ABSTRACT

The new goblin spider genus *Prethopalpus* is restricted to the Australasian tropics, from the lower Himalayan Mountains in Nepal and India to the Malaysian Peninsula, Indonesia, Papua New Guinea, and Australia. *Prethopalpus* contains those species with a swollen palpal patella, which is one to two times the size of the femur, together with a cymbium and bulb that is usually separated, although it is largely fused in four species. The type species *Opopaea fosuma* Burger et al. from Sumatra, and *Camptoscaphiella infernalis* Harvey and Edward from Western Australia are newly transferred to *Prethopalpus*. The genus consists of 41 species of which 39 are newly described: *P. ilam* Baehr (♂, ♀) from Nepal; *P. khasi* Baehr (♂), *P. madurai* Baehr (♂), *P. mahanadi* Baehr (♂, ♀), and *P. meghalaya* Baehr (♂, ♀) from India; *P. bali* Baehr (♂), *P. bellicosus* Baehr and Thoma (♂, ♀), *P. brunei* Baehr (♂, ♀), *P. deelemanae* Baehr and Thoma (♂), *P. java* Baehr (♂, ♀), *P. kranzae* Baehr (♂), *P. kropfi* Baehr (♂, ♀), *P. leuser* Baehr (♂, ♀), *P. magnocularis* Baehr and Thoma (♂), *P. pahang* Baehr (♂), *P. perak* Baehr (♂, ♀), *P. sabah* Baehr (♂, ♀), *P. sarawak* Baehr (♂), *P. schwendingeri* Baehr (♂, ♀), and *P. utara* Baehr (♂, ♀) from Indonesia and Malaysia; and *P. alexanderi* Baehr and Harvey (♂), *P. attenboroughi* Baehr and Harvey (♂), *P. blosfeldorum* Baehr and Harvey (♂), *P. boltoni* Baehr and Harvey (♂, ♀), *P. callani* Baehr and Harvey (♂, ♀), *P. cooperi* Baehr and Harvey (♂), *P. eberhardi* Baehr and Harvey (♂, ♀), *P. framenau* Baehr and Harvey (♂, ♀), *P. humphreysi* Baehr and Harvey (♂, ♀), *P. kintyre* Baehr and Harvey (♂), *P. scanloni* Baehr and Harvey (♂), *P. pearsoni* Baehr and Harvey (♂), *P. julianae* Baehr and Harvey (♂), *P. maini* Baehr and Harvey (♂, ♀), *P. marionae* Baehr and Harvey (♂, ♀), *P. platnicki* Baehr and Harvey (♂, ♀), *P. oneillae* Baehr and Harvey (♂), *P. rawlinsoni* Baehr and Harvey (♂), and *P. tropicus* Baehr and Harvey (♂, ♀) from Australia and Papua New Guinea. Three separate keys to species from different geographical regions are provided. Most species are recorded from single locations and only three species are more widely distributed. A significant radiation of blind troglobites comprising 14 species living in subterranean ecosystems in Western Australia is discussed. These include several species that lack abdominal scuta, a feature previously used to define subfamilies of Oonopidae.

INTRODUCTION

Goblin spiders of the family Oonopidae are a diverse group with over 755 described species in 83 genera (Platnick, 2011), but the unnamed species may number at least 2,000 species (Baehr et al., 2010). Goblin spiders are generally small in size (adult body length of 0.5–4.0 mm) and can be abundant in many terrestrial habitats including leaf litter, under bark of trees, in forest canopies, as inquilines, and in caves and other subterranean cavities (e.g., Wunderlich, 1994; Burger et al., 2002; Harvey and Edward, 2007b; Fannes and Jocqué, 2008; Platnick and Dupérré, 2009a, 2009b; Baehr and Harvey, 2010; Baehr et al., 2010; Baehr and Ubick, 2010; Platnick and Dupérré, 2010b). They occur on all continents and the Australasian fauna is extensive with the number of unnamed species greatly outnumbering the meager named fauna.

The discovery of *Opopaea fosuma* Burger et al. from Sumatra provided the opportunity to present extensive illustrations and a comprehensive description of an Asian gob-

lin spider (Burger et al., 2002). This species, however, exhibits differences from the typical morphology of species of *Opopaea* Simon (Platnick and Dupérré, 2009b), especially in the morphology of the male pedipalp, where the patella is about one to two times the size of the femur, connected to the femur sub-basally or submedially, and the cymbium is not fused to the bulb. Species of *Opopaea* have the male palpal patella several times longer than the femur, is connected to the femur medially, and the cymbium and bulb are completely fused (e.g., Saaristo, 2001; Saaristo and Marusik, 2008; Platnick and Dupérré, 2009b). The blind Australian subterranean troglobite *Camptoscaphiella infernalis* Harvey and Edward shows similar genitalic morphology to *O. fosuma*, but was placed in *Camptoscaphiella* Caporiacco by Harvey and Edward (2007b) due to the lack of the features diagnostic of *Opopaea*. Since then, a review of *Camptoscaphiella* (Baehr and Ubick, 2010) has shown consistent differences between *C. infernalis* and all species now attributed to *Camptoscaphiella*,

including the presence of spines on the anterior legs of *Camptoscapbiella* (Baehr and Ubick, 2010), and the lack of such spines in *C. infernalis* and *O. fosuma* (Burger et al., 2002; Harvey and Edward, 2007b).

The discovery of numerous new species from Australasia that are similar to *O. fosuma* and *C. infernalis* has allowed a better interpretation of their relationships. We here hypothesize that these species can be easily distinguished from *Opopaea* and *Camptoscapbiella* by the features discussed above, and we therefore propose a new genus, *Prethopalpus*, for these species. While the majority of species of this genus are rainforest litter-dwelling species, a significant radiation of troglobitic species was detected in the arid regions of Western Australia.

MATERIAL AND METHODS

The specimens examined for this study are lodged in the following museums: American Museum of Natural History, New York (AMNH); Australian National Insect Collection, Canberra, Australia (ANIC); Field Museum of Natural History, Chicago (FMNH); Muséum d'Histoire Naturelle, Geneva, Switzerland (MHNG); Natural History Museum, Bern, Switzerland (NMB); Queensland Museum, Brisbane, Australia (QM); Senckenberg Museum, Frankfurt am Main, Germany (SMF); National Natuurhistorische Museum, Leiden, Netherlands (RMNH); University of Turku, Finland (UTU); and Western Australian Museum, Perth, Australia (WAM).

Specimens were examined using a Leica MZ16A microscope. Photomicrographic images were produced using a Leica DFC 500 and the software program AutoMontage Pro Version 5.2 (p). Specimens prepared for scanning electron microscopy were dehydrated in 100% ethanol, critical-point dried, sputter coated, and imaged with a Hitachi S4700 SEM. Descriptions were generated with the aid of the Planetary Biodiversity Inventory (PBI) descriptive goblin spider database and shortened where possible. Drawings were done of the left palp. All measurements are in millimeters. Abbreviations are used in the text as follows: ALE, anterior lateral eyes; ALS, anterior lateral spinnerets; EF, epigastric fold; GR, groove

between tracheal spiracles; PL, median plate; PLE, posterior lateral eyes; PLS, posterior lateral spinnerets; PME, posterior median eyes; PMS, posterior median spinnerets. Scale bars for habitus and palpal images are 0.5 mm, and epigynes are 0.1 mm. Full-color, high-resolution versions of the images will be available on the goblin spider PBI website (<http://research.amnh.org/oonopidae>).

The species descriptions contain only the differences from the generic description. The description of the females includes just those differences from the male. To aid the reader, we treat species from different geographical separately, the first from India and Nepal, the second from Indonesia, Malaysia, Singapore, and Brunei, and the third from Australia and Papua New Guinea. Separate keys to species are provided for these regions.

Often older locality labels do not provide accurate geographical coordinates; latitudes and longitudes encased in parentheses indicate that the coordinates were obtained from the Google Earth website, and included in the locality information for mapping.

SYSTEMATICS

Family Oonopidae Simon, 1890

Prethopalpus new genus

TYPE SPECIES: *Opopaea fosuma* Burger et al., 2002.

DIAGNOSIS: Males of *Prethopalpus* resemble most species of *Opopaea* in having an enlarged palpal patella (e.g., figs. 62–130), but most species can be easily distinguished by the separate cymbium and bulb, which is fused in a few species (e.g., figs. 104–112); females and males lack a pair of small dorsolateral, triangular extensions on the pedicel as well as the paired curved scutal ridges on the scutopedicel region (e.g., fig. 537); females of *Prethopalpus* share with *Opopaea* the paddle-shaped sclerite and the naillike structure (e.g., figs. 134, 136), but have additionally a single, central receptaculum (e.g., figs. 58, 132, 134, 136) of various shapes.

ETYMOLOGY: The generic name refers to the swollen male pedipalpal patella (Greek *pretho*, “to swell, blow up, or inflate,” and

Figs. 1–10. *Prethopalpus fosuma* (Burger et al.), male (PBI_OON 16200). 1. Habitus, dorsal view. 2. Same, ventral view. 3. Same, lateral view. 4. Prosoma, anterior view. 5. Same, ventral view. 6. Same, dorsal view. 7. Same, lateral view. 8. Male palp, prolateral view 9. Same, dorsal view 10. Same, retrolateral view.

Latin *palpus*, “soft palm of the hand, feeler”). The gender is masculine.

DESCRIPTION: Total length of males 1.0–1.7, of females 1.2–1.8. Carapace pale orange to yellow-brown, without any pattern; ovoid in dorsal view (figs. 6, 16), pars cephalica flat or slightly elevated in lateral view (figs. 7, 17, 494, 506, 697), anteriorly narrowed to 0.49 times its maximum width or less, with rounded posterolateral corners, posterolateral edge without pits, posterior margin not bulging below posterior rim, anterolateral corners without extension or projections,

posterolateral surface with (e.g., figs. 41, 42) or without small spikes, surface of elevated portion of pars cephalica and sides smooth, striated, or strongly reticulate, thorax without depressions, fovea absent, without radiating rows of pits; rebordered (fig. 19), with or without denticles; plumose setae near posterior margin of pars thoracica absent; nonmarginal pars cephalica setae light or dark, needlelike, present in U-shaped row (figs. 19, 41); nonmarginal pars thoracica setae absent (fig. 42); marginal setae light or dark, needlelike. Clypeus margin slightly

Figs. 11–18. *Prethopalpus fosuma* (Burger et al.), female (PBI_OON 12377). 11. Habitus, dorsal view. 12. Same, ventral view. 13. Same, lateral view. 14. Prosoma, anterior view. 15. Same, ventral view. 16. Same, dorsal view. 17. Same, lateral view. 18. Female epigyne, ventral view.

rebordered, curved downward in frontal view (e.g., fig. 4), sloping forward in lateral view (e.g., fig. 7), high, ALE separated from edge of carapace by their radius or more, median projection absent; setae present, light or dark, needlelike. Eyes: absent or with six

eyes, well developed or reduced, subequal, ALE or PME largest (figs. 19, 357, 476), ALE circular, PME squared or circular, PLE circular; posterior eye row mostly recurved, sometimes straight or procurved from both above and front (figs. 357, 166, 195); ALE

Figs. 19–25. *Prethopalpus fosuma* (Burger et al.), male, scanning electron micrographs. 19. Prosoma, dorsal view. 20. Same, lateral view. 21. Same, ventral view. 22. Abdomen, ventral view. 23. Sperm pore, ventral view. 24. Spinnerets, lateral view. 25. Tarsal organ of left leg III, dorsal view. Scale bars = 200 μm (figs. 19–22), 50 μm (fig. 24), 10 μm (fig. 23), 2 μm (fig. 25).

separated by less than their radius, ALE-PLE touching, PME touching for less than half their length, PLE-PME touching. Sternum longer than wide (e.g., figs. 21, 43), yellowish white or pale orange, uniform, fused or not fused to carapace, median concavity absent, without or with shallow radial furrows between coxae I–II, II–III, III–IV (e.g., fig. 250), surface smooth, finely reticulate, coarsely reticulate, with or without pits,

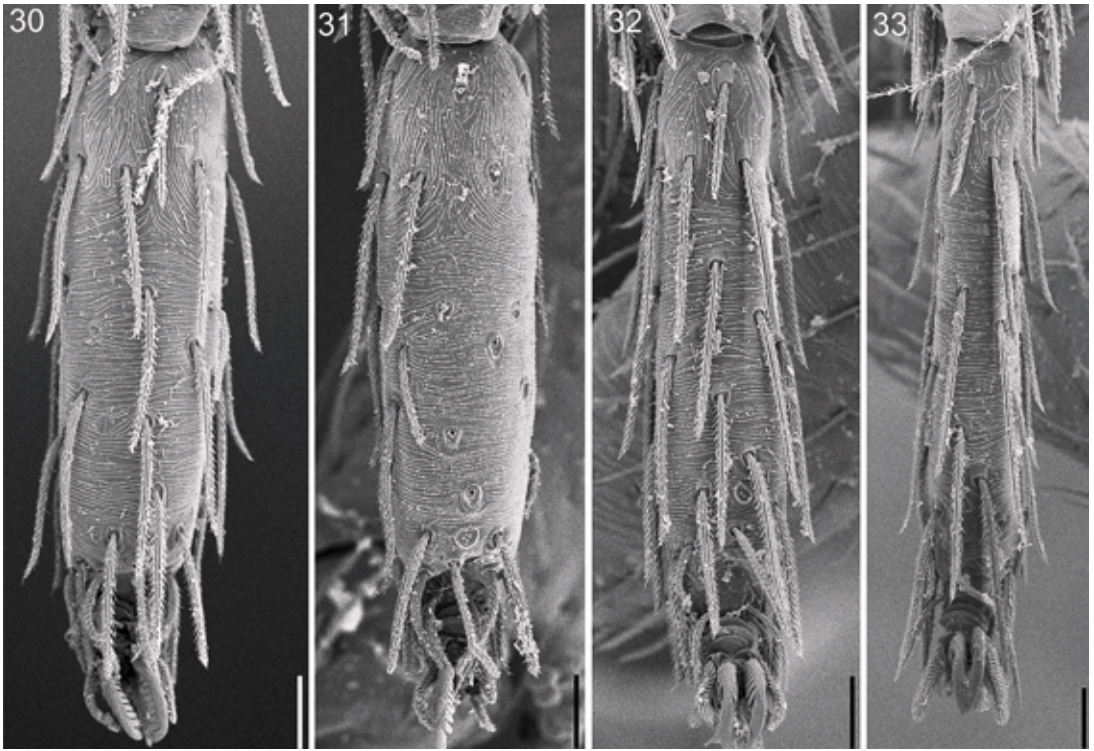

sickle-shaped structures absent, anterior margin unmodified (fig. 21), anterior corner unmodified, lateral margin with infracoxal grooves (fig. 21), distance between coxae approximately equal (fig. 21) or distance between coxae III and IV larger (fig. 695), with or without extensions of precoxal triangles (fig. 21), lateral margins unmodified, without posterior hump; posterior margin not extending posteriorly of coxae IV; setae

Figs. 26–29. *Prethopalpus fosuma* (Burger et al.), male metatarsi, dorsal view, scanning electron micrographs. 26. Left leg I. 27. Left leg II. 28. Left leg III. 29. Left leg IV. Scale bars = 20 μm .

sparse, light or dark, needlelike, evenly scattered, originating from small pits, without hair tufts. Mouthparts: chelicerae, endites, and labium pale orange. Chelicerae straight, anterior face unmodified; without teeth on promargin or retromargin; fang without toothlike projections, directed medially, shape normal, without prominent basal process, tip unmodified; setae needlelike, densest medially; paturon distal region unmodified, inner margin with scattered setae, posterior surface unmodified, promargin unmodified, inner margin unmodified, laminate groove absent or weakly developed. Labium (e.g., fig. 728) triangular, rarely trapezoidal or rectangular, fused or not to sternum, with two to five setae on anterior margin, subdistal portion with unmodified setae, anterior margin indented at middle, same as sternum in sclerotization. Endites distally not excavated, serrula present in single row (fig. 728), posteromedian part unmodified (fig. 728), anteromedian tip with small projection (fig. 728), same as sternum in sclerotization. Abdomen cylindrical or ovoid (figs. 22, 44, 488), without long posterior extension, rounded posteriorly, interscutal membrane rows of

small sclerotized platelets absent posteriorly; dorsum soft portions white, without color pattern. Book lung covers, ovoid (figs. 22, 44), without setae, anterolateral edge unmodified. Posterior spiracles connected by groove. Pedicel tube short, rarely long, ribbed, or plain (e.g., figs. 22, 44, 482), scutopedicel region unmodified (fig. 22), scutum not extending far dorsal of pedicel (figs. 7, 17), plumose hairs absent, matted setae on anterior ventral abdomen in pedicel area absent, cuticular outgrowths near pedicel absent. Dorsal scutum sclerotized (e.g., fig. 3) or absent (e.g., fig. 556); when present, yellow-brown to pale orange, without color pattern, covering full length of abdomen, no soft tissue visible from above, not fused to epigastric scutum (fig. 22), middle surface smooth, sides smooth, anterior half without projecting denticles; epigastric scutum weakly sclerotized, surrounding pedicel, not protruding or protruding, small lateral sclerites absent (figs. 2, 12); postepigastric scutum weakly sclerotized, pale orange to yellow brown, long, semicircular, covering nearly full length of abdomen, fused to epigastric scutum in males,

Figs. 30–33. *Prethopalpus fosuma* (Burger et al.), male tarsi, dorsal view, scanning electron micrographs. 30. Left leg I. 31. Left leg II. 32. Left leg III. 33. Left leg IV. Scale bars = 20 μ m.

with short posteriorly directed lateral apodemes (figs. 5, 18); spinneret scutum present as incomplete ring, with fringe of stout setae. Dorsum, epigastric area, and postepigastric area setae present, light or dark, needlelike. Dense patch of setae anterior to spinnerets absent. Interscutal membrane with setae. Colulus represented only by two setae (fig. 44). Spinnerets in females (based on *P. fosuma*, figs. 45, 46): ALS (fig. 46) with four long spigots; PMS (fig. 45) with one long spigot; PLS (fig. 45) with two shorter spigots; spinnerets in males (fig. 24) not examined in detail. Legs: pale orange, yellow, or white, without color pattern; femur IV not thickened, same size as femora I–III, patella plus tibia I nearly as long as carapace, or shorter, tibia I unmodified, tibia IV specialized hairs on ventral apex absent, tibia IV ventral scopula absent, metatarsi I and II mesoapical comb absent, metatarsi III and IV weak ventral scopula absent, without leg spination. Superior claws examined in detail in *P.*

fosuma (figs. 34–37); all surfaces striated; proclaws and retroclaws I–IV each with eight subapical teeth along inner margin; tarsi without inferior claw. Trichobothria: tibiae and metatarsi each with one distal trichobothrium (figs. 26–33, 48–51); base longitudinally narrowed, aperture internal texture not grate-like, hood covered by numerous low, closely spaced ridges. Tarsal organ of legs with two to three equal sized sensillae (figs. 31–33, 53, 54); tarsal organ of palpal tarsus with two sensillae (fig. 25). Male genitalia: epigastric region with small, circular or oval sperm pore situated at level of anterior spiracles (e.g., fig. 22), with or without strongly protruding extension (e.g., fig. 3), rebordered (fig. 23). Palp not strongly sclerotized, normal size, right and left palps symmetrical; trochanter normal size, unmodified; femur normal size, two or more times as long as trochanter, without posteriorly rounded lateral dilation; patella one to two times as long as femur, without prolateral row

Figs. 34–37. *Prethopalpus fosuma* (Burger et al.), male claws, scanning electron micrographs. 34. Left leg I, dorsal view. 35. Left leg II, lateral view. 36. Left leg III, dorsolateral view. 37. Left leg IV, dorsolateral view. Scale bars = 5 μ m.

of ridges, femur attaching to patella subbasally or submedially; setae unmodified; tibial trichobothria not examined; cymbium either not fused with bulb or nearly completely fused with bulb, but vestigial suture present; not extending beyond distal tip of bulb; bulb 1–1.5 times as long as cymbium, slender, tapering apically, plumose setae absent, without distal patch of setae, without stout setae. Embolus situated distally on bulb, usually long, bent medially, with or without conductor. Female genitalia (figs. 56–61): copulatory opening close to epigynal fold leading into single, central receptaculum variously shaped; small anterior sclerite variously shaped (e.g., figs. 134, 136); apodemes (fig. 57) originating close to epigynal fold, posteriorly directed, reaching beyond posterior groove.

BIOGEOGRAPHY: Species of *Prethopalpus* are found from the Himalayan Mountains through India and southeast Asia to New Guinea and northern Australia. The majority of species have been recorded from single locations, although some Asian and Australasian species are slightly more widespread (maps 1–10). Many species can be regarded as short-range endemics as defined by Harvey (2002) and Harvey et al. (2011).

Although the vast majority of species are ground-dwelling inhabitants of forest leaf litter, there is a remarkable radiation of 14 Australian troglobitic species showing full adaptations to a permanent subterranean lifestyle including the complete loss of eyes

and pale coloration. In addition to these characters, some species (*P. humphreysi*, *P. framenau*i, and *P. boltoni*) lack dorsal abdominal scuta. The presence or absence of abdominal scuta was used by Simon (1893) to define two separate groups of Oonopidae, the “Oonopidae loricatae” and “Oonopidae molles,” respectively, which were later formalized into the subfamilies Gamasomorphinae and Oonopinae by Petrunkevitch (1923). The utility of this single feature has long been debatable, and Platnick and Dupérré (2010a) recently cast doubt on whether Gamasomorphinae can be regarded as a monophyletic taxon based on this single feature.

The presence of obligate subterranean species of *Prethopalpus* in Western Australia is unique, as no other troglobitic species of *Prethopalpus* have been found across the range of the genus, and no epigeal species have been found in Australia west of eastern Queensland (maps 6–10). The presence of a suite of troglobitic species in the arid zone of Western Australia is consistent with patterns found in other arachnid taxa where the sole arid zone species are troglobites with the nearest epigeal representatives found in rainforests to the north in the Kimberley region of Western Australia, or to the east in Queensland (e.g., Harvey, 1993, 2001; Harvey and Edward, 2007a; Harvey and Volschenk, 2007; Harvey et al., 2008; Harvey and Leng, 2008; Platnick, 2008). This pattern is consistent with the hypothesis that the

Figs. 38–40. *Prethopalpus fosuma* (Burger et al.), male palp, scanning electron micrographs. **38.** Left palp, retrolateral view. **39.** Left embolus, anterolateral view. **40.** Tip of right embolus, retrolateral view. Scale bars = 100 μm (fig. 38), 20 μm (fig. 39), 2 μm (fig. 40).

gradual drying of Australia since the Miocene resulted in the formation of vast arid regions (Byrne et al., 2008), forcing the original rainforest fauna to extinction or, in some rare cases, to form subterranean populations that eventually have acquired troglotic adaptations (Guzik et al., 2011). We can find no morphological features to suggest that the subterranean *Prethopalpus* species form a monophyletic group, and it is likely that only molecular sequence data can test that hypothesis.

SPECIES FROM NEPAL AND INDIA

Key to Species

- 1. Males. 2
- Females (unknown for *P. khasi* and *P. madurai*). 6
- 2. Embolar region with conductor (figs. 62–67). 3
- Embolar region lacking conductor (figs. 68–76). 4
- 3. Conductor spatulate (fig. 64) *P. ilam*
- Conductor sickleshaped (fig. 67). *P. mahanadi*
- 4. Bulb ventrally bulging (figs. 68, 70, 197, 199); epigastric region strongly protruding (figs. 192, 196) *P. madurai*

- Bulb not ventrally bulging (figs. 71, 74); epigastric region not protruding (figs. 163, 167) . . . 5
- 5. Palpal femur about 1.4 times as long as patella, embolus slightly bent (figs. 74, 76, 168, 170) *P. khasi*
- Palpal femur about as long as patella embolus strongly bent (figs. 71, 73, 226–228). *P. meghalaya*
- 6. Copulatory opening broadly oval, with apical sclerotized hood; internal genital region with anterior sclerite rounded (figs. 135, 136) *P. meghalaya*
- Copulatory opening rounded, without apical hood; internal genital region different . . . 7
- 7. Internal genital region with anterior sclerite circular and drawn to a fine point (fig. 132). *P. ilam*
- Internal genital region with anterior sclerite T-shaped (fig. 134) *P. mahanadi*

***Prethopalpus khasi* Baehr, new species**
 Figures 74–76, 161–170; map 1

TYPE: INDIA: Meghalaya: Male holotype from Khasi Hills, au-dessus de Shillong, 25.56666°N, 91.88333°E, 1850 m (25 Oct. 1978, D. Burckhardt and I. Löbl), deposited in MHNG (PBI_OON 00023387).

ETYMOLOGY: The specific name is a noun in apposition taken from the type locality.

DIAGNOSIS: Males resemble those of *P. meghalaya*, also from India, in general

Map 1. Distribution records of *Prethopalpus khasi* (●), *P. ilam* (▲), *P. madurai* (■), *P. mahanadi* (★) and *P. meghalaya* (□).

habitus and eye sizes, but can be easily recognized by the much longer palpal femur, which is 1.4 times as long as the patella (figs. 74, 76).

MALE (PBI_OON 23387, figs. 161–170): Total length 1.22. Prosoma, mouthparts, and abdominal scuta pale orange, surface of elevated portion of pars cephalica smooth, sides finely reticulate; lateral margin without denticles. Eyes: six, tiny; ALE 0.037; PME 0.024; PLE 0.023; ALE largest, all eyes circular; posterior eye row straight from both above and front; ALE separated by their radius to diameter, ALE-PLE separated by less than ALE radius, PME separated by less than their radius, PLE-PME separated by less than PME radius. Sternum longer than wide, surface smooth, without pits, microsculpture absent, extensions of precoxal triangles absent. Endites twice as long as wide, with tiny toothlike projection. Abdomen ovoid; book lung covers large; pedicel tube short, ribbed. Dorsal scutum covering full length of abdomen, middle surface smooth, sides smooth; epigastric scutum not

protruding; postepigastric scutum, almost rectangular, covering nearly full length of abdomen. Legs yellow; patella plus tibia I nearly as long as carapace. Sperm pore oval. Palp yellow; embolus light; femur about 1.4 times as long as patella, connected subbasally, patella slightly swollen, bulb well separated from cymbium, pyriform, with thin, medially bent embolus (figs. 74–76).

FEMALE: Unknown.

OTHER MATERIAL EXAMINED: INDIA: Meghalaya: Khasi Hills, au-dessus de Shillong, 25.56666°N, 91.88333°E, 1850 m, 25 Oct. 1978, D. Burckhardt and I. Löbl, 1 ♂ (MHNG, PBI_OON 00023387).

DISTRIBUTION: *Prethopalpus khasi* is known only from the Khasi Hills in northern India (map 1).

Figs. 41–47. *Prethopalpus fosuma* (Burger et al.), female, scanning electron micrographs. **41.** Prosoma dorsal view. **42.** Same, lateral view. **43.** Same ventral view. **44.** Abdomen, ventral view. **45.** Spinnerets, posterolateral view. **46.** Spigots, posterolateral view. **47.** Tarsal organ of left leg III, dorsal view. Scale bars = 200 μm (figs. 41–47), 50 μm (fig. 45), 10 μm (fig. 46), 2 μm (fig. 47).

Mountains [26.90000°N, 87.93000°E], 270 m (3–5 Apr. 1988, Martens and Schawaller), deposited in SMF (PBI_OON 00023390). Female allotype collected with holotype, deposited in SMF (PBI_OON 00023391).

ETYMOLOGY: The specific name is a noun in apposition taken from the type locality.

DIAGNOSIS: This species resembles those of *P. mahanadi* from India in body shape and eye size; males have a conductor at the tip of the bulb but can be easily recognized by the

spatulate shape of the conductor (figs. 62–64). Females can be separated by the long and square internal genital structure, with the anterior sclerite circular and drawn to a fine point (fig. 132).

MALE (PBI_OON 15765, figs. 171–180): Total length 1.30. Carapace, mouthparts, and abdominal scuta pale orange, surface of elevated portion of pars cephalica smooth, sides smooth; lateral margin without denticles. Eyes: ALE 0.058; PME 0.049; PLE

Figs. 48–51. *Prethopalpus fosuma* (Burger et al.), female metatarsi, dorsal view, scanning electron micrographs. 48. Left leg I. 49. Left leg II. 50. Left leg III. 51. Left leg IV. Scale bars = 20 μ m.

0.040; ALE largest, ALE circular, PME squared, PLE circular; posterior eye row procurved from above, straight from front; ALE separated by their radius to diameter, ALE-PLE separated by less than ALE radius, PME touching throughout most of their length, PLE-PME touching. Sternum longer than wide, surface smooth, covered with small round pits, extensions of precoxal triangles absent. Endites about 1.5 times as long as wide, with small blunt toothlike projection. Abdomen ovoid; book lung covers large; pedicel tube short, ribbed. Dorsal scutum covering full length of abdomen, middle surface smooth, sides smooth; epigastric scutum not protruding; postepigastric scutum long, almost rectangular, covering nearly full length of abdomen. Legs yellow; patella plus tibia I shorter than carapace. Palp yellow; embolus dark, distal tip with large spatulate conductor and big retrodorsal concavity; femur attaching to patella subbasally; patella about as long as femur; cymbium not fused with bulb, bulb distal tip with large spatulate conductor and big retrodorsal concavity (figs. 62–64).

FEMALE (PBI_OON 23391, figs. 181–189): Total length 1.49. Eyes: ALE 0.049; PME 0.041; PLE 0.033. Epigastric area with oval epigynal opening, internal genital structure long and square, with anterior drop-shaped sclerite (figs. 131, 132).

OTHER SPECIMENS EXAMINED: **NEPAL:** *Bagmati:* Godawari, 27.60000°N, 85.40000°E, 1600 m, 31 Mar. 1984, I. Löbl, A. Smetana, 1 ♀ (MHNG, PBI_OON 00015515); Ilam District, between Mai Pokhari and Ilam [26.90000°N, 87.93000°E], 1330 m, 1 Apr. 1980, Martens and Ausobsky, 5 ♀ (SMF, PBI_OON 00015790); Ilam District, Sanishare, 5 km N, base of Siwalik Mountains [26.90000°N, 87.93000°E], 270 m, 3–5 Apr. 1988, Martens and Schawaller, 1 ♂ (SMF, PBI_OON 00015765); Lamjung District, Marsyandi, Senghe-Jagat [28.25000°N, 84.41667°E], 1100 m, 11 Apr. 1980, Martens and Ausobsky, 1 ♀ (SMF, PBI_OON 00015789).

DISTRIBUTION: This species is known only from Nepal (map 1).

Prethopalpus madurai Baehr, new species
Figures 68–70, 190–199; map 1

TYPE: Male holotype from **INDIA: Tamil Nadu:** 21 km N of Madurai, 9.83333°N,

Figs. 52–55. *Prethopalpus fosuma*, female tarsi, dorsal view, scanning electron micrographs. **52.** Left leg I. **53.** Left leg II. **54.** Left leg III. **55.** Left leg IV. Scale bars = 20 μ m.

78.08333°E, 250 m (2 Nov. 1978, C. Besuchet and I. Löbl), deposited in MHNG (PBI_OON 00015598).

ETYMOLOGY: The specific name is a noun in apposition taken from the type locality.

DIAGNOSIS: Males resemble those of *P. attenboroughi* from Australia in body shape, eye size, and palpal shape, but can be easily separated by the more spherical, ventrally bulging bulb (figs. 68, 70).

MALE (PBI_OON 15598, figs. 190–199): Total length 1.27. Prosoma, mouthparts, and abdominal scuta pale orange, finely reticulate; lateral margin without denticles. Eyes: six, small, ALE 0.036; PME 0.032; PLE 0.034; ALE largest, all eyes circular; posterior eye row procurved from both above and front; ALE separated by their radius to diameter, ALE-PLE separated by less than ALE radius, PME separated by less than their radius, PLE-PME separated by less than PME radius. Sternum longer than wide, surface coarsely reticulate. Endites twice as long as wide, with tiny toothlike projection. Abdomen ovoid; book lung covers large; pedicel tube short, ribbed. Dorsal scutum covering more than $\frac{3}{4}$ of abdomen, smooth; epigastric scutum strongly protruding; post-

epigastric scutum long, semicircular, covering about $\frac{3}{4}$ of abdomen, without posteriorly directed lateral apodemes. Legs yellow; patella plus tibia I nearly as long as carapace. Epigastric region with oval sperm pore and strongly protruding extension. Palp yellow; embolus light; femur attaching to patella subbasally; patella longer than femur; cymbium not fused with bulb, bulb ventrally bulging, embolus ending in a blunt tip (figs. 68–70).

FEMALE: Unknown.

OTHER MATERIAL EXAMINED: None.

DISTRIBUTION: *Prethopalpus madurai* is known only from Madurai in India (map 1).

Prethopalpus mahanadi Baehr, new species
Figures 65–67, 133, 134, 200–218; map 1

TYPES: INDIA: West Bengal: Male holotype from District Darjeeling, Mahanadi près de Kurseong [26.8550°N, 88.8120°E], 1200 m, 6 Oct. 1978 (C. Besuchet and I. Löbl), deposited in MHNG (PBI_OON 00015408). Female allotype collected with holotype, deposited in MHNG (PBI_OON 00012700).

ETYMOLOGY: The specific name is a noun in apposition taken from the type locality.

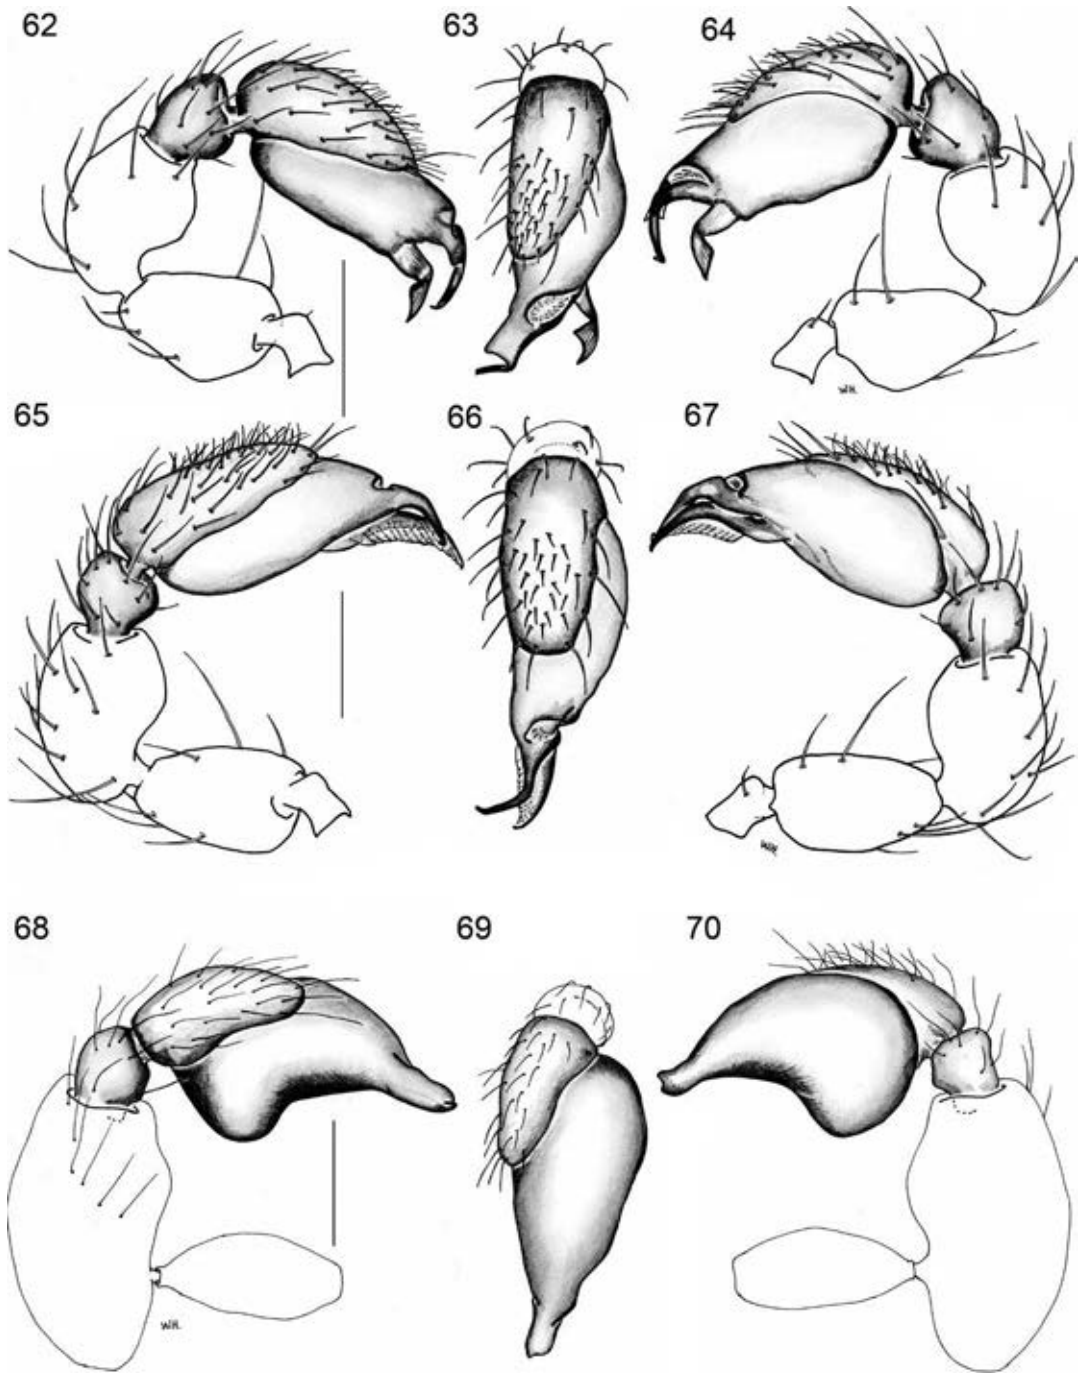

Figs. 56–61. *Prethopalpus fosuma* (Burger et al.), female genital area and internal genitalia, scanning electron micrographs. **56.** Genital area, ventral view. **57.** Internal genitalia, dorsal view. **58.** Receptaculum, lateral view. **59.** Uterus externus and T-shaped sclerite, posterior view. **60.** Gland ducts around receptaculum, lateral view. **61.** Close up of gland ducts around receptaculum. Scale bars = 50 μm (figs. 56, 57), 10 μm (figs. 58, 59), 2 μm (fig. 60), 0.5 μm (fig. 61).

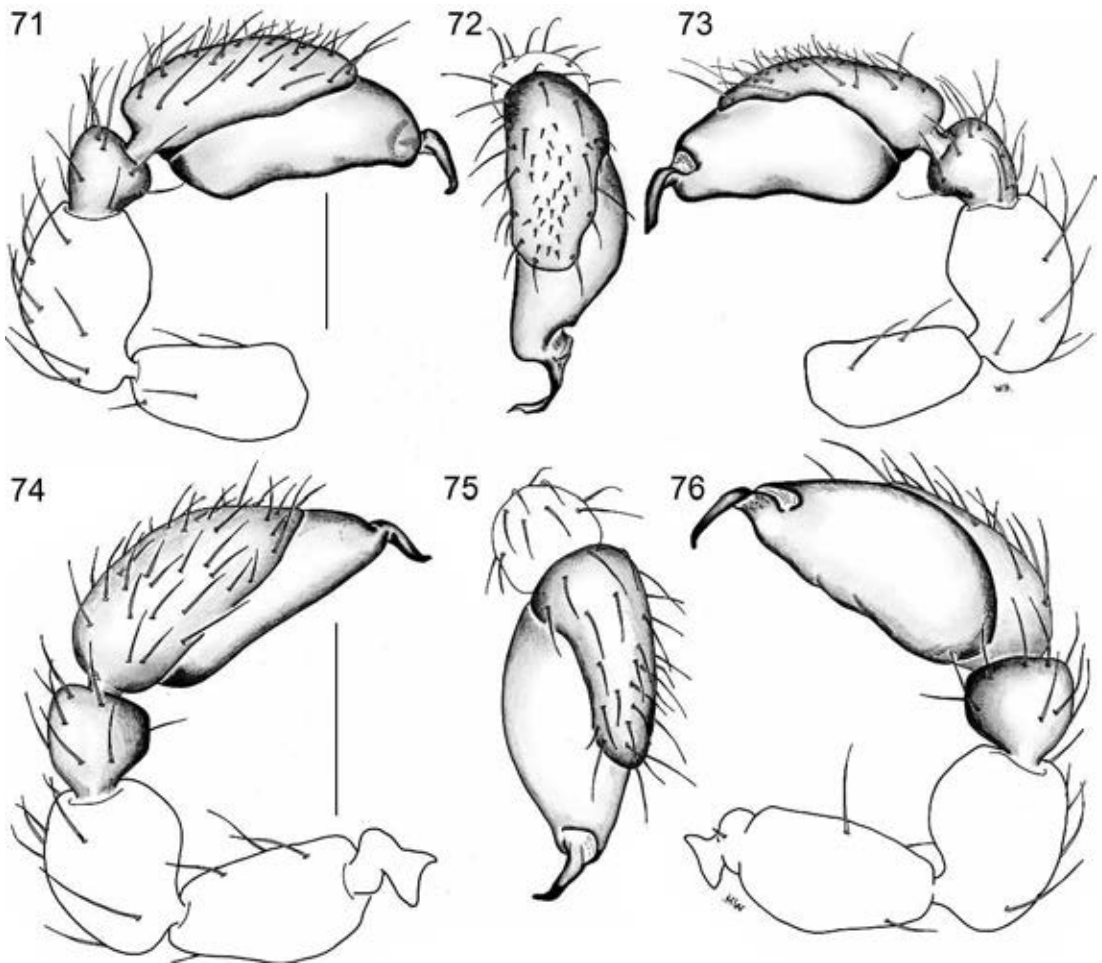

DIAGNOSIS: The species resembles *P. ilam*, also from India, in body shape and eye size; males in having a conductor at the tip of the bulb, but can be easily recognized by the sickleshaped conductor (figs. 65–67). Females can be separated by the internal genital structure with T-shaped anterior sclerite (fig. 134).

MALE (PBI_OON 15408, figs. 200–209): Total length 1.54. Prosoma, mouthparts, and

abdominal scuta pale orange, carapace surface smooth, sides slightly striated; lateral margin without denticles. Eyes: ALE 0.047; PME 0.042; PLE 0.038; ALE largest, ALE circular, PME oval, PLE circular; posterior eye row recurved from above, straight from front; ALE separated by their radius, ALE-PLE separated by less than ALE radius, PME touching for less than half their length, PLE-PME separated by less than PME

Figs. 62–70. Left palps, male: *Prethopalpus ilam*, n. sp. (PBI_OON 23390), *Prethopalpus mahanadi*, n. sp. (PBI_OON 15408), *Prethopalpus madurai*, n. sp. (PBI_OON 15598). 62. *P. ilam*, prolateral view. 63. Same, dorsal view. 64. Same, retrolateral view. 65. *P. mahanadi*, prolateral view. 66. Same, dorsal view. 67. DISTRIBUTION: This species is known only from West Bengal in India (map 1).

Prethopalpus meghalaya Baehr, new species
Figures 71–73, 135, 136, 219–237; map 1

TYPES: INDIA: Meghalaya: Male holotype from Khasi Hills, Mawphlang, 25.56666°N, 91.88333°E, 1800 m, 28 Oct. 1978 (C. Besuchet and I. Löbl), deposited in MHNG (PBI_OON 00015410). Female allotype collected with holotype, deposited in MHNG (PBI_OON 00015410).

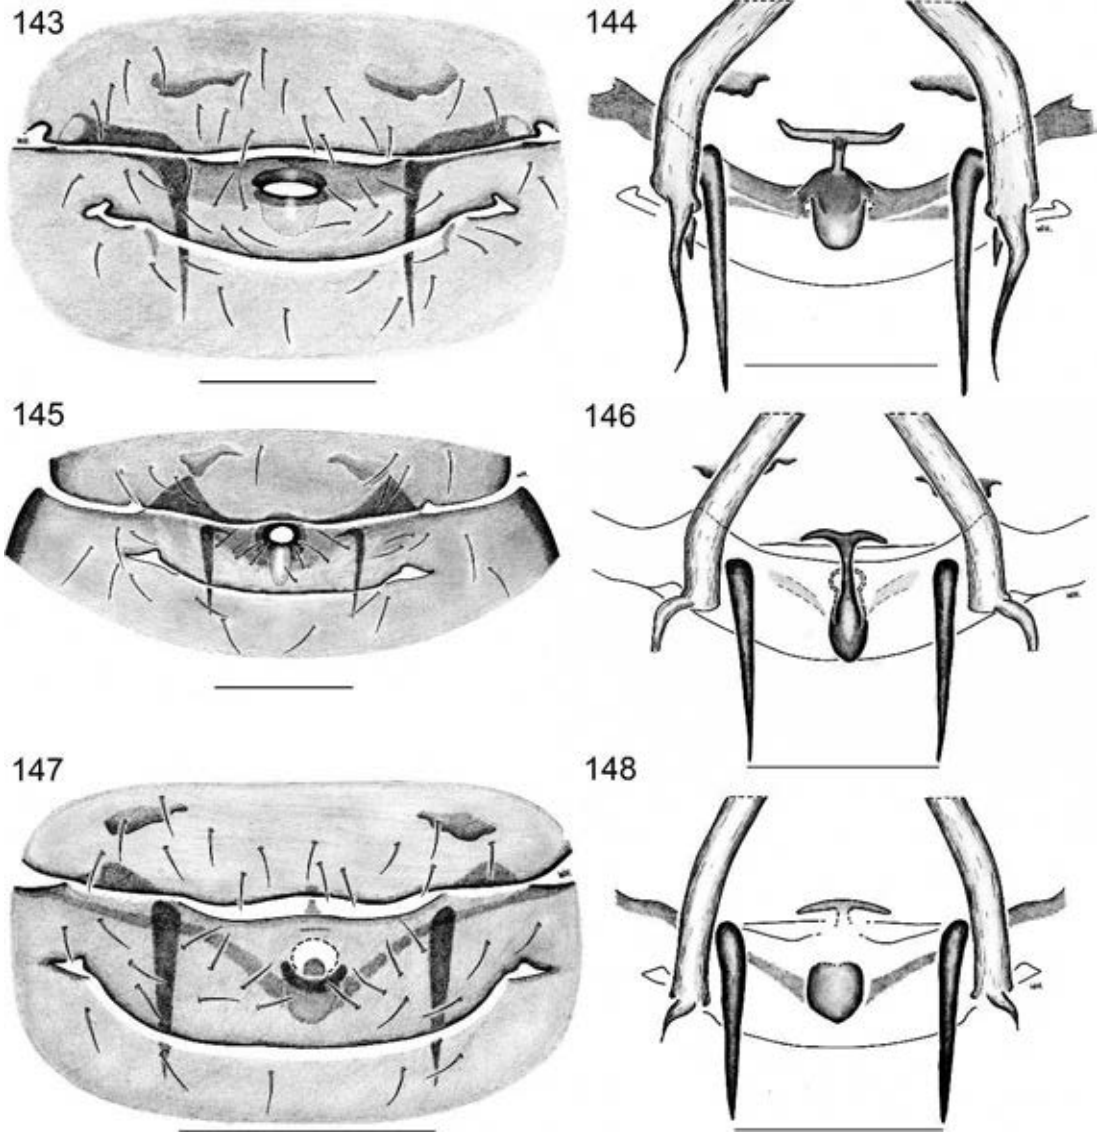

Figs. 137–142. Female epigyna. **137.** *Prethopalpus utara*, n. sp. (PBI_OON 23392), ventral view. **138.** Same, dorsal view. **139.** *P. fosuma* (Burger, Nentwig, and Kropf) (PBI_OON 12377), ventral view. **140.** Same, dorsal view, including detail of vulva, dorsal view (bottom left) and ventral view (bottom right) (from Burger et al. 2002) (arrow = sclerite bearing naillike structure; arrowheads = sclerites functioning as muscle attachments). **141.** *P. leuser*, n. sp. (PBI_OON 23397), ventral view. **142.** Same, dorsal view.

ETYMOLOGY: The specific name is a noun in apposition taken from the type locality.

DIAGNOSIS: Males resemble those of *P. khasi*, also from India, in general body shape

and by lacking a palpal conductor, but can be easily recognized by having a recurved posterior eye row (figs. 219, 224), a larger palpal patella, and a marginally sclerotized embolus

Figs. 143–148. Female epigyna. **143.** *Prethopalpus schwendingeri*, n. sp. (PBI_OON 12426), ventral view. **144.** Same, dorsal view. **145.** *P. brunei*, n. sp. (PBI_OON 16225), ventral view. **146.** Same, dorsal view. **147.** *P. java*, n. sp. (PBI_OON 16211), ventral view. **148.** Same, dorsal view.

(figs. 71–73). Females can be separated from those of all other Indian species by having the epigynal opening broadly oval with an apical sclerotized hood (fig. 135), internal genital structure long and oval, medially constricted, with circular anterior receptaculum (figs. 135, 136).

MALE (PBI_OON 15410, figs. 219–228): Total length 1.77. Prosoma, mouthparts, and abdominal scuta pale orange, elevated por-

tion of pars cephalica smooth, sides granulate; lateral margin without denticles. Eyes: ALE 0.062; PME 0.054; PLE 0.051; ALE largest, ALE circular, PME oval, PLE circular; posterior eye row recurved from above, straight from front; ALE separated by less than their radius, ALE-PLE separated by less than ALE radius, PME touching for less than half their length, PLE-PME separated

Figs. 149–154. Female epigyna. **149.** *Prethopalpus sabah*, n. sp. (PBI_OON 12313), ventral view. **150.** Same, dorsal view. **151.** *P. peraki*, n. sp. (PBI_OON 12515), ventral view. **152.** Same, dorsal view. **153.** *P. kropfi*, n. sp. (PBI_OON 23394), ventral view. **154.** Same, dorsal view.

by less than PME radius. Sternum longer than wide, surface smooth, covered with small round pits. Endites about 1.5 times as long as wide, with short, square toothlike projection. Abdomen ovoid; book lung covers large; pedicel tube short, ribbed. Dorsal scutum covering full length of abdomen, smooth; epigastric scutum not protrud-

ing; postepigastric scutum, long, almost rectangular, covering nearly full length of abdomen. Legs yellow; patella plus tibia I nearly as long as carapace. Palp yellow, embolus dark; femur attaching to patella subbasally; patella about as long as femur, enlarged; cymbium not fused with bulb, bulb pyriform distally with triangular, medially

bent embolus with dark sclerotized margins (viewed laterally) (figs. 71–73).

FEMALE (PBI_OON 15409, figs. 229–237): Total length 1.62. Eyes: ALE 0.044; PME 0.038; PLE 0.032. Epigastric area with epigynal opening broadly oval and apical sclerotized hood; internal genital structure long, oval, and medially constricted; anterior receptaculum circular (figs. 135, 136).

OTHER MATERIAL EXAMINED: INDIA:

Assam: Manas [26.72500°N, 91.03600°E], 200 m, 21–22 Oct. 1978, C. Besuchet and I. Löbl, 1 ♂ (MHNG, PBI_OON 00015391).

Meghalaya: Garo-Hills, above Tura [25.56000°N, 89.49000°E], 700 m, 1 Nov. 1978, C. Besuchet and I. Löbl, 1 ♂, 2 ♀ (MHNG, PBI_OON 00015409); Khasi Hills, au-dessus de Shillong, 25.56666°N, 91.88333°E, 1850 m, 25 Oct. 1978, D. Burckhardt and I. Löbl, 1 ♂ (MHNG, PBI_OON 00012714); same location, 30 Oct. 1978, C. Besuchet and I. Löbl, 1 ♂ (MHNG, PBI_OON 00012686).

DISTRIBUTION: This species is known from Assam and Meghalaya districts in India (map 1).

SPECIES FROM INDONESIA, MALAYSIA, SINGAPORE, AND BRUNEI

Key to Species

- 1. Males. 2
- Females (unknown for *P. bali*, *P. deelemanae*, *P. kranzae*, *P. magnocularis*, *P. pahang* and *P. sarawak*). 17
- 2. Eyes reduced (fig. 339); palpal bulb bulging dorsodistally (figs. 92, 94, 341, 343) . . . *P. leuser*
- Eyes well developed (e.g., figs. 6, 311); palpal bulb not bulging dorsodistally (e.g., figs. 8, 107) 3
- 3. Cymbium and bulb completely separated (e.g., figs. 95–100) 4
- Cymbium and bulb only partly separated marked by pits (figs. 102–112) 12
- 4. Embolar region with conductor and ventral apophysis (fig. 255) *P. bellicosus*
- Embolar region lacking conductor and apophysis (figs. 77, 100) 5
- 5. Embolus as long as bulb, with velum (figs. 95–97) *P. sarawak*
- Embolus shorter, without velum (figs. 77–91, 98–100) 6
- 6. Carapace strongly granulate (e.g., figs. 311, 312, 376, 377) 7

- Carapace smooth, finely reticulate, or finely granulate (e.g., figs. 243, 244) 8
- 7. Carapace posterolateral surface with a pair of spikes, lateral margin with sharply pointed denticles (figs. 311, 312) *P. kranzae*
- Carapace without spikes or sharply pointed denticles (figs. 376, 377) *P. perak*
- 8. Embolar tip bifid (e.g., figs. 98–100) 9
- Embolar tip pointed (e.g., figs. 77–79) 10
- 9. Embolus short, more or less straight in dorsal view (fig. 99, 246) *P. bali*
- Embolus longer, bent medially (fig. 87) *P. pahang*
- 10. Embolus short, broad, medially bent (fig. 93) *P. utara*
- Embolus long and thin (figs. 77–79) 11
- 11. Carapace sides with three upturned granulate patches (figs. 7, 20) *P. fosuma*
- Carapace sides continuously granulate (fig. 425, 426) *P. schwendingeri*
- 12. Sternum with whole surface strongly reticulate (e.g., fig. 393) 13
- Sternum with sides strongly reticulate and centre smooth (e.g., fig. 320) 15
- 13. Palpal femur about twice as long as patella (figs. 107, 109) *P. sabah*
- Palpal femur shorter (figs. 113, 115) 14
- 14. Bulbal tip broad with ventral concavity, embolus short (figs. 101–103) *P. java*
- Bulbal tip ending in thin, medially bent embolus (figs. 110–112) *P. brunei*
- 15. Sternum with median smooth area shaped like an inverted drop (fig. 320) *P. kropfi*
- Sternum with median smooth area a longitudinal band (e.g., fig. 284) 16
- 16. Eyes extremely large (figs. 353, 356, 357) *P. magnocularis*
- Eyes much smaller (fig. 283) *P. deelemanae*
- 17. Eyes reduced (fig. 349); epigastric area with procurved sclerotized area posterior to genital opening (fig. 141) *P. leuser*
- Eyes well developed; epigastric area without procurved sclerotized area (e.g., fig. 258) 18
- 18. Sternum with median area smooth and shaped like an inverted drop (fig. 261) 19
- Sternum with entire surface reticulate (e.g., figs. 301, 383, 404) 21
- 19. Epigynal opening extremely wide and procurved (fig. 258) *P. bellicosus*
- Epigynal opening much smaller and not procurved (figs. 281, 329) 20
- 20. Internal genital structure with anchor-shaped sclerite anteriorly (fig. 146) *P. brunei*
- Internal genital structure with T-shaped sclerite anteriorly (fig. 154) *P. kropfi*
- 21. Carapace sides strongly striated, top punctate (fig. 303) *P. java*

- Carapace granulate or smooth (e.g., figs. 42, 388) 22
- 22. Carapace sides and top granulate (fig. 388) *P. perak*
- Carapace at least top smooth (e.g., fig. 405) 23
- 23. Carapace sides and top smooth, only few rows of punctation (figs. 405, 406); epigynal opening broad and slitlike (figs. 149, 408) *P. sabah*
- Carapace sides granulate, top smooth (e.g., fig. 41); epigynal opening small, oval (e.g., fig. 137) 24
- 24. Carapace sides with three almost recurved granulate patches (fig. 42) *P. fosuma*
- Carapace sides continuously granulate (figs. 432, 451) 25
- 25. Internal genital structure spinelike, nearly reaching tracheal groove (fig. 138) *P. utara*
- Internal genital structure short and rounded, not reaching tracheal groove (fig. 144) *P. schwendingeri*

Prethopalpus bali Baehr, new species
 Figures 98–100, 238–247; map 2

TYPE: **INDONESIA: Bali:** Male holotype from northern Bali, between Busungbiu and Pupuan, 8.30110°S, 114.95330°E, 650 m (19–22 Dec. 2007, A. Schultz), deposited in MHNG (PBI_OON 00016128).

ETYMOLOGY: The specific name is a noun in apposition taken from the type locality.

DIAGNOSIS: Males resemble those of *P. pahang* in body shape and having a bipartite embolar tip, but can be easily recognized by the short, more or less straight, bipartite embolus in dorsal view (fig. 99).

MALE (PBI_OON 16128, figs. 238–244): Total length 1.12. Prosoma, mouthparts, and abdominal scuta pale orange, surface of elevated portion of pars cephalica smooth, sides granulate; lateral margin without denticles. Eyes small, ALE 0.039; PME 0.024; PLE 0.023, ALE circular, PME oval, PLE circular; posterior eye row straight from above, straight from front; ALE separated by their radius to diameter, ALE-PLE separated by less than ALE radius, PME touching for less than half their length, PLE-PME separated by less than PME radius. Sternum longer than wide, surface not finely reticulate, without pits. Endites about twice as long as wide; toothlike projection hook shaped and bent medially. Abdomen ovoid; book lung covers large; pedicel tube short,

ribbed. Dorsal scutum covering full length of abdomen, smooth; epigastric scutum not protruding; postepigastric scutum, long, almost rectangular, covering nearly full length of abdomen, with long posteriorly directed lateral apodemes. Legs yellow; patella plus tibia I shorter than carapace. Epigastric region with oval sperm pore oval. Palp yellow; embolus light; femur attaching to patella subbasally; patella about as long as femur, enlarged; cymbium not fused with bulb, pyriform with bipartite, medially bent embolus (figs. 98–100, 245–247).

FEMALE: Unknown.
 OTHER MATERIAL EXAMINED: None.

DISTRIBUTION: This species is known only from Bali (map 2).

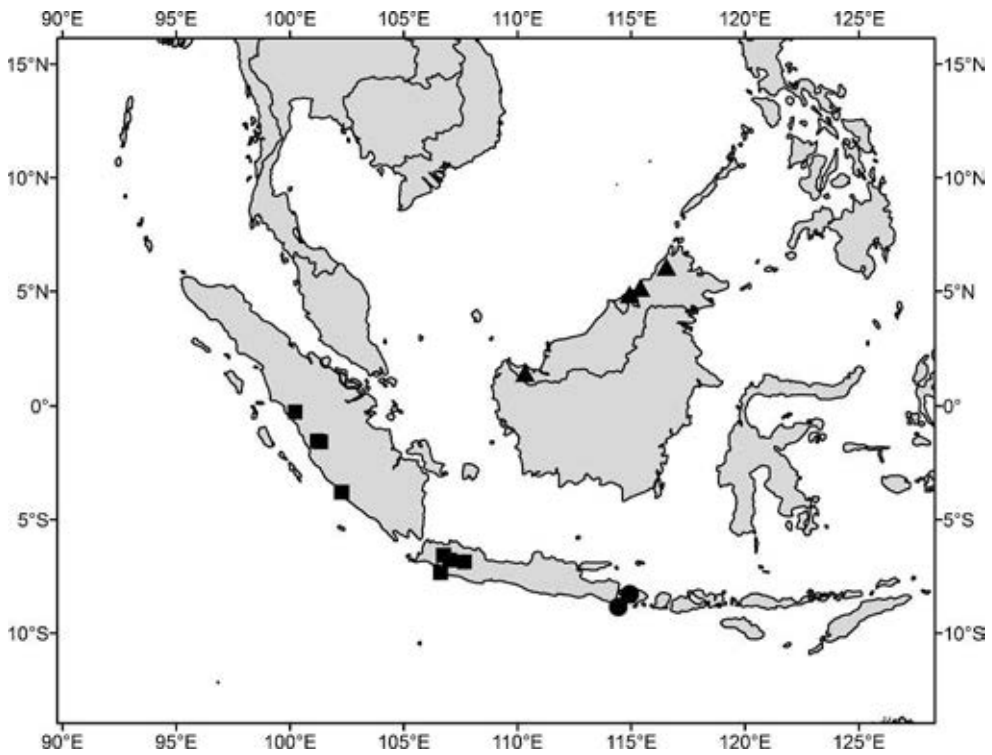

Prethopalpus bellicosus Baehr and Thoma,
 new species
 Figures 248–263; map 5

TYPE: **MALAYSIA: Sabah:** Male holotype from Crocker Range, 5.66666°N, 116.33333°E, 1600 m (16 May 1987, D. Burckhardt and I. Löbl), deposited in MHNG (PBI_OON 00012353).

ETYMOLOGY: The specific name *bellicosus* is Latin suggested by the heavily sclerotized scuta that resemble strong armature and a ready means for fighting.

DIAGNOSIS: Males can be easily separated from those of all other species by the palpal bulb with a conductor and an additional ventral apophysis (fig. 255), and females by an extremely wide and procurved epigynal opening (fig. 258).

MALE (PBI_OON 12353, figs. 248–254): Total length 1.26. Prosoma, mouthparts, and abdominal scuta orange-brown, broadly oval in dorsal view, pars cephalica strongly elevated in lateral view, posterolateral edge without pits, surface uniformly granulate except clypeus and area anterior to eye group; lateral margin with sluice reaching clypeus, without denticles; nonmarginal pars cephalica setae with three pairs of enlarged setae, one on clypeus (lateral setae), one (very thick hairs, close together) anterior to eye group, pointing anteriorly and a pair of smaller hairs between ALEs, pointing upward; marginal setae few. Clypeus sinuous in front view, sloping forward in lateral view,

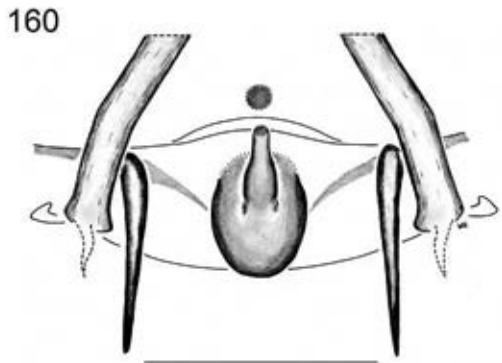

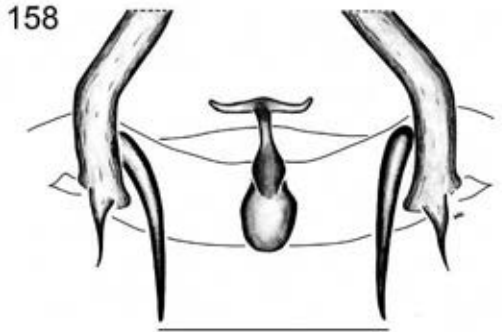

Map 2. Distribution records of *Prethopalpus bali* (●), *P. brunei* (▲), *P. fosuma* (■).

distance ALE to clypeus margin about $2.5 \times$ ALE diameter. Eyes: ALE, PME subequal, larger than PLE, PME circular; posterior eye row straight from above; ALE separated by more than their diameter, PLE-PME separated by PME radius to PME diameter. Sternum only slightly longer than wide; radial furrows weakly developed; infracoxal grooves present with anterior and posterior depression; with radial furrows between coxae I–II, II–III, III–IV, microsculpture only medially, setae evenly scattered. Chelicerae anterior face proximal part slightly convex in lateral view, laminate groove only weakly developed; setae few scattered setae on anterior face of paturon. Labium shape trapezoidal, anterior margin indented at middle; 2 setae on anterior margin (one on each side of indentation) and 3 subdistal setae. Abdomen oval, book lung covers ovoid; dorsal of pedicel tube with a pair of narrow elongated cuticular outgrowths. Dorsal scutum pits surrounding hair bases causing punctate impression; postepigastric scutum

long, semicircular. Legs pale orange, femora and basal half of tibiae darkened; about proximal half of femora darkened. Epigastric region with sperm pore situated between anterior and posterior spiracles. Palp orange-brown; embolus dark; trochanter with ventral projection; femur attaching to patella subbasally; patella longer than femur, slightly larger than femur; tibia stout, rounded, about 5 times shorter than patella; cymbium not fused to bulb; bulb with conductor and ventral apophysis (fig. 255).

FEMALE (PBI_OON 12353, figs. 256–263): Total length 1.30. Epigastric area with extremely wide, procurved, epigynal opening (fig. 258).

OTHER MATERIAL EXAMINED: MALAYSIA: Sabah: Mt. Kinabalu, 6.08333°N , 116.5500°E , 1500 m, 25 Apr. 1987, D. Burckhardt and I. Löbl, 1 ♂ (MHNG, PBI_OON 00012221); same location, 30 Apr. 1987, D. Burckhardt and I. Löbl, 1 ♂ (MHNG, PBI_OON 00012275); same location, 21 May 1987, D. Burckhardt and I.

Prethopalpus deelemanae Baehr and Thoma,
new species

Figures 283–286; map 5

TYPE: MALAYSIA: Sarawak: Male holotype from Bako National Park, 1.7300°N, 110.4600°E (30 Mar. 1989, C. Deeleman), deposited in RMNH (PBI_OON 00031349).

ETYMOLOGY: This specific name is a patronym in honor of Christa Deeleman-Reinhold, an extraordinary expert on spiders

in the Asian region, who collected the holotype.

DIAGNOSIS: Males resemble those of *P. brunei* in having a smooth pars cephalica and large eyes, but can be easily recognized by the recurved posterior eye row (fig. 283) and the presence of a smooth, median longitudinal band on the sternum (fig. 284).

MALE (PBI_OON 31349, figs. 283–286): Total length 1.8. Prosoma mouthparts, and abdominal scuta orange-brown, pars cepha-

ETYMOLOGY: The specific name is a noun in apposition taken from the type locality.

DIAGNOSIS: Males and females resemble those of *P. kropfi* in having a strongly granulated carapace, but can be easily recognized by the smaller eyes (figs. 287,

292), the recurved posterior eye row (figs. 287, 292), and the reticulated sternal area without a smooth median part (fig. 288).

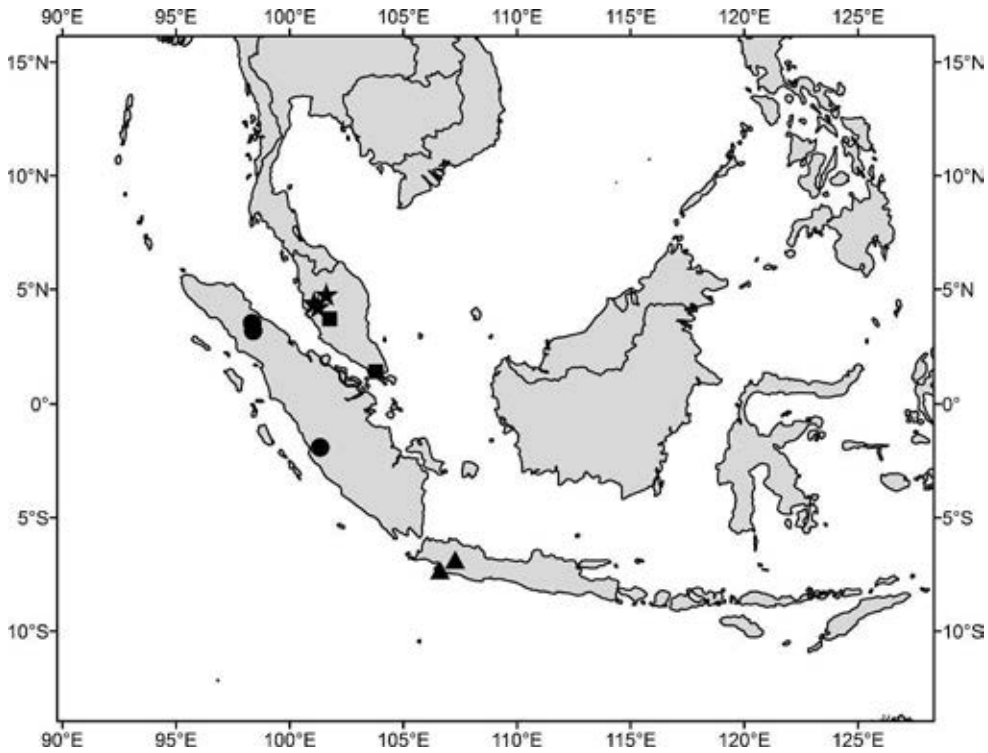

MALE (PBI_OON 12086, figs. 287–296): Total length 0.97. Prosoma, mouthparts, and abdominal scuta pale orange, pars cephalica

Figs. 306–315. *Prethopalpus kranzae*, n. sp., male (PBI_OON 12082). **306.** Habitus, dorsal view. **307.** Same, ventral view. **308.** Same, lateral view. **309.** Prosoma, anterior view. **310.** Same, ventral view. **311.** Same, dorsal view. **312.** Same, lateral view. **313.** Male palp, prolateral view. **314.** Same, dorsal view. **315.** Same, retrolateral view.

strongly elevated in lateral view, elevated portion of pars cephalica and sides strongly granulate; lateral margin without denticles. Eyes small, ALE 0.037; PME 0.030; PLE 0.028; ALE largest, ALE circular, PME circular, PLE oval; posterior eye row recurved from above, straight from front; ALE separated by more than their diameter, ALE-PLE separated by less than ALE radius,

PME separated by less than their radius, PLE-PME separated by less than PME radius. Sternum longer than wide, surface finely reticulate, without pits. Endites about as long as wide; anteromedian toothlike projection short. Abdomen ovoid; book lung covers large; pedicel tube short, ribbed. Dorsal scutum covering full length of abdomen smooth; epigastric scutum not

Map 3. Distribution records of *Prethopalpus kranzae* (●), *P. java* (▲), *P. pahang* (■), and *P. perak* (★).

protruding; postepigastric scutum long, almost rectangular, covering nearly full length of abdomen. Legs pale orange; patella plus tibia I shorter than carapace. Palp yellow; embolus light; femur attaching to patella subbasally; patella about as long as femur, enlarged; bulb only slightly separated from cymbium by 1 pit, pyriform with large retrolateral excavation distally, and short triangular medially bent embolus (figs. 101–103).

FEMALE (PBI_OON 00016211, figs. 297–305): Total length 1.8. Eyes: ALE 0.036; PME 0.032; PLE 0.030. Epigastric area with small round epigynal opening, internal genital structure pentagonal ending in an anchor-shaped anterior sclerite (figs. 147, 148)

OTHER MATERIAL EXAMINED: INDONESIA: Jawa Barat: Cibodas [6.85000°S, 107.28333°E], 50 km E of Bogor, 1400 m, 3–6 Nov. 1989, I. Löbl, D. Agosti, and D. Burckhardt, 1 ♂ (MHNG, PBI_OON 00012086).

DISTRIBUTION: *Prethopalpus java* is known only from Java (map 2).

Prethopalpus kranzae Baehr, new species

Prethopalpus leuser Baehr, new species
 Figures 92–94, 141, 142, 334–352; map 3

TYPES: INDONESIA: Aceh: Male holotype from Gunung Leuser National Park, Ketambe [3.17193°N, 98.39077°E], 300 m (23–30 Nov. 1989, I. Löbl, D. Agosti and D. Burckhardt), deposited in MHNG (PBI_OON 00012083). Female allotype col-

lected with holotype, deposited in MHNG (PBI_OON 00023397).

ETYMOLOGY: The specific name is a noun in apposition taken from the type locality.

DIAGNOSIS: Males and females resemble those of *P. attenboroughi* in having a smooth carapace and reduced eyes. Males can be recognized by the bulging distal bulbal tip (figs. 92–94). Females can be separated from those of all other species by the epigastric area having a procurved posterior sclerotization (fig. 141).

Figs. 371–380. *Prethopalpus perak*, n. sp., male (PBI_OON 15293). 371. Habitus, dorsal view. 372. Same, ventral view. 373. Same, lateral view. 374. Prosoma, anterior view. 375. MALE (PBI_OON 12083, figs. 334–343): Total length 1.8. Prosoma, mouthparts, and abdominal scuta pale orange, surface of elevated portion of pars cephalica smooth, sides finely reticulate; lateral margin without denticles. Eyes: six, small, ALE 0.047; PME 0.022; PLE 0.0164; ALE largest, all eyes circular; posterior eye row straight from both above and front; ALE separated by more than their diameter, ALE-PLE touching,

PME separated by more than their diameter, PLE-PME touching. Sternum longer than wide, surface finely reticulate, without pits, microsculpture absent. Labium rectangular, fused to sternum; endites about twice as long as wide anteromedian tip unmodified. Abdomen ovoid; book lung covers large; pedicel tube short, ribbed. Dorsal scutum covering full length of abdomen, smooth; epigastric scutum not protruding; postepigastric

Figs. 381–388. *Prethopalpus perak*, n. sp., female (PBI_OON 12515). **381.** Habitus, dorsal view. **382.** Same, ventral view. **383.** Prosoma, ventral view. **384.** Female epigyne, ventral view. **385.** Female epigyne, dorsal view. **386.** Prosoma, anterior view. **387.** Habitus, lateral view. **388.** Prosoma, dorsal view.

scutum long, almost rectangular, covering nearly full length of abdomen, with long posteriorly directed lateral apodemes. Legs pale orange; patella plus tibia I nearly as long as carapace. Palp white; embolus light, femur attaching to patella subbasally; patella longer than femur, enlarged; cymbium not fused with bulb, bulb pyriform with short, broad, medially bent embolus (figs. 92–94).

FEMALE (PBI_OON 23397, figs. 344–352): Total length 0.99. Eyes: ALE 0.029; PME 0.021; PLE 0.016. Epigastric area with procurved posterior sclerotization, internal genital region widely U-shaped, without anterior sclerite (figs. 141, 142).

OTHER MATERIAL EXAMINED: INDONESIA: Aceh: Gunung Leuser National Park, Ketambe [3.17193°S, 98.39077°E], 300 m, 23–30 Nov. 1989, I. Löbl, D. Agosti and D. Burckhardt, 2 ♂ (MHNG, PBI_OON 00023398).

DISTRIBUTION: *Prethopalpus leuser* is known only from Gunung Leuser National Park in Sumatra (map 3).

Prethopalpus magnocularis Baehr and

Thoma, new species

Figures 353–360; map 5

TYPE: INDONESIA: Kalimantan Timur: Male holotype from Kutal District, Lao Janan, 1°30'N, 116°30' E (30 Oct. 1979, P. Lehtinen), deposited in UTU (PBI_OON 00016026).

ETYMOLOGY: The specific name is Latin, and refers to the extremely large eyes of this species.

DIAGNOSIS: This species can be separated from all others by the extremely large eyes (fig. 357).

MALE (PBI_OON 00016026, figs. 353–359): Total length 1.49. Prosoma, mouthparts, and abdominal scuta pale orange, broadly oval in dorsal view, pars cephalica strongly elevated in lateral view, posterolateral edge with pair of pits, surface of elevated portion of pars cephalica and sides striate, partly interrupted by small smooth areas;

Figs. 389–399. *Prethopalpus sabah*, n. sp., male (PBL_OON 12344). 389. Habitus, dorsal view. 390. Same, ventral view. 391. Same, lateral view. 392. Prosoma, anterior view. 393. Same, ventral view. 394. Same, dorsal view. 395. Same, lateral view. 396. Opisthosoma, ventral view. 397. Male palp, prolateral view. 398. Same, dorsal view. 399. Same, retrolateral view.

lateral margin with blunt denticles; nonmarginal pars cephalica setae long U-shaped row reaching posterior end of pars cephalica, hair bases equal; nonmarginal pars thoracica setae light, needlelike, very few, scattered; marginal setae originating from anterior base of blunt denticles (= modified hair bases), pointing anteriorly. Clypeus curved downward in front view, vertical in lateral view. Eyes huge, PME largest, PME oval; posterior eye row recurved from above; ALE separated by less than their radius, PLE-PME touching. Sternum without radial furrows between coxae I–II, II–III, III–IV, microsculpture everywhere but middle, lateral margins with

three pairs of lateral projections; setae evenly scattered. Chelicerae anterior face with swelling. Abdomen oval; book lung covers round; pedicel short, ribbed. Dorsal scutum covering whole abdomen; postepigastric scutum long, semicircular. Legs pale orange, without color pattern. Epigastric region with oval sperm pore situated at level of anterior spiracles. Palp pale orange; embolus light; femur attaching to patella subbasally; patella shorter than femur, not enlarged; cymbium partly fused to bulb separated by about six pits (fig. 360); row of lateral directed, more strongly sclerotized “ducts,” running from one side of the bulb to the other.

Figs. 400–409. *Prethopalpus sabah*, n. sp., female (PBI_OON 12313). **400.** Habitus, dorsal view. **401.** Same, ventral view. **402.** Same, lateral view. **403.** Prosoma, anterior view. **404.** Same, ventral view. **405.** Same, dorsal view. **406.** Same, lateral view. **407.** Opisthosoma, ventral view. **408.** Female epigyne, ventral view. **409.** Female epigyne, dorsal view.

FEMALE: Unknown.

OTHER MATERIAL EXAMINED: None.

DISTRIBUTION: *Prethopalpus magnocularis* is known only from eastern Indonesia Borneo (map 5).

Prethopalpus pahang Baehr, new species
 Figures 86–88, 361–370; map 3

TYPE: MALAYSIA: ***Pahang***: Male holotype from Frasers Hill, south side, 3.7000°N,

101.7500°E, 1300 m (26 Aug. 2004, A. Schulz), deposited in MHNG (PBI_OON 00012123).

ETYMOLOGY: The specific name is a noun in apposition taken from the type locality.

DIAGNOSIS: Males resemble those of *P. bali* in having a bifid embolar tip but can be easily recognized by the ventrally bulging bulb (figs. 86, 88), with a long, thin, medially bent embolus (figs. 86–88).

MALE (PBI_OON 12123, figs. 361–370): Total length 1.22. Prosoma, mouthparts, and

DISTRIBUTION: *Prethopalpus pahang* is known from Peninsular Malaysia and Singapore (map 3).

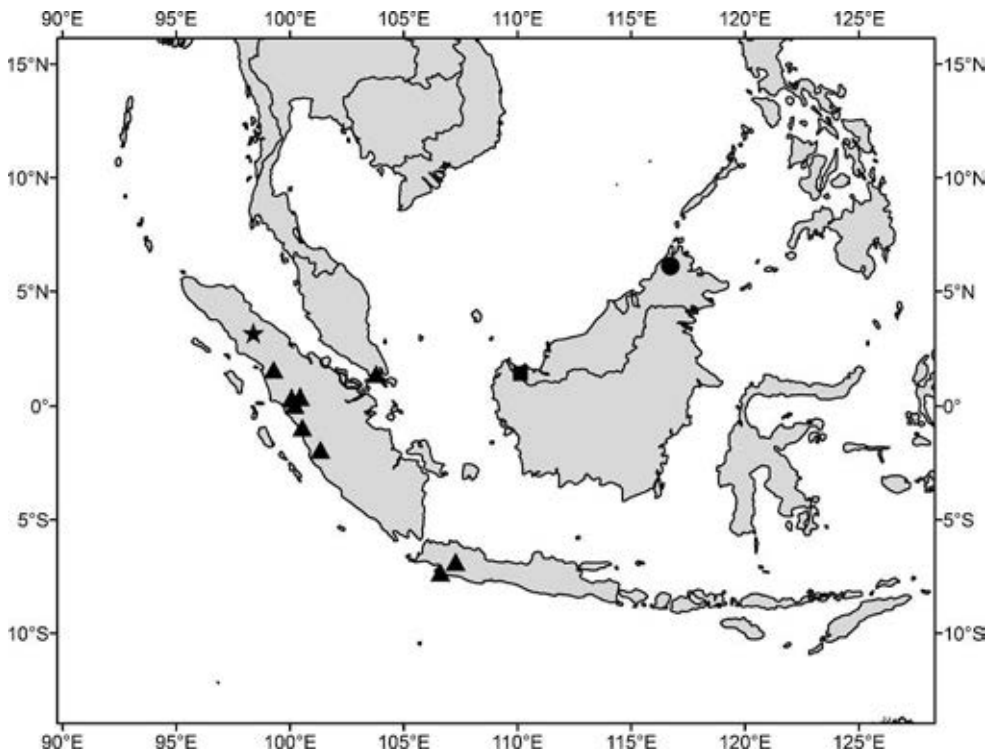

Prethopalpus perak Baehr, new species
 Figures 80–82, 151, 152, 371–388; map 3

TYPE: MALAYSIA: Perak: Male holotype from rainforest NE of Chenderiang, 4.23333°N, 101.25°E, 290 m (22–31 Jan. 1994, P. Schwendinger), deposited in MHNG (PBI_OON 00015293).

ETYMOLOGY: The specific name is a noun in apposition taken from the federal state in which the type was found.

DIAGNOSIS: Males and females resembles *P. kranzae* in the strongly granulate carapace sides and top (fig. 376), but can be differentiated by the lack of any spikes or denticles on the carapace (fig. 373).

MALE (PBI_OON 15293, figs. 371–380): Total length 1.12. Prosoma, mouthparts, and abdominal scuta yellow-brown, elongate oval in dorsal view, surface of elevated portion of

Map 4. Distribution records of *Prethopalpus sabah* (●), *P. schwendingeri* (▲), *P. sarawak* (■), and *P. leuser* (★).

pars cephalica and sides granulate; lateral margin without denticles. Eyes: ALE 0.43; PME 0.037; PLE 0.030; ALE largest, all eyes circular; posterior eye row straight from both above and front; ALE separated by their radius to diameter, ALE-PLE separated by less than ALE radius, PME just touching, PLE-PME separated by less than PME radius. Sternum longer than wide, yellow-brown, surface granulate. Endites 1.5 times as long as wide, with tiny toothlike projection. Abdomen ovoid; book lung covers large; pedicel tube short, ribbed. Dorsal scutum, covering full length of abdomen, striated; epigastric scutum not protruding; postepigastric scutum long, almost rectangular, covering nearly full length of abdomen. Legs yellow-brown; patella plus tibia I shorter than carapace. Palp pale orange; embolus light; femur attaching to patella subbasally; patella about as long as femur, enlarged; cymbium, not fused with bulb, bulb tip with deep retrolateral impression, and thin, medially bent embolus (figs. 80–82).

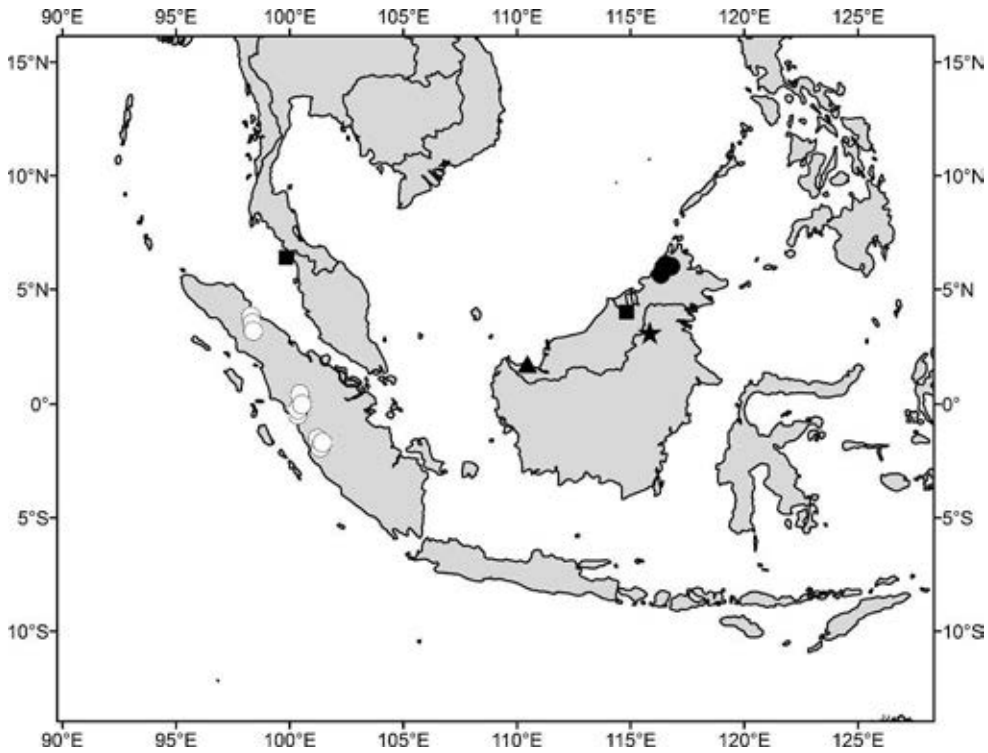

FEMALE (PBI_OON 12515, figs. 381–388): Total length 1.32. Eyes: ALE 0.44; PME 0.033; PLE 0.030. Epigastric area with small, slitlike epigynal opening; short, rounded, internal genital region and T-shaped anterior sclerite (figs. 151, 152).

OTHER MATERIAL EXAMINED: **MALAYSIA: Perak:** Cascade de Sungei Simei, Cameron Highlands, 4.78333°N, 101.61666°E, 25 Mar. 1977, T. Jaccoud, P. Map 5. Distribution records of *Prethopalpus bellicosus* (●), *P. utara* (○), *P. deelemanae* (▲), *P. kropffi* (■), and *P. magnocularis* (★).

Kinabalu National Park [6.11407°N, 116.72104°E], 575 m (9 May 1987, D. Burckhardt and I. Löbl), deposited in MHNG (PBI_OON 00012344). Female allotype collected with holotype, deposited in MHNG (PBI_OON 00012313).

ETYMOLOGY: The specific name is a noun in apposition taken from the federal state in which the types were collected.

DIAGNOSIS: Males and females resemble those of *P. brunei* in having a smooth pars cephalica and large eyes, but can be easily recognized by the recurved posterior eye row (fig. 394), the much longer palpal femur of males (figs. 107, 109), and the wide, slitlike epigynal opening of females (fig. 149).

MALE (PBI_OON 12344, figs. 389–399): Total length 1.9. Prosoma, mouthparts, and abdominal scuta yellow-brown, pars cephalica strongly elevated in lateral view, surface smooth but slightly granulate along the lateral margins; one shallow impression anterolaterally and one slitlike impression

posteriorly; lateral margin with blunt denticles. Eyes: ALE 0.052; PME 0.034; PLE 0.045; ALE largest, ALE circular, PME squared, PLE circular; posterior eye row recurved from above, straight from front; ALE separated by their radius to diameter, ALE-PLE separated by less than ALE radius, PME touching throughout most of their length, PLE-PME separated by less than PME radius. Sternum longer than wide, surface finely reticulate, without pits, microsculpture everywhere but front. Endites twice as long as wide, with tiny toothlike projection. Abdomen ovoid; book lung covers large; pedicel tube short, ribbed. Dorsal scutum, covering full length of abdomen smooth; epigastric scutum not protruding; postepigastric scutum long, almost rectangular, covering nearly full length of abdomen. Legs yellow; patella plus tibia I shorter than carapace. Palp yellow; embolus dark; femur attaching to patella subbasally, femur about 1.5 times as long as patella connected

Figs. 430–438. *Prethopalpus schwendingeri*, n. sp., female (PBI_OON 12426). **430.** Habitus, dorsal view. **431.** Same, ventral view. **432.** Same, lateral view. **433.** Prosoma, anterior view. **434.** Same, ventral view. **435.** Same, dorsal view. **436.** Same, lateral view. **437.** Female epigyne, ventral view. **438.** Female epigyne, dorsal view.

subbasally, patella slightly swollen. Cymbium separated from bulb only by two retrolateral pits and one prolateral pit; embolus thin, bent medially (figs. 107–109).

FEMALE (PBI_OON 12313, figs. 400–409): Total length 1.44. Eyes: ALE 0.050; PME 0.052; PLE 0.040. Epigastric area with broad, slitlike epigynal opening with inverted

Figs. 439–448. *Prethopalpus utara*, n. sp., male (PBI_OON 12085). 439. Habitus, dorsal view. 440. Same, ventral view. 441. Same, lateral view. 442. Prosoma, anterior view. 443. Same, ventral view. 444. Same, dorsal view. 445. Same, lateral view. 446. Male palp, prolateral view. 447. Same, dorsal view. 448. Same, retrolateral view.

dropshaped, internal genital structure, ending in T-shaped anterior sclerite (figs. 149, 150).

OTHER MATERIAL EXAMINED: None.

DISTRIBUTION: *Prethopalpus sabah* is known only from the type locality in Sabah (map 4).

Prethopalpus sarawak Baehr, new species
 Figures 95–97, 410–419; map 4

TYPE: MALAYSIA: **Sarawak:** Male holotype from Gua Bungon District, 1.38722°N, 110.11944°E (20 Apr. 1950, M.W.F. Tweedie), deposited in QM (S79886, PBI_OON 00022853).

ETYMOLOGY: The specific name is a noun in apposition taken from the federal state in which the types were collected.

DIAGNOSIS: Males can be easily recognized by the relatively short patella, which is only about as long as the femur (figs. 95, 97), and the very long, medially bent embolus (which is as long as the bulb), and the presence of a velum (figs. 95–97).

MALE (PBI_OON 22853, figs. 410–419): Total length 1.20. Prosoma, mouthparts, and abdominal scuta pale orange, ovoid in dorsal view, surface of elevated portion of pars cephalica smooth, sides finely reticulate; lateral margin without denticles. Clypeus

Figs. 449–457. *Prethopalpus utara*, n. sp., female (PBI_OON 23392). **449.** Habitus, dorsal view. **450.** Same, ventral view. **451.** Same, lateral view. **452.** Prosoma, anterior view. **453.** Same, ventral view. **454.** Same, dorsal view. **455.** Same, lateral view. **456.** Female epigyne, ventral view. **457.** Female epigyne, dorsal view.

margin unmodified, straight in front view, sloping forward in lateral view. Eyes: six, small, ALE 0.034, PME 0.020, PLE 0.020; ALE largest, ALE circular, PME oval, PLE circular; posterior eye row procurved from above, straight from front; ALE separated by their radius to diameter, ALE-PLE separated by less than ALE radius, PME touching

throughout most of their length, PLE-PME separated by less than PME radius. Sternum longer than wide, surface not smooth, without pits. Endites twice as long as wide, toothlike projection tiny. Abdomen ovoid, book lung covers large; pedicel tube short, ribbed. Dorsal scutum covering full length of abdomen smooth; epigastric scutum

Figs. 458–469. *Prethopalpus alexanderi*, n. sp., male (PBI_OON 46551). **458.** Habitus, dorsal view. **459.** Same, ventral view. **460.** Same, lateral view. **461.** Same, anterior view. **462.** Prosoma, ventral view. **463.** Prosoma, dorsal view. **464.** Abdomen, ventral view. **465.** Prosoma, lateral view. **466.** Male palpal bulb, prolateral view. **467.** Male palp, prolateral view. **468.** Male palpal bulb, dorsal view. **469.** Male palp, retrolateral view.

not protruding; postepigastric scutum pale orange, long, almost rectangular, covering nearly full length of abdomen, fused to epigastric scutum. Legs white; patella plus tibia I nearly as long as carapace. Palp white; embolus dark; femur attaching to patella subbasally; patella about as long as femur, slightly larger than femur; cymbium not fused with bulb, embolus about as long as bulb with velum, bent medially (figs. 95–97).

FEMALE: Unknown.

OTHER MATERIAL EXAMINED: None.

DISTRIBUTION: This species is known only from Sarawak (map 4).

Prethopalpus schwendingeri Baehr, new species
 Figures 77–79, 143, 144, 420–438; map 4

TYPE: **INDONESIA: Jawa Barat:** Male holotype from Cibodas, Jardin Botanique,

Figs. 470–480. *Prethopalpus attenboroughi*, n. sp., male (PBI_OON 07438). **470.** Habitus, dorsal view. **471.** Same, ventral view. **472.** Same, lateral view. **473.** Prosoma, anterior view. **474.** Same, ventral view. **475.** Same, dorsal view (arrow = clypeal process). **476.** Same, lateral view. **477.** Male palp, prolateral view. **478.** Patella, dorsal view. **479.** Palp, dorsal view. **480.** Same, retrolateral view.

7.31666°S, 106.61666°E, 1380 m (26 Nov. 1987, B. Hauser), deposited in MHNG (Sar-87/21, PBI_OON 00016192).

ETYMOLOGY: The specific name is a patronym in honor of Peter J. Schwendinger, senior curator of the arthropod collections at the Muséum d'Histoire Naturelle (Geneva, Switzerland) and an outstanding collector of Asian spiders.

DIAGNOSIS: Males and females resemble those of *P. fosuma* in general body shape and

eye sizes, but can be recognized by having the carapace sides being continuously granulate (fig. 425, 426).

MALE (PBI_OON 16192, figs. 420–429): Total length 1.34. Prosoma, mouthparts, and abdominal scuta pale orange, surface of elevated portion of pars cephalica smooth, sides granulate; lateral margin without denticles. Eyes: six, well developed nearly same size, ALE 0.045, PME 0.040, PLE 0.030,

Figs. 481–489. *Prethopalpus blosfeldsorum*, n. sp., male (PBI_OON 06425). **481.** Habitus, dorsal view. **482.** Same, ventral view. **483.** Same, lateral view. **484.** Prosoma, anterior view. **485.** Same, ventral view. **486.** Opisthosoma, ventral view. **487.** Male palp, prolateral view. **488.** Same, dorsal view. **489.** Same, retrolateral view.

ALE circular, PME oval, PLE circular; posterior eye row straight from both above and front; ALE separated by less than their radius, ALE-PLE separated by less than ALE radius, PME touching throughout most of their length, PLE-PME touching. Sternum longer than wide, surface finely reticulate. Endites twice as long as wide, toothlike projection tiny. Abdomen ovoid; book lung covers large; pedicel tube short, ribbed. Dorsal scutum, covering more than $\frac{3}{4}$ of abdomen, smooth but setae originate from small pits; epigastric scutum not protruding; postepigastric scutum long, semicircular, covering about $\frac{3}{4}$ of abdomen. Legs yellow; patella plus tibia I shorter than carapace. Palp yellow; embolus light; femur attaching to patella subbasally; patella about as long as femur, enlarged; cymbium not fused with bulb, oval, pear shaped with deep distal groove and medially bent embolus (figs. 74–79).

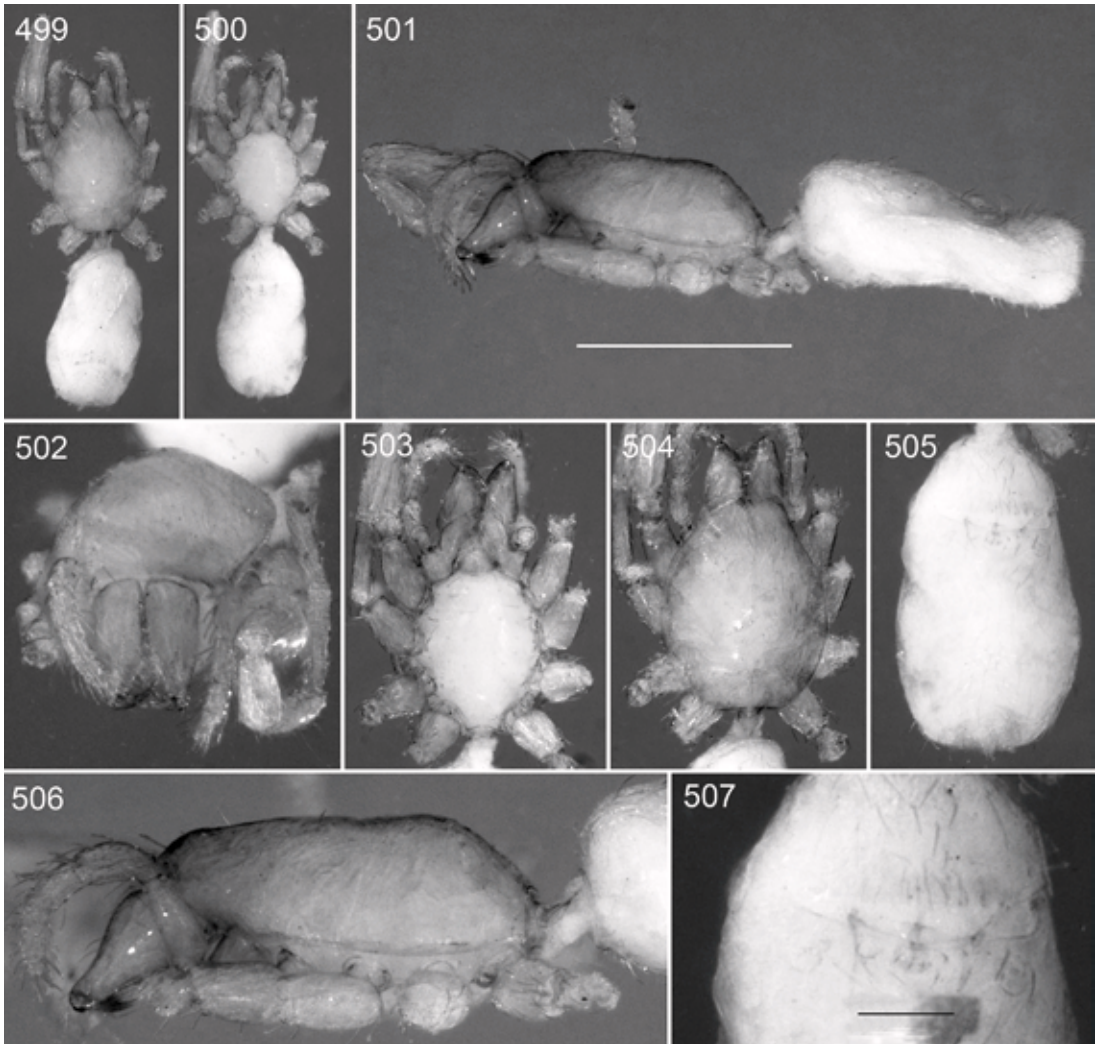

FEMALE (PBI_OON 12426, figs. 430–438): Total length 1.45. Eyes: ALE 0.044; PME 0.040; PLE 0.029. Epigastric area with broadly oval epigynal opening; internal genital region oval, with T-shaped anterior

sclerite with anteriorly directed lateral tips (figs. 143, 144).

DISTRIBUTION: *Prethopalpus schwendingeri* is known from Java, Sumatra, and Singapore (map 4).

Prethopalpus utara Baehr, new species
Figures 89–91, 137–138, 439–457; map 4

TYPES: **INDONESIA:** *Sumatra Utara:* Male holotype from Langkat, Reserve natur-

elle de Bukit Lawang [3.81666°N, 98.30000°E], 180 m (20 Nov. 1985, B. Hauser), deposited in MHNG (PBI_OON 00012085). Female allotype collected with holotype, deposited in MHNG (PBI_OON 00023392).

ETYMOLOGY: The specific name is a noun in apposition taken from the type locality.

DIAGNOSIS: Males and females resemble those of *P. fosuma* and *P. schwendingeri* in having a smooth pars cephalica top but can be easily recognized by the more domed carapace (fig. 445), and PLE-PME separated

Figs. 518–525. *Prethopalpus callani*, n. sp., female (PBI_OON 46564). **518.** Habitus, dorsal view. **519.** Same, ventral view. **520.** Prosoma, lateral view. **521.** Same, anterior view. **522.** Same, ventral view. **523.** Same, dorsal view. **524.** Habitus, lateral view. **525.** Female epigyne, ventral view.

by more than the PME diameter (fig. 444). Males can be separated from both species by the short broad medially bent embolus (figs. 89–91) and females by a long spinelike, internal genital structure reaching the tracheal groove (fig. 138).

MALE (PBI_OON 12085, figs. 439–448): Total length 1.15. Prosoma, mouthparts, and abdominal scuta yellow-brown, surface of elevated portion of pars cephalica smooth, sides granulate; lateral margin with blunt denticles. Eyes: ALE 0.043; PME 0.032; PLE

Figs. 526–538. *Prethopalpus cooperi*, n. sp., male (PBI_OON 46539). **526.** Habitus, dorsal view. **527.** Same, ventral view. **528.** Same, lateral view. **529.** Prosoma, anterior view. **530.** Prosoma, ventral view. **531.** Prosoma, dorsal view. **532.** Abdomen, ventral view. **533.** Prosoma, lateral view. **534.** Male palp, prolateral view. **535.** Same, dorsal view. **536.** Same, retrolateral view. **537.** Abdomen, anterior view. **538.** Abdomen, lateral view.

Figs. 539–545. *Prethopalpus eberhardi*, n. sp., male (PBI_OON 18855). **539.** Habitus, dorsal view. **540.** Same, ventral view. **541.** Same, lateral view. **542.** Prosoma, anterior view. **543.** Male palp, prolateral view. **544.** Same, dorsal view. **545.** Same, retrolateral view.

0.031; ALE largest, all eyes circular; posterior eye row straight from above, straight from front; ALE separated by their radius to diameter, ALE-PLE separated by ALE radius to ALE diameter, PME separated by less than their radius, PLE-PME separated by more than PME diameter. Sternum longer than wide, surface strongly reticulate, without pits, microsculpture everywhere but front. Endites twice as long as wide, with very short blunt projection. Abdomen ovoid; book lung covers large; pedicel tube short, ribbed. Dorsal scutum covering full length of abdomen smooth; epigastric scutum not protruding; post-epigastric scutum short, almost rectangular, covering nearly full length of abdomen. Legs pale orange; patella plus tibia I nearly as long as carapace. Palp pale orange; embolus light; femur attaching to patella subbasally; patella longer than femur, enlarged; cymbium not fused with bulb, bulb pyriform with deep retrolateral slitlike excavation distally, embolus with broad base and short medially bent tip figs. 89–91).

FEMALE (PBI_OON 23392, figs. 449–457): Total length 1.39. Eyes: ALE 0.040; PME 0.036; PLE 0.026. Epigastric area with oval epigynal opening a long spinelike structure reaching tracheal groove and ending in a T-shaped sclerite anteriorly (figs. 137–138).

OTHER MATERIAL EXAMINED: **INDONESIA:** *Sumatera Utara:* Reserve naturelle de Bukit Lawang, 3.81666°N, 98.30000°E, 180 m, 20 Nov. 1985, B. - Dorsal scutum covering about or less than 80% of abdomen (figs. 539, 600, 626) . . . 11
- 7. Abdomen cylindrical (figs. 458, 526, 608, 691) 8
- Abdomen ovoid (fig. 660) *P. oneillae*
- 8. Distance between coxae II–III larger than others (fig. 695) *P. pearsoni*
- Distance between coxae about equal (figs. 462, 530, 612) 9
- 9. Epigastric area strongly bulging in lateral view (fig. 538) *P. cooperi*
- Epigastric area flat in lateral view (figs. 460, 610) 10
- 10. Endites about 1.5 times as long as wide (fig. 612); palpal patella posteriorly rounded (figs. 615, 617) *P. julianneae*
- Endites at least twice as long as wide (fig. 462); palpal patella posteriorly pointed (figs. 467, 469) *P. alexanderi*
- 11. Dorsal scutum covering about 70% of abdomen (fig. 600) *P. infernalis*
- Dorsal scutum covering about 80% of abdomen (figs. 539, 626) 12

- 12. Palpal patella posteriorly pointed (figs. 543, 545) *P. eberhardi*
- Palpal patella posteriorly rounded (figs. 633, 635) *P. maini*
- 13. Book lung covers darker than surrounding area (fig. 589) *P. humphreysi*
- Book lung covers pale, like surrounding area (figs. 494, 512, 560, 713) 14
- 14. Carapace weakly sclerotized (fig. 492); palpal patella posteriorly pointed (figs. 496, 498) *P. boltoni*
- Carapace well sclerotized (figs. 513, 561, 714); palpal patella posteriorly rounded (e.g., figs. 515, 564, 716) 15
- 15. Chelicerae frontally swollen (fig. 514) *P. callani*
- Chelicerae frontally not swollen (figs. 562, 715) 16
- 16. Epigastric area strongly bulging in lateral view (fig. 711) *P. scanloni*
- Epigastric area flat in lateral view (fig. 558) *P. framenau*
- 17. Bulb ventrally bulging (e.g., figs. 119, 122, 487, 705); epigastric region with strongly protruding extension (figs. 483, 704) 18
- Bulb not ventrally bulging (e.g., figs. 477, 649, 738); epigastric region without protruding extension (figs. 472, 646, 733) 19
- 18. Bulb with conical extension (figs. 122, 124, 705, 708) *P. rawlinsoni*
- Bulb with rounded extension (figs. 119, 121, 487, 489) *P. blosfeldsorum*
- 19. Sternum surface finely reticulate (figs. 720, 735) *P. tropicus*
- Sternum surface smooth (fig. 648) *P. marionae*
- 20. Eyes absent or strongly reduced (e.g., figs. 504, 523, 687) 21
- Eyes present, not strongly reduced (e.g., figs. 657, 746) 29
- 21. Eyes small (fig. 687) *P. platnicki*
- Eyes absent (e.g., figs. 504, 523) 22
- 22. Abdomen with dorsal scutum (figs. 546, 636) 23
- Abdomen without dorsal scutum (e.g., figs. 499, 590, 618) 24
- 23. Carapace broadly oval (fig. 551) *P. eberhardi*
- Carapace long oval (fig. 641) *P. maini*
- 24. Distance between coxae II–III larger than others (fig. 622) *P. kintyre*
- Distance between coxae about equal (figs. 503, 522, 571, 594) 25
- 25. Book lung covers much darker than surrounding abdominal region (fig. 598) *P. humphreysi*
- Book lung covers pale, same color as surrounding abdominal region (figs. 505, 524, 558) 26

- 26. Carapace weakly sclerotized (fig. 504) *P. boltoni*
- Carapace well sclerotized (fig. 523, 572) 28
- 28. Internal genital structure reaching groove of posterior spiracles (fig. 575) *P. framenau*
- Internal genital structure not reaching groove of posterior spiracles (fig. 525) *P. callani*
- 29. Internal genital structure reaching beyond tracheal groove (figs. 157, 158) *P. marionae*
- Internal genital structure shorter, not reaching beyond tracheal groove (fig. 156) *P. tropicus*

Prethopalpus alexanderi Baehr and Harvey,
new species
Figures 458–469; map 10

TYPE: AUSTRALIA: Western Australia: Male holotype from Exmouth Limestone, 9.4 km S of Exmouth, bore, –20 m, 22°00'03"S, 114°04'47"E (25 July 2008, J. Alexander, J. Cairnes), deposited in WAM (T95473, PBI_OON 46551).

ETYMOLOGY: This species is named for Jason Alexander, one of the collectors of the holotype.

DIAGNOSIS: Males resemble those of *P. oneillae* and *P. cooperi* in having a dorsal scutum covering the whole abdomen and no eyes, but can be separated from these species by the cylindrical abdomen (fig. 458) and the flat epigastric area (when viewed laterally) (fig. 460).

MALE (PBI_OON 46551, figs. 458–469): Total length 1.05. Carapace, sternum, mouthparts, palp, legs, and scuta pale orange, ovoid in dorsal view, pars cephalica flat in lateral view, surface smooth, sides slightly granulate; Clypeus straight in front view, vertical in lateral view. Sternum fused to carapace, surface smooth. Endites twice as long as wide. Abdomen cylindrical; book lung covers large. Dorsal scutum weakly sclerotized, without color pattern, covering full length of abdomen, no soft tissue visible from above, middle surface smooth, sides smooth; postepigastric scutum weakly sclerotized, long, almost rectangular, covering nearly full length of abdominal length, without posteriorly directed lateral apodemes; spinneret scutum with fringe of stout setae. Legs: patella plus tibia I shorter than carapace. Genitalia: epigastric region with

Figs. 590–599. *Prethopalpus humphreysi*, n. sp., female (PBI_OON 23555). 590. Habitus, dorsal view. 591. Same, ventral view. 592. Same, lateral view. 593. Prosoma, anterior view. 594. Same, ventral view. 595. Same, dorsal view. 596. Abdomen, ventral view. 597. Prosoma, lateral view. 598. Female epigyne, ventral view. 599. Female epigyne, dorsal view.

sperm pore small, circular, situated in front of anterior spiracles. Palpal patella slightly bulging ventrally with conical base (fig. 467); bulb pear shaped with narrow curled embolar tip (figs. 466–469).

FEMALE: Unknown.

OTHER MATERIAL EXAMINED: None.

DISTRIBUTION: This species is known only from a borehole south of Exmouth, Cape Range, northwestern Australia (map 7). Al-

though this specimen came from a location near the type locality of *P. infernalis*, they undoubtedly represent different species.

Prethopalpus attenboroughi Baehr and Harvey, new species

Figures 113–115, 470–480; map 7

TYPE: AUSTRALIA: *Queensland*: Male holotype from Horn Island, Torres Strait, 10.61667°S, 142.2833°E (2–8 Dec. 1986, J.

Figs. 600–607. *Prethopalpus infernalis* (Harvey and Edward), male (PBI_OON 46550). **600.** Habitus, dorsal view. **601.** Same, ventral view. **602.** Prosoma, anterior portion of abdomen, ventral view. **603.** Male palp, prolateral view. **604.** Same, detail of bulb, retrolateral view. **605.** Habitus, lateral view. **606.** Prosoma, dorsal view. **607.** Prosoma, dorsolateral view.

Gallon), deposited in QM (S72955, PBI_OON 00007438).

ETYMOLOGY: This species is named for the eminent naturalist David Attenborough in honor of his contributions to recognizing the beauty and splendor of the world's biodiversity.

DIAGNOSIS: Males resemble those of *P. platnicki* in general body shape and bulbal shape, but can be separated by the larger eyes (fig. 473), and a lateral process on the clypeus (fig. 475).

MALE (PBI_OON 7438, figs. 470–480): Total length 1.04. Prosoma, mouthparts, palp, legs, and abdominal scuta white, surface of elevated portion of pars cephalica smooth, sides granulate, clypeus with pair of small projections containing stiff setae; lateral margin without denticles. Eyes: six, tiny; ALE 0.030, PME 0.016, PLE 0.016; ALE largest, all eyes circular; posterior eye row

recurved from above, straight from front; ALE separated by more than their diameter, ALE-PLE separated by less than ALE radius, PME separated by their radius to diameter, PLE-PME separated by less than PME radius. Endites twice as long as wide, with tiny toothlike projection. Abdomen cylindrical; book lung covers large; pedicel tube short, ribbed. Dorsal scutum covering full length of abdomen smooth; epigastric scutum not protruding; postepigastric scutum long, almost rectangular, covering about $\frac{3}{4}$ of abdomen, without posteriorly directed lateral apodemes. Legs: patella plus tibia I nearly as long as carapace. Epigastric region with circular sperm pore. Palpal bulb, distal tip with broad a medially bent hook (figs. 113–115).

FEMALE: Unknown.

OTHER MATERIAL EXAMINED: **AUSTRALIA:** *Queensland:* Horn Island, Torres Strait,

Figs. 608–617. *Prethopalpus julianneae*, n. sp., male (PBI_OON 46587). **608.** Habitus, dorsal view. **609.** Same, ventral view. **610.** Same, lateral view. **611.** Prosoma, anterior view. **612.** Same, ventral view. **613.** Same, dorsal view. **614.** Same, lateral view. **615.** Male palp, prolateral view. **616.** Same, dorsal view. **617.** Palp, retrolateral view.

10.61667°S, 142.2833°E, 2–8 Dec. 1986, J. Gallon, 1 ♂ (QM S72955, PBI_OON 00007438).

DISTRIBUTION: This species is known only from the type locality, Horn Island in the Torres Strait (map 7).

Prethopalpus blosfeldsorum Baehr and Harvey, new species

Figures 119–121, 481–489; map 7

TYPE: AUSTRALIA: Queensland: Male holotype from Kroombit Tops, 45 km SSW

of Calliope (site 2), 24.40611°S, 150.98333°E, 860 m (15 Dec. 1983, G. Monteith, V. Davies, J. Gallon, G. Thompson), deposited in QM (S12800, PBI_OON 00006425).

ETYMOLOGY: The specific name honors Bruno and Denise Blosfelds, M.S.H.’s parents-in-law.

DIAGNOSIS: Males resemble those of *P. rawlinsoni* in having a strongly protruding epigastric scutum and a ventrally bulging bulb, but can be separated by having a bulb

Figs. 618–625. *Prethopalpus kintyre*, n. sp., female (PBI_OON 46574). **618.** Habitus, dorsal view. **619.** Same, ventral view. **620.** Same, lateral view. **621.** Prosoma, anterior view. **622.** Same, ventral view. **623.** Same, dorsal view. **624.** Same, lateral view. **625.** Female epigyne, ventral view.

with a rounded basal extension (figs. 119, 121).

MALE (PBI_OON 6425, figs. 481–489): Total length 1.05. Prosoma, mouthparts, and abdominal scuta yellow-brown, pars cephalica flat in lateral view, surface of elevated

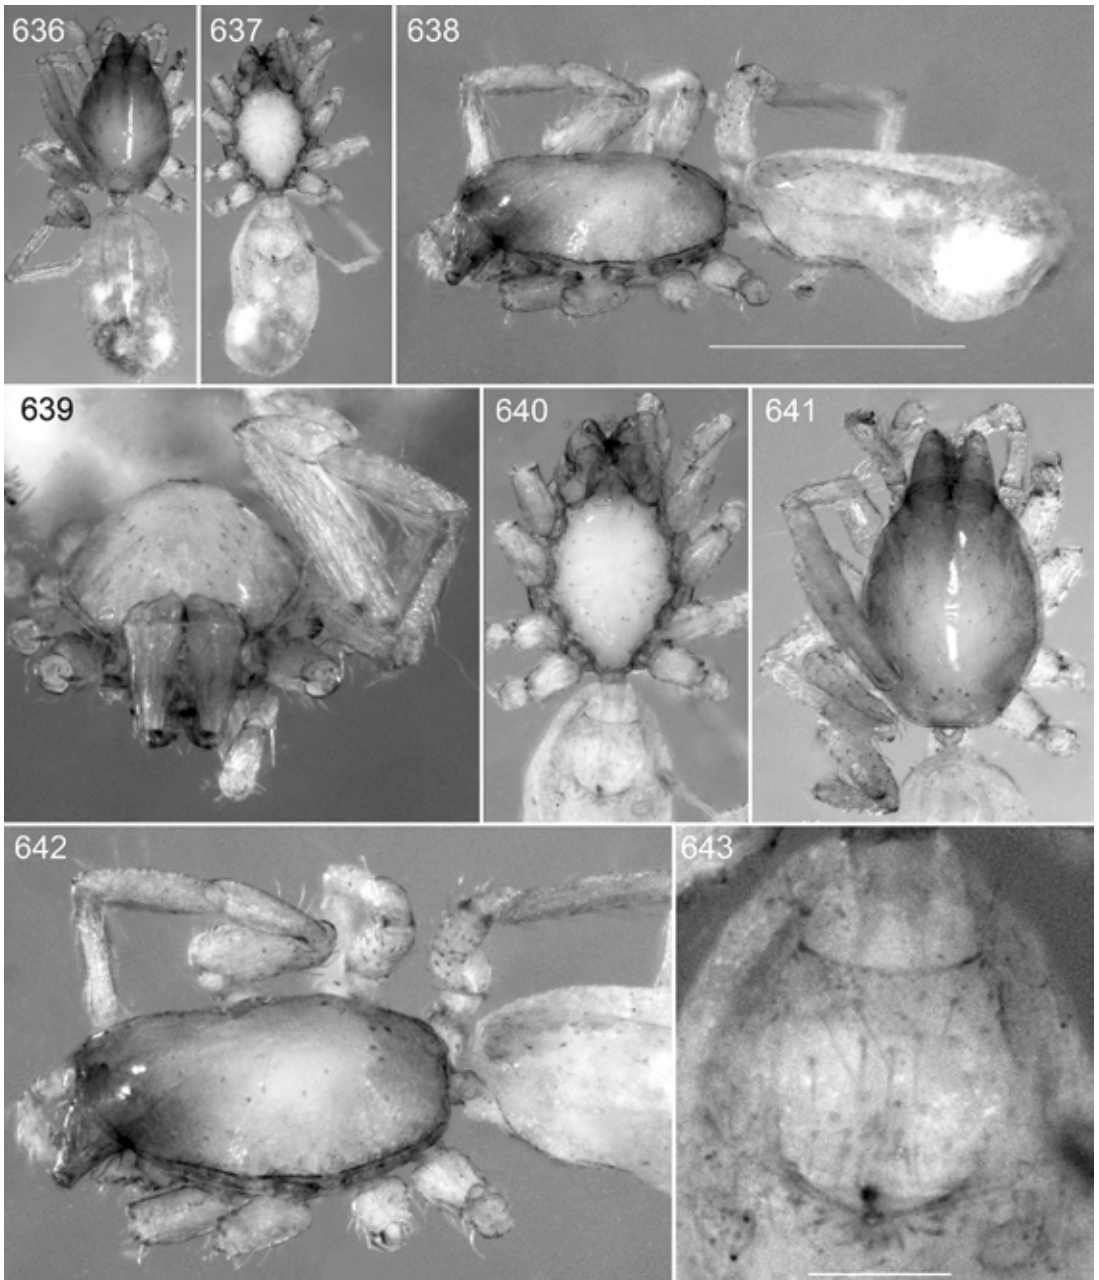

portion of pars cephalica smooth, sides finely reticulate; lateral margin without denticles; nonmarginal pars cephalica setae light, needlelike, present, scattered; marginal setae light, needlelike. Clypeus margin unmodified, straight in front view, vertical in lateral view,

Figs. 626–635. *Prethopalpus maini*, n. sp., male (PBI_OON 46586). **626.** Habitus, dorsal view. **627.** Same, ventral view. **628.** Same, lateral view. **629.** Prosoma, anterior view. **630.** Same, ventral view. **631.** Same, dorsal view. **632.** Same, lateral view. **633.** Male palp, prolateral view. **634.** Same, dorsal view. **635.** Palp, retrolateral view.

high, ALE separated from edge of carapace by their radius or more; setae present, light, needlelike. Eyes: ALE 0.040, PME 0.039, PLE 0.038; ALE largest, all eyes circular; posterior eye row straight from both above and front; ALE separated by less than their radius, ALE-PLE separated by less than ALE radius, PME just touching, PLE-PME separated by less than PME radius. Sternum longer than wide, surface smooth, without pits. Endites twice as long as wide, toothlike

projection tiny. Abdomen cylindrical; book lung covers small; pedicel tube short, ribbed. Dorsal scutum covering full length of abdomen, smooth; epigastric scutum strongly protruding; postepigastric scutum long, almost rectangular, covering about $\frac{3}{4}$ of abdomen, without posteriorly directed lateral apodemes. Legs white; patella plus tibia I shorter than carapace. Epigastric region with circular sperm pore and strongly protruding extension. Palp yellow; embolus light; femur

Figs. 636–643. *Prethopalpus maini*, n. sp., female (PBI_OON 46590). **636.** Habitus, dorsal view. **637.** Same, ventral view. **638.** Same, lateral view. **639.** Prosoma, anterior view. **640.** Same, ventral view. **641.** Same, dorsal view. **642.** Same, lateral view. **643.** Female epigyne, ventral view.

attaching to patella submedially; patella longer than femur; cymbium not fused with bulb, bulb ventrally strongly bulging with rounded extension (figs. 119–121).

FEMALE: Unknown.

OTHER MATERIAL EXAMINED: **AUSTRALIA: Queensland:** Kroombit Tops, 45 km SSW of Calliope (site 2), 24.40611°S, 150.98333°E, 860 m, 15 Dec. 1983 (G. Monteith, V. Davies, J. Gallon, G. Thompson, QM S80973, PBI_OON 00022766, QM S16187, PBI_OON 00022767, QM S12829, PBI_OON 00022769), 4 ♂.

DISTRIBUTION: This species is known only from the type locality in eastern Queensland (map 7).

Prethopalpus boltoni Baehr and Harvey, new species
 Figures 490–507; map 10

TYPES: **AUSTRALIA: Western Australia:** Male holotype from Hope Downs, 35 km NW of Newman, 23°07'52"S, 119°32'01"E, stygofauna haul net (16–18 Feb. 2009, P. Bolton, J. Puglisi) (WAM T96817, PBI_OON 46552).

ETYMOLOGY: This species is named for Paul Bolton, one of the collectors of the type specimens.

DIAGNOSIS: Males and females resemble those of *P. framenau*i and *P. humphreysi* in lacking abdominal dorsal scutum and eyes, but can be easily separated by their much less sclerotized carapace (fig. 492). Males can be easily separated by the pointed basal region of the palpal patella (from lateral view) (figs. 496, 498), and females can be recognized by the long, straight posterior tube in the genitalia, and the short sinuous section, not reaching the posterior half between the epigastric and spiracular grooves (fig. 507).

MALE (PBI_OON 46552, figs. 490–498): Total length 1.18. Prosoma, mouthparts, and abdominal scuta yellow, carapace ovoid in dorsal view, pars cephalica flat in lateral view, surface smooth. Sternum finely punctate. Endites twice as long as wide, directed medially. Abdomen ovoid; book lung covers not visible (abdomen in poor condition). Dorsal scutum absent; postepigastric scutum weakly sclerotized, almost semicircular, only around epigastric furrow, fused to epigastric scutum, without posteriorly directed lateral

Figs. 653–659. *Prethopalpus marionae*, n. sp., female (PBI_OON 23403). **653.** Habitus, dorsal view. **654.** Same, ventral view. **655.** Same, lateral view. **656.** Prosoma, ventral view. **657.** Same, dorsal view. **658.** Female epigyne, ventral view. **659.** Female epigyne, dorsal view.

apodemes; spinneret scutum not visible (abdomen in poor condition). Legs white; patella plus tibia I nearly as long as carapace. Genitalia: epigastric region with sperm pore small, circular, situated in front of anterior spiracles. Palp patella slightly bulging ventrally, with conical base; middle part of bulb only slightly bulging ventrally, with narrow curled embolar tip (figs. 496–498).

FEMALE (PBI_OON 18856, figs. 499–507): Total length 1.29. Book lung covers and spinneret scutum not visible (abdomen in poor condition). Genitalia: epigastric area with broad slitlike epigynal opening, internal genital structure with free, needlelike anterior sclerite, and a long sinuous posterior tube, posterior part reaching half the distance to groove of posterior spiracles (fig. 507).

OTHER MATERIAL EXAMINED: AUSTRALIA: Western Australia: Hope Downs, 35 km

NW of Newman, 23°07'51"S, 119°32'00"E, stygofauna haul net, 13 Mar. 2008 (P. Bolton, C. Weston, WAM T92116, PBI_OON 18856), 1 ♀ (now lost, see REMARKS).

DISTRIBUTION: This species is known only from a subterranean ecosystem at Hope Downs, situated in the Pilbara region of Western Australia (map 10).

REMARKS: Unfortunately, after the description of the female specimen was prepared, the specimen was lost.

Prethopalpus callani Baehr and Harvey,
new species

Figures 508–525; map 10

TYPES: AUSTRALIA: Western Australia: Male holotype from Yeelirrie Station, 87 km S of Wiluna, bore YYHC0048H, 27°18'59.90"S, 120°09'02.14"E, troglifauna (17 Mar. 2010, S. Callan, G. Perina), deposited in WAM

Figs. 660–671. *Prethopalpus oneillae*, n. sp., male (PBI_OON 46537). **660.** Habitus, dorsal view. **661.** Same, ventral view. **662.** Same, lateral view. **663.** Prosoma, anterior view. **664.** Prosoma, ventral view. **665.** Prosoma, dorsal view. **666.** Abdomen, ventral view. **667.** Prosoma, lateral view. **668.** Abdomen, anterior view. **669.** Male palp, prolateral view. **670.** Same, dorsal view. **671.** Same, retrolateral view.

(T108171, PBI_OON 46576). Paratypes: 1 female, from Yeelirrie Station, 87 km S of Wiluna, bore YYHC0048H, 27°18'59.90"S, 120°09'02.14"E, troglofauna (13 Nov. 2011, P. Bell, S. Callan), deposited in WAM (T108166, PBI_OON 46564); 1 female from Yeelirrie, 87 km S of Wiluna, bore YYAC285, 27°10'17.84"S, 119°54'28.4"E, troglofauna (12 Nov. 2009, P. Bell, S. Callan), deposited in WAM (T108168, PBI_OON 46562).

ETYMOLOGY: This species is named for Shae Callan, collector of the type specimens.

DIAGNOSIS: Males of *P. callani* can be separated from those of all other blind

Prethopalpus species without a dorsal scutum by having anteriorly swollen chelicerae (figs. 513, 514), and females by having an internal genital structure not reaching the posterior spiracle groove (fig. 525).

MALE (PBI_OON 46576, figs. 508–517): Total length 1.36. Prosoma, mouthparts, and palp pale orange, carapace broadly oval in dorsal view, pars cephalica flat in lateral view, surface smooth, margin widely rebordered, front darker; Clypeus curved downward in front view, sloping forward in lateral view; Sternum longer than wide, not fused to carapace, surface smooth, distance between

Figs. 672–681. *Prethopalpus platnicki*, n. sp., male (PBI_OON 21352). **672.** Habitus, dorsal view. **673.** Same, ventral view. **674.** Same, lateral view. **675.** Prosoma, anterior view. **676.** Same, ventral view. **677.** Same, dorsal view. **678.** Same, lateral view. **679.** Male palp, prolateral view. **680.** Same, dorsal view. **681.** Same, retrolateral view.

coxae approximately equal. Labium not fused to sternum. Endites twice as long as wide, directed medially. Abdomen ovoid; dorsum soft portions white; book lung covers large. Dorsal scutum weakly sclerotized, white, without color pattern, covering less than $\frac{1}{2}$ of abdomen, less than $\frac{1}{4}$ abdomen width, surface smooth, scutum same color as abdomen; epigastric scutum not protruding; postepigastric scutum weakly sclerotized, white, short, only around epigastric furrow, without posteriorly directed lateral apodemes; spinneret scutum absent.

Legs: white; patella plus tibia I nearly as long as carapace. Genitalia: epigastric region with sperm pore small, circular, situated at level of anterior spiracles. Palpal patella basally rounded, ventrally only slightly bulging; bulb pyriform, ventrally bulging, with long, narrow embolar tip (figs. 515–517).

FEMALE (PBI_OON 46564, figs. 518–525): Total length 1.43. Postepigastric scutum not fused to epigastric scutum. Legs: patella plus tibia I shorter than carapace. Epigastric area with large oval epigynal opening, inter-

nal genital structure triangular, not reaching groove of posterior spiracles (fig. 525).

OTHER MATERIAL EXAMINED: AUSTRALIA: Western Australia: Yeelirrie Station, Yeelirrie Deposit, bore hole YUN1, 27°11'38"S, 119°51'20"E, stygofauna haul, 10 Mar. 2009, staff from Subterranean Ecology (WAM T97287, PBI_OON 46553), 1 ♂; Yeelirrie, 87 km S of Wiluna, bore YYAC118, 27°10'28.8"S, 119°53'23.06"E, stygofauna net haul, 12 Nov. 2009, P. Bell, S. Callan (WAM T108169, PBI_OON 46563), 1 ♂; Yeelirrie, 87 km S of Wiluna, bore YYHC0110, 27°06'43.96"S, 119°49'46.19"E, stygofauna net haul, 14 Oct. 2010, S. Callan, P. Bell (WAM T108170, PBI_OON 46578), 1 ♂.

DISTRIBUTION: This species is known only from subterranean environments in Yeelirrie Station, situated in the Pilbara region of Western Australia (map 10).

Prethopalpus cooperi Baehr and Harvey, new species

Figures 526–538; map 10

TYPE: AUSTRALIA: Western Australia: Male holotype from Cunyu Station, State Bore Field bore 97U, 25°46'50"S, 120°06'27"E (22 July 2008, W.F. Humphreys, S. Cooper, J.M. Waldoek), deposited in WAM (T103074, PBI_OON 46539).

ETYMOLOGY: This species is named for Steven Cooper of the South Australian Museum, one of the collectors of the holotype.

DIAGNOSIS: Males resemble those of *P. alexanderi* and *P. oneillae* in having a dorsal scutum covering the whole abdomen and no eyes, but can be separated from these species by the cylindrical abdomen (fig. 526) and the strongly bulging epigastric area (in lateral view) (fig. 538).

MALE (PBI_OON 46539, figs. 526–538): Total length 1.26. Prosoma, mouthparts, palp, legs, and abdominal scuta yellow-brown, carapace ovoid in dorsal view, pars cephalica flat in lateral view, surface of elevated portion of pars cephalica smooth, sides granulate, only center of carapace smooth. Clypeus straight in front view, sloping forward in lateral view. Sternum fused to carapace, surface finely reticulate, microsculpture covering entire surface. Endites twice as long as wide, directed medially. Abdomen cylindrical; book lung covers large; pedicel ribbed, scutum

not extending far dorsal of pedicel. Dorsal scutum weakly sclerotized, pale orange, covering full length of abdomen, no soft tissue visible from above, surface smooth; epigastric scutum surrounding pedicel, strongly protruding, with two darker lateral patches at height of anterior spiracles; postepigastric scutum weakly sclerotized, long, almost rectangular, covering about ¾ of abdominal length, fused to epigastric scutum, without posteriorly directed lateral apodemes. Legs: patella plus tibia I shorter than carapace. Genitalia: epigastric region with sperm pore small, circular, situated in front of anterior spiracles. Palpal patella about as long as femur, slightly larger than femur, patella not bulging ventrally, with rounded base; bulb pear shaped, extremely bulging ventrally, with narrow curled embolar tip (figs. 534–536).

FEMALE: Unknown.

OTHER MATERIAL EXAMINED: None.

DISTRIBUTION: This species is known only from a subterranean calcrete deposit on Cunyu Station, situated in the Yilgarn region of Western Australia (map 10).

Prethopalpus eberhardi Baehr and Harvey, new species

Figures 539–555; map 9

TYPES: AUSTRALIA: Western Australia: Male holotype from ca. 13 km NE of Yarrie Homestead, borehole #CA0011R, stygofauna haul, 20°38'57.1"S, 120°18'27.2"E (26 Apr. 2008, S. Eberhard), deposited in WAM (T91749, PBI_OON 18855). Paratype: 1 female, Yarrie area, hole #CA0012R, 20°39'06.1"S, 120°18'23.1"E (26 Apr. 2008, S. Eberhard), deposited in WAM (T91743, PBI_OON 18854).

ETYMOLOGY: This species is named for Stefan Eberhard, collector of the type specimens and many other fascinating subterranean organisms.

DIAGNOSIS: Males and females resemble those of *P. infernalis*, *P. alexanderi*, *P. oneillae*, and *P. cooperi* in having an abdominal dorsal scutum and no eyes, but can be separated from these species by the postepigastric scutum covering ⅔ of the abdomen (figs. 540, 546). Males can be separated from *P. infernalis* by the palpal patella with a strong ventral swelling (figs. 543, 545).

MALE (PBI_OON 18855, figs. 539–545): Total length 1.07. Prosoma, mouthparts, palp, legs, and abdominal scuta pale orange, carapace, ovoid in dorsal view, pars cephalica slightly elevated in lateral view, surface of elevated portion of pars cephalica smooth, sides granulate. Clypeus curved downward in front view, sloping forward in lateral view. Eyes absent. Sternum fused to carapace, surface smooth. Labium not fused to sternum. Endites twice as long as wide, with tiny tooth at anteromedian tip. Abdomen ovoid; book lung covers large; pedicel ribbed. Dorsal scutum weakly sclerotized, covering more than $\frac{3}{4}$ of abdomen, no soft tissue visible from above, surface smooth; epigastric scutum not protruding; postepigastric scutum weakly sclerotized, long, semicircular, covering about $\frac{3}{4}$ of abdominal length, fused to epigastric scutum, without posteriorly directed lateral apodemes; spinneret scutum with fringe of stout setae. Legs yellow; patella plus tibia I nearly as long as carapace. Epigastric region with sperm pore small, oval, situated at level of anterior spiracles. Palpal patella about as long as femur, patella ventrally swollen, with rounded base; bulb pear shaped bulging ventrally, with narrow curled embolar tip swelling (figs. 543–545).

FEMALE (PBI_OON 18854, figs. 546–555): Total length 1.22. Epigastric area with broad slitlike epigynal opening, internal genital structure with free, inverted teardrop-shaped anterior sclerite, and a long sinuous posterior tube, posterior part not reaching groove of posterior spiracles (fig. 555). Dorsal scutum covering ca. $\frac{3}{4}$ of abdomen; postepigastric scutum almost semicircular, covering about $\frac{2}{3}$ of abdominal length, not fused to epigastric scutum.

OTHER MATERIAL EXAMINED: None.

DISTRIBUTION: This species is known only from a single location in the Pilbara region of Western Australia (map 9).

Prethopalpus framenaui Baehr and
Harvey, new species
Figures 556–575; map 9

TYPES: AUSTRALIA: Western Australia: Male holotype from Nambi Station, Shady Well calcrete, bore litter trap 11, bore, 28°23'54"S, 122°11'55"E (July 2010, W.F.

Humphreys, S. Cooper), deposited in WAM (T104043, PBI_OON 46542). Paratypes: 1 female, collected with holotype (WAM T111751, PBI_OON 23554); 1 male, collected with holotype (WAM T104045, PBI_OON 46544).

ETYMOLOGY: This species is named for Volker Framenau for his contributions to arachnological research.

DIAGNOSIS: Males and females of *P. framenaui* resemble those of *P. boltoni* and *P. humphreysi* in lacking a dorsal abdominal scutum and eyes, and *P. humphreysi* in sharing a well-sclerotized carapace but lacking the dark book lung covers. Males can be easily separated from *P. humphreysi* by having a much shorter, more pear-shaped palpal bulb (figs. 564, 566), and females can be recognized by the long, straight posterior tube in the genitalia, with only the posterior part sinuous, reaching the posterior spiracular groove (fig. 575).

MALE (PBI_OON 46542, figs. 556–566): Total length 1.22. Prosoma, mouthparts, palp, legs, and abdominal scuta pale orange, carapace ovoid in dorsal view, pars cephalica flat in lateral view, surface of elevated portion of pars cephalica smooth, sides finely reticulate. Clypeus curved downward in front view, sloping forward in lateral view. Sternum fused to carapace, surface smooth. Endites twice as long as wide, directed medially. Abdomen ovoid; book lung covers small; pedicel unmodified. Dorsal scutum absent; epigastric scutum surrounding pedicel, not protruding; postepigastric scutum weakly sclerotized, almost semicircular, only around epigastric furrow, fused to epigastric scutum, anterior margin unmodified, without posteriorly directed lateral apodemes; spinneret scutum with fringe of stout setae. Legs: patella plus tibia I shorter than carapace. Genitalia: epigastric region with sperm pore small, circular, situated in front of anterior spiracles. Palp patella not bulging, ventrally rounded at base, bulb strongly protruding ventrally with a short coiled embolar tip (figs. 563–566).

FEMALE (PBI_OON 23554, figs. 567–575): Total length 1.35. Abdomen with postepigastric scutum not fused to epigastric scutum. Epigastric area with small round epigynal opening, internal genital structure

Map 6. Distribution records of *Prethopalpus attenboroughi* (●), *P. tropicus* (▲), and *P. rawlinsoni* (■).

with free, needlelike anterior sclerite, and a long sinuous posterior tube, posterior part reaching groove of posterior spiracles (fig. 575).

OTHER MATERIAL EXAMINED: None.

DISTRIBUTION: This species is known only from a subterranean calcrete from Nambi Station, situated in the Yilgarn region of Western Australia (map 7).

Prethopalpus humphreysi Baehr and
Harvey, new species
Figures 576–599; map 9

TYPES: AUSTRALIA: *Western Australia*: Male holotype from Sturt Meadows Station, bore 128, 28°42'04"S, 120°53'55"E, litter traps in bore (24 July 2008, W.F. Humphreys, S. Cooper, J.M. Waldoek), deposited in WAM (T103073, PBI_OON 46538). Paratypes: 1 female collected with holotype, deposited in WAM (T111752, PBI_OON 23555); 1 female collected with holotype, deposited in WAM (T104044, PBI_OON 46543); 1 female, from Sturt Meadows Station, bore 128, 28°42'30"S, 120°53'39"E

(Nov. 2006, A. Allford), deposited in WAM (T103076, PBI_OON 46541).

ETYMOLOGY: This species is named for Bill Humphreys of the Western Australian Museum, one of the collectors of the types.

DIAGNOSIS: Males and females of this species resemble those of *P. boltoni* and *P. framenau* in lacking an abdominal dorsal scutum and eyes; they differ from *P. framenau* in sharing a well-sclerotized carapace but having dark book lung covers (fig. 578). Males can be easily separated from *P. framenau* by the much longer bulb, which is ventrally more pointed (in lateral view) (figs. 587, 588); females can be recognized by the shorter straight posterior tube in the genitalia, and the larger sinuous part, not reaching the posterior spiracular groove (fig. 599).

MALE (PBI_OON 46538, figs. 576–589): Total length 1.28. Prosoma, mouthparts, and palp pale orange, carapace ovoid in dorsal view, pars cephalica flat in lateral view, surface of elevated portion of pars cephalica smooth, sides finely reticulate. Clypeus

Map 7. Distribution records of *Prethopalpus blosfeldsorum* (●), *P. marionae* (■), and *P. platnicki* (★).

curved downward in front view, sloping forward in lateral view. Sternum fused to carapace, surface smooth. Endites twice as long as wide. Abdomen ovoid; book lung covers large, brown, darker than abdomen. Dorsal scutum absent; epigastric scutum surrounding pedicel, slightly protruding; postepigastric scutum absent, postepigastric area slightly protruding; spinneret scutum with fringe of stout setae. Legs white; patella plus tibia I nearly as long as carapace. Genitalia: epigastric region with sperm pore large, triangular with rounded angles, situated in front of anterior spiracles. Palpal patella longer than femur, ventrally slightly bulging, posteriorly rounded, connection to femur subbasally; bulb ventrally strongly bulging and with elongated distal embolar tip (figs. 584–588).

FEMALE (PBI_OON 23555, figs 590–599): Total length 1.58. Epigastric area with slitlike epigynal opening, internal genital structure with free, needlelike, T-shaped anterior sclerite that is medially thickened, and a long sinuous posterior tube, posterior

part not reaching groove of posterior spiracles (fig. 599).

OTHER MATERIAL EXAMINED: None.

DISTRIBUTION: This species is known only from subterranean calcrete deposits at Sturt Meadows Station, in the Yilgarn region of Western Australia (map 9).

Prethopalpus infernalis (Harvey and

Edward), new combination

Figures 600–607; map 6

Camptoscaphiella infernalis Harvey and Edward, 2007b: 14–16, figs. 9–13.

TYPE: AUSTRALIA: Western Australia: Male holotype from Cape Range region, Learmonth Limestone bore #LL11, 22°13'27"S, 114°01'52"E, depth 31 m (6 Apr. 2001, R.D. Brooks), deposited in WAM (T54533, PBI_OON 46550).

DIAGNOSIS: Males resemble those of *P. eberhardi*, *P. alexanderi*, *P. oneillae*, and *P. cooperi* in having an abdominal dorsal scutum and no eyes, but can be separated from these species by the postepigastric

Map 8. Distribution records of *Prethopalpus maini* (●), *P. scanloni* (▲), *P. infernalis* (■), and *P. oneillae* (★).

scutum covering only 1/2 of the abdomen (fig. 601).

MALE (PBI_OON 46550, figs. 600–607): Total length 1.19. Prosoma, mouthparts, palp, and abdominal scuta pale orange, carapace ovoid in dorsal view, pars cephalica flat in lateral view, surface smooth. Clypeus curved downward in front view, vertical in lateral view. Sternum fused to carapace, surface smooth. Anteromedian tip of endites unmodified. Abdomen ovoid; book lung covers large. Dorsal scutum weakly sclerotized, covering 70% of abdomen, ca. 1/2 of abdomen width, surface smooth; epigastric area not protruding; postepigastric scutum weakly sclerotized, almost semicircular, covering about 1/2 of abdominal length, fused to epigastric scutum, without posteriorly directed lateral apodemes; spinneret scutum with fringe of stout setae. Legs: yellow; patella plus tibia I nearly as long as carapace. Genitalia: epigastric region with sperm pore small, circular, situated in front of anterior

spiracles. Palp patella ventrally slightly bulging, basally rounded, bulb perform, slightly bulging, ventrally with short narrow embolar tip (figs. 603, 604).

FEMALE: Unknown.

OTHER MATERIAL EXAMINED: None.

DISTRIBUTION: This species is known only from a borehole at Cape Range in northwestern Australia (map 6).

Prethopalpus julianneae Baehr and Harvey, new species
 Figures 608–617; map 10

TYPES: AUSTRALIA: *Western Australia*: Male holotype from mining Area C, bore SF0569R, c. 100 km NW of Newman, troglofauna, –39m (18 Mar. 2010, J.S. Cocking, D.C. Main), deposited in WAM (T108273, PBI_OON 46587).

ETYMOLOGY: This species is named for Julianne Waldock in recognition of her arachnological prowess.

Map 9. Distribution records of *Prethopalpus eberhardi* (●), *P. pearsoni* (○), *P. kintyre* (▲), *P. humphreysi* (■), and *P. framenau* (★).

DIAGNOSIS: Males can be separated from those of all other blind *Prethopalpus* species with a dorsal scutum by having endites about 1.5 times as long as wide (fig. 612).

MALE (PBI_OON 46587, figs. 608–617): Total length 1.26. Prosoma, mouthparts, legs, palp, and abdominal scuta pale orange, carapace broadly oval in dorsal view, pars cephalica flat in lateral view, surface smooth. Clypeus straight in front view, sloping forward in lateral view. Sternum longer as wide, not fused to carapace, surface smooth, distance between coxae approximately equal. Endites about 1.5 times as long as wide. Abdomen ovoid; book lung covers large. Dorsal scutum weakly sclerotized, covering full length of abdomen, more than $\frac{1}{2}$ to most of abdomen width, surface smooth; epigastric scutum not protruding; postepigastric scutum weakly sclerotized, long, semicircular, covering about $\frac{3}{4}$ of abdominal length, fused to epigastric scutum, without posteriorly directed lateral apodemes; spinneret scutum absent;

spinneret scutum without fringe of setae. Legs: patella plus tibia I shorter than carapace. Genitalia: epigastric region with sperm pore small, circular, situated at level of anterior spiracles. Palpal patella ventrally slightly bulging, basally rounded, bulb pyriform, ventrally rounded with wide tip (figs. 615–617).

FEMALE: Unknown.

OTHER MATERIAL EXAMINED: None.

DISTRIBUTION: This species is known only from subterranean habitats in the Pilbara region of Western Australia (map 10).

Prethopalpus kintyre Baehr and Harvey,
new species
Figures 618–625; map 9

TYPE: AUSTRALIA: Western Australia: Female holotype, Kintyre, ca. 60 km S of Telfer, 22°20'07.5"S, 122°04'51.5"E, troglodfauna, –23m, (28 July 2010, D.C. Main, G.B. Pearson, deposited in WAM (T108263, PBI_OON 46574).

Figs. 682–690. *Prethopalpus platnicki*, n. sp., female (PBI_OON 23402). **682.** Habitus, dorsal view. **683.** Same, ventral view. **684.** Same, lateral view. **685.** Prosoma, anterior view. **686.** Same, ventral view. **687.** Same, dorsal view. **688.** Same, lateral view. **689.** Female epigyne, ventral view. **690.** Female epigyne, dorsal view.

ETYMOLOGY: The species name is a noun in apposition derived from the type locality.

DIAGNOSIS: Females can be separated from those of all other blind *Prethopalpus* species without a dorsal scutum by a greater distance between coxae II–III than between coxae I–II and II–IV (fig. 622).

FEMALE (PBI_OON 46574, figs. 618–625): Total length 1.09. Prosoma, legs, palp, and abdominal scuta white, mouthparts pale orange, carapace elongated hexagonal in dorsal view, pars cephalica flat in lateral view, surface smooth. Clypeus curved downward in front view, sloping forward in lateral

Figs. 691–700. *Prethopalpus pearsoni*, n. sp., male (PBI_OON 46591). **691.** Habitus, dorsal view. **692.** Same, ventral view. **693.** Same, lateral view. **694.** Prosoma, anterior view. **695.** Same, ventral view. **696.** Same, dorsal view. **697.** Same, lateral view. **698.** Male palp, prolateral view. **699.** Same, dorsal view. **700.** Palp, retrolateral view.

view. Sternum not fused to carapace, surface smooth, distance between coxae II and III greater than distance between coxae I and II, and coxae III and IV. Labium not fused to sternum, anterior margin not indented at middle. Endites twice as long as wide directed medially. Abdomen: book lung covers large; pedicel unmodified. Dorsal, epigastric, postepigastric, and spinneret scuta absent. Legs: patella plus tibia I shorter

than carapace. Epigastric area with small epigynal opening, internal genital structure with free, needlelike anterior sclerite, and a long sinuous posterior tube, posterior part reaching groove of posterior spiracles (fig. 625).

OTHER MATERIAL EXAMINED: None.

DISTRIBUTION: This species is known only from subterranean environments in the Pilbara region of Western Australia (map 9).

Figs. 701–708. *Prethopalpus rawlinsoni*, n. sp., male (PBI_OON 07129). **701.** Habitus, dorsal view. **702.** Same, ventral view. **703.** Prosoma, ventral view. **704.** Habitus, lateral view. **705.** Male palp, prolateral view. **706.** Same, dorsal view. **707.** Patella, dorsal view. **708.** Palp, retrolateral view.

Prethopalpus maini Baehr and Harvey,
new species

Figures 626–643; map 8

TYPES: **AUSTRALIA:** *Western Australia:* Holotype male from mining Area C, bore SF0288R, c. 100 km NW of Newman, 22°59′05.8″S, 118°49′06.4″E, troglofauna, –27m, (18 Mar. 2010, J.S. Cocking, D.C. Main), deposited in WAM (T108272, PBI_OON 46586). Paratype male from same location (27 June 2010, G. B. Pearson, M. K. Curran), deposited in WAM (T108276, PBI_OON 46590).

OTHER MATERIAL EXAMINED: **AUSTRALIA:** *Western Australia:* mining Area C, bore SF0140R, c. 100 km NW of Newman, 23°00′35.2″S, 118°58′57.4″E, troglofauna, –56m, 16 Feb. 2010, G.B. Pearson, D. C. Main, 1 ♀ (WAM T108269, PBI_OON 46583); mining Area C, bore SF0140R, c. 100 km NW of Newman, 23°00′49.2″S, 118°59′18.7″E, troglofauna, –93m, 17 Feb.

2010, G. B. Pearson, M. K. Curran, 1 ♂ (WAM T108270, PBI_OON 46584); mining Area C, c. 100 km NW of Newman, bore SF0383R, 22°59′05.5″S, 118°51′13.0″E, troglofauna, –57m, 19 Mar. 2010, J.S. Cocking, D.C. Main, 1 ♀ (WAM T108274, PBI_OON 46588).

ETYMOLOGY: This species is named for Dean Main, collector of the holotype.

DIAGNOSIS: Males and females resemble those of *P. eberhardi* in having a dorsal scutum covering about 80% of the abdomen but can be separated by the posteriorly rounded patella (in lateral view) in males (figs. 633, 635), and the more elongated carapace in females (fig. 641).

MALE (PBI_OON 46586, figs. 626–635): Total length 1.28. Prosoma, mouthparts, and palp pale orange, carapace oval in dorsal view, pars cephalica flat in lateral view, surface smooth. Clypeus straight in front view, sloping forward in lateral view. Sternum longer than wide, not fused to carapace, surface smooth, distance between coxae

Figs. 709–718. *Prethopalpus scanloni*, n. sp., male (PBI_OON 07129). **709.** Habitus, dorsal view. **710.** Same, ventral view. **711.** Same, lateral view. **712.** Prosoma, anterior view. **713.** Same, ventral view. **714.** Same, dorsal view. **715.** Same, lateral view. **716.** Male palp, prolateral view. **717.** Same, dorsal view. **718.** Palp, retrolateral view.

approximately equal. Endites twice as long as wide, directed medially. Abdomen ovoid; book lung covers large. Dorsal scutum weakly sclerotized, white, covering $\frac{3}{4}$ of abdomen, more than $\frac{1}{2}$ of abdomen width, surface smooth, dorsal scutum very weak barely visible; epigastric scutum surrounding pedicel, not protruding; postepigastric scutum weakly sclerotized, white, long, semicircular, covering about $\frac{2}{3}$ of abdominal length,

fused to epigastric scutum, without posteriorly directed lateral apodemes, postepigastric scutum very weak, nearly the same color as soft parts of the abdomen; spinneret scutum absent. Legs: white; patella plus tibia I longer than carapace. Tarsi I to IV without inferior claw. Genitalia: epigastric region with sperm pore small, circular, situated at level of anterior spiracles. Palpal patella basally rounded and ventrally bulging; bulb pyriform

Figs. 719–730. *Prethopalpus tropicus*, n. sp., male, scanning electron micrographs (PBI_OON 06426). 719. Prosoma, dorsal view. 720. Same, ventral view. 721. Same, anterior view. 722. Same, lateral view. 723. Sternum, lateral margin. 724. Opisthosoma, ventral view. 725. Pedicel and sperm pore, ventral view. 726. Male palp, dorsal view. 727. Embolus, dorsal view. 728. Labium, endite, ventral view. 729. Serrula, lateral view. 730. Base of embolus, retrolateral view.

Figs. 731–740. *Prethopalpus tropicus*, n. sp., male (PBI_OON 23339). 731. Habitus, dorsal view. 732. Same, ventral view. 733. Same, lateral view. 734. Prosoma, anterior view. 735. Same, ventral view. 736. Same, dorsal view. 737. Same, lateral view. 738. Male palp, prolateral view. 739. Same, dorsal view. 740. Same, retrolateral view.

ventrally slightly bulging with narrowed excavated embolar tip (figs. 633–635).

FEMALE (PBI_OON 46590, figs. 636–643): Total length 1.16. Epigastric area with small round epigynal opening, internal genital structure with free, needlelike globular anterior sclerite, posterior tube short not reaching groove of posterior spiracles (fig. 643).

OTHER MATERIAL EXAMINED: None.

DISTRIBUTION: This species is known only from subterranean environments northwest of Newman, in the Pilbara region of Western Australia (map 8).

***Prethopalpus marionae* Baehr and Harvey, new species**

Figures 128–130, 157, 158, 644–659; map 7

TYPES: AUSTRALIA: Queensland: Male holotype from 3 km NNE of Mt Webb, 15.5000°S, 145.1500°E (30 Apr.–3 May 1981, A. Calder, J. Feehan), deposited in ANIC (PBI_OON 00023006). Female allotype collected with holotype, deposited in ANIC (PBI_OON 00023403).

ETYMOLOGY: The specific name is in honor of Marion Morgan, M.S.H.'s mother.

Figs. 741–749. *Prethopalpus tropicus*, n. sp., female (PBI_OON 23373). **741.** Habitus, dorsal view. **742.** Same, ventral view. **743.** Same, lateral view. **744.** Prosoma, anterior view. **745.** Same, ventral view. **746.** Same, dorsal view. **747.** Same, lateral view. **748.** Female epigyne, ventral view. **749.** Female epigyne, dorsal view.

DIAGNOSIS: Males and females resemble those of *P. tropicus* in general body shape and eye sizes, but can be separated by a smooth sternal surface (fig. 648).

MALE (PBI_OON 23006, figs. 644–652): Total length 1.09. Prosoma, mouthparts, palp, and abdominal scuta yellow, surface of elevated portion of pars cephalica slightly

Map 10. Distribution records of *Prethopalpus alexanderi* (●), *P. julianneae* (○), *P. cooperi* (▲), *P. boltoni* (■), and *P. callani* (★).

granulate, sides mostly smooth; lateral margin without denticles. Eyes: six, well developed but relatively small, ALE 0.040, PME 0.039, PLE 0.037; ALE largest, all eyes circular; posterior eye row straight from both above and front; ALE separated by less than their radius, ALE-PLE separated by less than ALE radius, PME just touching, PLE-PME separated by less than PME radius. Sternum longer than wide, surface smooth, without pits. Endites twice as long as wide, with tiny anteromedian projection. Abdomen cylindrical; book lung covers large hardly visible; pedicel tube short, ribbed. Dorsal scutum yellow, covering full length of abdomen, middle surface smooth, sides smooth; epigastric scutum not protruding; postepigastric scutum long, almost rectangular, covering nearly full length of abdomen. Legs yellow, patella plus tibia I shorter than carapace. Palpal femur attaching to patella subbasally; patella about as long as femur, ventrally

slightly bulging, and basally rounded, bulb pyriform with thin, medially bent embolus (figs. 128–130).

FEMALE (PBI_OON 23403, figs. 653–659): Total length 1.22. Carapace, sides are slightly granulate, but cephalic area is smooth. Eyes: ALE 0.039, PME 0.038, PLE 0.036. Epigastric area with small epigynal opening, internal genital structure long oval, reaching posterior fold and ending in T-shaped anterior sclerite (figs. 157–158).

OTHER MATERIAL EXAMINED: AUSTRALIA: Queensland: 16 km N of Pilgrim Sands (NQ 23), 16°00'00"S, 145.4333°E, 28 Nov. 1992–18 Apr. 1993, P. Lawless, R. Raven, M. Shaw, 1 ♂ (QM S25118, PBI_OON 00021446); Mt Cook, Quarantine Road (NQ 21), 15.5000°S, 145.2333°E, 20 July–28 Nov. 1992, R. Raven, P. Lawless, M. Shaw, 1 ♂, 2 ♀ (QM S24421, PBI_OON 00020049); 3 km NNE of Mt Webb, 15.0500°S, 145.1500°E, 30 Apr.–3 May 1981, A. Calder, J.

Feehan, 1 ♂, 2 ♀ (ANIC 723, PBI_OON 00023404); Pilgrim Sands, 16.0833°S, 145.4333°E, 20 July–28 Nov. 1992, R. Raven, P. Lawless, M. Shaw, 5 ♂, 2 ♀ (QM S24398, PBI_OON 00019930). **PAPUA NEW GUINEA: National Capital District:** Port Moresby, 9.46630° S, 147.13610°E, 1 Aug. 1973, J. Nieminen, 1 ♂, 1 ♀ (UTU, PBI_OON 00015921); Port Moresby, 9.46630°S, 147.13610°E, 22 Sep. 1973, J. Nieminen, 2 ♂, 2 ♀ (UTU, PBI_OON 00015926).

DISTRIBUTION: This species is found in North Queensland and southern Papua New Guinea (map 7).

Prethopalpus oneillae Baehr and Harvey,
new species

Figures 660–671; map 8

TYPE: AUSTRALIA: Western Australia: Male holotype from Homestead, 77.7 km NNW of Tom Price, borehole RHWRC0249P2–1, 22°04'42"S, 117°25'31"E (29 Mar. 2010, C. O'Neill), deposited in WAM (T102800, PBI_OON 46537).

ETYMOLOGY: This species is named for Caitlin O'Neill, collector of the holotype.

DIAGNOSIS: Males resemble those of *P. alexanderi* and *P. cooperi* in having a dorsal scutum covering the whole abdomen and no eyes, but can be separated from these species by the ovoid abdomen (fig. 660), and the slightly bulging epigastric area (in lateral view) (fig. 662).

MALE (PBI_OON 46537, figs 660–671): Total length 1.35. Prosoma, mouthparts, palp, and abdominal scuta pale orange, carapace broadly oval in dorsal view, pars cephalica flat in lateral view, surface granulate, only center of carapace smooth. Clypeus curved downward in front view, sloping forward in lateral view. Sternum fused to carapace, surface finely punctuate. Endites twice as long as wide. Abdomen ovoid; book lung covers large; pedicel ribbed. Dorsal scutum weakly sclerotized, covering full length of abdomen, no soft tissue visible from above, surface smooth; epigastric scutum slightly protruding; postepigastric scutum weakly sclerotized, long, almost rectangular,

covering nearly full length of abdominal length, fused to epigastric scutum, without posteriorly directed lateral apodemes. Legs: white; patella plus tibia I shorter than carapace. Genitalia: epigastric region with sperm pore small, circular, situated in front of anterior spiracles, slightly protruding. Palpal patella ventrally bulging with rounded base; bulb ventrally bulging with short curled embolar tip (figs. 669–671).

FEMALE: Unknown.

DISTRIBUTION: This species is known only from a single subterranean location in the Pilbara region of Western Australia (map 8).

Prethopalpus platnicki Baehr and

Harvey, new species

Figures 116–118, 159, 160, 672–690; map 7

TYPES: AUSTRALIA: Queensland: Male holotype from Thursday Island, Torres Strait, 10.58333°S, 142.2167°E (30 Mar.–15 June 1991, A. Von Berkey), deposited in QM (S79606, PBI_OON 00021352). Allotype female, collected with holotype, deposited in QM (S84698, PBI_OON 00023402).

ETYMOLOGY: This species is named for Norman Platnick in honor of his contribution to systematic theory, arachnid systematics, and the progenitor of the PBI project by which this research was funded.

DIAGNOSIS: Males resemble those of *P. attenboroughi* in general body shape and bulbal shape, but can be separated by their strongly reduced eyes (fig. 677), and a patch of strong setae at the front of the carapace (fig. 675).

MALE (PBI_OON 21352, figs. 672–681): Total length 1.05. Prosoma, mouthparts, and abdominal scuta yellow, carapace broadly oval in dorsal view, surface of elevated portion of pars cephalica smooth, sides finely reticulate; lateral margin without denticles; a field of stiff setae at cephalic area. Eyes reduced to 6 pale, hardly visible spots. Sternum longer than wide, surface smooth, without pits. Abdomen cylindrical; book lung covers large; pedicel tube short, ribbed. Dorsal scutum covering full length of abdomen, smooth; epigastric scutum not protruding; postepigastric scutum long, almost rectangular, covering nearly full length of abdomen. Legs white; patella plus tibia I

nearly as long as carapace. Epigastric region with circular sperm pore. Palp with proximal segments yellow; embolus light; femur attaching to patella subbasally; patella longer than femur, slightly larger than femur; cymbium with distal patch of setae, not fused with bulb; embolus with massive, medially bent hook (figs. 116–118).

FEMALE (PBI_OON 23402, figs. 682–690): Total length 1.20. Carapace, pars cephalica without a field of setae. Eyes: six, pale, hardly visible spots. Epigastric area with large oval epigynal opening, internal genital structure large oval reaching posterior fold, anterior sclerite reduced to a short trunk (figs. 159, 160).

OTHER MATERIAL EXAMINED: None.

DISTRIBUTION: This species is known only from the type locality in the Torres Strait (map 7).

Prethopalpus pearsoni Baehr and
Harvey, new species
Figures 691–700; map 8

TYPE: AUSTRALIA: Western Australia: Male holotype from mining Area C, bore PSD115R, c. 100 km NW of Newman, 22°54'07.1"S, 118°59'19.2"E, troglofauna, –42m (10 Apr. 2010, G.B. Pearson, M.K. Curran), deposited in WAM (T108277, PBI_OON 46591).

ETYMOLOGY: This species is named for Grant Pearson, collector of the holotype.

DIAGNOSIS: Males can be separated from those of all other blind *Prethopalpus* species with a dorsal scutum by a larger distance between coxae II–III than between coxae I–II and II–IV (fig. 695).

MALE (PBI_OON 46591, figs. 691–700): Total length 1.05. Prosoma, mouthparts, legs, palp, and abdominal scuta yellow pale orange, carapace elongate oval in dorsal view, pars cephalica flat in lateral view, surface smooth. Clypeus curved downward in front view, sloping forward in lateral view. Sternum longer than wide, not fused to carapace, surface smooth, distance between coxae II and III greater than distance between coxae I and II, and coxae III and IV, lateral margins with extension only between coxae II and III, leg I and II directed forward, with lateral pointed extensions,

largest between coxae II and III. Endites twice as long as wide, directed medially. Abdomen cylindrical. Dorsal scutum weakly sclerotized covering more than $\frac{3}{4}$ of abdomen, more than $\frac{1}{2}$ to most of abdomen width, surface smooth, scutum barely visible; epigastric scutum not protruding; postepigastric scutum weakly sclerotized, long, semicircular, covering about $\frac{2}{3}$ of abdominal length, fused to epigastric scutum, without posteriorly directed lateral apodemes; spinneret scutum absent. Legs: patella plus tibia I shorter than carapace. Genitalia: epigastric region with sperm pore small, circular, situated at level of anterior spiracles. Palpal patella basally rounded ventrally only slightly bulging; bulb ventrally rounded with narrow embolar tip (figs. 698–700).

FEMALE: Unknown.

OTHER MATERIAL EXAMINED: None.

DISTRIBUTION: This species is known only from subterranean habitats in the Pilbara region of Western Australia (map 8).

Prethopalpus rawlinsoni Baehr and
Harvey, new species
Figures 122–124, 701–708; map 6

TYPE: AUSTRALIA: Queensland: Male holotype from Boomer Range, Python Scrub, site 5, 23.18983°S, 149.7245°E, 240 m (16 Dec. 1999–22 Mar. 2000, G. Monteith), deposited in QM (S78688, PBI_OON 00007129).

ETYMOLOGY: The specific name is a patronym in honor of Wendy Hebron's father, a great naturalist. Wendy Hebron, technician at the Queensland Museum, prepared all of the scientific drawings for this paper and obtained this skill from her father.

DIAGNOSIS: Males resemble those of *P. attenboroughi* in having a strongly protruding epigastric scutum and a ventrally bulging bulb, but can be separated by the bulb having a conical extension (figs. 122, 124).

MALE (PBI_OON 7129, figs. 701–708): Total length 1.24. Prosoma, mouthparts, and abdominal scuta pale orange, surface of elevated portion of pars cephalica smooth, sides granulate; lateral margin without denticles. Eyes: ALE 0.052; PME 0.034; PLE 0.045; ALE largest, ALE circular, PME squared, PLE circular; posterior eye row

straight from both above and front; ALE separated by less than their radius, ALE-PLE separated by less than ALE radius, PME just touching, PLE-PME separated by less than PME radius. Sternum longer than wide, surface smooth, with pits. Endites twice as long as wide, with tiny toothlike projection. Abdomen cylindrical; book lung covers large, slightly darker than scutum; pedicel tube short, ribbed. Dorsal scutum, covering full length of abdomen, smooth; epigastric scutum strongly protruding; postepigastric scutum long, almost rectangular, covering nearly full length of abdomen, with long posteriorly directed lateral apodemes. Legs white; patella plus tibia I nearly as long as carapace. Epigastric region with circular sperm pore. Palp pale orange; embolus light; femur attaching to patella submedially; patella longer than femur, enlarged; cymbium not fused with bulb, bulb ventrally with large basal conical extension; embolus poorly differentiated, blunt (figs. 122–124).

FEMALE: Unknown.

OTHER MATERIAL EXAMINED: **AUSTRALIA: Queensland:** Boomer Range, Mongrel Scrub, site 1, 23.19317°S, 149.7687°E, 200 m, 16 Dec. 1999–22 Mar. 2000, G. and S. Monteith, 1 ♂ (QM S79628, PBI_OON 00021478).

DISTRIBUTION: This species is known only from eastern Queensland (map 6).

Prethopalpus scanloni Baehr and Harvey,
new species

Figures 709–718; map 8

TYPE: **AUSTRALIA: Western Australia:** Male holotype from Robe River Valley, c. 65 km SW of Pannawonica, bore DBRC089, 21°44'00.4"S, 115°45'41.9"E, troglifauna, –9m (22 Sept. 2010, J.S. Cocking, M.D. Scanlon), deposited in WAM (T108284, PBI_OON 46598).

ETYMOLOGY: This species is named for Michael Scanlon, collector of the holotype.

DIAGNOSIS: Males can be separated from those of all other blind *Prethopalpus* species without a dorsal scutum by having a strongly bulging epigastric area (in lateral view) (fig. 711).

MALE (PBI_OON 00046598, figs. 709–718): Total length 1.16. Prosoma, mouthparts, legs, palp, and abdominal scuta pale

orange, carapace ovoid in dorsal view, pars cephalica flat in lateral view, surface smooth. Clypeus straight in front view, sloping forward in lateral view. Sternum as long as wide, not fused to carapace, surface smooth, distance between coxae approximately equal, lateral margins unmodified. Chelicerae anterior face with swelling. Endites twice as long as wide, directed medially. Abdomen ovoid; book lung covers large; pedicel unmodified. Dorsal scutum absent; epigastric scutum surrounding pedicel, not protruding; postepigastric and spinneret scuta absent. Legs: patella plus tibia I near as long as carapace. Genitalia: epigastric region with sperm pore small, circular, situated at level of anterior spiracles. Sperm pore slightly protruded; patella basally narrow, ventrally only slightly bulging; bulb ventrally rounded with narrow embolar tip (figs. 716–718).

FEMALE: Unknown.

OTHER MATERIAL EXAMINED: None.

DISTRIBUTION: This species is known only from subterranean environments in the Robe River Valley in the Pilbara region of Western Australia (map 8).

Prethopalpus tropicus Baehr and Harvey,
new species

Figures 125–127, 155, 156, 719–749; map 6

TYPES: **AUSTRALIA: Queensland:** Male holotype from Mt Windsor Tableland, 16.1700°S, 145.5000°E, 900 m (5 November 1976, R.W. Taylor and A. Weir), deposited in ANIC (PBI_OON 00023050). Female allotype collected with holotype (deposited in ANIC, PBI_OON 00023373).

ETYMOLOGY: The specific name refers to the occurrence of this species in the tropical region of North Queensland and Papua New Guinea.

DIAGNOSIS: Males and females resemble those of *P. marionae* in general body shape and eye sizes, but can be separated by a finely reticulate sternal surface (figs. 720, 735, 745).

MALE (PBI_OON 23050, figs. 719–740): Total length 1.27. Prosoma, mouthparts, and abdominal scuta pale orange, pars cephalica flat in lateral view, surface of elevated portion of pars cephalica smooth, sides granulate; lateral margin without denticles. Eyes: six, small, ALE 0.040, PME 0.020, PLE

0.018; ALE largest, ALE circular, PME oval, PLE circular; posterior eye row straight from both above and front; ALE separated by their radius to diameter, ALE-PLE separated by less than ALE radius, PME separated by their radius to diameter, PLE-PME separated by less than PME radius. Sternum longer than wide, surface finely reticulate, without pits. Chelicerae paturon distal region abruptly narrowed. Labium triangular, fused to sternum; with 3–5 setae on anterior margin. Endites serrula with one row of low blunt stubs and some additional stubs laterally (fig. 728); endites twice as long as wide, toothlike projection tiny. Abdomen cylindrical; book lung covers large; pedicel tube short, ribbed. Dorsal scutum covering full length of abdomen, punctuate; epigastric scutum not protruding; postepigastric scutum long, semicircular, covering nearly full length of abdomen. Legs pale orange; patella plus tibia I shorter than carapace. Epigastric region with sperm pore oval, rebordered. Palp pale orange; embolus dark; femur attaching to patella subbasally; patella about as long as femur, enlarged; cymbium not fused with bulb, bulb pyriform with long thin, medially bent embolus (figs. 125–127).

FEMALE (PBI_OON 23373, figs. 741–749): Total length 1.64. Eyes: ALE 0.032, PME 0.019, PLE 0.018. Epigastric area with small oval epigynal opening, internal genital structure short oval, not reaching posterior fold with T-shaped anterior structure (figs. 155, 156).

OTHER MATERIAL EXAMINED: AUSTRALIA: *Queensland:* Alexandra Bay, 16.18333°S, 145.45°E, 21 June 1971, Taylor and Feehan, 1 ♂ (ANIC 328, PBI_OON 00022942); Black Mt Road, 5 km N of Kuranda, 16.78333°S, 145.65°E, 1200 m, 2 Dec. 1988, G. Lehtinen, 3 ♂ (UTU, PBI_OON 00015899); Sapphire, 9.41666°N, 147.31666°E, 13 Feb.–22 Mar. 1974, P. Lehtinen, 1 ♀ (UTU, PBI_OON 00015857); Taurama, 7.41666°N, 144.26666°E, 11 Feb.–21 Mar. 1974, P. Lehtinen, 1 ♂, 1 ♀ (UTU, PBI_OON 00015940); same location, 25 Feb. 1974, P. Lehtinen, 1 ♀ (UTU, PBI_OON 00015955); same location, 11 Feb.–21 Mar. 1974, P. Lehtinen, 5 ♂ (UTU, PBI_OON 00015969).

DISTRIBUTION: *Prethopalpus tropicus* occurs in North Queensland and Papua New Guinea (map 6).

ACKNOWLEDGMENTS

This paper was completed with support from the National Science Foundation's PBI (Planetary Biodiversity Inventory) program provided through grant DEB-0613754. We thank Jason Alexander and Garth Humphreys (Biota Environmental Sciences), Shae Callan and Stefan Eberhard (Subterranean Ecology), Christa Deeelman and I.J. Smit (National Natuurhistorische Museum, Leiden), Bruce Halliday (Australian National Insect Collection, Canberra), Yvonne Kranz-Baltensperger and Christian Kropf (Natural History Museum, Bern), Pekka Lehtinen (University of Turku), Jochen Martens (Senckenberg Museum, Frankfurt am Main), Jane McRae, and Stuart Halse (Bennelongia), Norman Platnick (American Museum of Natural History, New York), Robert Raven and Owen Seeman (Queensland Museum, Brisbane), Peter Schwendinger (Muséum d'Histoire Naturelle, Geneva), Petra Sierwald (Field Museum of Natural History, Chicago) and Julianne Waldoek (Western Australian Museum, Perth) for loan of the material, and their support of the project. We thank Peter Schwendinger, Alexandre Bo-

naldo, and Norman Platnick for their insightful comments on the manuscript, and Wendy Hebron for her excellent drawings.
