### General experimental considerations

All synthetic manipulations were performed using standard Schlenk techniques. Toluene was degassed and dried by refluxing over sodium-potassium alloy under nitrogen.

X-ray diffraction data on **1a**, **1b** and **2** were collected on an OXFORD Diffraction XCaliber2 CCD diffractometer using MoK $\alpha$  radiation.

SQUID measurements were carried out on polycrystalline samples of **1** and **2** by enclosing the sample in O-ring-sealed Kel-F capsules. The capsules were transferred to sample holders in a glovebox, transported to the SQUID magnetometer in a sealed Schlenk tube, and then rapidly transferred to the helium-purged sample space of the magnetometer. Corrections for diamagnetism were made using Pascal's constants.

**Synthesis of 1a and 1b.** A freshly prepared solution of sodium cyclopentadienide (37 mmol) in thf (60 mL) was added to a stirred suspension of anhydrous dysprosium(III) chloride (5.00 g, 18 mmol) in thf (100 mL) at 0°C. The mixture was refluxed for 16 hours and the solvent then evaporated under reduced pressure, producing a pale yellow solid. Sublimation of the yellow solid (10<sup>-3</sup> mbar/180°C) resulted in the formation of yellow single-crystals of [Cp<sub>2</sub>Dy( $\mu$ -Cl)]<sub>2</sub> (**1a**) and [Cp<sub>2</sub>Dy( $\mu$ -Cl)]<sub>∞</sub> (**1b**), suitable for X-ray diffraction. Total yield of [Cp<sub>2</sub>Dy( $\mu$ -Cl)]<sub>n</sub> (3.27 g, 54%). Elemental analysis calculated (%) for C<sub>10</sub>H<sub>10</sub>ClDy: C 36.60, H 3.07; found C 37.12, H 2.99.

**Synthesis of 2.** A mixed polymorph sample of **1a/1b** (1.50g, 2 mmol) was transferred to a Soxhlet apparatus and repeatedly extracted with hot thf for 6 hours. Slow cooling of the resulting yellow solution produced large yellow crystals of [Cp<sub>2</sub>Dy(thf)( $\mu$ -Cl)]<sub>2</sub> (**2**) (1.27 g, 70%). Elemental analysis calculated (%) for C<sub>14</sub>H<sub>18</sub>OCIDy: C 42.01, H 4.53; found C 41.93, H 4.40.

**Fig. S1.** Powder X-ray diffraction pattern of a mixed polymorph sample of **1a/1b**.

**Fig. S2.** Powder patterns of **1a** (left) and **1b** (right) calculated based on single-crystal diffraction data using the Mercury software. **1a** has a large single peak at  $6.3^\circ$ , and **1b** has large peaks at  $5.4^\circ$  and  $7.6^\circ$ .

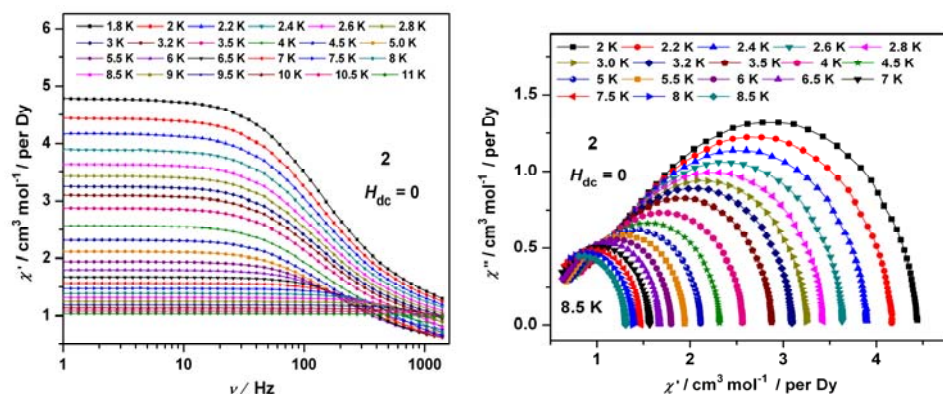

Isolated  $2\theta$  peaks are present in each compound that show little overlap, allowing the determination of a mixing ratio. The experimental powder patterns shows significant peaks at  $6.3^\circ$  and one at  $7.3^\circ$ , although no peak was observed at  $5.4^\circ$  due to the beam stop obscuring the diffraction. Matching the intensities of the  $6.3^\circ$  and  $7.3^\circ$  peaks in the experimental powder pattern with the calculated intensities for the  $6.3^\circ$  and  $7.6^\circ$  peaks yielded an approximate mixing ratio of 3:1 for **1a:1b**.
