#### Abstract

Two series of amino-1,4-benzoquinones (AQ1-18) based on the structural analogs of plastoquinones were synthesized and the structure-activity relationship against chronic myelogenous leukemia activity was examined. All of the synthesized compounds were tested for their cytotoxic effects on different leukemic cell lines. Of interest, AQ15 exhibited a better selectivity than the reference drug imatinib on cancer cells. Owing to this, AQ15 was selected for a further apoptosis/necrosis evaluation where AQ15-treated K562 cells demonstrated similar apoptotic effects like imatinib-treated cells at their $\mathrm{IC}_{50}$ values. The inhibitory effects of AQ15 and the other three compounds with various activities against eight tyrosine kinases, including ABL1, were investigated. AQ15 showed weak activity against ABL1, and a correlation was observed between the anti-K562 and anti-ABL1 activities. The binding mode of AQ15 into the ATP binding pocket of ABL1 kinase was predicted in silico, showing the formation of some key interactions. In addition, AQ15 was shown to suppress the downstream signaling of BCR-ABL in K562 cells. Finally, AQ15 obviously cleaved DNA in the presence of an iron(II) complex system, indicating that this can be the major mechanism of its antiproliferative action, whereas the mild inhibition of ABL kinase is just in-part mechanism of its overall outstanding cellular activity.

## 1 | INTRODUCTION

Quinone structure is found in many medicinally important compounds possessing anticancer, anti-inflammatory, antimicrobial, and antiviral
activities. In particular, 1,4-quinones constitute an important group of anticancer drugs. ${ }^{[1]}$ DNA often becomes a major target for anticancer quinones, that is, mitomycin C -which crosslinks $\mathrm{DNA}^{[2]}$; streptonigrinwhich cleaves $\mathrm{DNA}^{[3]}$; and quinone enediyne antibiotic dynemicin

FIGURE 1 Biologically important molecules containing the 1,4-quinone moiety

A-which cleaves DNA, as shown in Figure $1 .{ }^{[4]}$ Natural or synthetic 1,4quinones take part in a wide range of redox processes in organisms and plants, such as plastoquinones and ubiquinones, which are two important prenylquinones. ${ }^{[5]}$ Idebenone, a structural analog of plastoquinones and ubiquinones (Figure 1), is a drug for the treatment of emotional disturbances associated with cerebrovascular diseases. ${ }^{[6]}$ Further investigation about the synthesis and in vitro studies has shown that cationic plastoquinones serve as powerful inhibitors of ROSinduced apoptosis and necrosis in HeLa cells and human fibroblasts. ${ }^{[7]}$ The recent development in the design of a novel agent is SkQ1 (Figure 1), which suppresses the growth of fibrosarcoma HT1080 and rhabdomyosarcoma RD tumor cells in vitro. ${ }^{[8]}$ In 2010, novel analogs containing 1,4 -quinone moiety were reported as effective in combination with chemotherapeutic agents against pancreatic cancer cell lines. ${ }^{[9]}$ 1,4-Quinone compounds are also reported as potential anticancer agents against ovarian cancer cell lines. ${ }^{[10]}$ Recently, a new series of 1,4 -quinones designed on the basis of the natural product hybrid approach was proven to be active against two different leukemia cell lines (CCRF-CEM and CEM/ADR5000). ${ }^{[11]}$ In addition, a quinonecontaining natural product shikonin is currently a center of interest due to its potent effect for multiple myeloma owing to its unique dual activities, proteasome inhibition and necroptosis induction. ${ }^{[12]}$

In our ongoing studies on the chemical modification of 1,4-quinones aiming at biologically useful compounds, our research group is working on the synthesis of dimethyl-1,4-benzoquinone analogs by using different pathways reported previously in the literature. ${ }^{[13]}$ Previously,
we synthesized some sulfanyl 1,4-naphthoquinone compounds containing aryl amines with different substituents to investigate antimicrobial activities against Gram-positive and -negative bacteria and anticancer activities against human tumor cell lines. ${ }^{[14]}$ Some compounds having strong antibacterial efficiency were reported as promising antibacterial agents. ${ }^{[14 a]}$ Furthermore, some tested compounds showed important selectivity on peripheral blood mononuclear cells (PBMCs), though they exhibited considerable anticancer activities against colon and leukemia cancer cell lines. ${ }^{[14 b]}$ Herein, we focus on chronic myelogenous leukemia (CML) among various cancers.

CML is caused by a reciprocal translocation between chromosome 9 and chromosome 22, known as the Philadelphia chromosome or Philadelphia translocation. ${ }^{[15]}$ This translocation gives rise to a BCR-ABL kinase made up of two genes BCR and ABL. ${ }^{[16]}$ The ABL kinase family has been reported to play important roles in normal cells, for example, cell adhesion and motility, DNA damage response, and microbial pathogen response that may occur in the cytosol and cell membranes. ABL kinase is also present in the nucleus. ${ }^{[17]}$ Deregulation and aberrant expression of ABL kinases are associated with many types of cancer, such as breast ${ }^{[18]}$ and colon cancers. ${ }^{[19]}$ Okabe et al. ${ }^{[20]}$ presented the investigation of the combination therapy with an ABL tyrosine kinase inhibitor (TKI) and alisertib against $\mathrm{Ph}+$ cells; thus, a strategy for the treatment of $\mathrm{Ph}+$ leukemia patients could be Aurora A inhibition. Since the overactivity of the protein tyrosine kinase (PTK) has been implicated in a number of diseases, a variety of PTKs has been targeted for the screening of
antitumor drugs. TKIs, as rivals of ATP for the ATP-binding site of PTK reducing tyrosine kinase phosphorylation, have made progress although resistance has been restricted by the treatment of cancer. ${ }^{[21]}$ Imatinib is a highly specific inhibitor of BCR-ABL binding to the ATP-binding site of the protein. ${ }^{[22]}$ More recently, highly potent inhibitors dasatinib and nilotinib have been developed and used as a standard remedy together with imatinib. Although these anti-CML drugs have a combinatorial structure comprising various components, we considered a possibility of 1,4-benzoquinone variants to serve as anti-CML drugs.

In this study, a new series of 1,4-quinone compounds was synthesized, and its activity against CML cell lines was examined. Finally, some compounds were found to have unique activity based on the dual mechanism of kinase inhibition and DNA cleavage.

## 2 | RESULTS AND DISCUSSION

## 2.1 | Chemical synthesis

We designed our molecules based on the plastoquinone scaffold, replacing either prenyl from plastoquinone or decyl-triphenylphosphonium cation appendage from SkQ1 by aliphatic and aromatic amines, and named them AQ analogs (Figure 2). We also introduced the chloro group that appears to be favorable for biological activity. ${ }^{[23]}$

The reaction of primary and secondary amines with 1,4quinones to give AQs has already been reported. ${ }^{[24]}$ As shown in Scheme 1, initially, the 2,3-dimethyl hydroquinone (1) was smoothly oxidized to the corresponding 1,4-benzoquinones (2 and 3). The 2,3-dimethyl-1,4-benzoquinone (2) was obtained according to the reported methods using $\mathrm{KBrO}_{3}{ }^{[25]}$ or $\mathrm{MnO}_{2}{ }^{[26]}$ in $98 \%$ or $86 \%$ yield, respectively. Another precursor, 2,3-dichloro-5,6-dimethyl-1,4-benzoquinone (3) was synthesized by oxidizing with the $\mathrm{HNO}_{3} / \mathrm{HCl}$ variation of the reported method. ${ }^{[27]}$ Subsequently, $A Q$ analogs (AQ1-18) were prepared by the reactions of the key 1,4-benzoquinones (2 and 3 ) with the corresponding substituted amines according to the literature procedure but omitting the use of $\mathrm{CeCl}_{3} .{ }^{[13 a]}$ Heating the mixture in refluxing absolute ethanol at higher temperature gave the target
compounds (AQ1-18). Among these compounds, AQ1, AQ6, ${ }^{[28 a]}$ AQ8, ${ }^{[29]}$ and AQ10 ${ }^{[30]}$ have been reported in the literature, while the other AQ analogs are novel molecules. Structural characterization of the AQ analogs (AQ1-18, Table 1) was complemented by Fourier-transform infrared spectroscopy (FTIR), nuclear magnetic resonance ( ${ }^{1} \mathrm{H} N M R,{ }^{13} \mathrm{C}$ NMR), and high-resolution mass spectroscopy (HRMS). In addition, the structures of AQ3 (1892191), AQ9 (1892192), AQ11 (1892193), AQ17 (1892194), and AQ18 (1892197) were further elucidated by single-crystal X-ray diffraction analysis (Figure S56).

## 2.2 | Evaluation of anticancer activity

The cytotoxicity and selectivity of the synthesized 18 AQ analogs (AQ1-18) against three cancer cell lines, K562 (chronic myelogenous leukemia), Jurkat, and MT-2 (other two human T-cell leukemias), were evaluated by 3-(4,5-dimethylthiazol-2-yl)-2,5-diphenyltetrazolium bromide (MTT) assay using imatinib as a control drug.
$\mathrm{IC}_{50}$ values are summarized in Table 1. The compounds AQ1-10 showed $\mathrm{IC}_{50}$ values higher than $15 \mu \mathrm{M}$ against K 562 , MT-2, and Jurkat cells. Among them, AQ7 was the most effective against the chronic myelogenous leukemia K 562 cell line. Introduction of a trifluoromethyl group at $R_{1}(A Q 2), R_{2}(A Q 3)$, or $R_{3}(A Q 4)$ resulted in a decreased activity. The activity was retained by the introduction of the methyl group at $R_{2}(A Q 5), R_{3}$ (AQ6), and isopropyl group at $R_{1}$ (AQ7).

On the contrary, the introduction of a chloro group into the quinone moiety led to an increase in anticancer activity against all three cell lines. Thus, for the chloro-substituted series of AQ analogs (AQ11-18), AQ11, AQ12, AQ14-15, and AQ17 exerted the best cytotoxic activity against K 562 cell line better than imatinib. These compounds also exhibited strong anticancer activities against other two leukemia cell lines (Figure S1). Introduction of a trifluoromethyl group at $R_{2}$ (AQ12) retained the activity, but introduction at $R_{3}$ (AQ13) led to a decrease in activity. Introduction of the methyl group at $R_{2}$ (AQ14) or $R_{3}$ (AQ15) retained the activity. AQ10 and AQ18 with 2-picolylamine led to a decrease in activity in all cell lines.

SCHEME 1 Synthesis of AQ analogs (AQ1-18): (i) $\mathrm{KBrO}_{3}, \mathrm{H}_{2} \mathrm{SO}_{4} / \mathrm{H}_{2} \mathrm{O}, 10 \mathrm{~min}, 80^{\circ} \mathrm{C}$; (ii) $\mathrm{HNO}_{3} / \mathrm{HCl}, 10 \mathrm{~min}, 90^{\circ} \mathrm{C}$; (iii) substituted amines (1.2 equiv), EtOH, reflux, 6-12 hr

Table 2 shows the cytotoxicity results of selected AQ analogs (AQ11, AQ12, and AQ15), with submicromolar $\mathrm{IC}_{50}$ against K562, compared with PBMC. As the selectivity index (SI) is calculated as the ratio of cytotoxicity of the $\mathrm{IC}_{50}$ between the PBMC and K562 cells, the greater the SI value, the more selective it is for cancer cells. Among them, AQ15 exhibited a better selectivity than imatinib against K562 cell line.

Among this series, AQ15, the most selective anticancer agent, was chosen to investigate its apoptotic activity in CML. Thus, the annexin V/ethidium homodimer III and Hoechst 33342 staining methods were carried out with K562 cell line treated with AQ15 at $\mathrm{IC}_{50}$ concentration and then observed by a fluorescence microscope (Figure 3). In the control experiment, all cells were stained with blue (healthy cells) at 6 hr after treatment of dimethyl sulfoxide (DMSO; Figure 3a). On the contrary, K562 cells treated with AQ15 and imatinib were stained mostly with healthy cells (blue), then with apoptotic cells (green), late apoptotic or necrotic cells (both green and red), and necrotic cells (red; Figure 3a), suggesting that AQ15 and imatinib induced apoptosis mainly in an earlier time. The results indicated that AQ15 had $66 \%$ apoptotic, $22 \%$ late apoptotic/necrotic, and $12 \%$ necrotic effects at 6 hr, as shown in Figure 3b. The response of K562
cells upon 6-hr imatinib treatment was $58 \%$ apoptosis, $23 \%$ late apoptosis/necrosis, and $19 \%$ necrosis (Figure 3b). The results revealed that AQ15 induced cell apoptosis similar to imatinib in CML (Figure 3c).

We speculated that significant anticancer activity of AQ15 against CML (BCR-ABL positive leukemia) may be due to its potential inhibitory activity on ABL (the kinase portion of BCR-ABL). Thus, a panel of kinases including ABL1 was selected. In this activity-based kinase system, the inhibitory effects of AQ11, AQ15, AQ16, and AQ18 with various activities were tested against eight kinases (ABL1, BRK, BTK, CSK, FYN A, LCK, LYN B, and SRC) using multipoint dose-response experiments and the results are shown in Table 3. In this series, AQ15 was found as the most potent ABL1 kinase inhibitor with the $\mathrm{IC}_{50}$ value of $17.92 \pm 2.45 \mu \mathrm{M}$, followed by AQ11 with the $\mathrm{IC}_{50}$ value of $23.60 \pm 1.94 \mu \mathrm{M}$ when compared with imatinib ( $0.27 \pm$ $0.04 \mu \mathrm{M}$ ). On the contrary, AQ16 and AQ18 were found to be inactive against ABL1 at $100 \mu \mathrm{M}$ concentration. A correlation was observed between anti-K562 and anti-ABL1 activities. Notably, AQ15 significantly inhibited BRK, BTK, CSK, and SRC stronger than compounds AQ11, AQ16, AQ18, and imatinib with $\mathrm{IC}_{50}$ values in the micromolar range. Furthermore, all compounds were found to be

[^0]inactive against FYN A and LYN B. These results pointed out that AQ15 could be defined as a promising lead multitargeted kinase inhibitor with different kinase inhibitory profile than imatinib.

Afterward, we tried to explore the potential binding mode of AQ15 into the ATP-binding site of ABL kinase by computational approaches using MOE software. Despite the distinct stereoelectronic features and a molecular weight from imatinib, AQ15 could
form some critical interactions that granted it an acceptable inhibition effect $\left(\mathrm{IC}_{50}=17.92 \pm 2.45 \mu \mathrm{M}\right)$. AQ15 NH forges a key H-bond with the gatekeeper amino acid Thr315. Moreover, the dimethyl benzoquinone is sandwiched between Val256 and Leu370 forming two $\mathrm{CH}-$ л interactions. The compound is further anchored by another $\mathrm{CH}-\pi$ interaction with Phe317. The chlorine atom does not seem to contribute to the interaction through hydrogen bond or

halogen bond formation. ${ }^{[31]}$ Less affinity of the AQ15, compared to the native ligand imatinib, may be attributed to the missing crucial bonding with Met318, Asp381, and Glu286 (Figure S58).

As shown, AQ15 could be roughly superimposed on the pyridine-pyrimidine-amino-benzene segment of imatinib and lacks the piperazine-benzamide fragment (Figure 4). Presumably, AQ15 is less active against ABL1, FYN A, LCK, and LYN B due to the lack of the piperazine-benzamide fragment and more potent against BTK and SRC owing to the lack of the piperazine-benzamide fragment.

The BCR-ABL and its downstream signaling pathway such as rapidly accelerated fibrosarcoma (Raf)/mitogen-activated protein kinase/extracellular signal-regulated kinase (MEK)/extracellular signal-regulated kinase (ERK) play important roles in CML K562 cells. The K562 cells treated with AQ15 or imatinib were evaluated for their inhibitory effects at $20 \mu \mathrm{M}$ concentration after 6 hr of drug treatment (Figure 5). AQ15 showed stronger inhibitory activity on phosphorylation of ERK than imatinib. It can be concluded that AQ15 suppresses signaling downstream of tyrosine kinases.

Overall, the docking output is matched with the experimental data and both confirm that the mild inhibition of ABL kinase by AQ15 is not

Pyridine-Pyrimidine-Amino-Benzene

FIGURE 4 Comparison of the structure between imatinib and AQ15 is shown below
the sole underlying mechanism for its pronounced cytotoxicity. As described in the Introduction, anticancer quinones target DNA. ${ }^{[1-4]}$ To explain high toxicity of AQ15 on CML, we next examined another mechanism of its action with some other compounds (AQ11, AQ16, and AQ18), involving metal-binding/oxygen-activating site of quinones, that is, oxidative cleavage of DNA strand, which was reported by many papers. ${ }^{[32]}$ Thus, the DNA-cleaving capability of AQ15 at 1 and $3 \mu \mathrm{M}$ and AQ11, AQ16, and AQ18 at $3 \mu \mathrm{M}$ concentrations was studied using pUC19 DNA with and without the iron(II), hydrogen peroxide $\left(\mathrm{H}_{2} \mathrm{O}_{2}\right)$, and ascorbic acid complex as shown in Figure 6. The reaction solution was incubated at $37^{\circ} \mathrm{C}$ for 2 hr and electrophoresis was performed at 100 V for 30 min . The DNA was stained with ethidium bromide and the gel image was captured by an electronic camera under ultraviolet radiation (UV). AQ15 exhibits the strongest DNA-cleaving activity at $3 \mu \mathrm{M}$ (Figure 6a), followed by AQ11, AQ16, and AQ18, respectively (Figure 6b). These results demonstrated that tested compounds may generate activated oxygen and cleaved DNA in a cell. In addition, these compounds may activate oxygen in the cytoplasm. It also points out that the induction of DNA may correlate with the cytotoxic activity against K562.

To assess the drug-likeness of AQ15, we used computational calculations of ADMET Predictor software to predict its potential risks and physicochemical properties. AQ15 toxicity risk (TOX-Risk) value is 1 (acceptable value is up to 3.3). Mutagenic risk (MUT-Risk)

FIGURE 5 The effect of AQ15 and imatinib on ERK signaling. K 562 cells were incubated with tested compounds at 10 and $20 \mu \mathrm{M}$ for 6 hr , and then immunoblot analysis was conducted. ERK, extracellular signal-regulated kinase
(a)

(b)

FIGURE 6 The DNA-cleaving activity of AQ15 in the presence and absence of $\mathrm{FeSO}_{4}, \mathrm{H}_{2} \mathrm{O}_{2}$, and ascorbic acid system (a) and comparison experiments using AQ11, AQ16, and AQ18 (b)
value is 1.5 , slightly exceeding the standard value 1 . Risk related to metabolism by or inhibition of major cytochrome P450s (CYP-Risk) is 0.0 (standard value does not exceed 2.5). Noticeably, AQ15 has an adequate safety profile. AQ15 exhibits zero violation of Lipinski rule of 5 in terms of molecular weight, Log P, tPSA, number of H -bond donors and acceptors, and number of rotatable bonds. Moreover, absorption risk (Absn-Risk) is 1.0 (desirable value does not exceed 3.5) reflecting a high likelihood of good oral activity. In general, the overall ADMET-Risk value is 2.0 (acceptable value is up to 7.5 ). In conclusion, AQ15 is predicted to have both favorable pharmacokinetic and safety profiles (Figure S57).

## 3 | CONCLUSION

In this study, we found a new amino-1,4-benzoquinone compound AQ15 with high antiproliferative activity against CML cell line K562 among various plastoquinone analogs. The activity of AQ15 (IC $\mathrm{C}_{50}=$ $0.76 \mu \mathrm{M}$ ) surpassed imatinib ( $\mathrm{IC}_{50}=5.58 \mu \mathrm{M}$ ), and its selectivity index between K562 and PBMC of AQ15 (10.05) was higher than imatinib (6.08), indicating a potentially enhanced safety profile. The results proved that the main mechanism of AQs anticancer activity is DNA cleavage but not inhibition of BCR-ABL kinase. DNA cleavage causes apoptosis of K562 via downstream signaling of the kinase, showing the unique activity of AQ15 distinct from imatinib. Further investigation of plastoquinone analogs and their potential anti-CML activity is in progress.

### 4.1.1 | General

Melting points ( mp ) were uncorrected and recorded on a Buchi B-540 melting point apparatus. Thin-layer chromatograph (TLC) was purchased from Merck KGaA (Silica gel 60 F254) based on Merck DCplates (aluminum-based). Compound visualization for TLC was achieved by UV light ( 254 nm ). For column chromatography, silica gel 60 (63-200$\mu \mathrm{m}$ particle-sized, 60-230 mesh; Merck) was used as the stationary phase. FTIR spectra were recorded as ATR on either a Thermo Scientific Nicolet 6700 spectrometer, an Alpha T FTIR spectrometer or a Perkin Elmer Spectrum 100 Optical FTIR spectrometer. NMR spectra were obtained as $\mathrm{CDCl}_{3}$ solutions using either Bruker spectrometers with 400MHz frequency for ${ }^{1} \mathrm{H}$ and $100-\mathrm{MHz}$ frequency for ${ }^{13} \mathrm{C}$ NMR in ppm ( $\delta$ ) or Varian ${ }^{\text {UNITY }}$ INOVA spectrometers with 500 MHz frequency for ${ }^{1} \mathrm{H}$ and 125 MHz frequency for ${ }^{13} \mathrm{C}$ NMR in ppm ( $\delta$ ). ${ }^{1} \mathrm{H}$ NMR and ${ }^{13} \mathrm{C}$ NMR signals were reported relative to the solvent signal at $\delta 7.19$ and $\delta 76.0$ ppm, respectively. Chemical shifts ( $\delta$ ) were reported in parts per million (ppm). Coupling constants (J) are reported in Hz . Multiplicities were described using the following abbreviations: $s$ (singlet), $b r s$ (broad singlet), $d$ (doublet), $t$ (triplet), $q$ (quartet), hept (heptet), $m$ (multiplet), and $t d$ (triplet of doublets). Mass spectra were recorded using a Thermo Finnigan LCQ Advantage MAX MS/MS spectrometer equipped with an ESI (electrospray ionization) source. HRMS were recorded by a JEOL JMSDX303HF using positive fast atom bombardment (FAB) with

3-nitrobenzyl alcohol as a matrix. The purity of the AQ analogs was analyzed by HPLC (Shimadzu/DGU-20A 5 HPLC apparatus fitted with a $25-\mathrm{cm}$ Chiralpac AD-H chiral column) using hexane/2-propanol $=95: 5$ as the mobile phase with a flow rate of $1.0 \mathrm{ml} / \mathrm{min}$. The purity of all analogs was $\geq 95 \%$. Data for the single-crystal compounds were obtained with a Bruker APEX II QUAZAR three-circle diffractometer. Indexing was performed using APEX2. ${ }^{[33]}$ Data integration and reduction were carried out with SAINT. ${ }^{[34]}$ Absorption correction was performed by a multiscan method implemented in SADABS. ${ }^{[35]}$ The Bruker SHELXTL ${ }^{[36]}$ software package was used for structures solution and structures refinement. Aromatic C - and N -bound hydrogen atoms were positioned geometrically and refined using a riding mode. Crystal structure validations and geometrical calculations were performed using the Platon software. ${ }^{[37]}$ Mercury software ${ }^{[38]}$ was used for visualization of the .cif files. The precursors ( $2^{[25]}$ and $3^{[27]}$ ) were synthesized using the reported method in the literature. All substituted amines were commercially obtained from the commercial supplier and used without further purification unless specified otherwise.

The $\operatorname{lnChl}$ codes of the investigated compounds are provided as Supporting Information.

### 4.1.2 | General procedure for the preparation of the AQ analogs ${ }^{[13 \mathrm{a}]}$

A mixture of the corresponding substituted amines (1.2 equiv) and quinone ( $[2,0.50 \mathrm{~g}, 3.67 \mathrm{mmol}]$ or $[3,0.50 \mathrm{~g}, 2.44 \mathrm{mmol}]$ ) in ethanol ( 25 ml ) was stirred at reflux for $6-12 \mathrm{hr}$ until consumption of the quinone. The reaction mixture was cooled to ambient temperature. After ethanol was evaporated under reduced pressure, the residue was dissolved with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ( 50 ml ), and the solution was washed sequentially with water (3 $\times 30 \mathrm{ml})$. The organic layer was dried over $\mathrm{CaCl}_{2}$, filtered, and concentrated under reduced pressure, and the residue was purified by means of column chromatography on silica gel to give AQ analogs.

## 2,3-Dimethyl-5-(phenylamino)-1,4-benzoquinone (AQ1)

The title compound was synthesized according to the general method from compound 2 ( 1 equiv, 3.67 mmol ) and aniline ( $0.410 \mathrm{~g}, 1.2$ equiv, $4.40 \mathrm{mmol})$, the crude residue was purified by column chromatography using petroleum ether/ $\mathrm{CHCl}_{3}$ (1:2) eluent to furnish AQ1 as a dark red solid. Yield: $191 \mathrm{mg}, 23 \%, \mathrm{mp} 109-110^{\circ} \mathrm{C}$. FTIR (ATR) $v\left(\mathrm{~cm}^{-1}\right): 3,304$ (NH), 3,058 ( $\mathrm{CH}_{\text {aromatic }}$ ), 2,962, 2,922 ( $\mathrm{CH}_{\text {aliphatic }}$ ), $1,642(>\mathrm{C}=\mathrm{O}) .{ }^{1} \mathrm{H}$ NMR $\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta(\mathrm{ppm}): 1.95\left(\mathrm{q}, \mathrm{J}=1.5 \mathrm{~Hz}, 3 \mathrm{H}, \mathrm{CH}_{3}\right), 1.96$ (q, J = $\left.1.0 \mathrm{~Hz}, 3 \mathrm{H}, \mathrm{CH}_{3}\right), 6.05(\mathrm{~s}, 1 \mathrm{H}, \mathrm{CH}), 7.06(\mathrm{t}, \mathrm{J}=7.8 \mathrm{~Hz}, 1 \mathrm{H}$ $\mathrm{CH}_{\text {aromatid }}$ ), $7.10\left(\mathrm{~d}, \mathrm{~J}=7.8 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{CH}_{\text {aromatic }}\right.$ ), $7.26-7.29(\mathrm{~m}, 3 \mathrm{H}$, [ $\mathrm{CH}_{\text {aromatic }}$ and NH$]$ ). ${ }^{13} \mathrm{C}$ NMR ( $125 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta(\mathrm{ppm}): 11.0,11.7$ $\left(\mathrm{CH}_{3}\right), 99.8,120.9,124.1,128.5,135.6,136.9,141.6,142.8$ ( $\mathrm{C}_{\text {aromatic }}$ and $\left.\mathrm{C}_{\mathrm{q}}\right), 183.0,185.4$ ( $>\mathrm{C}=\mathrm{O}$ ). MS (+ESI) m/z (\%): 229 (14, $\left.[\mathrm{M}+2 \mathrm{H}]^{+}\right), 228$ (100, $[\mathrm{M}+\mathrm{H}]^{+}$). Anal. calcd. for $\mathrm{C}_{14} \mathrm{H}_{13} \mathrm{NO}_{2}$ (227.26).

## 2,3-Dimethyl-5-((2-(trifluoromethyl)phenyl)amino)-1,4-benzoquinone (AQ2)

The title compound was synthesized according to the general method from compound 2 ( 1 equiv, 3.67 mmol ) and 2-trifluoromethylaniline
( $0.710 \mathrm{~g}, 1.2$ equiv, 4.41 mmol ), the crude residue was purified by column chromatography using petroleum ether $/ \mathrm{CHCl}_{3}$ (1:2) eluent to furnish AQ2 as a red solid. Yield: $324 \mathrm{mg}, 30 \%, \mathrm{mp} 111-112^{\circ} \mathrm{C}$. FTIR (ATR) $\cup\left(\mathrm{cm}^{-1}\right): 3,330(\mathrm{NH}), 2,959,2,926\left(\mathrm{CH}_{\text {aliphatic }}\right), 1,639(>\mathrm{C}=\mathrm{O})$. ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta(\mathrm{ppm}): 1.98\left(\mathrm{q}, J=1.1 \mathrm{~Hz}, 3 \mathrm{H}, \mathrm{CH}_{3}\right)$, $1.99\left(\mathrm{q}, \mathrm{J}=1.1 \mathrm{~Hz}, 3 \mathrm{H}, \mathrm{CH}_{3}\right), 5.91(\mathrm{~s}, 1 \mathrm{H}, \mathrm{CH}), 7.22(\mathrm{t}, \mathrm{J}=7.7 \mathrm{~Hz}, 1 \mathrm{H}$, $\left.\mathrm{CH}_{\text {aromatic }}\right), \quad 7.38-7.42\left(\mathrm{~m}, 2 \mathrm{H}, \quad\left[\mathrm{NH}\right.\right.$ and $\left.\left.\mathrm{CH}_{\text {aromatic }}\right]\right), \quad 7.50$ (t, J = $7.7 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{CH}_{\text {aromatic }}$ ), 7.62 (d, J $=7.8 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{CH}_{\text {aromatic }}$ ). ${ }^{13} \mathrm{C}^{\mathrm{C}} \mathrm{NMR}\left(100 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta(\mathrm{ppm}): 12.1,12.7\left(\mathrm{CH}_{3}\right), 101.6,123.6$ (q, ${ }^{1} J_{\text {CF }}=273.0 \mathrm{~Hz}, \mathrm{CF}_{3}$ ), 123.9 (q, ${ }^{2} \mathrm{~J}_{\mathrm{CF}}=30.0 \mathrm{~Hz}, \mathrm{C}_{\mathrm{q}}$ ), 125.0, 125.4 , 127.2 (q, ${ }^{3} J_{C F}=5.2 \mathrm{~Hz}$ ), 132.9, 136.0, 137.0, 143.0, 143.6 (Caromatic and $\mathrm{C}_{\mathrm{q}}$ ), 183.4, 186.6 (>C=O). MS (+ESI) m/z (\%): 297 (17, $\left.[\mathrm{M}+2 \mathrm{H}]^{+}\right), 296\left(100,[\mathrm{M}+\mathrm{H}]^{+}\right)$. HRFABMS: Calcd. for $\mathrm{C}_{15} \mathrm{H}_{13} \mathrm{~F}_{3} \mathrm{NO}_{2}$ $[\mathrm{M}+\mathrm{H}]^{+}: 296.0898$; Found: 296.0889.

## 2,3-Dimethyl-5-((3-(trifluoromethyl)phenyl)amino)-1,4-benzoquinone (AQ3)

The title compound was synthesized according to the general method from compound 2 ( 1 equiv, 3.67 mmol ) and 3-trifluoromethylaniline ( $0.710 \mathrm{~g}, 1.2$ equiv, 4.41 mmol ), the crude residue was purified by column chromatography using petroleum ether $/ \mathrm{CHCl}_{3}$ (1:2) eluent to furnish AQ3 as a red solid. Yield: $271 \mathrm{mg}, 25 \%$, mp 142-144 ${ }^{\circ} \mathrm{C}$. FTIR (ATR) $v\left(\mathrm{~cm}^{-1}\right): 3,297(\mathrm{NH}), 3,054\left(\mathrm{CH}_{\text {aromatic }}\right), 2,963\left(\mathrm{CH}_{\text {aliphatic }}\right)$, $1,644(>\mathrm{C}=\mathrm{O}) .{ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta(\mathrm{ppm}): 1.97(\mathrm{q}, \mathrm{J}=1.0 \mathrm{~Hz}$, $3 \mathrm{H}, \mathrm{CH}_{3}$ ), $1.98\left(\mathrm{q}, \mathrm{J}=1.0 \mathrm{~Hz}, 3 \mathrm{H}, \mathrm{CH}_{3}\right), 6.07(\mathrm{~s}, 1 \mathrm{H}, \mathrm{CH}), 7.32(\mathrm{~d}, \mathrm{~J}=$ $7.8 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{CH}_{\text {aromatic }}$ ), 7.36 (s, $1 \mathrm{H}, \mathrm{CH}_{\text {aromatic }}$ ), 7.38 (br s, $1 \mathrm{H}, \mathrm{NH}$ ), $7.42\left(\mathrm{t}, \mathrm{J}=7.8 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{CH}_{\text {aromatic }}\right) .{ }^{13} \mathrm{C}$ NMR ( $125 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta$ (ppm): 11.0, $11.7\left(\mathrm{CH}_{3}\right), 100.6,117.6,120.4,122.6$ (q, ${ }^{1} \mathrm{~J}_{\mathrm{CF}}=272.7 \mathrm{~Hz}$, $C F_{3}$ ), 123.7, 129.2, $131.2\left(q^{2}{ }^{2} J_{C F}=33.0 \mathrm{~Hz}, \mathrm{C}_{\mathrm{q}}\right), 135.9,137.7,141.1$, 142.9 ( Caromatic and $\mathrm{C}_{\mathrm{q}}$ ), 182.7, 185.4 (>C=O). MS (-ESI) $\mathrm{m} / \mathrm{z}$ (\%): 295 (15, [M] $]^{-}$), 294 (100, $[\mathrm{M}-\mathrm{H}]^{-}$). HRFABMS: Calcd. for $\mathrm{C}_{15} \mathrm{H}_{13} \mathrm{~F}_{3} \mathrm{NO}_{2}$ $[\mathrm{M}+\mathrm{H}]^{+}: 296.0898$; Found: 296.0894.

## 2,3-Dimethyl-5-((4-(trifluoromethyl)phenyl)amino)-1,4-benzoquinone (AQ4)

The title compound was synthesized according to the general method from compound 2 ( 1 equiv, 3.67 mmol ) and 4-trifluoromethylaniline ( $0.710 \mathrm{~g}, 1.2$ equiv, 4.41 mmol ), the crude residue was purified by column chromatography using petroleum ether/ $\mathrm{CHCl}_{3}(1: 1)$ eluent to furnish AQ4 as a red solid. Yield: $311 \mathrm{mg}, 29 \%$, mp $179-181^{\circ} \mathrm{C}$. FTIR (ATR) $v\left(\mathrm{~cm}^{-1}\right): 3,243(\mathrm{NH}), 3,058\left(\mathrm{CH}_{\text {aromatic }}\right), 2,962\left(\mathrm{CH}_{\text {aliphatic }}\right)$, $1,645(>\mathrm{C}=\mathrm{O}) .{ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta(\mathrm{ppm}): 1.98-2.01(\mathrm{~m}, 6 \mathrm{H}$, $\mathrm{CH}_{3}$ ), 6.18 (s, $1 \mathrm{H}, \mathrm{CH}$ ), 7.22 (d, J = $8.8 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{CH}_{\text {aromatic }}$ ), 7.39 (br s, $1 \mathrm{H}, \mathrm{NH}$ ), 7.56 (d, J = $8.3 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{CH}_{\text {aromatic }}$ ). ${ }^{13} \mathrm{C}$ NMR ( 125 MHz , $\left.\mathrm{CDCl}_{3}\right) \delta(\mathrm{ppm}): 11.1,11.7\left(\mathrm{CH}_{3}\right), 101.5,119.9,122.9\left(\mathrm{q},{ }^{1} \mathrm{~J}_{\mathrm{CF}}=271.6\right.$ $\left.\mathrm{Hz}, \mathrm{CF}_{3}\right), 125.4\left(\mathrm{q},{ }^{3} \mathrm{~J}_{\mathrm{CF}}=33.1 \mathrm{~Hz}, \mathrm{C}_{\mathrm{q}}\right), 125.8\left(\mathrm{q},{ }^{2} \mathrm{~J}_{\mathrm{CF}}=3.8 \mathrm{~Hz}, \mathrm{CH}\right)$, 136.0, 140.5, 142.8 ( $\mathrm{C}_{\text {aromatic }}$ and $\mathrm{C}_{\mathrm{q}}$ ), 182.6, 185.5 (>C=O). MS (-ESI) $\mathrm{m} / \mathrm{z}$ (\%): 295 ( $15,[\mathrm{M}]^{-}$), 294 (100, [ $\left.\mathrm{M}-\mathrm{H}\right]^{-}$). HRFABMS: Calcd. for $\mathrm{C}_{15} \mathrm{H}_{13} \mathrm{~F}_{3} \mathrm{NO}_{2}[\mathrm{M}+\mathrm{H}]^{+}: 296.0898$; Found: 296.0901.

## 2,3-Dimethyl-5-(m-tolylamino)-1,4-benzoquinone (AQ5)

The title compound was synthesized according to the general method from compound 2 ( 1 equiv, 3.67 mmol ) and $m$-toluidine ( $0.472 \mathrm{~g}, 1.2$
equiv, 4.40 mmol ), the crude residue was purified by column chromatography using petroleum ether/ $/ \mathrm{CHCl}_{3}$ (1:2) eluent to furnish AQ5 as a red solid. Yield: $227 \mathrm{mg}, 26 \%, \mathrm{mp} 98-100^{\circ} \mathrm{C}$. FTIR (ATR) v $\left(\mathrm{cm}^{-1}\right): 3,311(\mathrm{NH}), 3,047\left(\mathrm{CH}_{\text {aromatic }}\right), 2,920\left(\mathrm{CH}_{\text {aliphatic }}\right), 1,641$ $(>\mathrm{C}=\mathrm{O}) .{ }^{1} \mathrm{H} \operatorname{NMR}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta(\mathrm{ppm}): 1.96(\mathrm{q}, \mathrm{J}=1.0 \mathrm{~Hz}$, $3 \mathrm{H}, \mathrm{CH}_{3}$ ), $1.98\left(\mathrm{q}, \mathrm{J}=1.0 \mathrm{~Hz}, 3 \mathrm{H}, \mathrm{CH}_{3}\right), 2.27\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right), 6.06(\mathrm{~s}, 1 \mathrm{H}$, $\mathrm{CH}), 6.88-693\left(\mathrm{~m}, 3 \mathrm{H}, \mathrm{CH}_{\text {aromatic }}\right), 7.17\left(\mathrm{t}, \mathrm{J}=7.8 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{CH}_{\text {aromatic }}\right)$, 7.23 (br s, $1 \mathrm{H}, \mathrm{NH}) .{ }^{13} \mathrm{C}$ NMR ( $125 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta(\mathrm{ppm}): 11.1,11.7$, $20.4\left(\mathrm{CH}_{3}\right), 99.6,117.9,121.4,124.8,128.3,135.6,136.8,138.6$, 141.6, 142.9 ( Caromatic and $\mathrm{C}_{\mathrm{q}}$ ), 183.0, 185.5 ( $>\mathrm{C=O}$ ). MS (+ESI) m/z (\%): $243\left(14,[\mathrm{M}+2 \mathrm{H}]^{+}\right), 242\left(100,[\mathrm{M}+\mathrm{H}]^{+}\right)$. HRFABMS: Calcd. for $\mathrm{C}_{15} \mathrm{H}_{16} \mathrm{NO}_{2}[\mathrm{M}+\mathrm{H}]^{+}:$242.1181; Found: 242.1121 .

## 2,3-Dimethyl-5-(p-tolylamino)-1,4-benzoquinone (AQ6) ${ }^{[28 a]}$

The title compound was synthesized according to the general method from compound 2 ( 1 equiv, 3.67 mmol ) and $m$-toluidine ( $0.472 \mathrm{~g}, 1.2$ equiv, 4.40 mmol ), the crude residue was purified by column chromatography using petroleum ether/ $/ \mathrm{CHCl}_{3}$ (1:2) eluent to furnish AQ6 as a dark purple solid. Yield: $185 \mathrm{mg}, 21 \%$, mp $110-111^{\circ} \mathrm{C}$. FTIR (ATR) $v\left(\mathrm{~cm}^{-1}\right): 3,301(\mathrm{NH}), 3,054\left(\mathrm{CH}_{\text {aromatic }}\right), 2,962,2,919$ $\left(\mathrm{CH}_{\text {aliphatic }}\right), 1,641(>\mathrm{C}=\mathrm{O}) .{ }^{1} \mathrm{H} \operatorname{NMR}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta(\mathrm{ppm})$ : $1.98\left(\mathrm{q}, \mathrm{J}=1.0 \mathrm{~Hz}, 3 \mathrm{H}, \mathrm{CH}_{3}\right), 1.99\left(\mathrm{q}, \mathrm{J}=1.0 \mathrm{~Hz}, 3 \mathrm{H}, \mathrm{CH}_{3}\right), 2.27(\mathrm{~s}, 3 \mathrm{H}$, $\mathrm{CH}_{3}$ ), $6.00(\mathrm{~s}, 1 \mathrm{H}, \mathrm{CH}), 7.01\left(\mathrm{~d}, \mathrm{~J}=8.8 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{CH}_{\text {aromatic }}\right.$ ), $7.11(\mathrm{~d}, \mathrm{~J}=$ $8.3 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{CH}_{\text {aromatic }}$ ), 7.19 (br s, $\left.1 \mathrm{H}, \mathrm{NH}\right) .{ }^{13} \mathrm{C}$ NMR ( 125 MHz , $\left.\mathrm{CDCl}_{3}\right) \delta(\mathrm{ppm}): 11.1,11.8,20.0\left(\mathrm{CH}_{3}\right), 99.3,121.1,129.1,134.0$, 134.2, 135.5, 141.9, 143.0 ( $\mathrm{C}_{\text {aromatic }}$ and $\mathrm{C}_{\mathrm{q}}$ ), 183.1, 185.4 ( $>\mathrm{C}=\mathrm{O}$ ). MS (+ESI) m/z (\%): $243\left(16,[\mathrm{M}+2 \mathrm{H}]^{+}\right), 242\left(100,[\mathrm{M}+\mathrm{H}]^{+}\right)$. Anal. calcd. for $\mathrm{C}_{15} \mathrm{H}_{15} \mathrm{NO}_{2}$ (241.29).

5-((2-Isopropylphenyl)amino)-2,3-dimethyl-1,4-benzoquinone (AQ7) The title compound was synthesized according to the general method from compound 2 ( 1 equiv, 3.67 mmol ) and 2-isopropylaniline ( 0.595 $\mathrm{g}, 1.2$ equiv, 4.40 mmol ), the crude residue was purified by column chromatography using petroleum ether/ $/ \mathrm{CHCl}_{3}$ (1:2) eluent to furnish AQ7 as a purple oil. HRFABMS: Calcd. for $\mathrm{C}_{14} \mathrm{H}_{14} \mathrm{ClN}_{2} \mathrm{O}_{2}[\mathrm{M}+\mathrm{H}]^{+}$: 277.0744; Found: 277.0769.

## 4.2 | Biological assays

### 4.2.1 | Cell culture and drug treatment

Briefly, the K562, Jurkat, and MT-2 leukemia cell lines were cultured in Rosewell Park Memorial Institute (RPMI) 1640 (Wako Pure Chemical Industries, Osaka, Japan) medium with $10 \%$ fetal bovine serum (FBS; Sigma-Aldrich, MO). PBMCs (Precision Bioservices, Frederic, MD) were incubated in RPMI 1640 medium with $10 \%$ FBS. All media were supplemented with $89 \mu \mathrm{M} / \mathrm{ml}$ streptomycin (Meiji Seika Pharma, Tokyo, Japan) in a humid atmosphere at $37^{\circ} \mathrm{C}$ and $5 \% \mathrm{CO}_{2}$. In experiments, the leukemia cells and PBMCs were incubated in 24 -well and 96 -well culture plates (Iwaki brand Asahi Glass Co., Chiba, Japan) at $2 \times 10^{4}$ and $1 \times 10^{6}$ cells $/ \mathrm{ml}$ concentration, respectively, for 24 hr . The stock solution of compounds and Imatinib (Wako Pure Chemical Industries) in concentrations between 0.3-3 mM were prepared in DMSO (Wako Pure Chemical Industries) and then were added to the fresh culture medium. The concentration of DMSO in the final culture medium was $1 \%{ }^{[39]}$

### 4.2.2 | Cytotoxicity assay

The MTT test was performed as previously described in the literature with small modifications. ${ }^{[40]}$ The tested compounds were cultured with cells in different concentrations $(0.3-30 \mu \mathrm{M})$ for 24 hr and then, MTT (Dojindo Molecular Technologies, Kumamoto, Japan) was added to cells. After 4 hr of incubation, the medium was taken out and $100 \mu \mathrm{l}$

DMSO was added to each well. The absorbance at 550 nm was measured using a microplate reader Infinitive M1000 (Tecan, Mannedorf, Switzerland) with background subtraction at 630 nm . All experiments were run in triplicate and $\mathrm{IC}_{50}$ values were estimated from the results of the MTT test described as the drug concentrations that reduced absorbance to $50 \%$ of control values.

### 4.2.3 | Detection of cell death

Apoptotic/necrotic/healthy detection kit (PromoKine, Heidelberg, Germany) was performed according to PromoKine's instructions with the modifications. ${ }^{[41]}$ Briefly, K562 cells were treated with AQ15 and imatinib at $\mathrm{IC}_{50}$ concentrations for 6 hr . Then, the cells were harvested and washed with phosphate-buffered saline (PBS) and stained with $4 \mu$ l of FITC-Annexin V, $4 \mu$ l of ethidium homodimer III and $4 \mu \mathrm{l}$ of Hoechst 33342 in $1 \times$ binding buffer for 30 min at room temperature in the dark. The cells were analyzed by a fluorescence microscope Biorevo Fluorescence BZ-9000 (Keyence, Osaka, Japan). The number of apoptotic cells (Annexin V ), late apoptotic or necrotic cells (Annexin $V$ and ethidium homodimer III), and necrotic cells (ethidium homodimer III) were counted as previously described. ${ }^{[42]}$

### 4.2.4 | Tyrosine kinase assay

The kinase inhibition assay system (TK-2; Promega Corporation, Madison, WI) was performed as previously described with some modification. ${ }^{[43]}$ In this system, eight kinase strips (ABL1, BRK, BTK, CSK, FYN A, LCK, LYN B, and SRC) and their substrates were diluted with $2.5 \times$ kinase reaction buffer ( $95 \mu \mathrm{l}$ ) and $100 \mu \mathrm{M}$ ATP ( $15 \mu \mathrm{l}$ ) solution, respectively. The reaction of kinases was performed in the 384 -well plate using $2 \mu \mathrm{l}$ of the compound solution at multiple concentrations in a buffer, $4 \mu \mathrm{l}$ of kinase working stock and $4 \mu \mathrm{l}$ of ATP/substrate working stock. After 1 hr of incubation at room temperature, the ADP-Glo Kinase Assay (Promega Corporation) protocol was employed and inhibitory kinase activity of the test compounds was determined as previously described. ${ }^{[44]}$

### 4.2.5 | Immunoblot analysis

The K562 cells were incubated in the presence of 10 and $20 \mu \mathrm{M}$ of AQ15 and imatinib for 6 hr and then lysed in PBS-Laemmli sample buffer. Immunoblot analysis using phosphospecific-p44/42 MAPK (Erk1/2; Thr202/Tyr204; D13.14.4E) XP rabbit mAb (1:1,000; Cell Signaling Technology, Danvers, MA) or anti- $\beta$-actin clone AC-15 (Sigma-Aldrich) was conducted. For immunoreactivity detection, chemiluminescence method was performed. ${ }^{[45]}$

### 4.2.6 | DNA-cleaving activity

The DNA cleavage activities of the compounds on supercoiled plasmid pUC19 DNA were studied by gel electrophoresis. pUC19 DNA ( $2 \mu \mathrm{~g}$ ) was dissolved in water and Tris/boric acid (Nacalai Tesque, Kyoto, Japan) buffer ( $10 \mathrm{mM}, \mathrm{pH} 8.5$ ) in the presence and absence of iron(II)
sulfate heptahydrate $\left(\mathrm{FeSO}_{4} \cdot 7 \mathrm{H}_{2} \mathrm{O} ; 30 \mu \mathrm{M}\right.$; Wako Pure Chemical Industries), $\mathrm{H}_{2} \mathrm{O}_{2}(30 \mu \mathrm{M}$; Tokyo Chemical Industry, Tokyo, Japan) and ascorbic acid ( $30 \mu \mathrm{M}$; Tokyo Chemical Industry) as an activator and mixed with the different concentration of compounds. The reaction was incubated at $37^{\circ} \mathrm{C}$ for 2 hr and then mixed with the loading buffer (Takara, Kyoto, Japan). Agarose gel electrophoresis was undertaken for 30 min at 100 V in Tris-acetate/ethylenediaminetetraacetic acid buffer. The gel (1\% slab) was stained with ethidium bromide (Wako Pure Chemical Industries) and then DNA was visualized by photographing the fluorescence of intercalated ethidium bromide under a UV illuminator (Nippon Genetics, Tokyo, Japan).

## 4.3 | Molecular docking simulation and ADMET prediction

The crystal structure of the ABL kinase domain in complex with imatinib was retrieved from the RCSB Brookhaven Protein Data Bank (PDB: 1IEP); AQ15 was built by ChemDraw Professional 15.1. Before docking simulations, AQ15 and 1IEP were prepared as previously described. ${ }^{[46]}$ MOE 2018.01 software (Chemical Computing Group, Montreal, Canada) was employed for preparation, interactive docking, visualization and analysis procedures using its default parameters. ${ }^{[47]}$ The ADMET properties were calculated in silico using ADMET Predictor 9.0 from Simulation Plus, Inc.; the risk models were previously explained in details. ${ }^{[88]}$

## ACKNOWLEDGMENTS

We thank Sadık Metin Ceyhan and Yunus Zorlu for helpful discussions on crystal structure analyses. This study was financially supported by the Scientific Research Projects Coordination Unit of Istanbul University (project numbers: FBA-2016-20662 and FBA-201724559) and the Grant-in-Aid for Challenging Exploratory Research to M.O. (24659048). The crystallographic data have been deposited at the Cambridge Crystallographic Data Centre, and CCDC reference numbers are 1892191 for the AQ3, 1892192 for the AQ9, 1892193 for the AQ11, 1892194 for the AQ17, and 1892197 for the AQ18.

## CONFLICT OF INTERESTS

The authors declare that there are no conflict of interests.

## DATA AVAILABILITY STATEMENT

The data can be obtained available free of charge from http://www. ccdc.cam.ac.uk/conts/retrieving.html or the Cambridge Crystallographic Data Centre (CCDC).
