) suggested a pattern classification of patina based on the type and location of creation by means of case analysis of interaction between products and users. They separated the patterns by the patina formed on the product, such as wear and tear, and texture change, and the patina of users, such as memory, emotion and habit. The patina is accrued in the surrounding circumstances in the form of writing experience or uploading pictures to a blog or other media. In addition, products develop a material patina like scratch, wear, or intentional marks and non-material patina such as the information of experience and memory.

Table 1. Classification by forming locations and patterns of patina (Lee & Nam, 2012)

By location of forming	Formed in the products
	Formed in the users
	Accrued in the surrounding circumstances
By patterns	Material
	Non-material

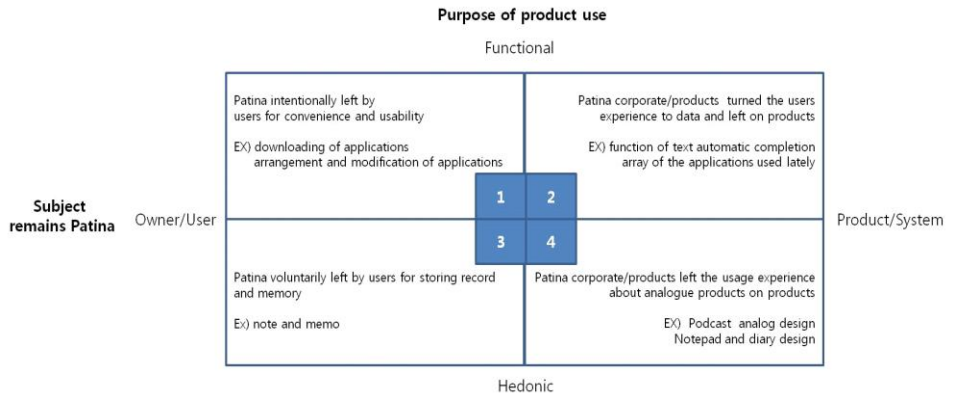

In contrast, Schütte (1998) applied the concept of patina to his study on the history of digital products and classified the patina patterns by agent, object and remaining trace. This is separation based on the accrued history of patina, which remains as time goes by from the interaction of users, and this can be a classification for exploration of various processes of patina formation.

The purpose of this study is to search for sustainability through building the relationship between users and products and expanding the scope of the relationship. We have focused on the interaction between users and products for classification. The main subjects are the consumer's usage pattern of products and the creation of patina. Products are divided by the buyer's desire and the purpose of the goods into functional/utilitarian goods and hedonic/symbolic goods. Purchase of functional/utilitarian goods is mainly motivated by mechanical and functional needs, whereas hedonic/symbolic goods are purchased based on the experience of consumption which has already provided fun or pleasure. (Dhar & Wertenbroch, 2000: Hirschman & Holbrook, 1982). However, such classification by functional and hedonic goods does not classify the goods themselves but is arbitrary according to the consumer or functional purpose (Okada, 2005) and the two classifications cannot be applied at the same time to one product. Therefore, Tractinsky, Katz and Ikar (2000) classified the factors of the experience digital goods provide from the perceptive aspect, such as utility or usability, and the beauty and sense aspect such as the attractiveness and pleasure. Hassenzahl (2004, 2008) studied users' experience related to digital goods by separating pragmatic and hedonic goods. In this study, we try to divide the pattern of patina by experience and the functional/hedonic utility of the product.

Another classification is by remaining patina. Users can leave traces intentionally to signal ownership of the product or unintentionally by means of the manufacturer's system while the user is using the product. In the process of purchasing and determining the utility of digital goods, buyer involvement is necessary. The buyer must be involved in purchasing,

downloading, and installing the product. They actively and intentionally leave the patina for customisation. Users' involuntary trace can also be left on the goods. Picture 2 demonstrates the consequent patterns of patina.

[Picture 2] Classification of patina

#### 4.1 Patina left by users for pragmatic utility of the products

While users are using smartphones for pragmatic purpose, in relation to functions, the standard examples of patina intentionally left involve downloading and installing new applications and customizing products, such as modifying the icon array by sensibility and accessibility.

The structure of the first screen of smartphones has special meaning to users in relation to function customizing because it functions not only to express character and make screen design, but also as a window connecting to the utility of applications. After users purchase smartphones, they install and array the applications to suit their preference or lifestyle, then they create categories by similarity. In the process of this manipulation, users engage with the products so that they can control the functions of the products for their own purpose. This engagement can lead to improvement of product.

Like this, users intentionally leave patina on the first screen of the smartphone to optimise its functionality. This process reflects the user's characteristics and contributes to product development. Additionally, users specialise their use and purpose from the patina left by participation and experience. Consequently, the smartphone comes to mean something to

the owner. In the process of users' modification of the screen provided by the manufacturer, users become manufacturers themselves by participating in the product design to produce customised goods and thus their emotional affection for the product grows.

#### *4.2 Patina left on the product for pragmatic use*

While users use the products for pragmatic purposes, despite users' intentions, traces are occasionally left through the system. The patina is left from use by, for example, the function of making data based on repeated patterns of use and realising customisation like text automatic completion, instantly visible functions of the applications used recently, frequently used applications, and automatic sound volume control. 'Text automatic completion' does not work in the beginning, but, as time goes by, the device saves the user patterns to carry out the function. Users can conveniently send texts because this function remembers their frequent texts. Users experience convenience, speed, and functional superiority and their ownership is enhanced by this customizing. This patina is similarly applied when users listen to music. At the first use of listening function, users perform the function 'music added lately'; later they can conveniently use the function 'most frequently played'. The more data are saved in the smartphones and the longer the data are saved, the more automatically arrayed the data are in the system so the usability increases. Additionally, users can also experience another patina, 'the function of automatic volume control'. At the moment a user connects the earphone to the smartphone, the volume automatically fits the same volume as established at the last use. This means the extension of usability through the patina formed in the short term. By means of the interaction between consumers and products, both usability and convenience are increased. The more users make the use of the smartphone, the more experience the smartphone accrues; thus, smartphones remember user patterns, personalise related functions, and provide improved usability compared to the basic functions.

#### *4.3 Patina left by users for hedonic use*

Users contain their identity in their smartphones, modify wallpaper to decorate the screen, or save memos, a diary and photos to store their own experiences and memories for hedonic purposes. Thus, patina for hedonic use is all patterns of record intentionally left by users. This includes everything about the users themselves that they save in the phone. As the IT environment began to allow transmission from the personal computer (PC)

to mobile devices, smartphones become representative of personal devices and, moreover, became users' second self. Users inspire the meaning of ownership of the phone by modifying the original wallpaper into the one with their own style; including photos or other images that expresses their preference or characteristic. Besides, the story revealed by the photos and memos about the owner are not only the sign representing specific occasions of memories, but also something long and worn representing history and old times. This strong affection has to do with the meaning users inspire in the products. Just as we do not throw away a teddy bear we grew up with just because it is worn out, the patina stored in the products with personal memories creates a connection between users and products.

#### *4.4 Patina left by products for hedonic use*

This patina associated with hedonic use provides the digital goods with experience or emotion users remember through design factors in the process of transmitting from existing goods people have used for a long time to digital ones. This is a good example of the patina applied to digital products from analog designs used for pot cast service. With the newly introduced pot case service through smartphones, we can use various content such as news or drama in the form of internet-base audio and video files, which provides great convenience because consumers can enjoy the recorded contents, while they reserve time for real-time news or drama without them. The new name 'pod cast service', converting the existing service to digital and then providing users, is delivering familiarity and comfort to consumers and has got more understanding from users because in the design the service applied a metaphor that reminds people of analog service. This applies to the case of the notepad in the same way. The most general color, yellow, was applied to the icon for the notepad, which is frequently used in iPhone or iPad. Besides, by leaving a trace like a torn shape made by the users at the top of the notepad, the patina, the trace of use, is applied in the icon design. It also makes the page look real when pages are turned; application of a real shape in the page design strengthens the connection with experience.

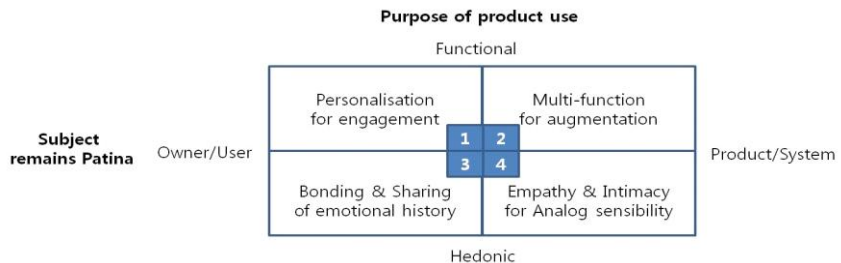

Consequently, patina which contains memory of an analog product connects physical world and digital world, so it helps consumers understand products and interaction with them. Patina suggests the method consumers have used and controlled in physical world and helps them use products in digital world without difficulty. Since people come and go between analog real society and digital cyber world, they are involved in two life systems.

Therefore, patina provides users with mental richness and the emotional affection to apply the original analogue design to digital products.

## Application of patina

In the course of interaction by patina classification, we have studied the characteristics and features of the patina left on products. Patina accrued as time passes reinforces the products' function and value, inspires emotional affection, and help product design through high sustainability and an extended life span. Reinforcement of each factor in patina will create a dense relationship between products and consumers. The four classifications illustrated in Picture 3 offer a strategy to strengthen patina factors.

*[Picture 3] Application of patina*

### *Patina left by users for pragmatic use of the products: strengthened user's involvement*

In order to strengthen pragmatic use of the products, users themselves intentionally leave patina, and therefore personalisation of products is necessary. Modern consumers who have strong self-assertion tend to own their personal products with their own brands; thus, the popularity of the products which enables consumers to make their own product and to have ownership is high (Blom and Monk, 2003). Consumers can even hack smartphones to personalise products and manage the applications and services without any restrictions. From this process, personalised usability increases. In addition, personalisation and strengthened factors in design reinforce the relationship between products and users, and make the products more meaningful in themselves. The personalisation of digital

products, depicted as 'ensoulment' by Odom, Pierce, Stolterman & Bleviset (2009) is possible by means of patina, identity and intention for use left by the users, which increases the degree of connection with involvement, users and products. A relationship developed through personalised experience and participation can significantly influence sustainability by attracting consumers' strong and positive attention.

### *Patina left on the product for pragmatic use: understanding on the context of use*

To employ the patina left on the product by transforming users' experience into data, we need to analyse the consuming environment and context and the functional diversity according to consumption purpose and intention. Otherwise, the patina may fall to an element that results in inconvenience. This frequently happens if users do not intend to save their use patterns or do not intend to keep their previous repeating pattern. We communicate in a little different language depending on to whom we speak. When we comfortably use internet terms with friends or speak with teachers or elder people, we use different patterns of language. Therefore, the function of automatic text completion can be convenient or not based on the saved words in the situation. It is necessary to customise use experience in more detail in order to make the best functional use of the patina unintentionally left by users. In the case of automatic text completion, we will be able to avoid user inconvenience in advance if we use the patina that is individually saved. Users can enjoy more if the patina is applied to an obvious purpose, like having users see all related phone numbers after typing a few initial numbers.

### *Patina left by users for hedonic use: abundant sensitive record and sharing*

For patina users who voluntarily save to record their own memory or experience, it is necessary to reinforce the convenience in saving, diverse saving factors, and factors for sharing memories. Products containing the users' history and spirit should be reinforced to keep the spirit rather than repaired or turned into goods that are only a little better (Odom, 2008). Especially, when personal stories can be recalled, the spirit will be reinforced. Remembrance has been created in life between one person and others over a long time and, as time goes by, this remembrance becomes more valued. This phenomenon has a thread of connection with the patina mechanism. For instance, it provides humanity and emotion in that the user

takes photos, saves them and adds some notes to them, just like the feeling or emotion at the moment of the shot. As the photos pile up in the products, consumers come to value the products more. This value is amplified in diversity as the consumer's history is saved and it enriches the spirit in the products. Rather than good image quality and high resolution, by means of enabling the instant addition of feelings to the consumer's actual memory, saving the record to revive later provides emotional value. The patina, as personal record and story, encourages people to share experiences and memories with related people and becomes a powerful medium. The sentiment of ownership of 'having' or 'keeping' a digital material could build strong relationship and attachment in the same manner as physical one and sharability may help foster ownership of sharable resources and digital product. Moreover it could reduce material consumption by enabling sharing of digital data or software contents (Jung et al.,2010).

*Patina left by products for hedonic use: analog sensitivity*

Lastly, to strengthen the patina, infiltrate analog sense and become familiar with a new technology or service, empathy and intimacy should be reinforced. The existing analog method is disappearing due to the development of digital products. People are reading e-books through digital products instead of reading paper books. Because mobile products such as iPad, utrabooks, and tablet PC provide much more convenience and effectiveness, they have replaced paper notes. Nevertheless, digital products can never provide an experience like tactile paper, scents or other experience such as underlining with a pen or inserting reference marks. The fact that digital products are fast and accurate, makes it possible to modify them at anytime, to keep data for a long time that is focused on technology, functionality and usability rather than emotion. However, the skeptical perspective on the modern society which has already been digitalised longs for the past material subject and value system. In this process, analogue design naturally becomes recognised as the object of longing. Because digital products are improved in usability not through the interaction of users but only through technology upgrade, users can not develop strong affection for digital artifacts; on the other hand, users appear to have more affection for analogue products since they are becoming 'users' goods' and getting increased in usability as time passes (Odom and Pierce, 2009). Therefore, having memory of the analogue products alive in the people's mind, the analogue design containing patina such as memory of the old

things and longing will inspire emotional factors associated with digital products that indicate the digital products are overly mechanical; it is difficult to develop affection for them and reinforce the interconnection between users and products.

## **Conclusion and Implication**

In an environment of both massive production and consumption, as consumers spend more frequently, studies conducted in diverse disciplines have examined products' sustainability to deal with environmental/social problems. In this study, we suggest not only that the design factors can enhance durability using eco-friendly material or new technology, but also that the application of patina as a searching method strengthens sustainability as well.

As the interaction between users and products is ongoing, usability has gained more importance, and the reinforced emotional relationship delays the disposal of products and actively leads to the alternative use instead of disposal. By means of extending the life span, products can be turned into sustainable products.

Therefore, in this paper, we have defined the concept of patina as the trace of use through interaction with a product and classified the patterns of patina. Since we are aware that it is difficult for digital products to form intimate affection with users in explaining patina based on smartphones, we have searched applications of patina for forming relationships with consumers and development. Lastly, we have identified the application of patina for future design to increase sustainability of products and extend their life span. Active application of patina that increases practical and emotional value, and enables the forming of relationships of affection is significant in designing sustainable products.

## Design for development management

Ledia ANDRAWES<sup>\*a</sup> and Adela MCMURRAY<sup>b</sup>

<sup>a</sup>RMIT University, Australia; <sup>b</sup>RMIT University, Australia

*Due to the evolving role of development organisations over the years, critical questions are being asked of their accountability and performance throughout the development literature. The complexity of the challenges these organisations are facing are accelerating faster than can be addressed with traditional, analytically based management approaches. The design community has much to say on how it can play a more significant role in this context.*

*Consolidating an in-depth literature review with applied, hands-on and in-the-field experience, we propose new perspectives on how more human-centred design approaches assist development organisations. Particularly, how these organisations may achieve greater social accountability by moving beyond quantitative measures in defining and delivering initiatives to address real human needs. In addition we extend Buchanan's 2001 seminal body of work which introduced the role of human centred design as affirming human dignity through the empowering of people and communities to engage in decisions that work for them rather than being recipients of external and sometimes misaligned "solutions" to them.*

*Our work is relevant to a mixed audience comprised of designers, development managers, donor organisations, and other actors involved in the design of new futures for marginalised populations in developing countries.*

**Keywords:** *Development management, international development, non-profit, human-centred design, sub-Saharan Africa*

## Introduction

It is becoming ever more apparent that the existing nature of political systems and business practices are proving unable to adequately address the underlying large-scale problems which are causing poverty to prevail. With increasing pressure on global resources and funding availability, non-profit organisations who administer aid and development programs are increasingly being expected to do more with less, particularly around building local capacity and co-designing solutions based on shared value rather than long-term dependency for beneficiaries.

The growing criticism of development organisations extends to the ineffectiveness and unsustainability of their traditional, linear and cause-effect models of change, which have had minimal long term impacts on marginalised communities in developing country contexts (Dennehy, Fitzgibbon et al. 2013, O'Dwyer and Unerman 2007, Collier 2007, Britton 2005, Madon 1999). These linear approaches have ensured accountability to be directed to donors more so than beneficiaries, and on project needs more so than human needs. Whether intentional or not, this has resulted in limited beneficiary participation in defining the need or solution possibilities early enough to really influence key issues which directly affect them. Human centred design offers prospects for a strengthening of development organisations' social accountability and performance. This is achieved through balancing out the current over-reliance on survey data, averages and quantitative measures with more qualitative representation of human need through nuanced representation of the voices of the beneficiaries themselves.

Just as human centred design delivers competitive advantage for businesses and governments who use it (Westcott, Michael et al. 2013), it also has the potential to support international development organisations in achieving more inclusive and community-driven innovation. Victor Grau Serrat, Co-Director of D-Lab at MIT notes:

*“the emphasis has shifted, more from designing for poor people, to designing with poor people, or even, design by poor people. The key aim now is to develop the local capacity, so that villagers themselves can develop their own technology. Instead of viewing them as needy and vulnerable, we view them as resourceful and creative” (Chandler 2012).*

The characteristics of human centred design provide gap fillers in this context and contribute to the way real human need is understood and used to inform decisions in development management practice.

Some development industry professionals liken human centred design to the anthropological concept of ‘participatory development’ and that the idea of engaging local populations in development projects in the hopes that projects will be more sustainable and successful (Mohan 2008) is not new at all. However, human centred design is different in that it is not just about stakeholder engagement. It borrows much more from the designer’s tool kit, specifically, to empathise, visualise and create end-to-end solutions with user needs at the centre of any management planning, decision making and evaluation.

Bringing together analysis and insights from Design, Business and Development bodies of literature, as well as in-the-field observations and narratives with designers and development practitioners, this paper puts forward the case for the integration of more qualitative design-based approaches in development management practice and decision-making.

## **Today’s challenges in development management**

*Why is this important? A new level of consciousness  
(Moyo 2009)*

Across Africa, there are many pieces of expensive medical equipment lying around with no one trained to use them (Perry and Malkin 2011), pump wells lying idle because a part unavailable locally has broken down (AE 2011), and education programs that fail to leverage the cultural context and so don’t achieve a sustained impact (Schweisfurth 2011).

Then there is the greatest issue of all: traditional approaches to charity reinforce peoples’ reliance on others to help them – rather than building a notion that they are able to help themselves (Moyo 2009, Andrawes and McMurray 2014). Moyo claims aid to Africa has made the poor poorer, and the growth slower, arguing that:

*“Africa’s development impasse demands a new level of consciousness, a greater degree of innovation, and a generous dose of honesty about what works and what does not as far as development is concerned”  
(Moyo 2009)*

From another perspective, Collier (2007) argues the design, organisation, distribution and implementation of development initiatives are what's central to the issue. Development organisations and their donors have persisted with conventional management practices and knowledge systems, despite their limitations in achieving sustainable economic growth and poverty reduction (Moyo 2009).

This calls for a more nuanced approach to the management of development initiatives (Collier 2007) if these organisations are to improve their effectiveness and extend their accountability to those they are claiming to serve.

### *What needs to change? The accountability paradigm*

The call for greater accountability toward key beneficiary constituencies in the development literature is termed 'social accountability' and has been discussed extensively for years (Burger and Seabe 2014, Newcomer et al. 2013, Unerman and O'Dwyer 2010, Ebrahim 2005, Cronin and O'Regan 2002, Najam 1996). In practice, however, development management accountability to beneficiaries is not as prioritised as accountability to donors, on whom development organisations depend on for survival (Gent et al 2013, Edwards and Hulme 2002; Najam 1996).

Donors place great emphasis and importance on 'functional accountability,' which is short-term in orientation, requires reporting on resources and resource use, preferences high levels of control during implementation and prioritises the measurable and quantifiable over more ambiguous and less tangible changes in human development (Newcomer et al. 2013, Dennehy, Fitzgibbon et al. 2013, Unerman and O'Dwyer 2010, Ebrahim 2003, Edwards and Hulme 2002). This is in stark contrast to long, iterative and people-centred projects that do not provide quick, tangible results or may not correspond with the outcome perceived by the initial intervention thus making this latter approach unfavourable to donors, even if the project addresses the real needs of the beneficiary population (Dennehy, Fitzgibbon et al. 2013).

There is a significant push for development organisations and their donors to move beyond a focus on narrow, functional accountability and more towards a social accountability one that engages their key beneficiary constituencies more (Cronin and O'Regan 2002; Dillon 2004; Ebrahim 2005; Lloyd 2005; Najam 1996). Embracing this broader form of social accountability has been challenging within a funding environment which

concentrates on upward accountability through financial reporting on activities and short-term impact.

*What is stifling progress? An over-reliance on logic*

Chambers and Pettit (2004) write about the changing nature of development rhetoric to include words like partnership, participation, empowerment and transparency, which imply changes in power and relationships in recent years. This rhetoric seems not to have been matched in practice, rather:

*“power and relationships are governing dynamics that... prevent the inclusion of weaker actors and voices in decision-making” (Chambers and Pettit 2004).*

In practice, most donors require the use of the Logical Framework Approach (LFA) as a planning and evaluation framework to demonstrate accountability for spending designated monies for designated purposes (Najam 1996). It is now, and has been for decades, the global standard endorsed and required by many donors for planning and evaluation relating to development initiatives. The LFA, as adopted by many development organisations and required by many donor organisations, is considered to stifle participation, as it:

*“reinforces relationships of power and control... [and] embodies a linear logic associated with things rather than people” (Chambers & Pettit, 2004).*

The use of the LFA in formulating development programs has reinforced patterns of exclusion (Tacchi, Lennie et al. 2010). Power et al. (2002) state that this particular tool is not conducive to community processes and can prevent communities from driving the development process. It is important to build systems and procedures starting from the community's needs and abilities, instead of expecting communities to conform to donor requirements of using tools such as the LFA (Dennehy, Fitzgibbon et al. 2013).

The structures and approaches that are put in place by the donors, through mechanisms like the LFA do not allow the space for management styles that encourage innovation, collaboration and participatory ways of working (Tacchi, Lennie, & Wilmore, 2010). The requirement to fit within the framework encourages development managers to focus on work which can

show reasonably predictable outcomes in a relatively short time frame. As a result, they tend to lose sight of emerging opportunities and unintended positive and negative impacts (Bakewell and Garbutt 2005). This failure of the LFA to cope with unintended consequences should not be taken lightly. It is these unexpected consequences which might be the most important consequences of all. There are many case studies of development initiatives where the most striking success was seen in areas not anticipated in the plan, making it very difficult to report with the logical framework:

*“In cases where donors have a distaste for reporting beyond the terse numbers neatly set out in the logframe’s rows and columns, insights of real value are highly vulnerable” (Harley 2005).*

In practice, most development initiatives are experiments, but the LFA sets them up to be judged by the criteria of what they set out to do. This reduces the possibility of supporting initiatives which are explicitly experimental – looking to see what happens rather than predicting a narrow set of outcomes (Bakewell and Garbutt 2005). What this one dimensional approach fails to consider is the messy and complex realities facing development actors. The sector’s reliance on the LFA seems to produce more confusion than clarity, and reinforces:

*“mechanistic views of the development process in which inputs automatically lead to the specified outputs” (Bornstein 2003).*

Development initiatives do not operate within a self-contained system – there are often many factors involved which lie beyond the scope of the planned initiative that will change the way things work (Bakewell and Garbutt 2005). The challenges facing development managers are changing and with that comes new opportunities for improving both the effectiveness and social accountability of development programs through new and complementary ways of working.

## **Tomorrow’s opportunities for design in development**

### *What is the way forward? A more nuanced picture*

As seen with the LFA, most development organisations have adopted conventional management practices from the business world which has resulted in an audit culture of obligatory tools, frameworks and reporting

(Jenkins 2012, Angus 2008). Two key issues with some of the more linear management approaches are:

*“the attempt to make a science of planning with its subsequent loss of creativity... [and] the excessive emphasis on numbers” (Liedtka, 2000).*

In the same vein, Joel Best (2001) challenges why there is a tendency to refer to statistics as absolute facts that cannot be challenged: *“people gather statistics much as rock collectors pick up stones.”* His point resonates with the status quo in development organisations today where there is a reluctance to recognise that all statistics are shaped by human actions:

*“people have to decide what to count and how to count it, people have to do the counting and the other calculations, and people have to interpret the resulting statistics, to decide what the numbers mean” (Best, 2001).*

The excessive emphasis on numbers, when those numbers are in fact social products, does not provide a nuanced or holistic picture by which development management decisions can be made effectively. The use of such quantitative-heavy measurement frameworks also place pressure on development organisations to show their donors that everything has been done in a positive light, and subsequently stifle the possibility of learning within and outside the organisation (Taylor and Soal, 2003).

This risk averse management style does not value or reward attributes of experimentation, action learning, risk taking and creativity (Angus, 2008). Over the years, however, there has been growing critique and unease with this over-reliance. These quantitative-heavy and linear approaches to inform decision-making cannot hold their own in such complex environments. However, neither would a purely qualitative one, hence why a mixed method approach is what is being proposed. Increasingly today, the design discipline is becoming of particular interest in strategic management circles as an approach to dealing with complex realities (Johansson-Sköldberg, Woodilla et al. 2013). As is the case in businesses and governments the world over, development actors are increasingly turning to the design community for ways to better represent and respond to a more nuanced understanding when serving their beneficiary populations.

Thomas Lockwood defines human centred design as *“a process that emphasises observation, collaboration, fast learning, visualisation of ideas, rapid concept prototyping, and concurrent business analysis”* (Lockwood

2010). Human centred design offers a complementary knowledge system that offers approaches that are more widely participatory as well as:

*“more dialogue-based, issue-driven rather than calendar-driven, conflict-using rather than conflict-avoiding, all aimed at invention and learning, rather than control” (Liedtka 2000).*

**Field example: Understanding farmer circles of trust**

In one example in Kenya, designers have worked with a development organisation, a private sector bank and farming communities to understand how best to provide farmers with access to new types of financial products and services. As part of the user research activities, the designers mapped out the trust relationships of farmers in several semi-urban and rural communities. Who do they go to first for various purposes? Who do they go to second? Third?

Figure 1 is a visual representation of trust relationships which would be difficult to communicate through more statistical means. The depiction is not meant to be an accurate representation for each and every farmer, however, it has provided development managers with new ways of understanding concepts of trust and reach for the user group they are seeking to benefit. It also provided an immediate reality check which challenged prior assumptions around how farmers perceived financial institutions.

As depicted in Figure 1, most farmers preferred to borrow and save money through informal means such as family and neighbours, mainly out of fear of losing their homes if they could not pay back a bank. One development manager reflected by noting:

*“we assume that all farmers want credit, but this tells us that just because they want it, it doesn’t mean they trust it coming from us or even our local financial services partners” (personal communication).*

There is significant investment from donors for the development of financial products and services for low-income consumers in developing country contexts. The financial inclusion space is full of statistics informing us of the majority ‘unbanked and underserved’ populations in Kenya for example – however what these statistics don’t tell us is some of the contributing factors as to why – why it may have more to do with trust and perception than a lack of access as is sometimes assumed. This is the point

we argue – quantitative approaches tell us ‘how many’ but qualitative approaches tell us ‘why’ (McMurray, Pace and Scott).

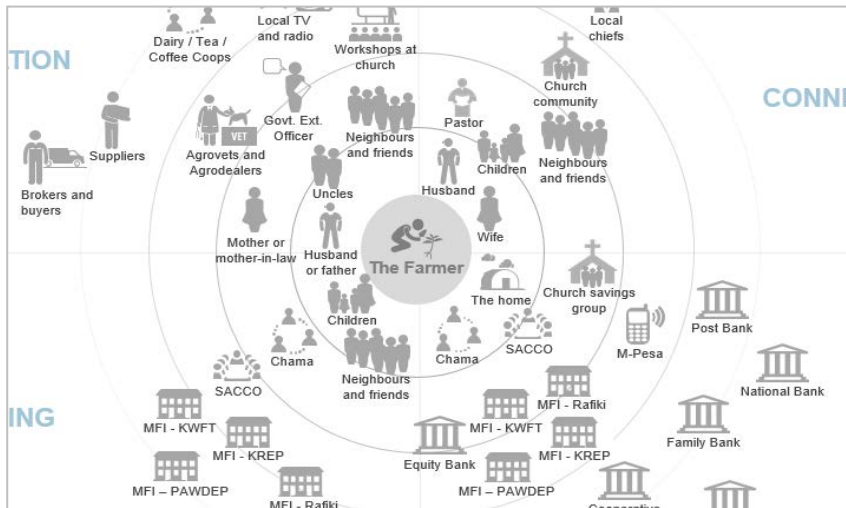

Figure 1: Visual mapping of farmer circles of trust. Source: ThinkPlace Foundation and Grameen Foundation: AppLab Money Kenya Research Findings Report (2014)

As seen with this small example, human centred design provides more nuanced perspectives when identifying beneficiary needs from which to base strategic management decisions. This contrasting approach offers development managers the opportunity to lean more on a knowledge system rooted in iteration and experimentation, with:

*“sequential attention to idea generation and evaluation in a way that attends first to possibilities before moving onto constraints”  
(Liedtka, 2000; Liedtka, King, & Bennett, 2013).*

Through new ways of working adopted from the designer’s toolkit, development managers’ assumptions are being challenged, more and more, decisions are being based on grounded empathy and a deep understanding of the complex realities faced in context. The conversation is changing regarding what’s really important.

### *What can human centred design do? Affirm human dignity (Buchanan 2001)*

There are many powerful examples of the application of human centred design methods for the development and marketing of tangible products in developing country contexts (Thomas 2006, Prahalad 2005). To date, human centred design's contribution to poverty reduction can be determined as either of two things, (1) the production of goods and (2) the consumption of goods (Thomas, 2006). However, Richard Buchanan's 2001 work takes the concept of human centred design further than that, it is:

*“fundamentally an affirmation of human dignity. It's an ongoing search for what can be done to support and strengthen the dignity of human beings as they act out their lives in varied social, economic, political, and cultural circumstances.”*

This suggests that human centred design has a more significant role to play than just developing new products and services. It actually has an extended responsibility to advance people's dignity. The work of London and Hart (2004) agrees with this, suggesting that the traditional business logic model of introducing products into low-income markets requires fundamental rethinking – suggesting a stronger participatory focus on local capacity building and inclusive processes of co-design of innovations.

#### **Field example: Empathising with nurses through nurses' words**

In Ghana, designers worked with development managers in understanding the intrinsic drivers of rural community health nurses and possible solutions to their day-to-day challenges through strongly grounded ethnographic research and facilitated co-design workshops with the nurses.

One of the techniques employed was a process and experience mapping exercise designed to understand nurses' greatest sources of frustration – in their words – this led to a nuanced understanding of what was working and where things were breaking down in the system. It was clear that supporting rural community health nurses goes beyond providing them with the means to do their jobs, but also hinges on making them feel appreciated and rewarding them with professional development opportunities.

This is not revolutionary in and of itself, however, visualising what was learned in new ways, such as figure 2, offers a new way of responding to human need that is significant for addressing many of the challenges development managers face working in such complex environments.

### *What is the designer's role? Solutions rooted in humanity*

Designers depict issues as experience by making things visual and tangible. Whether sketches, models or prototypes, these are all used to mobilise people. Designer strengths lie in creating artefacts around issues which development managers can gather to interpret and discuss. The point here is not so much that these artefacts are visual but rather that they embody knowledge that cannot be easily articulated using tables, words and numbers. The visual evokes emotion and as seen in the field examples, influences the nature of conversations being held at senior levels within development organisations.

This approach tends to provide development managers with an experience which helps them understand what it might be like to be involved in a particular social context or scenario from a user's outside-in perspective rather than the traditional organisation's inside-out default.

While the basic role of development management remains the same as in business management, that is, getting the job done effectively and efficiently, it has the additional task of needing to affirm human dignity. Human centred designers' support development managers to do this through ways to listen to, interpret and represent beneficiary needs, their voices, their values, and enable empathy to be at the centre of development planning and evaluation. In addition to this point, what this demonstrates is that by applying human centred design beyond traditional product and service design, to develop tools for more effective and human centred ways of working within and outside organisations (Buchanan 2001, Brown and Katz 2009, de Mozota 2013, Lockwood 2013, Liedtka 2014) poises a significant opportunity for development organisations to continue their evolution of learning, innovating and optimising their effectiveness.

A human centred design approach provides a stark contrast view of solving social problems to the status quo where a problem can be fully described and then solved in a linear way. The messy, iterative process that designers know how to organise and work effectively through is closer to the complex realities development actors are faced with in their contexts.

As demonstrated by the points above, the design community, now more than ever, is looking at better supporting development managers to think about problems as systems, rather than individual parts. As noted by Buchanan (2001) in his seminal work, by expanding their approaches, designers can go beyond aesthetics and basic form and function, to solutions rooted in humanity.

### *Where to from here? Rethinking measurement sector-wide*

The current nature of funding dominated by quantitative outputs and measures, understandably drives donors to invest in development initiatives which generate predictable and tangible returns on the dollar. Although the current way of operating is working, it is not optimal to maximise outputs. Development organisations, as with other types of organisations, need to consistently innovate in order to keep pace with current trends, remain sustainable and persist as leaders in their respective fields of expertise.

Since their inception since World War II, development organisations and their business practices have matured and the way they function needs to evolve to keep pace with this evolution of maturity. As we move into a different era, organisational architectures and mind-sets require a blended methodology approach to defining human need and measuring their impact in order to remain sustainable – for both these organisations and those people they seek to serve.

Taking into consideration that development sector success is predominantly being measured on per-capita economic growth (Morse 2013), it is clear why there is an unhealthy obsession with numbers in the sector as reflected in donor demands and development management dynamics. For some time now, there have been growing concerns about the relevance of current measures of development performance, in particular those based on GDP figures. The conclusion of the Sarkozy Commission Report (2009) supports the idea that those organisations concerned with genuine human-centred development need to shift their focus from narrow measures of economic progress to broader measures of human wellbeing (Stiglitz and Sen, et al. 2010).

No doubt having numerical and defensible measures of success is critical for the continued legitimacy of international development initiatives, but what if an over-emphasis on this approach is coming at the expense of human dignity and wellbeing? Although less familiar and less tangible than substitutes such as the 'dollar-a-day' proxy, developing measures for terms such as 'dignity' and 'wellbeing' is key in shaping a new approach to how development organisations measure their success (McGregor and Burns et al. 2012). Anecdotal evidence from the field supports this, human need should be depicted in terms of what is important in people's day-to-day lives in order to shape new metrics for development sector success.

Working towards the promotion of a more holistic measure for human development requires development organisations to engage in human-centred and multi-method approaches. This is paramount to better

understand what people define as their needs and allow for their voices to contribute to deliberations over policy direction and programmatic implementation which will have a direct impact on their lives.

The key challenge of this change is to bring the beneficiaries' voice in dignified forms to the decision making table as well as defining success through broader measures of wellbeing, dignity, rights, quality of life or satisfaction. In order to protect and promote human wellbeing it is necessary to increase awareness of alternative, human-centred measures as development indicators, find out where and how they are being used, and consider how they can be adapted by development organisations (McGregor and Burns et al. 2012).

## Conclusion

We triangulate the criticisms outlined in the literature review, combined with anecdotal evidence and in-the-field first-hand experience. The findings suggest there is a pressing need for development organisations to integrate their beneficiary needs, as framed by the beneficiaries themselves, as early as when in funding gathering and planning mode. This is generally not the case across development organisations. The inflexible and linear management approaches required by donors have led to many initiatives focusing on projects and not beneficiary realities, resulting in limited or no beneficiary participation in defining the need or solution possibilities. Development organisations have followed this rigid model for long enough.

The real challenge is to move from intermittent cases of product successes to a systemic approach to development planning that integrates beneficiary needs, through participatory methods, before programs become too rigidly attached to their narrow set of LFA outputs and outcomes. There are growing interest as more development organisations are looking to challenge the status quo as they experiment with human centred design approaches to help them achieve such an integration.

The way development organisations empathise, interpret, design, implement and evaluate initiatives is where designers can play a more significant role. There is scarce mention in the literature of the design community's responsibility within development organisations, and the sector at large. We suggest future research to focus on the issue of how designers can play a role, beyond the current mode of facilitating the production and consumption of new goods and services, rather in how

greater social accountability and participatory practices can be achieved at the strategic management levels of development organisations.

Based on the gaps in the existing literature, we argue that human centred design approaches can offer an unconventional, yet powerful way for development organisations to manage fast-changing and ever-increasing complex realities – while moving them toward more human-centred ways of working in developing country contexts.

In consolidating the literature with in-the-field experience, we also propose further investigation into redefining success measurement specific to the development sector. We do not propose to discard the current dominant quantitative paradigm but instead build and extend on it with the inclusion of qualitative approaches facilitated through human centred design. We assert the proposed shift to multi-methods facilitates, and thus impacts on, the wellbeing and human dignity of people living in developing country contexts. This poises the opportunity for further research to better develop the conceptual framework and necessary rigour to support the arguments made here.

# Editorial: New Modes of Design Management

Anne STENROS and Pia TAMMINEN

The meaning of design management and industrial design or service design to companies and company ecosystems is a common nominator of the papers presented in the themed track *New Modes of Design Management*. Design has various functions, it can for example be an integrative agent and/or process for interdisciplinary teams, it can play an important role when creating new business models, and it can be used when developing attractive products and services that enhance well-being of the users. Design can also contribute to the development or renewal of company strategies or value-creating networks. The papers presented in this themed track bridge design also with innovation, creativity, branding and sustainability.

Langrish has a “biological” view of design in his article about a Darwinian design in the era of disruption. He discusses the changes of the Design Method Movement, and the complexities that today’s development has brought about. According to Langrish, rational views cannot alone describe the present era of disruption in design management but Darwinian view could be applied. Barquero et al. distinguish an emergence of new social structure on the market. It challenges the traditional design management methods and increases the role of uncertainty when developing new products and services. Barquero et al. introduce the future foresight approach as a tool for the design management to describe and envision the possible futures.

Abrell explores the connection between design thinking and corporate entrepreneurship. His study reveals ambiguous results; understanding the user can lead towards new opportunities and the organization needs to be able to act upon them as well. Strarostka presents three different case studies of companies who use design strategically, yet, in different ways. The main strategic objectives of the companies are 1) design for finding new opportunities, 2) design for building strong brand, and 3) design for challenging the status quo. Sathikh’s conceptual paper discusses the differences between creativity and innovation within industrial design; “design and designers are associated with creativity, while management and business are associated with innovation.” He also examines whether the

framework of design managers is creative or design-driven, or even both at the same time. Tamminen enhances a business design model for design-oriented communities that could be used in any collaborative project organized by small organizations. She also sheds light to the potential of design-oriented communities in the future.

Åman and Andersson explore the future directions of design management from the knowledge integration perspective; “the integration of design indicates a functional orientation and a limited role for design, while integration *by* design may indicate a strategic role”. Corlett introduces an agile “live” prototyping method with continuous releases for hardware product development in “microbranding” context. Monguet et al. introduce a collective decision making support system CID, Cells of Innovation Development, for innovation management. The system enables professionals to be involved and participate in decision making processes.

Two of the papers touched on the role of a designer from different viewpoints; the study by Murto and Person focuses on designers’ role in the context of sustainable product development, and Niinimäki et al. examine designers’ involvement in design interventions. According to Murto and Person, there are many possibilities to create sustainable design solutions in a networked development project of a large passenger ship but due to for example regulations and existing production methods, holistic design approach and multidisciplinary collaboration turned out to be the most important factors when developing sustainable complex products. Based on the findings by Niinimäki et al., companies can benefit of design interventions as they provide the broader understanding of design to the companies.

As the papers in this research track propose, design management is transforming into new modes as the line between tangible and intangible world becomes more and more diversified and complex and the behaviour of the people in the network society is inclined to be more unpredictable than ever before.

## Construct the Future: new models and visions

Sara BARQUERO\*, Luis CALABUIG and Borja GARCIA

Universidad CEU-Cardenal Herrera

*The new social structure and dynamic is transforming the way in which the organizations are operating on the market. The design management became the main vehicle for the development of products and services, as well as for the instigation of innovation processes. Its methodologies have to be oriented towards the user and the market and from a social point of view. The design management is a process, which is continuous, complex and fast at the time of making decisions that determine a strategy within an increasingly uncertain and new context; it must be turned into a transversal operating discipline that integrates wider, more complex and interconnected knowledge. The management methods and definition of strategies have to be based on tools that are highly flexible, reflective, collective, participatory and interactive. Foresight is a discipline that tries to remove uncertainty through anticipation, which draws up the strategic action plan. A new approach of the design management should be to determine and vision possible futures through foresight. Build the future, determine possible directions, take optimal decisions, determine and select possible scenarios, assume changes quickly as a constant and, fundamentally, transform the mental schemes of professionals who are involved in these processes.*

**Keywords:** methodologies, foresight, strategy, decisions-making, anticipation

## Introduction

The last decades of the twentieth century and the first decades of the twenty-first century are characterized by the global transformation of societal structures in their widest sense, affecting economic, political, social and cultural dynamics. This profound transformation is referred to by some authors as “the great disruption” (Fukuyama, 1999), which is produced by the convergence of a number of interactive processes, including the technological revolution, the global economy and processes of cultural change.

The technological changes produced in different areas are represented by the impact of information and communication technologies on not only the business and professional sectors, but more importantly, the personal and social sectors. The key feature of these developments is the convergence of various technologies (Burton, 1992; Papp, 1998), which, in a fast and different way, is transforming both the established structures and its associated dynamics.

The technological revolution is based on two operating principles:

- A focus on the processes; its effects include all spheres of human activity; and
- The fundamental raw material, as well as its main result, namely information.

Simultaneously, and with the impetus that are permitted by the new technologies, a number of multidirectional, economic and social processes are generated, which are defined as globalization (Levitt, 1983; Albrow, 1990; Ohmae, 1990; Porter, 1990; De la Dehesa, 2001). On the other hand, but in an interrelated way, a profound cultural and social transformation is occurring: new ideologies and ways of life are on the rise and social and family structures are being transformed. These changes define a completely new paradigm.

These phenomena result in a new type of society, discussed at length by various authors using a multitude of terms: post-industrial (Bell, 1994), programmed (Touraine, 1976), red (Castells, 1997), post-capitalistic and information society (Masuda, 1981) or informational (Castells, 1998), and the more advanced knowledge society (Burton, 1992). As Toffler indicates, “We are the final generation of an old civilization, and the first generation of a new one” (Toffler, 1994, p. 21).

The civilization of the information, that will succeed the agricultural and the industrial, will be based on the productivity of the same information,

through the use of computer-mediated communication. (Masuda, 1981, pp. 70–72)

From the approaches and characteristics analysed by the different authors, the key feature defining this new society is the value attributed to information, both its creation and its use, in terms of the capacity to transform this information into knowledge, as well as generate, with the help of the acquired knowledge, wider knowledge.

These processes are produced at a much more accelerated rate than expected and have a direct impact on the lives of individuals. Other key features describing the new society are:

- The rupture of synchrony and linearity of space and time;
- An increase in the production of services at the expense of products, causing the transformation of the concept of benefit. The post-industrial societies are characterized by exchanging produced goods for service activities; and
- A shift from the division of professional work to the integration of disciplines.

These factors have increased the complexity and uncertainty of the environment, making adjustments in all areas that must be structured in a completely new form, in which the traditional and valid guidelines, now are no longer tenable.

In fact, these transformations require not only redefining the organizations and the management methods, but also understanding the functioning of the new market, as well as the new users involved in it, who will position themselves and interact with the environment and its elements in completely new and different ways. The organizations must adapt themselves to the new environment characterized by innovation, flexibility and unpredictability.

These characteristics present a fundamental challenge for organizations, affecting their internal structures and dynamics, and above all, their market activity. We understand that the development of new products and services is the form in which organizations present themselves on the market, while design management is the way in which they anchor themselves between the internal and external processes.

The analysis of the organizations within this new environment has to be systemic, and their processes should be treated considering their complexity; in this regard, traditional management methods are no longer valid. Alternatives for the models of traditional management must be examined in relation to the market, as well as the fact that the organizations

themselves will progress more effectively. The enterprises have to assume management methods that permit them to be more flexible, innovative, effective, stable and productive.

The objective of this study is to propose new methodological models for the design management of organizations, based on the new context they now face and the demands of the new market and the new user.

## **A new paradigm for design management**

The new socioeconomic scenario is characterized by a number of features that have a direct impact on organizations:

- The worldwide use and power of information and communication technology, fundamentally shown in the interconnection and integration of networks: the Internet, intranets and entrepreneurial extranet;
- Knowledge management defined as the “leveraging of collective wisdom to increase responsiveness and innovation” (Koulopoulos & Frappaolo, 2002, p. 28). In today’s enterprises, it is of vital importance to find the best way to generate, communicate and apply knowledge, taking full advantage of the “intellectual assets”;
- Growth in the materiality of the service sector and of the workforce dedicated to it in all economic activities (Quinn, 1992, p. 4);
- Changes within the market; currently, clients/users not only demand a quicker response, but are better informed and have more power (Naisbitt & Aburdene, 1990, pp. 283–294); thus, they must convert themselves into technological partners of the enterprises, becoming involved in the production processes (Quinn, 1992, p.178; Tapscott, 1996, p. 68);
- The rapid pace of innovation as an indispensable requirement for the competitiveness on the market;
- The redefinition of mediation, as a consequence of the capacities of information and communication technologies, goes to the providers and consumers; the middlemen have to provide services or add value that is valid for the new paradigm;
- Virtualization through the use of information and communication technologies in order to realize effective and efficient interactions among individuals, without spatial limits:

the origin of countless virtual communities connected by common interests;

- The importance of developing competitiveness at an international level within an interconnected and globalized world;
- The technological and sectorial convergence; and
- The digitalization of all types of information.

Having characterized the new paradigm and defined knowledge as the driving force of the new social structure, the necessary changes within the enterprises and the management, including design management, should be determined, both in their structures and in their dynamics.

The organizations always had, used and exploited knowledge for the realization of their objectives, although it seems that they suddenly became aware of the need to define and instrumentalize ways to manage that intangible asset.

A transformation of information intensive organizations is produced by means of the intelligent use of information and information technologies with the aim of being more competitive. Analyses of the most advanced organizations in the world seem to indicate that what makes an organization successful is the intelligent management of information and knowledge. This includes having people on-board who know how to develop methods, processes and cultural forms, thereby permitting the combination of the input information from the environment with the information generated in the interior in pursuit of the final aim of innovation and generating differential knowledge. Such organizations also know how to project information of their activities towards the environment (Davenport & Prusak, 1998). Thus, the described environment, loaded with uncertainty and complexity, requires the determination of flexible and adaptable strategies.

At the same time, a welter of tools and methodologies linked to the management of enterprises of different kinds arises: management of the information, management of technology, management of innovation (Roberts, 1996) and the management of knowledge (Cabrera, 2001). In this context, knowledge, innovation and technology are concepts strongly related to each other. All are valuable in the strategic processes of an enterprise, with the management of knowledge agglutinating the most relevant and necessary aspects for the current context. The knowledge management is of an organizational nature: it is a method or an array of

possible techniques to radically transform the working environment in such a way that what the individuals know will be shared, created or secured.

To be more concrete, the knowledge is the main axis of the new society, and innovation the imperative for the enterprises, whether or not it is of a technological nature. Within the enterprise's environments, the creation of new knowledge, which is materialized in new products, processes, services and organizations, is directly linked to the capacity of invention and innovation. The assimilation and generation of innovation, in turn, is one of the factors that significantly contribute to the introduction of change within the enterprises, and to increased competitiveness.

Design management must be involved in the processes of knowledge management, since the development of products and services cannot be understood in isolation from the creation of new knowledge and innovations. Concentrating on design management, we have to revise its roll in relation to the development of products and services. In fact, when there is not yet a general agreement on the definition of design, the value of the design within the development of products and services, and how to formulate the design management together with the strategic entrepreneurial definition, which in the end should be focused on the self-management of design, has been transformed, specifically the structure on which those disciplines and dynamics are based.

This statement necessitates the resetting of not only each of their positions, but also the relationships and values that they assume in the connection process between what is defined strategically by the enterprises as new products and services, and their effectiveness in answering the new demands of the market and the users, i.e., the key participants of said market.

*The market and the user are changing in a somewhat incisive way, beginning with their own terms "market" and "consumer" that became increasingly inadequate for the description of the underlying complex reality. (Fabris, 1995, p. 2)*

During the second half of the twentieth century, the designer and manager were required to have an enhanced approximation of the organization, its knowledge and dynamics, thus assuming an important role in the strategic entrepreneurial processes, and focusing on the elements of competitiveness and benefits.

The new context is demanding for the growth of organizations, moving the focus to social sectors, the market and the user who defines it. In this

way, the methodologies linked to the development of new products and services, and the management of those processes in the business environment, must assume an approach that focuses more on humankind and the social sector, and logically on solving problems and facing a more global and complex environment.

Assuming that innovation is more necessary today than ever before, we have to establish a mode in which the development of products and services will be, at its core, a process that is closely linked to innovation. During the last decade of the twentieth century, the term 'innovation' was inseparable from technology; in fact, Oslo Manual (1997) only defines innovation in connection with technology. His initial definition of innovation quickly became obsolete, indicating that it does not respond to the real necessity of the context. During the last few years, the term transitioned towards social innovation, thus permitting an appreciation of the relevance of the social arena in innovative processes.

An approximation of the social sciences and its methodologies allows us a different mode of observing the context and, thus, a different mode to analyse the problems, find solutions and generate knowledge that answers questions that have not yet been asked by the market or users.

Likewise, the enterprises must assume methodologies that permit a more systemic view of themselves, such as management tools that permit anticipating and searching for signs that indicate new opportunities for the market, thus allowing for envisioning future scenarios, rather than continuing to accept the ways things are done. The speed and unpredictability of environmental changes demand an innovative attitude, as well as methodologies that not only deal with rational data and approximations, but which also take into account behaviour, experience and intuition.

## **Symbiosis of design and strategy**

In the new knowledge society, the design manager, who is responsible for the development of new products and services, must transform his or her activities into knowledge-intensive and the generation new ideas from and for the future. Structured methodologies that allow for determining how to manage and channel knowledge are necessary. Knowledge, explicit and tacit, and containing both objective and subjective data, resides within the process of design as a strategic structure.

The new professionals have to base their activities on predictions and assumptions, and not only on facts (Rowe, 1998). They have to position themselves as the main and empathetic interpreter of what the end consumer will need, with a focus on the human being, thereby showing the will and capacity to understand and interpret the signs that are transmitted by the end consumer (Brown, 2009). These activities must be performed concurrently with bearing in mind the technical feasibility and commercial viability of the organizations.

This approach will require methodologies that permit working intuitively, relying on experience and qualitative data of human behaviour, wishes, emotions, etc. Within the new context, “the design does not give shape to objects” (Adams, 2010); it turns into a special form of relating to and acting in the world (Buchanan, 1992; Rylander, 2009), and above all, in the building of the future world.

These statements transfer the activity of developing products and services to the centre of an enterprise’s strategic formulation, with the design management being primarily strategic.

The development of products and services is a continuous and constant process of effective and informed decision-making, that is to say, the determination of a strategy: “The conscientious selection of a line of action out of available possibilities, having in mind the disposition of limited resources, and with the motivation to achieve some desired result”. (Claver et al. 1994. p.191) In fact, decisions about new products affect every single area of decision-making. Thus, product decisions should be closely coordinated with all of the other business activities.

The widespread opinion, mostly of business analysts and consultants (Hamel & Prahalad, 1994; Gabiña, 1995), as well as a significant number of publications (Michalko, 1991; Fobes, 1993; Collins & Porras, 1994; Higgins, 1994; Nadler & Hibino, 1994) link management to creativity and innovation, striving to establish a close connection between the decision-making process and other open and creative management processes, and based on a high level of knowledge of the present reality but with a look towards the future. Thus, the strictness of decision-making does not necessarily include the adoption of anti-progressive or conservative positions. On the contrary, in this context of uncertainty the conventional analyses that are nourished by exclusive data from the past are not sufficient; instead, it demands having new tools at one’s disposal, which explore and illuminate the possible future developments of complex issues the enterprises are involved in. The design linked to the strategy is the fundamental axis of the

development of products and services which, in the current environment, shall be closely linked to the knowledge of technologies, organizations, the social-cultural environment, etc., and, obviously, to the processes of effective decision-making through the analysis of the possibilities of the future.

The design is understood as that which realizes the plan: “A look that aims at something...A will that contemplates the attainment of the end proposed” (Zimmermann, 1998, pp.160–161). Finizio, on the other hand, points to a closer relationship between the design and the innovation processes, by saying that “the real reason of being from the design lies in the integration of the product strategy with the enterprises’ culture, in other words the design management.” Design and enterprise must go together, and in order to understand where, they must prefigure possible scenarios, even preparing for the impossible, even for exceptional events (Finizio, 2002).

The analysis strengthens the existence of a clear analogy between strategy and design, considering that they are operating in a similar way when they intervene in order to solve a problem of quite a complex situation. Both have the need to provide all the information concerning the nature of the problem which is to be solved, permitting them to plan and arrange a project.

On the other hand, the development of products and services, as an essential element of business dynamics, is a consequence of the strategic action. Making business decisions on products and services, determines the actual strategy of the organization; likewise, the generation and management of information, which is to be converted into knowledge, efficiently guides the decision-making process with reference to the products and services.

In more concrete terms, the development of the products is an interminable and cyclical activity within the business dynamics; therefore, innovation, the creation of values and knowledge management can only be considered as processes requiring continuity.

A new approach for the generation of product ideas will be to mark and envision future scenarios, in which the products will be re-enrolled, including the reality of the future market, the technological tendencies, and the needs of the potential and future consumer. In other words, define the aim to be achieved and establish the steps that are required in order to achieve it; and describe the products that give rise to this scenario and

satisfy all the factors that configure the environment in which the aim is to be achieved.

This new approach has to be based on future studies, and more precisely, on foresight as a discipline that can provide answers within the new context in which organizations are operating.

## **Foresight as a discipline**

During the twentieth century, future studies (Masini, 1993) were developed and structured. In Europe, interest in future studies evolved later than in the United States (US). The country that excelled in this discipline was France with, among others, Bertrand de Jouvenel, author of “L’Art de la Conjeture”; Gaston Berger, inventor and proponent of the term foresight; and Pierre Massé, who introduced foresight to territorial planning. More recent are the works realized by Michel Godet, as well as the outreach work carried out by the magazine *Futuribles*.

Foresight is particularly useful to strengthen knowledge for scientific-technical development, as well as for social and business needs. In fact, it is not surprising to realize how in past years foresight has been used for trend analysis at a global level, as well as in public politics at the national and local levels, apart from exercises of a sectorial or private nature for business management.

Are innumerable foresight exercises performed in different areas (Textor, 1983; Dator, 2002, Nordman, A. 2004, Inayatullah, S. 2005, Stevenson, 2004), it should be noted the Halal study that predicts breakthroughs that span the spectrum of science and technology. The results come from a great project foresight and projections carried out over the last decade at the George Washington University and TechCast LLC Company. The result is probably the best set of data for foresight that has ever compiled. The trends obtained describe how the technology is ready to transform lives throughout the next 20-30 years. (Halal, 2012).

The results of foresight are recognised as making valuable contributions to the establishment of priorities in public or private initiatives, in the designing of future visions, in the formation of networks, and in the spread of education and knowledge among the main actors, particularly the decision-makers.

The main focus is how social conditions influence the images of the future, and the way that images of the future, along with the values and

beliefs, influence the decisions that lead us to act, and therefore help configure our own future that is coming (Bell, 2005).

Table 1 Contributions of foresight/prospective to the new context:

Society – Enterprise Environment	Prospective/Foresight
Complexity – complex systems	Systemic
Globality relations Globality markets CONVERGENCE Globality strategies	Holistic / Global
Quick and unpredictable changes	Dynamic
Need collective intelligence	Encourages participation
Participatory decision-making	Search consensus
Knowledge / human capital	Optimal learning process

Foresight provides a number of elements that are quite valuable within changing environments and environments of great uncertainty such as, for example, today's environment. It engages creative and intuitive thinking, but it also takes into account the factors that can affect the results and the attitudes of the persons involved, such as social, economic, political and environmental factors. It provides a vision for the future, which is very useful for the making of decisions (Bell, 1996, p. 43) and for competitive positioning. It also suggests the continuous process of learning, something essential for the knowledge society (May, 1997, pp. 229–241).

Foresight looks for progressive knowledge (Manermaa, 1996), dedicated towards the non-deterministic, fortuitous and probabilistic anticipation. "There is not only one future, but there are various, at least the likely, possible, preferable and plausible ones" (Masini, 1993, pp.8–9). Foresight anticipation implies the action (Godet, 1993, p.187), meaning to raise possibilities in order to act from the present, with the intention of optimizing the results. As a discipline, foresight is characterized by:

- Vocation for totality: economic, social, political and technological factors are not studied in isolation but from an overall view;
- Systemic: it examines the existing relationships or ones that may exist between the elements;
- Dynamic: it examines the developments of the object in connection with the forces that are produced, and it is destined towards the action;

- It is receptive to changes that may be produced, and because of its structuralist characteristics, it considers the search for possible futures;
- Its objective is based on explaining the future by combining the three sets of factors that shape it: history, knowledge of facts and experiences; unpredictable events; and our intentions, will and actions of moving into the ostensible future;
- One of the key factors is the collective character of the foresight exercises, fostering its mobilizing effect and its metadisciplinary character;
- Foresight does not deliver conclusive results; in fact, the process is of higher importance – metadisciplinary, collective, open, flexible, etc. – which is the result of the exercise;
- Foresight examines the variables and its development in the future. One of its strengths is the consideration of both qualitative and quantitative variables and, thus, it looks at objective and subjective values; and
- Its main goal is the reduction of uncertainty, the illumination of the present action, and that the mechanisms leading to an acceptable future are convenient and desired.

Some authors (Dimma, 1985; Godet, 1993; Bas, 1999) identify foresight as a proactive approach towards the future, an approach with determination. However, it is, at the same time, a science as soon as it uses a systematic work system, verifiable and sound, that cannot and must not speculate as to what exactly might be happening in the future.

Foresight should assist the decision-makers to distinguish the different options of the future, brought to light by the available data, without venturing about what exactly might happen. The future does not exist, it is being construct. Thus, foresight, being anticipation and reflection, is intended to search for new strategies; within the contexts of business and design management, it can be a useful tool, as it provides and structures knowledge and analyses and organizes the information in order to build the future. In other words, it uses information in order to propose trends of future change and envisions what might happen.

“Foresight is a strategy” (Gabiña, 1995, p. 16). In this respect, foresight must contribute to the strategy: the capacities to innovate, create and respond; the strategy, in turn, must transform those capacities, integrating and expanding them, generating the adaptation by which the foresight receives feedback. Action without anticipation is very likely to be false; in

the same way, anticipation that is not directed towards action does not make any sense.

Frame the key issues affecting the organization, scan the environment to see how they can finish desirable trends and anticipate possible outcomes, and all this is part of the strategic foresight. The incorporation of this discipline to the organizational culture can help advance clearly, creativity and confidence (Bishop & Hines, 2012)

The outlined features of this quite new and unknown discipline permit the verification of its suitability for the given context and for the specific activity of developing products and services, as a key objective of business strategy and management.

## **Anticipatory methodologies for the design management**

As our world becomes increasingly more complex and interdependent, change is becoming more and more non-linear, discontinuous and unpredictable. Accordingly, the future is less and less like the past and not what it was expected to be: the future is no continuation of the past, because the future will be different (Handy, 2000). Therefore, it is necessary to stop thinking what we will do by analysing what we have done (Senge, 2000).

The prevailing complexity makes it necessary for us to anticipate changes and put forward a new way of thinking and a new vision of our reality. This would clear up our current attitude and, thus, allow for acquiring vision foresight in order to act in the present (Godet, 1980; Cornish, 2004).

The new challenge for the upcoming years will be to anticipate the new demands of today's lifestyle, producing scenarios. (Morace, 2003)

If we accept that uncertainty is penetrating the determination of business strategies, mainly those regarding the development of products and services, we need to be able to unravel this uncertainty with the aim of assuming less risky decisions. In addition, the situation must be in direct relation with the claim to analyse and examine the future.

In order to react properly and manage the current complexities of the market, it is necessary to understand some profound and outstanding phenomena of the cultural and social context. On the other hand, it is also necessary to have the flexibility of sufficient analysis in order to provide descriptions and interpretations that help the enterprises and professionals

to imagine their specific conceptual positioning and the positioning of the market in a global context.

The traditional management techniques hardly deliver any answers to the questions concerning the uncertain future, because there are no statistics on what is new and unknown. At the same time, the majority of management techniques suffer from non-quantifiable parameters that are indispensable within this new environment, since it is not possible to pretend to systematize and control the knowledge through Cartesian models that do not include cognitive criteria of the experience and of humans.

The proposal generated through this research is to explore the possibilities of methodologies that provide optimal settings for the current context, and differentiated from the traditional management methodologies. The fundamental differences are specified in using both quantitative and qualitative data, including intuition and experience; explore alternatives not linked to the know. At the same time require to transform the way of thinking and acting, linking strategy to the medium/long term and leaving the common short-term dynamics.

Foresight methods integrate the rational aspects of organizations, as well as the emotional ones and those linked to behaviour. It is a management tool that efficiently supports informed decision-making to clear up uncertainty in environments where complex decisions have to be made.

Enterprises are having difficulties envisioning the future, as their objectives are based on results, with a short-term horizon. Their vision is based on the western belief that time is linear and the future is nothing more than an empty space that can be occupied by the present and, over time, becomes fuller with technology and consumer goods. "Every organizations must prepare for the abandonment of everything it does" (Drucker, 1973). This situation enforces a need for a change of mentality, valid models and tools for the management and collective reflection that allow for facing the new challenges of a different world.

In today's context, a methodology to prepare, understand, structure and establish a hierarchy of information and knowledge is fundamental. Foresight offers a wide range of methodologies and tools which should be incorporated in design management:

- Anticipatory, proactive, mobilizing and creative;
- Few resources needed;

- Consider the business system as an interconnection of relations: systemic and dynamic;
- Allow for obtaining and working with the information with the objective of making decisions for the development of strategies;
- Systemic and controlled method that considers intuition and experience;
- Permit a process of communication in groups, synchronous and anonymous;
- Provoke a continuous process of feedback on information, in a way that it will be converted to a process that improves learning and generates knowledge.

These characteristics are relevant for two of the foresight methods that are highly elaborated and effective in business environments: the Delphi method and the method of scenarios.

The Delphi method is the most applied qualitative method in anticipation and probably the best way to manage obtaining information on the expectations of the future (Linstone & Turoff, 1975; Sackman, 1975; Turoff, 1975; Helmer & Rescher, 1976; Malla & Zamora, 1978; Ranch, 1979; Helmer, 1994; Passig, 1999). Nevertheless, the method can be considered to be incomplete considering that the foresight anticipated in business environments should always be linked to strategic action. This method is structured through a basic functioning scheme; consequently, it can adapt the necessities, possibilities and objectives of the studies.

The basic characteristics that configure it are:

- Structure of group communication at a distance, through the process of feedback of the information;
- Its objective is to obtain information, consensual or not;
- Quantitative – qualitative method;
- Use of experts;
- Directed and coordinated process;
- Central and characteristic feature: anonymity.

The method of scenarios (Wiener & Kanh, 1967; Martino, 1972; Coates, 1985; Godet, 1991; Millet & Honton, 1991; Schwartz, 1991; Clemons, 1995) is considered the primary method of foresight, to the extent of mingling the terms 'scenario' and 'foresight'. The majority of the authors consider this method as the reflection of foresight, the best way to give an idea of the future, and the most complete and versatile one.

Figure 2 What are scenarios

Scenarios are:	Scenarios are not:
Hypothesis	Predictions
Alternative developments	Scans of past trends
Shared representation of possible future obtained in a workgroup	Official Forecasts developed by internal or external experts
Tools to challenge corporate assumptions	Tools to strengthen corporate assumptions
Combination of intuition and rational analysis	Embodiment of intuitive visions or development of rational models
Focused Description in multiple environments on future business	Wide view of possible future microenvironments
Divergent stories for a dissension	Converging stories to achieve consensus
Holistic thinking process that integrates several scientific academies	Outcome of a dominant scientific academy
Tools to transform an organization reactive to proactive	Tools to strengthen reactive behaviors

In fact, it is a model created for supporting decision making when dealing with changing and uncertain contexts, and it is widely applied in the business world. Simplifying the argumentation, the most important values that configure this method are:

- Conceptual and hypothetical vision of possible futures, considering the objective and subjective probability of occurrence;
- Hypothetic sequences of events in the long-term view, centred on causal processes and decision points;
- Alternative and divergent developments, combining intuition and rational analysis; and
- The end of the construction of scenarios is the development of a strategy.

Figure 3 What can achieve a scenario.

Scenario can...	Scenario can't...
Acknowledge uncertainty and illuminate the critical points	Hide uncertainty or ambiguity
Develop possible future scenarios, recognizing that all are not equally likely	Develop a single likely or average response prediction
Develop a set of strategies and indicators of future strategies more critical	Develop a single strategy
Recognize discontinuities about the future	Get Data not available or make decisions based on irrelevant data

Both methods consider the process of decision making appropriate to the strategy of developing products and services, and the design management of the enterprise, not only as tools that permit a more efficient process, but in essence a shift in the thinking and acting of the decision-makers during the process.

This methodological approach is not proposing to incorporate the Delphi method or scenarios method to design management without prior adaptation. In fact there are many variables and both methods depending on the type of dynamics to perform. (Linstone & Turoff, 1975; Sackman, 1975; Press, 1978; Ranch, 1979; Poolpatarachewin, 1980; Harkins et al. 1983; Wack, 1985; Millet, & Honton, 1991; Schwartz, 1991; Helmer, 1994; Clemons, 1995; Gabiña, 1995; Schoemaker, 1995; Perrottet, 1996; Passig, 1999; Fernández Güell, 2004; Inayatullah, 2012).

## **Conclusion**

The new social paradigm penetrates all areas of action, especially the business organizations and their models of management. The approach raises the necessity for new methods of management, abstracted from the social sciences that may give effective answers to the enterprises and, consequently, to the consumers.

Design management should be positioned in the centre of strategic action within the enterprises, since the development of new products and services is a continuous and cyclic process of making strategic decisions, which configure the positioning of the organizations.

Prospective methodologies are formulated, the Delphi method and the method of scenarios, which can be linked in a complementary manner. The fundamental value of these methodologies is their capacity to analyse the future and the scenarios in which the new products and services will be involved, while at the same time transform the attitude, dynamics and thinking of the decision makers.

The proposal raises the analysis of the values of the above methodologies for adaptation and structuring to the specific requirements of design management, the approach want to value the essence that defines these methods and especially profound change in attitude, approach and way of thinking that must take design managers, and business managers as a whole.

Finally, design management requires a complete overhaul; this approximation formulates the possibilities that might derive from the use of

methodologies that provide values, which are necessary in the current context.

This research is aimed to initiate the process, which should conclude with the formulation of specific methodologies for design management.

*CID, for Cells of Innovation Development, is an online system created to facilitate the participation of professionals in the decision making processes of innovation development. The system has been designed, implemented and tested with 6 cases, involving different kind of companies in the region of Barcelona. The innovation model and its online tool version have been proposed and created, to handle a Real Time Delphi participation of designers, experts and managers in the evaluation and discussion of all the relevant topics of an innovation project oriented towards the creation of a new product and/or service. The first part of the paper is devoted to expose the theoretical backgrounds that define the interdisciplinary research field of this work. In the second part of the paper Innovation Consensus Model is presented and the functionalities and characteristics of the CID online tool explained. In the last part the results of the experience are summarised. The final conclusion is that it's relevant and very useful to get professionals efficiently and effectively involved and participating in the processes of decision making in innovation project management. The online strategy proposed in this work is feasible and accepted by participants who have expressed high levels of satisfaction.*

**Keywords:** Innovation, Innovation Management, Participation, Collaboration, Real Time Delphi and Collective Intelligence.

## Introduction

### *Collective Intelligence*

Collective intelligence may be defined as the ability of a group of individuals that collaborate and share efforts in order to collectively perform intellectual tasks. According to Pierre Lévy (1999), collective intelligence is a form of universally distributed intelligence that may be constantly enhanced, coordinated in real time, and resulting in the effective mobilization of skills. The current emergence of collective intelligence in professional environments is based on the possibilities of combining expert knowledge and experience applying ICT enhanced ways of processing information.

Although the idea of collective intelligence is not new, its tools and models to facilitate participation are growing thanks to the resources provided by a networked society and a continuous enrichment and enhancement of human interaction. There is nowadays extensive evidence that outcomes collectively produced by sets of connected people may be as important as knowledge produced within formal organizations: open source software, social networks or Wikipedia are just some of the most know cases, and this is just the beginning.

The Collective IQ, term proposed by Engelbart (1995), refers to the measure of a group's collective capacity, and it should be, in the near future, a key determinant of how effectively a particular challenge can be understood and effectively addressed by an organization. One of the most important advantages of collective intelligence is the impact of collective learning by employing best practices and tools to facilitate the expression of collective capabilities. All this happens in a fertile dynamic knowledge ecosystem that evolves into better and better tools and practices. And, as Engelbart states (1992), further facilitates this evolution.

### *Online collective intelligence*

Anyone can witness that the online-bound humankind is already a reality, and besides the former and casual social networks, more specific and formal networks with professional focus are arising, facilitating collective intelligence in many forms. Collective work strategies, based on face to face meetings, have limitations in terms of time, costs and amount of people that may be involved with it. So, traditional participative processes are not appropriated if the number of participants is high, resources limited and time is short.

New and more efficient ICT's, particularly the internet, overcome many of the constraints related to the space-time and costs contingencies. Online technology allows to articulate mechanisms that facilitate the participation of large groups of people, be them professionals involved in the creation of products or services in a company or even customers.

The design and development of online collective intelligence solutions are evolutionary, and ground founded, with a lot of trial and error in the process of combining knowledge, design, technology, management and social interaction. Social network proliferation and its use in professional or academic environments have increased the culture of participating and feeling of belonging.

### *Innovation management through collective intelligence*

As Buchanan (2010) points out, innovation projects are multifactorial and cannot be solved from a single discipline approach. The higher the diversity of people that contributes to the solutions and the larger the participation outreach, the most likely we will get a good result, as evidenced by the many initiatives in the field of collective intelligence. Contributions of Surowiecki (2005) and Bonabeau (2009) are particularly remarkable.

Discrete design practices and disciplines, that play a major role in innovation, may be reformulated from the perspective of collective intelligence, converting them into "hypercommunicative technosocial networks" (Hight & Perry, 2006). Collective intelligence pushes design, as well as research groups, to learn from the new models of distributed exchange and production based in sharing knowledge through technically enhanced networks.

Collective intelligence practices, based in participation, collaboration and learning, stand for transparency during the development of a project, therefore the involvement of designers and other professionals or even customers in decision making really takes into account the capillarity of knowledge and relevant data for innovation projects. Figure 1 is a conceptualisation of Innovation Consensus, understood as a continuous cycle that flows through participation, collaboration, learning and decision making.

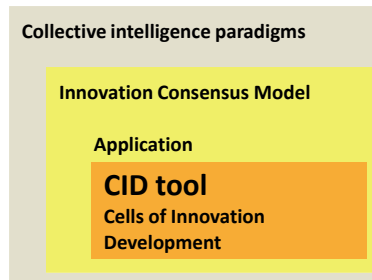

Figure 1. Collective intelligence conceptual framework

### *Objective and method of this research*

The central objective of this research was the creation, development and test of a first prototype of a tool inspired in the concepts exposed above, applying action research methodology (Kock 2011). The exploratory-descriptive research done is intended at providing a new approach to collaborative innovation through the use internet technology. The central idea is that collaborative innovation will be enhanced gradually with the application of ICT tools.

The paper expose the Innovation Consensus model based in the principles of collective intelligence, and present a practical application of it, the “Cells of Innovation Development” (CID). So, once introduced the emerging trend of participation and the connection with online resources for sharing any kind of information, next sections will present a general model of Innovation Consensus and will describe CID, a particular Innovation Consensus tool consisting in an online system created to facilitate the participation of professionals and users in the decision making processes required in innovation projects. Figure 2 is a sketch of the structure of the paper.

*Figure 2. Structure of the paper*

## **The Innovation Consensus Method**

### *Real Time Delphi*

Innovation Consensus is defined as a participative method inspired in a Delphi consultation that allow a group of participants to agree, validate or assess diverse aspects of an innovation project. Therefore it facilitates the transition from a model of a particular innovation construct proposed by a limited number of people to an agreed one, by a larger group of people. This process may be done real time or asynchronously as well as it can be organized in face to face meetings or virtually.

Based on Innovation Consensus, the CID model, which will be explained in the next section, is a Real Time Delphi system for the participation of designers, experts, managers and users, in the evaluation and discussion of all the relevant topics of an innovation project oriented towards the creation of a new product and/or service. As exposed by Monguet, Ferruzca, Gutiérrez et al. (2010) in “Vector Consensus: Decision Making for Collaborative Innovation Communities” provision of results to participants based on real-time calculation encourages the involvement of users in the consensus process. The innovation Consensus Model follows three main steps synthesised in figure 3:

- First a general innovation model is structured by a set of drivers<sup>56</sup>, where each driver is defined by a question that represents a

---

<sup>56</sup> We use the term driver referring to the attribute, ítem, element or component that is used to define the model.

- particular aspect related with a product/service or its process of design or development.
- Secondly, participants express quantitative preferences or opinions about those drivers. The questions are answered using scales with semantic differentials. The drivers are evaluated answering what are called participative questions, with the purpose of establishing its level of performance, difficulties or any other parameter. What does a participative question mean? The term participative refers to the fact that once answered, participants are allowed to see the aggregated votes of other participants and eventually change their votes.
- Finally in the third step an agreed model, defined through the evaluated drivers, is obtained and shared among all participants. The final model may be considered a quantitative-qualitative assessment of the different attributes of the innovation project.

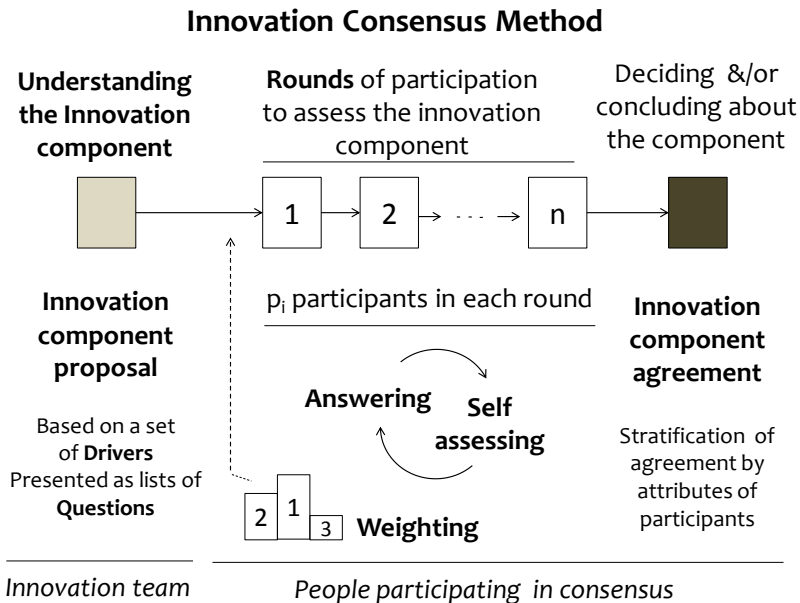

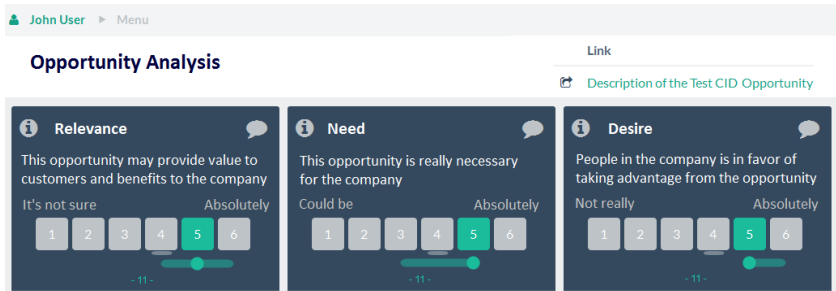

Figure 3. General view of the Innovation Consensus Method

### **Components and process**

Once understood the model to be discussed and agreed, participants start the process of responding to the questions for each driver. As soon as a participant answer a question, an instant representation of all participants aggregated results is exhibited next to the answer. This way, the participant may ponder the answer against the crowd through centrality (mean or median) and dispersion scores (standard deviation or interquartil range) and decide whether or not to change opinion (Figure 4). As it is allowed to change answers to facilitate agreement, a degree of consensus should eventually be calculated, indicating which components of the model have gained a strong consensus and where weak agreement has been found. The model may be presented and displayed in a number of consecutive rounds, having each round a specific intention and an optional timing. Prior to the participation of the main group in each part of the consensus, it is necessary to get answers from a minor group, so the early participants may already compare with some previous respondents.

*Figure 4. Three participative questions of the Opportunity analysis. Blue coloured square is the last answer and the grey line under the number is the first answer given blindly. The blue point is the median and the blue line is the interquartil rank*

Participants as well as drivers are classified in specific categories. Then, participants according to their category may be associated to a specific expertise and their votes for each driver weighted correspondingly depending on the category in which the driver has been also classified.

In Table 1 the main components of the Innovation Consensus method are summarised.

*Table 1. Components of Innovation Consensus*

Innovation project	The object to be assessed looking for consensus or agreement.
Set of drivers	The items presenting the different aspects that define the innovation project.
Question	The question or questions that expresses a driver
Answer	Possible answers for the questions.
Scales	Structured answers based on semantic differential scales (1 to 6) where edges define the meaning range (e.g. completely disagree to completely agree).
Rounds	Groups of drivers, distribution of time and management of participants.
Feedback	For each driver, participants are allowed to give insights, comments and opinions.
Participants	All different professionals involved in all the rounds of consensus.
Research team	Team that have designed and built the model that represents the innovation project.
Weighting categories	Classification of drivers and participants in categories in order to weight votes.
Results generation	Presentation of consensus results to the participants.

## Cells of Innovation Development

### *Drivers of the process of innovation*

The CID system is a particular and first application of the Innovation Consensus Model and consists into a tool that provides a general checklist of the elements that may be considered from the detection of an opportunity till the assessment of a prototype of the resulting product and/or service.

The CID tool is based on 96 independent drivers and 24 dependent drivers that are obtained as a combination of the previous 96. The process to select the independent drivers has been based on a systematic review of the innovation processes in literature.

*Figure 5. Steps of the innovation project as they appear in the management interface for each one of the projects loaded in CID*

The CID tool divides the innovation process into four main steps as it's shown in figure 5:

- Environment: Any innovative project is carried out in a certain environment, which facilitates or hinders innovation.
- Opportunity: In the process of a project that aims to create a successful new product or service, it is necessary objectively evaluate the potential of the opportunity.
- Value: The expression of value of product or service may be divided in two steps, the concept and formal value proposition.
- Prototype: If the proposal is feasible from all points of view, then it can be created a prototype, which may be submitted to potential customers and users.

This cyclic process can be done n times, depending on the type of product or service to create.

Table 2 lists the 96 independent drivers separated in those 4 steps (rounds) considered in the process of innovation:

*Table 2. Independent variables of the CID checklist tool*

Environment	Opportunity	Value	Prototype
12 drivers of Culture of innovation	12 drivers of Importance of opportunity	12 drivers of Concept assessment	12 drivers of Prototyping assessment
- Initiative promotion - Risk management - Proactive attitude	- Relevance - Need - Desire - Deepening - Specification - Diversity	- Objectives clarity - Customers participation - Company identification	- Price - Quality - Distribution & sales - Novelty - Utility

<ul style="list-style-type: none"> <li>- Autonomy of people</li> <li>- Experimentation</li> <li>- Error tolerance</li> <li>- Inspiration</li> <li>- Model of innovation</li> <li>- Support to innovation</li> <li>- Innovation community</li> <li>- Teamwork</li> <li>- Values</li> </ul>	<ul style="list-style-type: none"> <li>- Cost</li> <li>- Technical barriers</li> <li>- Cultural barriers</li> <li>- Risk of yes</li> <li>- Risk of not</li> <li>- Alignment</li> </ul>	<ul style="list-style-type: none"> <li>- Customer relationship</li> <li>- Customer communication</li> <li>- Prices policy</li> <li>- Balanced teamwork</li> <li>- Heterogeneous teamwork</li> <li>- Motivated teamwork</li> <li>- Commercial alliances</li> <li>- Technology alliances</li> <li>- Research alliances</li> </ul>	<ul style="list-style-type: none"> <li>- Warranties</li> <li>- Aesthetics</li> <li>- Usability</li> <li>- Brand</li> <li>- Deadlines</li> <li>- After-sales service</li> <li>- Sustainability</li> </ul>
<p>12 drivers of <i>Management of innovation</i></p>	<p>12 drivers of <i>Capacity to manage the opportunity</i></p>	<p>12 drivers of <i>Proposal assessment</i></p>	<p>12 drivers of <i>Prototyping improvement potential</i></p>
<ul style="list-style-type: none"> <li>- Idea generation</li> <li>- Idea selection</li> <li>- Application of ideas</li> <li>- Expertise</li> <li>- Company ecosystem</li> <li>- Time and money</li> <li>- Method of innovation</li> <li>- Strategy</li> <li>- Learning</li> <li>- Customer orientation</li> <li>- Selling agility</li> <li>- Benchmarking</li> </ul>	<ul style="list-style-type: none"> <li>- Sector</li> <li>- Trends</li> <li>- Model adequacy</li> <li>- Property compromise</li> <li>- Managers compromise</li> <li>- Staff compromise</li> <li>- Knowledge</li> <li>- Expertise</li> <li>- Technology adequacy</li> <li>- Segmentation</li> <li>- Specific customers</li> <li>- Competitors behaviour</li> </ul>	<ul style="list-style-type: none"> <li>- Integration</li> <li>- Requirements users</li> <li>- Co-creation</li> <li>- Project management</li> <li>- Sustainability</li> <li>- Legal Framework</li> <li>- Trials</li> <li>- Inclusion</li> <li>- User environment</li> <li>- Forecasts</li> <li>- Sellers</li> <li>- Resources</li> </ul>	<p>The same list used in the Prototyping assessment</p>

The table 3 presents the 24 dependent drivers obtained as a combination of the previous 96 drivers. For each one of the 4 steps of the innovation process there are:

- 2 drivers that are obtained as a linear aggregation of two groups of the 12 drivers already listed in the table 3 for each step.
- 8<sup>57</sup> more drivers that are based in an algorithm using the 24 drivers of the corresponding round or step.

*Table 3. The dependent drivers for each step of the innovation project*

Environment	Opportunity	Value	Prototype
Culture of innovation	Importance of opportunity	Concept	Prototype evaluation
- Entrepreneurship - Creativity - Leadership - Collaboration	- Opportunity value - Identification - Viability - Risk	- Concept model - Business scenario - Team - Alliances	- Commercial - Product service - Design - Logistics
Management of innovation	Capacity to manage the opportunity	Proposal	Room for improvement
- Ideation - Resources - Process - Marketing	- Vision - Commitment - Know-how - Market access	- Design - Development - Tests - Sales	- Commercial - Product service - Design - Logistics

### *Process of participation*

It may be defined in brief that the checklist of drivers presented above is used as a set of indicators to consensus the perception of performance level in the consecutive steps of an innovation project. The drivers, embedded in the online asynchronous opinion sharing system, allow the group of professionals to agree, validate or assess the innovation project, and as it has been explained, to do that, participants express their quantitative-qualitative opinions about the different attributes affecting the goodness of ideas, resources, limitations and/or results obtained. Therefore this is the

---

<sup>57</sup> In the case of the prototype the 4 dependent drivers are repeated.

way CID facilitates and carries out people involvement in the assessment of the innovation project. Following the checklist presented, participants begin with the evaluation of the environment and the opportunity of a product and/or service. First, a limited number of people share their opinions about the attributes affecting the goodness of ideas and concepts, but as the project advances, formalising the value and proposing some kind of prototype, it is expected to increase the number of people involved in the project assessment.

In Table 4, following the general Innovation Consensus presented in the previous sections, are summarized the main components of CID.

Table 4. CID components

Component	Definition	CID
Model	The construct, knowledge, decisions etc., which is object of consensus or agreement.	The innovation process, formed by four groups of indicators representing: <ul style="list-style-type: none"> <li>• Environment of innovation</li> <li>• Opportunity for innovation</li> <li>• Value</li> <li>• Prototype</li> </ul>
Set of drivers	The items displaying the model.	96 Independent drivers: <ul style="list-style-type: none"> <li>- Encouragement of Initiative,</li> <li>- Management of risk, etc.</li> </ul> 24 Dependent drivers: <ul style="list-style-type: none"> <li>- Entrepreneurship</li> <li>- Creativity, etc.</li> </ul>
Question	Driver related question.	One question per independent driver, referring to the level of the driver. For the driver "Encouragement of Initiative" the question is: "Organisation values imagination and encourages people to propose and lead new projects?"
Answer	Possible answers for the questions.	A scale from 1 to 6 with specific semantic differentials for each extreme of the question. For the driver "Encouragement of Initiative" the semantic scales are: <ul style="list-style-type: none"> <li>- From time to time (minimal of 1)</li> <li>- Always (maximum of 6)</li> </ul>
Rounds	Groups of drivers, distribution of time	Four rounds that are managed by an administrator according to the interest of

	and management of participants.	each project.
Feedback	Communication facilities.	For each indicator (driver) participants are allowed to give insights, comments and written opinions.
Participants	All different professionals involved.	Groups of people invited to take part in the consensus process has not a limit except the logics of each particular innovation project.
Research staff	People that has designed and build the model.	A core group of 3 researchers and a group of 12 professionals have completed the first trial and validated the model with the online consensus system.
Weighting categories	Classification of drivers and participants in categories in order to review votes.	The indicators (drivers) and the participants are classified in three categories: Design, Management and Technology. The option selected the first weights 5, the second one weights 4 and the last one weights 3.
Results generation	Presentation of results to the participants.	The results of the participative process have two levels: - A final list with 24 indicators that aggregates the 96 independent drivers. - The stratification of answers for each group of users with the consensus for each one of the 96 independent drivers.

There are different ways and tools that are possible under the general model of Innovation Consensus, and during the design of the CID tool some decisions were taken to define it. Table 5, summarizes the criteria applied in the design of the CID solution, and it allows to imagine other possible applications based in the Innovation Consensus Model.

*Table 5. Criteria and decisions taken during the design of CID*

Drivers	The number of drivers and how to order and present them is the most significant aspect of the tool design. The accuracy of the model increases with the number of drivers, but it does so the complexity and the intensity of the participative process. The aggregation and classification of the drivers is a critical aspect in order to help participants to
---------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

	understand the innovation model.
Questions	The question for each driver is different and adjusted to express with fidelity the meaning of the driver. Using the same questions for all the drivers would have made easier for the participants to answer, but changing the questions for each driver produces a much more precise opinion.
Participants	The selection and stratification of participants is directly related with their gradual involvement in the innovation process. If the number of participants is very high the value of the consensus increases but participation becomes more depersonalized, and the impact of each participant vote is diluted.
Rounds	The model of innovation is divided into 4 consecutive rounds, and the number of participants may be increased en each round. A major number of rounds would have allowed to define the process with more precision, but also would have made more complex the definition of the innovation product o service.

### *The web-based tool*

Nowadays internet capabilities allow creating, in a relatively feasible way, tools that are able to address the model exposed above. The following images in figures, 6, 7 and 8, together with figures 4 and 5 already presented, are a summary of the general functionalities of CID.

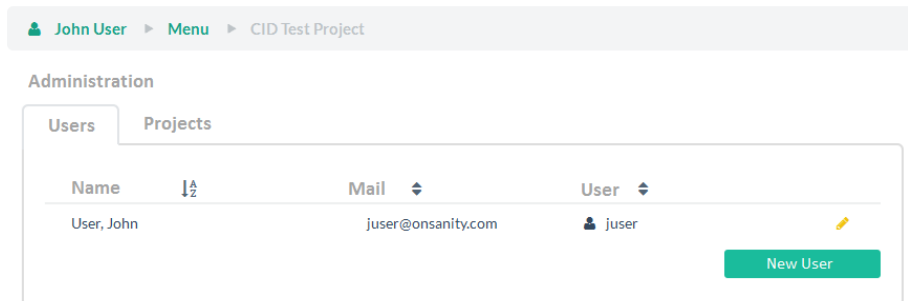

Figure 6. Main page of a user that has the privileges to open new projects and load new user.

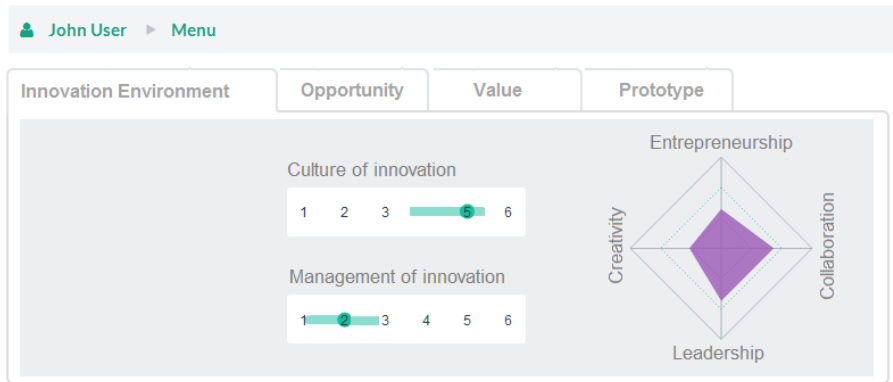

Figure 7. Visualisation of results of a project, showing the level of the 24 dependent variables. In this case, the culture of innovation has a high level of 5, but the management of innovation may be improved considerably. The team promoting this project has also a certain lack of entrepreneurship and of creativity.

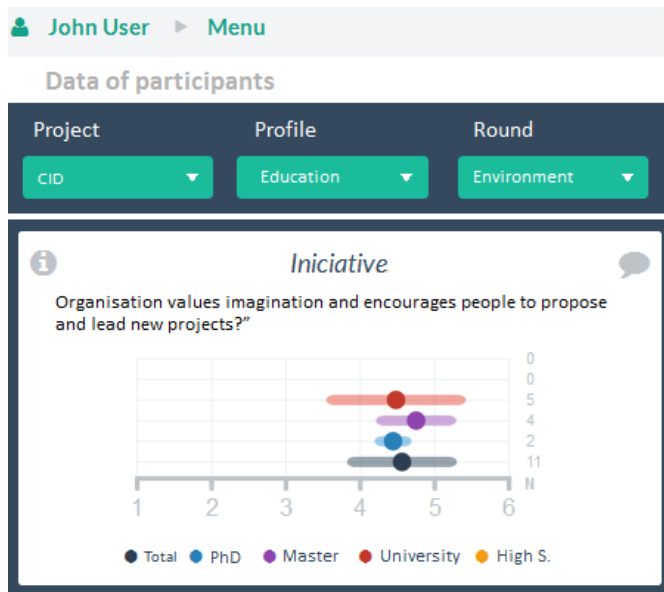

Figure 8. Presentation of data stratified by categories of users.

## Results

To test and assess the validity and adequacy of the CID tool for the purpose defined, the research has been done in two phases; the first one was conducted without any kind of digital tool, working with the participating companies involved in the development of innovation projects that extend over a year. The second phase was based in the use of a digital tool that facilitated to users the CID application.

The first phase allowed, thanks to different tests and experimentation done with the companies, the design of the tool that was used in the second phase. The test and assessment process described in this paper represents a first step in the research, and is devoted to see the usability of the tool and the self identification of participants with the outputs.

The research technique applied in the first phase of the test has been based on a focus group inspired method, with 15 participants, all of them CEO's and/or leading people from the companies. At the end of the debates with each one of the participating teams, three main questions were asked regarding:

- The level of identification with the drivers of the model according to products and/or services of the company.
- The perception of utility of the innovation consensus model in order to facilitate the assessment of the innovation projects.
- The usability and viability of the application based on the presentation of the first prototype of CID.

In all cases, the final consensus about CID was more or less the same and may be summarized as follows

- In general terms everybody felt quite comfortable with the list of drivers, both, dependent and independent. As a result of the focus group a new functionality was added to the system allowing personalizing the list of drivers to a sector, particularly relevant for the health sector where the terminology used in hospitals is different from the more commercial one used in companies.
- Few people found difficulties in the use of the application, and if so it was due to the fact that they were using not updated computers or smart phones.
- Everybody agreed about the intuition of utility of the profile of the innovation project although because of the novelty nobody knew exactly how and when to use those outcomes.

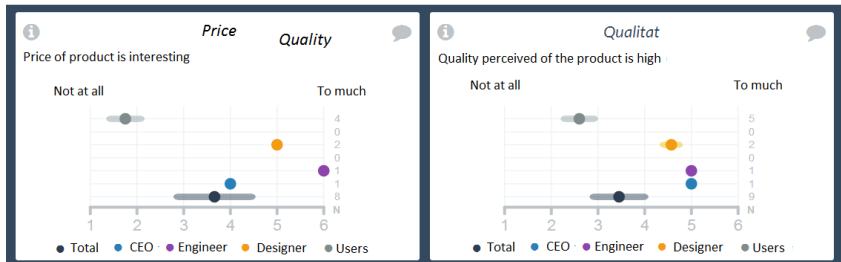

- There were no relevant differences between the opinions of different kind of users.

The CID system, in the second step of the research, has been applied with 6 different cases, and the results are synthesized in table 6. The users were proposed to go to the application <http://cid.healthconsensus.net> and do the whole job by themselves without any kind of instruction or advice. The group of applications has allowed testing and assessing the validity and adequacy of the prototype of the tool. Not all the participants completed all the rounds before the presentation of this paper due to the differences in rhythm in the respective innovation projects.

*Table 6. Companies participating in the validation of the prototype*

N	Sector	Rounds	Participants
1	Health	3	3, 14, 14, -
2	Car Ind.	2	6, 7, -, -
3	Alimentation Ind.	3	2, 5, 15, -
4	Audiovisual Ind.	4	2, 6, 12, 23
5	Distribution	3	3, 7, 12, -
6	R&d Pharma Ind.	4	3, 5, 12, 16

In the figure 9 it can be seen a nice example of the utility of the tool as significant differences between customers and professionals where clearly depicted.

*Figure 9. Presentation of data stratified by categories of users.*

## Conclusions

The objective of the work presented here is to share the advances in a research programme which intention is to provide tools and resources to help in the development of innovation projects. The main conclusions are:

- Experts, particularly design professionals, respond positively to the proposed model of participation based in the model of Innovation Consensus.
- The participation process is efficient and obtains high levels of satisfaction.
- Participants perceive they contribute with value as a result of their involvement in the participative process.

From this point, with a consistent model, it will be possible to continue with the development of new functionalities oriented to make recommendations to the companies according with their results.

The future research has two main directions. On one hand, the research may contribute to the development of the wide area of collective intelligence and the application of technological tools. Mobility, big data or social learning are some of the areas where the research will be extended.

The general goal of the research was to share the advances in a work which its explicit intention is to provide IT tools and resources to help in the development of a more participative innovation management.

There have been also discovered some weakness in the action-research design and development that provides very interesting elements to consider in the future versions of this prototype:

- There is a leak of culture in managing online asynchronous process that decreases the rate of response.
- There are difficulties managing the richness of multi-disciplinary and limitations when mixing very different profiles.

***Acknowledgements:** This research was possible thanks to the support of SOC from Generalitat of Catalonia.*

## Knowledge integration of and by design

Per ÅMAN\* and Hans ANDERSSON

Linköping University, Dep. of Management and Engineering Business Administration

*The capability to integrate across a range of specialized knowledge bases is a crucial contemporary source of competitive advantage, and the field of knowledge integration aims at structuring the issues. The purpose of this paper is to explore the possible uses, benefits, limitations and future directions of a formal knowledge integration perspective on design management. The paper develops the concepts of management thinking and design(erly) thinking, and questions the contention. With a knowledge perspective, design management may be seen as including the capability to integrate specialized, distributed and heterogeneous knowledge bases. Consequences regarding the characteristics of scope, flexibility and efficiency of knowledge integration indicate both greater difficulties and greater possibilities. Regarding the architecture of knowledge, the integration of design indicates a functional orientation and a limited role for design, while integration by design may indicate a strategic role. Also, whether integration of design or by design, the construction of common knowledge, bridging the specialized fields, seems a prerequisite for the effective knowledge integration of management thinking and design(erly) thinking*

**Keywords:** *management thinking, design(erly) thinking, knowledge integration, scope of integration, integration capabilities*

## Design (management) as integration

The integration of the design function for the benefit of the overall performance of the organization is a crucial issue that has been awarded a considerable amount of attention (e.g. Cooper et al., 2011; Svengren, 1995; Buchanan; 1992, Johansson and Woodilla; 2008). Design is an integrative discipline and designers 'explore concrete integrations of knowledge' (Buchanan, 1992, p. 6). More recently Hobday et al. stated that design ought to be viewed as a 'knowledge creating, generation and integration activity' (2012, p. 18), not just as problem solving.

On a domain-independent level, design is the general human ability to improve existing conditions by creating the artificial (Simon, 1996). Design is a generative process (Hatchuel et al., 2010), the result of human interest, purpose and activity, and generally applicable. However, different domains may lead to different contents, which may in turn influence the design processes and the processes of integration. For our purposes here the perspective on design is inspired by John Heskett:

*The deliberate and reasoned shaping and making of our environment in ways that satisfy our needs and give meaning to our lives. (Heskett, 2002, p16)*

This definition gives prominence to the human actor and the human capacity to create a 'betterment of the human condition' through making tools of increasing complexity and abstraction. The crucial words being 'needs' and 'meaning' where the human being is seen not only as a (boundedly) rational seeker of utilities and satisfaction of material needs, but also as an aesthetic and social being seeking experiences of beauty and sublimity as well as symbolic values in a social context.

This duality is found in many works on design, albeit in different conceptual clothing, for example in Norman and Verganti's (2014) discussions on design and innovation in two dimensions: technology and meaning.

*Through capturing, recombining and integrating knowledge about socio-cultural models and product semantics in several different social and industry settings, designers help in creating breakthrough product meanings. (Verganti, 2003, p. 35)*

Design may consequently be seen as integrating across 'needs' and 'meanings', while design management is the managerial capability to make

use of design as a strategic resource, and consequential decisions and actions:

*Design management is the effective deployment by line managers of the design resources available to an organisation in the pursuance of its corporate objectives. It is therefore directly concerned with the organisational place of design, with the identification with specific design disciplines which are relevant to the resolution of key management issues, and with the training of managers to use design effectively. (Gorb, 1990, from Cooper, Junginger and Lockwood, 2011 p 14)*

First, design management contains the organizational need for and capability to integrate 'design' and 'management', but as design is inherently integrative, design management is effectively integrating the integrative. Second, issues pertaining to integration may be addressed with a knowledge perspective, as integration of knowledge bases.

The study of organizations as knowledge-based entities has some history and has become a significant stream in organizations research. Including Nonaka and Takeuchi's (1995) work on types, locations and transfer (or conversions) of knowledge, the perspective has branched into a wide number of management fields, including international management (Kogut and Zander, 1992) and theory of the firm (Kogut and Zander, 1996). A possible general position is that

*A firm is a repository of knowledge that consists of how information is coded and action coordinated. (Kogut and Zander, 1993, p. 626)*

One example of a subfield is that of knowledge management (KM) which from a design perspective has been argued to be a rather rationalistic, instrumental set of pragmatic methodologies (Rylander, 2009), opposed to a design process characterized by intuitive and holistic thinking.

Given our interest in the integration of design, we will turn our attention to the structured treatment of integration from a knowledge perspective found in the field of knowledge integration (KI). From the formative contributions of developing a knowledge based perspective on organizations, such as Kogut and Zander (1992), Nonaka and Takeuchi (1995), the field of knowledge integration (Grant 1996a, 1996b; Kogut and Zander, 1993) has found its own contours. The list of publications has been increasing (Tell, 2011), boundary conditions have been set, and communities

formed (Berggren et al., 2011). KI is in principle neutral in terms of domain, with the advantage of a structured set of propositions on types and characteristics of integration. By introducing KI into the design management discourse we seek to explore consequences for design management, with an ultimate interest in how the integration of design may contribute to the creation and sustainability of competitive advantage.

The defining premise of KI is that knowledge has become increasingly specialized, leading to dispersed and heterogeneous knowledge fields, which, in turn, lead to a need for integration. To that we might add that the objective is not learning in the form that levels differences and lets us all become privy to the other's knowledge, but integration of dispersed, heterogeneous and complementary knowledge bases into a greater whole that employs and leverages the diversity.

### *Purpose*

The purpose of this paper is to explore possible uses, benefits, limitations and possible future directions of a knowledge integration perspective on design management.

We approach the issues with a strategic management perspective. The present work is about the use of the particular design knowledge in an organized context, for the greater goal of the performance of that organization. The ultimate interest is how the knowledge integration of design contributes to the performance of the organization. With a resource based view (Penrose, 1959; Wernerfelt, 1984; Barney, 1991): to understand design as a strategic resource for the firm, and design integration as strategic capability. Our issue becomes the integration of 'management thinking' and 'design(ery) thinking' (Johansson et al., 2013), as specialized, heterogeneous but complementary knowledge bases.

### *Structure of the paper*

We posit a straight-forward formulation of our possibly wicked problem: there is the two knowledge bases of 'management thinking' and 'design(ery) thinking', a difference between the two, a possibly positive effect of combining them, and consequently an issue of integrating the two.

Our knowledge integration perspective will eventually, for the purpose of clarity, be rather 'Grantian', focusing on the seminal contributions by Robert Grant (1996a; 1996b). Grant's is the most prominent and used knowledge perspective within the field of strategy (Eisenhardt and Santos, 2002), and the most cited author on knowledge integration (Tell, 2011).

We will address the issues in the following manner. Our first set of issues concern the two knowledge bases. First, we will address the idea of management thinking, and second, design(erly) thinking, ending with a discussion outlining some consequences for the contention of the two concepts. Then, the field of knowledge integration (KI) will be introduced as a structured framework for integration, and our particular approach formulated. In order to make sense of the consequences of design management as knowledge integration we will first examine the integration of design in terms of the characteristics of knowledge integration – the scope, efficiency and flexibility of knowledge integration processes (Grant, 1996a), and second, we will examine the location of design in the hierarchy of capabilities (Grant, 1996a). We will end with general observations and implications.

## Two knowledge bases

### *Management thinking*

Management thinking has often been perceived and modelled as a purposeful, shareholder value based, instrumental problem solving activity, based on rationalistic argumentation with resource efficiency as guiding principle (e.g. Rylander, 2009). Taylor's (1911) scientific management has been identified as a possible core of management thinking (Johansson and Woodilla, 2008). The organization, its employees and activities are means for achieving ends, which are formulated in capital yield terms. It becomes a Tayloristic and Friedmanish stereotype of management thinking, possibly with a detached systems engineering-like perspective to the approach of organizing work, where subsequently hierarchy is a leading principle (Johansson and Woodilla, 2008). A teleological and instrumental view of activities finds all decisions an investment of financial capital and subject to being judged for their contribution to the organization's overall objective function, through techniques of investment analysis by net present value (NPV) and internal rate of return (IRR). The economic rationality is perfectly neutral in domain; whether production systems investments, marketing decision, recruitment decision or design expenses, the decision to go ahead is subject to the same format of calculation.

Like Peter Gorb (2001) observes, the management language remains in the numbers of the profit and loss statements and impact to the balance sheets. The management language treats decisions as investments and if there is a sense of functional beauty (Parsons and Carlson, 2008), it lies in

the level of the compound annual growth rate (CAGR), return on capital, and the ability to consistently increase shareholder value.

On the other hand, organization theory, and the part of strategic management that is not wholly formulated within (neo-classical) economics, has evolved considerably from the rationalistic and uni-dimensional perspective somewhat caricatured above. Already the Hawthorne studies introduced management action as symbolic, rationality in decision making became bounded (Simon, 1973), post-modern organization theory (Hassard and Parker, 1993) and the influential study on 'excellence' of Peters and Waterman (1982) helped spur an interest in organization culture studies and narratives. A series of works argue for an aesthetic organization theory (Gagliardi, 1996; Strati, 1999; Ramirez, 1991).

Indeed, a limitation observed in strategic management research is that focus has been on the material and the supply side, at the expense of the immaterial and the demand side:

*(a) extant research has focused on producer activities and on the cost side of the value-creation equation ... to the neglect of the role of consumer perceptions and practices; and (b) extant research has focused on the importance of technology in value creation to the neglect of cultural and symbolic resources (Dalpiaz et al., 2010, p.176).*

In other words, management thinking does have a pragmatic base in the language of numbers, a logic that is derived from a shareholder's perspective and represents a technical/ economic rationality. But strong contemporary voices develop and elucidate a socio/ cultural perspective on management work and theory.

Perhaps more intriguing yet, are formulations of the two as a duality of technical/ economic and socio/ cultural perspectives arguing for a paradoxical conceptualization. Most provocative and elegant is perhaps James March's statement that 'leadership is a matter of poetry and plumbing' (March and Weil, 2005). The plumbing being the technical, economic and pragmatic workings of the organization while the poetry contains the aesthetics of work and workplace and the social symbolic values of products, work and ideas.

Summing up; to pinpoint management thinking as an instrumental resource-efficiency discourse is possible and in some ways pragmatically correct, but overly simplistic in the light of advances in the field. Managerial

knowledge and practice does contain the paradoxical nature of a duality of a technical/ economic rationality and a socio/ cultural one.

### *Design(erly) thinking*

Whereas mainstream management thinking has been argued to be repressive of creative thinking (Johansson and Woodilla, 2008), design is denoted as part of the creative industries (EU commission report 2006), and creativity is one characteristic often recurring in discussing design(erly) thinking. The intuitive aspect of design work is another recurring characteristic. Designers are also empathic (Kelley and Littman, 2005; Brown, 2008), drawing their inspiration from a deep respect and understanding of the human condition. Designers are idealistic, foregoing the instrumental shareholder perspective for an all-embracing stakeholder view. Designers are artsy, bringing a disinterested aesthetic judgment to the work, thereby delivering experience and meaning to the beholder. All in all, designers are artsy, creative, empathic, inclusive, intuitive and even fun; in short, most of the qualities that management thinking is not. But then again, design in a managed context, e.g. as industrial design, is more complex.

Is design art? In a certainly entertaining but rather poignant remark, design has been seen as 'useful', and art as 'useless' (Sudjic, 2008). Professional industrial design is not arts in the disinterested, detached way of the romantics (Kant, 1790/2000), but guided by the objective function of the firm (Lovaas and Ghoshal, 2002).

Designerly thinking is what designers do and design thinking is that knowledge transferred to a managerial context (Johansson et al., 2013), and what may then be the core of that way of thinking? Design competence has been identified as the result of three interlinked characteristics: a holistic view, an ability to zoom between holistic to detail, and a capacity to structure and dissolve structures (Johansson, 1998). This leads to a formulation of design practice rather antithetical to hierarchy and functional boundaries (Johansson and Woodilla, 2008). Design competence is to zoom in and out of hierarchical layers, and to cross functional boundaries and borders of disciplines, in order to move from holistic to detail.

As developed earlier, design is a field that inherently incorporates a cross-speciality integrative aspect, stretching across the divide between the rational and the 'irrational' of the aesthetic and symbolic. The consequence here being that design(erly) thinking rests in a similar paradoxical state of affairs as management thinking; technical/ economic and socio/cultural.

Still, the idealistic legacy of certain waves of design is revered. Already William Morris for instance

*believed that beautiful design enriched the quality of life and that the designer had a moral responsibility in his or her work towards the greater good (McDermott, 1992).*

Echoes of this ideological, humanistic position have a long reverberation and examples highlight the balancing of a technological and economical logic with an (ideological) orientation. Design is not just an instrumental, industrial activity for the betterment of the industrial process and its performance, but an instrument for the betterment of the human condition, processed through industry as the mass production methods democratizes quality. Low cost and industrial processes are not only seen as means to create margins and capital turnover, but means to make good designs available for a greater number of people. Industrial techniques are means, not ends. The ideological stance is not necessarily outspoken or very marked in industrial design, which is, again, a professional and embedded deployment of design knowledge, but the questioning of rational, technological knowledge as panacea remains.

*Placing industrial design within art or technique, however, is an almost impossible task. Industrial design is a combination of both, and it is this combination that is the core of the profession. An industrial designer always takes the beauty of forms into consideration. But he or she never does so regardless of function and the production process, thereby distinguishing themselves clearly from "pure art" and artists. (Johansson et al, 2003, p, 2)*

From a knowledge perspective, designerly thinking is arguably more tacit than management thinking. From a practitioners perspective, Chris Bangle argues that 'artists really only learn to create winning designs by trying over and over again; their professional growth occurs almost invisibly..' (Bangle, 2001, p. 51), indicating the importance of experience based, tacit knowledge.

Summing up, design(erly) thinking is not an obvious counterpoint to management thinking, but may represent a complementary knowledge base, specialized and perhaps dispersed.

### *The contention*

Wherein lies the contention between management thinking and designerly thinking? Wherein lies the contention between management knowledge and designerly knowledge? Is it real, perceived or an illusion? With undeniable experiential legitimacy, Chris Bangle of BMW calls it the “inevitable conflict between corporate pragmatism and artistic passion” (Bangle, 2001, p, 47). Given the discussion above we should approach the contention with some caution.

*According to (Heidegger 1977/1953), modern technology essentially means an abstract, disenchanted, and decontextualized thinking of the world... (Johansson et al., 2003, p. 2)*

A view of a duality permits us to capture the complexity in the earlier debate and propositions for the difficulty of integration of design. If management thinking and design(erly) thinking can be approached through the same paradox, they should be approached as complementary rather than excluding. Depending on how big - or paradigmatic -the difference, the contention has been seen as a small ditch, a significant stream,

*... there's a huge river of misunderstanding between the design and the business world. (Peter Gorb, 2001, p. 2)*

or a wide chasm:

*The modern split between engineers and industrial designers or between art and business, therefore, appears not to be a small ditch simply to jump over. Rather, it seems to be of such a magnitude that it is doubtful whether it is even worth trying to overcome it.”(Johansson, Sköldberg and Svengren, 2003, p. 10)*

The potential and difficulties of design integration have been perceived in various ways. In some contributions the integration issues have been addressed as an organization structure issue, as an issue of roles, as issues pertaining to external or internal location of the design function, or as an issue of paradigmatic difference between the rationality of business and the wicked problems of the arts and design.

Summing up, we will approach the contention, and the integration issues from the following distinction. First, that design has a greater acceptance for, and methods for, embodied knowledge; or rather knowledge about embodied knowledge. Embodied knowledge is tacit, partly lodged in the

senses. Second, management thinking has a greater strive for, and methods for, explicit and objectified, 'reasoned', knowledge.

## **Knowledge integration; an integrative framework**

Contemporary competitive patterns are increasingly based on intangible resources (Teece 2011; Dalpiaz et al., 2010). Knowledge is a key intangible resource and a knowledge perspective on the firm has become an important perspective on how organizations work.

The contemporary need for depth of knowledge leads to increasing specialization and subsequently organizations need increasingly sophisticated means for integration. As knowledge is dispersed across individuals and collectives within (and outside) the firm, "the primary role of the firm is integration of knowledge" (Grant, 1996a, p. 377). Thus, knowledge integration has been defined as the combination of specialized but complementary knowledge bases in a goal-directed process aiming to achieve a significant outcome for the concerned organization(s) (Berggren et al., 2011b, p.7).

Knowledge integration is concerned with understanding and explaining processes of knowledge integration, and implications for the design of such processes. Tell (2011) identifies several streams of research, and more particularly one that seems of particular interest to us, concerned with the combination of specialized, dispersed but complementary knowledge. A generative perspective on knowledge creation link to innovation, and indicate that in innovative settings knowledge integration takes place despite knowledge-base dissimilarities (Lindkvist 2005). On the other hand results include that integration of specialized knowledge may not be easy (Dougherty 1992, Hoopes and Postrel 1999) or even possible if the common knowledge that may bridge between areas is lacking (Grant, 1996a; Postrel, 2002), or there may be a trade-off between exploiting familiar knowledge and exploring uncharted territory.

Knowledge integration may give us an interesting starting point for exploring the integration of design(erly) thinking and management thinking. Task, knowledge, and relational characteristics have an influence on KI (Tell, 2011). The knowledge characteristics identified are of a rather general character, i.e. internal vs. external, tacit vs. explicit, etc. This, just as the general definition by Berggren et al., does not discriminate between different knowledge bases relevant to the task at hand. KI is in that sense domain-independent.

Grant (1996a) grounds his discussion on knowledge integration on a basic distinction of knowledge as tacit and explicit (Nonaka et al., 2000), and focuses on the specialization needed on an individual level in order to acquire more – deeper – knowledge. On an individual basis he argues, for cognitive restrictive reasons, for a necessary trade-off between breadth and depth of knowledge. Hence, in order for the organization to create means for integration between individuals with specialized knowledge, Grant argues that explicit knowledge poses little problems because of its ease of communicability (p 379). The coded, stored and retrievable explicit knowledge may easily be accessed by other individuals, given that the language of the code is common to others. On the other hand, tacit knowledge presents more substantial issues, as tacit knowledge not necessarily can be converted to explicit without knowledge loss. Grant (1996a) identifies two major mechanisms for aiding this process: direction and routines.

It is reasonable to extend this discussion into the realm of social contexts. Groups of individuals form social communities where common experiential background, e.g. education and project collaboration, comes to form socially bound norms and expectations. Social norms of instrumentality, idealism, ‘artistry’ concerns the content of work, while norms of efficiency, linearity, goal-orientation and rationality influences the expectations on work process. Social communities define identities and peer-recognition.

In the following, we will focus on Robert Grant’s models (1996a, 1996b) on knowledge integration to explore some consequences of using KI as a vehicle to understand the integration of management thinking and design(ery) thinking. Specifically, Grant identifies three characteristics of knowledge integration of importance for competitive advantage, and presents an architecture of knowledge integration.

First, the **efficiency** of knowledge integration is judged by ‘the extent to which the capability accesses and utilizes the specialist knowledge held by individual organizational members’ (Grant, 1996a, p. 380) i.e., the efficiency is determined by the level of common knowledge and the frequency and variability of task performance. Second, the **scope** of knowledge integration is constituted by ‘..the breadth of specialized knowledge...’ (Grant, 1996a, p. 380), i.e., the scope is affected by complementarities and substitutability as well as causal ambiguity. Third, the **flexibility** of knowledge integration is ‘...the extent to which a capability can access additional knowledge and reconfigure existing knowledge’ (Grant, 1996a, p. 380), where flexibility lies

in the ability to encompass new knowledge or reconfigure existing repositories of knowledge.

Grant (1996a) introduces a perspective of knowledge as a '*hierarchy of integration*', from the specialized knowledge held by individual members of the organization, successively broadening the scope of fields of knowledge to be integrated until we reach the top of 'wide-ranging functional integration'.

To sum up, KI contains a developed discourse on how the integration of specialized, dispersed and heterogeneous fields of knowledge may be structured, conceptualized and approached, eventually evaluating the contribution to the competitive advantage of the organization.

## **Integrating the resources and capabilities of design(erly) thinking**

We will here first discuss some implications for integrating the *resource* of design. Second, we will discuss some implications for the *capability* of design management in order to integrate design. With an ultimate interest in how design may contribute to the creation and sustaining of competitive advantage, we will first use Grant's (1996a) conceptual structure regarding characteristics of knowledge integration processes – efficiency, scope and flexibility -linked to competitive advantage. We will begin with the scope of the fields of knowledge to integrate.

### **The scope of knowledge integration**

Design knowledge broadens the scope of what to integrate, in relation to integrating different traditionally technological knowledge bases. With design as incorporating a humanities dimension, and concerned with human interaction with artefacts in an aesthetic and symbolic way, design aims to integrate the material with the immaterial.

In the extreme of scope, this extent of this scope may represent the paradigmatic divide between technology and the humanities. Communication may be difficult across such divides. Individuals have been educated and trained in different traditions. In the polytechniques rationality prevails, and an undertext of rationality, progress and materiality emerges – in short a Newtonian based universe of modernity.

Design schools are located either within the polytechniques, or within beaux arts, which has spawned a considerable debate concerning the effects in terms of attitudes, values, work processes.

In the minimum of scope, design is added to fix the appeal of an item, perhaps as 'styling'. Perhaps with planned obsolescence built-in. At the least, design scope introduces a humanities element in how we perceive the properties of the artefact or process to be designed. The artefact or process is not just about material utility and problem solving, but *also and including* aesthetic experience and symbolic meaning creation.

Grant (1996) argues that increasing the span of knowledge to be integrated actually has the potential to be beneficial for the firm, on two accounts. First, up to a point of 'diminishing relevance', different types of knowledge may be seen as complementarities rather than as substitutes. Second, a greater scope of knowledge increases the possibilities of a greater causal ambiguity and thus increases the sustainability through sheltering the firm from imitation.

Design increases the scope of knowledge to be integrated and thus carries a promise or potential for increasing sustainability of competitive advantage – given that the two conditions can be met. If the aesthetic and symbolic considerations of design are seen as a poor complement it may stretch beyond the point of diminishing relevance in the eyes of other organizational actors. Given the tacit nature of much of design, it may certainly contribute to causal ambiguity and thus shelter competitive advantage from imitation, but the extreme of causal ambiguity is simply fuzziness and lack of causality.

### **The efficiency of knowledge integration**

The efficiency of knowledge integration depends in part on the ability to communicate across functional borderlines, regardless of whether the knowledge is explicit or tacit and thus if the integration mechanisms may be based on direction (explicit) or routine (tacit) (Grant 1996).

A prerequisite for communication across knowledge areas has been the level and quality of common knowledge, which rest on common language, commonality of vocabulary and conceptual knowledge. Can we expect the design professionals to speak the same language as technology or management specialists?

Shared behavioural norms are fundamental and *"the wider the scope of knowledge being integrated...the lower is the level of common knowledge"* (Grant, 1996, p. 380). Similarly concerned with managerial processes, but in another field, it has been proposed that the creation of a 'common space' was critical for the successful transfer of knowledge to international market entry in the form of green-field investment, in order to bridge between

nationalities (Hurt and Hurt, 2005). These propositions in turn have parallels to the common space of *ba*, conducive to knowledge conversion processes, proposed by Nonaka et al. (2000).

Design, in its introduction of aesthetics and symbolic value, risk being problematic on most of these accounts. It widens the scope of knowledge to be integrated; the intra-field languages, concepts and structures are likely to be different; behavioural norms risk being different and intra-field cultural values are likely to be different.

Further, the frequency and variability of task performance influences the efficiency of knowledge integration (Grant 1996). This would point to industrial design being successfully integrated in situations where design is part of the routines of a firm, rather than an exception.

Lastly, organizational structuring may facilitate the efficiency of KI. Interestingly, Grant (1996) uses the automobile industry, from Clark and Fujimoto (1991), to illustrate the possible benefits from sequencing, functional differentiation and product segmentation to overcome knowledge integration barriers, although without paying any special attention to design.

### **The flexibility of knowledge integration**

In a dynamic market setting, sources of competitive advantage have a best-before date, and the capability for continual renewal may maintain performance (Eisenhardt, 2002; Teece, 2007). First, a firm's ability to encompass additional fields of knowledge depends greatly on the ability to communicate (Grant 1996). The more tacit and historically and culturally embedded, the more difficult knowledge will be to transfer and to integrate. Socio-cultural patterns of meaning creation (Verganti, 2008) are certainly both path dependent and culturally embedded. Second, an ability to reconfigure existing knowledge through new patterns of integration is a potential capability for renewal.

All of the three characteristics of knowledge integration indicate some difficulties when we introduce the broader set knowledge of design. We posed question marks around the efficiency of integration, partially because of communication issues; the scope of what to integrate may move beyond the point of diminishing relevance; and flexibility of integration may be slow partially because of the tacit nature of design knowledge and practice. However, following the argumentation regarding scope by Grant (1996a), the broader scope of industrial design also carries the potential for creating

and sustaining competitive advantage. Great potential coupled with great difficulties.

*Design management capability: integration of and by design*

A specific issue of knowledge integration that is highlighted from a design perspective is whether design is being integrated as a function, or itself an agent of integration; in other words whether knowledge integration takes place *of* or *by* design.

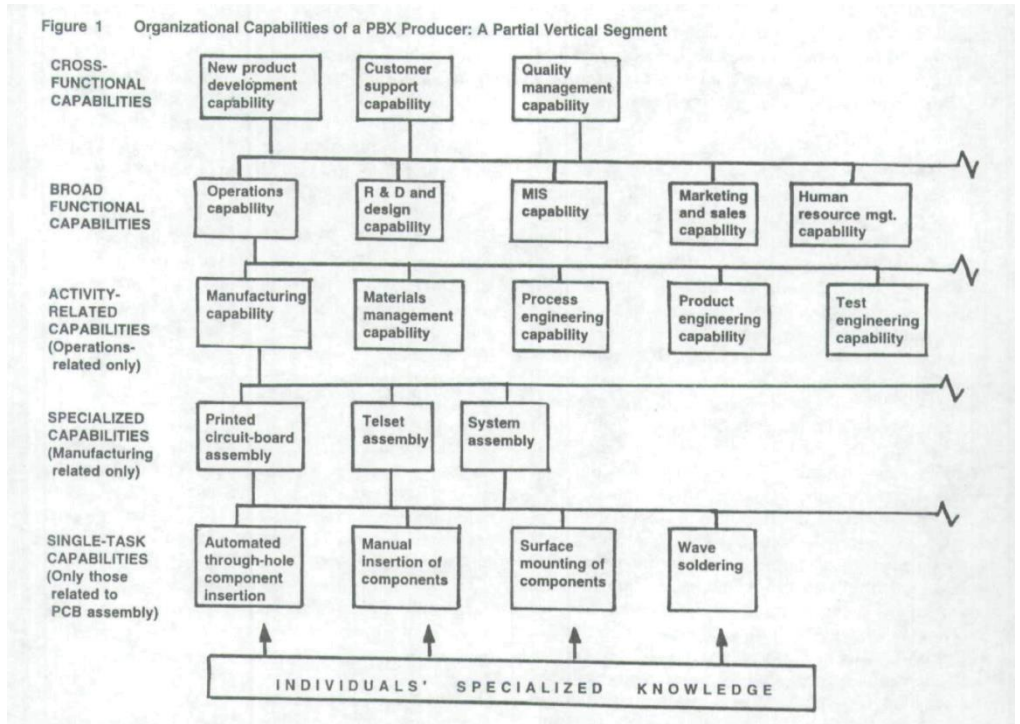

Figure 1. Organizational capabilities architecture (Grant, 1996a, p. 378)

Part of design management is the idea of design as integrated into the activities of the organization; **integration of design**. From a mainstream conception of the firm as a technical/economic optimization problem, design then needs to be *added* to the existing set of activities. Design is one activity along other activities, one department along other departments. How to structure, organize, place and integrate design with such a

perspective is a recurring theme in design research, for example in Lisbeth Svengren's discussion of functional integration (Svengren, 1995). With integration of design, at its most fundamental we are adding a field of knowledge to be integrated. The problem possibly being that we hereby attempt to achieve flexibility through encompassing new knowledge (Grant, 1996), something Grant sees as unlikely to be successful unless the new knowledge is explicit and communication can be found through direction. The integrating mechanism of flexibility would most likely occur through reconfiguration (Grant 1996). Hence we have a paradoxical situation that may be difficult to resolve, and possibly a line of explaining the many reported difficulties in finding success through incorporating industrial design.

The design function is placed along other functions and activities and becomes one knowledge area among other knowledge areas. It would represent an 'independent subsystem' (Simon, 1973; Grant, 1996), and design would have a 'horizontal' role. The focus would most likely be to employ and apply known knowledge. In principle, design(ery) thinking in this situation does not alter or has any effect on management thinking. The design resource is added to the existing resources of the firm.

If so we may arrive at an asymmetrical communication pattern (Johansson et al., 2003) where design need to legitimize itself vis-à-vis a possibly mainstream technical and economic interest and logic, leading to issues of relative importance of design compared to other functions such as technical development of supply chain management. An investment in design needs to be evaluated in the same manner as any investment. The role of design is functional rather than strategic.

A further step is to see design as an integrating activity, where design is the agent of change; **integration by design**. Design is the activity that links, or creates links between the activities of the firm. This perspective moves design more clearly into the realm of business strategy, as an overarching process logic that binds value creating and appropriating activities together. This seems to be a growing field of interest in design research, such as Svengren's (1995) conceptual integration. Design may, thus, be a higher order capability with a 'vertical' role and responsibility. As such design is a facilitator of knowledge integration processes, with responsibility for creating meaning and order throughout the process.

### *The technical envelope*

An empirical illustration of integration of or by design may be the attitude towards a technical level or envelope. While integration of design would most likely work within a set boundary of technology and apply that level of knowledge, it is easier to see integration by design as pushing that boundary, in order to meet the vision of the design, not accepting the given. Design here would be the leading activity, and any specific field of technological knowledge would represent a resource, or a subordinate capability, in the hierarchy (Grant, 1996a). Design would have a 'vertical' field of authority.

Throughout the history of Apple products there are numerous stories of when Steve Jobs refused to accept boundaries of existing technological fields of knowledge. When the iPhone was being developed, the front with one single glass surface was an integral part of the vision. The problem being that there was no glass material hard enough for the intended use, which risks stalling or stopping the entire project. True to his style, Steve Jobs phoned the CEO of Corning, flew over and convinced Corning to spend research time inventing the impossible. Within a month Corning had found an unused technology and the glass surface issue was solved. (Isaacson 2011)

Another approach is illustrated in the example from the Swedish glass works Orrefors (Andersson, 2002). Orrefors recruited its first designer (or artist as they were called back then) in 1916 and has ever since been a company which has relied heavily on its designers for the development of new products with commercial potential, combining an artistic content with cost-efficiency consideration (whether manufacturing is completely manual or mechanical or combinations thereof). An often referred to expression in the glass works when designers presented their sketches, sometimes drawing with chalk on the floor of the glassworks, was "it can't be done" ("de' gaur inte" in the local Swedish dialect) which was another way of saying "we have never done that". More or less everything in the company centred around the company's eight designers, recruited in order to be different from each other, expressing their individuality in their products, while working under the umbrella of the brand and its tradition. Combining commercial potential by pushing (technological) limits and stretching, but not breaking the tradition of the brand, was thus the essence of integrative design(ers) at Orrefors.

The organizational level of where to find 'integration agents' may, as the Apple and the Orrefors examples show, vary. Grant (1996a) writes however

that the hierarchy of integration is not to be confused with the administrative one of authority and control, and that the two hierarchies, in most organizations, do not correspond closely with each other.

## **Discussion**

By exploring design management with a perspective of knowledge integration, we have extended the scope of what knowledge to be integrated. We have identified a managerial issue that formally encompasses both the material and the immaterial (Hodder, 1991), the rational and the 'irrational', use value and user value, functional and symbolic value (Ravasi and Rindova, 2008); encompassing *the poetry and plumbing* of management (March and Weil, 2005). Some of the worlds most highly valued companies, such as Apple or BMW, are undoubtedly 'design-intensive' firms (Verganti, 2008), building their success on a combination of rational problem-solving and meaning creation, of technology and meaning creation into product epiphanies (Norman and Verganti, 2014). Whether this combinative capability (Kogut and Zander, 1992) is called industrial design, design thinking or design management or something else is in a way secondary. We have here sought to explore some consequences of introducing knowledge integration into the design management discourse, specifically what the consequences may be of knowledge integration *of or by design*.

The design knowledge represents at its most basic a distinct set of resources. The employment of these resources requires distinct operational capabilities, and the integration of which may require higher order capabilities. The 'designer' uses the input of the resources of knowledge content through the capability of process knowledge to 'design' things and processes as output.

With this perspective, design is inherently integrative, bridging the needs, desires and self-perceptions of the user, and the resources and capabilities of the firm. Design, in content and process, represents an identifiable and distinct resource and/ or capability for the firm. The placement of industrial design in a hierarchy of capabilities (Grant 1996a) is in fact a critical managerial issue, indicative of whether the integration is seen as integration of or by industrial design.

## Conclusions

First, from a knowledge perspective, design management may be reformulated: design management includes the capability to integrate specialized, distributed and heterogeneous knowledge bases.

Second, when studying integration of design through the lens of knowledge integration what stands out is the increased scope of what to integrate. In order for the design process to provide improvement of the existing situation the process needs to bridge needs as well as meaning.

Third, all of the three characteristics of knowledge integration (Grant 1996a) – scope, efficiency and flexibility - indicate some difficulties; regarding the efficiency of integration, partially because of communication issues; the scope of what to integrate may move beyond the point of diminishing relevance; and flexibility of integration may be slow partially because of the tacit nature of design knowledge and practice. However, following the argumentation regarding scope by Grant, the broader scope of industrial design also carries the potential for creating and sustaining competitive advantage. Great potential coupled with great difficulties.

Fourth, the location of design in Grant's hierarchy of capabilities may help identify critical managerial issues, indicative of whether the integration is seen as integration OF or BY industrial design. Integration OF design indicates that design (with its distinct capabilities) is placed alongside other functions of the firm, and thus could be described as extending the horizontal dimension of organizational capabilities (Grant 1996). This calls for efficient integrative capabilities at a higher level; integration is not intrinsic to the design field itself. Integration BY design, on the other hand, refers to the vertical dimension in a hierarchy of capabilities (Grants, 1996a). Design (thinking) – spanning the economic/technological and the socio-cultural – permeates the organization and thus becomes, or constitutes, an integrative capability in itself, wherever its agent(s) reside. If knowledge integration takes place BY design, then design is an integrative agent and design becomes part of strategic management.

Finally, the knowledge integration 'method' of integration of specialized, dispersed and heterogeneous resources is not to create uniform knowledge as such, but via a 'common knowledge' (Grant, 1996) permit the leverage of the various knowledge bases. That common knowledge provides a language that permits the knowledge integration to outshine the sum of the parts. Similarly, a 'common space' (see Hurt and Hurt, 2005) is a ground for empathy, respect and trust. The common ground of knowledge integration,

the 'ba' (Nonaka et al., 2000), may be crucial and conducive to the knowledge integration process.

## What are you Managing in Design? Creativity or Innovation or Both?

Peer M SATHIKH

Nanyang Technological University

*Managing design has become an important ingredient of successful business management and to the success of the business itself, especially when a business is dependent on products and/or services that reaches consumers and the wider public. Design and designers are associated with creativity, while management and business are associated with innovation. While creativity is defined as the process that results in ideas that are novel, innovation is defined as the process that creates value to both the business and the consumer.*

*If you are to manage the design process in an organization, are you managing creativity? Or innovation? Or both? Research and writing on the subject reveals that creativity and innovation are used interchangeably without understanding the underlying differences between the two. This paper starts by outlining the difference between creativity and innovation, in reference to design management, and goes on to establish the difference between artistic and idea creativity in order to effectively bring about innovation within a group or organization. This paper also introduces the need for design managers to differentiate the culture of creativity and culture of innovation in order to bring value through innovation.*

**Keywords:** *Creativity, Innovation, design management, culture of creativity, culture of innovation*

## Introduction

Design as a profession is ninety-five years old from the founding of Bauhaus in Germany, or eighty-five years old from the start of the Raymond Lowey's industrial design practice in USA. These two starting points are important from the author's perspective since they represent two distinctly different approaches to how design is managed. Bauhaus was founded by Walter Gropius core with a radical concept at its core: to reimagine the material world to reflect the unity of all the arts. Proclamation of the Bauhaus of 1919 described a utopian craft guild combining architecture, sculpture, and painting into a single creative expression which combined fine art with design education to turn out artisans and designers capable of creating useful and beautiful objects appropriate to this new system of living. ([http://www.metmuseum.org/toah/hd/bauh/hd\\_bauh.htm](http://www.metmuseum.org/toah/hd/bauh/hd_bauh.htm)). Gropius's dream of unifying arts through crafts was not financially feasible, especially with the start of mass production of products in the western world. This meant a refocus from a utopian ideals to 'art for the industry' stressing the importance of designing for mass production.

Raymond Lowey, on the other hand discovered 'streamlining' which he called 'beauty through function and simplification'. In his book *Industrial Design* (Lowey, 1979) Lowey states that, 'success finally came when we were able to convince some creative men that good appearance was a salable commodity, that it often cut costs, enhanced a product's prestige, raised corporate profits, benefited the customer and increased employment'.

In the first instance itself one notices two different value propositions brought about by the two influential founders of industrial design. This seem to have been picked up as a dichotomy ever since, leaving the door wide open for misrepresentation of design and design management in many ways till today.

Figure 1 Influential founders of industrial design

Source: <http://www.walter-gropius.com> and <http://raymondloewy.com>

Bauhaus' approach of 'art for the industry' set the tone for an intellectual approach to design which was adopted by the next famous Hochschule for Gestaltung in Ulm, a 'teaching and research institution to foster the humanistic education ideal and link creative activity to everyday life ([http://www.designhistory.org/Bauhaus\\_pages/BauhausWomen.html](http://www.designhistory.org/Bauhaus_pages/BauhausWomen.html)). Lowey's philosophy of 'never leave well enough alone' (Lowey, 1951) set the tone for a more commercial approach to design, where design was associated with appearance as a saleable commodity meant to bring 'satisfaction' to the consumer and profit to the manufacturer.

Intertwined between these two strands of design approaches are important threads such as creativity, design process, innovation, design management, etc., which are important in making design outcomes that are uniquely different and successful in their own way.

Many variants have been derived from these two founding approaches to design, many a time marrying the two approaches in different proportions to concoct new design 'cocktails' that are interesting to consume for the consumers/users and the clients/company alike. During the period that design was evolving, from roughly the end of World War I right till today, creativity and innovation was studied and researched upon by academicians and practitioners from wide variety of areas other than design. Creativity was studied predominantly by psychologists such as Robert J Sternberg (1989), Teresa Amabile (1996, 1998), Mihaly Csikszentmihalyi (1997) and Marc Runco (2007) amongst others and also by medical doctors such as Edward deBono (1970) and journalists such as Arthur Koestler (1989). Innovation, on the other hand, has become the domain of business management with eminent personalities such as Larry Keeley (2013), C.K.Prahalad (Prahalad and Krishnan, 2008) and major management schools such as Harvard Business School, Wharton School, Stephen M Ross School of Business, Stanford Graduate School of Business and Cambridge Judge Business School and many innumerable academicians, professionals and personalities contributing to the vast source of knowledge available on innovation.

While designers and design schools from around the world, through their practice and teaching, stake claim to creativity and, to an extent, innovation, the main theoretical framework for both creativity and innovation seem to come from fields outside of design.

With this in mind, this paper puts forth several ideas about the role of creativity and innovation in design and the role of design management in

harnessing these two for end results that bring value to the various stakeholders such as the client/company and the users.

### *Understanding Creativity and Innovation*

In his foreword to the book 'Exploring Creativity', Howard S. Becker (Moeran and Christensen, 2013) states that, 'the crucial thing to understand is that innovation and creativity are not *things* but rather *process*'. They don't happen all at once, as the result of the coming together of an appropriate mix of the right ingredients in the right proportions: so much careful selection of properly trained personnel, so much managerial input, so much in the way of resources of money and time, etc. (Moeran and Christensen, 2013). If both are processes, it is then easy to argue that creativity and innovations are the same and this assumption causes confusion when both are interchangeably used. In order to effectively manage design, it is important to distinguish clearly between creativity and innovation. While it is acknowledged that creativity is a necessary, and probably the most important, element in innovation, in many ways experts see innovation as a management function whilst creativity is seen as a 'creative' function itself (Keely, 2013 and DeBes & Kotler, 2012). This would lead to a conclusion that creativity need not be managed and that design management is meant to manage innovation as a function. Isaksen & Akkermans (2011) in an article titled *Creative Climate: A Leadership Lever for Innovation* state that 'Although creativity and innovation are distinct constructs, there is an emerging consensus that creativity has to do with the generating and communicating of meaningful new ideas and connections, and innovation has more to do with the use and implementation of them'. With specific reference to design, in its various forms from graphic design to industrial design, interior design, interaction design, service design and so on, the role of creativity and innovation need to be defined in the backdrop of acknowledged definitions of design and design management

### *Definition of design from ICSID*

The International Council of Societies of Industrial Design (ICSID) defines design as 'a creative activity whose aim is to establish the multi-faceted qualities of objects, processes, services and their systems in whole life cycles. Therefore, design is the central factor of innovative humanisation of technologies and the crucial factor of cultural and economic exchange'. A designer according to ICSID then 'refers to an individual who practices an

intellectual profession, and not simply a trade or a service for enterprises'.  
<http://www.icsid.org/about/about/articles31.htm>.

It is clear from this definition that:

1. Design is a *creative* activity
2. Design is the central factor in the *innovative* humanisation of technologies
3. Design is an *intellectual* profession (italics by the author)

One can derive from the ICSID definition that design management involves management of an intellectual activity involving creativity and innovation, which also means managing people who are creative, innovative and are intellectual. The question of 'are all designers intellectuals?' is a difficult one to answer, with the question falling squarely on the definition of design itself. In the experience of the author, while design does not fall into the category of genius, designers, by their very nature, put a lot of thinking into various aspects of what they are designing, for whom and where the design will be used, etc., thus applying what many have defined as 'design thinking' along with their visual thinking and hand skill capabilities. Hence design management involves managing an intellectual process as well.

### *Definition of design management from DMI*

The Design Management Institute (DMI) definition of design management as '(it) encompasses the ongoing processes, business decisions, and strategies that enable innovation and create effectively-designed products, services, communications, environments, and brands that enhance our quality of life and provide organizational success. On a deeper level, design management seeks to link design, innovation, technology, management and customers to provide competitive advantage across the triple bottom line: economic, social/cultural, and environmental factors.

[https://www.dmi.org/dmi/html/aboutdmi/design\\_management.htm](https://www.dmi.org/dmi/html/aboutdmi/design_management.htm)

This definition of design management sees the appearance of design and innovation with creativity getting a fleeting mention as 'create effectively-designed...'. DMI's definition of design management sets about a beginning, i.e., to enable innovation and an end result, which is to provide competitive advantage at three levels: economic, social/cultural and environmental factors. By this one can infer that greater the (impact of) innovation through design greater the competitive advantage. What is not mentioned in many of the studies on design management is the expectations on the outcome

that brings about the competitive advantage. These expectations are set about by the upper management of organisations or by the principals/founders of enterprises/companies.

*Elements of design management*

The relationship between design management, innovation and creativity may be better understood if one works backwards from the definitions of design management and design.

- a) **Expectations** of outcome(s) to bring about competitive advantage
- b) **Competitive advantage** is directly related to successful innovation
- c) (Design) **innovations** occur through ideas brought about by successful design
- d) Successful **design** is the result of application of creativity and intellect
- e) **Creativity** and **intellect** are traits of effective designers (human traits)

What then are we managing in design management? Figure 2 shows the various elements involved in design management.

Figure 2 Elements of design management

While it is apparent from Figure 2 that a design manager is expected to manage the designer at one end and expectations (and the management) at the other, he or she is expected to be equally adept at managing the other elements in between as well. Of these elements in the middle, creativity and innovation are the most often quoted in the annals of business management as to the success of an organisation. Questions have been raised by pundits of management such as Theodore Levitt as to the validity to the claim that creativity is important to business success. In an article titled 'Creativity is not Enough' in the Harvard Business Review on The Innovation Enterprise Levitt declares (Harvard Business Review, 2003), 'Creativity is not the miraculous road to business growth and affluence that is so abundantly claimed these days' and goes on to say that managers, '... confuse creativity in the abstract with practical innovation...' While one could agree with Levitt's statement that many confuse creativity with innovation, the author believes that misplaced expectations on creativity and inability understand

the context at which creativity becomes useful is to blame for these statements and beliefs. Creativity and the act of 'creation' has been surrounded by myths that have been spun by different sources as David Burkus points out in his book titled 'The Myths of Creativity' (Burkus, 2014). What is creativity and how can design managers manage it successfully then?

### *Creativity*

Sathikh (2010) in a paper titled 'Cultivating Innovation' defines creativity as:

*the result of a playfully exploratory process by a person who is open, curious and imaginative in a conducive environment whose result is novel.*

In this definition, four definitive things are involved; **process, person, environment and result**. The common question that arises from this definition is, 'considering that the end point of design management is to achieve the level of expectations (Figure 2), is novelty sufficient to attain the competitive advantage required?' First level answers to this question may be answered by a more recent definition of creativity by Burkus (2014), where he defines creativity as:

'the process of developing ideas that are both novel and useful'

Burkus also states that 'the novel (in his definition) is easily recognized, but the useful is just as important'. Getting back to Levitt's article (Harvard Business Review, 2003) where he states that, '(too often)... creativity means having great original ideas... the ideas are often judged more by their novelty than by their potential usefulness, either to consumer or to the company'. This seems to be the first principle in design management:

**Principle 1:** At the creative stage, manage design by identifying ideas that have potential usefulness.

Understanding the first principle allows one to move on to addressing any lingering doubt on the role of creativity in bringing about innovation. Going back to Sathikh's definition, creativity is also the process rather than the result itself. By this definition the works of an artist like Pablo Picasso (Fig 3a) and a scientific discovery such as the DNA structure by James Watson et al (Fig 3b) can be termed as creative.

SATHIKH

In the same vein Dyson's bladeless fan (Fig 3c) is also creative. If all three were creative because they have gone through a creative process and the results are novel, wouldn't this be confusing to the pundits of business management?

Figure 3a Pablo Picasso's Mediterranean Landscape. Source: [http://uploads3.wikipaintings.org/images/pablo\\_picasso/mediterranean-landscape-1952.jpg](http://uploads3.wikipaintings.org/images/pablo_picasso/mediterranean-landscape-1952.jpg)

Figure 3b Structure of DNA by James Watson et al. Source: <http://www.nature.com/scitable/topicpage/discovery-of-dna-structure-and-function-watson-397>

*Figure 3c Bladeless fan by Dyson*

*Source: <http://www.redbrick.me/2009/10/dysons-bladeless-fan/>*

The pundits can obviously see that Picasso's artwork fetches a one-time value and the structure of DNA is useful to mankind in many ways including for bio-medical and bio-chemical industries as a business. However, it is Dyson's bladeless fans that will most probably catch their attention for the reason that, a creative idea has been taken through a design process into an innovation that has unique selling proposition which can bring profit for the company and benefit for the consumer. In other words, it is important to understand that creativity is not universal and not all results of creativity are equivalent. In support of this Bruton (2011) states that, 'As usual one of the big problems facing creativity is the inability of language to distinguish between artistic creativity and idea creativity'. According to Bruton, both types create something new which has value, but in different manner altogether. The value in artistic creativity can be said to be the creation itself, while the value in idea creativity will be its usefulness as a starting point of innovation. This would lead to the second principle of design management:

**Principle 2:** As design manager, clearly differentiate artistic creativity from idea creativity

*From creativity to innovation; by design*

Following the elements of design management depicted in Figure 2, the outcome of creativity is turned into innovation to gain competitive advantage and there is design in between the both. What then is the role of design in bringing out innovation? The most appropriate definition of design that connects creativity and innovation is found in the website <http://dancingwater.eu/2009/27-design-definitions/> and is attributed to A.M.Boutin and Liz Davis:

Design is not an art or a science, a socio-cultural phenomenon or a business tool. It is an innovative process, which uses information and expertise from all these sectors. It uses creativity first to analyse and synthesise the interactions between them and, secondly to offer appropriate and innovative responses (forms) which, in application, should go beyond the sum of each sector's vision and capacity and yet remain recognisable and pertinent to them all.

By this definition, design by itself is an innovative process and uses creativity to analyse and synthesise the interaction between art, science, socio-cultural phenomenon and business, thus allowing for the blending of artistic and idea creativity and moves towards an appropriate and innovative response that go beyond the sum of each. In other words, design is a process that helps bring about competitive advantage. The third principle of design management can be derived from this:

**Principle 3:** Manage creativity in a manner that leads to appropriate responses or forms (of solutions) that are innovative.

Appropriate responses or forms of solutions that are 'innovative' bring the discussion to innovation per se. Innovation seems to mean different things to different people. The author's choice of definition is from Barnett (1953) in his book titled 'Innovation: The Basis for Cultural Change' where he defines innovation as:

'any thought, behavior or thing that is new because it is qualitatively different from existing forms'.

The inclusion of 'thoughts' in Barnett's definition point clearly to innovation's association with creativity that could be realized in a meaningful way and 'qualitatively different' that points to competitive advantage in its realisation. Barnett's definition also encompasses innovation beyond tangible products to service innovation and others such as intellectual property as early as 1953. Qualitatively different innovation does not appear all of a sudden in any system or company unless creativity is synthesized properly which brings the attention back to managing design leading to the fourth principle in design management:

**Principle 4:** Manage creativity, not innovation, through design and set about means to bring about qualitative difference of the outcome through innovation.

While it could be argued that, in design, one cannot be differentiated from the other, it is important that design managers understand this difference so that they can present and promote the right type of creativity at the right time. A common mistake in design management could be to highlight the aesthetic idea for a design concept when explanation on the functional idea of the design is required at that point in time and vice versa.

### *Innovation as qualitative difference*

Renowned management consultants Arthur D. Little, in an article titled *Innovation: measuring it to manage it* in their in-house magazine Prism, states, 'Unlike many other core business processes such as manufacturing and logistics, the output of the innovation process, with creativity at its source, is rather unpredictable – and should be, up to a point. That may be where many executives give up: if the output is unpredictable or, even more so, if you want it to be unpredictable, why bother to measure it, even assuming you could? And since we are unable to capture innovation in plain indicators and targets, these executives may further argue, 'we had better leave innovation management in the hands of R&D specialists' (Kolk et al, 2012).

The first thing to note is that the output of innovation is unpredictable and especially so in design, which is heavily centred on creativity. Secondly, innovation cannot be captured in plain indicators and targets. A look at a cross section of articles and published research on measuring innovation always talk about measuring the effect of innovation, either as measures of sales volume, market share, revenue and profit or by the number of patents

and citations that innovations attract. A sample of such approach can be found in the *Oslo Manual: Guidelines for Collecting and Interpreting Innovation Data* (Oslo Manual, 2005), *Measuring Innovation and Intangibles: A Business Perspective* from the Science & Technology Policy Institute (Stone et al, 2008) and others. The most complex way of ascertaining the value of innovation is from an article published by BearingPoint Management and Technology Consultant (BearingPoint, 2011) titled *Measuring Innovation: Sustaining competitive advantage by turning ideas into value*, where they talk about 'Innovation Value Stream Analysis' as seen in Fig. 4:

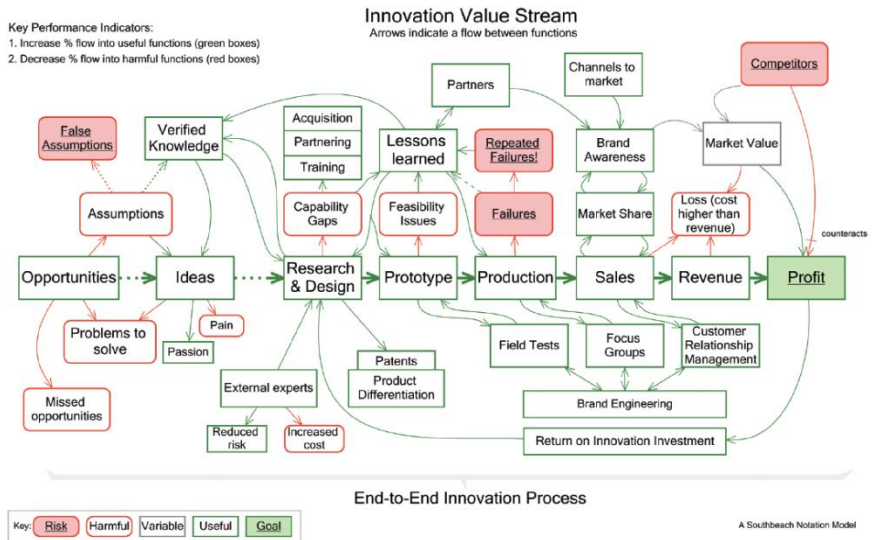

Figure 4 Innovation value stream analysis. Source: (BearingPoint, 2011)

Figure 4 clearly indicates that innovation in design cannot be measured in the manner shown in the diagram nor in ways outlined by the various literatures on measurement of innovation, discussed in this paper. The main reason for the difficulty in measuring (design) innovation for qualitative difference is in the multifaceted nature of design which can result in multitude incarnation of the original intention / expectations whose success cannot be guaranteed. A good example is the design of the first Sony Walkman (Figure 5), which has become a legend of design innovation. At the same time the low cost TATA Nano designed by the design team at TATA Motors in India (Figure 6), which was hailed for design innovation has

*What are you Managing in Design? Creativity or Innovation or Both?*

not done well since its release in 2008, though the design itself cannot be faulted for the failure as innovation.

*Figure 5 Sony Walkman (1979). Source: <http://imgarcade.com/1/sony-walkman-1979/>*

*Figure 6 TATA Nano (2008)  
Source: <http://www.dezeen.com/2009/03/25/tata-nano-by-tata->*

Both these products had their expectation defined at the very top, Akio Morita, the CEO of Sony and Ratan Tata, the CEO of TATA Motors, who were both hands-on working together with their design teams. Success and failures of notable innovations brings about the fifth principle:

**Principle 5:** Determine what could be the qualitative difference of the creative outcome (innovation) and be prepared to return to design to invoke further creativity.

### *Defining qualitative difference*

From a design perspective, innovation can be said to have succeeded if it brings new value proposition to the stakeholders, the organization, the promoters (distributors) and the users/consumers. In the world of business management attempts to determine value propositions of innovation is through:

1. Measure of the number of patents taken up by the organization.
2. Market penetration and market share of the product/service and the organization
3. Revenue and profit

These are measurements that are only possible *after* the product or services has been released to the market, which means that the design team needs to wait till work has been done in developing, producing and selling the product or service and the sales/financial report start coming back in, indicating the success of innovation. Design as a process that turns (design) creativity into innovation requires much more dynamic and 'real time' measurement in order to correct any perceived deviation during the design stage itself.

Real time prediction of successful innovation is the toughest task of a design manager. Many a corporation easily fall back on surveys, showing design concepts and real or virtual mock-ups to 'target' consumer in order to determine a democratically selected concept to move forward. While this could be successful in certain areas of design such as fashion, gift items, jewelry and other personal/private products, it could be disaster for products and services that need heavy investments upfront such as tooling and infrastructure building. Examples of such products are cars, household products, IT products, etc.

Jacobs (2007) while discussing radical innovation comes to a conclusion that innovation needs both interpretative and analytical approach, which calls for different kinds of people. It is at this point that a design manager has to comeback to the people he/she is managing to determine what would make the outcome of their work 'qualitatively different'. While managing the creative process is about identifying potential useful ideas (Principle 1), managing innovation requires the ability to identify the value

*What are you Managing in Design? Creativity or Innovation or Both?*

that the final design or solution(s) will bring. In other words there seems to be a difference between the culture of creativity and the culture of innovation itself that the design manager has to deal with.

**Principle 6:** Identify the differences between creative culture and innovation culture in order to nurture talents who can bring about qualitative difference.

Principles 1 to 5 seems to have a linear flow to the management of design while principle 6, seems to shift the attention back to creativity again, this time on creative culture. Many of the works by Amabile (1996), Csikszentmihalyi (1997) and others lead to a set of characteristics of creative culture as shown in Table 1.

*Table 1 Characteristics of creative culture*

No	Characteristics	Remark
1	Curiosity / playful	Person
2	Childlike approach	Person
3	Breadth /Disparate ideas	Ideation
4	Multitude of Ideas (Creative Darwinism)	Ideation
5	Experimentation and risk taking	Attitude, policy
6	Ambiguity and propensity of failure	Attitude, policy
7	Humour, eccentricity, horseplay	Attitude, policy
8	Individual freedom (autonomy)	Attitude, Policy
9	Complete freedom on space and work area	Policy
10	Limited respect for management	Attitude
11	Loose sense of time, deadlines and time management	Attitude, Policy

Similarly works done by Morris (2011), Berkun (2010), Keeley (2013) and others lead to a set of characteristics of innovation culture as shown in Table 2.

Table 2 *Characteristics of innovation culture*

No	Characteristics	Remark
1	Carry out mid-course corrections	Work dynamics
2	Preference for group anatomy and control	Group dynamics
3	Low level of associative barrier (both physical and psychological)	Work dynamics
4	Able to breakdown extrinsic motivation into chunks of intrinsic motivation	Work dynamics
5	Comprise of whole brained team with varied perspectives/expertise	Team Building, policy
6	Well defined roles for each person in the team	Group Dynamics, policy
7	Room for team play as well as solo play	Policy
8	Provision for 'encouraging' supervision	Policy
9	Organizational belief and support (in the innovative work)	Policy
10	Humour / jovial environment	Continued from creative culture
11	Means to manage creative abrasion	Leadership, Policy
12	Allow for ambiguity without losing sight of the goal.	Policy
13	Comprise of team that focuses on ideas rather than career	Team selection

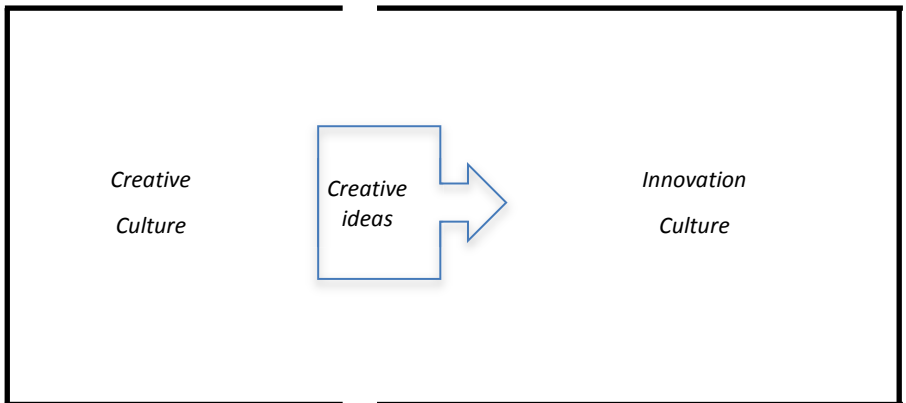

From Table 1 and 2 it is easy to identify four key highlights that need to be noted by design management:

1. Creative culture is interested in creating ideas while Innovation culture is interested in realizing those ideas that have value propositions

*What are you Managing in Design? Creativity or Innovation or Both?*

2. Creative culture is a loose composition while innovation culture thrives on a controlled system with certain level of autonomy and freedom
3. Creative culture needs to be nurtured while innovation needs to be cultivated
4. Creative culture requires a 'shepherd' leader with high level of tolerance for personal quirkiness, methods, housekeeping and time management while innovation culture requires a 'captain' who will steer the team towards a defined goal in terms of budget, time and results, with a high level of tolerance for experimentation, iterations, inter-personnel relations.

In other words, design management, in effect, is managing two cultures, carefully passing viable ideas from one culture to the other as shown in Figure 7.

*Figure 7 Managing culture not design*

Dominance of one culture over the other, according to the author, may ascribe to the type of direction that the design will take. A design management team that emphasizes more on creative culture alone maybe subscribing to the school of 'style with function' descended from Raymond Lowey and a team that lays more emphasis on innovation culture may be subscribing to the Bauhaus school of 'form through functional analysis'. This brings the discussions to the starting point of this paper!

## *Summary*

This paper started with the two founding philosophies of modern industrial design originating from Raymond Lowey and Walter Gropius in early 20<sup>th</sup> century. It went on to define design and design management and discovered that design lies between creativity and innovation. Creativity was then defined and during that process, two types of creativity, artistic and idea creativity were discovered. The paper then moved on to define innovation and came to a realisation that successful innovation need to be qualitatively different in order to bring about a value proposition, which signals successful innovation. Finding ways to identify and document qualitative differentiation proved to be difficult and it leads the search to having people in the team who are discerning and can identify qualitative difference. This meant that in a design team that there are two types (predominantly) of people within a design team that is innovative. Two types mean two cultures, which have two distinct characteristics. The role of the design manager (management) is to manage the journey of a potential idea from one culture to another seeing the idea 'grows' into innovation. This discovery also leads to appreciation of the cultural differences in the works of style centric designers and the user and analysis centric designers, thus identifying them with the ethos of Raymond Lowey and Walter Gropius respectively.

In addition to what is mentioned above, six principles for design management were discovered along the way:

**Principle 1:** *At the creative stage, manage design by identifying ideas that have potential usefulness.*

**Principle 2:** *As design manager, clearly differentiate artistic creativity from idea creativity*

**Principle 3:** *Manage creativity in a manner that leads to appropriate responses or forms (of solutions) that are innovative.*

**Principle 4:** *Manage creativity, not innovation, through design and set about means to bring about qualitative difference of the outcome through innovation.*

*What are you Managing in Design? Creativity or Innovation or Both?*

**Principle 5:** *Determine what could be the qualitative difference of the creative outcome (innovation) and be prepared to return to design to invoke further creativity.*

**Principle 6:** *Identify the differences between creative culture and innovation culture in order to nurture talents who can bring about qualitative difference.*

### **Conclusion**

The premises of this paper, was to examine what design managers manage; creativity, innovation or both. The full circle of event during this study has lead to four distinct outcomes. Firstly, a detailed study of design and design management has lead to the discovery six principles that are essential for a design manager or management to know, irrespective of the type of design that is being managed. Secondly, innovation, especially with reference to design, is difficult to measure during the design stage and only qualitative differences could be identified during the process. Thirdly, identification of qualitative differences that brings about innovation is still a domain of people or human beings. Finally, people in design teams form distinct cultures, where creative culture and innovation culture are different. The eventual success of design management, ultimately, depends on effectively managing these two cultures.

**Acknowledgements:** *The author wishes to acknowledge Prof Heitor Capuzzo of Nanyang Technological University and Prof Arcot Desai Narasimhalu of Singapore Management University whose graduate courses on creativity and innovation, respectively, brought about the insights for this paper.*

## Darwinian Design in an Era of Disruption

John Z LANGRISH\*

Salford University

*This paper takes a previous era of disruption as the background for a discussion of the Design Methods Movement (DMM) of the 1960-70s. It shows how the founders of the DMM attempted to produce a more 'scientific' view of design but were forced to either modify their approach or just give up. It is claimed that their concept of 'scientific' was that of physics and that the physics world-view is not appropriate for complex systems. There is a need to change from a rational, scientific (ie physics) type of view to one best described as 'biological' or Darwinian, making use of memetics. This leads to the suggestion that in the present era of disruption, design management should consider adopting a 'biological' view of design.*

**Keywords:** Darwinian design; Design Methods Movement; memetics; 50-year cycles.

---

## **Introduction**

The paper is in five parts:

1. A general discussion of eras of disruption, including a mention of 50 year waves in the economy.
2. The DMM and how it changed. The writings of Christopher Alexander, Bruce Archer, John Chris Jones and Horst Rittel are discussed, showing how they eventually realised that their task had become much more complex than they had anticipated.
3. A biological, Darwinian view of design. The world outside physics is extremely complex and biology has methods for coping with complexity.
4. Examples of the successful use of varieties competing within a selection system are given to demonstrate how a Darwinian approach to design management has been used.
5. Conclusions for design management.

The theme that connects the five parts is that a physics approach cannot predict the future of a complex system. Patterns detected in the past may continue into the future but in eras of disruption those patterns may change. When the future is unpredictable, the best approach is to learn from biology, the science of complexity.

## **Eras of Disruption**

There have been several eras of disruption in the past and although history does not repeat itself, there may be some merit in looking at the past. Two kinds of disruption are noticeable, one being the impact of new technologies creating what economist, Joseph Schumpeter, called 'waves of creative disruption' and the other being eras of depression that have seemed to punctuate the eras of new technology. There is some evidence that these eras occurred at intervals of approximately 50 years with periods of prosperity interspersed with depressions. The depression and financial crisis around 1930 reminded some people that this had happened before with 'The Great Depression' of the 1890s.

In the Soviet Union, the economist N. Kondratiev claimed that the 1930s depression was not the downfall of capitalism, hoped for by Marxists. It was the latest manifestation of a cyclical process happening roughly every 50 years, interspersed by phases of recovery, prosperity, decline and then another depression. This made him very unpopular with the authorities.

However, his idea of cycles reached the West where Joseph Schumpeter, added 'gales of creative destruction' to the Western economics literature.

Some 50 years later, there was another depression and Kondratiev cycles were studied again. The German economist, Gerhard Mensch (1979) claimed that previous depressions had been ended by the benefits of major technological innovations. The English economist, Chris Freeman (1983), added some detail to the picture claiming that new product innovations were followed by a period of cost saving in production methods until innovation ran out of steam and along came another depression.

The effect of such cycles on design has been revealed by a study of adverts (Langrish, 1982). It was claimed that in phases of recovery and prosperity, there is an atmosphere - a zeitgeist - of optimism, accompanied by a belief that science is making things better. However in the decline and depression phases, optimism is replaced by pessimism and a loss of faith in science. This is reflected in the designs of the different phases as shown by both words and pictures used in adverts. In optimistic phases, there is a frequent use of words such as new, latest, scientific and so on but in pessimistic phases, words such as traditional, reliable, original, established etc. are more frequent. This also applies to images in adverts. As an example, bread was advertised before 1913 as 'untouched by human hand', accompanied by a picture of 'our latest patented machinery'. This was in a phase of optimism following recovery from the depression of the 1890s. In contrast, modern bread adverts tend to suggest that the bread is made in a farmhouse kitchen.

Following recovery from the 1930s and the war, the Festival of Britain in 1951 was a celebration of optimism and belief in scientific progress. Designers from the Royal College of Art went next door to Imperial College and came back with electron microscope images that were turned into designs for wallpaper, curtains and other fabrics. The red spheres connected by black rods, as used in atomic models, cropped up as legs for paper holders and clothes-hooks. Science was seen as producing antibiotics, synthetic fibers, thermoplastics, TV, computers etc. leading to a healthier and more colourful way of life. It is not surprising then that this period produced attempts at making design more 'scientific' as described in the next section.

The 1952 festival was in sharp contrast to London's millennium exhibition, 50 years later, which was not a celebration of progress and suggested that the supposed 50-year cycle has stopped repeating itself.

Optimism and belief in scientific progress now seem to be dim memories of a past era.

In the USA, belief in progress began to be threatened in the 1960s. Mathew Wisnioski (2012) dates the start of this change as 1964 – two years after the publication of Rachel Carson’s *Silent Spring* and the year in which Ellul’s *The Technological Society* appeared in English translation. Wisnioski sees these two events as representing two strands of growing concern, pollution as a side effect and the system itself. This system was the government-funded aerospace industry that employed the majority of America’s growing number of engineers and neglected traditional manufacturing.

Public attitudes towards science changed from seeing it as the bringer of progress to a suspicion of its harmful effects. Similar changes took place amongst people trying to make design more scientific - the Design Methods Movement.

## **The Design Methods Movement (DMM)**

The DMM started in a period of optimism when science was considered a ‘good thing’. It is usually associated with the names of Christopher Alexander, Bruce Archer, John Chris Jones and Horst Rittel.

It was not a ‘movement’ with a set of shared aims and methods other than an attempt to take some of the mystery out of intuitive or sub-conscious decision making in areas such as industrial design, architecture and town planning. It hoped to achieve this by using ‘scientific’ techniques, such as operations research, developed in the war. In different ways, they saw design as a process of problem solving that should be made more scientific. Rittel preferred to describe his approach as DTM - Design Theory and Methodology.

Christopher Alexander was born in Austria but studied both maths and architecture in England at the University of Cambridge. He then went to Harvard where he obtained a doctorate in architecture. After winning a prize for his paper “A city is not a tree” he published *Notes on the Synthesis of Form* (1964). This starts with the words, “These notes are about the process of design: the process of inventing things which display new physical order, organization, form, in response to function.” Having degrees in both maths and architecture, Alexander was able to produce an approach, based partly on set theory, that broke down design problems into subsystems, allowing for an incremental approach.

Hors Rittel had begun to develop his ideas in Germany where he was Professor of Design Methodology at the Hochschule für Gestaltung in Ulm. In 1963, both Rittel and Alexander were recruited to Berkeley by William Wurster, Dean of the College of Environmental Design, encompassing architecture, and city and regional planning, where Rittel became Professor of the Science of Design. He attempted to describe the process of design in terms of successive phases that he described as being like box-cars. His first in the line was 'understand the problem'.

Bruce Archer was an engineer who became head of design research at London's Royal College of Art (RCA). With Jones and others, he started the Design Research Society which grew out of a symposium held in 1962 at Imperial College (next door to the RCA)

J C Jones published a book, *Design Methods* (1970) that was purchased by many students in art and design colleges where they had discovered that no one would tell them how to design. He then became the first Professor of Design at the new Open University.

When the phase of prosperity, associated with belief in scientific progress, was replaced by doubts about progress, all four modified their approaches. In the new preface to a 1971 edition of *Notes on the Synthesis of Form*, Alexander repudiated the DMM -

*since the book was published, a whole academic field has grown up around the idea of 'design methods' - and I have been hailed as one of the leading exponents of these so-called design methods. I am very sorry this has happened and want to state publically that I reject the whole idea of design methods as a subject of study, since I think it is absurd to separate the study of designing from the practice of design.*

John Chris Jones went further. Having started out by trying to persuade engineers to use ergonomics, he felt he could no longer be Professor of Design and he resigned his position to go and write poetry and other forms of imaginative writing.

Rittel (1972) still attempted to use a systems approach in design but he realised the need for something new and came up with his "Some Principals of the Systems Approach of the Second Generation". This came after he had enunciated his ideas about 'wicked problems', problems that were so complex that they resisted a simple first generation systems treatment. He divided problems into 'tame' and 'wicked' with tame problems capable of being tackled by a 'box-car' line of phases, starting with 'understand the problem'. Rittel (1972) claimed that wicked problems can't start with

understanding because you only understand a wicked problem when you have solved it.

The DMM, in keeping with the zeitgeist of the 1950s and early 60s had attempted to make the process of designing more scientific. By 'scientific', they meant 'like physics'. They did not need to state that they were thinking like physicists; their paradigm of science was physics but a classical physics type world-view (abbreviated to P view) is not appropriate for complex problems such as Rittel's 'wicked' problems. (If you can not understand a wicked problem, you can not imitate a physics type solution) The P view of design is similar to what Papanek (1988) called the rational approach. Attempting to develop "rules, taxonomies, classifications and procedural design systems". He criticised this approach, "such a method leads to reductionism and frequently results in sterility and the sort of high-tech functionalism that disregards human psychic needs at the expense of clarity". The failure of the P view meant that the DMM had to either give up the attempt or modify their P view into something else.

What they did not do was realise that physics is not the only science. Biology is also a science with a different way of looking at the world (abbreviated to the B view).

These two world-views, P and B, differ in many respects. P has forces; B has interactions. P is best for simple systems. Rittel's wicked problems are problems of complexity and biology is the science that has learned how to cope with complexity.

The difference between the two views, P and B, can be illustrated by the different approaches used in the education of engineers and designers. Conventional engineering textbooks have 'problems' requiring the insertion of numbers into equations. Such problems have single correct answers and thinking in terms of such 'problems' leads to the entrenchment of a P view. In contrast, English industrial design students within former art colleges, now parts of larger establishments, have a completely different approach. They have few, if any, textbooks; their problems are presented as projects where every student may come up with a different solution and there are no 'right' answers but many poor ones.

P looks for causes having effects such that when the circumstances are repeated, the same result will be obtained independently of time or place. A carbon atom is seen as being the same as any other carbon atom, light years away or millions of years in the future. This means that the P view is not historical. The solution to an algebraic equation is always the same. In contrast, the B view sees that no two entities are identical with the results

that the future is uncertain and any account of living entities has to take into account their evolutionary past. The solution to a design problem here and now is unlikely to be satisfactory in the future.

As stated by the evolutionary biologist, Ernst Mayr, (1976)

*The goal of the physicist is to establish general laws and to reduce all phenomenon to a minimum number of such laws. General laws, however, play a much smaller role in biology. Just about everything in biology is unique: every animal and plant community, fauna or flora, species or individual. The strategy of research in biology must for this reason be quite different from the strategy of the physicist.*

The idea that a B view could help in making design more scientific almost occurred to two of the above four founders of the DMM. In the 2<sup>nd</sup> edition (1992) of Design Methods which has much additional material, Chris Jones claimed that the breakthrough in design came with the invention of the pencil because this allowed designers to try out many more ideas and discard the bad ones much more quickly. Having a variety of ideas and discarding the bad ones can be seen as a version of survival of the fittest (and extinction of the less fit) but Jones was looking for something that was not 'science' - either B or P. Many years later, he wrote, Jones (2000).

*I'd like to correct a misconception: when in the 1970s I criticised and appeared to leave design research it was not because design methods had become rigid tools that inhibited the imaginative skills of individual designers - it was because I was angry, and still am, at the 'inhumanity' of abstract design language and theories that are not alive to all of us as people, or to actual experience - and which threaten to reduce the reality of life to something less than human.*

Alexander was also clearly aware that design could be described in terms that are clearly consistent with a B view (gradual change within a tradition, leading to adaptation) but he classed such an approach to design as 'unselfconscious design' in contrast to his hoped for 'self-conscious design'. In self conscious culture - "form making is taught academically according to explicit rules". Presumably one aim of design research is to discover these 'rules' so that they can be taught. His mind was so wedded to a P view that even within unselfconscious design, he clearly rejected a Darwinian approach. In *Notes*, Chapter 3 (p 30 - 31), "The Source of Good Fit", he described the Mousgoum hut, built by African tribesmen in the northern

sector of French Cameroon, where everyone built their own hut using knowhow passed on from family and neighbours (including knowledge of mistakes). These huts fit with other huts, reflecting a social order and producing what he calls 'coherence'.

He used 'unselfconscious' to describe the process that produced this fit and claimed that unselfconscious culture passes on by imitation and correction leading to coherence. This may seem to resemble a B view but Alexander rejected what he called 'the myth of architectural Darwinism'. (He also rejected 'the myth of the primitive genius'). In place of Darwinism, Alexander suggested an old idea - "a homeostatic (self-organising) process that consistently produces well-fitting forms, even in the face of change." His source for this idea of a self-organising adaptive system was the American physiologist, W B Cannon. (1932)

Whilst the founders of the DMM modified their aims, the idea of making design more like physics is still very popular. Rittell's 'box cars' have become boxes connected by arrows - going in all directions - to produce those diagrams that litter many of the pages of the management literature.

Alexander's homeostatic alternative to 'architectural Darwinism' has become the search for some kind of order in complexity. A popular account of this search has been given by Stuart Kauffman (1995) who claims

*Maybe principles deeper than DNA and gearboxes underlie biological and technological evolution, principles about the kinds of complex things that can be assembled by a search process and principles about the autocatalytic creation of niches that invite the innovations which in turn create yet further niches."*

Kaufman refers to 'order for free' and suggests that 'Man is expected in the universe', as suggested in his title, *At Home in the Universe*. To me, the principles that are deeper than DNA and gear boxes are the principals of a general theory of Darwinian change in which biology is a special case along with language, gear boxes and many other products of human activity. The attempt to make the study of complex adaptive systems into something like physics will fare no better than the early attempts of the DMM. Complex systems need a B view, as suggested by Charles Darwin (1859).

## **Darwin on Complexity**

Charles Darwin was very aware of biological complexity. In his 1859 *Origin of Species* he referred to

*the infinite complexity of the relations of all organic beings to each other and to their conditions of existence, causing an infinite diversity in structure, constitution and habits.*

When this diversity is subject to competition within a selection system, the result is what Darwin (1859) called, “descent with modification under the influence of natural selection”. (He did NOT use the word ‘evolution’).

*if variations useful to any organic being do occur, assuredly individuals thus characterised will have the best chance of being preserved in the struggle for life and they will tend to produce offspring similarly characterised.” (p 99 1<sup>st</sup> ed.)*

Complex systems have some stability - otherwise they would not be ‘systems’. They also change over time and Charles Darwin had a special insight into the nature of change in biology.

*If it could be demonstrated that any complex organ existed which could not possibly have been formed by numerous successive, slight modifications my theory would absolutely break down. (6<sup>th</sup> edition p137).*

You can’t be much clearer than that. For ‘complex organ’ substitute ‘complex system’ or ‘radical innovation’ and it becomes obvious that Darwinians cannot accept the division of technological change into ‘incremental and radical innovation’, the title of a recent paper by Norman and Verganti (2014).

From a Darwinian perspective, all change in a complex adaptive system has to be incremental. The concept of descent with modification did not originate with Darwin; the descent of modern languages from a few classical languages was studied in the 18<sup>th</sup> century, leading to the idea of a common ancestor in a hypothetical Indo-European language. Also, it was known to animal breeders and horticulturalists centuries before Darwin’s birth and his *Origin* starts with a discussion of pigeon breeding that he called artificial selection. Darwin’s achievement was to provide a mechanism - selection between competing varieties, followed by many more rounds of competition leading to the appearance of design in nature. The same mechanism can be applied outside biology - not by crude analogy but by recognition that this is how complex adaptive systems have to change.

*A neo-Darwinian general theory of change.*

Two additions to Darwin's ideas have been made to produce a modern neo-Darwinian evolutionary biology and a third is needed for a general theory of change in complex systems. First we have to add symbiosis. Darwin's 'tree of life' has branches representing descent from a common ancestor. A single species slowly becomes changed over time and if part of the species becomes separated from the main body, then over time the separate group can become its own new species. Lynn Margulis (1998) has shown that new forms of life can come into being by a combination of existing forms. This is not branching; this is symbiosis of two different life forms to produce a new form. The concept of a species as an isolated breeding group is not required for asexual reproduction. Life evolved on earth for about a billion years before sex arrived. This means that technological change can be discussed without the need for a 'species'. Much innovation stems from symbiosis, the joining of one part of technology with some other part, described by philosopher Daniel Dennett (1995) as 'designed elsewhere' meaning that two separate streams of design can be joined together.

The second component of neo-Darwinian theory is genetics. Darwin knew that descent required a something that was passed on but genes were not discovered until after his death. He did suggest that things called gemules were passed on but this idea turned out to be erroneous. Darwin occasionally used the word 'genetic' but this was in its original sense of an adjective derived from genesis, meaning passed on at birth or innate but with no knowledge of just what was being passed on.

A neo-Darwinian general theory for use outside biology needs to specify the nature of 'passing on'. Technology does not have genes but it does have what Richard Dawkins calls imperfect replicators. Replicators are passed on. They are 'imperfect' in the sense of being subject to change, producing 'descent with modification'. Dawkins (1976) provided a name for the imperfect replicator in cultural evolution, his word, 'meme' (pronounced to rhyme with cream) has now entered the Oxford English Dictionary (OED) and given birth to memetics, the study of memes.

At first, it seemed that memetics would provide an interesting way of studying technological change but this did not happen. A new electronic journal, *The Journal of Memetics*, eventually ceased publication and interest declined. The main reason for this lack of growth was the adoption of a P view by people attempting to apply memetics. Like the founders of the DMM, they did not realise that change in complex systems needs a B view.

They saw memes as units with one method of transmission, imitation. They tended to see a simple cause and effect with memes producing ‘infection’ of our brains until resistance was acquired. Typical of this approach was Susan Blackmore’s (1999) *The Meme Machine* in which imitation is stressed even though the author is unable to define the term other than saying ‘the meaning of the word meme is that which is imitated’ The OED definition also reflects this P approach, “meme: An element of a culture that may be considered to be passed on by non-genetic means, esp. imitation.” Blackmore includes scientific theories as an example of memes but how do you ‘imitate’ a theory of gravity? She describes humans as ‘copying machinery’ for memes and claims ‘there is an evolutionary arms race between us and the memes that we find ourselves copying’. This concept is an example of what philosopher Daniel Dennett (1995) has called ‘memes versus us’, a concept that Dennett demolishes, pointing out that the nature of ‘us’ has itself been formed by memes.

In contrast, a B view of memetics looks for different kinds of memes that are not ‘units’; they are patterns having different methods of transmission and having different kinds of results. Such a B view has been described elsewhere, (Langrish 1999), involving memes as patterns of thought and three kinds of memes, recipemes (how to do things), selectemes (what sort of things you want to do, notions of ‘betterness’ and desirability) and explanemes that explain how recipes produce their results, ranging from scientific theories to ancient myths and needing a language for their reproduction. Newton’s law of gravity is an explaneme. It is passed on using maths and words. It is not imitated. Further discussion of the role of explanemes is outside the scope of this present paper but see Langrish 1999.

Dawkins has now accepted the idea of memes as patterns. In a revised edition of *The Selfish Gene* (1989) he states,

*If memes in brains are analogous to genes they must be self-replicating brain structures, actual patterns of neuronal wiring-up that reconstitute themselves in one brain after another. I had always felt uneasy spelling this out aloud, because we know far less about brains than about genes, and are therefore necessarily vague about what such a brain structure might actually be. So I was relieved to receive recently a very interesting paper by Juan Delius of the University of Konstanz ... publishing a detailed picture of what the neuronal hardware of a meme might look like. (1989 p 323.)*

Although, Dawkins has now recognized the importance of patterns, he is still inclined to think in terms of units. Memetic patterns are not 'hardware'; they are temporary circuits formed by interactions between neurons.

Human brains have a remarkable mechanism for responding to the masses of incoming sensory data that they perceive. When faced with another human being, the brain turns incoming data into a 'pattern'. Attempts to develop computer systems capable of recognizing people have not been able to match the human ability to recognize familiar people through a glimpse of part of their face, the way they walk, the sound of their voices etc.

When a brain recognizes the pattern of something in its environment, it triggers a response from selecteme circuits that can signal danger, desirability, 'could be useful' etc. These in turn trigger recipeme circuits that initiate action. If a potential prey recognizes the pattern of a predator, it flees. If it senses a source of food, it turns towards it. This combined action of selectemes and recipemes can be called 'purposive pattern recognition' or PPR for short. The recognition of patterns can convey what to do next; it is purposive and PPR can be used to describe how experienced designers make decisions as discussed below.

One major criticism of memetics was made by Jack Cohen, the biologist and science writer. He said to me, "Memes, OK but what can you do with them? What use are they?" To answer that question, two examples are given below, one is an account of research into how designers make visual choices and the other shows how company strategy can be biological rather than attempting to imitate physics.

## **4. Examples**

### **Visual choice: a study of how designers make decisions.**

The individual designer is more than just a maker of accidents. Changes in recipemes are not just random mutations; they have intentionality, situated as selecteme circuits in the brain. But the intentions have to fit into the changing complexity of everything else. Today's sensible decision can be tomorrow's disaster but designers have to make a living by making decisions.

Maria Abu-Risha (1999) observed and talked to designers at work, asking them question like 'why did you choose this particular picture to go on the cover of the brochure?' The answers were of the form, 'Well, it felt right' or 'its intuitive' or "I just knew". At the same time, the designers

were very well informed about their clients' preferences, the state of the market, what other designers were producing and so on. These ideas are not worked out like a physics equation; they form a 'pattern' in the mind, what Maria Abu-Risha called a 'pattern of need'. This can be seen as a pattern of selectemes. (Langrish, J. & Abu-Risha, M. 2008)

At the same time, decision makers have other ideas, concerning things that are possible, ideas about how to do things - recipemes. These form a pattern of possibilities, compared with the pattern of need until there is a 'click' - a fit between the selectemes and the recipemes. We called this 'click' Purposive Pattern Recognition, PPR. It is purposive because once the 'click' has been obtained, the decision maker knows what to do next.

The interviews with designers were recorded and transcribed. Typical answers to questions about visual sources and methods of selection included:

- It's all quite intuitive really. It's difficult to describe. You're thinking about the brief and about a particular design.
- Instinct; you know when something is the right sort. There is no formula to it and they will always be very different.
- Don't know; it's not specifically scientific. It's purely intuitive. You just have your own ideas that you think are right. I don't think I ever get scientific about it. It is just that.

The research included some mini case studies with opportunities for discussion. One respondent said,

*talking to the record market. Talking to the client. And we know a lot of music business. If you were talking to a packaging designer he would know about food and he would know supermarket shelves. We know music; we know what looks good. We know what audiences expect. So we get all our information. It is intuitive and its knowledge that we hold already. ... There was no research commissioned. It was entirely intuitive.*

The most frequently used word was 'intuitive' followed by instinct, innate and subconscious.

Neuroscience has shown that brains can make decisions before the conscious mind is aware of what is happening in the brain. Chris Frith (2007) puts it this way,

*“We think we are making a choice when, in fact, our brain has already made the choice. Our experience of making a choice at that moment is therefore an illusion.” (p 67).*

This statement seems to match the experience of practicing designers. However, It does not stop there with one decision. In a Darwinian system, there is further selection and iteration leading to changes in the design.

Some responses from the designers in the study were,

*You might choose more than one. It is a matter of trial and elimination. You might pick a particular one and dismiss the others because it matches the brief. It becomes objective too because you have a team of creative people and then you have a marketing team and they agree which one fits the brief better.*

- Quite often, design is as much discarding as it is coming up with new ideas.
- To me, the important thing about being a designer is to evolve, to test and retest. The minute you stop searching you die.

These quotations illustrate how design is much more than getting THE idea. Sometimes, modification takes place within an environment of competition. Different recipes can compete in an environment of selectemes within one head or between different people. Ideas (ie memes) interact, compete, change and perhaps ‘evolve’. Design evolution has been the subject of a previous paper (Langrish, 2004)

### **Darwinian New Product Strategy**

The previous section showed how memetics can illuminate the design process. This section provides some examples of how companies can use a Darwinian strategy.

In the second half of the 19<sup>th</sup> century, the German synthetic dyes industry realised that the new techniques of synthetic chemistry provided the opportunity to make thousands of brand new chemicals that were different from the existing dyes extracted from material known for

hundreds of years. Their problem was that science could not predict which of these new substances would have the properties required of a dye - colour, light and wash fastness, ease of use, low cost etc. So they hit on a highly organized system of trial and rejection. Teams of synthetic chemists recruited from German universities were set to work making new compounds. These were numbered and passed on to another department, the Dyehouse, where they were subjected to a series of tests. The production of new dyes was institutionalized in the research department and dyes were housed in the Dyehouse.

At first, it was possible to find new dyes that were better in some respect than natural dyes but after that, any new dye had to have some advantage over the existing synthetic dyes. By the end of the century, it was estimated that some 10,000 new compounds had to be prepared to obtain one new commercially successful dye but the profits from that one could pay the costs of producing all the others. In many areas of investment, this is known as the portfolio strategy; when you cannot predict the future, then don't put all your eggs in one basket. It can also be described as a Darwinian strategy. Have as many varieties as possible and then subject them to competition within a selection system, followed by improvements and further rounds of selection. The Dyestuffs industry gave birth to the pharmaceutical industry, still using the Darwinian technique of making lots of compounds and subjecting them to rigorous testing with the hope that one will generate large profits, a process that becomes more difficult with time.

There are many examples of the use of a Darwinian strategy in new product policy. Two more examples will suffice, IKEA and Waddingtons. IKEA was founded by Ingvar Kamprad, who stayed in charge until he was 87 in 2013 to be replaced by his youngest son Mathias. IKEA has around 12,000 products sold world-wide through its 300 plus stores and its website. Its new products are controlled from Sweden where IKEA selects from products that are offered to it. A small number of offerings are purchased along with all future rights to develop the concept. The potential new products are altered in house by IKEA's designers and turned into a form that fits the IKEA systems of manufacture, distribution, sale and style. They are then subjected to further selection with the final choice, until recently, resting with Kamprad himself. The original supplier does not know that their design has been used until it appears in a store - or not.

Between 1922 and 1994, when it was bought by Hasbro, Waddingtons was a successful UK publisher of card and board games. Originally a printing company that specialized in playing cards, its acquisition of the Monopoly

board game in 1934 helped it to become what was perhaps Europe's leading game manufacturer, producing a stream of successful board games including Cluedo, Custer's Last Stand, Formula 1, Buccaneer, and Totopoly. These games emerged from a Darwinian process. Waddington's were bombarded with ideas for new games from enthusiasts who thought they had developed a brilliant new game. A very small number of these game concepts were selected for further consideration by experienced staff who modified them to fit their own selectemes. Most ideas were still rejected but a few survived to move into the next phase of box design, production method and so on, resulting in nearly one new game per year in time for Christmas. (Ibrahim 1997)

When there is no P type way of predicting market success for a new product, then a Darwinian approach can be successful. Modified recipemes compete in a selecteme environment within the brain of one person, within an organization or in the wider market - but there is no guarantee of success. In the examples given above, large numbers of recipemes were involved. Success was down to having a good selecteme system. This means that creativity is not the most important aspect of innovation; getting the best selectemes is the way to success. However, there is no P route to finding the selectemes; they also undergo Darwinian change.

## **Implications for design management**

The best strategy for an uncertain future is a Darwinian one with a variety of solutions to design problems being tested, followed by iteration - that is further varieties of promising solutions being selected, tested and developed.

In the past, waves of new technology have arrived to end eras of negative disruption. Hopefully, the arrival of some new technology will help solve the present disruption. It might be helpful to have someone in an organization responsible for keeping a lookout on the technological horizon. New materials such as graphene might offer opportunities. We now have a new version of genetic engineering - synthetic biology - and The J Craig Venter Institute is collaborating with the oil and pharmaceutical industries to create microorganisms that will produce new fuels, drugs and vaccines. The possibility of collaboration between scientists and designers has been explored (Ginsberg et al. 2014)

A Darwinian view suggests that selectemes are more important than new recipemes. There are always many new recipemes available. Most

patents are never used. Good designers are alert to the arrival of new selectemes such as sustainability. This has implications for the education of designers. Creativity, of course, will always be important but young designers need to be exposed to concepts of what makes one design better than other ie thinking about selectemes and how they change could be more important than developing new recipemes.

People will continue to try and imitate physics to strive for success in the future but this can not work because we have no way of knowing what we should be striving for - that does not stop us trying of course - you can not win a lottery if you do not enter but just for the record, I have never purchased a ticket in the UK's National Lottery.

# Community Based Business Design Model

Pia TAMMINEN\*

Aalto University School of Science

*This working paper introduces development of a business design model for a design-oriented community. The model combines the design expertise of small companies and societies, and transforms the ideas into a concept of unique customer experiences in a profitable way. This paper gives an answer to the following question: what constitutes a community based business design modelling? This is mainly a deductive case study. Data are gathered in workshops and semi-structured interviews. Preliminary findings indicate that the current business design model needs to be modified to be functional for a community consisting of mainly small companies and societies. The goal of this paper is to propose a community based business design model that could be used for any project organized in a collaborative mode by small organizations. The research sheds light to the potential of a design-oriented community, and points out possibilities for further research.*

**Keywords:** business design model, community, design management

## **Introduction**

When an innovative project starts, the normal scenario is that people from cross-functional teams of a company are combined to create a new, awesome solution faster and cheaper than ever before, but what happens when a network of cross-functional and skilful people from several companies and societies aggregate their forces to reach a common target? This paper provides insights into a process of creating a common business design model and a collaboration management blue print for mainly small companies and societies located in a design-oriented Fiskars village in Southern Finland. The rationale behind business design model is the need to increase the amount of visitors in the village which has a 365 years old history of attracting craftsmen, designers and artists into the region. The starting point for the collaboration is a common value base and a positive drive to increase the revenue of the companies and societies in the village, and contribute to the well-being of the region. A universal threat of commoditization, shrink of margins on standardized standalone products, and a notion that good enough products and services gain popularity over premium quality customized products and services is also a threat in Fiskars village, but could it be turned into a sustainable opportunity for a community through collaboration and agreed target setting?

Design can be seen as a creative management process that integrates organization processes such as idea management, innovation management, and research and development management (Borja de Mozota, 2003). It also modifies the traditional structure of process management in a company (ibid.), or a company network. Importance of great designs has been recognized long time ago, but Roger Martin (2004, 2009) pointed out its relevance by introducing design thinking as a method for companies to create a competitive advantage. The goal of the thinking is to create value for all stakeholders, including human users, the environment and the company (Johansson, 2010). Design thinking uses designers' sensibility and methods to match people's needs in a feasible way by taking into account the capabilities of company business strategies to convert the solution into customer value and market opportunity (Brown, 2008). Heather Fraser (2009) presented a business design model based on similar methods and mind-sets as in design thinking. The business design model maximizes the impact of corporate outcome with the help of creative thinking, the second nature of good designers. In this paper, Fraser's business design model is used in a design-oriented community consisting of mainly small companies, societies and experts instead of a big corporation. The purpose of this study

is twofold; first to enhance Fraser's business design model by piloting it in a multi-party network, and second to point out emerging topics for further research within a design-oriented community. Research has been done in design-inspired innovation (e.g. Verganti, 2006, 2008, 2011; Berends et al., 2011), and in customer involvement in product or service development (e.g. Mugge et al., 2009, Franke et al., 2010; Möller et al., 2008) but not much is known about the potential, strengths and benefits when a business design model is created and implemented for a design oriented community by the members of the community.

Design is defined in this paper as 'the optimum solution to the sum of the true needs of a particular set of circumstances' (Matchett, 1968). Design orientation is defined in this paper as a characteristic reflected in an organization culture that distinguishes it from the other, non-design-oriented organizations, and reinforces the capabilities of design-oriented organizations to generate competitive advantage from the other organizations by a design-oriented behaviour (Calabretta et al, 2008).

### *Business Design*

As consumerism becomes more compassionate and societal transformation entails new challenges to designers on a daily basis, swift responsiveness and future foresight are required in thinking and practice (Hands, 2009). Design can maximize the impact on corporate outcomes by being a path to understand stakeholder needs, a tool to visualize new solutions, and a process of translating innovative ideas into effective strategies (Fraser, 2009). The importance of design mix, i.e. blend of performance, quality, durability, appearance and cost, was acknowledged already in 1984 (Kotler and Roth, 1984). Design thinking is a human-centred, prototype-driven process that explores new ideas which can be applied in various ways, e.g. to operations, products, services, strategies and management (Serrat, 2010). Business design is a symbiotic model that delivers both market and experience value. Fraser's business design model (2006, 2007, 2009) is presented in Figure 1.

Figure 1. Three gears of design. Source: Heather Fraser, *Turning Design Thinking into Design Doing*, *Rotman Magazine*, Spring/summer 2006, pp. 24 – 28.

The model is an iterative process based on the needs of a user or ultimate customer target (Fraser, 2007). User understanding in *gear 1* means reframing the business through the eyes of a user or a critical stakeholder. The activities aim to look beyond the obvious solutions with an empathetic approach taking into account circumstances, needs and feelings of a user. It is vital to think beyond obvious and be willing to take risks to invent a radically new solution or unmet needs. Reframing of a challenge and defining of innovation criteria can open up new opportunities for value creation. *Gear 2* is about the visualization of a concept. Ideation process, the following prototyping and user evaluation by cross-functional teams are iterative activities. The purpose is to see the concept through each individual's base of functional expertise and experience, and define a user-driven solution. In *gear 3* the strategic concepts are iteratively aligned with the future realities. This can require reprioritization of activities, new definitions for strategic, operational and economical relationships, and determination of the net impact of the new model. The deliverables of the third phase are a business design model, and identification and design of interrelated activities. The end result of the whole process is a net commercial gain and a sustainable competitive advantage.

A designers' mind-set is an essential part when creating a business design model. Open-minded collaboration, abductive thinking with 'leaps of faith' and an ability to explore new solutions with persistency are needed when modelling a new business design.

## Research methodology

Two different research approaches are used in the study: deductive thinking is applied to modify Fraser's business design model to fit for communities (2006, 2007, 2009). Abductive thinking is applied when conducting the workshops with an ultimate goal of increasing the amount of visitors, and revenue of the companies and societies in Fiskars village. Action research was chosen to be the way to gather information in the workshops in a democratic way (Stringer, 2007). Action research included the use of design thinking and general project management to reach a conclusion within the set timeframes. The use of several methodologies fit with the abductive, yet exploratory nature of the research and enables gaining of insights in the case (Eisenhardt, 1989; Yin 2009). Author of this article is one of the managers of the development work and a facilitator of the workshops and meetings.

### *Research Methods*

Multiple data collection methods such as conduction of workshops, meetings and interviews, open discussions before the sessions, analysis of taken field notes, and review of web sites and brochures of companies and societies of the village strengthen grounding of theory by triangulation of evidence (Eisenhardt, 1989). Eight workshops, each lasting two hours, were conducted, and the number of workshop participants varied between seven and eleven. Majority of the participants had some level of design education, and all of them had been exposed to design and design processes at their work. A divergent approach was used in the three first workshops to collect ideas, visions, strengths, opportunities and needs related to the development of Fiskars village. A more convergent approach was used in the rest of the workshops to integrate and refine the thoughts into a concrete step by step plan for the future. However, creative and fruitful ideation and discussion continued throughout the workshops. Analysis of the process, discussions and outcome of each workshop was done right after the session as well as the preparation work for the next one. The workshops were effective; a common vision for the year 2020, a list of values, strengths and factors that can support the increase of visitors and revenue in the village, the first version of a common business design model, and a blue print for managing common projects and events in the village were the deliverables.

Nine semi-structured interviews were conducted to investigate participants' perception of the workshops and the collaboration between the companies and societies in the village. Interviews were transcribed word

by word for further analysis. Each interviewee had a chance to read this paper in order to verify the facts and rightness of the text.

### *Selection of Companies, Societies and Experts*

Fiskars village is an interesting subject for a case study thanks to its long tradition of manufacturing, craftsmanship, art and design which would have died without persistent pursuit for development, sustainability and self-sufficiency (Fiskars, history of the village, 2014; Fiskars' village society, 2014). Design is a legacy in the village so design thinking is a natural way of working in the local companies and societies. A purposeful sampling with representatives from all relevant parties of Fiskars village is the selection criteria for the organizations of study; all companies, societies and experts participating in the study are tightly linked with the village. The other factors considered in the selection are: 1) ability to use design thinking in daily operations since it is the basic process used in business design (Fraser, 2006), 2) demonstrated ability to collaborate with other companies and people in the village since a collaboration friendly climate speeds up decision-making, produces more creative ideas, and results in less error-prone solutions (Swink, 2000), 3) participants' constructive and positive attitude towards development of an own company or a society and the whole village since people are more creative and experimental in a positive atmosphere (Cameron, 2008).

## **Preliminary analysis**

Data collected during workshops, meetings and discussions is rich in detail, and the work is still on-going. Below presented analysis are based on the outcomes of the workshops and the discussions of the interviews.

### *Business Design Model*

Design thinking and business skills were converging in the workshops through creative thinking, practical examples and experience. To understand the current status and the ambitions of the participants, three questions were tackled in the first three workshops:

- 1. How is Fiskars village in 2020?
- 2. What knowledge, skills, experiences and passions would I like to share in Fiskars village?
- 3. What would I like to get from Fiskars village?

A need for a common business design model emerged already in the second workshop, but the decision to start with concrete activities was made in the third workshop in order to promote the uniqueness, strengths and potential opportunities of the village without forgetting the common vision. A business canvas of Osterwalder and Pigneur (2009) was used as a tool to map value propositions, customer segments, channels, customer relationships, revenue streams, key resources, key activities, key partners and cost structure of a concept, Christmas 2014, that was chosen to be the pilot for the model. A story line, a preliminary blue print of the collaboration management and a high level project plan were developed while filling in the business model canvas. Christmas event was a logical and timely choice for the model since majority of the companies, societies and people living the village are working in the event, either for profit - or non-profit -making purposes.

Based on the experiences of organizing Christmas events in the earlier years, the engagement of people to the common storyline and finding the common look and feel for the event were seen as the most difficult yet the most important activities. Recruitment of an additional person, a Christmas event coordinator, was also seen as a key enabler for a successful event. Discussion about the funding and further collaboration between companies and societies is currently on-going.

The workshops were facilitated by two researchers who were seen as a neutral yet trustworthy and down-to-earth party. The atmosphere of the workshops was creative and open. Discussions were dynamic, and the participants perceived the way of thinking refreshing and welcome as one of the interviewees stated:

*We had to think about matters we do not normally think even though the topics that came up are all so true.*

Population of Osterwalder and Pigneur's business model canvas (2009) could be seen as a collective sense making activity (Stigliani and Ravasi 2012); workshop participants interpreted their own company data focusing mainly on prospective Christmas 2014 event. Fine-tuning of the business model canvas continued in each workshop as all finished business model topics were reviewed briefly in the beginning of the new session. Strategic discussions, including the strengthening of village brand, are on-going. Piloting of the new business model will be start in December 2014. The model and the supporting plans will be updated and fine-tuned after the pilot.

The overall focus of the workshops was to create a roadmap and define the first activities of the development venture to improve the financial status of the companies and societies, hence create an offering that attracts visitors to Fiskars village throughout the year, and increase the quality of life for the people living in the village. The following approaches, which are in line with and complement Fraser's business design model (2006) emerged in the workshops and interviews.

### *Different perspectives to user understanding*

As the storyline for Christmas 2014 event iteratively progressed, it became evident that the customers ask for a holistic experience when visiting Fiskars village; as one of the owners of a small company stated:

*When a customer comes here, she does not think of which companies' shop floor she is standing on but she is experiencing Fiskars village.*

Creation, integration and management of products and services as a consistent customer experience labelled by the village brand is challenging. One of the insights of the interviews was that the designers have different design approaches which can be combined when creating a new product or service. Expert designers are solution-focused (Cross, 2004) and open for new ideas, so the approaches are not in conflict with each other although the designers can work for the same company, the same designer can even vary between approaches depending on the situation. The different design – driven practices companies and societies of the village have, are presented below.

### **User-centred design**

User –centred design implies that product and service development starts from a profound understanding of the user needs. (e.g. Norman and Draper, 1986; Veryzer and Borja de Mozota, 2005; Redström, 2006). 'Good design touches your heart, and when it touches your heart, design and desire become one' (Waters, 2008). Judgment of values in design is difficult (Lawson, 2005), a feature of a product or service might be a 'must have' to somebody whereas another person could not care less of the same feature. One of the interviewees, managing director of a furniture company, described their user –centred design approach as a dialogue and a long lasting project where the development is done with the customer using concrete samples of the furniture, and iteratively ending up with a right set of furniture for example for a hotel.

### **Design-driven innovation**

Design –driven innovation is a radical innovation of products' meanings and languages for customers (Verganti, 2008). Companies, designers and end –users are immersed in fast changing markets and sociocultural context which shape their understanding of the meanings (Gero and Kannengiesse, 2004). Companies and their customers actually face a diffusion of meanings and creation of a common symbolic content in products, services and their combinations can be challenging. So the customers do not always know what they want. Design –driven companies have a capability to propose innovations that redefine product's meaning for a customer (Verganti, 2008).

Companies in Fiskars are actively looking for new ideas, resources and opportunities. An unpredictable interaction can happen for example in an international exhibition and trigger a start for a new development project. A master goldsmith, who uses 3D modelling in his work, summarised his approach to design in a following way:

*I combine high end craftsmanship, design and high tech, and make things nobody else has been able to make before.*

### **Functional and symbolic designs**

Functional design contributes to survival and growth of the company (Borja de Mozota, 1998, 2003). The purpose of functional design is to build a competitive advantage by focusing on the impact of design on the company and its coordination methods, i.e. the relations in the value chain (ibid). Symbolic design gives a deeper meaning to an artefact; it is more than a function or beauty (Verganti, 2008). Symbolic design, guided by aesthetic and emotional values, appears to be more chaotic since it is created and developed by creative and passionate people like artists and designers.

People perceive aesthetics and symbolic meanings of the artefacts differently, but an understanding of unarticulated customer needs is behind many successful products and services such as iPods, navigators and search engines in the Internet. Fiskars village had a burning need for Christmas lights in December 2013. The need was satisfied quite fast functionally by setting up a chain of lights besides the main road of the village. However, after a while the people agreed that the lights did not fit in with the 'design language' of the village, the lights resembled tooth brushes. Another example, an ice cream kiosk was also discussed in the workshops. The kiosk was installed in the open market place of the village and the need to get ice

cream was satisfied. However, the kiosk reminded of a refrigerator, and a requirement for a more aesthetic solutions emerged.

Several interviewees confirmed that it is not profitable to participate in a competition, especially if there are several parties involved in creating the artefact; the expenses and the time spend agreeing on how an artefact should look like and be presented cannot be justified in monetary terms. But the companies and artists still do it, since being visible in certain contexts is important; it strengthens the virtue of the companies and gives meaning to the work.

### *Collaboration and physical closeness*

Chesbrough's (2003) notion 'Not all the smart people work for us' describes the situation many companies face today. Companies collaborate because they lack internal resources, knowledge and skills that another company can provide. Collaboration is feasible for the companies since they do not have to take additional risks by for example investing in resources that are not their core business (Powell et al., 1996).

Many studies have proven that closeness of functional areas, or other companies responsible of a function, is essential in successful businesses (e.g. Liker et al., 1999; Bruce and Morris, 1998). Accessibility of buildings and the host of common areas facilitate cross-fertilized innovation (e.g. Dougherty, 1990; Donnellon, 1993; Calabretta et al., 2008). Physical proximity enables the use of non-verbal aspects in collaboration and the ability to point to, and act upon, artefacts in a shared context (Sirkin, 2011). Proximity can also increase familiarity with business processes and cultures, it enable face-to-face interaction, and contributes to building trust (Calabretta et al., 2008). There is an increasing need for design expertise in a range of different sources due to complexity of products, use of technology in the design process, availability of design expertise in service organizations and companies' tendency to utilize a network of suppliers to carry out value-added functions (Bruce and Morris, 1998).

When companies and societies of Fiskars village need another company to perform an activity they cannot do themselves, the primary source for a collaboration partner is the village. The companies contact stakeholders and companies outside of the village only if appropriate resources or tools are not available locally at the needed time. The demand for a consistent customer experience requires small companies to work closely together since none of them can fulfil the requirements alone. Common goals have

impacted the local way of thinking as a craftsman having worked in the village for 23 years stated:

*Collaboration... for me it is such a dim area that I cannot even say what collaboration is and what is some other type of work.*

Working culture, reliability of the local companies and experts, and the high quality of work are unwritten but very clear rules of the community. The collaboration in Fiskars village starts usually with a spontaneous yet creative discussion. The dialogue is conducted often in an informal place like an aisle of a grocery store or by the main road that runs across the village. When parties have a common goal but different needs, skills and tools, the synergy is noticed quite easily. There would probably be even more collaboration between different parties if the people knew what the others were capable of doing at certain time span, and which tools and a work space they had to reach the common target. A need for 'a dynamic knowledge bank' was identified both in the workshops and interviews.

### *Values of the Community*

Communities can usually be characterized by a common connection between all members, e.g. geographically, or they can share a common interest or occupation (e.g. McAlexander et al., 2002). There are three core components that define a community; consciousness of kind (e.g. Weber, 1978), shared rituals and traditions (e.g. Douglas and Ishwerwood 1980), and the sense of moral responsibility (e.g. Muniz and O'Guinn, 2001). Exchange has always been part of the community (e.g. Chen and O'Mahony, 2009). Calabretta et al. (2008) talks about a clan culture which emphasises shared values and goals, cohesion, participativeness and teamwork.

A person who has never visited the village has difficulties understanding the strong values that act as a powerful glue between companies, societies and inhabitants of Fiskars village. Design-oriented companies, artisans, artists and designers have been attracted to Fiskars village for years, and it is important that the products and services offered in the village are locally made. The values are very personal since people not only work but also live in the village. Building of 'we-ness' emerged in the workshops for example as a need to create a strong Fiskars village brand. 'Locally made' is a value that clearly points out the appreciation for local manufacturing as well as for high quality and trust of the local craftsmanship. Companies selling goods or services not originating from the village are not fully recognized as being part of the community.

Certain events, like art exhibitions (Summer exhibition of Fiskars village, 2014), organized every summer, are already traditional happenings, and there are plenty of visitors in the village at those times. The aim is to create a similar tradition of the Christmas 2014 event. Many people in the village have years of experience organizing successful events but the experience seems to be tacit knowledge. How well can a common story line of Christmas 2014 event with the governance model be developed and documented so that it would generate a methodology and mode of operation while also capturing the silent wisdom of the local people?

Moral responsibility to help others and work together is so natural way of life in the village that the natives do not even notice it. Bee, a communal work, is also a common way to help the neighbours.

*There are often times so many bees on-going that we do not have any people left to do anything else.*

The development work has often a monetary aspect; hence the conflict of interests, for example functional versus symbolic design, becomes more significant. If quantitative and qualitative factors are evaluated in the same cost-analysis activity, all factors are measured using only one dimension of the problem (Lawson, 2005) which is quite often the monetary. Monetary value is not the only driving force of the activities in Fiskars village. For example, a comment stated in one of the workshops describes the difficulty of prizing own work as a craftsman:

*It is difficult to put a price tag to my own work since I cannot afford to buy my own products.*

Creativity, entrepreneurship and interdisciplinary higher education pass the short term monetary values especially when pursuing for a better life and business development in the village. The vision of Fiskars village is to offer world class education in craftsmanship, design and art, and the business design model created in the workshops is one of the steps to reach the target.

## **Preliminary findings**

Fraser (2009) points out that the ambition of business design is to make a meaningful impact in the customer's life both functionally and emotionally. Creative design solutions tend to arise especially when there is

a conflict between designer's own commitment and high-level problem goals, i.e. symbolic design, and the criteria for an acceptable solution set by the customer or other requirements, i.e. more functional design (Cross, 2004).

Characteristics of people who participate in a design process as well as the conditions and context where the process is conducted impact the end result. Iterative nature of the model is very important in the community based model. A community of independent yet open and constructive – minded resources functions in a different way from a corporation so the business design model would need some modifications. Based on the preliminary analysis, a modified model is proposed for communities (figure 2).

### *Holistic user understanding*

Understanding of a user or a critical stakeholder means different attributes to different companies depending on their core businesses; a café owner sees a customer with different eyes from a goldsmith so a holistic user understanding is needed in a community context. As customers do not always know what they want, companies can make proposals to them. Seeing beyond the obvious indicates that the holistic user understanding has to go beyond physical and material artefacts to a more abstract level, a world containing people's mind-sets (Love, 2000), knowing what customers want before they realize it themselves.

### *Collaboration*

Building upon several perspectives of the user understanding, the concept has also many aspects and its visualization needs close collaboration of all relevant parties. It is noteworthy that the collaboration practices can vary between parties more than in a corporate context that has defined processes as well as communication and governance models in place so the collaboration is an essential factor in business design model. Collaboration is easier and more effective if the parties are located in the same region since physical presence is essential when creative and agile work is done with timely results.

### *Values*

Values are the foundation for the collaboration. Certain values, such as trust, act as glue between the parties, especially when there are risks related to schedule, money or quality involved in the collaboration. There is

a positive correlation between trust and cooperation (e.g. Glaeser et al., 2000; Gächter et al. 2004).

## Discussion

A pragmatic approach was taken when conducting the workshops; the same group of people participated in the workshop throughout the development process although there is a potential error since the divergent and convergent phases of the workshops require different types of behaviour and skills (Berendset al., 2010; Cross, 2000; Van de Ven, 1999). The aim of the workshops was not to substantiate a preconceived position (Yin, 2009) since the outcome of the workshops was not known in the beginning so the study is not biased from that perspective.

Value is regarded as a characteristic of how users perceive a product with its features (Childs, 2006) or a service with its functionalities. When the driving force for work lays in the common values, e.g. appreciation of sustainable design, the values impact also the acquisition of needed resources, and the values should be reflected in the nature of the end result. Quality, by contrast, is a characteristic of the product or service itself (ibid.). Therefore is not enough to offer a high quality product or service to a customer. To ensure an unforgettable experience, companies need to create a positive memory trail for a customer and also make sure it does not fade away easily. Environmental conditions moderate communities' abilities to

pursue a differentiated strategy (Chen and O'Mahony, 2009), so what is the value of design in Fiskars village as it is imprinted in its people, buildings, ambiance, products and services? Honest euro for an honest per day work, 'a perfect customer experience' or something else?

Cross-functional work can also be paradoxical in a design-oriented community despite common values and together agreed targets. The preliminary results indicate that there are constant 'battles' between e.g. good enough and high quality designs as well as symbolic and functional design. But maybe the best solutions breed in paradoxes; a creative person recognises an opportunity, seizes it, captures its economic value and makes it a successful product or service (Jevnaker, 2005).

## Conclusion

Good design, successful new products and services do not just happen by chance or by simply investing in design but it is a result of a managed process (Mascarenhas, 2004; Chiva and Alegre, 2009). Decision making routines of design collaboration should keep everyone and everything integrated, and tools enrich dynamic, continuous, iterative and informative design processes that ensure integrity of both informational and physical fluxes (Borja de Mozota, 2003).

The preliminary results indicate that it is not enough that each small company and society has a good understanding of the customer needs, if they want to offer competitive products and services to their customers. Instead, a network of small organizations can create an advantage by proactive and collaborative approach that creates together agreed products, services and experiences that are more attractive than any of the small companies could offer alone. A holistic understanding of user needs and desires from multiple perspectives, active collaboration of all involved parties and respect of common values should be added to Fraser's business design model (2006) when it is applied by communities consisting of many small organizations. By effective collaboration and values, such as trust, a community can introduce new products and services to the customers who did not even know such offerings existed, and that way create a new business opportunity.

Although small companies need to focus on short-term results due to resource constraints (Bradford and Childe, 2002), a network of small companies can still concentrate on their core businesses and aim for long-term goals if there is a synergy between the companies, and the

collaboration is managed appropriately. A well-functioning network or a community is 'a system' that allows people to be creative but at the same time respect the values and strategic norms of the network. Collaboration is dependent on people, their personalities, knowledge, skills and interests. The collaboration has to be managed in a way that does not hinder the core activities and businesses of small companies and societies. Values act as 'glue' in a community; they bond the community members together, create a common working culture and promote well-being. Unless the importance of design and its impact to business performance are understood well and stated e.g. in the company strategy, the feasible collaboration of designers, companies and societies could be lost as the involved people change. The greatest ideas can be initiated anywhere, whether the people meet in a store aisle or in an evening party. An essential factor is the physical presence and spontaneity of the creative people.

**Acknowledgements:** *I would like to express my great appreciation to the companies and societies of Fiskars village for the workshops and interviews, and the resultant information concerning the development of the community based business design model. In addition, I would like to thank the anonymous reviewers of the DMI research conference for their insightful and constructive feedback that strengthens the scientific approach and enables the publication of this paper.*

# Designers and Environmentally Sustainable Design in a Business Network: a case study on the development of a passenger ship

Pekka MURTO<sup>\*a</sup> and Oscar PERSON

Aalto University School of Art, Design and Architecture

*Designers are often seen to hold a central role in improving the environmental impact of products in literature on sustainable design. Yet, there is limited research on the practical possibilities for designers to cater to such a role. The role of designers is particularly poorly understood in the context of product development where activities, actors and resources are distributed across multiple companies and suppliers in a network. In this paper, we address this gap in research through a case study on the work of designers in a networked development project for a passenger ship where significant environmental improvements were made. The results of the study problematize the role of designers in environmentally sustainable design. Designers addressed sustainability in the early phases of the project. However, from the perspective of design, the work in the early phases came to have limited influence on how the environmental improvements of the ship were realised in the later phases of the project. Based on our results, we discuss what impact designers potentially can have on sustainability improvements in networked development projects.*

**Keywords:** *Environmentally sustainable design; business networks; collaborative product development*

## **Introduction**

The work of designers – whether they are industrial, interior or product designers – is seen as central in determining the environmental sustainability of products and systems in literature on sustainable design (Lewis, Gertsakis, Grant, Morelli, & Sweatman, 2001; Papanek, 1985; Shedroff, 2009; Vezzoli & Manzini, 2008a). Given their propensity for strategic and holistic design thinking (see Cross, 2011; Brown, 2008), designers are recommended to utilise systemic approaches to environmentally sustainable design, such as product-service systems (Manzini & Vezzoli, 2003; Mont, 2002) and whole systems design (Blizzard & Klotz, 2012; Charnley, Lemon, & Evans, 2011).

Yet, research on the practical possibilities for designers to cater to such a role in environmentally sustainable design is limited. Understanding about the possibilities is particularly limited in contemporary product development where activities, actors and resources are distributed across a network of companies and suppliers. So far, literature on environmentally sustainable design has mainly addressed product development from an integrative manufacturing perspective where the majority of activities, actors and resources are managed within a single company (Charter, 2001). Historically, design management has also been much concerned with integration of designers from the perspective of a single organisation (e.g. Cooper and Press, 1995; Bethge and Faust, 2011). In networked development projects, companies are disintegrated, bringing complementary competences and resources to the development process and collaborate to produce a complete offering (Ford, Gadde, Håkansson, & Snehota, 2011; Möller, Rajala, & Svahn, 2004). Hence, networked product development creates new managerial challenges. A critical task for design managers is to consider how designers can be utilised within the wider network of activities, actors and resources.

In this paper, we study the work of designers in a networked development project for a passenger ship in which significant environmental improvements were achieved. Previous studies have addressed the management of designers in collaborative product development on a team level (e.g. Berends, Reymen, Stultiëns, & Peutz, 2011; Cross, 2008; Von Stamm, 1998), the role of designers in environmentally sustainable design (e.g. Lofthouse, 2004) and the development of sustainable products in business networks (e.g. Baraldi, Gregori, & Perna, 2011; Håkansson &

Waluszewski, 2002). However, to the best of our knowledge, studies on environmentally sustainable design in business networks are scarce with no prior study addressing the work of designers and their management in a networked development process.

Based on interviews with designers, managers and coordinators involved in the project, we explore how the designers were viewed to have contributed to the environmental improvements of the ship. Our study focuses on the work of designers developing the interfaces between the ship and its passengers, i.e. industrial and interior designers (referred to as 'architects' in shipbuilding). Ships are complex large made-to-order products that require input from and coordination of many different professionals during development and manufacturing (Stoyell, Kane, Norman, & Ritchey, 2001). Our contribution lies in illustrating how the work of the designers connected to the wider project targets in developing a more environmentally sustainable ship. In particular, we shed light on the challenges that business networks can pose for design management and management of environmentally sustainable design.

## **Designing environmentally sustainable products in business networks**

In their most basic form, guidelines for environmentally sustainable design typically advise designers to adopt a lifecycle perspective during product development. Designers are recommended to utilise environmentally benign materials and production processes, ensure that product usage and disposal are handled properly from an environmental perspective and so forth (see e.g. Brezet & Hemel, 1997; Lewis et al., 2001; Vezzoli & Manzini, 2008a). Additionally, given the complex nature of sustainability, designers are recommended to take a systemic and solution-oriented view on design (Blizzard & Klotz, 2012; Vezzoli & Manzini, 2008b). In order to satisfy the fundamental needs of customers, designers should extend their focus beyond products to services and product-service systems (Brezet & Hemel, 1997; Vezzoli & Manzini, 2008b). A systemic view on sustainability is also often coupled with the ideal that designers should 'design on a clean sheet' (Blizzard & Klotz, 2012, p. 470) to achieve greater sustainability improvements.

Regardless if their application is for products, services or systems guidelines of environmentally sustainable design frequently share two underlying principles. First, environmental impact of products and systems

should be addressed in the earliest phases of development. Ideally, designers should place emphasis on environmental sustainability already during planning and concept design when the exact scope of a development project still is open for elaboration (Deutz, McGuire, & Neighbour, 2013; ISO, 2011; Lewis et al., 2001; Sherwin & Bhamra, 2000). Second, design and the work of individual designers should ideally have a central role in determining what resources (e.g. materials, processes, services) are used during development and manufacturing (Lewis et al., 2001; Tischner, 2001). As Lewis et al. (2001, p. 15) suggest, 'it is ultimately the designer who creates the interface between the consumer and the technology underlying the shell or surface of a manufactured product'. Thompson and Sherwin (2001, p. 350) assign such a bridging role to industrial designers in particular because of their position 'between producers and the market'. Similarly, Vezzoli and Manzini (2008a, p. x) suggest that in addition to improving sustainability of products, industrial design should focus on production system improvements. Together, these two principles emphasise the centrality of designers in determining the environmental sustainability of products and systems because of their location in the junction between ideas and manufacturing in the early phase of product development.

From a network perspective, environmentally sustainable design holds direct implications for companies. In business networks, companies focus on their core competences and collaborate with other companies in producing products and services (Ford et al., 2011; Möller et al., 2004). As companies interact with each other, they create interfaces and connections between their own resources and the resources of others (e.g. a shipbuilder needs to interact with engine suppliers, creating a resource interface between the companies). In doing so, guidelines for environmentally sustainable design outline recommendations for how resource interfaces should be established and managed in a network. For example, following business network logic, a decision to improve the sustainability of a product could result in everything from alterations in relationships with existing suppliers to switching suppliers to switching entire business models.

Studies on business networks show that making such alterations can be complicated for managers. Companies in a network collaborate and complement each other in terms of resources. However, they can rarely fully align their interests and actions in developing new products and service because past investments and existing resource combinations typically affect interests and actions (Håkansson & Waluszewski, 2002). An individual

company can therefore seldom (if ever) fully control the network that it operates within. That is, the network both prevents and enables operations of individual actors within it (Håkansson & Ford, 2002). Moreover, the interests and goals of individual actors may change and become conflicting over the course of development projects (Baraldi et al., 2011). The interests and goals of individual actors may also influence other actors in the network even when direct connections between them do not exist (Ford et al., 2011). For example, Håkansson and Waluszewski (2002) found that paper producers ignored IKEA's demands for a more sustainable paper quality for their catalogue because they were more aligned towards serving publishing houses. When IKEA finally managed to get a more sustainable paper quality 'the end product was one that differed considerably to what had initially been visualised, and was produced in a different production facility using different production technology' (Håkansson & Waluszewski, 2002, p. 3).

To conclude, business network literature suggests that the early phase of development may not be as open for designers as typically treated in literature on environmentally sustainable design. New development projects are located in a historical continuum of investments and resource developments within a network of interactions, interfaces and interdependent relationships. This continuum can be difficult to break away from. Design managers need to therefore grasp how network dynamics influence environmentally sustainable design if they want to induce alterations to the process. In this paper, we study how existing resource combinations influenced sustainable design in a business network.

## Method

To understand how a business network potentially affects sustainable design, we conducted a case study on the development of a passenger ship in which ambitious improvements in environmental sustainability were made. Case studies are relevant for studying 'dynamics present within single settings' (Eisenhardt, 1989, p. 534) and in addressing questions of *how* or *why* a certain phenomenon occurred (Yin, 2009). For business network studies, case study methods are commonly recommended because they grant a structure for dealing with the inherent dynamics of a network as a research setting (Easton, 1995; Halinen & Törnroos, 2005). Given the networked nature of shipbuilding and the environmental targets in the project, the studied case well represents the theoretical background of our

study by providing an example of sustainable design in a business network (on theoretical sampling, see Silverman, 2010).

Business networks are seldom clearly visible constructs to outsiders. Therefore, the theoretical foundation and empirical findings of the study were developed iteratively during the research process (as recommended by Dubois & Gadde, 2002; 2014). In case boundary setting and sampling, we utilised a dyad-network perspective (Halinen & Törnroos, 1998), i.e. we focus on the relationship between the shipyard and the shipping company that ordered the new ship. We also accounted for the network surrounding this core dyad through inclusion of suppliers and external design consultants working in the project.

It is often difficult to define who belongs to a network from the outside. Therefore, we located interviewees through chain-referral/snowball sampling, starting from the contacts the first author had with industrial designers working in the shipyard. We also located interviewees based on media reports and other publically available materials to avoid personal bias common to snowball sampling (Heckathorn, 1997). The final sample extended beyond the personal networks of the initial interviewees. Our sample is comprehensive in terms of design, covering the main designers from the organizations working with design of the different areas of the ship (i.e. the main exterior, interior and cabin designers have been interviewed).

The interviews were semi-structured and revolved around the involvement and work of the interviewees in the project (i.e. their tasks, collaboration and influence of environmental objectives). Free speech was encouraged in the interviews to benefit from the increased accuracy typically associated with free reporting in retrospective reports (Miller, Cardinal, & Glick, 1997).

The interviewees were in different phases of the project at the time of interviews. Some had already finished working with the project while others were in the middle of it. We asked the interviewees to bring documents made during the process to the interview in order to enhance recall. This was deemed particularly important with interviewees who had already finished their work in the project. This practice also enabled us to access documents otherwise unavailable to us such as internal presentations made in the process, schedules and meeting minutes. We complemented the interview data with secondary data about the project including professional press coverage, available interviews and official documents.

The final main dataset of our case study are interviews with 23 designers, managers and coordinators involved in the project. We see designers as individuals actively creating new design proposals for how the ship would look and feel to passengers. Managers are seen as being more concerned with leadership and control tasks in the project. Coordinators are seen as individuals who aligned different tasks and activities but with no clear leadership or design duties. Instead, they supported designers, managers and other developers in their work. Managers and coordinators were interviewed to gain a more comprehensive view and contextualise the work of designers in the study. Follow-up interviews with five interviewees were also conducted to add depth to the analysis, resulting in a total of 28 interviews in the main dataset.

### *Data analysis*

The interviews were recorded and transcribed for analysis. As a first step in the analysis, we used temporal bracketing and visual mapping (see Bizzi & Langley, 2012) for creating an overview of the data. Figure 1 displays a project overview with the main phases of the project, network location of each interviewee and when they were involved in the project.

As shown in Figure 1, the interviewees were involved in various phases of the project. Designers were involved in the project throughout its duration. Although individual designers rarely worked on the project from start to finish our data gave us an overview on the work of industrial and interior designers in all phases of the project. We defined three network locations based on where the interviewees worked in the project. The locations in the project were based on our dyad-network perspective, resulting in three locations: the shipyard, the client organization and external consultants. We also defined three temporal brackets based on important project milestones and common shipbuilding procedure. The first phase was *pre-contractual sales* (P1), covering the period before the project contract was signed between the client organization and the shipyard. The second phase was *development* (P2), covering the period after the contract to the start of manufacturing. The third phase was *manufacturing* (P3), covering the start of manufacturing until the final delivery of the ship to the client (for more information on shipbuilding processes, see e.g. Gale, 2003).

To map the role the designers had played in the project, we analysed how the designers described their contribution in advancing environmental sustainability of the ship and how they considered that the overall goals to improve sustainability in the project had influenced their work. Interviews

with managers and coordinators were used to contextualise the descriptions of the designers. Overall, we coded the interviews for instances where environmental improvements were discussed and analysed how the designers, managers and coordinators reflected on their contribution to those improvements. Temporal bracketing enabled us to investigate what kinds of contributions the designers made and how the network operated in different phases of the project.

*Figure 23. Temporal bracketing and visual mapping of the interview data. Interviewees are identified with first two letters indicating network position (Sy=Shipyard, Co=Client organisation, Ec=External consultant). Third letter indicates role (D=designer, M=manager, C=coordinator). Numbers are used to differentiate between interviewees belonging to same professional groups in the same location.*

### **General case context**

The studied development project was initiated to replace an older vessel of the client organisation. The process from sales negotiations to delivery lasted a few months short of four years. In P1 design work for the whole ship was performed predominantly in-house in the shipyard. Other

companies in the network also performed design work in P1 but typically only for the purposes of generic R&D and marketing of their own services. In P2, designers outside the shipyard formally entered the project. Their contributions were mainly in interior and cabin design, the exterior design being handled by the shipyard. In P3, designers entering the project were contracted to work on small subdivisions and tasks within the ship.

The interviewed designers had training and/or experience in industrial design or interior design. All but one designer had formal design education, with one designer having learned through apprenticeship. The interviewees seldom had clear-cut professional profiles, e.g. the cabin designer had some education in industrial design but had worked predominantly as an interior designer. The common denominator between the designers was that they worked with the 'architectural design' of the exterior, interior and cabins.

The design work was managed mainly by the client organisation. No single manager was responsible for the design of the entire ship. For example, exterior designers developed their work predominantly with the project manager (CoM1) while interior designers were more involved with the architectural (CoM2) and product (CoM3) managers. Moreover, the designers were given much freedom in order to renew the overall cruise experience. No explicit design guidelines were employed in the project and the architectural manager in the project (CoM2) described his role as monitoring the interests of the client company. The distributed nature of design management was also reflected in the remarks made by the designers. Design management in the process was frequently described as a joint activity between the designers and the client organisation (whose wishes often came to the designers through managers of their own organisation).

The main sustainability improvements in the project stemmed from energy-efficiency improvements and the use of liquefied natural gas (LNG) as fuel. Two drivers behind these improvements can be identified. First, incentives for improving sustainability have recently been developed at state and EU-level. This means that companies can receive environmental aid for solutions going beyond existing regulation. Such aid has been targeted particularly towards energy-use and energy-efficiency (see European Commission, 2008). Such aid was successfully applied for in the studied case. Second, tightening environmental regulation in shipping is increasingly reflected in marine fuel prices and has resulted in the introduction of new emission control areas. Consequently, alternative fuel sources are attractive for shipping companies and an important research

and development area for shipbuilders and their contractors. The studied ship operates within an emission control area in Northern Europe and regulation was reflected in the client organisation as a desire to find alternative fuel solutions. Regulation has warranted attention also from the shipyard in question in recent years. Thus, both a general interest (and push) towards environmental sustainability in the shipping industry and a need to comply with regulation in a given area drove in many ways the environmental improvements in the project.

## **Results**

A general concern for sustainability was present in the work of most designers. Especially in the first phase of the project (P1), many holistic concepts highlighting environmental sustainability were developed and put forward by the designers working at the shipyard and elsewhere in the network. For example, a designer working in the shipyard (SyD2) suggested a new operational concept that would decrease environmental impact through slower operation speed. Similarly, a design office (represented in the sample by EcD6) with a long-lasting relationship with the client put forward concepts strongly driven environmental sustainability, particularly energy-efficiency.

However, from the contract onwards (P2 and P3), the designers' contribution to the environmental improvements became less defined. When directly asked, most designers also responded that the environmental targets in the project had weak or no formal influence on their work; this despite the fact that a strong focus on sustainability was present on a general level in the project. For example, the main cabin designer (EcD5) mentioned that '[sustainability] had no influence in it [cabin design]. I did not even – of course I knew how the ship is going to work and that it uses LNG but it did not cause anything that would have been reflected here [to cabin design]'. The main exterior designer (SyD1) stated that '[the sustainability focus of the project] did not really, in terms of the environment, bring anything to the design, so that we would have somehow emphasized environmental friendliness in it'. That said, a number of designers saw environmental sustainability as important in their work. For example, a designer (EcD3) working with a part in the interior in P3 stated that 'I have to say that it [environmental sustainability] has not played a big part. [...] But of course, I personally prefer to choose that kind of materials [that are sustainable]'

The results above are not specifically problematic from the perspective of environmentally sustainable design. Despite a lack of formalized demand and design management towards environmental sustainability, the designers still often took an active (self-initiated) stance in improving sustainability. However, the problem emerges when we turn focus to the influence the designers considered to have induced through their work. We distinguish two challenges the designers faced in trying to improve the environmental credentials of the ship which are of direct relevance to design managers in managing sustainable design in a network.

### *Designing new resource combinations in shipbuilding*

The first challenge pertains to the practical possibilities of designers to design new resource combinations during the shipbuilding process. Passenger ships need to fulfil many different functions and tasks, ranging from mobility to food provision to waste management to collision safety. This makes ships complex products to develop. How this complexity was managed came to represent a strong challenge for designers to induce and effect on the environmental improvements in the case of study, and for ship design in general.

The work of the designers in the project often revolved around designing new concepts and ideas for the ship to be. In environmentally sustainable design, as noted earlier, starting design on a clean sheet is a desirable condition in the early phase of product development. However, starting a ship project from scratch is seldom practically and financially feasible. As noted by Gale (2003), completely new designs are slow, difficult and risky to develop and are therefore rarely pursued. Instead, new ships are often designed based on a 'reference ship' that eases in determining the overall technical characteristics (e.g. volume, stability etc....) and in estimating a more accurate price and quality level for a new ship. Moreover, given the tight regulation ships need to follow (e.g. fire safety), a reference ship provides a concrete example where such regulation has been successfully taken into account. From a business network perspective, a reference ship can be seen to function as a concrete representation of feasible resource combinations in a network.

The importance of the reference ship, and the resource combinations inherent within it, was a salient topic of discussion during interviews. As a designer (SyD1) in the shipyard pointed out, 'it [the reference ship] speeds up and makes the start of design easier. It is intellectual capital that is hard to avoid using because that is where our knowhow and our shipbuilding are

based on'. Thus, the design work for the new ship was largely orientated towards re-designing the reference ship. For example, when the contract was made, the volume, price and quality level of the interior of the ship were defined but the final style and material choices were still left open.

The past resource combinations in the network restricted the possibilities of the designers to have an impact on the environmental improvements of the ship. Notably, the influence of the early phase design concepts was rarely definitive. Many designers acknowledged this in the interviews. For example, a designer from the shipyard (SyD4) described his own role as 'throwing in' ideas of more sustainable technologies in the early phase. However, he also noted that it is typically a long way for such 'suggestions' to become realised. Similarly, in discussing their solar powered ship concept, a designer consulting in the project (EcD1) mentioned that, 'I'm not an expert in this fuel or anything so I wouldn't be able to make that judgment whether that's good or bad, but what I do think is, that it is important that you can push technology'. So, while the design concepts utilising solar power designed by external consultants (represented in the sample by EcD1) were used in reporting about the future visions of the client organisation, they were not developed further as the technical assessments showed poor energy yield in the operating area of the ship.

In the later phases of the project (P2 onwards), regulation, price concerns and influence of past resource combinations made improving the environmental performance of the ship increasingly difficult from the perspective of the interviewed designers. A designer working (EcD4) with parts of the cabin stated that '...I'd like to say yes, it's all environmentally friendly, but unfortunately given, given the, [...] certification and this sorts of, legal entitlements of those fabrics it's difficult to come up with nice entirely eco-friendly product'. Or, as stated by the main exterior designer (SyD1) in reflecting on his work with material selection, 'I don't make any decisions regarding material choices and such, in our organisation'. Challenges caused by past resource combinations were also visible in introducing LED-lighting as the lighting specifications in the ship contract were largely based on the reference ship. As described by interior designers (EcD2, EcD 7), using LED-lighting in the interior required extensive development to arrive at the right price and technical quality to meet specifications. In the end, LED lighting was used in the ship but it required additional work from the designers who had to make two different lighting

designs, ensure more budgeting for lights and customise the light fixtures to survive the vibration present on ships.

### *Role and position of designers in the network*

The second challenge concerns the role and organisational positioning of the designers in the network. This challenge stemmed largely from the complexity of ships as a product and the need for different expert knowledge and skills during development and manufacturing.

The new ideas and concepts that the designers developed for the ship were commonly communicated visually. This core competence of designers has earlier been framed as expertise in 'the science of appearance' (see Dreyfuss, 2003[1955], p. 65). The framing of their competence (contribution) implied that designers were frequently asked to design how things should look while simultaneously having limited possibilities to control the realisation of their ideas. For example, as noted earlier, material selection was seldom completely determined by designers. Consequently, the designers' work only partly determined how the ship was realised.

The limited possibility for designers to manage the realisation of their ideas was further substantiated by the use of separate companies and actors for engineering and building different parts of the ship. For example, the main exterior designer (SyD1) worked with an engineer who translated his work to the structural ship model. Through multiple iterations, they ensured that both the structural strength and appearance of the ship were properly addressed. Yet, technical feasibility (e.g. structural strength) overruled design appearance as a criterion in decision-making. Similarly, an interior design company designed the public spaces of the interior but the areas were engineered and built by multiple turnkey delivery companies. The turnkey delivery companies were experts in technical realisation and they often worked under tight budget and weight constraints. The dynamics of this division of labour was well reflected in comments by a manager in the turnkey cabin manufacturer (EcM2): 'well we have it purely so that, you could say that we have the technical design. The architect [designer] gives the, the principal ideas how the appearance and things are, and then our planners just put it into a technical format'. He also noted that this typically meant that the final design seldom corresponded exactly to what the designers had put forward. Thus, architectural design in the process was indicative – but not definitive – of what the outcome would be like.

That said, from the perspective of environmentally sustainable design, the turnkey managers were often pressed with the environmental concerns

in the project. A turnkey manager (EcM1) stated that the environmental targets in the projects did influence them and mentioned that '[in the nightclub] we changed the wood material on the dance floor to get grown wood to it'. Accordingly, with the responsibility to ensure material suitability for the ship they were also in a stronger position to influence the environmental improvements of the ship.

## Conclusions

How does one manage sustainable design in a business network? In our study, design management was distributed over multiple actors and companies. The complexity of the ship dictated the use of a reference ship to make the general development task feasible. The reference ship served as an important *example of resource combinations that fulfilled regulations and would be possible to realise in the network*. The complexity of the product also required specialists for designing, engineering and manufacturing of which designers were an important part. As a result, while designers actively advanced environmentally sustainable design in the project, they rarely had a direct possibility to impact the final solutions embedded in the ship. Overall, the way design and environmentally sustainable design was managed in project poses new questions for sustainable design.

It would be easy to criticize the management of design in improving the environmental performance of the ship. However, it should be remembered that the ship has been awarded for its overall design and environmental improvements. During the interviews, many of the designers also expressed pride in their work and did not necessarily consider the handling of environmentally sustainable design as problematic in the project. To this end, our case provides an interesting example from the reality of managing environmentally sustainable design and the work of designers as a part of a larger system. Moreover, following Brunsson (1989), ideas and actions often become acted upon separately when organisations are faced with conflicting demands. Our results suggest that connecting design concepts with realised solutions is not always straightforward, i.e. that ideas would determine actions. Environmental sustainability often requires changing existing ways of producing. However, in shipbuilding existing means of production and ways of operating are often economically rational ones and also more acceptable in terms of regulation. Thus, environmental sustainability (or any significant change) and feasibility can become seen as

conflicting demands in shipbuilding and they are more easily handled when they are attended to separately. Design managers need to therefore be aware of the conflicts that suggested new resource combinations may raise during development. Finally, while much literature in sustainable design highlights the importance of holistic design approaches and multidisciplinary collaboration as key success factors in developing more sustainable products, the responsibilities and roles of individual professions are rarely discussed in great detail (for notable exceptions, see Lofthouse, 2004; 2006). Based on our results, we note that a grand strategy of sustainable design does perhaps not make up for a lack in clear and actionable coordination of individual professions.

### *Limitations and further research*

Managing and performing environmentally sustainable design in business networks have only invited limited research interest. Hence, there are several research opportunities in expanding on the limitations of our study. First, shipbuilding represents a typical context for large made-to-order product commonly developed in a business network. The studied project offers a compelling and theoretically representative case to examine environmentally sustainable design in a business network. Future research could fruitfully explore different development contexts and product types to build more comprehensive understanding of design and design management in networked development projects, independent of the specifics of shipbuilding.

Second, the focus of our study was on the work of designers within a single project. This makes conclusive inferences regarding the entire development project and the work of designers in general hard to make. However, as pointed out by Bizzi and Langley (2012), such limitations are difficult to overcome within single studies in business networks and would require a more programmatic stance on research. More holistic studies of networked product development could yield more explanations to the success factors of environmentally sustainable design in business networks. Thus, future research could approach studies of product development in business networks from complementary angles to cover a broader spectrum of phenomena.

### ***Implications for the management of environmentally sustainable design***

Much literature on environmentally sustainable design advocates that designers should systemically attend to sustainability in the early phase of design and development. Such advice roughly follows the general discourse on design management by viewing design as a central integrative function in product development (e.g. Beardsley, 1994; Borja de Mozota, 2003), by highlighting the strategic potential of design (e.g. Ravasi and Lojcono, 2005; Stevens and Moultrie, 2011) and highlighting the importance of a holistic stance when designing (e.g. Cross, 2011; Cooper, Junginger, & Lockwood, 2009). In exploring a new domain for design management, our case study points to specific challenges in managing environmentally sustainable design in collaborative settings such as a business network. In particular, our results suggest that the early phases of design and development may not always be as decisive in terms of environmental performance as commonly suggested or that designers can begin to design from a clean sheet. A business network structure calls for a focused role for design. Thus, design managers wishing to improve the environmental credentials of products would need to pay specific attention to the particular roles that different professionals – from industrial designers to engineers – can play in business networks and collaborative product development.

Additionally, design managers operating in business networks need to traverse organisational and temporal boundaries in order to attain a comprehensive picture of how different companies and individuals within them complement each other. Traversing organizational and temporal boundaries can stretch beyond individual product development projects. For example, replacing a material with a more sustainable one might require extensive work with suppliers and may be hard to change retrospectively. As different solutions become codified in network connections, design managers are therefore advised to stretch their perspective on the impact of environmentally sustainable design both temporally and contextually.

## Design interventions in small- and medium-sized companies: Initial findings from a case study

Kirsi NIINIMÄKI<sup>a</sup>, Oscar PERSON<sup>\*a</sup>, Janne PEKKALA<sup>b</sup> and Sanna PELTONEN<sup>b</sup>

<sup>a</sup>Aalto University; <sup>b</sup>Design Centre Muova

*The business significance of design has made academics, industry professionals, and policy-makers to all urge companies to use design more strategically. Still, it remains a well-known fact that design is far from universally utilized by companies with a marginalized role for design perhaps most strongly articulated for small- and medium-sized companies. Introducing designers (or design students) to development processes has been a common practice for promoting design in the Nordic countries. Subsidizing the involvement of designers in development processes has also been a common practice to support the integration of design in Nordic companies. In this paper, we refer to the early-stage involvement of designers in such practices as design interventions. We also present preliminary findings from a case study on design interventions and their capacity to cater for an increased usage of design in small- and medium-sized in companies from the Ostrobothnia region in Finland. In presenting preliminary findings from our study, we describe how design interventions benefited four companies in acquiring a greater understanding about design. Analyzing a broader set of design interventions, we also discuss how basic project characteristics potentially impact the success of design interventions. In particular, based on the remarks of managers and designers, we note the presence of good communication and a reflective development process in the studied projects.*

## **Introduction**

The business significance of design has made academics, industry professionals, and policy-makers to all urge companies to use design more strategically (see e.g. Cox, 2005; Nordic Innovation Centre, 2004; Thompson and Koskinen, 2012). In tandem, numerous research studies and industry reports have addressed design in product development and company renewal (for some recent examples see Johansson and Svengren-Holm, 1998). Historical studies on design have also long addressed the work of designers in industry; pointing to a broader and potentially more strategic role for designers in companies today (Valtonen, 2007).

Still, it remains a well-known fact that design is far from universally utilized by companies. A recent industry report by the Finnish Association of Designers Ornamo suggests that only 30% of all Finnish companies use design for product development, visual design or brand development (Ornamo, 2013). While not always unveiling as grim results, a marginalized role for design is also noted elsewhere. For example, while a recent industry report suggest that more than 75% of Swedish companies utilize design, only 30% of the sampled companies reported that they recognize design as strategic (SVID, 2008). Based on a study of companies in UK, Livesey and Moultrie (2009) concluded that the average spending on design was £260K a year. However, they (p. 18) noted a significant skew in their sample “with just over 15% of companies reporting no design spend and 37% of respondents indicating a spend of between zero and £10K.” Moreover, only 19% of the investments in design were non-technical in nature; raising questions about what constitutes dedicated investments in design in comparison to general investments in R&D.

A marginalized role for design is perhaps most strongly present for small- and medium-sized companies where resources are scarce and managers may only hold a limited understanding about design and the work practices of designers (Bruce et al., 1999; Walsh and Roy, 1985; SVID, 2008). In the earlier mentioned report by Ornamo, only 20% of the small- and medium-sized companies in Finland indicated that they use design. Small- and medium-sized companies are often seen to lack long-term strategies and, accordingly, only turning to design in a crisis situation (Cawood, 1997). In general, they are often also described to lack skills to work effectively with creative professionals such as designers (Cox, 2005) with external support systems to cater for the deficiencies often are scarce (Nordic Innovation Centre, 2004).

Introducing designers (or design students) to development processes has been a common practice for promoting design in the Nordic countries. Subsidizing the involvement of designers in development processes has also been a common practice to support the integration of design in Nordic companies. In this paper, we refer to the early-stage involvement of designers in such practices as *design interventions*. We also present preliminary findings from a case study on design interventions and their capacity to cater for an increased usage of design in small- and medium-sized companies from the Ostrobothnia region in Finland. The growth and development of small- and medium-sized companies is often recognized as critical for the competitiveness of national industries (Ministry of Employment and the Economy 2014). Small- and medium-sized companies are often also seen to be in a prime position to benefit from design in developing their business activities (Cawood, 1997; Dong-Sung, 2004). Professional design organizations often present that the use of design does not only produce products of higher quality and better functionality but also increase margins and raise profits (see e.g. Ornamo, 2013). Further, by acquiring a deeper understanding about the potential of design in an industry, companies are seen granted a possibility to act as a design leader in the market and to be as successful as, or even more successful than, the market leader (Zec and Jacob, 2010). Given this, it is not surprising that many nations have implemented development programs for the promotion of design to local industry and (financially) support small- and medium-sized companies in contracting designers (Raulik-Murphy, 2010).

The benefits of participating in a design intervention are frequently articulated in terms of providing companies a cost-effective way to learn more about design and the strategic benefits it can bring to an organization. However, despite their commonness in Finland and elsewhere, academic scrutiny of the impact of design interventions is scarce with only an emerging body of empirical studies addressing what capacity they fulfill for companies (for a noteworthy example, see Matthews and Bucolo, 2011). The lack of research in the area is not surprising given the fact that formal impact evaluations of design policies and their associated development activities often are lacking (Moultrie and Livesey, 2009; Raulik-Murphy, 2010). In presenting preliminary findings from our study, we describe how design interventions benefited four companies in acquiring a greater understanding about design. In targeting immediate development needs in industry, the scope of design interventions is often tightly coupled with the specific needs of individual companies. As a result, the overall scope of

design interventions is not always easily articulated from the outset. The preliminary results of our study suggest that design interventions can benefit companies in a multitude of ways but that not all companies acquire a greater understanding about design following an intervention. Analyzing a broader set of design interventions, we also discuss how basic project characteristics potentially impact the success of design interventions. In particular, based on the remarks of managers and designers, we note the presence of good (open) communication and a reflective development process in the studied projects.

## **Design interventions for knowledge formation in industry**

The basic reasoning for participating in a design intervention, as noted earlier, is often described in facilitating a cost-effective way to learn more about design and the strategic benefits it can bring to a company. Policy reports from South Korea (Dong-Sung, 2004) and Welsh (Cawood, 1997) also suggest that companies can benefit from working with designers in a multitude of ways. Recent research also suggests that the work of designers may also be perceived differently depending on who is asked in a company (Valencia, Person and Snelders, 2013). Accordingly, the impact of design interventions is likely to be contextual; depending both on the development context at hand and the experiences and expectations of the professionals participating in an intervention.

From a policy perspective, design interventions represent an opportunity to promote design and to support its immediate use in industry through education and business development (for a more in-depth discussion on the scope of national design policies, see Raulik-Murphy, 2010). In brief, design interventions are about equipping companies with the knowledge and competence needed to start using design in their development activities by exposing them to the work practices of designers. With a focus on integrating design in development processes, design management sits naturally with policy discussions on design and in articulating the added value of design interventions.

To contract an external design is often presented as the easiest way for companies to acquire knowledge about design. The main benefit of this approach, as outlined by Zec and Jacob (2010), is that design knowledge can be acquired quickly through a direct encounter with a professional.

However, as also noted by the same authors, learning about design through external collaboration is risky. An immediate risk is that a company will not actually learn from the collaboration and the new knowledge remains outside the organization; failing to provide a deeper understanding about the “language of design” (ibid, 116).

What is captured by the language of design and/or what knowledge companies could acquire through a focus on design and design management is not always clear. Important reasons for this are (1) the broad scope of design and (2) the evolving nature of design management. For example, following a general expansion of the design management concept to more actively also embrace a discussion on the components of design thinking, Cooper et al. (2009) note that the current state of design management research and practice spans three different development contexts. The first development context is *manufacturing* where “design management concerns itself with management issues that directly relate to the product development process.” (ibid, p. 53) The value of design is framed in terms of improved competitiveness in the market with design management scholars frequently asking questions about how to assess the added value of design. The second development context is *marketing and branding* where design management concern itself with questions about “the perception and experience of a product by the people defined as the target group.” (ibid, p. 54). An emphasis is often placed on the tangibility of products and services according to Cooper et al. (2009). Questions about visual identity building and how to communicate a (coherent) message to the market (see e.g. Svengren, 1997) seem also to be of interest. The third development context is *organization and society* where “design management is changing its course from one of designing as managing to one of managing as designing.” (Cooper et al. 2009, p. 54). In this context, design is recognized outside product/service development. Design thinking begins to be “practice independent of the product” and further design activities are used to characterise the problem and to address new problems (ibid, 54). In other words, a new understanding of design is formulating where managers do not only accept the use of design but further begin to take a more active part in design and development processes. Design begins to be a major force in the organization (Dumas & Mintzberg, 1989).

Overall, Cooper et al. (2009) argue that a greater focus on design thinking and “thinking about design” has resurfaced discussions on the importance of a systemic view on design (in contrast to traditionally “thinking of design” in individual products). Moreover, in “thinking through

design”, design is no longer only concerned with products (and services) but the general business system; how business itself is conducted. Thus, while design management traditionally may have concentrated on product design and incremental improvements, Cooper et al. (2009) argue that a focus on design thinking underscore a more radical shift in the way organizations do business and benefit from design. A broader role for design seems also to be advocated in many policy documents for design (or reports advocating such policies) where design is not only seen to befit the development of individual products but the general process by which companies organize their business activities (see e.g. Nordic Innovation Centre, 2004; Ministry of Employment and the Economy 2014).

## **Method**

In exploring the impact of design interventions in small- and medium-sized companies, we are currently running a case study in collaboration with Design Centre MUOVA, Vaasa, Finland. The broader objective of our study is to explore and understand the basic premises by which MUOVA impact companies through their activities.

MUOVA is a research and product development centre which works in close collaboration with industry by offering design, research and training services to companies. MUOVA was founded by University of Art and Design Helsinki (now Aalto University School of Arts, Design and Architecture) in 1988. Today, MUOVA is organized as a joint research and development platform between Aalto University, University of Vaasa and Vaasa University of Applied Sciences.

For the scope of our case study, we are studying the impact of 12 design interventions at companies in the Finnish Ostrobothnia region. The interventions are design and development project where designers from MUOVA have participated in or lead the process. The projects were executed between 2005 and 2012 and selected in collaboration with MUOVA to be representative of industrial design. The scope of the projects covers activities in product developments, service design and image building. The companies in our sample are mainly from engineer-driven industries in metal, technology, plastic and textile.

A qualitative and interpretative approach guides our inquiry in locating attributes and themes on our phenomena of interest (Alkula et al. 2002). The specific question we ask ourselves in analysing the work of MUOVA for

this paper is: *how did the design intervention – executed by an external designer(s) – impact the understanding (knowledge) of design within the company?*

The primary data for our study are (1) interviews with company representative on the managerial level, (2) interviews with the designers from MUOVA participating in the projects as well as (2) briefs from the projects provided to us in writing or described to us verbally.

## **Case background: Design interventions and their motivations**

The initial starting point for the projects and the reasons for contracting designers differed across the studied interventions. In most cases, there was a tactical interest in design and effort to develop a new (incremental) product (or service). Following our initial sampling, there were also a couple of projects in which the initial starting point for design and development was more strategic and exploratory in nature. For these projects, the decision to contract a designer was typically coupled with a clear development brief for design.

From a management perspective, the underlying reasons to contact MUOVA and to contract professional designers for the projects were predominantly described as financial. By using designers in the projects, the companies had hoped to increase profits, to increase sales, to make the product more saleable (attractive), to find new business opportunities and/or to enter new markets. Moreover, the interviewed company representatives frequently described that improving their company's image had been an important reason to contract designers. Curiosity and a general need for new ideas were also mentioned as a reason for involving designers in the projects.

From a policy perspective, the initial interests in design seemed to have been based on an understanding that design is important in competition and for differentiation. Through the use of design, it was described possible to differentiate a (new) product from those of competing companies. Further, professional designers were described to bring new knowledge and/or expertise to a company or a development process. The knowledge contribution of designers was described to entail everything from aesthetics to ergonomics to material selection to manufacturing. A number of the interviewees also commented that the designers had brought in valuable (new) information about customers during the development process.

## **Results**

In most cases, the studied projects were described as highly successful by the interviewed managers and designers. Most projects had not only produced the expected outcomes, they had exceeded the company's expectations. From the perspective of MUOVA, the projects were also described as successful in terms of, in many cases, introduced the companies to the value of a use-centred approach to design. From the studied projects, only one was described as unsuccessful. (MUOVA had been contracted to design a service concept for a manufacturing company. A service concept had been designed incorporating the all necessary elements needed to start offering the service to clients. The company had been enthusiastic about the results, the collaboration with the designers and the project in general. Yet, the concept had not been implemented and the project had accordingly not reached its full potential.)

Two-thirds of the companies indicated that they had not worked with design or designers prior to the intervention. Still, despite the positive comments about the use of design in the project, only four of the interviewees stated that the interventions had changed their understanding about design. In fact, most of the interviewees commented that there had been no major changes in their understanding of design. Some of the interviewees commented that while their company did not have much direct experience with design at the time of the project they personally had understood the importance of design because of their education or work history. Other interviewees noted that, while their company had not had any direct experience from working with designers, the company had worked as subcontractor in project involving designers.

Below, we describe the involvement of MUOVA in the four development projects for which the managerial level of the companies stated a change in their understanding about design. For the sake of brevity, we focus ourselves on the role of design in the project and how the contribution of design was articulated in each project.

### *Project 1: Going from resistance to acceptance*

The first development project took place in a medium-sized manufacturing company (170 employees) in the metal industry, manufacturing the products of other companies.

The company had not had any previous design experience before contacting MUOVA. In fact, there had even been a strong resistance inside

the company towards using professional designers. The company representative also described how he initially had been strongly against the idea of using designers. Nonetheless, based on the initial experiences with MUOVA, the acceptances towards designers had improved within the company. As example, following the initial project with MUOVA, the company had hired a design student for a three month internship to further explore value of in their industry.

The initial initiative to contract MUOVA had come from the board of the company who had recognized a general need to develop the image of the company. As a first step, MUOVA had been contracted to develop a brochure. However, as the company representative noted, the project evolved to cover a broader discussion on mission and vision of the company: “what we are and what we can offer to the clients”. Following these developments, MUOVA designers did to wide stakeholder interviews, competitor analysis and general image building to clarify the overall (marketing) message of the company. The resulting image was also translated to graphic design materials in accordance with the original intentions.

With a growing acceptance towards design in the company, the project was in many ways recognized as successful. The company representative also described how the general development process initiated by the project had continued; the project about a “four page brochure” had turned into four years project in image building.

In reflecting back on the use (and adoption) of design within the company, the company representative noted that designers seemed to approach things differently. The design student had for instance displayed a totally different way of approaching and communicating with clients; an approach that seemed to produce more relevant (solution-focused) information than the information produced by regular (marketing) staff of the company. The company representative also noted that the work of designers typically also trespass boundaries by seeing (approaching) things differently. As concluded during the interview: “designer’s approach is so different that it can open gates which otherwise stay closed” Learning from the work practices of designers, he also recognized that they had in part changed their internal processes.

### *Project 2: Testing the skills of designers*

The second development project took place in a micro-sized company, producing sensor technology for control hydraulics. The company had not

worked with designers prior to the intervention. However, the owner of the company commented that he had heard about MOUVA and had followed them closely for several years before contacting them. He also described that the company had been well-prepared for the project by having a good general understanding about the capabilities and skills of designers.

The scope of the project was described in terms of improving upon an early-stage technical prototype. The company had been founded in the beginning of the 1990s. However, it had been inactive for several years at the end of the 1990s and the beginnings of the 2000s. Accordingly, the company had only been re-activated a few years prior to the project.

The design task included improving upon the appearance and ergonomics of the new product, drawing 3D models for manufacturing, locating a suitable material and manufacturing technique as well as determining a suitable place for production. The decision to involve designers in the project seemed in many ways to have been driven by the curiosity of the owner. The prototype already contained the principle technical solution for the new product at the outset of the project, which was recognized to have set a clear frame of reference for design. The brief was also noted to have been clear and tightly formulated. As described by the company representative, the product's technical solution was innovative and unique. It had therefore been seen as important that the design of the new product should be unique as well.

Both MUOVA and the company representative described the collaboration as pleasant and successful. The company representative described how they had held several meetings during the development process. The purpose of these meetings had been to collaboratively generate ideas and to settle on shapes and material options. The designers developed these ideas further into product options (concepts) that were presented and discussed in the following meeting.

In reflecting back on this process, the company representative noted had brought valuable information to the development process: "Designers are good at providing new information". The information had not only concerned the overall shape of the new product or its functioning (ergonomics) but also addressed its realisation. For example, when a suitable form for the new product had been determined, the designers had introduced the idea of using 3D printing for prototyping and testing; a development opportunity prior untested by the company.

From a business perspective, the project was recognized as success within the company. The company representative estimated that they had got what they had ordered. The market response to the product had been positive. From the perspective of design, the ergonomics of the product was especially seen as insuperable which was described to provide a clear point of differentiation from the competition. In addition, a well functioning design in terms functionality and ergonomics was seen to have added brand recognition to the company. The company representative pointed out that he was proud when presenting the product to clients: "The designed product sells itself." He also noted that design had helped them in establishing a solid market position for the product. To this end, he further noted that the use of design in the project had boosted a general growth tendency within the company.

### *Project 3: Strengthening the brand*

The third project took place in small-sized manufacturing company (20 employees) in the textile industry. The majority (70%) of the company's business comes from business gifts with the remaining business situated in home textiles. Prior the project, the company had worked with freelance (textile) designers for over 30 years for product development. The first designer had entered the company as a summer intern who had continued to work with the company as a freelancer afterwards. On a general note, the company representative explained that it was a prerequisite that external designers understood the technical limitations of production in developing designs for the company.

For the project with MUOVA, the company had wanted to develop their packaging. The basic objectives for the project were that the new package should help the company differentiate its product from the competition and help them to express the company's (current/updated) image. The company had heard about MUOVA through other companies and had been compelled to contact the company based on their positive reputation.

Upon entering the project, the designers from MUOVA soon reinterpreted the original project objectives, changing the project from packaging design to image building. In the process, a researcher from MUOVA was also brought in to the development process to do interviews with retailers, business clients and consumers. Based on the information from the interviews, a package design concept was developed which later was finalized by other graphic design studios.

The project was in many ways described as successful, not only in terms of having produced a well-functioning packaging concept but also more generally by strengthening the brand activities of the company and its products. In particular, the company representative vividly described how the project had even come to change general branding strategy of the company. In short, the analysis of the company's current operations had lead to the realisation that the company would need for co-branding the products in the business gift sector in order to develop brand equity. Prior to the project, the company had only displayed the logo of its clients on the products. Following the project, the idea was now that the company would also add its own logo in order to create wider recognition for their products among future clients. Following a revised strategy for branding and image building, the company had also decided to formalize the internal team that had worked on the project and make branding and image building a continuous process inside the company.

#### *Project 4: Altering the focus of development*

The fourth project took place in a small-sized manufacturing company (50 employees) producing packaging and manufacturing lines for the food industry. The company had earlier worked with a designer. However, the collaboration had in many ways been unsuccessful and it had taken a couple of years before the company had decided to work with a designer once more and contacted MUOVA for the project.

The decision to contract a designer for the project was strategic, originating from the board of the company. The precursor for the decision was the remarks of a client, who had taught that company's products looked "ugly". There were also some functional problems with the current products that the company believed would be possible to solve through further development. The board of the company had therefore decided to initiate a development project and use design to develop the appearance of their machines "which only engineers could love".

The designers at MUOVA described how they responded to the challenge through user observations and stakeholder interviews, trying to pinpoint problems in ergonomics and function. They then created concepts, and used user and stakeholder feedback for concept refinements. The first concepts were futuristic looking machines (in line with company's wishes and expectations), which were refined and simplified as the development process evolved.

While the initial focus had been on the appearance of the company's products, the involvement of design in the development process was in many ways recognized to have pushed for more radical changes in the company. At the time of the project, the company designed and manufactured individual machines (solutions) for their clients. However, based on their user observations and stakeholder interviews, MUOVA presented modular concepts which enabled the product to partly be built beforehand and later customized onsite at the client. To this end, in reflecting back on the development process, the designers described how they came in some ways to envision a new future for the company in designing new solution for the company.

The overall results of the project were described as successful. Following the intervention, the company has also begun selling several machines using a modular design. As a result, the intervention both met and exceeded the initial expectations of the company. The company also decided to contract designers for the next development project. The company representative also noted design had transformed the overall development and sales process within the company. Prior to the intervention, the development process had been linear; engineering plan, technical drawings, manufacturing and finally sales introduction to the client. However, the work practices of the designers in the project had inspired the company to listen more carefully to the wishes of their clients. The company representative also described how the development process had become more interactive as the focus had changed from the functions of their machine to the wishes of their clients. To this end, he in many ways recognized the main value of using professional designers in their ability to bring user-centered knowledge to a company. They were also described to have offered new ways of thinking in development processes; placing greater emphasis on interaction and continuous development.

## **Success in design interventions**

With only four company representatives stating a change in their understanding about design, it is hard to draw broader conclusions about the potential reasons for the added learning process in these interventions. The situation is further complicated by the fact that the scope and contribution of the studied project varied. Many of the projects also changed and/or were altered during the development process in order to profit to unforeseen development opportunities.

In general, from a policy perspective, the studied companies did not only articulate the value of design in the end result but also from the general process of designing. To this end, most design interventions were predominantly seen to have brought *knowledge about* rather than practical *skills in* designing. There was also a risk noted in that this new knowledge would be dependent on individual people (e.g. designers) and accordingly not enter a company after a project. As noted in one interview: “the know-how doesn’t transfer, while at the end we have the product but not the knowledge how it was designed and made and why so.”

While it is hard to draw broader conclusions about the reasons for the added learning process in some of the project, it is possible to distinguish re-occurring themes in what the managers described as characteristic for successful involvements of design and designers. In particular, across all project, the company representative typically place great emphasis on good (open) communication and a reflective process for development. In short, open communication and a reflective process was seen to establish trust and to generate agreement on goals and objectives, which was recognized as important in collaborating with designers.

Remarks about open communication and a reflective process were often coupled remarks about finding the “right people” or designers for a project. Several company representatives noted that the attitude of the individual designer could in many ways predetermine the outcome of a project. Similar, a number of representative noted that the basic motivation to use design should be a strategic decision by senior management in order to establish necessary commitment within the organization.

## **Discussion**

Design interventions are a common way to introduce design and the work practices of designers to small- and medium-sized companies. Yet, the scope of design interventions and what impact they may have on the participating companies is not always clear. In this paper, design in the studied projects is perhaps best understood as a tool for collaborative sense-making (Mozota, 2003) where an intervention at best brought an alternative (design) understanding of the development context within a company and/or industry.

Following Cooper et al. (2009), design interventions can target everything from manufacturing to market and branding to organizational

development. The preliminary results of our study suggest that interventions may have an impact one or two of these development contexts or overlap all three; especially when facilitating a holistic learning process within a company.

The results of our study also point to a multidimensional value of the interventions. As Mozota (2003, p. 140) points out, an excellent product often only represent a partial result of a design process. “[H]ow to do the job better, faster, more effectively” and how to integrate this knowledge within an organization is typically of equal value. In harnessing this extended value, the preliminary results of our study suggest that open communication and a reflective stance for development form important factors for success.

Intentionally or unintentionally, the studied companies were through the interventions frequently granted an opportunity to think “outside the box” with respect to their current practices and, in some cases, to engage with a deeper learning process on the possibilities to use design within their industry. To this end, the value of an intervention should not only be assessed in terms of its final (tangible) outcome but also in terms of the new knowledge that a company may have acquired about its industry and the possibilities to use design within it. In a smaller number of cases, the design interventions in our study came to facilitate a holistic learning process through which a company came to look a new on their mission and vision, values and business actions in the process of learning more about design.

The scope of this learning process constitutes an important area for further research in understanding the potential value and effectiveness of design interventions. Future studies could fruitfully try to more accurately capture a company’s understanding of design before, after and during an intervention. As an initial study, our findings are unfortunately limited by the quality of retrospective accounts of managers and designers. Yet, as preliminary findings from an ongoing study, they suggest a development potential in design interventions which warrant further attention. We therefore end this paper with a hope that our study will not only add to past studies on design but also may stimulate some new ones.

## Different Models of Design Management – three examples from the Swedish furniture industry

Justyna STAROSTKA\*

Kozminski University

*The role of design in business has shifted dramatically over the past few years. The responsibilities of designers are increasing, as they become interpreters of the market changes and very often the driving force behind innovation. The management of design has never played such an important role as it does today, yet it still provides serious challenges for many organizations. This article is based on the results from the exploratory research that has been conducted among design-oriented companies from the furniture industry in Sweden and Poland. This project was qualitative study aimed to compare managers' attitudes towards design; to look into existing processes in companies connected with design and to explore the different roles that designers play in organizations. 24 in-depth interviews were conducted among two groups of respondents: managers and designers. The purpose of this article is to present three different case studies from the Swedish furniture industry. Cases selected for this article are companies that use design strategically, yet, in very different ways. Company names are omitted for confidentiality reasons, but the in-depth description of attitudes towards design, strategies and practices in the design management area are provided. In the description of cases, interesting quotes from interviews are also included. Cases are built around one main strategic objective that was the most important in each company: Case 1 – design for finding new opportunities; Case 2 – design for building strong brand and Case 3 – design for challenging status quo.*

## **Changing role of design**

The role of design has shifted considerably over the past few years. Design is now being recognized as a key business asset that can add significant value to business performance (Press & Cooper, 2003; Kristensen & Gronhaug, 2007; Brown, 2009). Traditionally, design was perceived mainly as visual appearance, aesthetics, external form of a product. In recent years, however, we can observe increased interest in design in a much broader sense - as a tool to support the creation of innovation, building strong brand, or even the strategy throughout the organization (Martin, 2009; Verganti, 2006, 2009). That led to growing attention in design management as an important business specialization, because, as Bruce and Bessant (2002) put it: 'Good design does not happen by accident, but rather as the result of a managed process'. At the same time, very few business professionals – or design professionals, know how to develop a design-minded organization (Lockwood, 2009). Borja de Mozota (2003) stresses that design is based on exploration and risk-taking, whilst management is founded on control and predictability, thus design management can present significant challenge to many organizations.

The Design Ladder (Ramlau & Melander, 2004; Nielsen, 2004) developed a framework to assess the degree of design activity implemented by businesses. The ladder categorises the design activities into four different levels. The levels are as follows:

- Non-design. In these businesses, design is a negligible part of the business, and is usually performed by other professionals than the designer.
- Design as styling. In these companies design is perceived solely as relating to the physical form of a product. Design activities may or may not be carried out by professional designers.
- Design as process. Design is not an end result, but rather a method of work adopted in the new product development process.
- Design as strategy. Design is of such critical importance that designer works with the company's management towards a holistic approach of doing business. (Ramlau & Melander, 2004; Nielsen, 2004; Frössén & Nielsén, 2008).

The growing interest in design among businesses means also changes in the roles and responsibilities of designers (Borja de Mozota, 2006). More and more authors opt for transfer certain competencies related to

management and marketing to designers (Von Stamm, 2003; Leonard & Rayport, 1997). In this area complementary to The Design Ladder tool is a work of Perks, Cooper & Jones who identified three roles that designers can play in manufacturing companies in the area of new product development (2005). Those three roles correspond with the steps of The Design Ladder presented above. These are defined as follows:

- Design functional actions (which corresponds with 'design as styling');
- Integration actions (which corresponds with 'design as process');
- NPD process leadership actions (which corresponds with 'design as strategy').

In the first case, when the design is considered as a specialized function, we have the traditional role of the designer, who is contracted to develop the physical form of the product. The role of the designer is mainly limited to issues related to the aesthetics of the product and the scope of his duties is associated with the artistic skills - sketching, modelling, visualization.

In the second case, when the design is treated as an integration, there is a full integration of the designer in the process of new product development - from idea generation phase to commercialization. The designer's role is expanding, as he becomes a member of the project team. In this area, the traditional role of the designer is extended to the issues related to the integration of various resources of the new product development process.

In the third case, the designer takes over the leadership of the new product development process. Designer's role is to actively participate in the process, but also to initiate and coordinate innovation process.

To have that theoretical knowledge in mind, it seemed interesting to ask how companies manage the design processes, how they develop cooperation with designers and what level of design maturity they present? To partly answer those questions, research project was developed.

Objective of this study was to empirically explore the nature of the current role of design within design-oriented companies ('design leaders') from Sweden and Poland (Starostka, 2012). This project was qualitative research aimed to compare managers' attitudes towards design; to look into existing processes in companies connected with design issues and to explore the different roles that designers play in organizations.

We've decided to narrow our study only to 'design leaders' in order to identify and compare best practices in both countries. In the process of

selecting companies, the following criteria have been taken into account: number of design awards ('Red Dot Design Award', 'The Design S' in Sweden and 'Dobry Wzór' in Poland), industry publications, consultations with design specialists and designers, companies' web-pages.

In this research 24 in-depth interviews were conducted among two groups of respondents: managers and designers. Interviews were carried out over a period of six months (from January to July 2010). Interviews were guided by a semi-structured questionnaire, ranged from one to two hours, were taped and transcribed. The broad themes of the questionnaire encompassed the following: company and respondent characteristics, attitudes towards design, design management, processes and strategies connected with design, the role of designer in a company and design-marketing interplay.

In this article we present partial results of this research. During this study many interesting strategies connected with design were identified, three of which we present in this article (there were in total 10 companies analysed in each country). As this article is limited in space, we present cases selected from the Swedish part of the research, as they presented more mature approach to design management. Company names are omitted for confidentiality reasons.

## **Design management practices**

### *Case study 1: Design for finding new opportunities*

This company was established in early 80' and emerged as one of Scandinavia's leading manufacturers of contemporary outdoor products. Company is managed by two owners, one of which is design manager – a woman who is a good in both sides of design management – she understands business, but at the same time she works very well with designers. As she admits:

*Design management? That is very good that you have theoretical background, but you have to understand it that this is not only about products, but about the whole appearance as well, how you communicate with people, it's about graphics, it's about everything. It's an idea how you want the company to be, not only to look like, but also to be.*

One of the most interesting aspects of this company is very unique structure. This company is quite small, as current employment is around 9 employees. As a furniture producer this firm does not have an internal production at all. They rely on very close cooperation with external manufacturing companies that provide technology and production:

*We don't have our own production, but we have very, very talented companies that we work with. With some of them we work with for a long, long time, but some of them are quite new to us as well. (...) That is one of the strengths of our company, that we had this type of organization from the beginning.*

This company acts like a broker between designers/architects and production companies, and a crucial part is networking with different specialists:

*You have to remember about personal contact, networking – that has always been important for us. To meet people it's really important I think. Especially when creating new thing it's crucial to meet with people.*

From one side they develop very close cooperation with production companies, from the other with designers and architects. That flexible model helps to find and fulfil new market opportunities. As design manager reflects, thanks to that strategy they have the opportunity to be open for new technologies, new methods of work and new production techniques. But what's even more important, they are not limited to one type of production technique, one type of material or process:

*I think that this is the best way to work, because if you have your own production you focus so much on it, you focus on the production, focus on the machines, and if you have the technology to bend, you're only thinking about bending things. And then you developing something with bending tool...*

This strategy also gives them the opportunity to continuously explore different market niches and new market opportunities. As one interviewee was reflecting:

*Another advantage is that you don't have to focus on the same market, for example now we develop bicycle shelters. So we don't*

*Different models of design management - three examples from the Swedish furniture industry*

*have to stay on the same way of thinking, but more thinking about the trends that are on the market. And you have to be aware of what is happening all the time (...). They are building now infrastructure with the train stations. And there is also market place for us!*

Although this company has no production in-house, they have developed very wide portfolio of designers they work with. It was also very unusual compared to the competition, as one manager reflected:

*And if you compare my company to others, that can look so strange that we have been working with so many designers, because they [competitors - JS] were working with one or two, or three maybe, and they didn't change their policy during 80' and 90' (...). I don't think that was so good for them, actually. Now I think they changed and started to work with broader group of designers and with designers from other countries as well to broaden the design.*

This unique approach gave them strong position on the market. In the opinion of design manager main source of competitive advantage is very high number of new products and very short cycles of developing them. Main source of competitive advantage is flexibility – the company is continuously looking for new product ideas. They have developed three main ways of the design process: (1) cooperation with architects on new products dedicated for different buildings; (2) product propositions send by designers and (3) 'traditional' design process initiated by the design brief:

*During the year, we have constantly new products on the run. Initiatives for those products come from different ways. One way is when an architect is working on a project and have a special product need – so if they have an idea about those products, we build this product together. And that is what we do a lot of times. (...) The second way is that we have this ongoing relation with the designers that we work with and (...) sometimes there is 1, or 2 or 3 that I work with at the same time. And they have lot of ideas what they want to do. The third way is when we feel that we lack product in a specific area. I give them [designers - JS] a brief and tell them that actually I want this type of product.*

To sum up, the design management model in this case study is built around the concept of broker/networker. This company cooperates only with external specialists – production companies and designers. Main two advantages are: flexibility and very fast process of new product development, as a reaction of identified market opportunity or market need.

Requirements when developing this model: close cooperation with wide network of (1) production companies, that can produce even very limited lines of product effectively, (2) designers, and (3) architects that very often are also furniture designers, and, at the same time, buyers of the final designs.

### *Case study 2: Design for building strong brand*

The second company was founded in early 1990' by two owners, one of which has been design manager since the beginning. Current employment is around 50 employees. Company has been growing rapidly to now become a leader in contract furniture market, with export to more than 50 countries. In this company design was used as a tool of building a strong brand. As manager reflects:

*I think good design is reflecting certain brand name. And if the product fits well into the brand and feels very new and fresh, you're successful designer. If it feels like a fantastic product but it doesn't speak with the brand it's not a very good project.*

This manager also acknowledges that external designers have to reflect each brand they cooperate with differently, which can raise specific challenges:

*To be external designer is one of the hardest profession, because you need to understand so many different things in different companies. You cannot simply go with your old language, you need to reflect the company you work for.*

In the design process, crucial part is to have good communication between designers and the company management ('sharing the same dream' as one interviewee said). Design manager was stressing that product development is very hard, as good communication with designer is crucial, but, at the same time, can be very challenging:

*Different models of design management - three examples from the Swedish furniture industry*

*Without sharing the same dream it's really hard to be successful. You cannot buy understanding. It's not that easy that any company can call anyone to get the fantastic product – you need the dialog in the company that connects to the external designer. Or if you work with your own designers, they need to have really sharp communication with the board, because design is about strategic questions. And in a lot of companies, they are not connected: design team is going in that direction and the board is not even interested in the field, they care only for money.*

As design manager was emphasizing, to use design as a tool for strong brand, you have to develop internal capabilities to manage the design process and the relationships with different designers. This company cooperates with external designers only – in company portfolio they have very well-known designers, but also very young, not very recognized ones. As design manager reflects, it's sometimes very hard to cooperate with those 'iconic' designers, as they are very often focused more on building their own brands, than on a company they work for:

*We have those icon-stars designers (...) and they act the same, no matter for what company they work for – they are their own brand marketers. And the real product design is a concern of different brands you work with.(...) And that is a problem for us sometimes – that we really like the person, we like what they do, but they misunderstand the situation and they try to sell their own brand. And that's not really how product design should be managed.*

Respondents were perceiving the role of design as brand-building in different international markets. When trying to establish a brand in foreign country, the most successful way is to start a cooperation with designer from abroad. As an illustration interviewee showed an example of a project developed by French designer, that was initiated with a goal to gain recognition in France. In this international context, local designers are very effective way to have access to local culture and increase local publicity.

In this company, similarly to the first example, ideas for new products also come from three different sources:

*We work in three different ways when it comes to design process. One is when people send us material, that wants to work with us, every month is about 500 proposals, and one proposal is like 9, 10, 15*

*different products, it takes two days to just look through that products. (...) I'm really rarely happy with things I find in this box, but very often you see a girls that is making a bowl in silver in a very special way, and you have that in mind, and you start to speak, you meet at the fair, and then you start to, not teach, but inform what your dream is, and if your dreams go together, you usually end up with a good product. The second step is when designers you've already worked with, you send them very specific brief in the area that the designer works with and you continue to work in that direction. Third way is that we make a lot of special projects: for hotels, offices, resorts, spas, whatever. And sometimes you see that this type of language for this specific project actually fits in the big market, so why don't we take it into standard product?*

Except the position of design manager this company developed very close cooperation with one designer, who is a part of "Design Advisory Board". They meet regularly with him (every two, three months), consulting current trends, product portfolio and market niches. This designer acts more like a brand consultant, less like traditional designer. As one design specialist was reflecting:

*They have XY who is a designer for them, but he is also the unofficial art director of the company...he leads them, advises them, looks at the ideas of others.*
