

Biodiversity of hillstream fishes in Bangladesh

ABU TWEB ABU AHMED, MD. MIZANUR RAHMAN & SUMAN MANDAL

Department of Zoology, University of Dhaka, Dhaka-1000, Bangladesh. E-mail: abu_tweb@yahoo.com

Abstract

Bangladesh is a country of 1,47,570 km² of mostly flat topography, but about 12 percent is hilly. The hilly areas are confined to the northeast and the southeastern parts of the country bordering India and Myanmar. Hill streams are highly variable and very important for the study and understanding of the aquatic biodiversity of Bangladesh. Hillstream ecosystems include a variety of habitats including those with sand, clay, cobble, gravel, mud, and rock substrates. In a recent field survey, 82 species of fishes have been identified from those habitats. The ichthyofauna belongs to the following families (numbers of species in parentheses) Notopteridae (1), Engraulidae (1), Cyprinidae (32), Psilorhynchidae (3), Nemacheilidae (2), Cobitidae (6), Bagridae (6), Schilbeidae (5), Amblycipitidae (1), Akysidae (1), Sisoridae (4), Erethistidae (1), Clariidae (1), Olyridae (1), Aplocheilidae (1), Ambassidae (2), Badidae (1), Mugilidae (1), Gobiidae (2), Osphronemidae (2), Channidae (3), Mastacembelidae (3), Belonidae (1) and Tetraodontidae (1). This paper provides a checklist of the hillstream fish species with their habitat preferences and associated fauna.

Key words: biodiversity, hillstream fishes, Bangladesh

Introduction

Bangladesh lies in the northeastern part of South Asia between latitudes 20° 34' N and 26° 38' N and between longitudes 88° 01'E and 92° 41' E. It has a total area of about 147,570 km² and is bounded on the west, north and northeast by India, in the southeast by Myanmar, and in the south by the Bay of Bengal. The geomorphology of the country is comprised of a large portion of floodplains (79.1%), terraces (8.3%), and hilly areas (12.6%).

Because of the unique situation in this tropical region, between the mighty Himalayan Mountains and the Bay of Bengal, and within the delta of the three great rivers, the Ganges, the Brahmaputra and the Meghna, warm water temperatures, plentiful rainfall, and nutritive silty clay-loam soil, the water bodies in Bangladesh are very productive. The aquatic environment as a whole is very rich in aquatic biodiversity.

The hilly areas of Bangladesh occur in the northern and eastern areas of the country in Khagrachari, Rangamati, Bandarban, Chittagong, Cox's Bazar, Mymensingh, Netrokona, Sylhet, Moulavibazar and Habiganj districts. The hills contain a number of creeks, small rivers, waterfalls, caves, lakes and a large reservoir. The hilly rivers include the Sangu River of Bandarban, the Kangsho and Somesswari rivers of Netrokona, and the Piyang and Sari rivers of Sylhet. There is a remarkable number of waterfalls in the hilly area which has created large, medium and small streams and pools. Among these, the Madopkundo waterfalls of Sylhet, the Himchori and Barachara waterfalls of Cox's Bazar, the Shailopropat Waterfall of Bandarban, and the Chittagong University campus waterfalls of Chittagong are remarkable. There is an unusual cave pool near Teknaf. The Kaptai Lake of Rangamati and the Boga Lake of Bandarban are important reservoirs. These streams, rivers and reservoirs are assumed to contain a great diversity of fish and shellfish fauna, although they have not been properly inventoried.

The inland, surface-water fish fauna of Bangladesh is an assemblage of 266 species, the diversity of which is attributed to the habitats created by the Bengal Delta wetlands and the confluence of the Brahmaputra, Ganges and Jamuna rivers that flow from the Himalayan Mountains into the Bay of Bengal. Of a total of 266 species of freshwater fish reported in Bangladesh (IUCN, 2000), more than 70 species belong to the order Cypriniformes. Rahman (2005) reported 71 cypriniform fishes in his book on inland open water bodies. He described the morphometric and meristic characteristics, habits, habitats and distributions of freshwater fishes, but does not

provide information on the present status of hillstream fishes of Bangladesh. Recently, Conway and Mayden (2008) recorded a new species of *Psilorhynchus* from the hill streams of Chittagong University, and Conway et al. (2009) described a new species of *Devario* from a stream in Cox's Bazar.

The present study was initiated to assess the biodiversity of fishes in relation to the diverse habitats of hill streams of Bandarban, Cox's Bazar, Chittagong, Sylhet and Netrokona districts for preparing a checklist of hillstream fishes of Bangladesh with information on their taxonomy and habitat preferences.

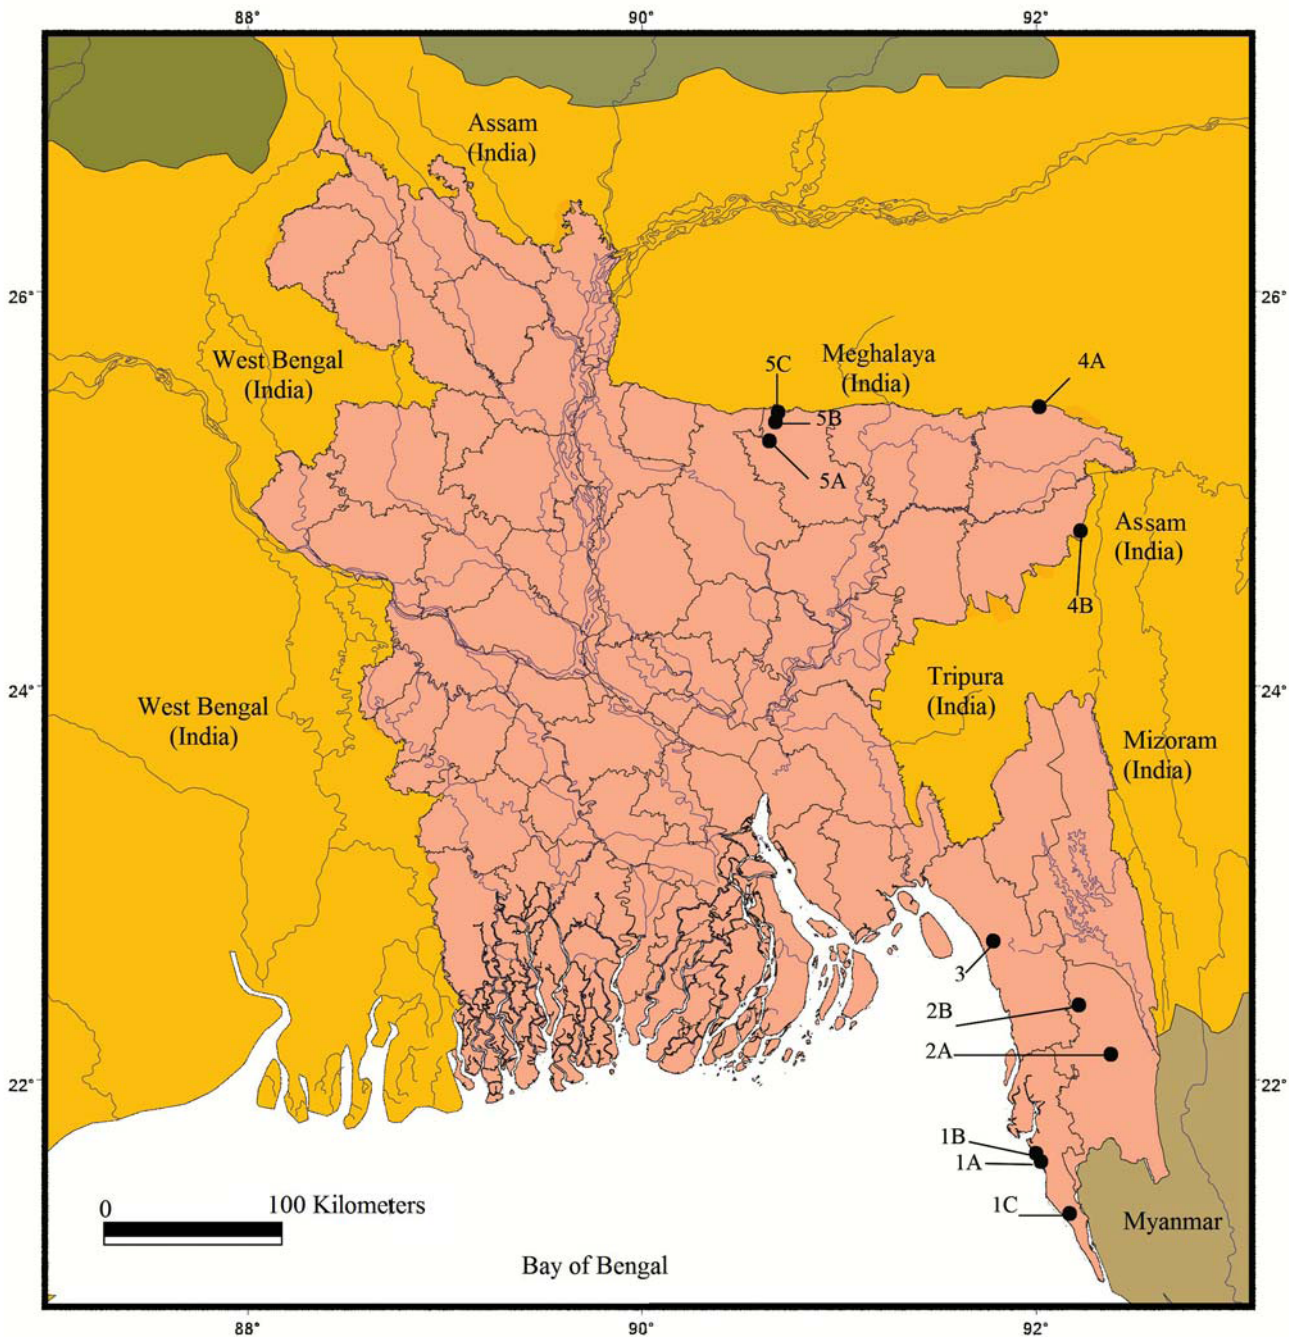

FIGURE 1. Sampling sites in hillstream areas of Bangladesh. 1) Cox's Bazar District: A, Himchori; B, Barachora; C, Kudung Cave. 2) Bandarban District: A, Sangu River; B, Shailopropat. 3) Chittagong District: Chittagong University Waterfall. 4) Sylhet District: A, Piyang River; B, Madhabkundo Waterfall. 5) Netrokona District: A, Kangsha River; B, Someshwari River; C, Gopalpur Hill Stream.

Material and methods

The present investigation was conducted in the hill streams of the northeastern and southeastern parts of Bangladesh during May 2011 to November, 2012. The 11 major sampling stations (Fig.1) included Himchori (21°21'18.36"N, 92°01'31.68"E), Borochra (21°23'45.82"N, 92°00'02.39" E) and Kudung Cave (21°05.534"N, 92°10.168"E) of Cox's Bazar; Chittagong University Waterfall (22°28'25.8"N, 91°46'59.3"E) of Chittagong; Shailopropat Waterfall (22°09'05.34"N, 92°12'59.00"E) and Sangu River (22°10'58.00"N, 92°13'54.00"E) of Bandarban; Piyang River (25°11'10.44"N, 92°01'00.00"E) and Madopkundo Waterfall (24°33'17.00"N, 92°13'26.40"E) of Sylhet; and Kangsha (25°00'41.40"N, 90°38'47.70"E), Somessawri River (25°06'32.99"N, 90°40'41.47"E) and Gopalpur Hill Stream (25°09'27.30"N, 90°41'33.24"E) of Netrokona District.

Live specimens were collected from 11 sampling sites (Fig. 1) using push-nets, seines, dip nets and cast-nets, and the samples were preserved in 10% formalin for taxonomic and morphometric studies. At each location, basic field data, including latitude, longitude, and elevation taken with a GPS unit, were recorded. Photographs of live and preserved specimens and habitats were taken. Specimens of associated fauna were also collected. The identifications of fishes and other fauna were completed using morphological features and morphometric analysis. Measurements were taken by slide calipers in millimeters and measuring tapes in centimeters. For the identification of genera and species of fishes, Talwar and Jhingran (1991), Menon (1999), Rahman (2005) and Siddiqui et al. (2007), Conway and Mayden (2008) and Conway et al. (2009) were followed. For verification of species identifications, the data were compared with reports of scientists and workers on the same or similar taxa and information on the internet.

Results

A total of 82 species of fishes have been identified from different ecological habitats of the hilly areas of Bangladesh. They belong to 55 genera in 24 families and 8 orders, and have been identified on the basis of meristic and morphometric characteristics. The fish diversity is dominated by the cyprinids (32 species) followed by the cobitids and bagrids with 6 species each. The taxonomic diversity of fishes is listed in Table 1 and illustrated in photos in Figs. 2-4. Sampling stations with habitats present, and fishes collected are listed in Table 2.

Total: 8 orders	24 families	82 species in 55 genera

Associated fauna found in the hill streams were the following: Mollusks: *Bellamya bengalensis*, *Melanoides tuberculata*, *Tarebia lineata*, *Brotia costula*, *Paludomus conica*; Prawns: *Caridina weberi*, *Atyopsis spinipes*, *Macrobrachium birmanicum*, *M. dayanum*, *M. hendersoni*, *M. kulsiense*, *M. lamarrei*, *M. lanatum*, *M. lanchesteri*, *M. latimanus*, *M. lar*, *M. malcolmsonii*, *M. platyrostris*, *M. rosenbergii*, *M. rude*, *M. villosimanus*; Crabs: *Acanthopotamon martensi*, *Perbrinckia cracens*, *Sartoriana spinigera*; Frog: *Hoplobatrachus tigrina*; Terrapin: *Kachuga tecta*; and Snake: *Python molurus*.

Discussion

The present investigation was conducted in hill streams in a diversity of habitats including headwaters, riffles, pools, lakes, and pools below waterfalls, and in pools at the entrances of caves. A total of 82 species of fishes in 55 genera, 24 families, and 8 orders have been identified. Species of barbs (Cyprinidae) accounted for the highest number of species in almost all habitats. Catfishes were collected from sandy, gravelly and silty-clay habitats. The suckerfishes (Psilorhynchidae) prefer cobble and smaller rocks in pools of streams. Loaches (Nemacheilidae, Cobitidae) are common in all types of hillstream habitats. Among the species of hillstream fishes recorded, several are common on flood plains and in other standing water bodies. The hillstream fishes are more abundant (e.g., at Sangu river station) where streams meet with larger streams because of the nutritive water and warm temperature. Species diversity is less (e.g., at Madhabkundo Waterfall at 265 ft elevation) in upper altitudes presumably because fewer species are adapted to cold water and strong current. The barbs and the loaches, however, are widely distributed in these habitats.

Kaptai Lake, the largest manmade reservoir in Bangladesh (68,800 hectares), was created by damming the Karnaphuli River near Kaptai in the Rangamati District in 1961. Kaptai Lake has an 'H' shape, and two arms of this lake join near Shuvalong. Many scientists and organizations have recorded the fishes and other fisheries-related fauna and information on Kaptai Lake. Recently, Halder et al. (1991) recorded a total of 71 fish species, including five exotic species, and two species of prawn. A study by Chakma (2007) recorded 74 freshwater species of fishes and two prawns. Recent data on fish production (2007-2008) from this lake showed an average of 8248 MT per year. Carps were dominant at the beginning, contributing about 60% of the production, but at present *Corica soborna* and *Gudusia chapra* contribute 50% of the production. Because of the loss of its natural status and conversion to a commercial aquaculture farm, the lake was not included in the present study.

TABLE 2. Sampling stations by district in Bangladesh, descriptions of habitats, and fishes collected.

Sampling station & habitat description	Fish species by family (numbers of species in parentheses)
1. Cox' s Baz ar	
(a) Himchori (16) 21°21'18.36"N, 92°01'31.68"E Elevation: 93 ft.
