Organizations must continually innovate in order to succeed over time. In recent decades, an increasing portion of this innovation is enabled or driven by digital technologies. New products, services, operations, business models, industrial arrangements, work organization, etc., have all been dramatically influenced by the digital technologies that are involved in their development, and the digital technologies that are embedded in the innovations themselves.

The goal of this minitrack is to offer a venue for research that focuses on unique and specific effects of digital technologies on different forms of organizational innovation. In particular, new forms of service offerings, products, or ways of organizing processes that did not exist before the availability of large scale digitalization.

Along these lines, we have identified three broad themes in association with digital technologies and organizational innovation:

(1) Digital Technologies and Process Innovation
Advancements in digital technologies have made possible new ways of doing things. In organizational contexts, these new ways of doing things take the form of process innovations that have the potential to transform those organizational contexts.

(2) Digital Technologies and Product / Service Innovation
Digital technologies can also be a key component of novel product and service offerings. These technologies can have a tremendous impact organizational structure and strategy, as recent work on digital architectures, modularity, platforms, and systems integration have discovered.

(3) Infrastructures for Digital Innovation
The digital technologies, tools, and infrastructures that support innovative processes such as software development, product design & engineering, R&D, and science are becoming ubiquitous. Such innovative organizational practices may be different than other organizational practices because they involve virtual collaboration, geographic distribution, iteration, simulation, and other generative activities. The tools and infrastructures upon which these practices rest might shape those practices in different industrial contexts.

This minitrack explicitly emphasizes the way in which particular forms of digital technologies contribute to organizational innovation in a variety of ways. Papers in this minitrack carefully attend to the fundamental elements and features of the digital technologies that shape or impact innovation processes and outcomes.
