CpG island near the gene encoding MIR200B and predicted conserved TFBSS

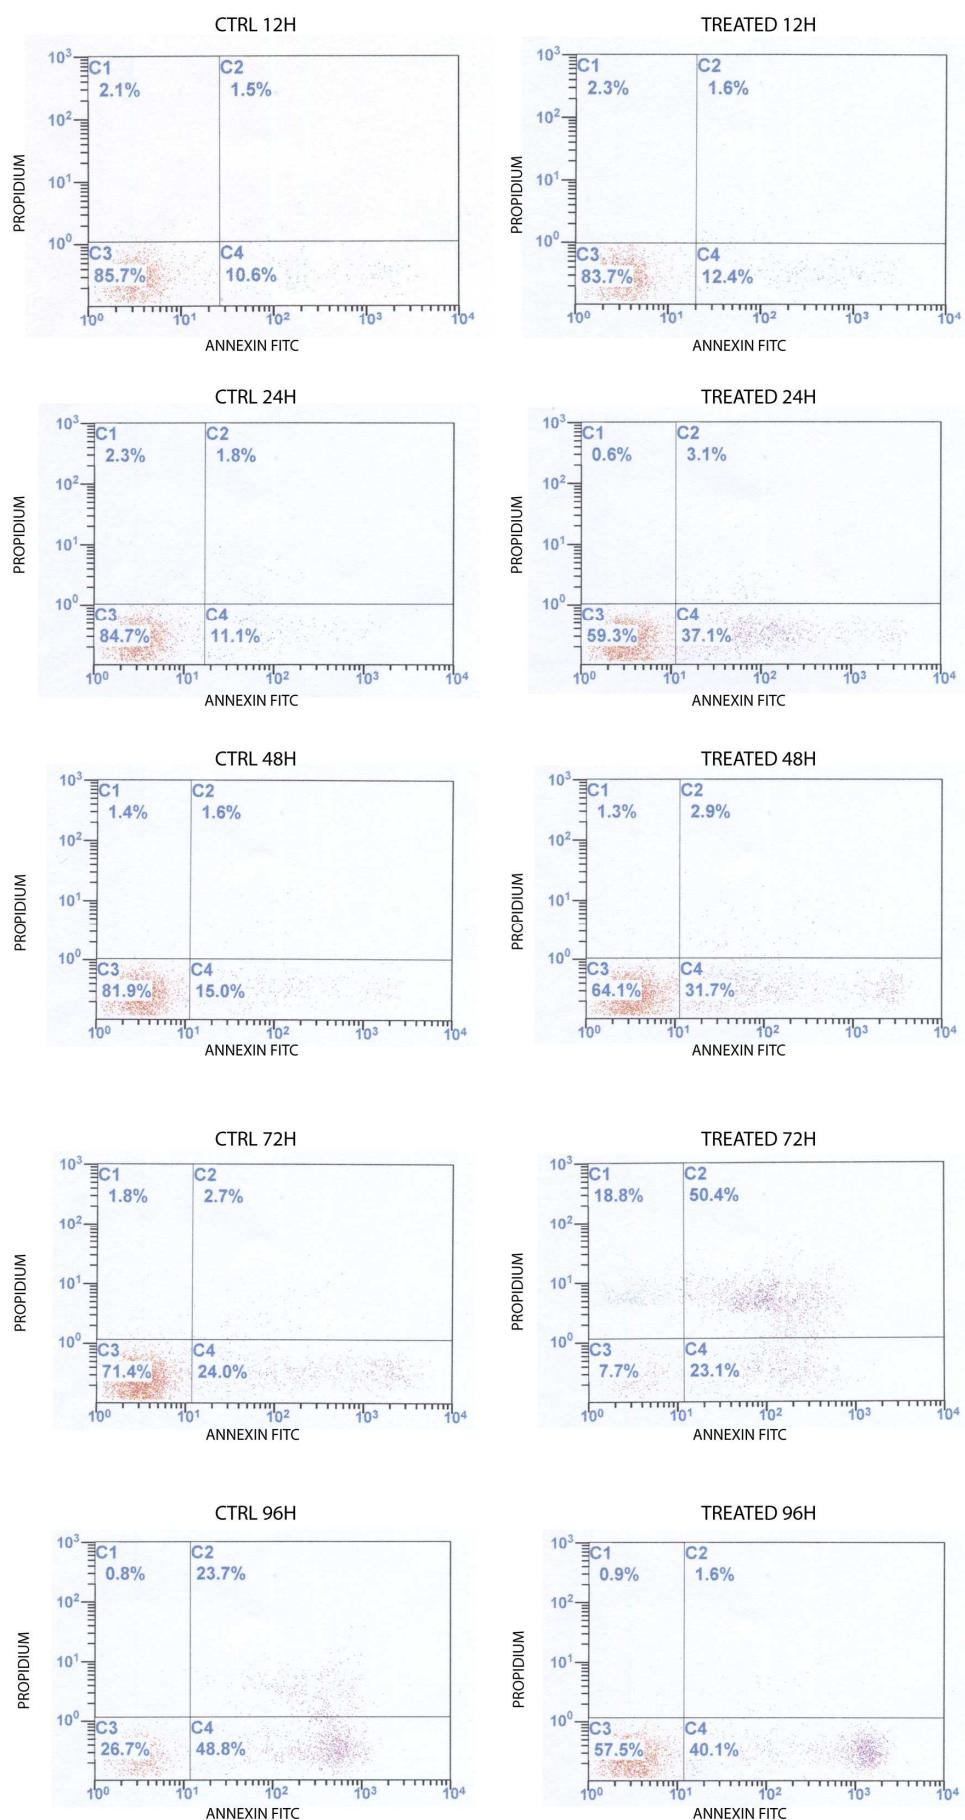

upstream of MIR200B and MIR338

(A) CpG island (5.5 Kb long) extending over the genomic region comprising the genes encoding MIR200B and MIR200A. (B) A conserved TFBS for CREB1 was found at position -4382 bp from the MIR200B gene TSS (Transcription Start Site). (C) Conserved TFBSs regulating MIR338 expression, located within the promoter of the host gene AATK. TFBSs for AP2 α and Sp1 were found about 100 bp upstream of the transcription start site of the AATK gene.

Cellular Network based on molecular interactions among targets of MIR152, MIR200B, MIR338

Network was built up by using interactions from cytoscape APID2NET and MIMI plugins for MIR targets and their second level neighbours nodes. The colours of the nodes indicate their expression levels on NB, according to the bar shown above the network. The over-sized nodes with rhombus shape are proteins involved in Regulation of Apoptosis and Developmental Process.
