ABSTRACT

The knowledge of trees damaged by termites in disturbed and natural areas of China is limited. Historically, termites are the most problematic pests threatening woody plants in China. They are abundant in tropical and subtropical environments and responsible for the loss of 40-60% of *Cunninghamia lanceolata* in southern hilly land. It has been estimated that termite damage in China results in approximately 1.8 billion RMB annually (equivalent to \$217 million US) economic loss. About 150 species of termites belonging to 4 families and 28 genera have been reported to infest plants. Correspondingly, 303 species of trees belonging to 76 families have been reported suffering from termite attack in China.

Key words: Termite damage, trees

INTRODUCTION

Termites living in colonies depend entirely on wood, either living or dead, or the woody tissue of plants, intact or partially decayed. They are important components of forest ecosystem, and are of great importance in recycling woody and other plant material. However, they become economic pests when they start destroying wood and wooden products of human homes, building materials, forests, and other commercial products (Verma *et al.* 2009).

Historically, termites are the most problematic pests threatening woody plants in China. They are abundant in tropical and subtropical environments. Unfortunately, the major species of trees found in Chinese forests are *Pinus* spp., China fir (*Cunninghamia lanceolata*), tea-oil tree (*Camellia oleifera*), bamboo (*Phyllostachys pubescens*), poplars (*Populus* spp.), willows (*Salix* spp.), elm (*Ulmus pumila*), and locust trees (*Robinia pseudoacacia*) (Hsiao 1982). It was reported that the percent of China fir infested by termites reaches 40%~60% in the southern hilly land of China (Ke *et al.* 2008). Moreover, as rapid urbanization occurs in China, the attack of termites on landscapes and garden plants also become more and more serious. It has been estimated that termite damage in China results in approximately 1.8 billion RMB annually (equivalent to \$217 million US) economic loss (Gao *et al.* 1986).

Currently, about 2800 termite species are recognized and classified in seven families (Aanen *et al.* 2002). Over 470 termite species, belonging to Hodotermitidae, Kalotermitidae, Rhinotermitidae, and Termitidae families, have been documented in China and these termite species are distributed mainly in the southern area of Yangtse River (Huang *et al.* 2000). Of which, Yunnan province has the highest species, which has 125 species of termites known (Mo *et al.* 2008).

Species of Termites Attacking Trees in China

In the last few decades, much more attention has been paid to the termites attacking trees by Chinese researchers, and about 150 species of termites belonging to 4 families and 28 genera have been reported to infest trees (Table 1) (Chen & Zhang 1993, Lin *et al.* 1994, Jiang & You 1995). Among them, *Coptotermes formosanus*, *Reticulitermes flaviceps*, *R. chinensis*, *Odontotermes formosanus*, and *Macrotermes barneyi* are the species with serious damage to trees.

Species of Trees Damaged By Termites

In China, about 76 families and 303 species of trees have been reported to suffer from termite attack (Table 2). Among them, *Cunninghamia lanceolata*, *Cinnamomum camphora*, *Eucalyptus* spp., *Salix babylonica*, and *Platanus orientalis* are the species damaged seriously by termites (Wang 2007, Lin 2007). The damage caused by termites has been widely noticeable, especially in valuable old trees in recent years. In some areas, 51.26%~76.05% of old trees are being or have been damaged by termites (Zhong *et al.* 2005).

Table 2. Species of trees damaged by termites (continued).

Family	Genera	Species	
Celastraceae	<i>Euonymus</i> Linn.	<i>E. alatus</i> (Thunb.) Sieb.	<i>E. japonicus</i> Linn.
Rutaceae	<i>Citrus</i> Linn.	<i>C. reticulata</i> Blanco	<i>C. grandis</i> (Linn.) Osbeck
		<i>C. sinensis</i> (Linn.) Osbeck	
	<i>Clausena</i> Burm. f.	<i>C. lansium</i> (Lour.) Skeels	
	<i>Euodia</i> Forst.	<i>E. lepta</i> (Spreng.) Merr.	
Ulmaceae	<i>Ulmus</i> Linn.	<i>U. parvifolia</i> Jacq.	<i>U. pumila</i> Linn.
		<i>U. chenmouli</i> Cheng	<i>U. gaußennii</i> Cheng
	<i>Zelkova</i> Spach	<i>Z. schneideriana</i> Hand.-Mazz.	
	<i>Pteroceltis</i> Maxim.	<i>P. tatarinowii</i> Maxim.	
	<i>Celtis</i> Linn.	<i>C. julianae</i> Schneid.	<i>C. sinensis</i> Pers.
Palmae	<i>Caryota</i> Linn.	<i>C. ochlandra</i> Hance	
	<i>Chrysalidocarpus</i> H. Wendl.	<i>C. lutescens</i> H. Wendl.	
	<i>Roystonea</i> O. F. Cook	<i>R. regia</i> (Kunth) O. F. Cook	
	<i>Trachycarpus</i> H. Wendl.	<i>T. fortunei</i> (Hook.) H. Wendl.	
	<i>Livistona</i> R. Br.	<i>L. chinensis</i> (Jacq.) R. Br.	
	<i>Cocos</i> Linn.	<i>C. nucifera</i> Linn.	
	<i>Elaeis</i> Jacq.	<i>E. guineensis</i> Jacq.	
	<i>Phoenix</i> Linn.	<i>P. dactylifera</i> Linn.	
Gramineae	<i>Phyllostachys</i> Sieb. et Zucc.	<i>P. glauca</i> McClure	
		<i>P. edulis</i> (Carrière) J. Houz.	<i>P. praecox</i> Chu et Chao
	<i>Bambusa</i> Retz. corr. Schreber	<i>Bambusa oldhamii</i> Munro	
Dipterocarpaceae	<i>Dipterocarpus</i> Gaertn. f.	<i>D. retusus</i> Blume	
	<i>Shorea</i> Roxb.	<i>S. robusta</i> C. F. Gaertn.	<i>S. assamica</i> Dyer
Burseraceae	<i>Canarium</i> Linn.	<i>C. album</i> (Lour.) Raeusch.	

ACKNOWLEDGMENTS

This work was supported financially by the Natural Science Foundation of China (Project No.: 30872030).
