Abstract

The aim of this study is to determine teachers' professional image in Turkish school series on television. Teachers' professional image was analyzed under four categories as demographic characteristics, positive, negative and omitted image components. To this end, four school series broadcasted on different TV channels were analyzed. The TV series were obtained from the websites of the channels or they were downloaded from YouTube. The study was carried out as an ethnographic study which is one of the qualitative designs. Study materials were chosen through criterion sampling method. The first three episodes and main teacher character of the series were included in the study. Data was collected through document review method. To analyze the data ethnographic content analysis was utilized. The following results were obtained. There were not stereotypes in terms of gender or age of the characters. On the other hand, three of the characters were seen as teachers in social sciences while only one of them was a Math teacher. All of the characters were single or widow which was regarded as a negative image component. Additionally, all of the series were set in high schools. As for the positive image components, the characters were idealistic, self-sacrificing, concerned, role-model, respectable and just. The names of the characters can be said to have positive connotations in Turkish language. They had positive visual image and good relations with their students. The characters could solve their students' personal problems. However, some negative image components were present in the series. These can be listed as financial status, the fierce opposition to the school administration, solving the problems at school informally, making exam in the first lesson and using insulting words to the students. Teachers were also depicted as an occupational group which can easily be appointed from place to place as a punishment. It was also determined that there were some omitted image components. Teachers were not depicted while planning, preparing for the lesson, training, participating in the meetings, grading the exams or doing extra tasks.

Key Words: Teacher, professional image, media, television series.

1. Introduction

Teaching is one of the most crucial professions for the survival and development of the society and can be regarded as a profession which will never lose its importance (Arslanoğlu, 1992). In this respect, the success of the teachers affects the whole society. The success of any profession, on the other hand, can be susceptible to self and professional image since the professionals behave in line with this image (Akyüz, 1978). The prestige of teaching profession is the result of factors such as behaviors and attitude displayed by the teachers, dominant culture of the society, politics and some other societal factor. For this reason, the teachers who are perceived as role models are expected to behave suitable to their profession's quality (Aydın, 2013). In today's knowledge society in which social interaction has been very dynamic, it has been an obligation for any profession to present itself accurately and properly (Mynbayeva & Yessenova, 2016). In other words, professionals have to create a positive image. However, it is not only the professionals creating this image with their occupational or daily life. The image can be generated by all kinds of media. People can judge professionals based on the news they read on the paper or a movie they watch on television. So, teachers who carry out an important task for the society should have a positive image in media or the media should reflect them positively.

1.1. Definition of Image

According to Ünsal & Bağçeci (2016), the success of any profession depends on the image of the members' quality, performance, expertise and skills. Image can be defined as the sum of the views about a person, institution or an occasion (Balta Peltekoğlu, 1997). On the other hand, İbicioğlu & Avcı (2003) defines it as the impression a person or institution forms in the eyes of other people and institutions. Bolat (2006) puts forward a more comprehensive definition. According to him, image is the sum of impressions and thoughts about a person or organization which are created as a result of conscious or unconscious broadcast of information or data to

public. These impressions and thoughts may consist of subjective or objective judgments. Polat & Arslan (2015) point out some features of image. It can change over time; it is subjective; it can be positive or negative; it can be formed consciously or unconsciously and it is the result of the interaction between the source and holder of the image.

1.2. Professional Image

Nearly all the professions have an image that is prescribed to their members and this image includes certain qualities, features and competencies. For example, a manager is expected to be “competitive, rational, enterprising and having technical competencies (Demaier & Adams, 2009). In its broadest sense, professional image can be expressed as the people’s generalizations about a profession. Among these generalizations are personalities of profession’s members, the kind of tasks they carry out, their lifestyles and income, working conditions, aptness of the profession to different individuals (Gottfredson, 1981). Factors such as historical, societal, cultural and politics are among the determinants of professional image (Grandy & Mavin, 2011). The attitude and behaviors, achievements and communication styles of the members are also among important factors (Bağçeci, Çetin, & Ünsal, 2013). In addition to these, level of the professionalism it requires, the status it provides for the members, ethical connotations of the profession and the personal qualities of the members can have a positive or negative influence in development of the image (Akkol Gök & Derin, 2014). At the same time, the experiences people have with the members of a profession can contribute to the image they hold about this profession (Çelik, Pasinlioğlu, Kocabeyoğlu & Çetin, 2013). According to Gottfredson (1981) professional image originates more from the lifestyle it offers for the members but less from the tasks the members carry out or the admission requirements for it which can be regarded as a misconception.

The image the society hold about any profession is closely related to the status of that profession and is also very important for the members of the profession (Sis Çelik and et al., 2013). In addition to its personal value, professional image is regarded as one of the factors in the creation and development of organizational image (Taslak & Akin, 2005). Considering the teaching profession which is directly serving to the students and indirectly to the whole society, it can be said that teachers’ professional image becomes much more important (Bağçeci, Çetin ve Ünsal, 2013). It can also be said that perceived image of teachers brings about professional prestige (Hoyle, 2001).

Professional image of the teachers have different functions. These are as following (Mynbayeva & Yessenova, 2016); informing the society and students about teachers’ personality traits; contributing to students’ and even adults’ character formation through a positive image; promoting professional development of teachers and improvement of teaching through a positive image; broadening teachers’ horizons; motivating teachers to self-actualize and leading them to personal achievement. To sum up, in the formation of a professional image not only the factors originating from its members but also external ones can be influential. Among these factors, media is the one whose scope is the widest. In this sense, the relationship between media and teachers’ professional image is an issue which should be taken into consideration seriously.

1.3. Media-Image Relationship

Image can be defined as the opinions which occur as a result of an informing process. People make a decision of impression by judging the information and data they receive from various channels (Gürüz, 2004). Among these channels media is the most influential one. With the development of different kinds of media, its potential power in affecting society’s values and perceptions has been realized (Newman, 2001). In this sense media, whose original function was to meet communicational needs, has become a powerful actor influencing the society. This means a very quick transformation. Firstly, media draws a purposeful image and later it imposes this image to the society (Bal, 2011). According to Türkkahraman (2011) media, especially television, creates a pseudo image and suspends people from the reality. Society is tried to be led to a magical and brilliant world by means of mass media. Grandy & Mavin (2011) mentions two basic functions of media: ‘creating perception’ and ‘providing perception’. In its first function, media designs individual’s interpretation of complex phenomenon. In the latter one, media can make purposeful guidance about certain facts. So, we can say that media may have a role in creating, maintaining and changing the image of any profession. Thus, in the literature it is possible to come up with studies investigating the relationship between professional image and different kinds of media (Weaver, Salamonson, Koch, & Jackson, 2013; Wittenberg, 1997; Grandy & Mavin, 2011; Rucks (1978) ve Thompson (1972) cited in Wotruba, 1990; Park & Berger, 2004; Akbaba Altun & Kirkit, 2005).

In terms of teachers' professional image, as mentioned above, media is a major determinant. In their study based on teachers' views, Ünsal & Bağçeci (2016) states that media is one of the top factors in the creation of professional image. The image people hold about schools and teachers can originate from the things they see, read or hear in media (Dalton, 2004; Swetnam, 1992; Cunningham, 1992). Fictional television programs depicting teachers can have a bearing on the society's perceptions and expectations of teachers (Townsend & Ryan, 2012; Swetnam, 1992). In another study, Dagaz & Harger (2011) found that media depictions of teachers affect students' expectations from their instructors at university. On the other hand, teachers' self-image is not independent from media effect (Townsend & Ryan, 2012). Schwarz-Franco (2016) focuses on a similar point and state that the messages in the movies are bilateral. Teachers are depicted as super heroes in movies and it is inspiring for inexperienced ones. On the other hand, it may convey the message that if a teacher wants to create a change, she / he has to confront some challenges. Burbach & Figgins (1993) and Swetnam (1992) draw attention to the omission of some image components about teachers in media which is also an influential factor in the creation of professional image.

Burbach & Figgins (1993) state that teachers' image in movies can be divided into three sub-groups: positive, negative and omitted image. According to them, while positive image components are idealism, being extraordinary, commitment, negative ones are incompetency, being excessively humorous, the message of anyone can become a teacher, desperation, opposition, depicting female teachers' as a symbol of sexuality. Character development, love affairs and teaching activities are not reflected enough in movies. Swetnam (1992) lists the components spoiling teachers' image as demographics, subconscious messages, prejudices about teachers and teachers as extraordinary characters. The image media conveys is very important particularly for the ones who do not interact with teachers one by one. In this sense, it is a requirement to determine teacher image in media especially on television.

Today image has a deep and significant impact on our culture. Many people spend much time in front of television so their thoughts and interpretations are shaped to a great extent by television (Newman, 2001). Television series whose themes are schools and teachers provide affluent records waiting to be investigated in terms of these series' impact on teachers' image and perception of the society (Terzian & Ryan, 2015; Trier, 2001). Studies in English, especially in the scope of movies are plentiful on teachers' image (Schwarz-Franco, 2016; Townsend & Ryan, 2012; Dagaz & Harger, 2011; Ryan & Townsend, 2010; Weaver, 2009; Beyerbach, 2005; McCullick, Belcher, Hardin, & Hardin, 2003; Newman, 2001; Trier, 2001; Burbach & Figgins, 1993; Kaplan, 1990). On the other hand, literature in Turkish is very limited (Akcan & Polat, 2016; Efendioğlu, 2013). According to Swetnam (1992), depiction of teachers in mass and printed media is a salient topic to be studied in terms of preference of teaching as a career and the support to the teachers in the society. For a better educational system it is important to have more realistic expectations which will increase the cooperation between schools and society.

Considering the ratings of television channels and studies carried out, television series in Turkey are breaking track records and becoming a usual part of people's daily speeches (Karadaş, 2013). This proves the force of television series in influencing the society. The current study aims to determine image components in school series and draw attention to them.

2. The aim of the study

This study aims to determine teachers' professional image in school series on television. In line with this aim, it seeks answer to the following question:

- a) What are the demographics of the teachers in school series on television?
- b) What are the positive image components in school series on television?
- c) What are the negative image components in school series on television?
- d) What are the image components omitted in school series on television?

3. Method

3.1. Research Design

The current study utilizes ethnography which is one of the qualitative research designs. Ethnographic design focuses on the perception and behaviors of individuals as well as social structure and mechanism, the definition of cultural units such as values and norms (Yıldırım ve Şimşek, 2016). Ethnographic content analysis is a method used to determine themes and categories generated from data collected through movies, videos and photos (McCullick, Belcher, Hardin, & Hardin, 2003; Seggie ve Bayyurt, 2015).

Data was collected through document review. In ethnographic approach, document review is based on the principles of qualitative research. While analyzing television news, series and movies, it allows using data from narration (Altheide, 1987). Movies, videos and photos can be used in qualitative research (Yıldırım & Şimşek, 2016). These kinds of materials can be data collection tools. According to Mertens (2010), document review provides an important advantage for the researchers because there is not time or space limit. It also allows researchers to reach information which is not normally accessible.

3.2. Study Material

The population of the study consists of recent school series on television (since 2000). Marshall & Rossman (1999 cited in Yıldırım & Şimşek) state that movies, videos and photos provide some advantages for the researchers. The first one is that they present facial expressions and gestures in their original form and within permanence. The second one is that the researcher can watch them more than once and at different times. The third one is that they allow determining the events and phenomena which rarely occur and are difficult to repeat. Lastly, these documents can be used by other researchers; the findings can be verified and compared to the ones by other studies. In this sense, it can be said that the material of this study, namely school series on television, accommodates these advantages. Since 2000, there has been six school series which can be analyzed in the scope of this study (see Table 1). Yet, in the series named “Koçum Benim” the main character is not a teacher so this one was not included in the study. The information about series is presented in Table 1.

Table 1. Information about the school series

Name of Series	Director	Actor / Actress	Character	Date	Tv Channel
Koçum Benim	Vecihi Ener / Serdar Akar	Tarık Akan	Koç Can	2002-2004	TRT-1
Hayat Bilgisi	Tarkan Karlıdağ	Perran Kutman	Afet Güçverir	2003-2006	Kanal D / Show TV
Arka Sıradakiler	Hamdi Alkan	Bülent Emin Yarar	Kemal Güngör	2007-2012	FOX TV
Öğretmen Kemal	Hamdi Alkan	Bülent Emin Yarar	Kemal Güngör	2010	FOX TV
Elde Var Hayat	Cem Tabak	Emre Altuğ	Kenan Öğretmen	2010-2012	TRT-1
Hayat Bazen Tatlıdır	Hamdi Alkan	Birce Akalay	Hayat Öğretmen	2016	Star TV

As can be seen in Table 1, six series on various television channels have been determined since 2000. Both the character and the actor in “Arka Sıradakiler” and “Öğretmen Kemal” are the same. In addition to this, the records of “Arka Sıradakiler” were not accessible so only “Öğretmen Kemal” was analyzed. Since there were too many episodes of each series, it was impossible to analyze all of them. On the other hand, in the first three episodes the characters are introduced in detail. Also, there are a lot of teacher characters in series so it was impossible to analyze all of them. Yıldırım & Şimşek (2016) state that it is impossible to analyze all the documents so researchers can use sampling methods. Based on these, in this study criterion sampling one of purposeful sampling methods was employed. The first three episodes and main characters were included in the study. Patton (2002) defines purposeful sampling as choosing situations purposefully and strategically which are rich in data we want to gather. The type and size of situations may vary based on the aim of the study and resources in hand. Criterion sampling is based on including all the situations in the study which meet the criteria set in advance. In this study criteria are being the main character and acting in the first three episodes of the series as a teacher character.

3.3. Data Collection and Analysis

Forster (1995; cited in Yıldırım and Şimşek) proposed some steps that can be applied in document review. Yet, these steps can be adjusted based on the research problem and how detailed the documents or data will be analyzed. These steps are as following; (1) accessing to document, (2) checking its originality, (3) understanding the documents, (4) analyzing the data and (5) using the data. The series in this study were reached from the websites of the channels they were broadcasted or if not available they were downloaded from Youtube. Descriptive analysis was utilized in the study. In this approach, the data is summarized and interpreted according to themes determined in advance. Data is organized based on the themes derived from research questions. Also, direct quotations are given to reflect the observation more saliently (Yıldırım ve Şimşek, 2016).

In this study the categories by Burbach & Figgins (1993) which are positive, negative and omitted image were used and also demographic characteristics were also analyzed. To support the findings lines and visuals from different scenes were given. The researchers watched the episodes carefully and noted down lines which can be interpreted as an image component. Visuals from some scenes were shot and used in the study. These were thought to increase the validity of the findings.

3.4. Validity and Reliability

To increase the validity of the study the process from determining the study material to analysis was presented in detail and the findings were compared to literature. Also, visuals related to findings were presented to support their validity. As for the reliability, the researchers categorized the image components separately and using the formula by Miles & Huberman (1994) the reliability was calculated. According to this, intercoder reliability was found $p > \%70$ which proved the coder reliability of the study.

4. Findings

Findings on Demographic Characteristics of Characters

Table 2. Demographic characteristics of characters

Characters' Name	Gender	Age	Branch	School Level	Marital Status
Afet Güçverir	Female	54	History	High School	Single
Kemal Güngör	Male	56	Turkish Literature	High School	Widow
Kenan Dağışan	Male	40	Mathematics	High School	Widow
Hayat Sarıyaz	Female	32	Turkish Literature	High School	Single

Table 2 shows the demographic characteristics of the characters in the series. Three of the characters are female and two of them are male. Considering the actors real ages, it ranges from 32 to 56. There are characters in his/her 30's, 40's and 50's. Another variable presented in table is teachers' branch in series. It can be seen that three of them are teachers in social sciences while only one of them is a Math teacher. Considering meanings of the names of the characters in Turkish, they all have positive connotations. For example, "Güçverir" means giving power; "Hayat" means life; "Kemal" means maturity, perfection; "Dağışan" means climbing over the mountains. This can be interpreted as a positive image component. As for the marital status, two of them are single and three of them are widow which can be regarded as a negative image component. They do not have a usual family life. On the other hand, all the series take place in high schools which is another salient finding.

Findings on Positive Image

In this section of the study, the positive image components about the main teacher characters in series are presented. To this end, the researchers watched the first three episodes of the series carefully and they tried to find the scenes which reflect a positive image component in terms of teaching profession. First of all, it can be said that all the characters have a positive image visually. Their outfits, hair styles, makeups and shavings are appropriate for a teacher. They give a positive impression. The photos taken from the series below support this finding (see photo 1,2,3,4).

Photo 1

Photo 2

Photo 3

Photo 4

As can be seen in the photos, male teachers wear a suit and the female ones wear a dress elegantly. The men are shaved and the women are made up. So, we can say that teachers have a positive visual image in television series.

Secondly, it can be said that teacher characters in the series are committed to their profession and students. They are self-sacrificing and idealistic teachers. They love their jobs. It can be interpreted from both their speeches and acts. For example, in “Elde Var Hayat” teacher Kenan is appointed to school on summer holiday. He immediately inquires the level of academic success at school. He finds out that the students are not good at Math. On finding out this, he wants to open a free course for students to tutor them during the holiday. Below you can see the dialogue between him and the school principal on this issue.

In principal’s room (Episode 2):

Principal: *How did you find our school, Mr. Dağışan?*

Teacher Kenan: *Quite frankly, I could not walk around much but as far as I can see it is a nice school. In fact it does not mean anything to me when there are not students in it.*

Principal: *I agree with you. In summers it is just a building. We miss our students but I do not think they miss us.*

Teacher Kenan: *They are too young to miss, my dear director. When they get to ages in which they start to lose, they will become acquainted with missing.*

Principal: *You are absolutely right.*

Teacher Kenan: *I wonder the overall success of the school.*

Principal: *Actually, I can not say that we are as successful as we would like. The students are not much interested especially in sciences.*

Teacher Kenan: *It is not a problem. I am used to these kinds of situations. May I have a look at student files to know the students’ past grades?*

Principal: *Of course, you may.*

Then, assistant principal comes in. The principal says that assistant principal can help Teacher Kenan. The assistant principal accepts and says:

Assistant Principal: *You may feel sorry for what you find out.*

Teacher Kenan: *If the grades are low, it means that the students have lots to learn. It also means that I have to spend more time for students. Yet, it is not a problem. I really like to spend time with my students. It is a pleasure for me.*

The dialogue among principal, assistant principal and Teacher Kenan is given above. The expressions above prove that Teacher Kenan is dedicated to his profession. He is concerned about the students and loves them which gives a positive impression about him. Also, we can see that he is a self-sacrificing teacher because he volunteers to lecture the students during the summer holiday.

In “Hayat Bilgisi” Teacher Afet has an image of a teacher who is dedicated and loves her profession. She also loves her profession. The dialogue between her and school principal is as following:

In the garden to the principal (Episode 1)

Teacher Afet: *I have always loved the school but the ones (implying principal and assistant principal) at school does not love me.*

To the principal who wants her to be realistic she says:

Teacher Afet: *I am not realistic. I am a teacher. Here is a slum school. Any of the students will not inherit houses or villas from their parents. The only thing these children need is education. And I am here to educate them. We are their only chance.*

The expressions above show how a dedicated teacher she is. She wants to say she will do whatever she can for the students. She is worried about their future. And the only thing she cares about is the education which again gives a positive teacher image.

In “Öğretmen Kemal” a friend of Teacher Kemal who is a principal at a private school offers a job. To persuade him to work at a private school she focuses on the good salary he may get. Teacher Kemal says:

Teacher Kemal: *You know that you can not convince me by talking about money.*

Here we can see that the teacher is not a materialistic one which can also be regarded as a positive image component. Teacher Kemal loves his job and does not care much about money.

There are scenes which portrays the teachers as just. In “Hayat Bilgisi” and “Hayat Bazen Tatlıdır” we can see examples of just teachers. When Teacher Afet sees that her brother who is a student at the same school with her fights with one of his classmates, she takes both of them to the principal’s room to be punished. The dialogue between her and the principal is as following:

In principal’s room (Episode 2):

Teacher Afet: *They should serve their sentence, dear principal!*

Principal: *Yet, in this situation I have to punish your brother, too.*

Teacher Afet: *Of course you will. He must be punished, too. Here is a school not a monarchy.*

In the same series, Teacher Afet says that she will make an oral exam in the second lesson. Her brother Kerem is in the classroom and he is the first student to take the exam. She asks some questions to her brother but he can not answer them. So he gets a low grade. In “Hayat Bazen Tatlıdır” there is a similar scene. Teacher Hayat’s sister is a student in the same school. But she wants her sister to call her as “teacher” not “sister”. These examples indicate how just and professional the teachers are in the series. They do not bestow on their sisters or brothers.

Teachers in these series are concerned about not only educational problems but also personal ones. They try to solve the students’ problems which are actually the main theme of the series. A salient example can be given from “Hayat Bazen Tatlıdır”. Teacher Hayat finds out that one of the best students whose father dies a while ago drops the school and starts to work to earn his family’s living. The student also has to pay the loan his father gets from moneylender. Hayat teacher decides to persuade the student to come back to school and she goes to his home.

Photo 5. Teacher Hayat is at Onur’s home

Following this scene (see Photo 5) Teacher Hayat finds out the street address of the moneylender and opposes to him. She in a way pays the money and the student comes back to school. In the second episode of “Hayat Bilgisi” Teacher Afet comes to the classroom and she sees that some of the students are absent. She asks where they are and why they are absent one by one. Especially these two characters do their best to settle the students’ problems and they fiercely oppose to the school management in favour of students. In “Hayat Bilgisi” the principal uses school garden as toll parking and sells the school’s coal so the school does not heat enough. The one who opposes to the principal is Teacher Afet. In photo 6, she makes a trick with her students to the principal. She puts rocks into the coal sacks which the principal will sell. In “Hayat Bazen Tatlıdır” the principal gets money from students for the computers which a benefactor donated to the school for free use of the students and refuses to install banks in the school garden for the sit of the students. Teacher Hayat does her best to find solutions to these problems and in the end she does.

Photo 6. Teacher Afet and the students are in the boiler room.

In the series teachers are presented as role models for the society. In a scene, teacher Kemal is shown in front of a bookshelf full of books in his new home (see Photo 7). Additionally, teacher Hayat is shown while reading book in some scenes (see Photo 8). She also wears her seatbelt and makes her sister wear it while driving to school. Teacher Afet never sacrifices of her principles. So she was often appointed to different schools. She says *“Instead of doing wrong at the same place during 20 years I prefer following my own truths in different places.”*

Photo 7

Photo 8

Photo 9

In Photo 9 above , Teacher Kenan helps a laborer working in the refurbishment of the school. It is another indication of his selfsacrifice and commitment. In this scene he shows an extra role behavior and he does more than expected from him formally.

When it comes to their personal lives, we can say that Teacher Hayat and Afet are good sisters and Kenan is a good father which presents them as role models. For example, in “Elde Var Hayat” teacher Kenan spends the whole night by his son who has a fever (see Photo 10). Teacher Hayat is also shown while she is caressing her sister’s hair while the sister is sleeping (see Photo 11). Based on these findings, it can be said that the characters are not only good teachers but also good parents.

Photo10

Photo 11

Another finding which supports the positive image of the teachers is their status in the society. A good example of this can be given from “Hayat Bazen Tatlıdır”. While going home from school, teacher Hayat is at the greengrocer’s. When the greengrocer finds out that she is a teacher, they have such a conversation (Episode 2):

Greengrocer: *Are you a teacher?*

Teacher Hayat: *Yes, I am.*

Greengrocer: *That is very nice. You have a good job. My daughter is also a teacher candidate.*

Teacher Hayat: *Really?*

Greengrocer: *You have a sacred profession.*

Teacher Hayat: *Thank you very much.*

Greengrocer’s describing teaching as a sacred profession indicates that teaching is a high status profession in the society. In “Hayat Bilgisi” another scene shows the high status of teaching in the society. Teacher Afet looks for a house to rent for a long time and they go to Metin’s house. The following is the dialogue between Metin and the teacher (Episode 1):

Teacher Afet: *How much is the rent, sir?*

Metin: *I thought 400 TL but since you are a teacher it is 300 TL. I will also ease the damage deposit for you. If you have any problem, I am nextdoor.*

Teacher Afet: *It is OK for me.*

The dialogue above shows that the landlord makes things easier for her since she is a teacher which is an indication of the respect in the society. Lastly, the teachers have a good communication and are loved by the students. It also gives a positive impression about the teachers to the viewer. For example, in “Elde Var Hayat” the principal and assistant principal have a dialogue as following (They are talking about Teacher Kenan):

Principal: *The students in his ex-school rose up. They wanted him not to leave them. Do our students do the same for you?*

The principal’s expression shows that Teacher Kenan is popular among students. The other characters are also popular and have good communication with their students. This also contributes to teachers’ professional image positively. For example, Teacher Kemal’s ex-students visit him and they have very intimate conversation with their teacher. In “Elde Var Hayat” Teacher Kenan plays basketball with his prospective students. (see Photo 12).

Photo 12

Findings on Negative Image

One of the features of image is that it can not only be positive but also negative. In this sense, some negative image components have been determined in the first three episodes of the series. The most striking one is the financial status of the teachers. The cars they have, the houses they rent and the conversations they have with their colleagues are the indicators of this situation. The cars they have, for example, are very old and in addition to this they often break down. However, the characters do not have their cars repaired or buy new ones. This gives the impression that teachers do not earn enough and they have a low financial status (see Photos 13-14-15).

Photo 13

Photo 14

Photo 15

Another negative impression on teachers' financial status is from a scene in the greengrocer's. Teacher Hayat is shopping and the dialogue between her and the greengrocer is as following:

Greengrocer: *I think you are on a diet. (He says this because the teacher buys a few fruits and a little vegetable.*

Teacher Hayat: *The diet is an obligation. This is all I can buy with a teacher's salary.*

In "Hayat Bilgisi" when Teacher Afet finds out the rent of the house, she says to the estate agent "I think you misunderstood us. We will rent the house. We will not buy it." In the same series, one of her colleagues asks Teacher Afet "Do you have a part time job?" and she replies "We are new in Istanbul. When we have difficulty with the conditions here, we will do something." Teacher Kenan's car breaks down on the road. He takes his car to the repairman but the cost of the repair is too much. He finds out that he does not have enough money in his account on going to the bank. He becomes really sad. He calls one of his colleagues to borrow some money but when she complains about lack of money he does not. In the end, he has to sell the bracelets which belong to his lifeless wife. Based on these examples, we can say that teachers are presented as people who have some financial challenges.

Another interesting finding is that in series teachers are appointed to different places easily and without their will. Especially Teacher Hayat and Afet work in a lot of different cities and schools. The reason is their opposition to principals, not sacrificing of their principles and being on the side of justice. This gives a message to the teachers. If they oppose to the principals and if they have their strict principles, they may have to move from place to place. On the other hand, while they are opposing to the principal, the characters do not follow formal procedures since they do not work. So, they have to solve the problematic situations in informal ways. This can also be regarded as a factor contributing to teachers' image negatively. For example, the principal in Hayat Bilgisi makes the school garden toll parking. To solve this problem, Teacher Hayat plays football with the students in the garden and they break the cars' windows and mirrors intentionally (see Photo 16). On seeing that she will not give up opposing him, the principal surrenders. The students go on playing in the garden freely.

Photo 16

Another finding on negative image is that teachers make exams on the first lesson they meet the students. Later, they use the exam results to show the students that they have much to learn. However, this gives the impression that teacher's only and most used weapon is the exam so can be regarded as being negative.

Lastly, it is possible to see the teachers while teasing on the students. For example, Teacher Afet plans to make an exam in the first lesson. One of the students says “Teacher, you have just come. What about meeting each other?” And she replies “Why are we meeting? We will not marry so no need to meet each other.” Some of the students come late to the lesson and she says “Why did you bother to come? We would come to you.” As can be understood from the examples, she is often sarcastic.

Findings on omitted professional image

The omitted professional image in the series is also very important because of their possible contribution to teachers’ professional image in real life. In fact, teachers do much less than in the series than they do in real life. They show a much higher performance than they do in the series. However, when we watch the television series we see that teachers spend very little time in teaching activities since the screenplay of the series is mostly about the personal lives of teachers and students. Teachers in the series find solutions to the personal problems but they do not spend much time for finding solutions to the educational problems. Teachers are not portrayed while doing teaching in the classroom. Teachers do not get prepared for the next day’s lessons; do not do planning or grading the exam papers which are the tasks most of the teachers in real life have to deal with at home. Shortly, we can say that teaching in the classroom and getting ready for the teaching at home are the omitted image components.

Conclusion and Discussion

The aim of this study is to determine teachers’ professional image in school series on television. In this respect, the first three episodes of four series have been watched. Only the main character who is a teacher was analyzed. The series “Öğretmen Kemal” and “Arka Sıradakiler” stars the same actor and as the same character, and also the archieve of “Arka Sıradakiler” were not accessible, only “Öğretmen Kemal” was included in the study. Teachers’ professional image was analyzed under four categories: demographics, positive, negative and omitted image.

In terms of demographics, there were not gender or age stereotypes. As for their marital status, school and branch, the situation is different. All the characters are single or widow; they teach in high schools and in social sciences. In this sense, it can be said that the series have an unrealistic portrayal.

The depiction of teachers committed, self-sacrificing, idealistic, just, objective, respectful and prestigious is a factor contributing to teacher image positively. They communicate very well with their students and love them so much. They are presented as role models for the society. They also have a positive visual image. There are similar findings in the literature (Akcan & Polat, 2016; Efendioğlu, 2013; Ellsmore, 2005; Burbach & Figgins, 1993; Swetnam, 1992).

When it comes to negative image, the financial status of the teachers in the series are the most salient point. They are depicted as low-level income people. They are easily appointed from city to city and oppose to the principals fiercely. So they have problems with the principals and in the end solve them informally. During the lessons, they threaten the students by making exam. The last thing that can be regarded as a negative image component is teachers’ being sarcastic against students.

The omitted aspects of teaching profession was also investigated in the study. Teachers are not depicted while planning, teaching, engaging in professional development, grading exams and doing extra tasks. Swetnam (1992) had a similar finding in his study investigating the factors damaging teachers’ image.

It can be suggested that the series on television should depict teachers more positively. They should be broadcasted with the approval of Ministry of National Education and there should be educational experts in screenplay writing process. The actual teaching process should be involved more in the series. The series should avoid from scenes that reflect teaching profession negatively as much as possible.

Forums and The Reflection On Teaching/Learning The Mother Tongue: Conceptions Of Students

Cristina Manuela SÁ¹

Research Centre on Didactics and Technology in the Education of Trainers. University of Aveiro

E-mail: cristina@ua.pt

Abstract

Students' conceptions on the teaching/learning process influence the way they learn. In a course we teach in a second cycle of studies of Bologna, they must engage in two on line discussion forums to co-construct knowledge on essential topics concerning the teaching of the mother tongue and deliver an individual essay, one of the topics being the expression of their views on their contribution to their training. To determine how these students conceive the teaching/learning process and the role ICT play in it and to discuss their probable consequences, we selected relevant phrases/sentences in the essays and submitted them to content analysis, concluding that they have a very traditional conception of the teaching/learning process, which prevents them from taking profit of an organization that places them at the center of it and affects negatively their ability to propose this kind of interaction to their future pupils.

Keywords: Teacher education; Mother tongue; Conceptions; ICT.

Introduction

This text discusses the results of the analysis of Higher Education students' conceptions on the way online discussion forums affect the process of learning they are engaged in while attending a course included in a second cycle of studies of Bologna centered in their reflection on several aspects of the process of teaching/learning the mother tongue.

Teaching didactics of the mother tongue, supervising teacher training and directing seminars on educational research within Bologna cycles of studies, along with cocoordinating LEIP/Laboratory for Research on Portuguese Language Education, led us to reflect on factors that may affect the teaching/learning process, namely in Higher Education.

Students' conceptions are one of them, as proved by research, either at national and international level (Pardal et al., 2011; Richardson, 1996). We have been doing research on the importance of students' conceptions to promote a teaching/learning process in which they must engage actively since 2010 (Sá, 2010). Some of these studies – focused on their views on assessment as a way to regulate the teaching/learning process – led us to conclude that they fail to perceive its formative nature, which affects negatively their performance and training (see, for example, Sá, 2013, 2015). Others – focused on their views on the competencies they develop during the training process – revealed that the growing attention they pay to the student centred methodology combined with a formative assessment system the teacher adopted in the courses helps them to develop more competencies essential to their future professional practice (see, for example, Sá, 2014).

¹ This work is financially supported by National Funds through FCT – Fundação para a Ciência e a Tecnologia, I.P., under the project UID/CED/00194/2013.

ICT are also more and more important in the teaching/learning process due to their omnipresence in the 21st century society. One must reflect not only on the role they can play in the teaching/learning process (see, for example, Sá, 2016), but also on their impact on teacher education (Macário, Sá & Moreira, 2014a, 2014b; Sá & Macário, 2014) and the promotion of a teaching methodology that places the students in the center of the process and leads them to develop critical thinking (see, for example, Sá, 2016). This interest on ICT is supported by international documents on educational policy, which underline their importance and place their adequate use among the transversal competencies essential to integration in the 21st century society (cf. European Commission, 2007).

In this text, we reflect on student's views concerning the role ICT play in their training.

Method

This study is focused on a course of didactics of the mother tongue we teach in a second cycle of studies of Bologna designed to train early childhood educators and primary school teachers. While they are attending that course, the students must take part in two online discussion forums, selected among the several we have conceived alone or with a coauthor. They are supposed to give the students a leading role in their training process and to help them to coconstruct knowledge on important topics concerning the process of teaching/learning the mother tongue. At the end of the semester, as a part of their assessment portfolio, the students must deliver an individual written essay expressing their views on the contribution of ICT for their training among other topics mentioned in the guidelines presented by the teacher.

In order to determine how the students conceive the role played by these online discussion forums in their training, we used documental analysis to collect phrases/sentences on this topic in their essays, which were afterwards submitted to content analysis (cf. Bardin, 2013) combined with descriptive statistics (absolute and relative frequencies) when necessary.

Findings

We read 117 texts produced along five academic years (from 2010-11 to 2014-15) and collected 302 relevant statements (each one designed by S followed by a number corresponding to its order in the total sequence). We shall use some of them to illustrate aspects the data analysis.

In Table 1, we present the results of the analysis of the aspects of the teaching/learning process the students have related with the use of the online discussion forums:

Table 1. Pedagogical aspects mentioned in the reflection on the use of online discussion forums

Variable	N	%
Acquiring knowledge	199	35.2
Collaborative work	161	28.5
Reflection	122	21.6
Developing competencies	41	7.3
ICT and construction of knowledge	36	6.4
Future didactic use	6	1.0
Total	565	100

The table shows that the majority of the statements (83.6) concerns three categories: acquiring knowledge/collaborative work/reflection.

The most valued category is acquiring knowledge as referred in S21 – [...] The use of the interactive forums [...] reveals the importance of ICT to acquire knowledge and motivates us to assimilate more easily knowledge on reading/writing and other relevant topics.

The students believe that collaborative work has played an important role in this context, as mentioned in S197 – [...] the forums were a very important work device in what concerns the analysis of the contents of this course. As they allowed us to share our ideas with other students [...] we learned by reflecting on other people's views. According to them, collaboration promotes the coconstruction of didactic knowledge, as referred in S117 – [...] Moreover the interaction in the online discussion forums encouraged people [...] to share their ideas – often different – on several topics and thus allowed us to organize that knowledge and transform it into something we could use in our practice.

The use of these forums was also related to reflection, resulting not only of collaborative work, but also of individual analysis of the resources presented in them, as stated in S101 – During the semester I became aware of the important role played by the forums in the acquisition of knowledge. The topics dealt with in them were very interesting and they allowed us to begin by reflecting individually. [...] It was also strengthened by the comparison of the students' opinions with texts of expert authors presented in the forums, as mentioned in S65 – [...] After we had written down the ideas of the whole work team [on the topic of the forum] we were invited to read a document which presented information produced by experts on that topic. [...]

Some students (almost as much as the ones who mentioned developing competencies) explicitly referred to the role played by ICT in the acquisition of knowledge, as exposed in S53 – [...] the work done in the forums made me become aware of the importance attached to the use of ICT in the presentation of contents and the acquisition of knowledge and the development of competencies concerning the process of teaching/learning how to read and write.

Nevertheless, only a few students expressed the intention of using ICT with their future pupils. Those who did so, argued that this strategy allowed the pupils to engage more actively in the learning process and to develop collaborative work (S80 – After interacting in the forums during this semester I understood that they are very useful, because they allow the pupils to present their ideas, share them with their colleagues and discuss them. [...]) and the teacher to follow more closely his/her pupils (S80 – [...] Helps the teacher to follow the work the pupil does at home [...]) and made learning more appealing (S80 – [...] the use of a computer connected to the web makes the work more appealing, more interesting, because the pupils use them in their everyday life with great pleasure.)

In Table 2, we present the results of a further analysis of the statements related to the category ICT and construction of knowledge:

Table 2. Role of ICT in the teaching/learning process

Variable	Number	%
Student centered teaching	37	56.1
Presentation of contents	17	25.8
Motivation	6	9.1
Communication	5	7.5
Following the students	1	1.5
Total	66	100

This table reveals two opposite ways of conceiving the role played by ICT in education. For some students, they are mainly a way of presenting contents, as one can read in S13 – These forums [...] functioned as a kind of guides for research on relevant topics, as well as sources of information presented by the teacher, in order that we could compare our ideas with those of experts. Others present them mainly as instruments to promote a teaching methodology centred in the student, as referred in S39 – [...] forums were a means of making us think about our future practice and pay attention to what is really important, such as the competencies one must develop, the strategies one must adopt and the importance of teaching Portuguese. – or in S107 – [...] working with ICT [...] promoted collaborative work, based on permanent research and reflection, individually and in group, sharing knowledge and experiences. To me this is essential to our professional training and promotes interest in changes, adaptation to the moment and the needs, since everyone we deal with may become our teacher for a moment.

Results, Conclusions and Recommendations

The reflection of these results allowed us to characterize the way these students view the teaching/learning process they are engaged in and the role ICT plays in it.

We concluded that most of them reveal a very traditional conception of the teaching/learning process: the teacher is supposed to communicate knowledge that the student must assimilate. We relate this conclusion with the fact that they concentrate mainly on the acquisition of knowledge (putting aside the development of competencies) and tend to consider that collaborative work and reflection are essential to learn the contents of the course. ICT are viewed as ideal means to present the knowledge on the topics dealt with in the course to be assimilated, produced by the teacher, other students or experts.

But we also observed that some students pointed to a very modern conception of the teaching/learning process, where they were supposed to play the main role. Such conceptions were related to the importance of developing competences and the teaching methodology used in this course, as presented in S225 – In the course, the teacher has adopted several methods, such as theoretical expositions, practical work and interaction in forums. These different strategies made the classes more dynamic, productive and fruitful. In these statements, ICT tend to be viewed specially as means of putting the student in the centre of the teaching/learning process, as described in S265 – Among the distinctive features of this course, I must refer the interaction in the forums, which allowed a better understanding of some of the topics dealt with in it, mainly because we worked in team. [...] Consequently, there was place for mutual findings and feedback related to a frequent sharing of ideas. [...] there were also moments of individual work [...] and the other members in the team were able to accept the ideas expressed by each person.

Therefore there is much work to be done to make students aware of the importance of accepting to be at the center of the teaching/learning process, being able to take profit of that opportunity and reflecting on how to use that teaching methodology with their future pupils.

We believe that presenting them these studies and discussing with them their results and implications will help to solve the problem.

Abstract

Entrepreneurship education includes developing a mindset enabling and encouraging individuals to act in an entrepreneurial manner. According to the report presented to the European Commission by the unit of Entrepreneurship Education (2011), entrepreneurship education requires developing a culture, which is through, for and about entrepreneurship. In line with the findings and suggestions of the relevant research, we conducted a study with pre-service Physical Education teachers enrolled at Çukurova University, College of Physical Education and Sports. This paper provides a synthesis of the material gathered during the course of this particular study and an Erasmus Plus project funded by the European Commission.

Keywords: Entrepreneurship, teacher training, sports

Introduction

European Council recommends entrepreneurship as one of the eight key competences for lifelong learning. According to the European Framework of Key Competences for Lifelong Learning (2006), entrepreneurship includes creativity, innovation, showing initiative and risk-taking, as well as the ability to plan and manage projects in order to achieve objectives. Entrepreneurial culture can be developed through education. Education can contribute learners in acquiring a broad set of competencies, which bring them social and economic benefits in every aspect of their lives. There is ample amount of research done showing the essential role that education plays in the development of such mindsets, and in particular the central role that teachers play in this process. The Joint Research Centre for creativity in Schools (2010), for example, recommends teachers to be equipped with the right skills, knowledge and attitudes to be able to provide their students with the new curricula, pedagogies and learning environments that they will need if they are to acquire entrepreneurial competencies. Similarly, Roe Odegard (2006) highlights the importance of teachers by stating that teachers as being important role models play a vital role in promoting a positive attitude among young people in schools toward entrepreneurship. The researcher further adds that this reorientation requires that teachers have knowledge of entrepreneurship. Thus, offering specific training to teachers is crucial in order to make entrepreneurship education generally available and effective (European Commission, Entrepreneurship Education, 2011). However, research carried out by the European Commission shows that the core skills and values linked to entrepreneurship education are seldom a priority in initial teacher education programs. As a contribution to filling the gap in the field, and in line with the findings and suggestions of the relevant research, we conducted a study with pre-service Physical Education teachers enrolled at Cukurova University, College of Physical Education and Sports with the purpose of an improvement in their entrepreneurship skills. This paper describes our novel approach in which student teachers take a more active involvement in entrepreneurship education through opportunities we offered to raise their awareness about and to reinforce the development of entrepreneurial skills.

Method

Since entrepreneurship education is a transversal competence, it should be taught as a theme rather than as a separate subject at all stages and levels of education (ECOTEC, 2010). Following this line of reasoning, we integrated entrepreneurship education into our existing curriculum. To this end, we supported our program by systematically adding modules for entrepreneurship training. These modules were prepared by “Youthsport” EU project partnership under Erasmus Plus Program. “Youthsport” is a European project funded within the Erasmus+ Program by the Italian National Agency for Youth (Agenzia dall’Agenzia Nazionale Giovani). It operates through a partnership in 4 countries: Italy, UK, Romania and Turkey. The main aim of the project is the creation and implementation of an innovative and unique training program for the development of key competences to stimulate youth entrepreneurship in the sports environment. The curriculum prepared for this particular training program is structured in 12 modules of differing lengths (from 1 – 2.5 hours each). The evaluation of the training program implemented was conducted using feedback gathered at the end of the study through self-evaluation matrix, which was developed in accordance with the content of the modules used during the implementation period. Self-Assessment Scale for Entrepreneurship Skills describes in a comprehensive way what knowledge; skills and attitude individuals should have for developing a sense of initiative and entrepreneurship. These descriptors are aligned with the objectives of the “Youthsport” Project training curriculum. Further to the quantitative data collected through self-evaluation matrix, follow-up interviews with the participants were also made for gathering more extensive and reflective data. A total of 30 tertiary level students participated in the study. The students were senior level pre-service teacher candidates enrolled in the department of physical education of Çukurova University, College of Physical Education and Sports. They participated in the training on a voluntary basis. Their age ranges from 23 to 29. The data collected through the matrix was analyzed descriptively using the Statistical Program for Social Sciences (SPSS). The self-evaluation matrix includes six dimensions of social entrepreneurship in sports: management, social and emotional competence, communication skills, leadership and teamwork, social entrepreneurship and financial management and marketing. The scale defines four levels of competence (1 representing beginner level while 4 represents expert level) against which an individual can evaluate his/her conformance with each of the 55 descriptors defining entrepreneurship qualifications. Maximum score that can be achieved is 220 point (level 4 - expert). The lowest score is 55 (level 1 – beginner) followed by 110 for level 2 (intermediate) and 165 for level 3 (advanced). As for the qualitative data gathered through interviews, the transcriptions were read thoroughly and the key expressions reflecting the participants’ thoughts regarding the training program were noted.

Findings

The findings provided us insights on how the pre-service teachers perceive their competence in entrepreneurial skills. Overall, the participants were pleased with their entrepreneurship skills and perceived themselves as individuals with a good knowledge of entrepreneurship. The total mean score of the participants from the self- evaluation matrix was 168,3 and this represents level 3 (advanced) in the scale. However, a close look at the individual dimensions revealed that the participants did not perceive themselves as equally competent at all aspects of entrepreneurship. To put it in a more concrete way, the findings revealed that the participants, as their weakest areas, evaluated management skills (mean: 2,7) and financial management and marketing skills (mean: 2,8). On the other hand, they perceived themselves as more qualified in communication skills (mean: 3,4), leadership and teamwork (mean: 3,3) social entrepreneurship skills (mean: 3,2) and social and emotional competence (mean: 3,1). That is, the participants viewed themselves as competent/advanced in four of the six dimensions included in the matrix as components of entrepreneurship. Although the mean scores for management, finance and marketing are comparatively lower, they could be still considered as satisfactory since they are within the range from level 2 corresponding to intermediate to level 3 which means advance. The following figure shows the scores of the participants in individual items in management skills. As it can be followed from the chart, the participants’ evaluation of their management skill shows variations considering the individual items in this category. For example, while they think of themselves as intermediate (level 2) at the

first item which states, “I am equipped with the required skills and knowledge to manage enterprises”, they consider themselves as better when it comes to identifying the strengths and weaknesses within the process (shown as item 4 on the horizontal line). Similarly, the participants perceive themselves as advanced (level 3) in the last item in this category, which is about willingness to defend opinions that are believed to be true.

Figure 1. Management skills

As for the category relating to financial management and marketing, the participants’ scores show variations between 2, 8 and 3 as displayed in Figure 2. The participants evaluated themselves as less competent in conducting cost analysis (item 1), dealing with crisis economy (item 2), market research (item 8) and cost- benefit analysis (item 9). On the other hand, they thought that they could establish good customer relations (item 4) and survey for customer need analysis (item 6).

Figure 2. Financial management and marketing

The informal interviews with the participants yielded parallel results. The participants stated that although they benefited from the training in general, they still perceived themselves as in need of improvement in certain aspects of entrepreneurship skills. The most important contribution of the training was reported as an increase in their awareness regarding entrepreneurship skills. The participants also highlighted the importance of being innovative and taking initiative for being an entrepreneur. Last, the participants stated that although the program developed their self-confidence as young entrepreneurs, they would like to

continue their training for a more developed understanding of the concept and more hands-on experience under guidance.

Results, Conclusions and Recommendations

Acknowledging the critical role teachers play in the development of entrepreneurship education, European Commission, Directorate for Enterprise (2012) envisages a progression from the current position where entrepreneurship education has been highly dependent on the personal effort of individual teachers and their willingness to carry out activities as an extra-curricular activity to one where it is systematically available to every student in every school. The Directorate further reports that this in turn entails entrepreneurship education to be an intrinsic part of both initial and in-service teacher training. In parallel with the proposal made by the Directorate for Enterprise, in their final report, European Commission, Entrepreneurship Education (2011) also mentions a paradigm shift in delivering effective entrepreneurship education and argues that this new understanding requires teachers to be key agents of change. Therefore, according to Entrepreneurship Education (2011), from the beginning it is important that there is a scientific understanding of how teachers perceive entrepreneurship education; and the development of this understanding should inform the development of teacher training with the purpose of identifying core teacher competences within the related scope. However, as Entrepreneurship Education (2011) further argues, the role of teacher education in the development of entrepreneurship is lagging behind since it is not existent in most initial teacher education and continuing professional development. The result of the present study is significant as it shows the importance of establishing a framework of training with respect to entrepreneurship in teacher education programs. As current literature puts forward, since teachers are central to embedding entrepreneurship education more systematically in educational institutions, their attitudes, beliefs and perceptions are important factors to take into account in the entrepreneurship education implementation phase. Thus, by shedding light on pre-service teacher candidates' schema regarding perception of entrepreneurship skills, the study sets out some implications for teacher education. To sum up, as European Commission, Directorate of Enterprise (2012) points out teacher training is clearly a vital component in supporting teachers to deliver effective entrepreneurship education, and for this reason, entrepreneurship education needs to be incorporated into existing teacher training.

Abstract

Modern society is becoming an aging society. At present, this process is strongly dynamic, and demographic indicators indicate that this trend will intensify in the near future. It is a process that leads to huge transformations in many areas of life - politics, economy, culture, education, medical care, the media, and ultimately the future of all of us. Older people are often perceived by others as weak, insecure, alone, dissatisfied with life, abandoning participation in social life. These are the first symptoms leading to the marginalization and social exclusion of this category of persons. This may be due to a lack of knowledge about the functioning of the elderly, stereotypes or prejudices, as well as their image in the media. In the social sense, often mediated by the media old age and old man is the object of embarrassment, the sense of danger, which is reflected in senseless euphemisms. The aim of this article is to try to present the image of a senior and his social functioning in the media and social space.

Keywords: old age, senior, image, media, ageism

1. The social dimension of old age and aging

Old age is the last of the seven stages of human life. It causes quite often the fear of what is unknown and at the same time inevitable. This period, depending on the characteristics of the individual unit, may vary widely. The concept of old age is identified primarily with a decrease in the overall capacity of the organism, the loss of certain social roles, the deterioration of health, the reduction in the number and intensity of social ties. This is the result of biological, psychological and social changes. The age-old system of biological and psychological processes and changes in the social sphere, in particular the behavioral traits, is dynamic and simultaneously synergistic. Dynamism mainly concerns the time axis of events. Synergy is depicted in the parallel occurrence of aging processes of individuals, which in the short term can lead to complete exclusion of individuals from society (Szatur-Jaworska, Bledowski, Dzięgielewska, 2006: 45). Changes in biological level determine significant changes in functional status, occupational activity and participation in various spheres of social life. It is also an individualized process and runs differently in each unit, so it is again difficult to estimate the time when an individual becomes old. In the literature of the subject, the view prevails that this age is in the range of 60-65 years. This was not the case in Poland until the retirement age. However, there is a tendency to prolong this age. More and more societies are "aging", thus the proportion of elderly people in the social structure is systematically increasing (Błaszczuk, Rynkowska, 2016: 28).

Researchers dealing with aging and aging highlight that this process takes place in four aspects:

- biological - as a natural, irreversible and worsening changes in metabolism and physicochemical properties
- mental - Manifested by decreased psychophysical activity, leading to the non-proliferative nerve cells dying or succumbing to damage, loss of neurotransmitters and fibrinogenic degeneration leading to Alzheimer's disease,
- social - a third stage age is usually of age, the angle yellow rime PART hundred seq ę loss occurs autonomy need for care food ł manual carriers.
- spiritual - Characterized by greater sensitivity to the affairs of faith, catching up on the field of spiritual life, charity, and still-born questions after death? ((Pikuła 2011:15)

Many authors differently define the concept of old age, which means that the term has a multidimensional meaning. These definitions are the result of an earlier point of view. From a medical point of view, old age is a factor pointing to its biological character and a process that is irreversible within each species and every living

organism. . Psychology points to the degenerative changes in the sphere of human personality: withdrawal from social contacts leading to deepening loneliness. Old age is inscribed into every person's life, but as the process goes on, it is an individual matter. It consists of factors of a genetic, social, cultural, psychological nature and ecological. It is therefore very difficult to determine at what age or at what stage of life begins aging (Chabior 2000: 23-24). Currently, the criterion is metric, meaning arbitrarily determine the age at which the aging begins. Dominant positions, including the World Health Organization as the beginning of old age is 65 years old. It is a contractual age and can not be accepted by gerontologists as an objective indicator of old age. This is because individual nations and races are aging according to the pattern typical of a given area of residence. While the calendar age is facilitating demographic analysis and social policy planning, it does not mean that people over the age automatically go beyond the limits of old age and the biological effects associated with them. The end of this phase of life is death, which in the literature of the subject, especially the gerontological, gives the age of 110-120 years as the maximum length of human life (Brzezinska, Graczkowska 2012: 14). Due to the subject of this article, attention has been paid to the social aspect of aging. The aging of a person in society is defined as "the transformation of the needs and social roles, the way of life and the economic security of an aging person, and how the individual perceives the process of aging and how society relates to it." Between the individual experience of aging and the society in which a person functions " (Zych 2010: 168).

Modern civilization is a tribute to youth and high physical fitness. Today there is no mention of wisdom, of life experience, but features unfavorable qualities of old age such as infirmity, dependency, need for care. In Poland, the use of "old man" in public discussions turns out to be politically incorrect. The use of the adjective "old" to describe a man in an advanced age produces a living protests or even indignation. According to many The use of this term is a form of discrimination, exclusion and even some form of violence against the oldest generation in society. The situation of the elderly in society is evolving and even degrading. Old age appears as the dark side of life, infirm, difficult, afflicted, frustrated.

In the 1960s the term "ageism" came into being, which means discrimination against older people only because of their age. Old age arouses dislike, is identified with weight, and does not fit in the modern image of society. Based on the concept of ageism, several types of discrimination can be identified among older people: avoiding close contact with older people; Dissemination of beliefs about the negative characteristics of the elderly; To classify, according to the law of the elderly, a category of society without rights; Segregation, or isolation of the elderly from the social environment. (Pikla 2011: 45) Numerous manifestations of ageism are an expression of fear, fear of the consequences of natural aging and old age. Older people experience many difficulties and the consequences of their old age also in the social dimension. This is a time when there are many changes in positions, social roles, family, social and professional life.

We live in a time of worship youth and the young, healthy body. The consequence of this is the very serious phenomenon of gerontophobia, which is a panic fear of the old age of young people. It deepens the negative stereotype of old age, which is a harmful and untrue social image.

Aging and old age are phenomena that are associated with a number of stereotypes. Because of the protection of the dignity of an aging human being, it is important to shape the right image of old age on the basis of knowledge that shows the changes taking place during this period of life. This can contribute to weakening or even overthrowing the myths of old people, often very damaging to them, but also to reducing the fear of old age and their own aging. (Tobiasz-Adamczyk 2000: 78-80) The most common myth refers to mental health Older people say that these people are much more susceptible to stress and worse deal with it than young people. However, it has been found that people over the age of life have gained life skills very useful in the fight against stress. M. Seligman cites evidence that the number of stressful situations is decreasing over the years and older people are less likely to experience them. They are no longer experiencing the stresses of working and raising children, and older people are cautious, careful, and prone to risk. This is conducive to a regular schedule, a clear pattern of dishes, and more frequent contact with nature. Religious practices also have implications for finding peace in critical situations (Straš-Romanowska, Frąckowiak 2008: 32).

Ageism manifests itself in excessive exaggeration of external signs of old age: deformed silhouette, grayness, toothlessness, wrinkles, deterioration of sight and hearing, memory problems, difficulty in movement. Such ageist behavior is characteristic for both young and old people, but older people treat themselves as exceptions to

the rule. Older people now have the time to take care of themselves, go for walks, take a diet, go for rehabilitation treatments, which allows them to stay healthy and look good for a long time.

Often it is said that a retired man has a lot of free time, he can not manage it, and therefore evokes memories, lives myths. Every person living in his or her own environment, in society, adopts the patterns he or she professes. Every region of the world is getting old. This is due to upbringing and a different culture (Jakubowska 2009: 15-29). Story has positive and negative aspects. Positives include retirement. Pension is a free time that allows you to contact family, culture - television, cinema, theater, to participate in various forms of education, including. At the University of the Third Age. Retirement gives you the opportunity to become more involved in family life by organizing family gatherings, helping grandchildren to teach, and giving a sense of usefulness and satisfaction. It is also an opportunity to improve or rebuild ties between spouses who have been neglected due to lack of time. Now spouses - retirees can become re-retired, because they have time for themselves, to go out together, even for walks, they have time to share conversations and realize common passions. Families richer with life experience experience the second youth and enjoy each other. The negative effects of aging can also be attributed to retirement, which brings less income, which causes discomfort and the withdrawal of many pleasures for eg buying drugs. Older people have problems with their duties or moving. Stairs, lack of platforms for convenient entry, and even too fast change of traffic lights become a cumbersome obstacle and, at times, makes it impossible to get out of the house. Difficulties for older people make civilization and technical progress. The problem is the support of the cell, the computer, the ATM, and even the support of home appliances. Often, an older person encounters a lack of understanding even in the immediate family, who does not always notice the lack of fitness and helplessness of an older person. This causes a feeling of loneliness and regret to the ones nearest. They can not accept the fact that they are aging and that their silhouette changes, the body that more and more wrinkles appear on the face. Then they are less likely to leave home fearing the negative reaction of their friends. In this way stereotypes are passed down from generation to generation. Even TV commercials show the old man as a frail and afflicted person, and this gloomy picture juxtaposes with youth, health and fitness. The society receives an image of a nonproductive and demanding person. Even when older people live with their families, they rarely have good contact with their grandchildren who do not understand and sometimes even dismiss the old man without looking for any positive value. These two generations are alien to each other, and young people see an unattractive partner in an older person in terms of appearance and intellect (Baranowska, Kościńska, Wasilewska-Ostrowska 2013: 106-107).

Older people experience different consequences of old age not only in the social dimension. The position of older people often depends on the stereotype of a given socio-cultural environment. The cult of youth in modern societies causes that "it is not necessary to be old." The problem is complicated by the media, where there is still room for building a positive image of old age, for example by promoting a culture of active aging.

2. Image of old age and older people in the media

The media is an important factor shaping the cultural-social reality of human life. Their significance is growing with the ever faster, more intensive development of information technology. With functions such as information, education, entertainment, integration and opinion generation, the media (especially those with mass coverage) are not only an add-on facilitating the understanding of everyday life, but they also have the power to create the reality in which we function. The strongest influence is attributed to the press, the radio, the television and the Internet (Uzar 2011: 213). Specifically, the relationship between old age, the elderly and media, especially the rapidly developing digital media, is a specific image. Old-word displaced from social consciousness as a synonym for crisis, poor living condition, loneliness and negative emotions. The concept of "old age" as a sociological and cultural category disappeared from the mass media, the names of social projects and even scientific studies. The term "old" is replaced by terms such as older people, seniors, seniors, people aged 60 +, 70 +. Eliminating the notion of public language influences the social perception of the phenomenon itself, in this case old age. Old age, however named, is not today a subject of wide public debate and media debate. Old age is outside the mainstream of public interest, it causes fear and fear, is displaced from the social consciousness. Significant responsibility for the marginalization of old age in culture and social life is borne by the mass media and the Internet (Doktorowicz 2005).

Contemporary media is changing many areas of life, including, but not limited to, the way we spend our free time, which is largely devoted to the use of television, multimedia and the internet. Television is providing more

and more entertainment, the Internet allows participation in virtual communities, newsgroups and portals. social networks. Media civilization does not deny old age, but its mainstream is aimed at the generation born in the days of computer, internet and satellite television (Goban -Klas 2005).

However, research on older people clearly indicates that the development of leisure time by seniors is closely correlated with age and education level. In general, however, the area of interest of seniors is quite narrow. Rarely is the use of cinema, theater, hobbies, engaging in social or political activities. They most often watch television, listen to the radio, and increasingly use the Internet. Research shows that the overwhelming majority of seniors in Poland are engaged in leisure activities such as those that require little or no financial effort.

According to the CBOS survey in 2013, people aged 55-64 accounted for as much as 13% of all Poles using the Internet. Grandparents are less and less distant for children because, like the younger ones, they are becoming more and more involved in cultural and virtual life, blogs written by seniors, sharing on the Web, activity on Facebook - just a few examples. The intergenerational gap in some sense is getting smaller and smaller. The grandmother's grandfather's stilettos and grandfather on the rocking chair survived mainly in commercials. Seniors participate and are active recipients of modern media, but aggressive advertising and marketing are targeted at younger groups. Older people have more free time and television is considered as the primary source of information and entertainment. TV media offers series that set the daily rhythm of the lives of many seniors. For older and lonely heroes the series becomes members of their families. Television media, Internet portals are dominated by sensational, political, information about the lives of celebrities and people involved in the entertainment world. This problem is seldom related to the elderly. Media culture is primarily a world of serials, reality shows and shows. These messages dominate the active world, the participant, the buyer. Such attributes of contemporary media are not in the interest of senior citizens.

The lifestyle of people in late adulthood, mainly because of their pauperization, is not interesting for Polish media. The way in which a person experiences his or her old age may be due to individual personality conditions, but also to the way of life in the family, the cultivating of traditions. Active older people can be characterized by their preference for selected lifestyles.

Polish senior man is poor, sick, resigned and lonely, so it is often presented in the media. The products of the contemporary commercial world presented in television commercials are beyond his reach, primarily for financial reasons. Therefore, advertisers are less interested in senior subjects. Undoubtedly, the image of older people is influenced by advertising and advertising, both social and commercial. Advertising is an emotional message that encourages specific actions to trigger needs and desires. Advertising advertising not only brings new products to the market but also shapes consumption patterns, lifestyles and customs.

Old age does not meet the basic market requirements, because its economic situation does not allow for the development of consumption. They are not potential customers with high creditworthiness, young, healthy and with a happy and beautiful family. Advertising campaigns targeting seniors show mainly insurance products, pharmaceuticals (pharmaceuticals and vitamins) and financial institutions, primarily offering easy-to-access consumer loans or reverse mortgages (an offer based on the difficult financial condition of old people). Mass culture patterns deny old age from older people's awareness. The language of advertising is used. The standard of advertising for retirement funds is called the autumn of life, and the names of illnesses of old age do not even fall. Old age disabilities are unesthetic, shameful and in the media world would not be at all if the companies did not have to earn them. Seniors advertising painkillers, supplements, vitamins, look happy with life, rejuvenated, without problems and signs so old age. Actresses who advertise preparations for menopausal women are like 40 years old. The idea is that the aging process has been stopped as a result of these preparations. Older people also appear on the background of their families in food or cold food advertising, performing their stereotypical roles. However, presenting older people as unattractive and neglected as a contrast to consumer lifestyle is no longer socially acceptable. The evolving 60+ consumer market forces a different approach to the media image of senior citizens. In addition, the idealized image of television characters, especially women, who create the world without aging and wrinkles, is increasingly frustrating and socially frustrated.

Real characters of old people appear in documentaries, reportages, most often in the context of difficult problems and family conflicts. In Polish television media such characters appear in programs: Note, Reporter, Intervention. Nursing homes, illness, poverty, loneliness, soulless social workers, violence are the image of old

age in the lens of the Polish reporter. The television image, press photography, and photo shoots are increasingly influencing opinion formation and stereotyping. Image culture, short texts, simplified messages and passwords in some way restricts reflection on old age and old people.

In 2007, a report was published on the content of the Polish publications entitled "The image of the elderly in the media. 900 publications and 470 Polish web portals were analyzed. The results show that older people are presented as dependents, poorly positioned, often with mental problems. The most frequently discussed topics are retirement pensions and retirement pensions (Doktorowicz 2012: 151). Local and regional grocery publishers usually publish information on longevity and their jubilees. Much less is the problem of their health, well-being or activity. The image of older people in the media is also affected by the fact that the elderly are poorly organized, rarely appearing publicly and do not generate media topics. (Borowska) Few television shows on the issues of the elderly appear in the television broadcast. Dominant information about poor social services, neglect in hospitals, social welfare homes or the use of violence against the elderly are predominant. The information presented in this way is building new stereotypes about the incapacity, dependence and injustice of seniors. On the other hand, rapid technological changes and the development of the information society are, in effect, excluding from the market the current 70 and 80 year olds who are not quite up to the new media.

This is connected with the phenomenon of the digital divide, the digital divide occurring in modern societies, which are particularly vulnerable seniors (Porębski 2004 :: 91) is .Związane deficiencies in access to computers, software skills, cost of ownership, as well as physical barriers And psychic. Thus seniors are perceived as less educated, slower learners, unfamiliar with modern technical, contemporary digital reality and related concepts. Older people, especially after the age of 70, are afraid of new media. Often, the use of mobile phones or basic computer programs is beyond the physical capabilities of the elderly. Seniors are often hearing impaired and visually impaired. New generations of new media are becoming increasingly complex, especially when used in miniaturized devices. This does not encourage older users. In the case of using the internet by older people anxiety raises the lack of understanding of vocabulary, specific language, concepts and definitions. Internet culture is a world of short texts, acronyms and new phraseology that permeates everyday language. However, this is not the language of the elderly. Nonetheless, it is in the new media that prospects for seniors should be seen. The Internet, specialized news channels, as well as networking opportunities create a unique opportunity for active and efficient aging, breaking stereotypes about the old man and his image in the media reality.

Conclusion

As mentioned, the media is the important factor shaping the cultural-social reality of human life. Their significance is growing with the ever faster, more intensive development of information technology. The image of old age in modern society is influenced by many factors such as tradition, cultural values, social and civilizational changes, social policy and mass media. The latter play a special role in creating or rather depressing the image and problems of old age from social awareness. Old age and the elderly are not much interested in the world of entertainment, crowds, applause and flashes. The commercialization of modern media makes them primarily interested in consumers whose physical and economic condition allows full, active, hedonistic participation in social life. Old age and the elderly are simply non-medical.

However, the current demographic trends indicate that we will be an increasingly aging society, with all its determinants of changes in everyday life, in family, neighborhood, social and human relations. Replacing old age and aging is contradictory to demographic processes that tend to grow. It seems important to draw attention to media old age and seniors, where the idea of media coverage of old age should be an emphasis on the potential and wealth of this last stage of life - for the seniors themselves and the whole of society. This kind of solutions should become more intensive and frequent contact of media representatives with the environment, organizations in which seniors participate. There is a need for mutual openness - on the one hand interest, discovery of old age as an important media subject, and the desire to leave, show Opportunities of old age. While promoting and support the media sometimes referred „, the first power 'positive vision aging society, which becomes an aging society in Europe" (Lepa 2000).

Abstract

The study is concerned with the perception and experience of the phenomenon of friendship among Russian university students in the Czech Republic, considering its relation to the complex context of their life and adaptation to the mainstream Czech society. The research problem is approached from a combination of sociological, psychological, anthropological as well as cognitive-linguistic perspectives. The main research questions focus on the perception and experience of friendship among young representatives of the Russian minority in the Czech Republic and the meaning attributed to this phenomenon in the participants' lives with a special emphasis on the context of living and studying abroad. The study is based on an original qualitative research, conducted as an interpretative phenomenological analysis (IPA). The data were obtained via in-depth semi-structured interviews and analysed in accordance with the IPA methodology with respect to the whole context of the participants' lives.

Keywords: Russians, University students, Linguistic anthropology, Cognitive linguistics, Friendship, Identity, Multicultural Education.

Introduction

This study is a follow-up to a previous qualitative research focusing on the issue of the identity and its transformation among young Russians who study at one of the universities in the Czech Republic. From a long-term point of view, the Russian minority is one of the largest in the Czech Republic, therefore, the numbers of Russian students at all the levels of the Czech education system in comparison with other nations are among the highest (cf. Kleňhová, 2016). However, an ambivalent or negative perception of Russians can be found within the Czech society, potentially connected with the hostile attitudes of a part of the majority towards the Russian minority, as evidenced by various studies, among others by our first research. Apart from other negative characteristics, such as the remaining consequences of the Soviet-era relations between the countries or a fear of security breaches and increased crime rates, the Russian minority is also perceived as rather inaccessible and oriented primarily towards the community-based ties. On the other hand, our research confirmed that young Russians themselves perceive their contact with the representatives of the Czech society as problem-free or even pleasant although carried out predominantly within the limits of necessity. The research shows the importance of interpersonal relationships, namely the relationship known as “družba” in the Russian language, as a significant source of social security and psychological well-being, as well as some specific transformations of the perception of interpersonal relationships in the conditions of living abroad. The results suggest that the participants perceive finding friends among their Czech peers as difficult, if not impossible. The term “družba” refers to something exclusive, hardly definable, something that is – at the most abstract level – associated with the Russian origin as such. The common origin of Russians, their mentality and language ended up being some of the most commonly mentioned aspects of an existing stable friendships. Czechs were perceived largely positively, some participants even attributed certain good qualities to their peer-to-peer

contacts with them. However, it was declared by the Russians that it was not possible for them to create relationships with their Czech counterparts that would meet the criteria of “druzhba”, as understood by the participants (Cichá, Janečková, 2016).

The research problem is studied from the point of view of linguistic anthropology and cognitive linguistics; in particular, it works with the postulates of language relativity and the concept of friendship (“druzhba”) within the image of the world created by the Russian language. Cognitive linguistics is based on the conviction that each language provides a specific interpretation of the world shared across the language community. The language image of the world determines how the members of a specific language society (can) understand the world; it sets the boundaries to their common conceptualization. The differences between particular linguistic images of the world should be understood as testimonies of various cultural and social conditions and experience. On the other hand, there are certain universal components present in the image of the world that can be found across different languages (cf. Vaňková, 2005). Interpersonal relationships, their importance and differentiation are considered a significant feature of the Russian linguistic and cultural community. According to the Polish linguist Anna Wierzbicka, the Russian language possesses an unusually well-engineered categorization of interpersonal relations, not only in comparison with the Western European languages but also in comparison with other Slavic languages. “Druzhba” and, analogically, a person called “drug” are at the top of the hierarchy of categorizing interpersonal relationships as these words are expressions of utmost intensity and proximity of a relationship (Wierzbicka, 2001). The linguoculturological discourse views “druzhba” as a forming ethical concept with a clearly expressed normative. The key elements of the concept include the aspects of help, reciprocity and equality component (Konjaeva, n.d.). Therefore, the paper works with the assumption that there can be a relationship between a language and the image of the world created by it and the psychosocial dimension of its speaker’s life. The issue of friendship has been discussed in many works and viewed from different perspectives across the historical stages of the human kind. At this point, we can mention e. g. the definition by Joseph de Vito who defines friendship as an interpersonal relationship that is beneficial for both of the parties, is created and maintained on the basis of mutual freedom of decision and characterized by a mutual positive assessment (de Vito, 2001). The basic components of this relationship include strong positive emotions, mutual support and recognition, respect and trust (cf. de Vito, 2001; Plháková, 2007; Hewstone & Stroebe, 2006 etc.).

Therefore, the aim of the paper is to describe how young Russians who live and study in the Czech Republic experience friendship, to discover what kind of importance they attribute to this phenomenon in their lives and to identify the factors influencing these attitudes within the whole context of their life experience. Although the Russian-English equivalence of the terms in this sphere of human life is, for example according to above-mentioned Anna Wierzbicka (2001), quite problematic, in order to achieve a greater clarity in some passages of the text, we will use the English terms „friendship“ and „friend/s“.

Method

Keeping in regard that the nature of the topic requires an in-depth insight, we have come to choose the qualitative research methodology. When selecting the research design, the fact that the aim is to understand the experience of friendship among a specifically defined group of people led us to the conclusion that the phenomenological research would be appropriate. Phenomenology belongs to the part of the humanist tradition that emphasizes the common experience of all human beings and our ability to understand the feelings of others (Bernard, 1995). The fundamental purpose of phenomenology is to reduce individual experience with the studied phenomenon in order to describe the universal nature of it; the procedure should provide a deep understanding of the phenomenon (Creswell, 2013).

These postulates are at the base of the research approach called Interpretative Phenomenological Analysis (IPA). The main difference, compared to classical phenomenology, lies in the potential that IPA offers to the researcher. It provides a perspective oriented not only towards a description of things but also towards an interpretation of the meaning that the participants attach to their experience with the studied phenomenon. The experience is constructed as a result of the joint efforts of the researcher and the participant while preserving the clarity of both perspectives. In addition to phenomenology, IPA is also theoretically anchored in ideography and hermeneutics. The method is characterized by the work with the hermeneutic circle and the so-called double hermeneutics which means the process under which the participants try to understand their experience with a phenomenon and, at the same time, the researcher tries to understand the process of the creation of the participant's understanding (Koutná, Kostínková, Čermák, 2013). Considering the nature of the research, the research sample usually consists of a relatively small number of participants who, however, are well-representative of the studied phenomenon. The participants are selected purposefully, with regard to the particular perspective they can provide to the researcher (Smith, Flowers, Larkin, 2009).

At the very basic level, the sample in our research is made up of ethnic Russians living in the Czech Republic. Considering the methodological recommendations on maximizing the homogeneity of the group as well as the practical aspect of the existing contacts obtained during conducting the first research among Russian university students, the next step of defining the research sample was based on the criterion of the university student status and of at least a two years long stay in the Czech Republic. The length of the stay criterion was chosen to ensure that the sample would only include participants with a certain level of orientation in the Czech society and a certain degree of knowledge of the Czech language. The initial contact with all the participants was realized through the social networks. The contacts were obtained through our previously obtained connections. One of the five participants participated in the first research as well. From the gender perspective, the sample consisted of three females and two male. The participants were, according to themselves, motivated to engage in the research by trying to help another student (the researcher) but also by a positive perception of the Russia-related topic. Before the interviews, the participants were informed about the nature of the research and the probable form and duration of the interview. The participants were also asked to participate in the next stages of the research – in particular in reading and commenting on the interpretations and the final text. This step is very important with regard to the language in which the interviews were conducted. Since the first research which was held in the Czech language proved to be rather chaotic, it seemed appropriate to conduct the interviews in the second research study in the Russian language, allowing the participants to express their feelings and associations freely. The interviews were translated into the Czech language within the first phase of the analysis. The subsequent consultations with the participants, among other things, served as a means of verifying the accuracy of the translation and correct understanding of the meanings.

In contrast to the classical phenomenology, the most common data collection tool for the IPA is a semi-structured interview that gives the participants enough space for a free expression of their ideas but also allows the researcher to adjust the interview if necessary (Smith, Flowers, Larkin, 2009). The primary research question was set as follows: *How do young Russians perceive and experience friendship and what meanings do they attribute to this phenomenon in their life?* The secondary research questions were focused on comparing the acquired data with the interpretations available in the psychological, sociological and cognitive linguistics literature.

The data analysis was carried out in accordance with the instructions presented by Smith, Flowers and Larkin (2009). Each case was analysed separately. The zeroth phase, as recommended by the literature, was focused on the reflection of our own experience with the phenomenon, our motivations and beliefs. Then, after repeated reading of the translated interviews, conducted in order to gain an insider perspective, conceptual notes and comments were created and transformed. Based on comments and notes, main individual topics were identified. This process led to capturing the essential quality of the participant's experience. In the last phase, the context

and the way of their interconnection were sought among the identified topics. Once this process was applied to all the cases, all the research material was compared and analysed as a whole.

Through the deep insight into the inner world of the participants, the research was to present a comprehensive concept of the interpersonal relation sphere with a specific focus on the relationship denoted by the Russian expression “druzhba”. This paper presents five individual perspectives embedded in the participants’ lives’ context, it identifies the distinctive connectors between them as well as their probable causes. Although the research was conducted on a very small sample, combined with the data obtained in the first research, the primary value of the work is seen in the subjective views of a certain phenomenon which are understood as some of the most important concepts in the psychosocial life presented from a purely emic perspective.

Findings

In accordance with the results of the first research, the major significance of interpersonal relationships and especially the relationship called “druzhba” in the participants’ lives was confirmed. “Druzhba” is regarded as a very positive part of life; in three cases, it was perceived as an existential aspect. “Druzhba” was defined predominantly within an absolutist approach as a spiritual family, as a condition of existence itself or as probably the most important relationship of life. “Druzhba” serves as a means of meeting the need for a highly intense, intimate interpersonal contact that brings a sense of security. However, a strong practical dimension is an inherent part of this type of a relationship as well – “druzhba” is an essential aspect of achieving satisfaction in life. The key sense of “druzhba” can be expressed as a permanent satisfaction of the emotional needs. At the most basic level, “druzhba” serves to eliminate the burden of loneliness, primarily on a spiritual level. The essence of this feature lies in the feeling that there is someone who is prepared to provide support when problems emerge, whatever the problems might be (e.g. the “mere” feeling of loneliness), someone who is prepared to provide support even if they are thousands of miles away. Life security is understood by the participants as the knowledge that one is accepted without any conditions or limitations. The life support expected from a person called “drug” means the unlimited possibility to rely on this person. It should be noted that the material/practical side of this kind of an assistance is not considered the most important part of “druzhba”. Although the material aspect of a friend’s support is an essential part of the relationship, it is not enough to fulfil the definition of this relationship all by itself.

“Druzhba” is also characterized by a strong non-rational aspect. The irrational factor accompanies “druzhba” from the beginning, when it forms the conditions for its creation, and at the later stages of the relationship, it significantly affects its functioning. Specific factors of attraction were not mentioned either at all or only as subordinated to the factors such as situation, circumstances and environment which are perceived as hardly or partly influenced by an individual. A decisive influence on the development of “druzhba” at all of its stages is attributed to the configuration of particular life situation itself. Thus, it is possible to speak of a kind of a personified concept of the situation the character of which has a considerable power over the direction of the human life. The essence of a personal attraction is primarily abstract and spiritual. Generally, the aspects of the human nature that can only occur as a result of a sufficiently long and meaningful contact with one another are the most important ones. Regardless of how clearly the criteria of “drug” are defined, the most powerful attraction factor is a sort of a non-subordinate entity, “something”. This “something” is a permanent factor of attraction that can maintain the relationship despite a relatively strong crisis (caused consciously or unconsciously). The determining factor of time is one of the most specific. The amount of time spent together can be always found at the beginning of the chain of circumstances that lead to the perception of a person as “drug”. A direct proportion can be found between the intensity of the other components of “druzhba”, such as proximity, trust and understanding, and the amount of time spent together. In this context, time is also an essential condition for the development of a relationship affected by negative events. From the perspective of the participants, the concept of time seemed almost magical, as it can take away old wounds and acts as a healing

force that gives the chance to rebuild damaged or temporarily completely broken relationships. “Druzhba” is primarily represented by highly intense positive emotions. Certain negative emotions are understood as a natural part of the relationship, their perception, however, depends on the source of their origin, their strength and durability. The relationship is associated with the feelings of pleasure, friendly love, harmony and emotional comfort. The participants also associate “druzhba” with a source of warm and “sunny” feelings. On the other hand, complications and decline of the relationship are associated with the cold. The intensity and depth of the experienced positive feelings connect “druzhba” with a partner’s love. The difference between these two intense relationships can be found in the element of an intimate attraction which is absent in “druzhba”. Unlike love that can end with complete disappearance of a former partner from one’s life, the true “druzhba” is perceived as a permanent, life-long value.

Just like the participants have certain expectations about the behaviour of their friends, they require the same kind of behaviour from themselves. For them, “druzhba” represents a set of serious commitments of the highest priority. In the hierarchy of the friends’ duties to each other, support and help occupy some of the highest levels. One of the participants expressed the idea as follows: “drop everything and come as quickly as possible.” While staying in touch is generally considered significant, not all of the participants share the same opinion on the quantity and quality of it. This circumstance is especially important with regard to the importance of the relationships maintained with the friends in Russia. Although there are some limits to maintaining the relationship through the social networks, most of the participants do not perceive them as „fatal“, so the real “druzhba” can adapt to these conditions.

Of all the common topics discussed in the interviews, the gender composition of the relationships was the most controversial one. The research sample was divided into two groups: while three participants consider “druzhba” between men and women completely problem-free and fully-fledged, two (female) participants are convinced that in that types of a relationship, friendship is not or cannot possibly be the final state of things. Similar inconsistencies within the sample appeared when discussing the issue of the ideal / possible number of friends. While one of the participants assumes that there can be a manageable and enriching friendly relationship with fifteen people for her, other participants are more sceptical. Regardless of how many people they describe as friends, the participants have, according to their words, a large number of mates and other relationships in lower, less emotionally intense categories.

The perception of “druzhba” as presented by the participants corresponds to a large extent to the theoretical humanistic definition of the phenomenon of friendship. The findings correspond to the basic definition of friendship as a positive emotional relationship which represents an important life value, is characterized by intense emotions and greatly contributes to one’s psychological comfort. Particular emphasis was put on the element of support and assistance. The basic platform of “druzhba” as understood by the participants seems to be in accordance with the professional literature – it is an identified mutual understanding. The common attitudes were defined as a common worldview, the same way of thinking or the same moral views. An absolutely obvious part of “druzhba” for the participants are very personal themes and secrets. Sharing the intimate details of one’s life is nevertheless a component that brings the feeling of trust which is necessarily preceded by a stage of less binding contacts. An important role is also played by a similarity in the field of the friends’ intellectual orientation. There are various sources for the creation and transformation of the perception of “druzhba”: not only personal experience but also the circumstances of the personal development and cultural and media influences.

Results, Conclusion and Recommendations

The debates on the topic of “druzhba” have shown how rich the topic is and therefore, by its nature, cannot be endowed with a simple and unambiguous attitude with a predominant rational component. As the factors influencing the formation of the perception of “druzhba”, the participants identified some psychological specifics, the circumstances of their personality development as well as the impact of the surrounding environment, i.e. the factors considered as partly influenced by individuals, as well as culture-specific influences. The role of the Russian language in establishing close relationships but also in creating the ideas and expectations associated with the person identified as friend (“drug”) is evident. The research revealed a close link between the perception of friendship and the pillars of the participants’ identity derived from their Russian origin and the Russian language. Friendship, in terms of a relationship between Russian-speaking individuals, in many cases maintained across the Czech and Russian borders, is one of the most important sources of psychological stability when living and studying abroad.

Just like “druzhba”, the less “serious” types of relationships are characterized by having a positive dimension to them, however, they differ from “druzhba” by providing a lower degree of spiritual depth and durability. The relationships with the members of the Czech majority society fall into this category of positive but in comparison with the actual “druzhba” less important relationships as well. This fact needs to be seen in a wider context regarding the identity of the participants, as surveyed in our first research. The participants often suggested that there is a direct link between their identity and the Russian origin and language. These factors can be understood as an explanation of the participants’ perception of the relationships with the representatives of the majority society. The participants declared that they do not have particularly strong ties to the Czech environment, nor do they consider it necessary. The data verified one of the conclusions of the previous researches, namely the relative inaccessibility of the Russian community from the outside and the participants’ preference of maintaining relationships with their compatriots. The “compatriot category”, in most cases, included people from other post-Soviet states as well. The participants also confirmed the previously described model of Russian relations with the Czech majority society – the relationships are limited but perceived as problem-free. For the participants, the difference in the mentality was the main factor that does not allow the establishment of deeper and more permanent relationships and is responsible for the limited contact with the majority. Establishing relationships with Czechs was evaluated as difficult, in particular because the Czechs’ understanding of friendship is quite different to the Russian.

Although the partial attitudes and views of the participants correspond to the postulates of the linguistic and anthropological studies based on the ideas of linguistic relativism, an individual perspective based on unique experiences plays an equally important role in each life’s trajectory. At the same time, we can confirm the compliance of the findings with the general humanitarian definition of friendship. To sum up, the research results reveal a combination of identified culturally-linguistic influences, individual psychological factors and a kind of universal nature of the phenomenon of friendship. However, it is necessary to approach these conclusions as relative, contextually affected (e.g. factors as age, length of stay or specific living environment should be considered).

The paper strived to present the life beyond the borders of the native land and education in a language other than one’s mother tongue as a dynamic, context-dependent and multidimensional process in which the dimension of language competence itself is essentially inseparable from other dimensions, namely sociocultural and psychological. The work emphasizes the importance of a multidimensional relativistic approach as the only meaningful approach to the people from different cultural, language or educational environment.

Abstract

The study deals with evaluation of the importance of Czech schools in Croatia for the local expatriate community, specifically for preservation of the Czech national identity abroad. The aim of the study is to provide a description of educational reality in Czech schools in Croatia and consequently explore the potential of using gathered data in the process of improvement of the quality of education, both with regard to the needs of the Czech minority and the preservation of its national and cultural identity. The research seeks to discover whether there are any specific educational needs of children belonging to the Czech national minority in the context of cultural models of education in Croatia and Czech schools in Croatia and what is the role of the Czech language in the process of maintaining the Czech identity. The study is based on field study conducted in Croatia in 2016 via qualitative research methods (interviews with Czech teachers and other compatriots). The research results pointed out the significant role of bilingualism as an integral part of participants' identity. However, there is a strong tendency identified by Czech minority members to prefer the Croatian language in everyday communication at Czech schools. The representatives seek to create measures that would contribute to preservation of the Czech identity in Croatia in future generations. The anti-assimilation tendency applied in Czech minority education in Croatia is mainly of a language character. This condition results in emphasizing the need to formulate and implement a new objective - development of the Czech language competencies of the teaching staff.

Keywords: Czech minority, Croatia, Bilingualism, Minority education, Multicultural education

Introduction

The Czechs in Croatia constitute a significant national minority, the members of which identify themselves with the language and cultural legacy of their ancestors. Today, over 10.000 Czechs live in Croatia. On the other hand, about 25.000 people claimed their nationality was Czech in the 1970s (Vaculík, 2009: 62–66; Brouček, 2017). When trying to determine the factors that can help preserve the Czech national identity outside Czech borders, we must acknowledge the existence of Czech schools and the education in the Czech language as some of the most crucial ones.

Minority schools in Croatia started to emerge after World War I (Daněk, 1997; Janotová, 2009) and they went through a major development after 1945 (Matušek, 1993; Kolouch, 1993). This study focuses on the evaluation of their significance for the local compatriot community. The aim of this article is to describe the current state of minority education in Croatia and to analyse its strengths and weaknesses as we are convinced that those are reflected in the potential of the Czech minority either to resist the pressure to assimilate or to surrender to it. Presently though, many compatriots are concerned with the deteriorating influence of Czech schools in Croatia as far as preserving the Czech identity. Many critical observations were presented at the Symposium on the Czech Language in May 2016, organized by the Union of Czechs in Croatia. The discussions mainly revolved around the curricular reform in Croatia in which three models of minority education (A, B, C), differentiated by the degree of the use of minority languages, were created (Ministarstvo znanosti i obrazovanja, online; Český lidový kalendář 2016, 2015). In order to put the problem across clearly, we will now summarize the basic information on the models of education from the point of view of the Czech minority.

At the schools educating according to Model A, all the classes are taught in the minority (Czech) language (except for the Croatian language classes). The teachers' documents are translated into Czech although – for the purposes of the administration – a Croatian version of the documents must be available as well. Even the students' certificates are bilingual, using both the Croatian and the Czech languages. Only two Czech primary schools (Česká základní škola J. A. Komenského Daruvar and Česká základní škola Josefa Růžičky Končenice), six district schools (Daruvarský Brestov, Lipovec, Horní Daruvar, Dolany, Dolní Sřežany a Ivanovo Selo) and two kindergartens (Česká mateřská škola Ferdy Mravence Daruvar and Česká mateřská škola Končenice) provide an education in accordance with Model A.

Model B, also called bilingual, requires that the same numbers of lessons of the minority language and the Croatian language are taught, making it possible for the students to take up a Czech language exam as a part of their school-leaving exams. Most social science classes and humanities are taught in the minority language (history, geography, art, music classes). Unlike the curricula of regular Croatian schools, the curricula of minority schools contain Czech history and culture lessons and further information about the Czech minority in Croatia. Other subjects, such as mathematics, physics etc., are taught in the official (Croatian) language. Since 2016, this model of education has been used at Gymnázium Daruvar while. In the past, a separate department was dedicated to the minority students, whereas now, the Czech students are integrated in a regular class.

Finally, Model C has been the most common model in minority education in Croatia, the Czech schools being no exception. Within this model, the “minority language education” is reduced to a subject called Czech language and culture, implemented in 2–3 extra-curricular lessons per week. Trying to help the students to be able to participate in the activities of the compatriot clubs called besedas (a form of Czech compatriot organizations), the subject is not only focused on the language but also on Czech culture (traditions, music etc.). Since the majority of the Czech schools have adopted Model C, major differences in the Czech language proficiency have emerged among the senior students: “Many people will know that there are Czechs living in Croatia but it will be at the expense of the knowledge of the Czech language. It can be seen at the schools; the interest in Czech culture based on Model C prevails but not so much the interest in the Czech language based on Model A” (R20).

Nevertheless, the Czech language has constantly been considered the foundation stone of the national identity of the Czechs in Croatia which has helped the compatriots resist assimilation for over two centuries. Is it at all possible for a minority group living abroad to keep its national identity despite the worldwide process of globalization, or even cultivate its own culture? And many other questions come to mind: “What significance does it have to endeavour to preserve and protect the national culture and its values?” (Hajko, 2006: 50). “Why should we strive to slow down and stop ethnic and language assimilation?” (Šatava, 2009: 50–51). It is obvious that there are no simple answers to these questions, although in trying to find one, we might refer to the lived reality of the Czech minority in Croatia which has been continuously making this enormous effort. For some reason, it is worthwhile for them – but why?

Above all, it is necessary to realize that one's national identity is closely related to their emotional experience and, therefore, in many ways, it becomes a source of their personal happiness and social enrichment (Šatava, 2009: 30). Similarly, historian Miroslav Hroch argues that “the relationship to one's nation always includes certain emotional features. The inter-war anthropology defined a nation as a ‘community of emotional life’ in which the emotional connections to the nation are derived from the members' everyday habits, forms of thinking and common practice”. Emotions play a key, irreplaceable role in preserving the national identity. Nevertheless, it is obvious that it is not good enough. “It is extremely difficult to try to categorize or create a typology of national symbols and other cultural phenomena that can help to strengthen the national identity” (Hroch, 2009: 240). Therefore, we are unable to provide a universally truthful answer to the question of how to resist complete

assimilation. However, using the example of Croatian Czechs, we can analyse the area where all the factors that come into play when trying to preserve the compatriot national identity meet – the minority education.

Method

In 2016, we carried out a research study focusing on the broad topic of the past and the present of the Czech minority in Croatia, specifically in the region around the town of Daruvar. The anthropological field research presented in this paper was based on the qualitative approach. We used in-depth interviews with the members of the compatriot community as the main technique of acquiring our data. However, the interviews were not constructed as biographical narrations – they were defined by an opening question: „What does it mean to you to be a Czech in Croatia?” Subsequently, other open-ended questions were used which allowed to keep the interviews as informal as possible and enabled the respondents to answer the questions at their own discretion. Only a basic framework had been prepared beforehand, setting the topics of the interview, not specific questions. This unique kind of semi-structured interview, also known as “interview with a manual”, is “as a consequence of having the topics set beforehand more structured than a completely free-form narrative interview and it is typically used when the research goal is limited to specific topics only” (Kreisslová, 2013: 62).

The respondents for our research were acquired in three ways: 1) via their official role in the community (in the Union of Czechs in Croatia, Czech kindergartens and primary schools etc.); 2) via snowball sampling by acquiring further contacts from our respondents; 3) via randomly approaching the compatriots at compatriot events or in the public space.

Step by step, it was possible to record interviews with over thirty respondents who expressed their permission to be recorded. In order to analyse and interpret the interviews, they were anonymised and marked with the respective numbers R1–R25; a few of the interviewees were occasionally marked with a letter as well (e.g. R4a, R4b) since some of the interviews were carried out in a group. The acquired data was continuously confronted with the literature and resources available to us during the field work. The data was analysed using the open-coding method and categorization.

For the purpose of this particular article, only the findings related to the topic of minority education – which turned out to be an essential theme in the entire research – have been chosen to be presented. A complex analysis and interpretation of our data is available elsewhere (Barteček, Máčalová, Kočí, 2017). The aim of the presented study is to describe the reality of education at Czech schools in Croatia at a general level and the changes which have occurred over a long time span regarding the preservation of the Czech national and cultural identity abroad. We presume that the Czech language plays a major role as a means of providing education. The role of the Czech language is considered to be substantial in that process.

Findings

For most of us, Czechs, who were born and raised in Czechoslovakia or, subsequently, in the Czech Republic, the declaration of our ethnic or national affiliation is fairly straightforward, regardless of whether we have ever contemplated it or consciously thought about it. We are Czechs. And yet, there are Czechs (thousands of miles away as well as those in our midst) who experience their national awareness. They are Czechs not because it is part of the natural order of things but because they want to be Czechs – because the affiliation to being Czech and the declaration of their national or ethnic identity is part of their lives, just like marriage, parenthood or any other long-term status that requires responsibility.

Asking about the Czech national identity abroad, we got many different answers. There was not one, however, which would not – directly or indirectly – refer to the Czech language: “*I am Czech, my parents were Czech, we*

have always spoken Czech“ (R12). Being an immanent part of their identity, bilingualism plays an important role in the lives of Croatian Czechs: *“I feel like I’m both Czech and Croatian since both Czech and Croatian are my mother tongues”* (R7). In the past though, it was not an exception that the descendants of Czech colonists only learned Croatian when they started attending school or, alternatively, in the spontaneous contact with their environment: *“As a child, I didn’t speak Croatian at all, I only started learning it in the first grade”* (R5). The cause of that can be found in the predominant number of endogamous marriages due to which the Czech language kept being used as the compatriots’ mother tongue. However, Czech as a primary language has been disappearing, most likely due to the increased rate of mixed marriages: *“For me, the Czech language is my mother tongue and a value. Sadly, that’s just my opinion and it isn’t spread throughout the community very much”* (R18). Moreover, the phenomenon is reflected in the official census as well: *“The statistics show that only 70 percent of the compatriots who identify themselves as Czech consider Czech to be their mother tongue”* (R12). Therefore, the families are no longer able to help to develop their children’s language skills and the responsibility to do so is delegated to kindergartens and primary schools following Model A.

At the moment, Czech schools do not suffer from a lack of pupils – on the contrary, many parents who do not have Czech ancestors or those who generally do not identify themselves as Czechs show interest in Czech education: *“It has become a trend that Croatian children want to be enrolled in Czech kindergartens”* (R12). The trend originates in the good reputation of Czech schools on the national level and their good equipment: *“We’ve got children from Czech families and the families with at least some Czech roots, for example a Czech grandma, but we also have children who are not from Czech families. But the parents realise that for the same amount of money, the children will learn more. That’s one of the advantages – that they’ll learn one more language. Another advantage is that we are much better equipped because the Ministry of Education funds us as a minority kindergarten and the Czechoslovak Foreign Institute in Prague contributes as well”* (R5).

Apart from the quality of equipment and the actual education, the personal engagement of the Czech teachers who have to meet the specific requirements imposed on the minority schools represents another major strength of Czech schools compared to regular Croatian schools. The increased requirements include translating study materials into Czech and creating new ones but also more administrative work as well as many complications caused by the fact that some of the pupils do not speak Czech at all: *“When a child comes from a purely Croatian family, the teacher has to adapt to the situation as best as she can. When it happens that there are five children from Croatian families in the first grade, she might have to give instructions both in Czech and Croatian for the first few months. The children progressively move to the Czech language then”* (R7).

The teachers might strive to use Czech as the main means of communication in the classes but they are unable to prevent the increasing interaction of the students in the Croatian language during the breaks and after-school activities: *“We’re a Czech school but we’re in Croatia so our children talk to one another both in Czech and Croatian, we can’t prevent that. We can try to preserve Czech as long as we can. But the children might still switch to Croatian in the school’s corridors or at home. Somebody turns to someone, says a sentence in Czech and then speaks Croatian to somebody else. Those are the things that we can’t influence, for example, in the corridors during the breaks. There are different families. Even some families – in some of them, everybody speaks Czech and it really is the child’s mother tongue. And we also have pupils whose mom speaks Croatian, the dad speaks Czech, or we have children who have never been spoken to in Czech”* (R7).

That aspect precisely can be considered a weakness of the minority education which is quite new to the Czech minority: *“Our generation, as long as I can remember, we never talked in Croatian, we always talked in Czech”* (R17). In fact, it was not unusual that the people of other nationalities were influenced by the Czech language: *“Back then, 99 percent of the people in Končevice were Czech. Even the baker’s children, they came from Macedonia, attended the Czech school. (...) We would only speak Czech in Končevice. Even those who weren’t Czech would attend the Czech school. The baker’s daughter spoke Czech really well; she had no problems with*

Czech grammar” (R5). In the last few years, the influence of Croatian (so called croatisation) has become more intense. We can witness it both at school – „*Mainly Croatian can be heard during the breaks*” (R20) – and during after-school activities – “*Children finish dancing in Czech folk costumes and start talking in Croatian*” (R22).

The Czech education itself is sometimes criticised as well: “*Nobody was looking forward to the Czech language lessons at school; it didn’t get the children to become interested in participating in the activities of the community*” (R22). Similarly, some of the respondents were not satisfied with the class management at grammar school (called “gymnasium”): “*It was horrible at the grammar school, if I hadn’t liked the Czech language, I’d have never started studying it – because of that teacher of ours*” (R17). In the long run, we can observe some deterioration of the teachers’ language skills as well: “*I don’t know how things are now but when we were in the eighth grade, a teacher who didn’t speak English very well started teaching us; she only learned Czech at the faculty, we spoke Czech better than she did*” (R17). In the past, Czech intelligentsia came to Croatia and some of the compatriots completed their studies in the Czech lands so that they could work in favour of the Czech minority in Croatia. Now, those who leave to study in the Czech Republic stay in the land of their ancestors and are not motivated to return to Croatia: “*The teachers teaching at Czech schools are just the local pupils who graduated from universities in Croatia and returned to the Czech environment and are supposed to teach a subject that they studied in Croatian. I think it’s noticeable, especially at those schools*” (R18).

Being aware of these drawbacks, the representatives of the Czech minority strive to take actions that could help to preserve the Czech identity in Croatia in the next generations. A different opinion can be heard as well, though, mainly expressed by the parents and teachers, saying that “it is not necessary to encourage the children to speak Czech, we can only offer them to learn different languages and it is up to them which language they choose to communicate in” (Strániková, 2017). It is impossible to force the children to learn Czech since it would mean restricting their personal freedom: “*On the one hand, there are parents who keep trying to instil the Czech language and culture in their children from a very young age, on the other hand, there are also children from Croatian families that have no relation to the Czech culture, let alone the language. We have to give the children as much as they require, not force them into anything*” (R20). It was also mentioned by the respondents that it is necessary to “build” the relationship to the Czech language first: “*Many of the children come from mixed families so it’s only logical that they speak Croatian as well. So it’s necessary to make sure that they experience Czech at a Czech school, not just the grammar, but in regular communication, to build love for the Czech language so that they’ll pass it on to their children*” (R7).

Studying at Czech schools is associated with the necessity of putting a great amount of effort and time into it and not everyone is willing to undertake that. Some people also fear that the children attending Czechs schools might not be able to adapt to higher levels of education where schooling in Czech is no longer available: “*Our neighbours have a little girl, I don’t know why they talk to her in Croatian, perhaps they’re worried that if they spoke to her in Czech, she wouldn’t be able to learn Croatian – but we all have learned Croatian*” (R17). The schools try to minimize this “handicap” by implementing some lessons in Croatian in the eighth, final year of study: “*In the eighth grade, we do it half-bilingually. It’s because of the transition of the students to secondary schools. Not all of our students will go up to the Czech department of grammar school. They’ll go up to technical schools or schools of economy where they’ll have lessons in in Croatian. So to make the transition easier for the children, we do in a bilingual way*” (R7).

On the other hand, the knowledge of another language is an undisputable benefit, regarded as highly valuable by the majority of Croatian Czechs: “*I tell the parents not to be afraid to send their children to a Czech school, that it makes them more self-sufficient as they have to learn everything by themselves*” (R5). Another respondent agrees with that: “*And it is important that the children learn the language, that the parents know why the language is so important for them. Especially these days*” (R12). Young Croatians and their parents often realise

that Czech can be a ticket to a better future for the children since the economic potential of a state located by the sea (such as Croatia) is highly dependent on tourism and Czechs constitute one of the biggest groups of tourists in Croatia. Every summer, Croatia is visited by about 800.000 Czech tourists.

Results, Conclusions and Recommendations

The language is considered to be a symbol of the Czech existence in Croatia by the majority of the compatriots. That is one of the reasons they put such an emphasis on it. It is no coincidence that the song called *Ta naše písnička česká (That Czech Song of Ours)*, which is played at all the compatriot events, is very dear to them or even perceived as the Czech compatriot anthem. If Czech songs and Czech language stopped sounding in the area of Daruvar, would the Czech identity that has resisted assimilation for more than two centuries be truly gone? “In order to keep a language a functional means of communication in a minority group, it is necessary that the members of the community use it every day, in different situations; however, the private, interpersonal communication between the members of the community is the most important thing. That is why it is important for the young people to get used to talking in Czech because if they don’t get used to talking in Czech to the people around, will they feel the need to pass the language on to their children one day? Or is it that the language will no longer be one of the main features of their ethnic identity and they will identify themselves as Czechs based on other values?” (Stráníková, 2017).

It has progressively become more and more common that the Czech language is put aside and the representatives of the minority develop their identity based on other factors. Tradition, folklore, endogamy or the social life in the *besedas* might become the main aspects of the self-identification of the compatriots in Croatia, just like it is for those in America. The changes of the ethnic and cultural identity of Czech immigrants in the United States of America have been described by Alena Jaklová (2014). About 1.3 million people claimed to be of Czech origin in the census of 1990 (1.6 million claimed to be of Czechoslovak origin) which is the highest number of Czech compatriots living abroad in one country. Czechs have lived in the USA for about 160 years which is about one or two generations less than in Croatia. It should be noted that the Czech minority in the USA has always been very diverse since the migration took place at different times and for different reasons. Most of American Czechs identify themselves with Czech culture, they are interested in their ancestors and traditions but they do not speak Czech. We can assume that for them, the Czech language has been gradually losing its “communicative function and its only function left is the ethnically-symbolic one” (Jaklová, 2014: 92). Jaklová (2014: 97) argues that the ethnic and cultural identity of the compatriots has changed significantly over the years: “The Czechs once engaged in the national activities have become devoted Americans.” Today, the Czechs in the USA consider their Czech identity merely one of the possible forms of collective identity, standing next to other forms of identity that are not based on ethnicity (e.g. state-related identity, town-related identity, social identity etc.).

We must also consider that Czech compatriot communities do not create a separate world but that they are part of a multinational space. The Czech language spoken by Croatian Czechs is not as perfect as they wish it to be, on the other hand, the fact that some Croatian features have been actively incorporated into the Czech language leads us to believe that the language is alive, that it is actually used in everyday communication. The language is not reserved for a certain group of people or to be used exclusively at official compatriot events, it is not a cultural artefact (unlike the original folk costumes that the compatriot dancing groups wear). Not even standard Czech stays untouched by the development since it adopts vocabulary from different languages, mainly from English; the dialects are even more influenced by other languages, especially by Slovak, Polish or German, depending on the historical development or the proximity of the regions. The influence of the Croatian language is completely logical and natural.

Furthermore, when it comes to the Daruvar region, we can – without any exaggeration – say that the region is also being “bohemised”: If the local Croatians do not actively speak Czech, they at least understand it. Croatians

attend Czech kindergartens and schools, they participate in the activities of Czech *besedas* and are engaged in Czech social events. The same thing can be said about other significant national groups that live in the region of Daruvar and are influenced by Croatian Czechs as well, not even necessarily due to the Czech-Serbian or Czech-Bosnian mixed marriages. In a way, the coexistence of the Czech minority in Croatia is a typical example of inclusion of immigrants in a receiving country (to put it in the words of contemporary migration studies). The Czech presence in Croatia is an example of conflict-free inclusion that has not resulted in full assimilation or an ethnicity-based collision (even though there have surely been opportunities for that to happen).

In conclusion, it seems appropriate to ask the following question: Does the Czech minority education in Croatia play a major role in trying to fight the tendencies towards assimilation, mainly concerning the language aspect of identity? We believe that the process of assimilation could be slowed down by a consistent development of the teachers' language proficiency; however, it cannot be stopped completely. National identity, as a process of conscious self-identification, is certainly not a simple matter. The concept of identity cannot be reduced to an idea of a national identity tied to a state in which a person was born. Therefore, it is not possible to come to a similar conclusion concerning the language that a bearer of a national identity prefers.

The study was created within the project "Pedagogical anthropology in contemporary school conditions" supported by the Grant Fund of the Dean of the Faculty of Education of the Palacký University in Olomouc.

Abstract

The study aims to explore the value orientation among the representatives of Czech educational system – teachers and students – and their attitudes towards cultural minorities in order to get an overview about the perception of heterogeneity in contemporary Czech society, specifically focused on the status and perspectives of multicultural education. The data was gathered by the researchers' own questionnaire combining closed-ended, half-open and open format questions, sometimes giving respondents the possibility to substantiate their other answers. The acquired data were primarily processed through the statistical methods of the SPSS program, however, during the open-ended questions analysis, we also used some qualitative methods such as open coding and categorization. Teachers and students are influenced by their mutual interaction, which is why we came to the conclusion that effective multicultural education is important for both groups. Unfortunately, accepting the ideas of multiculturalism that are very distant to the Czech society and particularly the acceptance through the pedagogical process is going to be a long-term process.

Keywords: Diversity, Culture, Multicultural education, Values, Attitudes

Introduction

The contemporary society is living in an age of globalization, and along with that, it is also an age of plurality of ethical and political values. We ought to accept the reality of a world inhabited by people with different experiences, creating various stories about the world, living their lives in different ways and holding different political views and religious beliefs. When viewed from the position of postmodernism, it means that we do not live in a single world, but that we de facto inhabit a number of different worlds and we use varied, personal vocabularies to describe them. Globalization does not only bring new opportunities in its wake, but it also brings difficulties in the understanding of intercultural communication. A sound education which is capable of leading to the support for tolerance in a multicultural coexistence and general tolerance towards diversity, and also capable of implying a development of cross-cultural communication, should therefore be an implicit part of education in contemporary societies.

We are aware that the school environment is not the only factor influencing the values and attitudes of the younger generation, but that the family (socio-economic) environment and the media also have a significant influence. However, schools are a reflection of the society to which they belong (Sleeter, Grant, 2009), just as many research probes focused on the issue of the media construction of the reality have revealed, that the mass media interfere significantly in the transformation of our society. We returned here to the themes that we have discussed previously (Preissova Krejčí, 2014; 2013), and through our experience in managing the ESF OP VK project “Anti-prejudice workshops” we focused on the practical application of the ideas of multiculturalism in the educational process. Subsequently, we dealt with the same topic within the SGS 2014–2015 project, under which we carried out a research in 2014–2015 which sought to uncover the value orientation of adolescents, with a focus on the multicultural aspects of their education.

Method

Between September 2014 and June 2015, we conducted a broad research among the elementary and secondary school students and teachers in Olomouc, Zlín and Moravskoslezský district. The research focused on their values and attitudes towards the members of various ethnic and cultural minorities. To gather our data, we devised our own questionnaire, by combining different closed-ended, half-open and open format questions, sometimes giving our respondents the possibility to substantiate their own answers. The acquired data were primarily processed through the statistical methods of the SPSS program, however, in order to analyse the open-ended questions and substantiations, we also used some qualitative methods such as open coding and categorization (Skutil, 2011). The categories, that constitute the basis of our categorization, were not created a priori, but emerged from a deep analysis of the open answers, that represent the superstructure of every quantitative research; where the “hard” data face their limits, open answers provide a new, different kind of information that is highly valuable for the researcher as well (Disman, 2008: 163; Švaříček, Šedřová, 2014).

Our research sample consisted of 228 teachers from 26 elementary and secondary schools and 915 students from 15 elementary and secondary schools. Our respondents were between 24 and 68 years of age, therefore 45 was a median value and the most frequent age was 37. Also, most of the teachers (85.0 %) were women. The average age of „our” students (as well as median and modus) was 14 years and the gender layout was very even with a slight superiority of women (51.1 %) to men (48.5 %). This also corresponds with the gender layout of the Czech population and therefore confirms the representativeness of our research sample (ČSÚ, online).

Some of the questions in both types of the questionnaires matched in some points as we wanted to be able to compare them. The questionnaire starts with a few identification questions, followed by the content questions which we can differentiate as 1) those that were designed to determine the respondents’ attitudes towards foreigners or specific ethnic and cultural groups and 2) those designed to determine the attitude of other people towards foreigners or specific ethnic and cultural groups as they were mediated by our respondents. Firstly, we focus our attention on which general values our students and teachers consider the most important and less important. Thereafter, we will analyse their attitudes towards specific ethnic or religious groups.

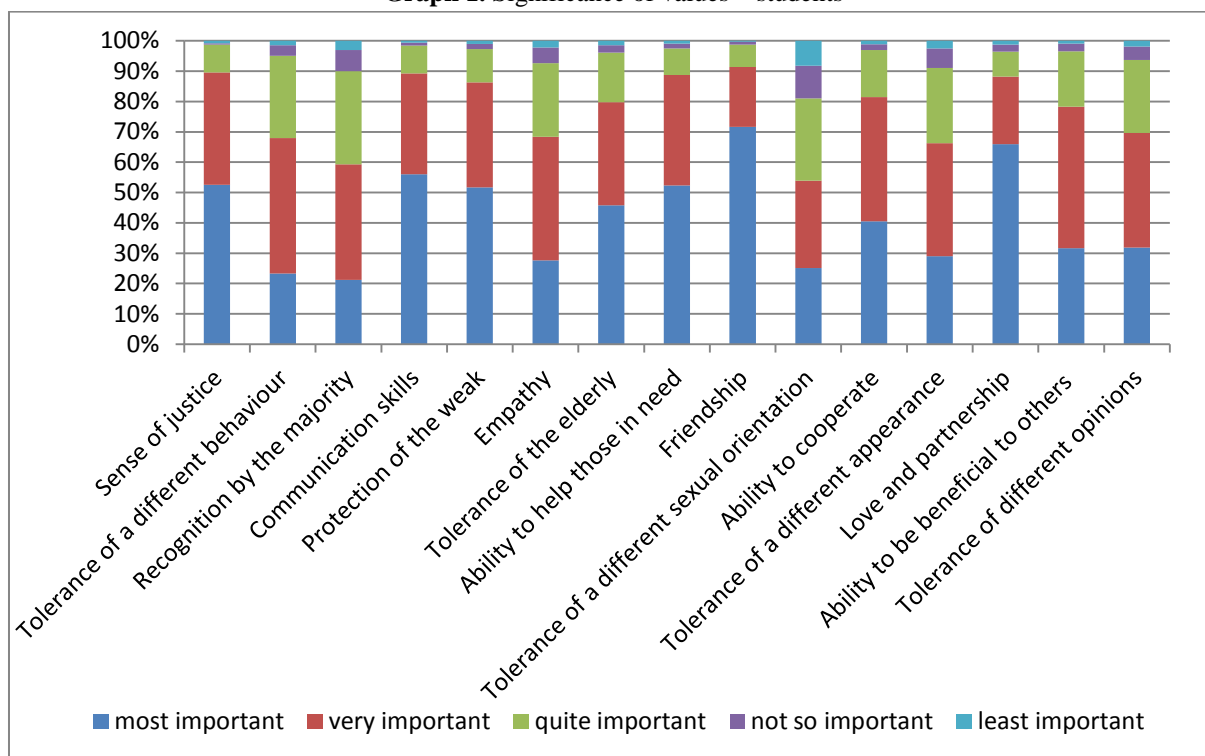

Findings

Values of students and teachers in the context of otherness

By using one of our closed-ended scale questions, we tried to discover the significance of the values, which we chose for this questionnaire. Our intention was to confront the results of the value orientation of our respondents with the answers we got from the questions dealing with otherness.

Graph 1. Significance of values – students

The most significant value evaluated by the students was Friendship, which was marked as the most important in 71.6 % of the cases of the answers and as very important in another 19.8 %. Love and partnership were also considered very significant and chosen as the most important in 66.6 % and very important in 22.2 % of the cases. Among the other significant values, Communication skills, Sense of justice and the Ability to help those in need were chosen. On the other side of the scale, Tolerance of a different sexual orientation was considered not so important in 10.8 % of the answers and the least important in 8.2 % of them. Some of the other values were assessed very differently by different respondents, especially the value of Tolerance of a different appearance.

Graph 2. The significance of values – teachers

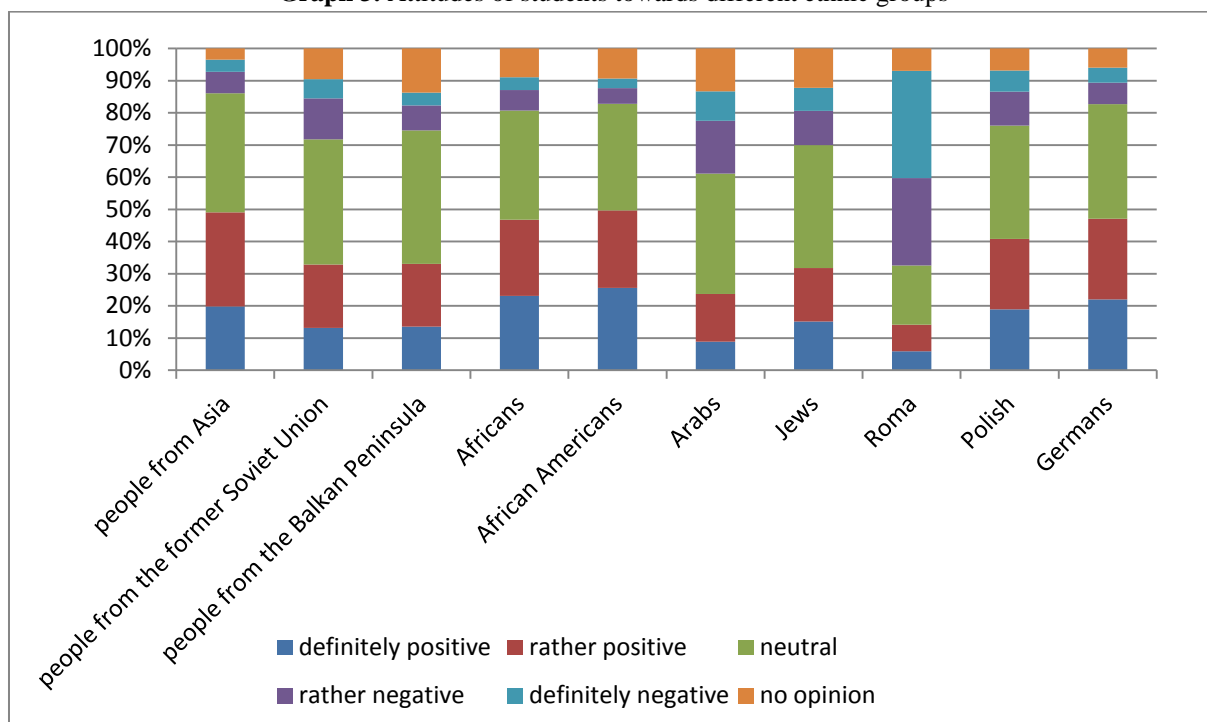

The values, that the teachers regarded as the most relevant are Love and partnership (63.0 %), Sense of justice (60.8 %) and Friendship (55.5 %). Some other values were also considered important, e.g.: Communication skills (the answers “most important” and “very important” combined represented 95.2 % of all the answers), the Ability to help those in need (92.9 %), Tolerance of the elderly (91.1 %), Protection of the weak (89.8 %) etc. As the less relevant and the least significant values, the teachers viewed Recognition by the majority (17.9 %), Tolerance of a different sexual orientation (8.9 %) and Tolerance of a different appearance (8.0 %).

Attitudes towards the representatives of otherness

To find out what attitudes towards different ethnic and cultural groups are adopted by our respondents, we used a closed-ended question with the possibility of a verbal justification of the answer. We divided the question into ten parts according to the specific groups we had chosen: the people from Asia, people from the former Soviet Union, people from the Balkan Peninsula, Africans, African Americans, Arabs, Muslims, Jews, the Roma, the Polish and Germans.

Graph 3. Attitudes of students towards different ethnic groups

Graph 4. Attitudes of teachers towards different ethnic groups

It is very clear that in the case of the students, neutral and positive attitudes are more common than the negative attitudes with only one exception, the Roma minority; the number of the positive answers, however, was the lowest when evaluating the Arabs.

The teachers also assessed their own attitudes to the majority of these groups as mostly neutral but the positive attitudes predominated over the negative ones; again, with the exception of the Roma minority. The most common explanations of the neutral attitudes expressed a lack of the respondent's knowledge of the groups and their members, which made it impossible for them to form an attitude other than neutral.

Our respondents evaluate their attitudes towards other ethnicities and cultures in a very similar way. The students chose the neutral attitude in 46.2 %, mostly positive in 17.1 % and in 13.3 % they answered that they had no opinion. The teachers assessed their attitude as neutral in 60.0 %, positive in 29.3 % and negative in 8.8 % of all of the cases. We have previously mentioned that the closed-ended part of the question was strengthened by the respondents' justifications. These, we later subjected to a qualitative analysis (open coding and categorization). Among students, we identified 619 answers and divided them into 11 codes. When it came to the teachers, we received 105 answers which were distributed into 12 codes. The most apparent feature in these answers is the emphasis on the reluctance of members of different ethnic groups to assimilate, behave according to the principles recognized as desirable in the Czech Republic ("It depends on their behaviour, on their willingness to assimilate"). This kind of sentiment constitutes 22.1 % of the students' answers and 34.3 % of the teachers' ones. More than 10.0 % of them emphasised that their attitude depends on what religious or ethnic group a person is a member of. The same approach was registered in less than 3.0 % of the answers in the teachers' questionnaires. The respondents usually reflected on their own experience even though it was absent from the answer (21.9 % of teachers and 8.1 % of students). In less than 10.0 % of answers the respondents talk about equality without any distinction among all people (9.5 % of teachers and 8.1 % of students). About 5.0 % of answers of our students mentioned fear of an increase in the numbers of the members of ethnic minorities in the Czech Republic, combined with the sense of patriotism or even nationalism. Among the teachers, this approach was identified only in one case.

The Roma minority – bearers of negative stigmata

The Roma minority represented the only exception from the neutral and positive attitude of our respondents towards different ethnicities and cultures; in their case the attitude was mostly rather negative and definitely negative (60.5 % from students and 46.0 % from teachers).

We were looking for the roots of these negative attitudes by using an open-ended question that was asking our respondents what the first thing that comes to their mind when someone says "the Roma minority" is. The results show that more than 70.0 % of these associations of our teachers and more than 56.4 % of those of students have negative connotations since only 23.7 % teachers' and 10.8 % students' answers were neutral or without any emotional character. Ambivalent answers were combining positive and negative tone and appeared in 4.0 % in the case of the teachers and in 5.2 % in the case of the students. Strictly positive answers appeared in 1.5 % of the answers of our teachers and 3.0 % of answers of our students. The main topics the answers focused on are connected with the respondents activities and behaviour (e.g.: abusing social benefits, criminal activities, murders, vandalism), ascribed traits and characteristics (e.g.: they refuse to work) and ascribed identity (e.g.: gypsies – orig. cikáni) or emotions (e.g.: fear, suspiciousness).

These answers did not expose the real roots of the respondents' attitudes, but reveal that with the label Roma are automatically, mostly unconsciously predominantly connected with negative qualities, characteristics or events, and thus this designation carries a significant negative stigma through which the individuals who are ranked in this ethnic group are regarded and complicates their successful integration into society. Our students mentioned the abuse of the social benefits and the excess of money they have thanks to that.

Results, Conclusions and Recommendations

In the case of both the teachers and the students, the most appreciated and important values are those related to the personal relationships among individuals. The same cannot be said about the values related to the tolerance of otherness, individual uniqueness of each and every person and our mutual differences in sexual orientation, appearance etc.

Jan Průcha mentions “ethnic consciousness of the youth” and divides students of the middle school age into groups of antiracist, racist and xenophobic also known as undefined group (Průcha, 2011: 49–50). However these categories are not consistent with our own results. For example, the xenophobic group is, according to Průcha, characterized as follows: “When different races behave well, they can move around freely” (Průcha, 2011: 50). But our respondents hardly ever mentioned races and when we asked them about their attitudes toward different ethnicities they usually answered in this manner: “They can be both decent and indecent”. Or even: “It does not matter, if they are foreigners when they are friendly; sometimes they even behave better than people who were born here”. These statements are neither antiracist nor xenophobic, they are neutral, as neutral as shortage of information or lack of interest and Průcha did not accept that as a possible way of thinking. It is time to think how to encourage the interest in otherness among the students and how to show them that respect and tolerance for otherness are one of the most important values for mutual coexistence of different ethnic and religious groups.

The students’ image about the Roma people who are living in the excluded localities is very foggy and is related to the spatial separation of these localities (Preissová Krejčí, 2013: 17). This chasm in conceptions about the life of the Roma minority is therefore getting more and more obvious. Social exclusion is a part of social inequality and stands opposite of the social and economic privileges. Johnson (2001: 54) mentions, that “historically one of the ways that white men have justified their domination over black men has been to portray them as sexual predators who pose threat to white women.” The Roma people are pictured as criminals and vandals and therefore as a threat for the whole of Czech society. This image is often used as justification for any excessive behaviour towards the Roma nation from the superior social or economic position. This image therefore created the image of unchangeable “Roma essence”, firmly definable by physical appearance (Jakoubek, 2004: 69). Any person belonging to the Roma minority is then a bearer of the typical Roma identity and therefore also of specific character traits. This one specific image is shared by most of our respondents, teachers and students alike.

Fundamental inadequacy of this image of the Roma people is the fact that in Czech Republic it is called “the Roma problem”. Allan G. Johnson (2001: 10) warns, that “the “problem” of race cannot be only a problem of being black, Chinese Sioux or Mexican. It has to be more than that, because there is no way to separate the “problem” of being, say, black (or in our case being Roma) from the “problem” of not being white. And there is no way to separate the problem of not being white from being white.” This is therefore a mutual affair that should be resolved inside its own context and by the whole of society, without excluding the privileged.

The attitudes of our respondents towards the ideas of multicultural coexistence are generally ambivalent, rather non-radical. However, both the teachers and the students share negative attitudes towards the Roma, who are considered the main problem of multicultural education. In the Czech Republic, the Roma are the group of “the different” that the teachers and the students are most frequently confronted with, personally or through the media. Therefore, the findings of our research confirm that, based on the concept of our American colleagues, even in the Czech Republic, “schools are a reflection of the society to which they belong” (Sleeter, Grant, 2009: 19). It is clear that the attitudes of the teachers and students are influenced by their mutual interaction, which is why we came to the conclusion that multicultural education is important as for the students as it is for their teachers.

The study was created within the project “Pedagogical anthropology in contemporary school conditions” supported by the Grant Fund of the Dean of the Faculty of Education of the Palacký University in Olomouc.

The role of social capital and cultural capital in the process of lifelong learning

Hubert KOTARSKI¹

¹*Dr, Assistant professors, PhD, University of Rzeszow (Poland)*

Email: kotarski@ur.edu.pl

Abstract

This paper presents the results of sociological quantitative research conducted in south-eastern Poland on a sample of 2,500 respondents. The purpose of this article is to confront the theory of cultural capital and social capital social reality in cross-border regions of the south-eastern part of Poland, with particular emphasis on the role played by the process of lifelong education. This confrontation will include both theoretical reflection on the nature, focusing on the problem of the application of the theory of cultural capital and social capital to describe societies of the south-eastern part of Poland. The specific objective of the paper is to analyze the concept of cultural capital and social capital as a factor of computers skills and language skills inhabitants of Poland. The present paper is an attempt to reflect on the role of social capital and cultural capital in the process of formation and functioning of the knowledge society. In the theoretical paper will be appealed to the role of social capital and cultural capital in contemporary society. The paper will be to establish the classic manuscripts of: Pierre Bourdieu, Robert Putnam, James Coleman or Francis Fukuyama, raising the problem of social capital and cultural capital. The concepts of social capital and cultural capital are today one of the most frequently raised concepts in the social sciences dealing with the changes taking place in the modern world. Social capital is a frequently discussed in the literature and examined empirically, factors affecting the formation, operation and development of the knowledge society.

Keywords: Social capital, Cultural capital, Computer skills, Language skills, Knowledge society.

Introduction

Emphasizing the role of immaterial types of capital as factors of development has become very common in the social sciences over the last twenty years. Apart from the concept of human capital and cultural capital, the concept of social capital is another attempt to theoretically complement the economic model in order to explain various phenomena both in the field of economy and in other areas of social life, including problems of regional development. The interest of sociologists in this issue is primarily related to the search for factors that enable and facilitate solution of problems of social groups, local communities and entire societies. In this connection it is assumed that social relationships and networks of interpersonal relationships can be seen as a resource thanks to which certain benefits can be achieved. Despite numerous studies on this subject, contrary to many other social science terms, there is no strict definition of social capital. The concept of social capital is defined in many different ways and in consequence it is not unambiguous. The list of elements that make up social capital is quite long, and the most important ones usually include diverse interpersonal connections, confidence, willingness to reach consent, set of common values and behaviors, as well as social networks conditioning joint activities. Social capital involves everything that determines collective activities for the common benefit in every field: economy, culture or politics. The theory of cultural capital is first of all based on Pierre Bourdieu's considerations.

The term "cultural capital" has been introduced as a key issue into the theory of social science. At the general theoretical level, this concept is used in the theory of reproduction of social structure published by Pierre Bourdieu. This theory was later developed by this sociologist in collaboration with Jean-Claude Passeron (Bartoszek, 2003, p. 22). Bourdieu and Passeron define cultural capital as "cultural goods provided by various family pedagogical activities whose value, as cultural capital, is the function of the distance between the cultural arbitrariness imposed by the dominant pedagogical activities, and cultural arbitrariness implemented by family pedagogical activities in different groups or classes (Bourdieu, Passeron, Neyman, & Kłoskowska, 1990, p. 60). According to Bourdieu, cultural capital is a system acquired by individuals, consisting of hierarchical and

approved cultural contents, defining legally valid values, knowledge, aspirations, lifestyles; which are prerequisites for achievements while competing with others (Bartoszek, 2003, p. 22).

Method

The results of the study presented in this paper include the research material collected within the framework of the project "The model of local community activation and IT tools through MASiT_COD co-design". As a part of the research, we managed to obtain very interesting and di-verse data. For their acquisition, the PAPI (Pen And Paper Interviews) method was used, and the research was carried out between November 2015 and July 2016 in five districts of South-Eastern Poland - Podkarpackie Voivodship. In total, 2,131 PAPI interviews were carried out.

Social capital and human capital - theoretical context of research

Social and cultural capital has become one of the most widely used concepts in social sciences in recent years. Theories dealing with these two types of capital proved to be particularly useful in attempt to explain the changes taking place within the social structure of post-communist societies. These changes can be seen at the level of change of attitudes and behaviors in the lives of representatives of different social classes. You can also try to grasp their consequences at the level of general mechanisms and directions of social mobility in the vertical sphere, i.e. between layers and classes, or horizontal mobility, between different segments of social structure (Bartoszek 2003, p. 7). The particular usefulness of Pierre Bourdieu's cultural capital theory, as well as the very concept of cultural capital in analyzing the changes taking place in the societies of Central and Eastern Europe after 1989, was emphasized by Ivan Szelényi. He wrote that the unprecedented increase in the value of cultural capital is evident when we look at the composition of political class that has come to power in recent years. In post-communist societies, the power is fully con-trolled by intellectuals and professionals. Presidents, prime ministers, ministers, parliamentarians, mayors and almost all leading persons both in the ruling and opposition parties are intellectuals or specialists. In capitalist countries, specialists play an important role in politics, but they are usually lawyers or economists. Humanistic intelligentsia rarely gets to the top of the political ladder. In post-communist societies, however, occupation of key positions in the structures of power by humanistic intellectuals is a rule rather than an exception. Leading post-communist politicians are playwrights, historians, sociologists, anthropologists and philosophers (Szelényi et al. 1995, p. 17).

In the literature, it is generally emphasized that social capital facilitates cooperation within groups and international corporations and extends the capacity of collective activities in order to achieve mutual benefits. In addition, it strengthens the collective learning process and is a key element in creation, diffusion and transformation of knowledge; those processes are of crucial importance for innovation and competitiveness. Finally, social capital cements the values that pro-mote networks as impulses to create regional clusters and regional innovation and policy strategies. This issue is especially important for underdeveloped regions with weaker social capital and weaker dissemination of science and knowledge. Under such conditions, those regions must meet the fundamental challenges of technological and social change (Kukliński, 2003, 9-10). The location factors are no longer the proximity of natural resources, the supply of labor or a large local market but the availability of adequate resources of cultural and social capital. In the social sciences in recent years, the concept of social capital is one of the most widely used theories. As Alejandro Portes points out, in recent years, the notion of social capital has become the starting point for formulating one of the most popular sociological theories that has been transferred into everyday language (Portes, 1998, p. 2). Despite numerous studies on this subject, contrary to many other social science terms, there is no strict definition of social capital. The concept of social capital is defined in many different ways and in consequence it is not unambiguous. The list of elements that make up social capital is quite long, and the most important ones usually include: diverse interpersonal connections, confidence, willingness to reach consent, set of common values and behaviors, as well as social net-

works conditioning common activities. Social capital involves everything that determines collective activities for the common benefit in every field: economy, culture or politics. (Kotarski, 2013, p. 17-18).

In scientific literature, the notion of cultural capital is primarily used in reference to Pierre Bourdieu's theory of social structure reproduction that was developed in collaboration with Jean-Claude Passeron. At this point, it is worth mentioning that the tenet of Bourdieu's concept was based on the use of the notion of capital to describe the whole of the social world. Bourdieu found that relationships and social inequalities can be described by a system of capitals in which, apart from the classical economic capital, analogous notions of social capital and cultural capital are used. (Zarycki 2009). The French sociologist defined the capital as "collected in work (in the materialized form or in its »objectified« shape, embodied in something), which, when it is privately appropriated, i.e. on an exclusive basis, by a person or a group of people, it allows them to usurp the social energy in form of objectified or live work" (Bourdieu 1986, s. 241). Bourdieu's theory de-scribes the reproduction of distances and structural differences by the educational system. This is achieved by means of symbolic violence mechanisms and social selection of individuals, conditioned by discrepancy between the inherited capital of their native habitus and the cultural habitus of dominant classes. In this theory, "cultural capital" is understood as provided to individuals system of hierarchical and approved cultural contents that defines legitimate values, knowledge, aspirations and lifestyles, which are the means of achieving success in competition with other persons. (Bartoszek 2003, p. 22). In his reflections on cultural capital, Bourdieu stated that the capital can exist in three forms: in the embodied state, i.e., in the form of long-lasting dispositions of the mind and body; in the objectified state, in the form of cultural goods (pictures, books, dictionaries, instruments, machines, etc.), which are the trace or realization of theories or critiques of these theories, problematics, etc.; and in the institutionalized state (Bourdieu 1986, p. 243). As the essential component of such concept of cultural capital, Bourdieu recognizes the linguistic capital, i.e. the ability to use complex logical and conceptual structures developed in the course of education and shaped to a large extent by the language spoken in the family as the primary group. According to P. Bourdieu and J.-C. Passeron, the cultural capital of an individual is most strongly influenced by father's education and occupation and it impacts the level of their school performance. (Bourdieu et al. 1990, p. 130–131). The cultural capital of students coming from higher social classes gives them a clear advantage over students coming from lower classes in the transition of social selection, from the earliest levels of education on, it favors them in getting admission to better university faculties and achieving better results. (Bourdieu et al. 1990, p. 152–153). In conclusion, it can be stated that the concept of so defined cultural capital makes it possible to deepen the perceptions of the role of the social status of parents in achieving higher positions by their children (Bartoszek 2003).

Findings

Nowadays, information has become one of the most desirable goods. Limitations in access to sources of electronic information or lack of skills in using them, is considered to be a modern form of illiteracy. In the era of development of electronic types of communication and flexible types of employment, the place of residence loses its importance. Thanks mainly to the wide-spread access to the Internet and its increasing capacity, peripheral location has ceased to be regarded as a barrier of development. We are dealing with the increasingly widespread phenomenon of working at home and communicating with business partners using modern types of electronic communications. Therefore, access to information is such an important aspect of social capital building. If the residents are well informed, the information channel between them and the representatives of authorities, social organizations, will not be disturbed and the process of social capital building will be unobstructed. The level of social trust will increase, the residents will broaden their knowledge of social organizations and their activities. Access to information will make it easier for residents to be involved in joint initiatives and their level of interest in the local community affairs will increase. The importance of getting access to information resources in the process of social capital building was highlighted by James Coleman, who

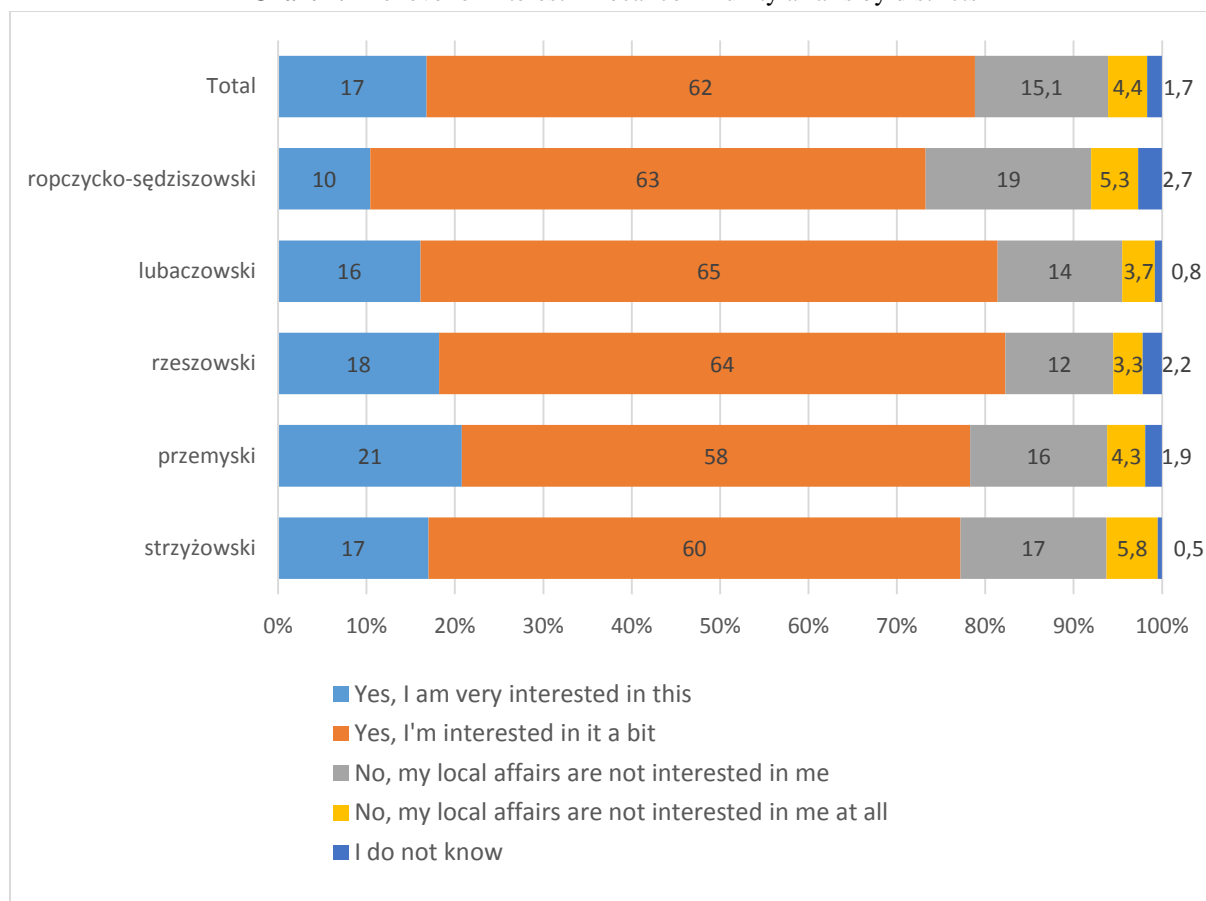

states that information is a part of an action, and in this connection the ability to access information, as a component of social relationships, is an important form of social capital. (Coleman, 1988, p. 104-108)

The research has shown that the vast majority of inhabitants of five districts of Podkarpackie Province is interested in what is happening in their local community. The level of that interest was varied. More than sixteen percent of respondents said that they were very much interested in affairs concerning their place of residence (16.8%). Nearly two thirds defined the level of their interest as medium, stating that they are a bit interested in those affairs (62.1%). Every fifth respondent is to a limited degree or not at all interested in what is happening in their village or town (15.1% are rather uninterested in affairs concerning their place of residence, 4.4% are not interested in them at all).

The level of interest in local community affairs was different due to the place of residence, i.e. the district in which the respondents lived. The highest level of interest was observed in Przemyśl and Rzeszow districts. In these two districts the highest response rate "I am very much interested in affairs concerning my place of residence" was recorded. The lowest level of interest was noted in the district of Ropczyce-Sędziszów..

Chart 1. The level of interest in local community affairs by districts

The level of interest in local community affairs also translates into conversations with other residents about issues regarding their common locality (Table 1). More than half of respondents who often talk to others about issues regarding their place of residence showed a high interest in what was happening in their locality (55.2%). Seventy percent of respondents, who never talked to anyone about what was happening in their area, were practically not interested in local affairs at all (70.6%). The Pearson's chi-squared test showed that there is a

statistically significant relationship between the level of interest in local community affairs and conversations with other inhabitants about their common place of residence.

For the surveyed residents of five districts, the value of Pearson's contingency coefficient was 0.612. This is a very high strength of the relationship.

Table 1. Does the respondent talk with other people about town affairs? The level of interest in what is happening in the local community (cross-table).

Do you talk with other persons about your town's affairs?	Tell me, please, if you are generally interested or not interested in what is happening in your place of residence?			
	Yes, I am very much interested in it.	Yes, I am interested in it, but just a bit	No, I am not interested in my town's affairs	No, I am not interested in my town's affairs at all
Yes, very often	55,2	7,6	2,3	2,4
Yes, from time to time	35,8	61,4	16,2	5,9
Yes, but very seldom	6,2	26,7	48,7	21,2
No, I never talk about it	2,8	4,3	32,8	70,6
Total	100,0	100,0	100,0	100,0

An important element of communication between residents and local authorities is the transparency of activities taken up by authorities and the awareness of the people's ability to control the authorities. The respondents were asked the following question: "Do you think that in your place of residence, people like you have the ability to control the activities of municipal authorities or are they deprived of that opportunity?" The analysis has shown that in opinion of residents, their ability to control the activities of authorities was rather low. More than one third believed that their ability was medium (38.0%). Not many less respondents thought that their ability was low or none (33.2%). Every fourth respondent pointed out that their ability to control the authorities was high or very high.

Table 1. Residents' ability to control activities of local authorities.

Residents' ability of to control activities of local authorities	%
Their abilities are very high	3,9
Their abilities are high	22,3
Their abilities are medium	38,0
Their abilities are low	19,6
They have no such abilities	13,6
I do not know, it is difficult to tell	2,7

As mentioned above, limited access to electronic sources of information or no skills in using them are currently regarded as a modern form of illiteracy. Therefore, in the course of the research it was analyzed if the respondents used electronic information sources in form of a computer, a tablet, or using the Internet and what they used a computer or a tablet for.

More than three quarters of respondents use a computer or a tablet as a tool for work, playing games or communication. The level of variation in the use of modern types of communication in form of a computer or a tablet was different due to the respondents' place of residence, i.e. the district. The highest level of using these tools was observed in respondents from the districts of Strzyżów and Ropczyce-Sędziszów. Slightly lower values were obtained in Lubaczów and Rzeszów districts, and the lowest ones in the district of Przemyśl. A similar trend can be observed with regard to using the Internet. Seven out of ten respondents use this type of communication. As in the case of using a computer or a tablet, the level of Internet usage variability was different due to the respondents' place of residence, i.e. the district. The highest level of using this type of communication was observed in the respondents from the district of Strzyżów and Ropczyce-Sędziszów. Slightly lower values were obtained in the districts of Lubaczów and Rzeszów, and the lowest ones in the district of Przemyśl.

Table 3. Using a computer / tablet by districts.

	Use	Do not use
strzyżowski	78,0	22,0
przemyski	64,1	35,9
rzeszowski	69,7	30,3
lubaczowski	68,7	31,3
ropczycko-sędziszowski	73,8	26,2
Total	70,7	29,3

Table 4. Using the Internet by districts.

	Use	Do not use
strzyżowski	77,2	22,8
przemyski	63,9	36,1
rzeszowski	70,8	29,2
lubaczowski	68,0	32,0
ropczycko-sędziszowski	75,0	25,0
Total	70,9	29,1

In the research, the ways of computer use in daily life were examined. More than half of respondents (51.9%) check and send emails, forty-five percent of respondents use Facebook (45.6%) and browse the Internet websites for entertainment purposes (45.3%). Nearly forty percent of respondents use computer in order to collect materials for study or work (39.4%); a slightly lower percentage of respondents uses the online banking (38.7%), acquires information from the websites of public institutions (38.2%), or buys products and services online in Poland (38.1%). The lowest percentage of respondents buys products and services over the Internet from abroad (10.9%), participates in Internet courses or trainings (14.0%) and takes part in Internet chat sessions (15.8%).

Table 5. Ways to use a computer.

Ways to use a computer	Yes	No
Checking and sending emails	51,9	48,1
Using the Facebook	45,6	54,4
Browsing Internet websites for entertainment purposes	45,3	54,7
Collecting materials for study or work	39,4	60,6
Using online banking	38,7	61,3
Acquisition of information from websites of public institutions	38,2	61,8
Buying products and services online in Poland	38,1	61,9
Listening to music or radio through the Internet	36,1	63,9
Phoning via the Internet (Voip, Skype)	33,0	67,0
Using communicators which make it possible to communicate with friends (communicators etc.)	28,3	71,7
Reading newspapers or books online	27,9	72,1
Downloading or completing official forms	25,7	74,3
Using other social portals	25,4	74,6

Downloading free software	17,0	83,0
Participation in chats	15,8	84,2
Participation in courses or trainings through the Internet	14,0	86,0
Buying products and services online from abroad	10,9	89,1

An important element of human life in an open globalized society and at the same time openness to the "outside world" and people living there is the knowledge of foreign languages. The most popular foreign language is English. However, only sixteen percent of respondents are able to communicate freely in this language, while a fifth of them (19.7%) are able to communicate. More than half of respondents (52.1%) do not speak English at all. In the case of other languages, the level of their knowledge is even lower.

Table 6. The level of foreign language skills.

Level of foreign language skills	Quite well, I can communicate freely	Poor, but I can communicate efficiently	Very poor, I would have problems with communication	I do not know the language at all
English	16,0	19,7	12,2	52,1
German	5,7	16,6	18,0	59,7
French	0,4	2,7	4,1	92,8
Spanish	0,4	1,0	1,4	97,1
Italian	1,7	2,5	2,7	93,2

Results, Conclusions and Recommendations

Summarizing the presented results of the research, it can be stated that social capital and cultural capital are the basic elements of building the model of a society which is open to knowledge and capable of lifelong learning. The analyzed types of capital can provide the basis for stimulation of endogenous resources of local communities. Social capital is a "lubricant" and at the same time a "binder" of grassroots activities and a fundamental element of social development. Cultural capital is a resource for investing, stimulating and encouraging the development of an individual.

Based on the conducted detailed analysis, it is possible to formulate some more general conclusions. Pearson's chi-squared test showed that there is a statistically significant relationship between the level of interest in local community affairs and conversations with other inhabitants of common place of residence. For the surveyed residents of five districts, the value of the Pearson's contingency coefficient was 0.612. This is a very high strength of the relationship.

More than three quarters of respondents use a computer or a tablet as a tool for work, playing games or communication. The level of variation in the use of modern types of communication by means of a computer or a tablet was different due to the respondents' place of residence, i.e. the district. A similar trend can be observed when using the Internet. Seven out of ten respondents use this type of communication. As in the case of using a computer or a tablet, the level of Internet usage variability was different due to the respondents' place of residence, i.e. the district. In the research, the ways of computer use in daily life was examined. More than half of respondents (51.9%) check and send emails, forty-five percent of respondents use Facebook (45.6%) and browse the websites for entertainment purposes (45.3%). Nearly forty percent of respondents use computer in order to collect materials for study or work (39.4%); a slightly lower percentage uses the online banking (38.7%), acquires information from public institutions websites (38.2%), or buys products and services online in Poland (38.1%). The lowest percentage of respondents buys products and services over the Internet from abroad (10.9%), participates in Internet courses or trainings (14.0%) and takes part in online chat sessions (15.8%).

The surveyed residents feature a very low level of foreign languages skills. English is the most popular foreign language. However, only sixteen percent of respondents are able to communicate freely in this language. Every fifth respondent (19.7%) is able to communicate. More than half of the respondents (52.1%) do not speak English at all. In the case of other languages, the level of their knowledge is even lower. It should be emphasized

that the factor that differentiated foreign language skills was the age of respondents. English, French, Spanish or Italian is mainly the domain of young people. The older the age group, the better the knowledge of Russian language.

Abstract

The aim of this study is to analyse the effects of multi-learning environments on student attitudes in social studies courses. The study also deals with the student views about social studies courses which are delivered through multi-learning environments. The study has both qualitative and quantitative research questions to achieve these goals. The quantitative research question of the study is as follows: “Do pre- and post-test scores of the experimental and control group students significantly vary?”. The qualitative research question is as follows: “what are the views of the students about the social studies courses which are delivered through multi-learning environments?”. The study was designed as a sequential explanatory research, which is part of mixed research methods. In the sequential explanatory design the first part is qualitative implementation. Then the qualitative part is constructed based on the findings obtained from the quantitative data. The participants of the study were the fifth-grade students attending two sections of a public secondary school in Afyon. Their pre-test scores did not significantly vary. The quantitative data obtained were analysed using percentage, frequency, the Mann Whitney U test and the Wilcoxon signed-rank test. The findings showed that there was no statistically significant differences between pre-test attitude scores of experimental students and those of control students. The pre-test attitude scores of both groups were found to be “high”. The post-scores of the participants showed that social studies courses which were delivered through multi-learning environments positively influenced students’ attitudes towards social studies courses. This effect was found to be statistically insignificant. The qualitative findings showed that more than the half of the participants reported that social studies courses which were delivered through multi-learning environments positively affected their interest in the courses. It was also found that the participants liked social studies courses which were delivered through multi-learning environments and that the most interesting part of the courses for them was the use of animations.

Keywords: Multi-Learning Environments, Student attitudes, Social studies

Introduction

Advances in knowledge accumulation have caused many changes in different fields. One of such fields is education in that formal education became an indispensable part of societies. Formal education is delivered in a special setting using pre-established educational program (Fidan, 2012). On the other hand, formal education has both advantages and disadvantages. One of such disadvantages is that artificial settings needed for delivering formal education (i.e., school, courses) present information about events and situations in an isolated way which may make it difficult to construct knowledge in a desired manner.

Given that some real world events are difficult or impossible to repeat in classrooms students may not clearly understand the related facts and concepts. For instance, in classrooms it is not possible to observe the natural occurrence of mountains or valleys. Therefore, such events that cannot be observed in classrooms are explained verbally by teachers to students. Such an effort may cause incomplete learning of the facts or misconceptions by students. The study by Demirkaya & Karacan (2016) showed that giving only definitions of the concepts involved in the social studies textbook is not enough to have a good understanding of these concepts by the students. In order to avoid such undesired teaching approaches both in concept teaching and skill and attitude teaching there should be various learning and teaching materials that appeal to more than one senses of students.

It is well-known that materials are essential elements of learning environment and they stimulate the senses of students and therefore, make them active participants of learning environments. One of such materials are multimedia materials. In a study which analysed the recall levels among students about the previous learning it is concluded that students recall 10% of what they read, 20% of what they heard, 30% of what they say, 50% of what they both saw and heard, 70% of what they said and 90% of what they both did and said (Yalın, 2015). Therefore, it is safe to argue that a learning and teaching process which is based on multimedia approach can increase the recall levels of students. Daşdemir & Doymuş (2013) analysed the effects of animations, which are seen as part of multimedia materials, on recall levels and concluded that the experiment group which taught the course through animations retained learning for much longer period in contrast to the control group.

Akkoyunlu & Yılmaz (2005) defined multimedia based education approach as the use of a combination of materials which contain both audio and visual elements and stimulate individuals' senses such as movies and animations. Multimedia based learning environments are much more joyful for students. In addition such environments have positive effects on student achievement. For instance, Arkün (2007) found that 92% of the students participated in the study considered multimedia materials as contributing to make the learning environment much more joyful. In the study by Yılmaz (2012) it was concluded that those students who were taught through multimedia materials were much more successful than control subjects. In Yünkül & Oğuz-Er (2014)'s study found that multimedia educational software has positive effects on student interest. The other studies concerning the effects of multimedia materials found that such materials increase students' achievement (Altınışık, 2001; Bülbül, 2009; Sezgin, 2009; Taşçı & Soran, 2008; Yeşiltaş, 2010) and positive student attitudes towards the courses (Yeşiltaş, 2010; Yünkül & Oğuz-Er, 2014)

It is well-known that learning environment should be designed to have effective learning and active student participation. One of the ways to achieve it is to employ a multimedia based approach. This study deals with the effects of multimedia based teaching in social studies course on the student attitudes towards the course.

Aim

The aim of the study is to analyse the effects of multimedia based teaching in social studies course on the student attitudes towards the course. It also attempts to reveal the views of students regarding the effects of multimedia based teaching in social studies course on the student attitudes towards the course.

Problem statement

In parallel to this aim the study attempts to answer the following research question: What are the effects of multimedia based teaching in social studies course on the student attitudes towards the course?

Sub research questions

Based on the major research problem given above the study has also the following sub research questions:

- ✓ Is there a statistically significant difference between experiment and control groups in terms of their pre-test attitude scores?
- ✓ Is there a statistically significant difference between experiment and control groups in terms of their post-test attitude scores?
- ✓ Is there a statistically significant difference between experiment and control groups in terms of their pre- and post-test attitude scores?
- ✓ What are the views of the participants about the multimedia-based teaching approach in social studies course?

Method

Study design

This study is designed as an eclectic study. This approach was adopted in the study due to the fact it makes it possible to better understand the topic of the study (Creswell & Garrett, 2008: 322) and it has many advantages in contrast to using a single method (Johnson & Onwuegbuzie, 2004). Eclectic method has many sub-categories. In the study explanatory sequential category of the eclectic method was used. This design is mostly used to describe and interpret those results which are interesting and extraordinary (Morse, 1991) or are very significant (Plano Clark & Creswell, 2008). This design is consisted of several steps. In the first step quantitative data are collected and analysed. Next qualitative data are gathered and analysed. Then the quantitative data collected are discussed based on the qualitative data. Therefore the quantitative data are reviewed using the qualitative data to account for significant, extraordinary or interesting results (Creswell & Plano Clark, 2014).

In the quantitative part of the study the study was designed as “pre-post-test matched control-experiment groups” which is part of semi-experimental desings to observe the effects of multimedia approach on student attitudes (Büyükoztürk, Çakmak, Akgün, Karadeniz & Demirel, 2013). In the qualitative part of the study structured interview forms are employed to determine the views of the participants about multimedia approach.

Participants

The participants of the study were the fifth grade students attending two different braches at Hoca Ahmet Yesevi Secondary School in Afyon Karahisar during the fall semester of the school year 2016-2017. Those participated in the quantificational part of the study were identified through the conventional sampling technique. This sampling technique makes it possible to sample those who are available and easy to access (Aziz, 2013). The participants voluntarily took part in the study. To determine the participants who would take part in the qualitative part of the study the maximum sampling technique was employed (Yıldırım & Şimşek, 2013).

The number of the students in the experiment and control groups was equal, each 48. However, due to several reasons such as absenteeism or class changes pre-test was administered to 46 students in 5/A and to 42 students in 5/E.

Table 1. Gender based distribution of the participants

Gender	Groups	class 5/A		class 5/E	
		f	%	f	%
Female		17	40	21	50
Male		29	60	21	50
Total		46	100	42	100

As can be seen in table 1 in 5-A there were a total of 46 students of whom 17 female and 29 male. There were 42 students in 5-E where equal of number of female and male students. Based on the pre-test attitude test scores the class of 5/A was designated as the experiment group and the class of 5/E as the control group.

Data collection tools

In order to collect quantificational data a data collection tool with two sections was employed. Its first section included items about the demographical characteristics of the participants. The second part included the scale for attitudes towards social studies course.

Scale for attitudes towards social studies course: In order to determine the participants' attitudes towards social studies course the scale for attitudes towards social studies course developed by Demir & Akengin (2010)

was employed. The Kaiser Meyer Olkin value of the scale was found to be 0.906 and its Bartlett test value was found to be significant at 0,001 level. The original analyses included a total of 72 items. Following the analysis it was found that 46 items had a factor load value under 0.50 and these items were excluded from the scale. Therefore, the scale is consisted of 26 items of which 11 were positively stated and 15 negatively stated. The Cronbach alpha internal consistency coefficient of the scale is 0,93. Its Spearman Brown internal consistency coefficient of the scale is 0,93 and its Guttman internal consistency coefficient of the scale is 0.93. internal consistency coefficient of the scale as a whole and of its sub-dimensions indicate that the scale is a reliable tool and all items in the scale have good level of discrimination. The responses to the items are given using a 5-point Likert scale: “1: completely disagree” and “5: completely agree”. Negative statements in the scale are scored in a reverse order. Higher scores from the scale indicate positive student attitudes towards social studies course (Demir & Akengin, 2010).

In the study the scale was also reviewed by field specialists. As a result of the feedbacks by them one of the items, item 14, (I like to listen to historical stories.) was also excluded from the scale due to the fact that it violated the content validity. Because the units covered in the course during the study were all about the geographical regions and were not concerned with historical events and topics. Following this modification on the scale a reliability analysis was carried out. The results of the analysis showed that the Cronbach Alpha internal consistency coefficient of the scale was found to be 0,91. Tekindal (2009: 62) argued that the scores related to the internal consistency coefficient refer to the followings: between 0.60 and 0.65 undesired, between 0.65 and 0.70 acceptable at minimum level, between 0.70 and 0.80 quite good, between 0.80 and 0.90 very good and between 0.90 and 100 excellent. Therefore, it can be stated that the scale used in the study is an excellent and reliable tool ($\alpha = 0,91$).

Interview forms: Interview forms were employed to collect qualitative data. Structured interviews are very similar to “fixed format survey interviews” described by Rubin (1983) in terms of content and method (cited in Yıldırım & Şimşek, 2013: 148-149). In order to develop an interview form first the related studies were reviewed (Akbulut, 2013; Arkün, 2007; Kan, 2012; Kunduz, 2013; İbili, 2013; Yazar, 2010). Then based on these review an item pool was developed. The items were designed to uncover the views of students concerning the use of multimedia materials in social studies. The interview form was reviewed by four specialists. Two of them were specialists in educational sciences, one in computer teaching and technology and the other one in Turkish language education and in social studies education. Based on the feedbacks by the specialists the interview form was finalized.

Teaching materials employed in the experiment and control groups

1. Teaching materials employed in the experiment group

- ✓ Teaching materials used in the experiment group were identified based on a review of literature.
- ✓ Various audio-visual materials (animations, videos, maps, photographs, pictures) were used which were accessed through educational websites such as Vitamin and Morps that were developed based on the premises of the social studies education programs.
- ✓ Some of the audio-visual materials were recorded from original studies as digital materials and the others were used online in the learning and teaching process.

2. Teaching materials employed in the control group

- ✓ In the control group textbook, guides and study sheets were employed.
- ✓ The same study sheets were used in both groups.
- ✓ The same topics and concepts were taught in both groups.

Data analysis

1. Quantificational data analysis

The normality analysis was carried on the scores of the participants from the scale of social studies course attitudes and the results showed that the scores did not have a normal distribution. Therefore, the scores of the participants were analysed using the *non-parametric tests*. The Mann Whitney U-test was employed to analyse the pre-test attitude scores of both experiment and control groups and to compare their scores. Comparisons of pre- and post-test attitude scores of both groups were made using the Wilcoxon signed rank test (Büyüköztürk, 2012; Can, 2013).

2. Qualificational data analysis

The qualitative data collected through structures interviews were analysed using the content analysis. The content analysis used in the study involved the following four steps:

- 1- Data coding,
- 2- Identifying the themes,
- 3- Organization of codes and themes,
- 4- Description of the findings (Yıldırım ve Şimşek, 2013:259-260).

Findings

Discussion of quantitative findings

The Mann-Whitney U-test was employed to analyse the pre-test attitude test scores of the experiment and control groups. The results of the test are given in Table 2 as follows:

Table 2. Results of the Mann-Whitney U-test about pre-test attitude scores of the groups

Groups	N	Mean rank	Total rank	U	p
Experiment	44	41,57	1829	789	,813
Control	37	40,32	1492		

Table 2 indicates that pre-test attitude scores of the experiment group (41,57) is higher than that of the control group (40,32). However, this difference is found not to be statistically significant ($U=789$, $p>0.05$). The Mann Whitney U-test was also used to response the following research question: Is there a statistically significant difference between experiment and control groups in terms of their post-test attitude scores? Table 2 presents the results of Mann Whitney U-test.

Table 3. Results of Mann Whitney U-test about post-test attitude scores of the groups

Groups	N	Mean rank	Total rank	U	P
Experiment group	44	43,56	1917	702	,286
Control group	37	37,96	1405		

Table 3 shows that the post-test attitude scores of the experiment group is much higher than those of the control group. However, this difference is found not to be statistically significant ($U=702$, $p>0.05$).

As stated earlier the comparisons of pre- and post-test attitude scores of both groups were made using the Wilcoxon signed rank test. Table 4 shows the results of the analysis.

Table 4. Results of the Wilcoxon signed rank test concerning the comparisons of pre- and post-test attitude scores of both groups

Groups	Post- and pre-test	N	Mean rank	Total rank	Z	P
Experiment group	Negative rank	18	19,97	360		
	Positive rank	25	23,46	587	-1,371	,170
	Equal	1	-	-		
Control group	Negative rank	18	16,58	299		
	Positive rank	17	19,50	332	-,271	,787
	Equal	2	-	-		

Table 4 indicates that concerning the experiment group's pre- and post-test attitude scores positive ranks are much higher. However, this difference is found not to be statistically significant ($z=-1,371$, $p>0.05$). Therefore, it is safe to argue that multimedia based social studies course has positive effects on the attitudes of the students towards the course, but this effect is not statistically significant.

Concerning the control group's pre- and post-test attitude scores positive ranks are much higher. However, this difference is found not to be statistically significant. Therefore, it can be argued that traditional approach does not have a significant effect on the attitudes of students towards the course.

Discussion of qualitative findings

The responses to the interview items were analysed using the descriptive statistics. Table 5 indicates the results of the statistics regarding their responses to the first item. This analysis identified the common codes and themes in this regard.

First interview item: What are the points that you liked or found interesting in the social studies course that was taught for six weeks? Why?

Table 5. Descriptive statistics regarding the student views about interesting and good points about multimedia based social studies course

Themes	Codes	f
About materials	Animations	19
	Maps	5
	Pictures/Photographs	4
	Interactive board	1
	Total	29
Teaching methods and techniques	Lectures/course delivery	12
	Demonstration technique	5
	Question-response/ discussion	3
	Brainstorming technique	1
	Total	21
Teaching	Entertaining	14

characteristics	Informative/productive	5
	Total	19
Teacher characteristics	Communication between students and teachers	2
Total		71

As can be seen in table 5 the content analysis related to the first interview item produced a total of 71 codes. These codes are categorized under four themes: materials (29), teaching methods and techniques (21), teaching characteristics (19) and teacher characteristics (2). Among the themes the materials involve the highest number of codes. The most liked materials are found to be animations, maps, pictures/photographs and interactive boards.

The following statements show the views of the students about these materials. It is seen that a single statement includes more than one code.

S 24: “I liked everything that we were taught for six weeks. Because each topic was very nice and interesting. For instance, pictures, videos (animations), and expressions.”

S 3: “I liked the videos (animations), pictures, animations and maps; because they were all entertaining and our teacher explained them very nice.”

S 16: “I liked animations most; because they are both joyful and informative ...”

S 22: “I liked the pictures. Animations were interesting.”

These direct quotations indicate that the students most liked the following materials: animations, maps, pictures/photographs and interactive boards.

Table 5 also shows that the theme of teaching methods and techniques is the second theme in terms of having higher number of codes. Therefore, it can be argued that the participants also liked or found interesting teaching methods and techniques in the social studies course which was delivered using a multimedia approach. The codes included in this theme is as follows: lectures/delivery of the course (12), demonstration (5), question-answer sessions/discussion (3) and brainstorming technique (1). The participants seemed not to know the difference between question-answer technique and discussions. Therefore, it is hard to make a distinction concerning their responses to them. As a result these two were grouped under a single code. The brainstorming technique was given as a response by only one student.

The following statements show the views of the students about this theme. It is seen that a single statement includes more than one code.

S 11: “I liked most watching videos and animations from EBA.”

S 40: “I liked most lectures and watching animations; these were very beautiful.”

S 31: “Our teacher taught the topics very nice using pictures and watching animations.”

It is seen that the participants mostly liked lectures and animations which were used in the courses.

S 4: “The things I liked most were lectures and questions the teacher asked.”

S 25: “I liked that the courses were very productive and that the teacher asked several questions to us.”

As can be seen in table 5 the third theme is about teaching characteristics. It is possible to argue that the participants liked some characteristics of teaching in the course. This theme included two codes: entertaining (14) and productive (5). The participants mostly liked that the courses are entertaining. They also liked that their courses were productive.

The following statements show the views of the students about this theme. It is seen that a single statement includes more than one code.

S 25: I liked that the courses were productive and the teacher asked various questions to us.

S 13: I liked that the courses were nice and productive.

S 24: I liked everything that we were taught for six weeks. The reason was that each topic was interesting, for instance, pictures, videos, lectures, etc.

S 39: I liked that the courses were productive. There were animations.

In short, the participants liked the entertaining and productive courses which were based on a multimedia approach.

Table 5 shows that the last theme is about teacher characteristics. It means that the participants liked some characteristics of their teachers. This theme has one code, teacher-student communication. The following statements show the views of the students about this theme.

S 1: “Lecturing style of teacher, interesting videos and kindness of the teacher. I liked that the animations were entertaining and interesting.”

Second interview item: What are the points that you did not like or found uninteresting in the social studies course that was taught for six weeks? Why?

This items sought to identify the negative views of the participants regarding the social studies courses based on a multimedia approach. Table 6 indicates the results of the descriptive statistics regarding their responses to the second item. This analysis identified the common codes and themes in this regard.

Table 6. Descriptive statistics regarding the students’ negative views about multimedia based social studies course

Themes	Codes	f
Learning environment	Noise	7
	Maps	2
Teaching materials	Pictures/photographs	1
	Total	3
Total		10

As can be seen from table 6 some of the students had negative views about the course, but more than half of them stated that they had no negative view about it. The following quotations show such responses of the participants:

S 24: “There was nothing I disliked in the course. Because everything that the teacher taught and showed us was very nice.”

S 7: “Nothing, because everyting was very joyful.”

S 16: “I liked everything. I did not dislike anything; because the teacher made us liked everything in the course.”

S 25: “There was nothing I disliked in the course.”

S 26: “I liked everything; because the teacher taught the course very nice.”

S 3: “There was nothing I disliked; because everthing was beautiful.”

Therefore, it can be stated that some students disliked anything in the social studies course which employed a multimedia approach.

On the other hand, Table 6 shows that there are ten codes which were found by the participants to be negative in the social studies course which employed a multimedia approach. These negative views are grouped under two themes: “learning environment” and “materials”. Negative student views concerning learning environment is coded as noise which was expressed by seven participants. It seems that these seven participants regarded the noise occurred during the course delivery. The following quotations show such student views.

S 1: “I could not understand anything due to the noise in the classroom.”

S 8: “My friends shouted at the class so the teacher had difficulty in delivering the course.”

S 27: “Those who were talking during the course.”

S 4: “The teacher could not manage to make my peers not talking during the course delivery... I could not hear what he said.”

S 13: I disliked that my friends talked so much in the course.”

The participants reported that the classroom was very noisy due to excessive talk by the students and it made them uncomfortable.

As can be seen in table 6 the other disliked point was about materials used in the course. the theme of materials included two codes, each was expressed by three participants. One of such materials was maps. The following direct quotations show such views about maps:

S 6: Maps; because for me maps are boring.

S 17: I found the maps used in the course uninteresting.

Within the theme of materials another code is pictures/photographs. It was reported by one participant who stated that he disliked pictures/photographs without giving any reason. In general the participants disliked the noise occurred in the classroom during the courses. In addition, two students reported that they disliked maps while one student disliked pictures/photographs.

Third interview item: Did the social studies course that you have taken for six weeks change your interest towards the course? How?

Table 7 indicates the results of the descriptive statistics regarding the responses of the participants to the third item. This analysis identified the common codes and themes in this regard.

Table 7. Descriptive statistics regarding the students’ views about the effects of the multimedia based social studies course on their interest

	Themes	Codes	f
Yes	Effective learning and teaching	Lectures	10
		Better understanding/learning	9
		Total	19
	Teaching characteristics	Entertaining	9
		Motivation increase	10
		Total	19
	Materials	Animations	3
		Pictures	1
		Maps	1
		Total	5
No	No effect	6	
Total		49	

As can be seen in table 7 more than half of the participants reported that the course increased their interest in the social studies course. On the other hand, six students reported that the course did not lead to any change in their interest towards the course.

Table 7 shows that the reasons for changing student attitudes and interest due to taking a social studies course based multimedia approach are grouped under three themes. These three themes were reported by 43 participants. Of these codes nineteen students mentioned the theme of “effective teaching and learning”, another nineteen the theme of “teaching characteristics” and five the theme of “materials”.

The theme of “effective teaching and learning” included two codes: lectures and better learning/understanding. Lectures were most frequently mentioned by the participants. The following direct quotations exemplify these codes:

S 12: “Yes. The teacher explained the topics very good. He showed us animations, videos, pictures....”

S 4: “Yes. Lectures were very nice and animations were not boring.”

S 3: “Yes, I begin to like the social studies course more. The teacher gave the lecture very nice that increased my interest in the course.”

S 10: “Yes. I used to like the social studies course, now I like it more. It is due to my teacher’s effort.”

Therefore, it can be stated that delivering the social studies course based on multimedia approach increased student interest towards the course.

S 24: Yes. I got much more information about the topics in contrast to previous courses and the topics were explained in a well manner.

S 21: Yes, I better learned the topics.

S 20: Yes. I could better learn the topics.

It is possible to argue that multimedia based teaching made it possible for students to better learn and understand the topics, which increased their interest in the social studies course.

As can be seen in table 7 the other theme is “teaching characteristics”. This theme also includes two codes: entertaining and motivating. These codes seem to positively increase student interest. Of these codes motivating feature of the course was much more mentioned by the participants (n=10). The other factor in increasing student interest is the fact that the multimedia based course was found to be entertaining by the participants (n=9). The following statements show the views of the students about these codes, motivating and entertaining. It is seen that a single statement includes more than one code.

S 11: “Yes, the course was very nice. Now the social studies course is a part of my life.”

S 16: “It caused a change; because the course was very entertaining. I begin to like the course.”

S 38: “Yes. Now I like the social studies course more.”

S 18: “Yes; lecturing was entertaining.”

S 23: “Yes, the courses were very entertaining.”

S 35: “Yes; I had fun in the courses.”

It seems that the participants perceived the multimedia social studies course as entertaining and motivating which increased the student interest towards the course.

Table 7 shows that the third theme is “materials”. Therefore, one of the factors which increased the student interest towards the course is the materials used in the course. The theme of materials is composed of three codes: animations (n=3), pictures/photographs (n=1) and maps (n=1). It is seen that more students regarded animations as a factor in their increased interest towards the course. It is followed by pictures/photographs and maps. The following quotations exemplify the views of the participants about these materials used in the course

S 34: “Yes, it changed my interest positively. Because there were much better activities in the course. Animations were very interesting.”

S 4: “Yes. Lectures were very nice and animations were not boring.”

S 12: “Yes. The teacher told every topic very nice. He showed us animations, videos and pictures.”

S 26: “Yes, it was very beautiful. There were maps and different topics in the course.”

It is seen that three materials, namely animations, pictures/photographs and maps, used in the course were concerned to be a factor in improved interest of the participants concerning the course.

Six participants reported that the multimedia based social studies course did not change their interest towards the course. The following quotations exemplify the views of the participants about it:

S 7: “Nothing changed. The course was and is entertaining.”

S 6: “No, there is no change in my interest towards the course.”

S 14: “No. I liked the course before this specific one.”

Some students reported that they liked the course before the multimedia based version of social studies course. Some others stated that the multimedia based course did not change their interest towards the course without giving any explanation.

Discussion of Findings and Conclusions

Pre-test attitude score analysis indicated that there is no significant difference between the experiment (101,6) and control groups (102,5). In other words the groups had similar and high attitude scores before the implementation. Post-test analysis on their attitude scores also showed that both groups had higher attitude scores.

Although the attitude scores of the experiment groups increased following the implementation, this did not lead a statistically significant difference between the groups. Therefore, it can be stated that the use of a multimedia approach in the social studies courses did not cause a positive significant increase in the attitudes of the participants in the experiment group. However, the multimedia approach produced much more positive increase in the attitudes of the participants in the experiment group.

In the structured interviews it is found that the participants disliked the noise occurred in the classroom during the multimedia activities. Such a negative view may affect the attitudes of the students towards the course. Tabancalı (2008) argued that noise is a factor which makes individuals uncomfortable, distracts their attention and affects their physical and mental health in a negative way. There were also other students who disliked maps and photographs. Yalın (2015) stated that each student has its own learning style and therefore, they cannot benefit from the learning environment presented at equal levels. Some students better learn through reading the materials, the others through seeing or hearing it. Some of them may prefer two of these modes simultaneously. Therefore, it can be suggested that individual preferences of some participants may not fit to the multimedia based educational approach and that such a situation may limit the effects of the multimedia based educational approach on student interest.

This finding of the study is consistent with previous findings. For instance, Akbulut (2013) analysed the effects of computer-assisted multimedia approach on the ninth grade students. Similar to the current findings, the students in the experiment and control groups had similar levels of attitude scores both in pre- and post-test. The authors argued that the reason for not having a statistically different post-test attitude scores between the groups is their similar and higher pre-test attitude scores. In addition, they suggested that a six-week implementation is not enough to change the students' established perceptions about education. Bayturan (2011) analysed the effects of the computer-assisted multimedia education on the student achievement, attitudes and self-efficacy perceptions. No statistically significant difference was found between the experiment group and control group in terms of attitudes. Balkan (2013) investigated the effects of the multimedia based computer presentations on the attitudes of the participants towards the mathematics course. It was concluded that the multimedia based approach did not have a visible effect on the student attitudes. Another study of which the findings are consistent with the current findings was carried out by Çener (2011). It dealt with the effects of the multimedia

based computer presentations in the social studies course on the student attitudes and gains. It was found that the multimedia based presentations did not have a significant effect on the student attitudes. A study by Altınışık (2001) also concluded that the multimedia based approach employed in the social studies course did not have a significant effect on the student attitudes. The reasons for this were given as short implementation period, unfamiliar learning environment for students and the attitudes of the teachers towards the presentations.

There are also some studies of which the findings are not consistent with the current findings. İnan (2015) analysed the effects of the computer-assisted multimedia presentations on student achievement and attitudes. It was found that the computer-assisted multimedia presentations produced very significant changes in student attitudes in contrast to traditional learning environment. Beydoğan & Hayran (2015) dealt with the effects of multimedia-based teaching in social studies courses on concept learning and student attitudes. It is concluded that the multimedia-based teaching in social studies courses has significant effects of student attitudes towards the course. Özüpekçe (2015) also found similar results among high school students.

In the current study it is found that although the multimedia based teaching made no significant effects of student attitudes, the attitude scores of the experiment group were higher than those of the control group. This finding is consistent with previous findings given above. It is also found that nearly all participants reported that their interest in the course increased following the implementation of the multimedia based teaching. For instance, a student reported: “ My interest has increased. Because we made better activities in the course. (Particularly) animations were very interesting.” Another student reported: “A change occurred. The courses were very joyful. I begin to like the social studies courses”. Another student reported: “Yes, a positive change occurred. Lectures was very nice and animations were not boring.”. The reasons for positive changes can be given as follows: the multimedia based teaching makes it possible to better understand the topics, produces much more entertaining and motivating course, and the use of such materials as animations, pictures, maps. Multimedia based learning environment also improved the attitudes of the teacher towards lecturing styles, methods and techniques. The students preferred to be taught the social studies topics through a multimedia based approach. The things they liked most include animations, lecturing style (method, techniques and materials), maps, demonstrations, pictures/photographs and question-answer/discussion activities. The students were asked to make a comparison between their prior experience of social studies courses and the multimedia based teaching. More than half of the students reported that the multimedia based teaching is much better.

However, three students reported that both the multimedia based teaching and traditional teaching method are good. There were also three students who stated that traditional approach is much better. Although the implementation positively affected the views of the students about the multimedia based teaching in the social studies courses, there were six students whose attitude was not positively affected by the implementation.

There is no consensus about the effects of the multimedia based teaching on student attitudes. Some findings suggest that the multimedia based teaching has significant positive effects on student attitudes, but there are also other findings that the multimedia based teaching does not have any significant effect on student attitudes. The latter group of findings may be resulted from short-periods of implementation, students' prior attitudes, different participant groups (in terms of age, and other variables) and physical conditions of the classrooms.

Interaction in university classrooms in Spain

Carmen ÁLVAREZ-ÁLVAREZ¹

¹ Assistant Lecturer, University of Cantabria, Faculty of Education, Department of Education
Email: carmen.alvarez@unican.es

Abstract

Research has shown the advantages of interaction and dialogue-based teaching in classrooms. However, in Spain, it is still only used in a minority of cases. The purpose of this paper is to investigate the state of interaction as a teaching-learning method in Higher Education. An exploratory study was carried out based on fifty in-depth interviews with students from all fields of knowledge from two Spanish universities. The results show that the usual teaching methods in Spanish universities are expository in nature, whereas teaching-learning through interaction takes place only sporadically. It can be concluded that there is an urgent need to introduce interaction-based teaching-learning practices in Spanish universities: students demand a methodological change, and those who have had some interactive experiences stated that they thoroughly enjoyed them, were more involved in their studies, further deepened their learning, and obtained better results.

Keywords: Learning interaction, University teaching, educational debate, oral language.

Introduction

One of the most important aspects of teaching is the communicative interaction that takes place in the classroom, as this is where student-student and student-teacher communication is promoted and a complex network of exchanges can be produced. However, teaching-learning practices through interaction are not predominant at the different levels of the education system (Gillies, 2014).

It is a major challenge to shift from a one-directional communicative model, in which the teacher is the custodian of knowledge and whose job it is to inform, to proposing a change in the teaching role that requires the teacher to 'create pedagogical situations that promote a construction of shared meanings among all class participants' (De Longhi, Ferreyra and Peme, 2012: 179). In an interactive class, verbal language is used to submit content for consideration by all involved, exchange meanings, ask questions, present arguments, discuss arguments, clarify misunderstandings, and so on. In so doing, knowledge is transformed and better internalised, since interaction occurs between the various concepts previously held by students, the new issues to be learnt, and the teacher's knowledge (Wells, 1999, Ashwin, 2012, Tlhoale, Hofman and Winnips, 2014). By working in this way, the teacher is able to monitor students' learning, identify errors or knowledge gaps, and evaluate the overall progress of the class. In addition, students can communicate, propose and negotiate meanings, and develop higher cognitive processes (Mercer and Howe, 2012, Skidmore and Murakami, 2012, Longhi, Ferreyra and Peme, 2012, Teo, 2013). This process similarly occurs through language, when students interact with each other. The interaction between peers, inside or outside the classroom, is also an important element for learning and for psychosocial and cognitive development (Nicol and Boyle, 2003, Wells and Arauz, 2006, Camila, Mercuri and Da Silva, 2011). In this context, research has shown that the more interaction between the agents that make up the classroom, the more opportunities arise for thinking, participation, motivation, satisfaction and learning (Mercer and Howe, 2012; Gillies, 2014; Richardson and Radloff, 2014; Tlhoale, Hofman and Winnips, 2014, Yannuzzi and Martin, 2014). It is therefore necessary to propose the use of interactive teaching practices in the field of higher education.

Academic output on interactive teaching practices has grown significantly in recent years, but is still very scarce in the context of university teaching and learning (Ashwin, 2012, Richardson and Radloff, 2014). However, some evidence on the matter already exists at both international and national level.

The study by De Longhi, Ferreyra and Peme (2012: 184-188) in Argentina, in which they analysed the communicative interactions used by different lecturers in science classes, has helped to identify four main types of dialogic circuits:

1. **Content transfer flow:** this is a traditional expository class in which the teacher initiates the teaching process and transmits closed knowledge to students, without leaving room for any questions, either from students, or allowing the knowledge presented to be questioned, using a logic defined beforehand. In this model, the teacher imposes a sequence of contents (conceptual or procedural) on the students, without awaiting their responses. The only return expected is a reproduction of that very transmitted knowledge, which should occur—most desirably—at the time of the examination.
2. **Open presentation:** these are classes in which the teacher initiates the process and checks students' knowledge of a given topic, in order to monitor the areas (concepts or processes) they are familiar with, regardless of whether or not they had been previously seen in class. The teacher usually introduces new content and asks related questions to analyse if the students understood it as it was being presented. Students respond to these requests by conveying what they already know or what they can interpret and make explicit at that moment, always with an evaluation purpose in mind. Finally, the teacher immediately assesses the answers, provides the correct ones, sometimes ignoring the incorrect ones, and legitimises the appropriate answer to the question.
3. **Controlled dialogue:** the teacher initiates the process, and checks the knowledge students have about a given topic in order to find out their ideas regarding the subject to be taught. The teacher puts strategies in place so that students can express them verbally and encourages the participation of the whole class. They make statements or ask questions that elicit a range of opinions from the group. The students respond using their previously-held ideas, that is to say, they put into words their experiences and representations on the subject from their everyday knowledge, or those seen in previous stages of schooling. The teacher gathers these answers, gives them some perspective and relocates these contributions in the context of the questions asked and the development of the issue at hand. In this way, information is gathered in order to subsequently provide an integrated, re-elaborated version that goes beyond the one given by each of the students. In these cases, the teacher does not make an exhaustive assessment of the students' contributions or question the logic behind these interventions. This involves that the teacher's knowledge is the reference point against which the content to be learned will be monitored.
4. **Dialogical inquiry guided by the teacher:** the teacher holds all students' contributions to be valid and worth being included in the thread of the topic under study, and uses them as a basis to work from. They are grouped according to their characteristics and elicit their analysis by the group. This allows the teacher to encourage students to investigate the understanding of what is being expressed, or to present alternatives that generate conflict, lead to review the activity performed or raise a problem or task to solve, or questions to give rise to hypotheses and/or justifications. Students, on their part, not only express their knowledge, but also give their own interpretation and understanding of it, sharing their opinions and constructing hypotheses. However, as in the previous cases, questions from students are rare in this type of dialogue; when questions are asked, they are intended to request clarification, confirm their ideas or request more details about the assigned topic. The purpose of this communicative proposal is for students to begin a process whereby they become aware of the answers they are developing during the pedagogical dialogue and to reinterpret them in the situations that the teacher proposes through new, successive questions. Unlike the previous case, not only do situations arise for students to express their ideas, but also to return to them, explore them and generate successive corrections, which give the teacher the opportunity to introduce new content to the class.

These identified dialogic circuits can help to understand the multiple forms of interaction that may be used in teaching practice, and to assess the degree and quality of the interaction that takes place in the classroom.

Richardson and Radloff's study (2014) in Australia, in which they examined data from numerous students and teachers, concluded that the teaching-learning processes through interaction generated higher levels of student participation, higher satisfaction, better academic self-orientation, and a lower dropout rate. The study by Yannuzzi and Martin (2014) on the introduction of dilemmas and debates in the classroom concluded that it is very important to allow students to have a voice in the classroom because it enables them to express themselves, as well as to strengthen their identity and improve their relationships with teachers. In Spain, the study conducted by Prados and Cubero (2016) on the use of academic or experiential utterances in the classroom by the teacher verified that this strategy facilitates the construction of knowledge in the classroom and the appropriation by the students of the forms of speech and the modes of discourse specific to educational contexts. This in turn generates a breeding ground to improve the training of university lecturers.

A recent study (Ononye, 2015) identified aspects that negatively affect educational communication, such as the lexical repertoire used in the classroom. The lexical options of the teacher, both in teaching and in evaluating (register used, synonymy, antonymy, hyponymy and colloquialism) broaden or reduce the options of participation in classroom dynamics. There are also some studies that have identified aspects that favour interaction-based teaching-learning. Several have demonstrated that the use of new technologies (blogs, virtual forums, wikis, social networks, etc.) as a complement to the interaction of face-to-face teaching can foster cooperative learning among peers, solve questions, and collectively build knowledge (Nicol and Boyle 2003; Tien-Chi, Yueh-Min and Fu-Yun 2011; Castano-Munoz, Sancho-Vinuesa and Duarte, 2013). Likewise, Cox and Orehovec's (2005) study of students living on North American university campuses explored the complex nature of teacher-student interaction outside the classroom, and concluded that non-academic interactions between students and teachers can be significant for students. They established five typologies (disengagement, incidental contact, functional interaction, personal interaction and mentoring) for these kinds of interaction. This study highlighted the importance of building bridges between lecturers and students outside the classroom.

In Spain, the study by San Fabián, Belver and Álvarez (2014) on the implementation of the European Higher Education Area concluded that future studies should verify whether new methods have been actually implemented in university classrooms, as they observed that students reported that the dominant model was the theoretical-master class, which is far removed from the development of competencies, and from the object of discussion here: teaching-learning through interaction.

This paper specifically investigates the state of affairs regarding interaction-based teaching practices in Spanish universities.

Method

The aim of this study is to gain a better understanding of interaction-based teaching practices in university classrooms, from a pedagogical perspective. I agree with De Longhi, Ferreyra and Peme (2012) that 'it is fundamental to deal with the subject of communication in the training and practice of teachers from a pedagogical perspective'. The specific objectives of this paper are: (1) to discover the communicative roles that are enacted in university classrooms; (2) to discover the communicative roles enacted in other times and spaces: before and after classes, virtual classrooms, tutorials and reviews; (3) to analyse the factors that facilitate or hinder interaction in the classroom and (4) to explore interactive teaching practices.

In order to meet these objectives, a qualitative study took place based on in-depth interviews with university students. Two Spanish public universities located in the capital of two one-province Autonomous Regions were

selected, and students from the five major fields of knowledge (Natural Sciences, Social Sciences, Health Sciences, Engineering and Humanities) were contacted. A total of 50 in-depth interviews were carried out with 10 students from each of the five fields of knowledge to ensure a diversity of subjects studied. Different levels of academic results and educational motivations existed among them. They were reached through various contacts from within their respective faculties (thanks to the support of lecturers, chancellors' teams, student associations, etc.).

The topics covered by the interviews were:

- Class interactions: types, frequency, etc.
- Interactions before and after class, virtual classrooms, tutorials and reviews.
- Factors that facilitate or hinder interaction.
- Outstanding educational experiences of classroom interaction.

The interviews were recorded and later transcribed. Subsequently, the various statements about university teaching that had been collected were organised and analysed by the use of content analysis. Extracts from the interviews will be used to substantiate the findings, using the name of the subjects (a pseudonym) and the field of knowledge to which each of them belonged.

Findings

The results have been grouped around three broad categories: (1) interaction in the university classroom; (2) interaction in other times and spaces ; (3) facilitating and hindering factors for interaction and (4) interaction practices.

Interaction in the university classroom

The answers provided by the fifty students interviewed revealed the usual dynamics that take place in university classrooms for different fields of knowledge.

It is particularly striking that a large number of statements reported that the usual form encountered is the master class, which is expository in nature and involves little or no interaction. 'Except for a few notable exceptions, here we have master classes, the typical old-fashioned ones ' (Lourdes, Health Sciences).

Given that the most common approach used in the classes is expository, questions and answers as the main means of communication in the classroom are of special interest. However, students expressed an enormous diversity of possible responses in this regard: some lecturers do not allow them, because they judge them to be an interruption; some do not respond adequately when they arise, in order to prevent them from happening; closed questions asked only to evaluate if the student knows the answer; a mixture of open and closed questions; open questions are used at the beginning of new topics to probe the level that students have; and those lecturers who ask, 'is this clear?' but continue to move on and introduce new content without waiting for a response; some lecturers who are delighted to be asked and answer questions, and to ask and find students willing to answer, etc. Regardless of the professional field, the students believed that it was (mainly) more a question of attitude, both of lecturers and students in the classroom.

It depends on the lecturer. I have some that before explaining or doing things, ask us if we think if it is true or false, they give us time to think about it, ask us how many people think this or that ... But, basically most of them don't do that. Most do the exercises and on we go. You may as well not understand anything. If you don't ask a question, and if you have gone three days without checking something at home, you may be very lost (Alicia, Natural Science).

Today, classes are usually organised around the lecturer's reading of PowerPoint slides. Students criticise their uselessness when they contain only text and the lecturer merely explains them. 'Seventy percent of them read the slides. There is no difference between being in class or being at home in front of the computer and reading them' (Félix, Engineering). Faced with this situation, students disconnect and become demotivated. 'If you're given a 55-minute non-stop talk, it's much easier to lose the thread, and you're likely to get your computer and Google and start looking at something else' (Lucas, Humanities).

This is transferred to the evaluation, as it involves merely reproducing the content they have been taught. 'The lecturers that I have learned the most with teach through interaction. But there are others, who are the majority, who use memory. You memorise it, do the exam and that is it' (Luis, Social Sciences).

The students value hold lecturers who are open to interaction with them in high regard, because they help them to stay focused and understand the subject.

I had two subjects where we talked more. I think it's necessary to have constant interaction, because otherwise you lose people. You have to explain and ask. Or directly, ask and then explain. That way your previous thoughts are cut through by what is explained later. Learning by interaction is very valuable. You have prior knowledge that can be radically changed by what you are told later. What do you think is X? I think it's this, this and this ... Everyone shares their ideas and then the lecturer explains what is right and what isn't, and that changes your views' (Guillermo, Social Sciences).

Even students who have declared themselves to be very shy and have difficulty making contributions in the classroom showed greater satisfaction with interactive teaching:

All contributions are enriching. Some of us are more withdrawn and we contribute less, but the debates help you get ideas, and even if you don't not write them down, if you have a bit of memory, help with discourse and with the exam. You retain information better, because generally the pace of the classes is very intense, so those moments of debate, discussion, exchange, serve a double purpose: drawing from what others say and having clear ideas about what you think, you understand ... There are some lecturers who give you speeches, and it's very difficult to keep focused then' (Adrián, Humanities).

As this student mentioned, interactive teaching has notable advantages: it helps learn more and enjoy it more, students retain knowledge better, it helps them overcoming laziness and embarrassment, follow the subject better, ask questions, concentrate more in class, question their own previously-held ideas, and improve results. Due to all of this, students would like classroom dynamics to be much more interactive.

I would love to have a lot more interaction during the lessons. To have to take in two hours of this non-stop stuff... I find it boring. I have tested this: the subjects in which I have the best grades are the ones with the most interaction, because they are the ones that I enjoy the most and I get involved more (Monica, Social Sciences).

Interaction non-class time and space

As well as the interaction-based teaching-learning approach, a particularly important aspect in the dynamics of higher education are the interactions that occur in other spaces and at other times that are complementary to the daily work of the university classroom. Students were therefore asked about the time before and after school, tutorials and the use of digital platforms.

As for the times before and after classes, students agreed that while teachers differ greatly, and some are open to interaction at all times, others only allow it at the end of the class or in tutorials. Students expressed satisfaction with those lecturers who were open to listen to them at all times, and especially with those who stayed after the class to clarify things when needed.

Before the classes, they are distant. After them, they become friendlier. We usually wait until the end of the class to solve any individual issues so we don't do it out aloud' (Darío, Health Sciences).

As reported by this student, interaction styles in tutorials differ greatly:

'Lecturers in tutorials are divided into two groups: those who are available in their office hours and encourage you to see them, and those who believe that they are the Pope and you have to go chasing them outside of their scheduled times. Usually they complain that we go to see them less than we should, and they are right' (Sandra, Humanities).

In any case, the few students who said they have gone to tutorials thought that, usually, their questions are answered and they are treated in a friendly way. 'Many teachers change radically in face-to-face interaction, in tutorials. There is a lecturer who seemed very distant in class, but then was much more approachable face-to-face' (Guillermo, Social Sciences).

In addition, if the tutorial was intended for a review of grades, the relationship was reported to be more or less interactive depending on many variables: the student's grade, the number of students waiting in the corridor to review their exam, etc. The vast majority of students said that the interaction with the teacher was usually friendly, close and positive, although there were also cases in which they recognised that it did not enable learning:

Many times, I have gone to reviews to see my mistakes because I had to repeat the exam in September. They think you are going because you want to up a grade and many times it is not the case. Generally, they do not explain much in reviews. In tutorials they do, but in grade reviews they don't usually explain very much (Angela, Humanities).

However, there are other forms of exam review that do enable learning, but do not usually allow interaction, as this student commented:

'One of our exam reviews involved the lecturer uploading a corrected exam to Moodle. The review in that case was to go to a classroom and retake the exam. And that was it, you weren't told if you had got something wrong, or anything. That's the typical review. The normal thing would be to go to the lecturer's office and for them to explain things to you by interacting with you' (Francisco, Engineering).

Great diversity was reported in ways of interacting with students by the use of digital platforms. The students interviewed stated that the most common use of these was to download content, without interacting with anyone. 'We only download things in Moodle. There is a discussion forum but it is there for all subjects and there is never even a single entry' (Antonio, Natural Sciences). As this student noted, forums available in virtual classrooms are rarely used, and students considered that they would be very helpful. Those who had had the experience of using them valued them very highly.

'In my degree, virtual forums are used a lot and they are very useful, especially in the more complex subjects. It is helpful, because if you don't have the courage or you do not have time... you ask your question there, and your classmates (in addition to the teacher) can help you and explain things to you as equals, at your level. It helps' (Laura, Social Sciences).

Moreover, students said that younger lecturers generally use ICT (e-mail, virtual classroom, videos in class, etc.) much more and this leads to a better teaching standard. 'There are very old teachers who should really be retired and they are stuck in a way of teaching that is old-fashioned. We only have one lecturer to whom we can send work by email, the rest continue to demand paper. I'm astonished' (Agustín, Humanities).

Facilitating and hindering factors for interaction.

In categorising the answers of the students interviewed, it some of the main facilitating and hindering factors for interaction in the university classrooms were identify. These are displayed in the following two tables. These are answers that were consistently repeated by the university students consulted.

Table n.1. Factors facilitating interaction.

Factors facilitating interaction.

- Lecturers encouraging and consciously promoting participation on a regular basis
 - Lecturers and/or students not being afraid to participate (asking, responding, formulating hypotheses,...)
 - Lecturers making it the norm to address students and asking questions directly
 - Lecturers forcing students to pay attention and preventing them from causing disruption in the classroom
 - Presentations containing graphical information (maps, videos, graphs, photographs, etc.) and not just text to be read
 - Having small groups (less than 30 people)
 - Practising in pairs, groups of three or small groups in the classroom
 - Having class debates
 - Having mature students within the classroom, who are committed to their degree and their learning
 - Enabling participation to be an element of evaluation
 - Understanding error as a form of learning, without restricting or sanctioning it
 - Having cohesive groups and a good atmosphere in the classroom (relaxed atmosphere, lecturers who makes jokes and uses anecdotes, etc.)
 - Higher courses than the degree: reducing group sizes, the students who remain are more filtered, more mature and subjects are more specific
-

Table n.2. Factors hindering interaction

Factors hindering interaction

- The size of some groups (more than 50 people and in some cases, more than 120) and the lack of basic procedural knowledge to hold a debate
 - Lecturer's comfort. It is easier to teach a class one-directionally than to interact with students in class constantly
 - Negative reaction of the lecturer to questions being asked on the subject or a debate being held
 - Fear of making mistakes, ridicule or reprisals from lecturers or students
 - The tradition of teaching by dictating notes or projecting a presentation
 - The tradition of teaching in a very individualistic rather than cooperative style
-

-
- Lack of training given to lecturers on how to plan interactive classes
 - Shyness, embarrassment or indifference of students within the classroom
 - Lack of students' interest in the subject or the degree they are studying
 - There are very technical subjects about which students lack previous knowledge to be able to encourage their participation
 - Class-mates with very different levels within the same class
 - Very broad and complex curricula, which are hastily approached. This would require reorganising the time allocated to each year and each class
 - Lecturers only being interested in research (not in teaching)
-

Interaction Practices

A large number of students considered that they had not had any interactive experience worth noting in their university classrooms. At times, they mentioned some specific classroom activity in which teachers and students had interacted with each other, but those concerned regarded it to be very isolated and infrequent. They made comments about specific classes, specific classroom, computer or laboratory practices, especially with interactive or dynamic lecturers, work through virtual forums, etc. Only a few students interviewed were able to provide some examples of interactive teaching-learning practices that they had experienced while at university. These practical experiences of interaction are extremely varied in nature and importance and, as shall be seen below, the students valued them highly. For reasons of space, and by way of example, five significant experiences will be highlighted, each of them taken from one field of knowledge:

Lucas, a Humanities student, highlighted a teaching experience based on reading seminars:

I had a fairly interactive experience that kept me really hooked. It was used in seminars and made me want to know more, to understand, to read, to find new ideas, especially to read. It has been much harder, but also much more manageable, because wanting to go to class is essential'.

Laura, a Social Sciences student, highlighted a subject in which they had to work collaboratively to solve exercises:

I had a subject in which we were solving exercises all the time and the teacher asked us "what would you put here", "what would you do there ". It was a good experience. At first it was a mess because we hardly knew how to do anything and we lacked the basics, but in the end, we did it. When you discuss the subject, you take away concrete examples from the class and you remember everything better. Even in the exam I remember the example that we analysed in class. Sometimes you were called to do an exercise on the blackboard and the lecturer kept asking you questions to encourage you to explain how you were solving it. If you got stuck, everyone would help you and sometimes it was like that for the whole hour.

Andrés, a Health Sciences student, highlighted that the classes in which they had to work cooperatively to argue for their answers, after the lecturer had offered different alternatives through group oral multiple choice tests.

With one lecturer, we sometimes worked with multiple choice tests, giving the correct answer in groups, and this was very good. People did participate more there, it's true. I retain content better when we do multiple choice tests or discuss examples of clinical cases. In our case, open questions are very difficult to answer. If you ask us multiple choice questions you are arguing and discarding, and you can find the answer. That helps. You're more certain when you answer. Until you study the theory, you can't get the answer. You can't work out the answer by yourself.

Elisa, a Natural Sciences student, decorated a teaching experience in which a lecturer always asked them about the class content during the class itself, to check for understanding, if they are paying attention and learning progress.

We do not have especially interactive classes in which we talk about topics or discuss things frequently, but there is a lecturer that others should imitate. He always asks us questions. This forces us to pay attention. I am shy, and knowing that tomorrow he may ask me, helps me to pay attention and encourages me to review content so that I am prepared when I go to class. He interacted a lot. He asked us questions to find out if we had understood what he had explained. In this degree, we need to interact with classmates and lecturers, but we don't do it much. The other day we had a very good class in which the lecturer started to ask us things we should know and we were shocked because we were supposed to know these things and more or less we knew, but now we remember everything we discussed.

Ezequiel, an Engineering student, highlighted his experience in two areas in which peer interaction was strengthened to solve practical assumptions:

There are two subjects I can talk about that are different. They are completely practical and make us come together as a group and we can talk and say 'here is what happens' and we support each other. We are asked to do things such as: 'Identify these plans'. But in the other subjects about plans, we never get together in a group. The lecturer arrives and explains, but there are never any stimuli, they never go further. It's all very individual-based.

As can be seen from their statements, some isolated experiences of interaction can be identified in all knowledge fields in university teaching. All of them were very highly valued, since students believe that the class environment is improved (collaboration is promoted, as opposed to individualism), the class is more enjoyable (there is more attention and involvement), and learning is enhanced (the use of debates and discussions encourages deeper learning of course content, which is retained better).

Conclusions

The results obtained confirm the low presence of interactive teaching-learning methods in university teaching in Spain. In the terms of the study by De Longhi, Ferreyra and Peme (2012: 184-188), which identified four main dialogic circuits (content transfer flow, open presentation, controlled dialogue and dialogical inquiry guided by the teacher), it could be said that, in general, university teaching in Spain mainly follows the first two models. Although all four of them can be found, the third and the fourth are used only by a minority. Monological discursive practices predominate, in which there is hardly any room for lecturers to interact with students or for students to interact with each other. Students easily identified classroom practices with non-interactive expository classes, following the traditional academic rationale, as well as other practices that were similar, but were open to questions, queries and observations during classes. Students also criticised the misuse and abuse of PowerPoint presentations.

In the interviews, it was observed how this style of teaching was generally applied in all the fields of knowledge, and it generated a certain feeling of disappointment with university teaching among students, as aptly expressed by Antonio, a Natural Sciences student:

I don't know whether debates should happen inside or outside the classroom, but I miss them a lot. I think people who go to university expect something else. Certainly not just going to classes,

taking notes and reviewing them. That's okay, but give me some forum or some group discussion tool as well. That's missing. I miss it. And other people too!

It is important that students in all disciplines understand that these disciplines are alive and that there are eternal dilemmas underlying them, which should find expression in teaching as scientific debates, competing ideas, position-taking, etc. (Wells, 1999; Wells and Arauz, 2006).

In other times and spaces linked to teaching and learning in the university, there is a lot of diversity, and students interviewed identified that the differences lie in the lecturer's interest in paying attention to the student before or after classes. Very different practices exist regarding tutorials and exam revision, although in general students considered that relationships are closer and lecturers are more accessible in these face-to-face meetings, which enables them to have their questions answered. Everything suggests that these extra-curricular spaces and times are of great importance and could be used for educational improvement (Cox and Orehovec, 2005). The same applies to digital platforms, which were reported to be often underused, despite the many resources they provide (blogs, virtual forums, wikis, social networks, etc.) to enhance collaborative interaction in the process of knowledge construction (Tien-Chi, Yueh-Min and Fu-Yun, 2011; Castano-Munoz, Sancho-Vinuesa and Duarte, 2013).

It can be concluded that students identify many facilitating and hindering factors for interactive teaching in university classrooms: lecturers' accessibility, fear of ridicule, size of groups, interest in subjects or degree, tradition, the cohesion of groups, etc., are all some of the variables that positively or negatively affect the classroom environment, and therefore, the management of dialogue in the classroom. These results are consistent with those shown in international studies (Wells and Arauz, 2006, Ashwin, 2012, Gillies, 2014, Tilhoale, Hofman and Winnips, 2014, Ononye, 2015).

It is also possible to conclude that students had serious difficulties in identifying interactive practices in which the teaching-learning process overcomes these models. This is partly due to the fact that they are rarely used. Most of the students interviewed were not able to identify any interactive practices, or if they did, they had mostly occurred at other education stages or in informal education (mainly referring to private tuition). Teaching-learning experiences through interaction in the university were 'isolated cases', but are very highly valued by students. In spite of this, there are interactive teaching practices in the university in all fields of knowledge in other countries (De Longhi, Ferreyra and Peme, 2012).

Despite the important conclusions referred to, it is not possible to make broader ones using this study, since it only reflects the view of the matter by students, and it would need to be replicated to include lecturers and professors. The repetition of this study with university teaching staff might offer additional perspectives to this field of research. Federico, a student of Natural Sciences, stated the following: 'When you see lecturers who don't motivate you in class, you do not feel like going, and when you have lecturers who do other things, then you are the one who discourages them'. Questions arise, however, as to how teachers are prepared for university teaching, and what pedagogical training they have to be able to use an interactive teaching style, whether they know specific techniques to enhance teaching-learning through interaction, what results they obtained when using them or putting into practice other 'home-grown' methods, etc. Given this situation, this may be something future studies could investigate to complement the present one. This remains a new field and much more research is needed (Ashwin, 2012, Richardson and Radloff, 2014, Prados and Cubero, 2016).

Nevertheless, and despite this limitation, a message is clear: students demand a methodological change in which the interaction in the teaching-learning process is prioritised. Those who have had some interactive experiences claim to have been more involved in their studies and to have felt part of the educational process, to have asked themselves more questions, to have had a deeper understanding of course, to have enjoyed their subjects more, to

have paid more attention in class and to have obtained better academic results (Mercer And Howe, 2012, Skidmore and Murakami, 2012, Longhi, Ferreyra and Peme, 2012, Teo, 2013). A methodological change is required in today's university classrooms in Spain, and teaching-learning practices through the use of interaction are essential in order to promote it (Mercer and Howe, 2012; Gillies, 2014, Richardson and Radloff, 2014, Yannuzzi and Martin, 2014).

I am aware that despite the high expectations for change in the European Higher Education Area, there is still much room for improvement in Spanish universities (some degree programmes are oversubscribed, there have been funding cuts, the employment situation of some lecturers needs improving, etc.). However, a commitment to the introduction of dialogic teaching-learning practices in our universities is viable, necessary and urgent, and could be a major step towards improving the quality of teaching and of the Higher Education system in Spain.

The Importance of the Tutor's Psycho-Pedagogical Development in Training Nurses

Abstract

In today's healthcare system, nurses make up the largest professional category. During clinical training, the nurse trainee learns, while working in a team or alongside a community, how to plan, how to put into practice and evaluate general medical care, based on previously acquired skills and knowledge. One of the most important members of the tutoring team is the nursing tutor. In order for the tutors to really meet the needs of the students, they are required to be acquainted with the learning knowledge theories and their models, as well as the application of learning methods specific to the pedagogy of medical education, coupled with a continuing personal and professional development. Thus, the definition of psycho-pedagogical training for clinical practice tutors, followed by the development of specific skills, regulation and status consolidation for them represent the strategic objectives in a general context of training for future nurses.

Keywords: tutor, nursing, psycho-pedagogical skills

Introduction

The first ideas of tutoring come from antiquity, when Socrates (470/469 BC - 399 BC) questioned himself and created thinking directions for the sake of learning from experience. His ideas were taken over by Comenius (1592-1670), who in the study "Didactica Magna" ("Great Didactic") considered education inseparable from social life and linked the idea of practice to the learning process. Thus, students will be directly involved in the education process if they develop practical skills for theoretical knowledge. This principle applies by extension to any person undergoing a learning process. An avant-garde in perfecting pedagogical methods, Comenius has created a concept of teachers being assisted by advanced students, who have the role of conducting practical application activities for beginner students. This profile outlined by Comenius defines what will later be called tutoring, and the person empowered to carry out these guidance and support activities to facilitate the progress of a student or group of students will be called a tutor.

The idea that the tutor could be equipped with psycho-pedagogical abilities is relatively new in the Romanian educational environment. While other countries are concerned with their training, even at an academic level, in Romania the tutors do not have a pedagogical profile and a clear status.

Mentoring and the Mentor are defined in the Romanian legal teaching framework of post-secondary education. Meanwhile, tutorship is only defined in the context of tertiary education, as follows: "tutorship is a program of support and counselling for students meant to facilitate integration in university education, to provide guidance in choosing the most student-appropriate didactic, cultural and social options, as well as encouraging the sharing of students' knowledge and skills, improving academic performance. The tutorship system encourages students' communication and trust towards the university and the academic environment" (Babeş-Bolyai University Cluj, Titu Maiorescu University Bucharest). The omission to define tutorship for the pre-university environment has negative effects on the tutor, leading to volunteering activity, lacking a well-defined legal and professional framework.

Student-centred education, known as the Bologna Process, is the main benchmark for European education and, implicitly, for Romanian education. According to this system, the student is a future expert, an active actor in education and training, and is considered a partner of those who build this type of education. Practical work is an integral part of the learning process. The specialized practice is compulsory for the student whose specialization

includes this type of activity according to the curriculum. Internship allows the application of the knowledge and skills acquired during the theoretical courses and has learning objectives, forms competencies and converges to the foundation and finalization of the bases of the profession.

Training tutors – last goal in teaching nurses

In today's health care system, nurses make up the professional category with the most numerous staff. The World Health Organization shows that there are currently over 9000000 nurses and midwives working in 141 countries. Clinical training of nurses takes place in hospitals, other health care facilities, including home medical care, under the responsibility of teacher nurses, and with the collaboration of other qualified nurses. By definition, nursing means caring. It is a profession within the health care sector focused on the care of individuals, families and communities so they may attain, maintain or recover optimal health and quality of life. However, there is a subtle difference between the two: nursing is widely considered as an art and a science, wherein caring forms the theoretical framework of nursing. Nursing and caring are grounded in a relational understanding, unity, and connection between the professional nurse and the patient. Task-oriented approaches challenge nurses in keeping care in nursing. This challenge is on-going as professional nurses strive to maintain the concept, art, and act of caring as the moral centre of the nursing profession. Keeping the care in nursing involves the application of art and science through theoretical concepts, scientific research, conscious commitment to the art of caring as an identity of nursing, and purposeful efforts to include caring behaviours during each nurse-patient interaction.

In clinical education, the assistant candidate learns, alongside a team, in direct contact with the sick or healthy person or community, to plan, practice and assess general medical care based on previously acquire knowledge and skills. The guidance team has in its composition a practice tutor whose decisive role in the formation of future nurses has been and is a subject of interest, research and development for all education systems. The triad of teaching / learning / practice and research is an indispensable element in the training of nurses. Practical experience of future nurses is an essential pivot in their training. The integrative alternation process, student guidance made by a professional, leads to a profession appropriation and allows the student to gradually acquire the necessary skills in the profession for which they are preparing.

In this process, the tutor's abilities are not limited to communicating, presenting, planning, guiding, understanding, analysing, interpreting, coordinating, examining, demonstrating, they also involve pedagogical knowledge, individual-specific knowledge and nursing theory, to be able to accept and guide clinical practice in accordance to current requirements. One of the components of basic care, as Virginia Henderson said, is “to help someone learn, discover, or satisfy their curiosity, all of which lead to normal development and health.”

Can we define, in the context of the changes taking place in Romanian education, based on the current legislation, who deals with the students' practice in the institutions of training future nurses (post-secondary schools, faculties)?

What is the role of the tutor?

Who can become a tutor?

Is the tutor a learning facilitator?

Can tutoring be regarded as a didactic profession?

Is the psycho-pedagogical training of the tutor necessary?

We use the term tutoring to define the support work done by a tutor to facilitate the progress of a learner or group of learners who don't only use theoretical materials in the care of the patient for learning, but also practice these techniques in a hospital unit. This activity can take different forms, the role of the tutor being interpreted from one system to another: diagnosing student problems, aiding learning skills, supporting practical activities, enriching, diversifying the type of patients, depending on affections - generally those activities whose purpose is to promote the study and to facilitate the implementation of accumulated theoretical notions.

The tutor is, in theory, the only person who comes in direct contact with the student (telephone, internet, face to face), but their role is only that of a mediator between the study material and the learner, in no case replacing a sequence of materials presented through a face-to-face form of teaching. Correlated with the activity of the tutor, different types of theoretical education can be used distinctly, which also impose the roles within the practice institution - hospitals, clinics, home care services, other health institutions, as follows:

- Institutions where lecturers and tutors prepare the necessary materials and distribute them;
- Institutions where the materials made in specialized centres are adapted by tutors according to the specialisation of the unit in which the practice is performed, for a specific target group and then distributed;
- Institutions where tutors distribute materials made in other centres without changing them.

Generally speaking, the title of “tutor” in a training system for future nurses involves certain types of tasks, some of which are also accomplished through consulting other programme participants.

As far as the necessary knowledge and skills are concerned, in the following table they are schematically highlighted in correlation with the tasks involved in the tutorial:

Table 1. Correlation between psycho-pedagogical skills and tutoring activities

Psycho – pedagogical key aspects	Tasks	Skills/Knowledge
Personalisation and adaptability	Selection and adaptation of learning materials Preparation of learning materials	Assimilation and use of content for courses and databases - Knowledge of the target group, course objectives and evaluation requirements - Selecting the right training package by including work experience - Ability to design the required materials
Guidance and freedom	Pre-course counselling (determining the learning needs)	- Knowledge of the course material available - Counselling / guidance skills, inter-personal relationships - Identification of training needs based on established practice objectives
Motivation & Developing self-regulated learning	Induction Learning support	Communication, guidance and motivating abilities - Knowledge of the psychology of education - Adapting to learning styles - Monitoring of practical work - Knowledge and assessment skills, assessment techniques - Maintaining and permanent review of the database - Managing crisis situations
Collaboration and good practice sharing	Post-course counselling	- Counselling and socio-professional orientation. - Knowledge of labour market requirements.

After analyzing the tasks and abilities extracted, one can deduce the most important functions of a tutor:

- Management function:**
 - They organise the group and establish responsibilities
 - They aim for reaching the established learning objectives
 - They elaborate a specific action plan
 - They validate each stage before moving forward to the next one
 - They fix the objectives through feed-back
 - They ensure direct communication between the practice partner and the school
- Pedagogical function:**
 - They ensure proper transmission of information through verbal and non-verbal communication
 - They give and offer feed-back
 - They give educational support to the student (guidance) in the process of accumulating professional abilities
 - They continuously provide learning situations (case studies)

We view tutoring as a knowledge-rich profession with tutors as “learning specialists”. As professionals in their field, tutors can be expected to process and evaluate new knowledge relevant for their core professional practice and to regularly update their knowledge base to improve their practice and to meet new teaching demands. By investigating the knowledge underlying effective teaching and learning, we are studying how to improve the tutor’s teaching quality. Teaching quality itself is an important factor in determining gains in student achievement and to improve student outcomes.

There are many features that characterise good teachers, which include extensive pedagogical content knowledge, better problem-solving strategies, better adaptation for diverse learners, better decision making, better perception of classroom events, greater sensitivity to context, and greater respect for students.

A good teacher is one that is capable of performing in a variety of teaching styles, thus having the opportunity to adapt their work to different circumstances, allowing more flexibility and an efficient delivery of the content. A current and modern teaching style is the creative one. Some teachers show more flexibility than others in their teaching attitude, being receptive to new ideas and experiences, demonstrating boldness, more freedom of thought manifested also in their teaching style, having the ability to take risks and willing to try new methods, new strategies.

Thus, in addition to proven professionalism, the tutor must also acquire the characteristics of a good teacher, so that his knowledge and experience are transmitted as well as possible. In other words, teachers teach *knowledge* and tutors teach/share *professional experience and guidance*.

While teacher knowledge is certainly a component of teacher professionalism, professional competence involves more than just knowledge. Skills, attitudes, and motivational variables also contribute to the mastery of teaching and learning. Blömeke and Delaney (2012) proposed a model that identifies cognitive abilities and affective-motivational characteristics as the two main components of teachers’ professional competence:

Table 2. Professional competence of teachers adapted from Blömeke and Delaney (2012)

Cognitive abilities	Affective-motivational characteristics
professional knowledge	Motivation
general pedagogical knowledge	self-regulation
content knowledge	professional beliefs about teaching and learning and the subject content
pedagogical content knowledge	

The pedagogical ‘knowledge base’ of teachers/tutors includes all the required cognitive knowledge for creating effective teaching and learning environments. So, it is the distinction between declarative (‘knowing that’) and procedural knowledge (‘knowing how’). This approach is relevant as it focuses on understanding how knowledge is related to behaviour, or in other words, the quality of teaching performance. Therefore it is very important to underline that *pedagogical content knowledge* is the knowledge which integrates the content knowledge of a specific subject and the pedagogical knowledge for teaching that particular subject. Also, *general pedagogical knowledge* is essential for developing quality teachers/tutors. Psychological components account for the fact that learning occurs in a social context and learning success depends on the general cognitive and affective characteristics of individual students.

Investigating the knowledge of tutors as ‘learning specialists’ involves understanding how this knowledge functions in the tutoring-learning process; more specifically, how tutors apply their knowledge in making decisions, for example, about case study design or making on-the-spot judgements in the clinical environment.

We can conceptualise the teaching profession as a ‘clinical practice profession’ and compare it to the medical profession. Some argue that decision-making is actually a basic teaching skill – decisions are made regularly by

teachers while processing cognitively complex information about the student in order to decide alternatives for increasing their understanding. But that is exactly what a tutor must do along the whole process of tutoring.

The nursing teacher is by definition a practitioner and a promoter of interactive methods, considering the ultimate goal of the teaching nurses – training the tutors.

Findings

Sanitary Post-high School “Fundeni” Bucharest is the most important state educational institution in Romania in the field of health care and a centre for continuous training of teachers in this field. Founded in 1950, it has traversed all the historical, economic and social periods of the Romanian educational environment, maintaining its leading position in the educational offer in the field of health care, through the high quality of the educational process and the development of a professorial elite. In full knowledge of the importance of training and preparation, it has been running many projects and partnerships, of which the most relevant are: "NURSING - Convergence of pre-university medical education with active life" (2009-2011); "SOS - Medical Sector!" - pilot project for the optimization of practice and insertion, correlated with national promotion campaigns, orientation and counselling for the reduction of medical personnel deficit (2010-2012); "Multiregional Program for Improving the Transition from School to Active Life for Students in Health Schools" (2010-2013) in the major field of intervention 2.1 "Transition from School to Active Life", Priority Axis 2 "Correlation of Learning Throughout Life with the Labour Market ", Sectoral Operational Program Human Resources Development 2007-2013, European Social Fund. Both through the development of partnerships and projects as well as through the current activity, the school permanently pursues the following objectives:

- Preparation of practical skills necessary for employment through practical training for potential employers;
- Development of career prospects by providing guidance and counselling services in support of the transition from school to active life;
- Improving the quality and effectiveness of internships through the training of nominee tutors through practical conventions and the development of support materials (practice books, evaluation and monitoring questionnaires for practical internships and a good practice manual);
- Developing partnerships with potential employers.

In the Sanitary Post-high School „Fundeni” the nursing teachers pay special attention to the professional development of the students, while also focusing on the skills needed for the nursing practice of the care process. The competencies, abilities, as well as psycho-motor, cognitive and relational skills for the nursing practice are conveyed and improved by the nursing teachers’art of teaching. They must select and use the teaching methods which shape the personalities of students, enabling them to provide individualized, personalized care in real-world context of health problems.

The methods and strategies used by us are aimed at communicating and exploring the patients’ health problems, as well as selecting the proper ways to solve them. Learning by experience and by applying certain gained knowledge in practice is the most efficient method of training skilled nurses.

The active and participative methods represent the leap from "learning" to "learning to be and become", i.e. the training to cope by gaining the motivation for action and involvement.

As a result, for the successful application of these methods, the teacher has to change their way of thinking and the methodology of training and education, in order to work with students, to become a real model for continuing education through flexibility and originality, to become involved in decisions pertaining to education, to ensure quality education for all. The teacher management training, the learning of the management culture, apart from the traditional psycho-pedagogical and methodical one, could provide the understanding and the application of the

authority-freedom relationship, as a new meaning for education by means of the teaching-learning process and by solving other cases related to the educational process.

The successful teaching and learning process is not only based on the factual and scientific competencies, but also on the pedagogical and psychological experience and safety. It demands from the teacher a continuous professional development, in which training is a valuable tool. The most important part of the training is learning through reflection.

The pedagogical competence does not only develop through experience, but it should also be strengthened by self-assessment. In the reflection process there can be a comparison of the lesson plan with what actually happened. For example, the students might behave differently than it was anticipated or one of the phases of the teaching process may take longer than expected. This happens quite frequently when applying participatory methods. Thus, by passing through the analysis phase and by identifying the root cause of the deviations from the plan, the teacher may have valuable cues both for the application of the teaching strategies and for their own professional development. Add to these a better observation and knowledge of the students, which implicitly leads to the best environment for valuing their potential.

These principles of interactive teaching methods represent the core of the psycho-pedagogical training of tutors offered by the school.

The training programme for tutors is done through a psycho-pedagogical module consisting of 90 hours – theoretical training and 60 hours for a compulsory pedagogical internship. The aim of this programme is to develop psycho-pedagogical skills that would allow tutors to identify efficient ways of transmitting *knowledge* and *knowhow*, using specific material resources.

Conclusions

Considering the European health strategies and the state of health of the population in our country, in the process of health education, nurses should not be prepared only to meet the needs of the individual, the family, the community, but also to trust their own intellectual and clinical capabilities so that they can work responsibly and autonomously to cope with more complex health needs. Educational results should enable the student, the future nurse, to select information to make it possible to assess, plan, implement and evaluate nursing care.

Tutor quality is conditioned by proven professional skills. The tutor's real encounter with the needs of the students requires knowing the theories of learning and their models, applying the teaching methods specific to medical pedagogy, alongside a continuous personal and professional development. Thus, defining the psycho-pedagogical training of the clinical practice guardian followed by the development of specific competences, the regulation and strengthening of the state are strategic objectives in the general context of preparing the future nurses. It is not enough for young nurses to have all the theoretical knowledge they need. In addition to knowing, their preoccupation with training must also focus on their preparation for the correct application of knowledge, which can only be achieved by the intervention of a tutor equipped with psycho-pedagogical abilities.

Abstract

To implement internships with undergraduate students is a pedagogical option with good results perceived by academic staff, employers, and among graduates. The Human Interaction Skills development as well as the attractiveness of such experiences for higher education students are topics assumed as core in the conception and management of the activities implemented in the undergraduate courses offered at the last three decades in computer science degree and in information systems technologies degree at one Portuguese private university. The objectives of this paper are to gather evidence of the Human Interaction Skills explained and valued at Information Technology Internships and to evaluate the importance and the relevance of these experiences in promoting employability after the Information Technology Internships. Data collection was based on the application of questionnaire to trainee supervisors and to students who have completed Information Technology Internships in the last decade at one Portuguese private university. The trainee supervisor, responsible for monitoring the student's performance at Information Technology Internships, evaluates the following Human Interaction Skills: Motivation and interest in the activities developed, interpersonal relationship, cooperation in company activities, assiduity, ease of knowledge apprehension, compliance with norms, insertion in the work environment, productivity, initiative, ability to take responsibility, creativity in proposing solutions, and self-confidence. The results show that in the concluding phase of these undergraduate courses students have positive levels of development of Human Interaction Skills and that these students, once they finish their degree, initiate remunerated work functions, mainly by invitation of the institutions in which they perform Information Technology Internships. Findings provided strong evidence of Human Interaction Skills advantages contribute to widen the analysis of its effectiveness in terms of future research and actions in regard to the transition from Higher Education pathways to the Labour Market.

Keywords: Human Interaction Skills; Employability; Internships; Information Technology; Higher Education

Introduction

To implement internships with undergraduate students is a pedagogical option with good results perceived by academic staff, employers, and among graduates. In recent years, the authors of social cognitive theory of career have been explaining the influence of academic experiences at Higher Education Institutions in various aspects of vocational development emphasizing that academic experiences are a source of relevant information in the process of constructing meaning the role of modeling, evaluation, performance and merit, contributing to the development of higher education students vocational interests and values (Costa-Lobo, 2011; Costa-Lobo and Ferreira, 2012; Magalhães et al., 2017). The transition to the labour market is seen as an component of vocational development which is categorized by a long process in time, which starts before the conclusion of graduation courses and that endures even subsequently the beginning of the labour activity (Lent, Taveira, & Costa-Lobo, 2012; Magalhães, 2017). The research carried out over the last eighty years on the issue of "school-labour market transition" has been emphasizing the importance of looking at the preparation of higher education for work in a developmental perspective (Brennan & Little, 2006; Fugate & Kinicki, 2008; Weible, 2009; Yorke & Knight, 2007; Zhao & Liden, 2011). There are few learning experiences in a work context during a course degree, which makes it difficult to understand how the labour market works, what is expected of young people in a professional context, what skills they need to develop, as well as learn what skills are necessary and valued in their area of expertise (Brennan & Little, 2006; Daniels & Brooker, 2014; Fugate & Kinicki, 2008; Jesus-Silva,

Medeiros, Caramelo-Gomes, & Costa-Lobo, 2016; Weible, 2009). These aspects are related to the difficulties in the transition to the labour market acknowledged both by employers and by young people - the struggle in adjusting to the hierarchical structure of companies, in understanding what is their role within and demystifying their expectations on tasks they feel able to do and/or hoping to make and those they really are assigned to do (Magalhães et al., 2017; Taveira et al., 2010, Weible, 2009; Yorke & Knight, 2007; Zhao & Liden, 2011). According to Vieira and Marques (2014) the skills chosen by employers as the most important for professional purposes in the first five years are: analysis and problem solving, creativity and innovation, adaptability and flexibility, planning and organization, motivation for excellence. Offer opportunities for the simulation and experimentation of roles designed to prepare students to solve everyday problems in employment, training in career management techniques and role-testing are types of intervention strategies recommended in preparing graduates for the transition to the labour market (Magalhães et al., 2017). Learning approaches should include learning by doing, learning by experimenting, learning by interacting, learning from mistakes in a group context, should promote contribution, problem solving and decision-making, it should also promote teamwork between individuals with divergent backgrounds, because the diversity of paths can lead to a larger collection of competences and joint decision-making among actors with complementary competences (Costa-Lobo, 2011). This paper describes activities implemented at one Portuguese private university, Portucalense University (UPT). UPT is a private institution of higher education, certified by ISO 9001, recognized by the Portuguese Government and by the Portuguese Agency for the Evaluation and Accreditation of Higher Education, located in the city of Porto, in the north of Portugal. The organizational philosophy that supports Information technology internships at Portucalense University is presented at figure 1.

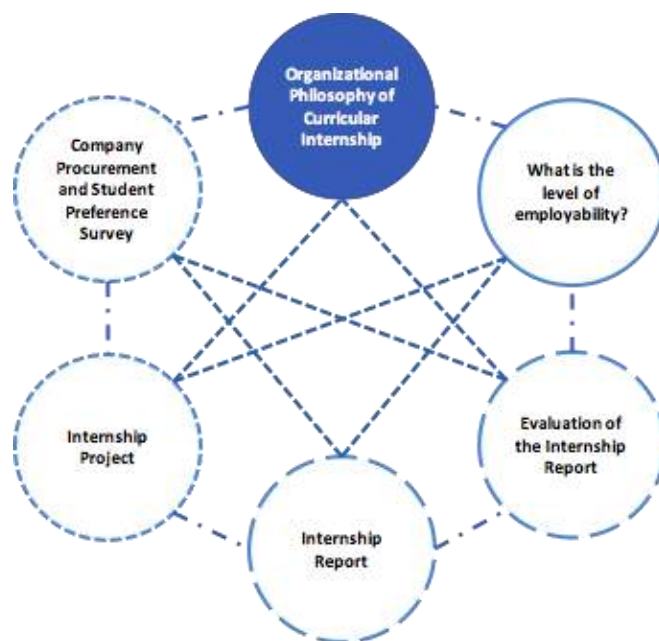

Figure 1. Information technology internships at Portucalense University: Organizational Philosophy (adapted from Magalhães et al., 2017)

Information Technology Internships at Portucalense University are understood in a learning environment systematized in table 1.

Table 1 – Information technology internships at Portucalense University: Characterization of the learning environment (adapted from Magalhães et al., 2017)

Steps	Task	Procedure(s)	Participants
1	Company Procurement and Student Preference Survey	<p>Short list of organizations segmented by area, location and type of internship.</p> <p>Identification of the organizations that correspond to the area, place and typology of preference for the curricular internship.</p> <p>Management of the contacts with the welcoming companies (contacts with the partners and reception of the requests)</p> <p>Internship regulations are sent to the organization.</p>	<p>Curricular internship student (AEC)</p> <p>Internship Coordinating Council (CCE)</p> <p>Welcoming trainees Organization (LAO)</p>
2	Organizational Philosophy of Curricular Internship	<p>Student CV is sent to the organizations to plan an interview and select the student.</p> <p>Appointment of the curricular internship advisor and supervisor, after approval of the student CV by the organization.</p> <p>Assignment of the project to the student and definition of the respective planning (gant chart).</p> <p>At the first internship meeting, the protocol is presented and the objectives of the internship are explained.</p>	<p>Curricular internship advisor (OEC)</p> <p>Curricular internship student (AEC)</p> <p>Curricular internship supervisor (SEC)</p> <p>Direction of the Department of Economics, Management and Informatics</p> <p>Internship Coordinating Council, UPT (CCE)</p> <p>Welcoming trainees Organization (LAO)</p>
3	Internship Project	<p>Signing of the internship protocol between the organization and the UPT.</p> <p>Development of the curricular internship project under the OEC orientation (practical implementation of the project) and supervision by the SEC (theoretical framework of the project).</p> <p>Note whether there are deviations in the project from the objectives and tasks carried out in relation to the planned.</p> <p>Realign the project, if necessary, considering the organization's initial objectives and expectations.</p>	<p>Core of internship:</p> <p>Curricular internship advisor (OEC)</p> <p>Curricular internship student (AEC)</p> <p>Curricular internship supervisor (SEC)</p>
4	Internship Report	<p>CCE evaluates and approves the report.</p> <p>OEC ensures that the writing of the internship report fulfils the objectives and initial expectations of the OAE organization.</p> <p>SEC guarantees that the writing of the internship report complies with the guidelines pre-defined by the Internship Coordinating Council of UPT (CCE).</p>	<p>Curricular internship advisor (OEC)</p> <p>Curricular internship student (AEC)</p> <p>Curricular internship supervisor (SEC)</p> <p>Internship Coordinating Council (CCE)</p>
5	Evaluation of the Internship Report	<p>ECC critically evaluates the report proposing suggestions for continuous improvement and good practices of the curricular trainee projects to the OEC.</p> <p>OEC assigns a qualitative evaluation on a Likert scale of 5 points, according to 12 evaluation and performance criteria.</p> <p>SEC and CCE quantitatively evaluate the student's report and oral test from 0 to 20 values.</p> <p>Student submits the report to the CCE and requests the marking of the oral test made up of 3 elements (SEC, OEC and CCE).</p>	<p>Curricular internship advisor (OEC)</p> <p>Curricular internship student (AEC)</p> <p>Curricular internship supervisor (SEC)</p> <p>Internship Coordinating Council (CCE)</p>
6	Conclusion of work contract with the trainee student	<p>Student demonstrated throughout the curricular internship project to have certain skills, abilities and knowledge of the labour market interest that are important and attractive to the company.</p>	<p>Curricular internship advisor (OEC)</p> <p>Curricular internship student (AEC)</p>

This learning environment is characterized by the following properties: Participatory and Problem-solving oriented. Information Technology Internships at Portucalense University apply a student centered approach where they are actively engaged in the learning process, using learning-by-doing and experience-based approaches. The Human Interaction Skills development as well as the attractiveness of such experiences for higher education students are topics assumed as core in the conception and management of the activities implemented in the undergraduate courses offered at the last three decades in computer science degree and in information systems technologies degree at UPT.

The objectives of this paper are to gather evidence of the Human Interaction Skills explained and valued at Information Technology Internships and to evaluate the importance and the relevance of these experiences in promoting employability after the Information Technology Internships.

Method

Data collection was based on the application of questionnaire to trainee supervisors and to students who have completed Information Technology Internships in the last decade at Portucalense University. The data presented and discussed for this study are based on a sample of 60 students from IT courses referring to nine school years (2006/07 to 2015/16). This sample is predominantly composed of male students (83.3%), a pattern that is constant throughout the school years studied. The trainee supervisor, responsible for monitoring the student's performance at Information Technology Internships, evaluates the following Human Interaction Skills: Motivation and interest in the activities developed, interpersonal relationship, cooperation in company activities, assiduity, ease of knowledge apprehension, compliance with norms, insertion in the work environment, productivity, initiative, ability to take responsibility, creativity in proposing solutions, and self-confidence. Statistical analyzes were performed using IBM SPSS software, v.22. Pearson's correlation coefficient was used to study the relationship between the assessment attributed by the curriculum internship advisor and the final grade obtained by the student. Regarding the students' performance in the curricular stage carried out in the company, the evaluations attributed by the company advisor regarding the cognitive skills, business skills and human interaction skills (questions Q1 to Q12) were analyzed, separately by sex. To evaluate the validity of the use of the Exploratory Factorial Analysis (EFA) the KMO criterion (Kaiser-Meyer-Olkin measure of sampling adequacy) was used with the criteria of classification defined by Marôco (2014a,b). Having observed a $KMO = 0.803$, EFA was used because this value indicates that the use of this factorial model is adequate; more, the Bartlett's test of sphericity has associated a level of significance of 0.000 that led to the rejection of the hypothesis that the correlation matrix is an identity matrix, reinforcing the existence, already verified, of correlation between the variables. If this were not the case, the use of this factorial model would be reconsidered (Pestana & Gageiro, 2008). In order to verify if these variables are strongly associated with each other independently of the student's sex, and given their nature (ordinal qualitative variables) was used Spearman's correlation coefficient. The relational structure of the 12 variables relating to the evaluation of curricular internship was evaluated by EFA based on correlation matrix, with extraction of the factors by Principal Component Analysis with orthogonal Quartimax rotation. The application of EFA allowed to retain two common factors that explained approximately 66% of the total variance. Finally, with the objective of grouping the variables into homogeneous groups and reinforcing the conclusions obtained by EFA, was used Hierarchical Cluster Analysis (exploratory multivariate data analysis).

Findings

The information was monetized concerning year in which the trainee student completed the 1st cycle of studies at Portucalense University, sex, bachelor's degree course attended (Informatics, Management Informatics, Informatics-software branch and Informatics-Information Systems branch), degree's final classification, and concerning internship final classification (these last two classifications were measured on a scale between 0 and 20 values). Each student indicated if was employed at the time of graduation and, if so, if was employed at the place where he / she performed the curricular internship. In addition to these data, information was collected on a set of 12 questions (Q1 to Q12) concerning the quantitative evaluation carried out by the curricular internship advisor based on the classification of a five-point Likert scale (1- poor, to 5-high), being the questions corresponding to components of the following skills: motivation and interest in the activities developed (Q1), interpersonal relationship (Q2), cooperation in company activities (Q3), assiduity (Q4), ease of knowledge apprehension (Q5), compliance with norms (Q6), insertion in the work environment (Q7), productivity (Q8), initiative (Q9), ability to take responsibilities (Q10), creativity in proposing solutions (Q11) and self-confidence (Q12).

Pearson's correlation coefficient was used to study the relationship between the assessment attributed to the curriculum internship advisor and the final grade, and a moderate positive correlation ($r = 0.47$) was found to be statistically significant at 1% (rejects the null hypothesis of the correlation is 0).

It can be concluded that the better is the student's academic performance (measured by their final grade), the better is their performance in the stage (as measured by the curricular stage grade) and the average final grade of these students is approximately 12,5 values ($SD= 0.96$), with a mean score of 15.4 ($SD = 1.25$), which indicates that students are well prepared while their curricular training is in progress. Hence, the high employability rate at the end of the curricular traineeship (77.8%) and the high percentage (57.1%) of these undergraduate degrees *alumni* who work at the company where they completed the internship are not surprising. These classifications were also analyzed separately by sex and it was found that there were no significant differences.

Regarding the performance of students in the curricular stage carried out in the company, the assessments attributed by the company advisor regarding cognitive skills, business skills and human interaction skills (Q1 to Q12) are presented in Table 1. This study was conducted separately by sex (see Table 2). For both sexes all the evaluations present an average score of over 4 (between good and very good), except for Q8 (productivity) and for Q9 (Initiative) for the female sex (being *Mean* = 4.8 in females, and being *Mean* = 4.4 in males). It should be noted that the average score obtained for male students is higher in all questions than the scores obtained for female students, except for "assiduity" (Q4) where the trend reverses ($m = 4.8$ in the Females vs $m = 4.4$ in males). These high ratings reinforce and explain the high classifications obtained in the curricular stage in detriment of the markedly lower scores in the final grade of the degree.

Table 2 – Descriptive statistics for questions Q1 to Q12

	Gender			
	Male		Female	
	Mean	Std. Deviation	Mean	Std. Deviation
Q1. Motivation and interest in the activities developed (Mean=4,48)	4,52	,646	4,30	,675
Q2. Interpersonal relationship (Mean=4,37)	4,40	,782	4,20	,632
Q3. Cooperation in the activities of the company (Mean=4,20)	4,24	1,001	4,00	,667
Q4. Assiduity (Mean=4,48)	4,42	,928	4,80	,422
Q5. Ease of knowledge apprehension (Mean=4,25)	4,28	,948	4,10	,568
Q6. Compliance with norms (Mean=4,63)	4,68	,551	4,40	,699
Q7. Insertion into the work environment (Mean=4,35)	4,36	1,005	4,30	,823
Q8. Productivity (Mean=4,25)	4,33	,718	3,90	,316
Q9. Initiative (Mean=4,20)	4,28	,834	3,80	,789
Q10. Ability to take on responsibilities (Mean=4,28)	4,28	,784	4,30	,949
Q11. Creativity in proposing solutions (Mean=4,10)	4,12	,824	4,00	,471
Q12. Self-confidence (Mean=4,12)	4,13	,789	4,10	,738

To verify if these variables are strongly associated with each other, regardless of the gender of the student, and given their nature (ordinal qualitative variables) Spearman's correlation coefficient was used. The correlations found are positive and globally high, namely between interpersonal relationship (Q2) and cooperation in company activities (Q3) ($r_s = 0.642$), between productivity (Q8) and creativity in proposing solutions (Q11) ($r_s = 0.705$) and between creativity in proposing solutions (Q11) and self-confidence (Q12) ($r_s = 0.648$).

To evaluate the validity of the use of the Exploratory Factorial Analysis (EFA) was applied the KMO criterion (Kaiser-Meyer-Olkin measure of sampling adequacy) with the criteria of classification defined in Maroco, 2014. Having observed a $KMO = 0,803$ the EFA was useful, because this value indicates that the use of this factorial model is adequate. More, the Bartlett's test of sphericity has associated a level of significance of 0.000 that led to the rejection of the hypothesis that the correlation matrix is an identity matrix, reinforcing the existence, already verified, of correlation between the variables.

Based on these results, the option was based on a multivariate analysis with the aim of identifying which skills contribute most to the curricular evaluation of internship advisor, and how these variables are associated with each other. A relational structure of the 12 variables relating to questions regarding the evaluation carried out by curricular internship advisor was assessed by EFA, based on correlation matrix, with extraction of the factors by Principal Component Analysis with orthogonal Quartimax rotation Revealed as the most appropriate), which allowed for an easier and more evident interpretation of the factorial structure. The finding of the factors potentiated to identify structural relations among the variables, structural relations that would otherwise go unnoticed in the set of the original variables. The application of EFA allowed to retain two common factors that explained approximately 66% of the total variance. Table 3 summarize the factorial weights of each variable in their factors and their eigenvalues.

Table 3- Exploratory factorial analysis results

	Components	
	1	2
Q1- Motivation and interest in the activities developed	,617	,050
Q2- Interpersonal relationship	,784	,115
Q3- Cooperation in the activities of the company	,442	,784
Q4- Assiduity	,157	,877
Q5- Ease of knowledge apprehension	,322	,820
Q6- Compliance with norms	,623	,075
Q7- Insertion into the work environment	,326	,830
Q8- Productivity	,798	,309
Q9- Initiative	,765	-,068
Q10- Ability to take on responsibilities	,843	-,026
Q11- Creativity in proposing solutions	,820	,217
Q12- Self-confidence	,741	,181
Eigenvalues	5,912	2,004

The first factor (component 1) shows high factorial weights on the variables "Interpersonal relationship" (Q2), "Productivity" (Q8), "Initiative" (Q9), "Ability to take on responsibilities" (Q10) and "Self-confidence" (Q11). The second factor (component 2) shows high factorial weights on the variables "Cooperation in the activities of the company" (Q3), "Assiduity" (Q4), "Ease of knowledge apprehension" (Q5). Figure 1 shows Component plot in rotated space, with map of factorial weights obtained display.

It is emphasized that, in relation to the 1st factor, factor defined by the variables Q2 and Q8 to Q12, all of them have positive weights which justifies their positioning on the same side of the axis, allowing to conclude that, the greater the student's creativity in the proposal of Solutions, the greater the productivity, the initiative, the self-confidence, the ability to take on higher responsibilities is the quality of the interpersonal relationship. As for the 2nd factor, a factor defined by variables Q3 to Q5 and Q7, the high weights allow us to conclude that the more easily the student is able to apprehend knowledge, the better the student is inserted in the work environment, being more cooperative in company activities and being more assiduous.

Figure 2. Component plot in rotated space

Looking at Figure 2, the 1st factor (component 1) defines human relations skills, and explains 49.3% of total variance, and the 2nd factor (component 2) defines organizational skills and competences, and explains 16.7% of total variance. Finally, with the objective of grouping the variables into homogeneous groups and

reinforcing the conclusions obtained by EFA, was used Hierarchical Cluster Analysis (exploratory multivariate data analysis).

The dendrogram obtained (see Fig. 3) suggests that there are two distinct clusters of variables: the clusters formed by the variables Q3, Q4, Q5, Q7 and the other formed by the remaining variables Q1, Q2, Q6, Q8, Q9, Q10, Q11, Q12.

Figure 3- Dendrogram for questions Q1 to Q12

It is interesting to note that this clustering in two clusters justifies the retention of two factors in EFA.

As for the first cluster, the most similar variables are Q3 (cooperation in company activities) and Q7 (insertion in the work environment), which reveals that the better the student enters the work environment, the more he participates in the company's activities. However, for the last cluster, the division between the variables (Q1, Q6) and the remaining ones (Q2, Q8, Q9, Q10, Q11, Q12) seems clear. In this last cluster, the closest variables are Q8 (productivity) and Q11 (creativity in proposing solutions), which reveals that the more creative the students are in proposing solutions, the more productive they are. It should be noted that these conclusions are similar to those obtained in the EFA, with respect to the two retained factors.

Results, conclusions and recommendations

These students, once they finish their degree, initiate remunerated work functions, mainly by invitation of the institutions in which they perform Information Technology Internships. The greater these students are in proposing solutions, the greater will be their productivity, initiative, self-confidence, as well as ability to take responsibility and good interpersonal relationship, and the more easily the student is able to apprehend knowledge, the better is inserted in the work environment, thus being more cooperative in the company's activities, and consequently more assiduous.

The results show that these undergraduate courses promote the development of Human Interaction Skills, and in this study human relations skills explains 49.3% of total variance, and organizational skills and competences

explains 16.7% of total variance. Through these results, in the curricular units attended prior to the beginning of the internship, and during the supervision of the internship practices, training strategies in the fields of human relations skills and organizational skills and competences are of interest.

These are undergraduate courses predominantly attended by boys, while performances (in both sexes) are equivalent. It is noteworthy that girls, compared to boys, are more assiduous, less productive and have less initiative. It is mainly significant to involve boys in the training and valuation of attendance, signaling with the girls, at formative contexts, both learner and non-learner contexts, behavioral options that increase the levels of productivity and initiative. The average grade in the internship is, higher than the average final grade of all the activities of the degree, which shows the good performance in the companies by the students as well as the recognition and appreciation of the trainees' competences by them. In the classifications issued by trainee supervisors, there are high scores (level 4 and level 5, in the scale of 1 to 5) for all 12 questions that assess students' competences in companies.

Findings provided strong evidence of Human Interaction Skills advantages contribute to widen the analysis of its effectiveness in terms of future research and actions in regard to the transition from Higher Education pathways to the Labor Market. This article, following the work of Magalhães et al. (2017) presents information that reinforces that it is important to consider the following suggestions and intervention strategies to be implemented with higher education students: to improve communication between teachers and students in order to build more and better supports and academic resources; create psychoeducational interventions to boost academic self-efficacy and outcome expectations; psychological counseling centered in the training of relations skills and in the training of organizational skills and competences; increase the level of practical experiences provided to young people during their academic career (e.g. job shadowing programs); help to identify the strengths and weaknesses of each individual in order to implement skill development techniques directed towards the real and personal needs of young people; the implementation of programs with the purpose of mentoring, coaching and talent development, and personal and social skills supports within and outside the education system.

Abstract

The aimed of this study is to explore the perceived justice of the undergraduates with regards to classroom management practices. Perceived justice is an important factor which allows for students to have a sense of belonging in the teaching and learning environment. The universe of this study consists of 1,892 undergraduates of the Sakarya University and students enrolled in the Formation Certificate Program of the Faculty of Education of Sakarya University during the spring quarter of the academic year of 2016-17. The sample of this study, on the other hand, consists of 320 undergraduates enrolled in pedagogical formation programs who participated in the study on a volunteering-basis using Simple Random Sampling Method. Simple Survey Model, one of the General Survey Models was used in this study. The data collected in this study was coded and analyzed using IBM SPSS Statistics V22.0 software. The results of this study show that students' perceived procedural justice differs depending on the variable of department type. In this context authors recommend future studies to focus on perceived justice in the classroom with respect to its many dimensions.

Keywords: Justice, Classroom Management, Pedagogic Formation, Perception, Teacher

INTRODUCTION

Justice, in general terms, refers to “the quality of being just, and being able to distinguish between right and wrong”. In this respect, one may suggest there is a relationship between justice and ethics and religious rules when justice is defined both in terms of a situation and people's behaviors. Justice, as a notion, also incorporates a view addressing, studying and criticizing human behavior with respect to the rules of ethics and morality. Organizational justice, on the other hand, can be explained with the need for adoption of justice in order to be able to efficiently manage the people who form a social system where the power of the people is coordinated in a voluntary and regular basis in order to achieve their goals. Therefore, organizational justice is a notion gained importance due to the effect of the perception people working in an organization about how just a working environment is and the impact of such a perception with individual and organizational consequences. “Considering the significance of satisfied employees with high working performance for both individuals and organizations”, it can be said that “organizational justice can be an important measure of employee behavior” and may be used accordingly (Irak, 2004: 40). A closer look into the literature showed that organizational justice is defined in terms of a number of dimensions.

Dimensions of Organizational Justice

Studies on organizational justice showed that the research most commonly focused on five dimensions of organizational justice.

Distributive justice: The concept of distributive justice builds on the Equity Theory developed by Adams (1965) and it posits being rewarded equally for equal effort (İşcan and Naktiyok, 2004:187). According to this theory, individuals tend to compare their inputs (education, experience, etc.) with the outputs (salary, fee, award, etc.) they obtain in return. If the result of such a comparison between input and output is perceived equitable and just by the employees, then it will lead to a sense of equality. However, if such a comparison results in a perception of inequality in the employees, then such inequality may lead to tension in many respects. In such cases, employees tend to act in a way to decrease their effort in the business in order to find a new balance (İçerli, 2010:79).

Procedural justice: Justice does not only concern the compensation of the employees, but it also concerns how the distributive decisions are made for the output. As a result, procedural justice emerged as the second type of organizational justice. Procedural justice involves the impartiality and objectivity of the decision-making process

with regards to reward distribution. Thibaut and Walker (1975) suggested two sub-dimensions of procedural justice. The first one, also known as formal procedure, concerns the structural characteristics of the procedures and practices used in the decision-making process. This dimension covers the practices such as giving a say to employees before making decisions and listening their input and suggestions. The second sub-dimension, transactional procedure, concerns the manner the policies and practices used in the decision-making process implemented by the decision-makers. Managers' behavior towards employees in the implementation of a process, and managers' sincerity and honesty in explaining the reasons behind a decision may have a positive or negative impact on the perception of employees about the impartiality of the process (Cit. İçerli, 2010:84)

Interactional justice: Interactional justice defines the opinion of individuals about the quality of the interpersonal interaction in the organizational process. Interactional justice is about 'how employees treat each other'. If an employee shares the information he/she obtains with his/her colleagues and if he/she avoids being rude and/or dishonest behaviors towards his/her colleagues (Cropanzano, Bowen and Gilliland, 2007:38), then it may lead to dishonest interaction. It was found that distributive and procedural justice is disregarded by employees in settings where interactional justice is at a high level. In other words, when employers are respectful towards their employees, it was found that employees show an increased tendency to disregard unjust salary distribution and unjust procedural transactions due to an elevated tolerance (Karademir and Çoban, 2010:57).

Interpersonal justice: Interpersonal justice focuses on group behavior and their respect towards the social identities of the members of that group. Interpersonal justice incorporates group-value model (Lind and Tyler, 1988) and relational model of authority.

Informational justice: Informational justice can be defined as just and honest information provision to the employees about the interest distribution and other events in the organization. In adverse cases such as declined work, providing more information about the process increases the possibility of a more just and positive perception. It may be more important to inform employees about processes than the salary they are paid in terms of employee satisfaction (Cropanzano and Greenberg, 1997; Eker, 2006; Folger and Cropanzano, 1998 Cit. Titrek, 2009).

Studies showed increased justice perception by the employees as the information level of employees was elevated. In this context, the communication channels between employees and the management are important antecedents in the formation of the perception of justice among the employees (Doğan, 2002: 72).

Justice in Classroom Management

Among the dimensions of classroom management are management of physical environment, education management, time management, relationship management and management of student behavior. Classroom climate is addressed under the dimension of management of student behavior (Çelik, 2012). The ability of the teacher to build a sound teacher-student relationship in the classroom depends on a better communication and warm classroom climate (Ağca, 2009). As the facilitator of an effective classroom management, the teacher's ability to create a warm classroom climate is important in terms of achieving the goals of education in an efficient and effective manner. And this is only possible through an effective classroom management. A positive classroom climate is a result of trust and a sense of belonging, socializing, engagement in decision-making, peer support, dynamism and morality of the teachers and other school personnel, sincerity, justness and communication between teachers, other school personnel and students, clear expectations and learning outputs

It is shown that schools have been focusing more on identifying their level of organizational justice especially in the last decade. Most of the studies available in the Turkish literature focusing on organizational justice in educational organizations are commonly performed at an primary school level (Atalay, 2005) Studies focusing on secondary school level such as Polat (2007) and Polat and Celep (2008), on the other hand, attempted to identify the perception of secondary school teachers with regards to organizational justice, organizational trust and organizational citizenship behavior. Cömert et al. (2008) studied the organizational justice perception of high

school teachers employed in the city of Malatya. Cömert et al. (2008) attempted to see if the perception of the participants on organizational justice differed depending on variables such as “gender, field, occupational experience, type of high school and the number of teachers employed in a school”. The authors tried to define the organizational justice perception with regards to the sub-dimensions such as interpersonal relationships and relationship with managers. However, the authors did not assess organizational justice perception in general terms. Other studies available in Turkish literature are found to analyze organizational justice perception in terms of its sub-dimensions. Yılmaz and Taşdan (2009) suggested that further studies must focus on the variable of “type of school” when analyzing organizational justice in primary school setting. In the light of the predecessors available in the literature, this study aims to analyze “the perception of justice of the undergraduates with regards to the classroom management practices of their teachers”. In this context, the following are the sub-problems of this study:

1. Is the perception of justice of the undergraduates studying in the Hendek district of the city of Sakarya with regards to the classroom management practices of their teachers vary;
 - 1) with regards to gender,
 - 2) with regards to the department,
 - 3) with regards to the economic status,
 - 4) with regards to the education level of parents,
 - 5) academic success of the student?

METHOD

This study aims to uncover the characteristics of a population collecting data form the same population. Therefore, the model used in this study was descriptive review model (Büyüköztürk, 2012).

Universe and Sample

The original universe of this study consists of approx. 1900 undergraduates studying in Sakarya University during the academic year of 2016-17 as part of a pedagogical formation program. The sample of this study, on the other hand, consists of 320 students enrolled in pedagogical formation programs who participated in the study on a volunteering-basis using Simple Random Sampling Method. According to the sampling formula, 320 out of 1900 students were selected (Balci:112). Having reached this figure, it was regarded as the minimum acceptable number and due to factors such as time invested and budget, the survey was completed. Using this sampling method, each unit in the universe has an equal and independent probability of being included in the sample. In other words, it is a sampling methods which applies equiprobability rule. Such equiprobability rule suggests that any possible sample of varying size can be extracted from the universe (Balci,2005:6).

Table 1. Demographics of the participants

Variables	Category	Frequency	Percent
Gender	Female	237	74.1
	Male	81	25.3
Family's economic status	TL1000 or less	17	5.3
	1001-2000	85	26.6
	2001-3500	139	43.4
	3501-4000	41	12.8
	TL4001 or more	38	11.9
Education Status of Family	Illiterate	13	4.1
	Primary	178	55.6
	Secondary	53	16.6
	High School	51	15.9
	University	24	7.5
	Post Graduate	1	.3
Education Status of Father	Illiterate	2	.6
	Primary	102	31.9

	Secondary	78	24.4
	High School	92	28.8
	University	42	13.1
	Post Graduate	4	1.3
Academic Progress Rate	2.5 or less	86	26.9
	2.51-3.00	150	46.9
	3.01-3.50	63	19.7
	3.51-4.00	20	6.3
Department	Faculty of Science and Letters	135	42.2
	Faculty of Theology	92	28.8
	Other	93	29.1

A closer look into the demographics of the participants, it was found that 74.1% are female while 25.3% are male. With respect to the economic status of the family, it was found that the majority (43.4%) was earning between TL2001 and TL3500.

Education level of the mothers showed that 55.6% are graduated from primary school. Education level of the fathers showed that 31.9% are graduated from primary school.

Data Collection and Data Analysis

The data collection tool used in this study was the “Perception of Justice in Classroom Management Scale” developed by Nural (2015). The data collected were analyzed using ‘IBM SPSS Statistics 22’ suite. First, the distribution of data was checked for being in a normal range. For this purpose, Kolmogorov-Smirnov test was performed using the SPSS suite and kurtosis and skewness coefficients were observed with respect to data distribution.

Table 2. Reliability analysis

Variable	Cronbach’s Alpha	Number of items
Perception of justice	0,941	16

The reliability of the 16-item justice measure used in this study in order to measure the perceived justice of students was found to be 0.941 (Cronbach’s alpha internal consistency coefficient) which indicates a rather high confidence in the scale. This value showed that the scale is very reliable.

FINDINGS

Table 3. Main statistics of the variables

Variables	Average	Standard dev.	Skewness	Kurtosis
Total justice	2.94	0.76	-.051	.072
Procedural justice	3.10	0.925	-.219	-.510
Reward justice	2.95	1.04	-.130	-.666
Interactional justice	3.00	0,895	-.050	-.367
Distributive justice	2.68	0.85	.068	-.423

According to Büyüköztürk (2011), a normal distribution can be identified and parametric tests may be applied if the arithmetic mean, median, and mode values of the dataset are similar, and if Skewness and Kurtosis values range between -1 and +1. Normal distribution of the dataset was observed according to the normality tests and parametric statistical methods were employed for analyses. Having defined the students’ perception of classroom management of the teachers with the data obtained, the results were compared to a number of variables. Independent sample t-test was used in the analysis of gender-related differences, while one-way ANOVA was

used in the analysis of variables with more than two subgroups. A significance level of 0.05 was expected to be obtained in all the analyses performed.

ANOVA analysis was performed in order to find if the perception of justice varies depending on department, gender, family's economic status, mother's education level, father's education level, and academic progress rate. According to the results of the analysis, it was found that the perception of justice was significantly different for only the department and there were no statistically significant difference for other variables ($p > 0.05$).

With respect to the variable of gender, there was no statistically significant difference in their opinions about distributive justice ($p = .411$, $t_{(315)} = -1.64$), interactive justice ($p = .118$, $t_{(316)} = 0.24$), procedural justice ($p = .805$, $t_{(316)} = -1.65$), reward justice ($p = .784$, $t_{(316)} = -1.32$) and total perceived justice ($p = .652$, $t_{(315)} = -1.03$).

With respect to the variable of family's economic status, there was no statistically significant difference in their opinions about distributive justice ($p = .667$, $F_{(4-314)} = .594$), interactive justice ($p = .328$, $F_{(4-315)} = 1.162$), procedural justice ($p = .473$, $F_{(4-315)} = .885$), reward justice ($p = .481$, $F_{(4-315)} = .872$) and total perceived justice ($p = .486$, $F_{(4-314)} = .864$).

With respect to the variable of mother's education level, there was no statistically significant difference in their opinions about distributive justice ($p = .816$, $F_{(4-314)} = .389$), interactive justice ($p = .214$, $F_{(4-315)} = 1.460$), procedural justice ($p = .107$, $F_{(4-315)} = 1.917$), reward justice ($p = .330$, $F_{(4-315)} = 1.156$) and total perceived justice ($p = .272$, $F_{(4-314)} = 1.296$).

With respect to the variable of father's education level, there was no statistically significant difference in their opinions about distributive justice ($p = .734$, $F_{(3-315)} = .426$), interactive justice ($p = .831$, $F_{(3-316)} = .292$), procedural justice ($p = .315$, $F_{(3-316)} = 1.187$), reward justice ($p = .664$, $F_{(3-316)} = .527$) and total perceived justice ($p = .962$, $F_{(3-315)} = .096$).

With respect to the variable of academic progress rate, there was no statistically significant difference in their opinions about distributive justice ($p = .901$, $F_{(3-314)} = .193$), interactive justice ($p = .233$, $F_{(3-315)} = 1.435$), procedural justice ($p = .363$, $F_{(3-315)} = 1.067$), reward justice ($p = .269$, $F_{(3-315)} = 1.316$) and total perceived justice ($p = .327$, $F_{(3-315)} = 1.157$).

Table 4. Results of the One Way ANOVA exploring if the perceived organizational justice varies depending on the variable of Department

	Fac. of	93	11.88	3.96	319		4388.62		
	Theo.	320	12.43	3.70					
	Other								

A closer look into Table 4 showed that, with respect to the variable of department, there was no statistically significant difference in their opinions about distributive justice ($p=.670$, $F_{(2-316)}=.402$), interactive justice

($p=.700$, $F_{(2-317)}=.356$), reward justice ($p=.584$, $F_{(2-317)}=.538$) and total perceived justice ($p=.358$, $F_{(2-316)}=1.03$) with the exception of procedural justice ($p=.008$, $F_{(2-317)}=4.84$). With respect to the variable of department, students' perceived organizational justice varies significantly only in terms of procedural justice ($p=.008$, $F_{(2-317)}=4.84$). Undergraduates of the Faculty of Theology displayed a significantly higher level of perceived organizational justice in the management of educational processes when compared to their counterparts studying in the Faculty of Science and Literature and other faculties.

RESULT AND RECOMMENDATIONS

This study aimed to define the level of perceived justice of undergraduates of Sakarya University with respect to classroom management. The perceived justice of the students was then explored in a way to account for the level of justice in classroom management. It was further aimed to analyze the differences in the perceived justice with respect to variables such as department, gender, academic success, family's educational status, and family's economic status. The findings of this study showed that the perceived justice differs with respect to the department. It was found that the perception of the undergraduates of the Faculty of Theology were significantly different when compared to others. The perceived organizational justice of the students differed only in procedural justice; and no significant difference was found for the other dimensions of organizational justice. Procedural justice is about managing the educational processes and efficient teacher-student relationship. Tomul, Çelik and Taş (2012) suggested that there is an elevated interaction between teacher and student in the classroom and that teacher needs to serve both as a manager, a teacher and a guide for the student in this setting. It can be concluded that perceived justice of classroom activities are important in terms of effectiveness if these roles are to be used effectively. It is recommended that the studies in this field are expanded to compare private and public universities with a larger sample size.

Abstract

In this study, we tried to determine the exchanges of teachers work in formal primary schools and the roles of directors in requests of their exchanges of place. Reasons of teachers' exchange of place and the role of the director in these exchanges; gender, professional level, type of school, branch of the teacher and exchange situation according to the number of change of place are searched as factors. In our research, we used screening model. Surveys are applied to 150 teachers who work in formal primary schools in Kandıra states in İzmit and in Karapürçek states in Sakarya in 2016- 2017 Education Year. The survey method conducted on this research is developed by Candaş (2015). The survey is composed of 3 parts. The first part includes teachers' personal information; the second part includes questions that measure the reasons of exchange related to school, private reasons and reasons related to the director. In the third part, teachers are enabled to express their reasons except from the reasons mentioned. Likert type four-item scale is used. Participants are asked to evaluate their views about exchange using one of 4 options: (1) Very Effective, (2) Mostly Effective, (3) Rarely Effective, (4) Not Effective. In the analysis of data SPSS 20.0 pack program is used and frequencies and percentages of demographic qualities are examined, and average and standard deviation of points taken from scales are calculated. To determine whether points taken from Teachers' Exchange Reasons Scale vary according to their gender, branch and the type if their school, we used Mann-Whitney U test, and Kruskal- Wallis H test to determine whether the points vary according to their professional level and exchange number. According to the results of the research, while teachers' exchange reasons doesn't vary according to their gender, school type, branch, their professional level and exchange numbers, the city which is worked is significant variable that leads teachers to request an Exchange.

Key words: Exchange schools, Teacher, Principal, Reasons

Introduction

Schools, the building blocks of education, and administrators, teachers and other employees, whom play an important role in the working of schools, hold organizational qualities. Any and each factor involved in this process is significant in terms of the efficiency of school administration (Bursalıoğlu,2015). In this respect, what are the reasons behind the preference of teachers, one of the factors involved in the school administration, to relocate? This question is what this study tries to answer in general. The correlation between a countries education level and its development level is based on the fact that education is a service spanning over an extended period of time with a larger reach when compared to other fields in terms of its corporate structure and employment potential (Ulug, 1998: 153). Primary education which is devised to bring up a standard type of citizen sharing the values of the society they live in at least to an extent, having socialized the individual, plays an important role in the sustainability of the society (Erdem, 2005: 1).

Education is recognized as one of the most important factors in the development of a nation in the necessary direction in line with the development of the world at that time (Öztürk, 2002: 14). With such awareness, teachers desire to educate their students in line with these ideals. The correlation between the development levels of nations in varying aspects and their education level increases every other decade (Demirtaş, 2002: 362).

The main purpose of personnel mobility is to use the resources at hand in the best way possible (Kaya and Göçen, 2012). In this context, the Ministry of education may relocate its employees in or out of the city based on their demand or excuse, due to promotion, vocational necessity, ongoing investigation, return to work during retirement, etc.(Candaş, 2015).

Today, any in and out of city re-appointment request of teachers employed in government schools is governed by the Ministry of Education's Teacher Appointment and Re-appointment Regulation announced in the Official Gazette dated 17/04/2015 and numbered 29329 (ikgm.meb.gov.tr/2017).

Any teacher who request re-appointment are now able to log in to their personnel profile on Mebbis (Ministry of Education IT System) and arrange a ranked list of schools they want to be transferred to using the application module. After submitting their applications, they need to declare such application to the principle of the school they are currently stationed in order to receive their approval. Thus, the teacher will need to have a printout of his/her application and submit this printout to their manager having signed it, in return, the manager will need to have a copy of this printout handed back to teacher having signed, sealed and approved it. This is followed by a waiting period until the re-appointments are announced in accordance with the re-appointment calendar once the application is approved (Candaş,2015).

A closer look into the reasons for local re-appointment requests of the teachers show that teachers often request to be relocated to schools with better funding from schools with poor funding. The setting of the school and the negative attitude of the administrators are among the other reasons for requests of re-appointment (Candaş,2015).

A number of issues are known to pester the schools in Turkey due to their physical conditions. The insufficient number of primary and secondary education institutions leads to crowded classes in schools (Öğülmüş and Özdemir, 1995).

It is also found that the management skills of the school administration can be another source of problem. It is possible to use the material and human resources of a school efficiently and effectively only if the administrators of a school has managerial skills. Results of a number of studies show that school managements have some shortcomings in this respect. An example of this finding was reported in the research named "Organizational and Managerial Problems of Turkish Education Management" which assessed the sufficiency of managerial know-how of educational administrators of principles and vice-principles employed in the Ministry of Education, principles and vice-principles employed in educational institutions, and principles employed in primary schools resulting in 35.8% inadequacy (Kaya,1993).

This study was conducted in order to define the reasons behind the re-appointment of teachers employed in state schools operating under Ministry of Education and the role managerial staff plays in such re-appointments. The correlation between the reasons behind the re-appointment requests of teachers and relevant variables was found. It was observed that the working/living condition of the spouse is most influential in requests to relocate. Moreover, funding level of schools and the attitude of school managers are factors driving in and out of city re-appointment of teachers.

Teachers as the practitioners of education have a position which may touch the lives of many adults of the future. Nevertheless, the generations brought up in these schools will provide and represent the future of our nation. In order to ensure a bright future, first we need to ensure the existence of efficient educational organizations. And this is only possible with sufficient number of managers, teachers, and personnel employed in educational institutions and the creation of a positive organizational culture and climate. An efficient education is possible only when there is no teacher shortage and when the commissioned teachers are willing to occupy their existing

positions for a reasonable period of time (Candaş, 2015). Therefore, a study was conducted covering the districts of Karapürçek and Kandıra in order to reveal the factors affecting the re-appointment of teachers.

Problem Sentence

The problem sentence of this study is “What are the reasons behind the re-appointment of teachers employed in primary schools and what is the role their managers play in such re-appointment decisions?”

Sub-problems

1. Are reasons behind the re-appointment of teachers employed in primary schools...
 - differ significantly depending on gender?
 - differ significantly depending on professional seniority?
 - differ significantly depending on the level of the school? differ significantly depending on the field?
 - differ significantly depending on the total number of re-appointments? What are the reasons arising from the school?
2. What are the personal reasons behind the re-appointment of teachers employed in primary schools?
3. What is the correlation between the reasons behind the re-appointment of teachers employed in primary schools and the attitude of school’s administrator(s)?

METHOD

This section of the study involves the research model, universe and sample, data collection tools, and data collection and analysis.

Research Model

This study follows the descriptive review model. Review models, in general, are research approaches which are suitable to describe a past situation or an ongoing one as it is Karasar (2008). This study was built on descriptive review model with the purpose to identify the reasons behind the re-appointment of teachers working in public schools and the role school administrators play in such re-appointment decisions. Descriptive review model tries to describe events, objects, assets, institutions, groups and several others. Using this model, it is possible to better understand these aspects, to group and classify them and to identify the relationships between them (Kaptan, 1998).

Universe and Sample

The universe of this study consists of 100 teachers and administrators working in the Karapürçek district of the city of Sakarya and 200 teachers and administrators working in the Kandıra district of the city of Kocaeli during the academic year of 2016-17. The sample was randomly selected from the pool of 5 primary schools operating in the Karapürçek district of the city of Sakarya and 20 primary schools operating in the Kandıra district of the city of Kocaeli in January, 2017 and a total number of 150 subjects participated in the survey. The number of applicable surveys included in the study was 150.

Data Collection Tools

The data collection tool developed in order to collect relevant data from the primary school teachers and administrators participating in this study consist of 3 sections.

The Section 1 of the survey included demographic questions such as gender, professional seniority, type of school, field, number of past re-appointments, and the current district/city of the teacher and administrator. Section 2 of this survey included a total number of 32 questions, of which 11 questions aiming to identify the school-related reasons behind the re-appointment request, 11 questions aiming to identify the personal reasons behind the re-appointment request, and 15 questions aiming to identify the role of

administrator(s) in the re-appointment request. Section 3 of this survey asked for the remarks of the participants elaborating their experience regarding this subject.

Confidence/Reliability

Cronbach's Alpha value of this study aiming to identify the "Reasons Behind Re-appointment of Teachers" was found to be 0.820.

Analysis Techniques

Data was collected from teachers commissioned in 5 schools operating in Karapüçek district of the city of Sakarya and 20 schools operating in Kandıra district of the city of Kocaeli. All the measuring tools were applied by the author.

Findings & Remarks

This section includes the findings obtained from the statistical analysis of the data collected in line with the purposes of the study and relevant remarks. The findings section offers frequency and percent distribution data in order to represent the general structure of the sample. Other findings were then listed in accordance with the purposes of the study.

This section of the study offers descriptive frequency and percentage distributions of the demographic qualities (gender, age, years of experience, field, number of students, number of teachers, number of administrators) of teachers and schools forming the sample.

Table 1. Frequency Table for the Reasons behind Re-appointment of Teachers

Item	Range	F	%	Item	Range	f	%
Gender	Female	72	48	Number of Re-appointments	Never	47	31.3
	Male	78	52		1-3 times	87	58
Commissioned In	Kandıra / Kocaeli	92	61.3	Type of School	4-6 times	15	10
	Karapürçek / Sakarya	58	38.7		Other	1	0.7
Years Of Experience	0-5 Years	77	51.3	Field	Primary	51	34
	6-10 Years	50	33.3		Secondary	99	66
	11-15 Years	15	10.0	Form Teacher	40	26.7	
	16 And More	8	5.3	In-Field Teacher	110	73.3	

As shown in Table 1, 72 individuals (48%) in the sample were female while 78 individuals (52%) were male, hence the total sample size was 150 teachers. 77 (51.3%) of the teachers in the sample had 0-5 years of experience, 50 (33.3%) had 6-10 years of experience, 15 (10%) had 11-15 years of experience, and 8 (5.3%) had 16 years of experience or more. 51 (34%) of the teachers in the sample were commissioned in primary school group, while 99 (66%) were commissioned in secondary school group. 40 (26.7%) of the teachers in the sample were form teachers, while 110 (73.3%) were in-field teachers. 47 (31.3%) of the teachers in the sample answered 'never' to the question of 'How Many Times You have Relocated in Your Career?', while 87 (58%) answered

‘1-3 times’, 15 (10%) answered ‘4-6 times’, and 1 (0.7%) answered ‘other’. 92 of the teachers in the sample answered ‘Kandıra/KOCAELİ’ to the item regarding the city/district they are commissioned in, while 58 (38.7%) answered ‘Karapürçek/Sakarya’.

Findings Regarding the Hypotheses of the Study

Mann-Whitney U-test was used in order to define if the scores of the teachers in the sample differ by their gender, type of school, and the city they are commissioned in; and Kruskal-Wallis H-test was used in order to define if the scores of the teachers in the sample differ by their age, education level, years of experience.

As shown in Table 3, Cronbach's Alpha value of this study aiming to identify the "Reasons Behind Re-appointment of Teachers" was found to be sufficient.

Mann-Whitney U-test performed with the aim to define if the total score of the teachers in the sample differs significantly depending on the 'type of school' variable did not give statistically significant difference between groups included (Sig.=0,143; Sig. > 0,05).

Mann-Whitney U-test performed with the aim to define if the total score of the teachers in the sample differs significantly depending on the 'gender' variable did not give statistically significant difference between groups included (Sig.=0,13; Sig. > 0,05).

Kruskal-Wallis H-test performed with the aim to define if the total score of the teachers in the sample differs significantly depending on the 'years of experience' variable did not give statistically significant difference between groups included (Sig.=0.291; Sig. > 0,05).

Mann-Whitney U-test performed with the aim to define if the total score of the teachers in the sample differs significantly depending on the 'field' variable did not give statistically significant difference between groups included (Sig.=0.663; Sig. > 0,05)

As shown in Table 8, Kruskal-Wallis H-test performed with the aim to define if the total score of the teachers in the sample differs significantly depending on the 're-appointment history' variable did not give statistically significant difference between groups included (Sig.=0.695 ; Sig. > 0,05).

Table 4. Results of the Mann-Whitney U-test which Aims to Define If Scores of the Teachers Differ Depending on the District of School

	N	Mean	Std. Deviation	Minimum	Maximum

			Asymp. Sig. (2-tailed)	.002		

As shown in Table 7, Mann-Whitney U-test performed with the aim to define if the total score of the teachers in the sample differs significantly depending on the ‘Low Socioeconomic Level of the District of School/the Parents’ variable, as subfactor of ‘School-Related Reasons Behind Re-appointment Request’ gave statistically significant difference between groups included (Sig.=0.000; Sig. It can be observed that this statistically significant difference favors Karapürçek/Sakarya sample (Sig=0.002; Sig.<.05).

Result and Recommendations

The employee group which is influenced the most by the attitudes of school administrators consists of teachers they work with. Teachers are the most strategic elements of a school (Bursalioglu, 1987:69). *The purpose of this study was motivated by the interest of the authors to explore the reasons behind re-appointment of teachers. The purpose of this study was to identify the reasons behind re-appointment of teachers working in schools located in the districts of Kandıra and Karapürçek.*

Further purposes of this study include identifying the role of administrators in re-appointment processes and the most important reasons, reducing the number of re-appointments identifying the general and common factors in addition to personal reasons resulting in re-appointment and satisfying the teachers with teacher appointment and re-appointment system also including the administrators’ attitudes (Candaş, 2015: 2).

Similarly, Yazıcı (2006) suggested that administrators need to be trained in communication skills, physical structure of the schools needs to be improved, teachers’ opinions must be taken with regards to re-appointment

regulations, activities must be planned in public schools to improve the cooperation between teachers and administrators if it is to reduce the requests for re-appointment.

According to Yazıcı (2006), the rules governing the appointment and re-appointment of teachers should be developed continuously and be adapted to emerging necessities. Service score in addition to occupational success and performance of the teacher can be considered when evaluating a request for re-appointment.

Candaş (2015) suggested that schools need to be institutions which produce, generalize, protect, communicate information while meeting the human expectations in order to be able to meet the needs of the century. And this is only possible if the educational institutions offer a positive teaching environment with sufficient amount of personnel. Motivation, job satisfaction, and efficiency of those employed in educational institutions, and organizational climate is closely correlated with the know-how, skills, attitudes and behavior, and the leadership role administrators have to offer. All these factors affect both the years of experience in one school and therefore being sufficiently staffed. An efficient education is only possible when there is no teacher shortage and when the commissioned teachers are willing to occupy their existing positions for a reasonable period of time.

According to Candaş (2015), among the most important reasons behind a teacher's request for re-appointment are working/living condition of the spouse and the mandatory service in the city/district of the school. After being appointed to mandatory service locations as their first appointment, teachers tend to request for re-appointment at the end of this mandatory service term, moving back to where their families live. The second most influential factor in re-appointment requests, on the other hand, involves the working/living conditions of the spouse.

Using one-way ANOVA, data obtained on the factors such as type of school, professional seniority, gender and field as part of the study on “the reasons behind the re-appointment of teachers employed in primary schools and the role their managers play in such decisions”. As all the relevant p-values were found to be higher than .05, there was no statistically significant difference between the reasons behind re-appointment and the type of school, professional seniority, gender and field.

Statistically significant differences were found between the two districts included in this study when exploring the administration-related aspects of the re-appointment request as part of the study on “the reasons behind the re-appointment of teachers employed in primary schools and the role their managers play in such decisions”. A statistically significant difference was found between the two districts in terms of ‘Workload Being Too Heavy’ and ‘Being Constantly Criticized’ as the subfactors of personal reasons behind re-appointment request and such difference favored the district of Karapürçek.

A statistically significant difference was found between the two districts in terms of As shown in Table 11, Mann-Whitney U-test performed with the aim to define if the total score of the teachers in the sample differs significantly depending on the ‘Administrator Pitting You Against Your Colleagues’, ‘Unfair Attitude of Administrator’, and ‘Tension/Unrest Between Administrator and Teacher’ as the subfactors of managerial reasons behind re-appointment request and such difference favored the district of Karapürçek.

A statistically significant difference was found between the two districts in terms of ‘Low Socioeconomic Level of the District of School/the Parents’ as the subfactor of school-related reasons behind re-appointment request and such difference favored the district of Karapürçek.

The following recommendations are developed for future research and for practitioners in the light of the findings of this study. Recommendations for practitioners:

- It is recommended to provide training on conflict management and communication skills to administrators in order to reduce the number of re-appointment requests.
- It is recommended to improve self-development opportunities at schools in order to reduce the number of re-appointment requests.
- It is recommended to reduce the number of re-appointment requests through improvements in the physical structure of schools.
- It is recommended to publish regulations on re-appointment of teachers upon consulting also to their opinions.

Abstract

The sports context has been characterized as intense on emotional experiences. Emotional responses and the ability to regulate them, seem to be a central competence for sports success and can have impact on well-being and motivation. To study the relationship between subjective well-being, emotional regulation, motivational orientation, and sports performance, was carried out an exploratory study with 50 male athletes, aged between 14 and 15 years old, of a Portuguese soccer club. For that, the Subjective Happiness Scale, the Emotion Regulation Index for Children and Adolescents, and the Motivational Guidance Questionnaire for Sports were used. The results suggest that the motivational orientation, specifically, the ego orientation seems to be associated with high sport performance. Significant differences in terms of emotional regulation were also founded. The discussion of the results is accompanied by the signaling of implications for the psychological practices and the analysis of scenarios of future research in the field of excellence in sport.

Keywords: Sports performance, subjective well-being, emotional regulation, motivational orientation.

Introduction

The excellent performance in sport have been asking for attention to the scientific community, mainly in the psychology area and the sport sciences, generating a research growing in this domain, in the last decade (Matos, Cruz, & Almeida, 2011). According to the literature in this domain, the excellent performance is the result of a multiple internal and external elements interacting between them (Gagné, 2004, 2007; Serpa, 2016; Sternberg, 2001). An athlete is considered excellent when he achieves the exceptional performance during a long period of time (Sá, Gomes, Saavedra & Fernandez, 2015). The research (Duda & Treasure, 2006; Duraud-Rush & Salmela, 2002; Gould, Dieffenbach, & Moffett, 2002; Holt & Dunn, 2004) about athletes with great performance results have demonstrate that certain characteristics, psychological and emotional, are associated to these people. Mahoney, Gabriel and Perkins (1987) in a study developed with 713 athletes from different competitive levels, concluding that those who have exceptional performance results presented lower anxiety levels, more concentration, being more self-belief and motivated to the success, maintaining the focus in the individual performance despite the group results.

In the portuguese context, different studies (Amaral & Cruz, 2013; Barbosa & Cruz, 1997; Bodas, Lázaro, & Fernandes, 2007; Cruz, 1994, 1996; Dias, Cruz & Fonseca, 2009; Vasconcelos-Raposo, 1993) concluded that athletes with excellent results present higher motivation levels, self-confident and concentration, define the objective aims, adding value and interest in the individual performance, using frequently the imagination and the mental visualization, presenting good capacity in the anxiety control, having capacity to lead efficiently with the unexpected situations, developing and using competitive mental plans and routines.

However, and despite the evolution verified in the research, seems there isn't an athletic personality, assuming the elements by psychological order in a crucial role in the sport success (Andrade, 2013). In this context, the literature has signed (Durand-Bush & Salmela, 2002; Holt & Dunn, 2004; Oliver, Hardy, & Markland, 2010) that the psychological profile to the excellence in the sport is associated to the higher levels of motivation, involvement, concentration, emotional regulation, competences of self-regulation, resilience, self-confidence and self-concept. Different authors (Serpa, 2016; Weinberg & Gould, 2011) have looking to understand the motivation process in the sport justifying the reasons to the personal elements (e.g. interests, aims, personality) and situational (e.g. attractive tasks, social influences, coach leader. The study of the motivation in the sportive practice has adopted a research line oriented by the theory social-cognitive (Tenenbaum & Bar-Eli, 1995). The

theory of self-determination (Deci & Ryan, 1985) and the theory of the achieve the objectives (Nicholls, 1984, 1989) are focused specially in the involvement study and the adoption of certain behaviors, including the sport practice. The self-determination theory defends internal and outer the motivation elements, considering the personality variables in social context, as well as the caused and consequences of the behavior (Deci & Ryan, 1985). The authors defend the motivation is related with the satisfaction of autonomy, competence and the relationship, defined as the three basic psychological needs (Deci & Ryan, 1985, 2000). The realization objectives theory (Nicholls, 1984, 1989) advocate the behavior in the realization context is influenced by personal and motivational factors. According Nicholls (1984, 1989), the people orient their motivation based in two orientation types, the orientation to the task and the orientation to the ego. The orientation to the task is related with the success in the task domain, but the orientation to the ego assume the higher demonstration of the competence in front of others (Álvarez, Castillo, Duda, & Balaguer, 2009). In accordance with Winterstein (2002), the success expectative is associated to the athletes with motivational orientation to the task, while the failure fear is related with the athletes motivation oriented to the ego. The author defends that the probability of the athlete achieves the success or the failure depends on the past similar situations. The orientation to the task has been frequently associated with the master experiences, and the orientation to the ego concerned to the social approval (Saies, Arribas-Galarrag, Cecchini, Luis-De-Cos & Otaegi, 2014). However, these definitions haven't been consensual in the literature. Different authors (White & Duda, 1994; Cecchine, González, & Montero, 2007) have demonstrated that orientation to the ego presents superior (best) results in the athletes who ate in higher levels of competition and performance results. According to the research (Ahmadi, Namazizadeh, & Mokhtari, 2012; Álvarez et al., 2009; Gómez-López, Granero-Gallegos, Abalde, & Rodríguez-Suaréz, 2013; Monteiro et al., 2014; Vansteenkiste, Mouratidis, Van Riet, & Lens, 2014), the realization objectives are associated with different levels of self-determination, putting evidence that the promotion of motivation oriented to the task promote the self-determined motivation. The way as the athletes guide the motivation seems to be related with the individual determinants, as well as the context where the coach assuming the fundamental role considering the influence relation given (Serpa, 2016).

Simultaneously with the motivation, the emotions have a central role in the research concerning the sport success. The sportive context has been characterized as a rich and intense context concerning the emotional experiences, the positive and negative ones. Shepard and Golby (2009) evaluated the emotions of the rugby professional players in different competitive levels. The authors concluded that in the middle level present higher levels to the positive emotions when compared with the superior level players. In the same research line, Vasconcelos-Raposo, Coelho, Mahl, Fernandes (2007) and Almeida (2013), concluded that professional soccer players demonstrate lower negativism and more self-confidence comparing with the amateurs. However, Vast, Young e Thomas (2011), in a study developed with the basketball players, achieved to the result that the efficiency of hit in the basket grows when the positive emotions expressed in the experienced players. The emotional answers of a specific athlete and his capacity to regulate in order to be possible to experience the correct emotions, seems to be a crucial competence to the sportive success (Amaral & Cruz, 2013; Sagar, Lavallhe & Spary, 2009). The emotional study associated to athlete performance result have been gaining the interest of different authors (Cruz, 1996; Cruz & Barbosa, 1998; Dias, Cruz & Fonseca, 2009; Folkman & Lazarus, 1985; Jones, Meijen, McCarthy & Sheffield, 2009; Lazarus, 2000) aiming invest in the scientific knowledge to understand better this phenomenon. Based in this premise, the research has developed the efforts to the positive emotional study in sport, in contrast to what was verified in previous studies, where the point was in the negative emotional study (Matos et al., 2011). So, it has been pointed out that positive emotional neutralize the negative emotions effects, promoting the stress adaptation (Fredrickson & Branigan, 2005) and helping the coping strategies acquirement (Folkman & Moskowitz, 2000). The coping strategies (e.g. concentration in the task, thinking stop, re-evaluation positive) have assumed the relevant role, demonstrating its efficiency in sportive success (Nicholls, Holt, Polman, & Bloomfield, 2006; Dias et al., 2009). The interpretation and the evaluation of the situations influenced the cognitive processes, physiologic and emotional, and consequently their own performance (Folkman & Lazarus, 1985; Dias et al., 2009). The athlete capacity to understand the emotions

during the competition, the vulnerability, their emotions as the way as they manage them, presented as fundamental aspects to the sportive success (Lazarus, 2000). Although the intrapersonal elements, the more recent research have pointed out that emotional regulation is a social and interpersonal (Friesen, Lane, Devonport, Sellars, Stanley, & Beedie, 2013).

As it has been confirmed in the literature review, the sport is frequently associated to the motivational and emotional elements, giving importance to the positive and to the negative emotions. Considering this conceptual board, it's important to verify the role of the Subjective Well-Being (SWB), mainly concerning the positive and negative emotions. According with Diener (2000), the persons who present higher levels of SWB when experienced more positive emotions than negatives, as when develop activities that they consider interesting and satisfying. In accordance with Coleta, Lopes and Coleta (2012) the happiness is related with the satisfaction of life in general with the more different aspects, in particular, the friendships and the popularity sentiments. Concerning the demographic variables, the authors (Coleta, Lopes, & Coleta, 2012) presents the youth, the feminine sex and the higher socioeconomic level, as determinants facilitating to the subjective well-being and the happiness. So, it's expected that SWB suffer influenced by the person emotions experienced. By other side, Rosa (2016) in a youth research has concluded that physical exercise enhances the well-being, including the presence of a positive effect in the school performance. In a study developed by Jones and Sheffield (2008) with hockey and soccer players, the authors had evaluated the result effect in a game of well-being of themselves, so they concluded that after the failure, the players presented more anxiety, anger and depression, as well as there are somatic symptoms stronger. The emotions appear after the evaluation done to the person about the significance given to each situation, with positive and negative consequences to the well-being (Lazarus, 2000). Whenever there is a positive evaluation, in general, the person achieves the goals considered important, experienced feelings of satisfaction and positive affection (Lazarus, 1991). Nevertheless, the negative emotional answer is experienced whenever the person understand how incompatible is to achieve a specific task. (Hanin, 2004).

Based on the above assumptions, the present research/study aims to verify the relation existing between the motivational orientation, the emotional regulation and the subjective well-being, as well as evaluate the levels of distinction depending on the sportive results of the young athletes. So, the objective is contributing to the scientific enrichment in the domain area, as well to promote a better understanding of the psychological and emotional elements that seems to influence the behavior of the higher competition athletes.

Method

Although the study of the relationship between the variables of the study, aiming evaluate the differentiation levels in the SWB, the emotional regulation in the motivational orientation depending the results, the research sample was organized according to their behavior. So, it was constructed two analyze group, the A group associated to the performance in higher levels, and the B group related with the lower performance.

Participants

The study sample is constructed by 50 athletes of masculine gender with age 14-15 years old, from the formation schools of the Portuguese soccer club from the premier league. The participants were distributed by 2 groups according to their sportive performance and results. So, the 30 participants had constituted the group A, associated to the sub-15 level, presenting the merit sportive more elevated. The results were categorized according to the system structures of the soccer leagues where both teams act. The A group elements are included in the junior national championship, corresponding to the superior exigence level, and the B group participate in the district championships where the exigence is inferior when compared with the previous.

Instruments

The instruments of measure used to evaluate the variables in study were the subjective happiness scale (Pais-Ribeiro, 2012) to analyze the SWB. The emotional regulation was measured through the *Emotion Regulation Index for Children and Adolescents* (ERICA) (MacDermott, Gullone, Allen, King & Tong, 2010) translated and adapted to the Portuguese population by Reverendo and Machado (2010). Finally, it was used the Sport Motivational Orientation Survey (SPOS) (Fernandes & Serpa, 1997) translated and adapted to the Portuguese Population of Task and Ego Orientation in Sport Questionnaire (TEOSQ) (Massuça, Fragoso & Rosado, 2011).

The subjective happiness scale (Pais-Ribeiro, 2012) including 4 items and the answers were given in a similar visual scale with seven positions. The internal consistence of the scale was acceptable in this study, presented in a value of *alpha Cronbach* de 0.64 (Marôco, 2011). The value was slightly lower than the result obtained by Pais-Ribeiro (2012) when the transcultural validation of the scale ($\alpha = 0.76$) that was also inferior to the obtained value in the original study ($\alpha = 0.86$). It was observed coefficients of satisfied correlation in spite of there were lower values comparing to the study of Pais-Ribeiro (2012), with values between 0.44 e 0.66. By the other side, the values of extraction were clearly positive between 0.538 e 0.97 (Marôco, 2011) concluding that in the possible situation of elimination of any item there is an internal consistence scale decrease. So, despite the results being a little bit lowers than the study of the transcultural validation, the values achieved in the present research allow the assumption that the scale presents good properties psychometrics generating the possibility of using it to evaluate the subjective happiness of the participants in this study. The ERICA (MacDermott et al., 2010; Reverendo & Machado, 2010) is measure of the self-report composed by 16 items, coted in a scale *Likert* with five points, with inverse quotation of the item 14 and 16, permitting evaluate the emotional regulation of children and youngers, from 9 to 16 years old. This instrument is composed by tree sub-scales that allow the evaluation of the subscale of emotional control and that it's composed by seven items enabling the evaluation of the non-regulation of the negative affection as the emotional answers socially unappropriated. (e.g. "When the things aren't going as I want, I stay bored easily), the sub-scale emotional self-conscience is concerned to the emotional flexibility and figure five items (e.g. "I'm a happy person"), and finally, the sub-scale situational responsivity that is related with the social sensibility and with the emotional answers socially adapted, composed by the four items. In this study, concerning the psychometric characteristics, the factorial analysis presents the structure in tree elements that explain the 56.8% of the total variance, assuming this way the tree sub-scales defined by the authors. The internal consistence of ERICA, in this study, was in favor with the values of *alpha Cronbach* that change between 0.62 e 0.75 to the tree elements obtained though the factorial analysis (Marôco, 2011). The scales concluded sensibility to the items elimination, verifying the internal consistence reduce, so there is a maintenance of the initial structure.

The Enquiry of the Sport Motivational Orientation (QOMD – TEOSQ) is a version of the Task and Ego Orientation in Sport Questionnaire (TEOSQ), translated and adapted to the Portuguese language by Fernandes and Serpa (1997) (Massuça, Fragoso & Rosado, 2011). This instrument enhances the evaluation to the motivational orientation concerned to the task and/or to the ego in the sportive context. This is composed by 13 items distributed by two sub-scales. The first is concerned to the orientation to the task, composed to the seven items (2, 5, 7, 8, 10, 12, 13), and the second one measures the orientation to the ego composed by six items (1, 3, 4, 6, 9, 11). To evaluate each item is used to the scale of 5 points, in each 1 correspond to "completely disagree" and 5 "totally agree" (Massuça, Fragoso & Rosado, 2011). In this study, the internal consistence of the subscales proved beneficial presenting values of *alpha Cronbach* variating between 0.70 e 0.84. In its totality, the items present a coefficient of satisfactory correlation (Marôco, 2011) with the total of the scale, with values situated between 0.44 e 0.51.

Proceedings

To be possible to realize this study it was achieved all need ethic proceedings guaranteeing the privacy and confidentially of the collecting data. It was obtained the authorization to collect the data with the soccer

institution responsible where this study was developed. The data collect was implemented with youth (formation classes) of a Portuguese soccer institution, in Oporto city, competing in the first league. The instruments were applied individually and the time given to collect the data was approximately of 15 minutes. In order to treat the data, it was used the Statistical Package for the Social Sciences (versão 22.0). It was made described statistical analysis including measures of central tendency (media), the dispersion measures (minimum value, maximum value and standard deviation). It was analyzed the normality of the distribution of the data through the test of Kolmogorov-Smirnov e Shapiro-Wilk. There was an inferential statistical analysis, namely, corrections of Pearson, and the test t-Student to compare the averages of both groups depending the variables in study. It was fixed the level of significance of 0.05 ($p \leq 0.05$) to be considered the significant statistical data. (Marôco, 2011).

Findings

Aiming evaluate the differences in the subjective happiness levels in both groups, we proceed comparing them depending their sportive results. The reading of Table 1 allows understand that group A ($M = 21.2$, $DP = 3.28$), associated to a superior performance, present an average slightly superior to B group ($M = 21.0$, $DP = 2.27$), however, the difference verified hasn't significance statistic ($t = 0.237$, $p = 0.81$). So, in present research, the subjective happiness seems doesn't have variation depending the athletes' performance levels.

Table 1. Analysis of the subjective happiness differences according to the sportive results: Test t-Student

	Sportive Results	<i>N</i>	<i>M</i>	<i>DP</i>	<i>t</i>	<i>p</i>
Subjective Happiness	Group A (Higher Results)	30	21.2	3.28	0.24	0.81
	Group B (Lower Results)	20	21.0	2.27		

**** $p \leq 0.01$; * $p \leq 0.05$**

In the Table 2 is presented the significant statistic differences in the emotional regulation levels of group A (superior results) comparing to the group B (lower results). The results state the existence of differences statistically in the sub-scale emotional control ($t = 2.99$, $p = 0.004$), presented as superior in the group B ($M = 79.0$, $DP = 7.92$). And in the emotional self-conscience sub-scale, the results present significant statistic differences ($t = -2.07$, $p = 0.04$) endorsing the group B ($M = 92.3$, $DP = 9.74$) when compared to the group A ($M = 86.2$, $DP = 10.49$). Concerning the situational responsivity, it's demonstrated that group B presents a superior average ($M = 88.3$, $DP = 10.17$), however, the results aren't statistically significant ($t = -0.39$, $p = 0.69$). The results conclude that athletes with inferior sportive performance present superior emotional regulation levels, comparing with the group of athletes with superior sportive results.

Table 2. Analysis of the emotional regulation differences according to the sportive results: Test t-Student

	Sportive Results	<i>N</i>	<i>M</i>	<i>DP</i>	<i>t</i>	<i>p</i>
Emotional Regulation						
Emotional Control	Group A (Higher Results)	30	71.9	8.39	-2.99	0.00**
	Group B (Lower Results)	20	79.0	7.92		
Emotional Self-Conscience	Group A (Higher Results)	30	86.2	10.49	-2.07	0.04*
	Group B (Lower Results)	20	92.3	9.74		
Situational Responsivity	Group A (Higher Results)	30	87.0	11.42	-0.39	0.69
	Group B (Lower Results)	20	88.3	10.17		

**** $p \leq 0.01$; * $p \leq 0.05$**

The Table 3 presents the results of the significant statistic differences of the motivational orientation depending the sportive performance. It's possible to see that group B presents a higher average ($M = 23.0$, $DP = 2.41$) in the motivational orientation to the task, but it's not verified the statistical significance ($t = -1.60$, $p = 0.11$). Concerning the motivational orientation to the ego, the results are statistically significant ($t = 2.12$, $p = 0.04$), beneficial to the group A. The results suggest that the athletes with superior performance present higher levels of motivational orientation to the ego.

Table 3. Motivational Orientation Differences according to the sportive results: Test t-Student

	Sportive Results	<i>N</i>	<i>M</i>	<i>DP</i>	<i>t</i>	<i>p</i>
Motivational Orientation						
Motivational Orientation to the Task	Group A (Higher Results)	30	21.9	2.47	-1.60	0.11
	Group B (Lower Results)	20	23.0	2.41		
Motivational Orientation to the Ego.	Group A (Higher Results)	30	15.8	3.06	2.12	0.04*
	Group B (Lower Results)	20	14.0	2.96		

** $p \leq 0.01$; * $p \leq 0.05$

Aiming evaluate the correlation between the emotional regulation and the motivational orientation the study was supported by the coefficient of correlation of *Pearson*. Through the reading of Table 4 we verify that sub-scales are composed by an emotional regulation scale, being linked with the sub-scales of the motivational orientation. The sub-scale orientation to the task presents a significant and positive relation with the sub-scales of emotional self-conscience ($r = 0.48$, $p = 0.00$) and the situational responsivity sub-scale ($r = 0.59$, $p = 0.00$). The results permit considerer that emotional self-conscience and the situational responsivity are higher in athletes with an orientation to the task. The subscale referent to the emotional control doesn't present significant statistical relation ($r = 0.17$, $p = 0.23$) with the orientation to the task. However, the emotional control presents a significant and negative relation ($r = -0.280$, $p = 0.05$) with the sub-scale orientation to the ego. These results seem to indicate that the athletes who invest in a motivational orientation to the ego have a lower emotional control. However, it's important to state that the two other sub-scales that compose the emotional regulation scale are not significantly linked with the orientation to the ego.

Table 4. Correlations between the Emotional Regulation and the motivational orientation: Correlation of Pearson

Emotional Regulation	Motivational Orientation	
	Orientation to the Task	Orientation to the Ego
Emotional Control	0.17	-0.28*
Emotional Self-Conscience	0.48**	-0.17
Situational Responsivity	0.59**	0.06

** $p \leq 0.01$; * $p \leq 0.05$

Conclusions and Recommendations

The excellence in the sport has been associated to the higher motivational levels, commitment, concentration, emotional regulation, self-regulation competences, resilience, self-confident and self-concept (Durand-Bush & Salmela, 2002; Holt & Dunn, 2004; Oliver et al., 2010), as well as the strategies development, the formulation of the aims clearly and specifics, and, appraising and demonstrate interest in the individual performance (Barbosa & Cruz, 1997; Bodas et al., 2007; Cruz, 1994, 1996; Dias et al., 2009; Vasconcelos-Raposo, 1993).

However, and despite the higher interest by the scientific community to the sport excellence study, it's not assumed an explicative and integrative theory. This difficulty can be connected with the complexity of the excellence that, as pointed out in the literature, the excellent performance is result of a multiplicity of elements – internal and external – interacting (Gagné, 2004, 2007; Serpa, 2016; Sternberg, 2001). In this context, different authors (e.g., Friesen et al., 2013; Matos et al., 2011; Monteiro et al., 2014) have been trying to understand this phenomenon through the study of different sentimental, emotional, motivational, social and contextual psychologic variables.

In this study, there is a special attention to the sentimental and emotional variables, and motivational as in the literature (e.g., Amaral & Cruz, 2013; Deci & Ryan, 1985; Dias et al., 2009; Nicholls, 1984, 1989; Sagar, Lavalle & Spary, 2009) has assumed the crucial role to the understanding the associated happenings to the higher performance.

According to the results of the present study, the emotional regulation and the motivational orientation seem to be associated to the sportive results. It was concluded that emotional regulation, specifically, the dimensions of emotional control and self-conscience change according to the results of the athletes, showing the higher results in the athletes with the inferior sportive performance.

The research (e.g., Amaral & Cruz, 2013; Dias et al., 2009; Lazarus, 2000; Matos et al., 2011) realized in this domain have occurred by suggestion by the emotions that assume the essential role in the sportive context, giving particular attention to the strategies of the coping and the role of the emotions management. As said, the results of this study state that athletes with sportive results lower seem have a better control to their emotions, so we can consider that athletes probably have more frequently the coping strategies. This emotional adjustment can be due elements extrinsically, as the family, the coach, as mentioned in the literature as enable elements to the sportive performance (Serpa, 2016). At the same time of these results, the motivational orientation presents significant relations as the emotional regulation dimension. Upon these results and considering the scientific research (e.g., Amaral & Cruz, 2013), the way as the athletes guide their motivation seem present a relation in the way how they regulate their emotions.

Giving focus to the motivational orientation according to the sportive results, as different authors present (e.g., Cecchine et al., 2007; White & Duda, 1994), in this research it was possible to achieve the result that as a motivational orientation to the ego, it is presented different superior levels of sportive performance. However, in this data is not consensual in the scientific community, as there are authors (e.g., Nicholls, 1984; Winterstein, 2002) who defend that higher performances are associated to a orientation to the task. Concerning to the subjective well-being and considering the literature (Diener, 2000; Jones & Sheffield, 2008; Lazarus, 2000; Hanin, 2004), it would be expectable that athletes with superior results would experience higher happiness levels, but this phenomenon was not verified. The results of the present study prove that the happiness levels are not variable according to the sportive results. This fact can be due to the involvement of the emotions, as according to Lazarus (2000) the emotions are result of evaluation about the significant given to each situation, with positive and negative implications to the well-being. Based in this explanation and considering the above text related to the emotional regulation, the athletes with a good capacity to manage the emotions cannot present significant implications at happiness level and their well-being.

In this context, it's not important to think about the coping strategies and the role that they can have in the happiness perception. Hanin (2004) says that there is a negative emotional answer experienced whenever the person realize how incompatible is to achieve a task. It's important to considerer that the possible influence of other variables in these results, as demographic and context variables that through this research (Coleta, Lopes & Coleta, 2012; Rosa, 2016) have demonstrate their influence in the well-being and the happiness.

It's important to point out to the study investment of the strategies used to the promotion of the excellent sportive performance in order to reinforce the knowledge about the efficacy and the implications in these elements of psychological nature.

So, it's important to potentiate the research in this domain featuring the mixt methodologies aiming to deep the knowledge about the perceptions of this public according to their performance, to their needs, as well as the used strategies. Finally, it's important to considerer that the longitudinal studies realization with representative samples of the population, allowing a behavior analysis over time during the different periods of the competition they are exposed. There is a reflection about the importance of the investment in psychological competences promotion programs adjusted to this public as well as other significant.

Abstract

The aim of this study is to determine the opinions of teachers and school administrators about the competences of school administrators. A survey model was used with a sample of 110 teachers working in Palandöken town in Erzurum. The data were gathered through “Bass Multidimensional Leadership Behavior Determination Scale”. Data analysis was conducted through descriptive statistics, such as t-test and ANOVA analysis. According to the obtained findings, although school administrators perceived themselves more proficient than teachers perceived them to be in all dimensions, the opinions of school administrators and teachers differentiated in the dimensions “Interacting with People–Working Efficiently” and “Service to Profession”. The opinions of school administrators didn’t differentiate according to school type, having in-service training and having training of administration, but differentiated according to seniority. The opinions of teachers about school administrators differentiated according to school type and seniority, but didn’t differentiate according to whether they had administrative experience.

Keywords: Proficiency of school administrators, School administrators, Teachers

1. Introduction

‘Leadership’ comes first among the most frequently studied and interesting topics that emerged in the early 20th century in business, management and school management fields. Only the number of serious studies on leadership is more than 3,000. For this reason, there is a diversity in the definition of leadership in the literature. When Warren Bennis and Burt Nanus examined more than 1,000 studies, they found that there were more than 350 different definitions of leadership (Bennis and Nanus, 1985, 21).

Leadership is an organization that develops ethical standards to guide the behavior of its employees, integrates ethical standards with values and enforces these ethical standards effectively. If we accept that school leaders are also leaders, we can measure how sufficient or insufficient their attitudes and behaviors towards leadership are from the perspective of teachers.

The topic of leadership and motivation has become very important in today's competitive environment. Leadership and motivation topics are assumed among the most important factors affecting the success of organizations. In addition to the success of organizations, business owners and top management need to give importance to leadership and motivation in order to make their employees happy and to make more contribution to business. Workers and / or managers who are not satisfied with the work place are exposed to physical and mental problems after a while. Therefore, they are not committed to business and they may feel unsatisfied and exhausted. The method to be used by the people who cannot use their potential and are not satisfied with the job is to leave the job as soon as possible.

Leadership can be described as an energetic process that provides adopting and realizing common goals willingly in which individuals come together in the framework of the vision created jointly.

Leadership is usually defined in terms of process and feature. In terms of process, a leader is a person who directs the activities of the members of the organization in line with the aims of the organization. As a means of

feature, a leader should have characteristics that can successfully affect group members.

According to Alkin and Ünsar (2007), leadership is the process of supporting and influencing employees in an enthusiastic way to achieve business goals. Leadership constitutes a significant part of the management process, but not all. A leader's primary role is to influence his or her followers to act on their own in the direction of the defined goals. A leader is the person who can affect his/her followers more than they affect him/her. Leadership is extremely important from the angles of organizations in order to achieve certain common goals. Because leadership has a strong influence on the behavior and performance of individuals and groups. However, the goals that group efforts are directed are the targets being adopted or desired by the leader.

The concept of leadership is for the future. Leaders are responsible for ensuring that the institution remains viable, determining how things are done and what values are valued, creating a vision and adopting that vision within the organization. When evaluated in this respect, it is only possible for the company to gain corporate identity, give pride and happiness to its employees, maintain its profitability in the long run and maintain its existence by being managed by people who have leadership qualities (Baltaş, 2000: 109-113).

Business life is a competition all over the world. In order to be productive in this competitive environment, all production factors need to be managed wisely. Among the factors of production, human resource is of the greatest challenge. Because the management requires that thoughts, feelings and emotions be managed wisely. At this point, organization communication has a significant role. Effective management requires collaboration and teamwork among employees. Hence, effective communication to motivate employees has become even more important (Rajhans, 2012, 81).

The school administrator is responsible for the productivity of the staff, the procurement of all sorts of resources and the achievement of the intended output through these resources. However, the overall productivity of the school is mainly obtained through the active working of the staff. For this reason, the principal must meet the needs of the teachers and ensure that their motivation is high. In a school, the various roles and functions of the school administrator can be mentioned, which are providing resources, planning, coordination, guidance and leadership. Managers must also possess some skills and competences in terms of human, technical and conceptual aspects in order to be able to perform these roles.

2. Method

In this part of the study; the research model, the universe and the sample, the data collection tools, the collection of data and the analysis of data are presented.

2.1. Model of Study

This research is in the screening model. Screening models are research theories that aim to describe the past or present situation without affecting it (Karasar, 2002, 77).

General screening models are screening arrangements on a group, sample or sample taken from all or the universe in order to arrive at a general judgment about the universe in a phase consisting of a large number of elements (Karasar, 2004, 79).

2.2. Universe and Sample

The universe of the research was formed by the teachers who were working in the secondary school institutions in Erzurum, Palandöken, affiliated to the Ministry of National Education in 2016-2017 Academic Year.

Within this universe, all secondary schools and sampling groups were involved. The researcher applied to 110 secondary school teachers included in the sample group of the study.

2.3. Data collection tool

In this study, personal information form and Bass versatile leadership behavior scoring scale were used.

2.3.1. Personal Information Form

Before the personal information form was prepared, the subject experts were asked and similar samples were checked. In personal information form, intended for the purposes of the study, the teachers were directed nine questions interrogating; their gender, seniority, education branches, type of educational institution of the

teachers, gender of principals, working hours of the teachers with the same director, educational background and faculty status of the director, with working hours of the teachers at the same school with opportunities of institution. According to the information obtained in the form, the situation of differentiation was examined in the perception of leadership competences among the teachers.

2.3.2. Bass Multi-Directional Leadership Behavior Identification Scale

It is a measure prepared by Bernard BASS in 1985 to reveal leadership styles according to multifaceted factors. The scale was translated from English into Turkish by Akdoğan (2002) by three English language instructors who were subject experts. In the measurement items; a five-point Likert type was used, with "never, rarely, sometimes, usually, always". The scale consists of 36 items and examines leadership qualifications.

As a result of the explanatory and confirmatory factor analysis, the scale was calculated as one factor.

2.3.3. Gathering of Data

The conceptual framework of the research whose literature review will be searched from the domestic and foreign sources about the research topic was established. The questionnaire was applied with the prepared personal information form and the Bass multi directional leadership behavior scoring scale. After receiving the necessary permission and approval for this survey application, in 2016-2017 academic year Palandöken District, it was applied to all the teachers who work in the secondary school institutions separately. The duration of the questionnaire is approximately 5 minutes for each teacher.

2.3.4. Analysis of the results

The data collected for the sub-problems, which were searched for the answers without going out of the research purpose, were recorded on the computer and the SPSS 23.0 program was used for statistical analysis.

3. Findings

3.1. Findings related to demographic variables

Table 3.1.1 Distribution Variable Frequency and Percent Distribution by Gender

Gender	<i>f</i>	%	% validity	% accu.
Female	49	44,5	44,5	44,5
Male	61	55,5	55,5	100,0
Total	110	100,0	100,0	

45% of the teachers who participated in the survey were female, 55% of them were male.

Table 3.1.2. How Long Have You Been a Teacher? Frequency and Percent Distribution

How Long Have You Been a Teacher	<i>f</i>	%	% validity	% accu.
1-5 years	73	66,4	66,4	66,4
6-10 years	15	13,6	13,6	80,0
11-15 years	11	10,0	10,0	90,0
16 years and over	11	10,0	10,0	100,0
Total	110	100,0	100,0	

Of the teachers who participated in the survey, 66% of them are in the 1-5 year seniority group, 14% of them are in the 6-10 year seniority group, 10% of them are in the 11-15 year seniority group and 10% of them are in the seniority group over 16 years.

Table 3.1.3. Learning State Variable Frequency and Percent Distribution

Learning State	<i>f</i>	%	% validity	% accu.
Educational Institute	4	3,6	3,6	3,6
Vocational school	5	4,5	4,5	8,2
Faculty	83	75,5	75,5	83,6
Masters	18	16,4	16,4	100,0
Total	110	100,0	100,0	

4% of the teachers participating in the research are education institute graduates, 5% of them are high school graduates, 76% of them are faculty graduates and 16% of them are master program graduates.

Table 3.1.4. Branch Variable Frequency and Percent Distribution

Branch	<i>f</i>	%	% validity	% accu.
Science	34	30,9	30,9	30,9
Social	54	49,1	49,1	80,0
Private talent	15	13,6	13,6	93,6
Total	7	6,4	6,4	100,0

31% of the teachers participating in the research are in science field, 50% of them are in social areas and 14% of them are in the special ability branches.

Table 3.1.5. Variance Frequency and Percent Distribution of Working Time with the Same Director

Working Time with the Same Director	<i>f</i>	%	% validity	% accu.
1-3	103	93,6	93,6	93,6
4-6	5	4,5	4,5	98,2
10 and over	2	1,8	1,8	100,0
Total	110	100,0	100,0	

The proportion of the teachers who worked in the survey with the same manager was between 1 and 3 years (94%), between 4 and 6 years (4%) and over 10 years (2%).

Table 3.1.6. Frequency and Percent Distribution of Faculty Variety Frequency in which the Master Graduated

Faculty Variety Frequency in which the Master Graduated	<i>f</i>	%	% validity	% accu.
Education	59	53,6	53,6	53,6
Science-literature	9	8,2	8,2	61,8
Theology	29	26,4	26,4	88,2
Engineering	13	11,8	11,8	100,0
Total	110	100,0	100,0	

Regarding educational background of Institutional directors of the teachers who participated in the research, 54% of them graduated from faculty of education, 8% of them science and literature faculty graduates, 27% of them theology faculty graduates and 12% of them engineering faculty graduates.

Table 3.1.7. Variable Frequency and Percent Distribution of Your Missing Years in this School

Your Missing Years in this School	<i>f</i>	%	% validity	% accu.
1-4	98	89,1	89,1	89,1
5-8	9	8,2	8,2	97,3
9-12	1	,9	,9	98,2
12 and over	2	1,8	1,8	100,0
Total	110	100,0	100,0	

54% of the faculty distributions of the directors of the participating teachers are education faculty, 8% of them from faculty of science and literature, 26% is faculty of theology, and 12% is engineering-technical education.

Table 3.1.8. Institution Facilities Variable Frequency and Percentage Distribution

Institution Facilities	<i>f</i>	%	% validity	% accu.
very low	7	6,4	6,4	6,4
low	17	15,5	15,5	21,8
average	43	39,1	39,1	60,9
good	33	30,0	30,0	90,9
Very good	10	9,1	9,1	100,0

The opinions of teachers participating in the research about institution opportunities are as follows: very low 6%, low 16%, middle 39%, good 30% and very good 9%.

Table 3.1.9. Descriptive Statistics Results

	N	Min	Max	X_{ort}	sh_x	SS	Conceptual meaning
Bass Multidimensional Leadership Behavior Discovery Scale	110	2	4	2,74	,403	110	

3.2. Difference Tests

No statistically significant difference was found in any of the leadership style sub-dimensions according to result of the independent groups t-test conducted to test the difference of school principals' leadership styles according to the gender of the teachers.

Table 3.2.1. Independent Groups for Discrimination of Gender Variance T Test

Statistic Factor	Gender	N	X_{ort}	SS	sh_x	F	p	T	sd	p
Bass Multidimensional Leadership Behavior Discovery Scale	Male	49	2,73	,425	0,61	,011	,916	-,180	108	,011
	Female	61	2,75	,387	,050					

Accordingly, it can be said that the gender of the teachers is not a factor that makes difference in the perception of the leadership style of school principals.

Table 3.2.2 How Long Have You Been Teaching? Anova Test for Your Variety

ANOVA RESULTS											
	Year	N	\bar{X}_{ort}	SS	sh_x	Var.K	KT	Sd	KO	F	P
Bass Multidimensional Behavioral Leadership Discovery Scale	1-5 years	73	2,76	,418	,049	In-group	,148	3	,049	,298	,827
	6-10 years	15	2,72	,351	,091	Non Group	17,543	106	,166		
	11-15 years	11	2,65	,433	,131	Total	17,691				
	16 years and over	11	2,71	,370	,111						
	Total	110	2,74	,403	,038						

Independent group test was applied to test the differentiation of school principals' leadership styles according to the occupational seniority, no significant difference was found in all of the scale due to occupational seniority.

Table 3.2.3. ANOVA Test for Learning Status Variable

ANOVA RESULTS											
	Graduation	N	\bar{X}_{ort}	SS	sh_x	Var.K	KT	Sd	KO	F	P
Bass Multidimensional Behavioral Leadership Discovery Scale	Education Institute	6	2,90	,365	,149	In-group	,403	3	,134	,823	,484
	Vocational school	6	2,72	,391	,160	Non Group	17,288	106	,163		
	Faculty	90	2,72	,408	,043	Total	17,691	109			
	Masters	8	2,90	,382	,135						

No statistically significant difference was found in any of the leadership style sub-dimensions as a result of the ANOVA test applied to test the difference of school principals' leadership styles according to the education status (graduation) of the teachers. According to this, it can be said that the educational background of the teachers is not a factor that makes difference in the perception of the leadership style of the managers.

Table 3.2.4 ANOVA Test for Branch Variable

ANOVA RESULTS											
	Branch	N	\bar{X}_{ort}	SS	sh_x	Var.K	KT	Sd	KO	F	P
Bass Multidimensional Behavioral Leadership Discovery Scale	Science	34	2,76	,409	,070	In-group	,480	3	,160	,986	,402
	Social	54	2,76	,392	,053	Non Group	17,211	106	,162		
	Vocational	15	2,59	,405	,105	Total	17,691	109			
	Flair	7	2,85	,456	,173						

No statistically significant difference was found in any of the leadership style sub-dimensions as a result of the ANOVA test to test the difference of school principals' leadership styles according to the branch variable of the teachers.

Table 3.2.5. ANOVA Test for Variance of Working Time with the Manager

ANOVA RESULTS											
	Year	N	\bar{X}_{ort}	SS	sh_x	Var.K	KT	Sd	KO	F	P
Bass Multidimensional Behavioral Leadership Discovery Scale	1-3 year	103	2,75	,394	,039	In-group	,276	2	,138	,847	,432
	4-6 year	5	2,76	,618	,276	Non Group	17,415	107	,163		
	10-more	2	2,38	,177	,125	Total	17,691	109			
	Total	110	2,74	,403	,038						

As a result of the ANOVA test, which was applied to test the difference of school principals' leadership styles according to the variable of working time with the same manager, there aren't any significant differences statistically found.

Table 3.2.6. ANOVA Test for Style Sub-dimensions in the Leadership

ANOVA RESULTS											
	Graduation	N	\bar{X}_{ort}	SS	sh_x	Var.K	KT	Sd	KO	F	P
Bass Multidimensional Behavioral Leadership Discovery Scale	Education Institute	4	2,90	,372	,186	In-group	,547	3	,182	1,127	,342
	Vocational school	5	2,76	,424	,190	Non Group	17,145	106	,162		
	Faculty	83	2,70	,421	,046	Total	17,691	109			
	Masters	18	2,88	,297	,070						
Total	Total	110	2,74	,403	,038						

No statistically significant differences were found in the leadership style sub-dimensions as a result of the ANOVA test conducted to test the difference between the teachers' perception of leadership styles of school principals and their learning status (graduation). According to this, it can be said that the educational background of the principals is not a factor that makes the difference between the leadership styles of the principals and the teachers.

Table 3.2.7. ANOVA Test for the Faculty Type Variant in which the Master Graduated

ANOVA RESULTS											
	faculty	N	\bar{X}_{ort}	SS	sh_x	Var.K	KT	Sd	KO	F	P
Bass Multidimensional Behavioral Leadership Discovery Scale	education	59	2,78	,437	,057	In-group	,659	3	,220	1,368	,257
	Science- letters	9	2,60	,402	,134	Non Group	17,032	106	,161		
	theology	29	2,66	,327	,061	Total	17,691	109			
	Engineering -technical edu.	13	2,87	,376	,104						
Total	Total	110	2,74	,403	,038						

As a result of the ANOVA test conducted to test the differentiation of the faculty type variable that the principals graduated to teachers' perceptions of the school principals' leadership style, there is no statistically significant difference for the whole scale.

Table 3.2.8 ANOVA Test for the Faculty Type Variant in which the Master Graduated

ANOVA RESULTS											
	Year	N	X _{ort}	SS	sh _x	Var.K	KT	Sd	KO	F	P
Bass Multidimensional Behavioral Leadership Discovery Scale	1-4 year	98	2,75	,417	,042	In-group	,361	3	,120	,735	,533
	5-8 year	9	2,78	,235	,078	Non Group	17,330	106	,163		
	9-12 year	1	2,47	.	.	Total	17,691	109			
	12-more	2	2,38	,177	,125						
	Total	110	2,74	,403	,038						

As a result of the ANOVA test to test the difference of the leadership styles of the school principals according to the variation of the working time of the teachers in the same school, no statistically significant difference was found.

Table 3.2.9. ANOVA Test for Institutional Facilities Variable

ANOVA RESULTS											
	Opportuniy	N	X _{ort}	SS	sh _x	Var.K	KT	Sd	KO	F	P
Bass Multidimensional Behavioral Leadership Discovery Scale	very low	7	3,12	,549	,207	In-group	3,135	4	,784	5,654	,000
	low	17	2,94	,407	,099	Non Group	14,556	105	,139		
	average	43	2,74	,381	,058	Total	17,691	109			
	good	33	2,68	,333	,058						
	very good	10	2,37	,226	,071						
	Total	110	2,74	,403	,038						

As a result of the ANOVA test applied to test the differentiation of school principals' leadership styles in the perceptions of teachers according to the variable of institutional possibilities,

A post hoc Tukey test was performed to determine which sub-dimensions were significant differences.

Tukey HSD

(I) variation	(J) variation	Mean Difference (I-J)	Std. Error	Sig.
very low	low	,179	,167	,822
	average	,378	,152	,100
	good	,431*	,155	,049
	very good	,748*	,183	,001
Low	very low	-,179	,167	,822
	average	,199	,107	,341
	good	,252	,111	,164
	very good	,570*	,148	,002
Average	very low	-,378	,152	,100
	low	-,199	,107	,341
		,053	,086	,973

	good	,370*	,131	,043
Good	very good			
	very low	-,431*	,155	,049
	low	-,252	,111	,164
	average	-,053	,086	,973
very good	very good	,318	,134	,134
	very low	-,748*	,183	,001
	low	-,570*	,148	,002
	average	-,370*	,131	,043
	good	-,318	,134	,134

A statistically significant difference of at least $p < 0.05$ was found in favor of those with very good school facilities and those with low school facilities and those with very low school facilities.

4. Conclusion and Suggestions

The gender factor is not an effective variable on the teachers' perceptions of the school administrators according to the results obtained without working. Similarly, according to Çetin (2009), Kaya (2002), Tahaoğlu and Gedikoglu (2009), the gender of teachers does not cause any difference in the perception of the leadership qualities of the managers. However, according to Özen and Kılıç (2012), gender variables reveal significant differences in teachers' perception of leadership qualities of managers.

When the results obtained according to the seniority of the teachers are evaluated, the teachers who have 16-20 years of seniority in the leadership sub-dimension that gives freedom are emerging. In other leadership sub-dimensions, the seniority factor does not cause any significant difference. According to the results obtained without working, the educational background does not cause any difference in the perception of the leadership styles of the teachers of the administrators.

According to the views of the teachers participating in the study, the branch change does not cause any difference in the perception of the school principals' leadership styles of the teachers. There are significant differences between teachers' perceived leadership and the duration of working with the same manager. According to these differences, in the charismatic - inspiring transformational leadership sub - dimension, there are significant differences in favor of the same manager and the same manager for 1-3 years between the teachers who work between 1-3 years and 4-6 years. Similarly, in the intellectual stimulation transformer leadership sub-dimension, there is a positive difference between 1-3 years in the positive direction compared to the same manager in 4-6 years with the same manager.

The educational background of managers does not have a significant influence on leadership perceived by participants. Proposals for results obtained without working can be ordered as follows. In order for the concept of educational administration to function well, it is necessary to establish bilateral relations that enable the governed and ruled to express their wishes easily. It is necessary to take into account the criteria for determining and comparing the management skills of candidates, rather than criteria that are not related to seniority or managerialism in the selection of managers in state schools.

Among the most important responsibilities of the manager, the authority to exercise initiative in the case of momentary decisions is not given to the managers who manage in state institutions. Given the ability to use initiative as an initiative in terms of flexibility in the case of instantaneous decisions, it may provide better management. Keeping the relationship of school administrators with teachers at a certain level can have an important facilitating effect on the work of managers and teachers.

The faculty to which graduates are admitted has an influence in the perception of the managerial characteristics of the teachers according to the results obtained in the study result. From these results, choosing candidates who graduated from the faculty of education in the election of administrators has an effect which may cause the teachers to approach the managers more positively. There is also a relationship between the possibilities of

schools offered by teachers and the perceptions of teachers' management. Thus, as opportunities increase, teachers have a more positive perception of managers. This will in turn positively affect teachers' attitudes towards managers of meeting managerial requests for the improvement of school facilities by the Ministry.

Abstract

Some social and educational dissatisfaction occurs when the school focuses almost exclusively on the development of the convergent thinking of the students, forgetting the creativity in a divergent and contextual sense. In this debate there is always some tension that occurs under the difficulties of the experts to reach consensus on a definition of creativity, and then to point out guidelines for their evaluation and training. The controversy that surrounds the evaluation of the construct of creativity has justified the search for alternatives, by some authors, to the similar tests of Torrance, in the fluidity, flexibility, originality and elaboration, resorting to stimuli essentially unfamiliar to the individuals (Lubbart, Besançon, and Barbot, 2011). It is assumed a theory of evaluation of the creative potential of the students of basic education, based on verbal and graphic subtests that evaluate the main forms of creative cognition: - Divergent exploratory and convergent integrative thinking. Assuming that creativity is a phenomenon that involves higher levels of consciousness and complexity (Cabrera, 2009); considering the work of Sternberg and Lubart as a theoretical foundation and arguing the results of Costa-Lobo, Coimbra and Almeida (2017), are addressed and epistemologically based didactic options for the pedagogical training of teachers and for the organization of curricular and extracurricular activities of the school, in order to develop creativity in educational contexts.

Keywords: Teacher training, Creativity, Creative potential, educational contexts

Introduction

The study of creativity as a complex phenomenon is proposed in a broader sense than what has been traditionally studied. This makes more sense in the educational field, given the new pedagogical trends that require an approach that integrates the new requirements in the educational institutions, their management teams and teaching staff, and the public policies that respond to a demand that not only deals with the Creative thinking and their possibilities of stimulation and evaluation, but also, consider the advances of knowledge, new technologies and educational improvements that involve contextualized innovations. In this sense, we propose to base the application of creativity in educational contexts, and at school in particular, with an epistemology that integrates the different approaches based on awareness, complexity and transdisciplinarity (Cabrera, 2011) and recent research that addresses some Forms of evaluation and teacher training (Costa-Lobo, Coimbra and Almeida, 2017). For this, the objectives of the shared studies are: to identify how the creativity is understood; to describe an epistemological model that integrates the different fields of knowledge in its field; describe the main guidelines in the evaluation of creative thinking; elaborate a proposal of basic guidelines to develop creativity in educational contexts.

According to Costa-Lobo, Sousa, Campina, Vestena, and Cabrera-Cuevas (2016) the implementation of specific strategies and promoting an appropriate educational environment for the development of creativity signals the importance of the construct to be increased in psychoeducational practices, challenging and multifaceted environments. Almeida et al. (2017) report the need to pay attention to the cognitive and learning processes of gifted children through the identification of measures that allow effective support for their psychological development and school learning; these authors characterize the cognitive abilities of gifted children and their particular forms of learning, evidencing how the current emphasis is no longer placed on quantity but on the functionality of cognitive abilities. Costa-Lobo et al (2016) and Costa-Lobo et al (2017) signaled harmony promotion practices between educational research and psychological intervention, with regard to the development of skills and attitudes that encourage thinking and creative potential.

Complex and transdisciplinary approach to pedagogical training in creativity

The transdisciplinary approach is a characteristic of knowledge, since, as it raises of Herran, "when investigating in a discipline, it ends up in the transdisciplinary" (2010, p.166). Regarding the study of creativity, it is necessary to consider a transdisciplinary and complex approach, since in order to approach its field, diverse disciplines are required, diverse material, spatial, technological resources, diverse methodologies and approaches to define and evaluate it. The complexity as a paradigm, intervenes in the educational task at the epistemological, ontological and methodological level given the multidimensional character of reality that, in Morin's words, forms a joint fabric (2004). Therefore, educational priority should not only be directed to processes of knowledge construction and learning, but also to "issues related to ecological sustainability, planetary citizenship, as a consequence of evolution, intelligence and human consciousness In an integrated perspective "(Moraes, 2007, p.6). The author herself offers us a proposal of possible educational purposes in the following dimensions and their respective indicators: a) Ontological, anthropological and eco-spiritual dimension (Learning to recognize, acquire and commit to aesthetic and spiritual values), b) Cognitive, emotional and Psychophysics dimension (Learning to think, to feel and to know, to learn to take care of the body), c) Ecological and planetary dimension (Learning to take care of the environment, of the planet and to live / to live), Creative and aesthetic dimension (Learning to learn to innovate, think and produce aesthetic and artistic objects), (Moraes, 2015, p 111). To consider, therefore, a complex and transdisciplinary approach, implies a greater adaptation to the particular contexts of this globalized era, where the proposals arise from the pooling with the values that each institution has for purpose, with an adaptive, flexible and open sense to the updates of the educational center itself. On the other hand, it is not only a question of focusing on a part of the system and what should be improved, but also, as Morin (2015) puts it in what must be preserved. In this respect, all changes will be understood in the vision, attitudes and cultural relations of those who make up the educational center, giving meaning to new projects, strategies and new contributions to evaluate creative thinking (Costa-Lobo, Coimbra and Almeida, 2017).

It is urgent to attend to the essential themes of perennial pedagogy, to promote reflective, critical and complex thinking, in order to be better prepared, among other topics, for new ways of perceiving reality and relating to each other that are causing the increase of digital technologies, as proposed by Ken Robinson (2015) regarding to the growing problems, for example, with cyberbullying (Ortega, Calmaestra, & Mora, 2008) and studies that explain how it affects students' emotions (Caetano, A., Freire I., Veiga A., Martin, M. & Pessoa, T., 2016). A teacher with a transdisciplinary and creative vision, will be able to respond better to the new challenges, and in agreement with de la Torre (2006) "to contribute to the knowledge of the qualities and potentialities of his students" (p.692). Considering the study of creativity, from this transdisciplinary perspective, is especially important because it is observed that in the advances of research in its field, there has been an expansion of studies beyond the definitions of the types of individuals with creative characteristics, and beyond researchers dedicated to stimulating creative thinking, or to link it to certain areas, such as artistic or advertising. We attend to the phenomenon that occurs at the transpersonal level, that is, collective, systemic and with repercussions on ecological sustainability. According to the study carried out in this sense, we have found that both theories of creativity, the different approaches and the most emerging trends have transdisciplinary attributes (Cabrera, 2009).

In the research carried out with the specific objectives of deducing transdisciplinary references and valuing these transdisciplinary references for training in creativity, (Cabrera, 2016), these are resolved in a favorable way. These transdisciplinary references are those that have to do with principles of personal improvement, formative and with a sustainable ecological relation. The specific referents of transdisciplinarity for training in creativity have to do with a teacher who facilitates learning processes, with the flexible use of the resources they have, with adaptation in the organization of time and space and the number of students, a teacher attentive to the motivations of the students, as well as situations that emerge from the context and social, political, economic and cultural contingency, an attentive teacher in generating a climate of respect, participation and collaboration, both

in the classroom and Outside of it, a teacher who values content, such as attitudes, participation, skills and competencies and adapts their assessments with different strategies in a permanent feedback process. Given the growing demand to incorporate creativity in different areas of society, and in the educational field in particular, we base the present proposal on a research that contributes to the epistemology of creativity, as a field of study, which has had two international awards (Cabrera, 2011): The Model of tendencies in creativity from a complex-evolutionary consciousness CCC, or Model of tendencies in creativity.

Epistemology of Creativity

The physicist David Bohm (2002), points out that "creativity is something impossible to define with words" (p.31). According to our disciplinary field and the way we perceive, understand and apply creativity in our field, it can be presented in different categories and approximations, as happened in a congress where more than four hundred meanings were collected (Sikora, 1979). For the researcher M. Romo (2006) "Creativity is a way of thinking whose results are things that have both novelty and value" (p.23) and as a special form of problem solving supported by other non-cognitive traits. For other authors, such as de la Herran (2006) is not enough a way of thinking, or respond to what or how, or who or what. For this author, creativity goes through levels according to its orientation and purpose. First, that which is produced as something isolated, that can be produced by discovery, then that which refers to an achievement for a given system (personal, ideological, institutional) where its basic process is productivity, and that creativity that interests to the formative sphere, which is that creativity that favors human evolution, individually and collectively.

In an exploratory study carried out in the course of research, as we approach the term of creativity, we find that some myths persist about this phenomenon, as they may be the subject of a few chosen persons with this gift or talent; which are attributes of those who have artistic skills; that it is about having very original ideas; that is to handle a number of important techniques that stimulate creative thinking, or that is linked to better spaces, material or technological resources (Cabrera, 2011). Creativity seen in this way is a biased proposal. On the other hand, several authors (De la Torre, 2006, Gervilla, 2003, Landau, 2002, MacKinnon, 1975, Money, 1957, Runko, 2009, Sternberg, 1977, in Cabrera, 2011) have been recurrent in categorizing the Creativity in separate qualities responding to the Who, the How, the What and the Where. These referents have to do with: a) creative person: has to do with personality traits, intrinsic and extrinsic motivation, creativity associated with certain pathologies, self-realization, stimulation of thought, measurement of creative thinking, b) creative process: involves seeking information, transforming, evaluating, executing, intuitive or analytical processes, preparation phases, incubation, enlightenment and verification, didactic processes such as problematizing, acclimatization, stimulation, estimation-valorization, orientation, c) creative product: It refers to if it has novelty, value, new implications, originality, complexity d) creative environment: Concerning the environment, psychosocial, didactic environment, physical environment; Climate, humor, game, material conditions, communication, respect, freedom.

We agree with the difficulty of defining creativity, first because it cannot be classified only in profiles or personality types, excluding other ways of being and communicating individual talents, even less of a way of thinking or 'creative thinking' (Romo, 1997), as the same author agrees subsequently (2006); second, because from Pedagogy, products cannot be categorized as creative without the context where they are used, and many products would be left out because of their lack of constructive input, a matter inherent in a creativity that contributes to the common good; third, because the advances in knowledge and studies on creativity show that the divergent thought not the only way of reaching creative processes and results as an example, and fourth, because there is a current of thinking that is working on the theme of the creative adversity for years (de la Torre, 2009, 2010), which indicates that not only adequate spaces and climates favor creativity, but adversity and resilience also constitute a great reference and potential of the same. On the other hand, several authors (Amabile, 1996, Csicszentmihalyi, 1998 and Sternberg, 1999) include the system as an annex to all of the aforementioned, which are called componential models, however, other researches in the creativity subject

(Alfonso, 2006, Landau, 2002, López, 1995) point out that what they offer, is not only to add the motivation nor the relevance of the context, since this responds to an insufficient understanding of the creativity. Faced with this, we broaden the field of study toward studies that link creativity as a potential and a transformative, social and ethical human value, all accompanied by awareness (de la Torre 2006, de la Herran, 2008), and other areas as varied as 'Creative Nature' (Moraes, 2007) or 'The Creative Cosmos' (Laszlo, 1997).

From the known models to explain the field of creativity we find: a) Process, Result, Personality, Development, Creativometry (de la Torre, 1984) b) P-creativity, H-creativity (Boden, 1994), (d) Intrapersonal, logical, mathematical, spatial visual, musical, kinesthetic-bodily, interpersonal intelligence (Gardner, 1997) e) Relevant skills for the countryside; Skills relevant to creativity and Motivation for the task (Amabile, 1996) f) Educational creativity or first order, Outstanding or second order creativity, Extraordinary creativity or third order (de la Herran, 1997) g) Mystical, Psychodynamic, Psychometric, Pragmatic, Cognitive-social, Social-person, Confluence. (Sternberg, 1999), h) Individual, Field, Scope. (Csikszentmihalyi, 1998), i) Creativity as imagination; as mental capacity, as problem solving; as self-realization; as an investment; Such as psychosocial interaction and paradoxical creativity. (S. de la Torre, 2008), l) Punctual or spontaneous creativity or action for an achievement, systemic or partial creativity or achievement for a system, Evolutionary or total or systemic creativity for human evolution (A. de la Herrán, 2008). These theoretical proposals are interpreted globally as a set of rich models, which are based on complementary criteria.

Creative trends model CCC

When we speak of creativity evolving in complexity of consciousness, we are referring to the development of its theory encompassing, every time, new fields of study in a process that goes from the most particular to the most general. Based on the development of the consciousness studied by many authors (Freud, Jung, Piaget, Freire, Montessori, Rogers, Maslow, Erickson) synthesized in a study by Dr. González-Garza (2006) Wilber (2005, 2006) reveal an evolution corresponding to a dimension that conforms biological, psychological, organismic-social and transpersonal or spiritual human nature. The Model of tendencies in creativity from a complex-evolutionary consciousness or 'Model of Tendencies in creativity CCC' covers the different fields of study as well as their more extensive and deep applied fields considering in a first subdivision, the approaches and theories known and consensual by Researchers (a type of individuals, all people, system), to the most emergent (complexity). We present a summary for each referent, with its theories, authors and force ideas. It should be noted that the theories and authors were elaborated from primary and secondary sources and reviewed several times by experts in creativity.

Consensus Approaches

Category: A sort of individuals

These studies contributed to clear myths about artistic genius to advance research on creativity and talent in all people.

Category: All People

In this category it is where the greatest contribution is received, especially from Gardner's denunciation in 1950, regarding the need to study creativity as a capacity other than intelligence (Sternberg, 1999).

We propose to associate theories with those that focus creativity in impulses (picodynamics and studies from pathology), measurement (psychometric tests), stimulation (pragmatic approach and its different techniques of stimulation of creative thinking), evaluation (The indicators of creative products), human development (humanist approach and creativity from self-realization).

Emerging approach

Category: Complexity

In this category creativity considers the particular types of individuals, all people, society, nature, integrating cognitive, corporative, emotional, spiritual and ethical components. (Megatrends, Transpersonal Approach to Consciousness, Complex Approach, Ecosystem Approach, Interactive and Psychosocial Theory, Complex-Evolutionist Theory) (Cabrera, 2009). In this emerging approach, we have considered two researchers who have been incorporating the transdisciplinary and complexity references in their research around creativity. In turn, and after an in-depth interview with each of them, it was considered pertinent to highlight the authors who are most significant for them, and in which they lay the foundations that make them committed to creativity from the complexity.

Table 4. Category Complexity

REFERENT	Theories and Models	Outstanding Authors reference works YEAR	FORCE IDEAS KEYWORDS
Transdisciplinary	Interactive and Psychosocial Theory.	S. de la Torre, 1982 a la Act. References: Osho, E. Morin; 1981 a la Act. It is defined beyond its action, product and system or reference ism. It has two destinations: personal growth and social improvement, formation and evolution of consciousness. Education for Universality. Education on Humanity.

Source: Own elaboration from Cabrera (2011, p.163)

This model is an open and flexible proposal that can be expanded and renewed constantly incorporating new research in each category. Some authors could, for example, be in more than one category.

What is intended is to give a panorama, as a general map of the field of knowledge of creativity, so that it can be understood, not only in a linear, chronological and separate way in certain specific fields of study, but in an integral way, with a sense that the researchers themselves have been weaving in history. In this sense, there are no lower or higher levels, but each professional, from his disciplinary field, will contribute to the larger context of the phenomenon.

CONCLUSIONS

There is a need for more training in Creativity for the educational field in particular and in other dimensions that have to do with greater social, cultural and ecological responsibility. Although cognitive studies of creativity have been predominantly understood, the way of understanding it has an increasing tendency towards transdisciplinarity and complexity, integrating other social and personal domains. The trends in Creativity reflect that Creativity is related to ethical implications and social improvement, as well as self-training. The references of complexity and transdisciplinarity have valuable implications in contexts of didactic innovation, methodologies and evaluation. Regarding the conclusions with the new ways of evaluating, Stands out the EPoC battery, battery that allows creative giftedness to be measured, in elementary and middle-school students, in several fields of expression. This battery aims to evaluate the creative potential of school-age children. Measurement relates to two fields of expression, graphic and verbal, and implies two ways of thinking: divergent-exploratory (find numerous original responses based on a given stimulus) and convergent-integrative (produce an original work integrating several elements in a creative synthesis).

This complex and transdisciplinary vision of creativity, we can apply it in different areas on a personal and social-cultural level. From the astounding talents that increasingly appear every day in children and adolescents

from different countries, small inventors, scientists and artists with extraordinary qualities and with whom pedagogy has a great responsibility, as well as with all children empowering Their abilities and competences to express their uniqueness and their relationships with others, to generate an inclusive and respectful environment, and of course not, also considering the environment of which it is part, to generate more contextualized learning in a system that integrates local heritage, Artistic and cultural, in the neighborhoods, the city, and consider as part of the principles, a conscience and ethics that contributes to the care needs of the ecosystem and the planet. With this model of trends in creativity, we can promote a favorable impact in educational communities, whenever a system-wide renovation is proposed: its mission and vision, its community (managers, students, families and other members), their methodological strategies (project-based learning, others), their resources (space, technology, materials), their activities, their network connections, etc. This requires the participation of the entire community, both in training, and in the design and implementation of innovative projects.

Abstract

Reading comprehension is the cornerstone of much scientific research and, as a fundamental axis that converts reading competence, a reason for generation of theories, methodologies and computer tools that evaluate and train in a specific or generic way.

The main objective of this study is to demonstrate the effectiveness of the digital tool LeoBien Supertics to improve reading competence by training the speed and effectiveness of reading in primary education in Spain in 2017, taking into account constructs such as attention, memory and reading speed.

In a total of 3,000 students at the primary education level, the first 500 students enrolled of each grade in the primary stage were selected, with 250 boys and 250 girls from grades 1 to 6. A pretest and a post-test were performed, with an interval of six months in which a training, without control group, was conducted for reading, memory and attention skills as elements for improvement in reading comprehension. The results point to a significant improvement, especially in the first year of primary education, and, in general, to an improved performance with more favorable scores for girls.

Keywords: comprensión lectora, competencia lectora, velocidad lectora, memoria y atención.

1.- Introducción

Reading comprehension, understood as the ability of a human being to understand as objectively as possible what an author meant by a text and as an essential part of reading competence (Jiménez-Pérez, 2014), implies both intrinsic factors (self-motivation, absence or not of disorders) and extrinsic (learning process, training). Within extrinsics, reading speed, as part of training, influences “cognitive processing that needs fluency at the time of reading” (Areces et al., 2017; Holguin, Cerquín, & Rodríguez, 2015, p. 131), as speed is a structural part of reading fluency (Calero, 2003, p. 33) and this fluidity, as the cornerstone of reading skill, focuses mainly on the text (Escurra, 2003, p. 100). Thus, reading speed can be trained using activities (González, Cuetos, López-Larrosa, & Vilar, 2017; Miguel, 2017) and stands as a fundamental element of the comprehension of a text (Gómez, 2011; Aguilar, Navarro, Menacho, Alcalé, Marchena, & Ramiro, 2010), as shown by, among other things, the fact that readers who need to spend more reading time than others for the same text feel frustrated and reduce their reading habits. (Escurra, 2003, p. 105).

Likewise, memory plays a fundamental role in cognitive processes that converge in an optimal reading competence. According to specialists (Bull & Lee, 2014; Alloway & Copello, 2013; Alloway & Passolunghi, 2011), working memory, especially verbal (González, Otero, Castro, 2016, 4), unequivocally influences the acquisition of reading ability and its development. It also operates as a buffer for recently read words or sentences, allowing them to be integrated to establish coherence and, in turn, maintains information retrieved from long-term memory to facilitate its integration with the currently active text (Vernucci, Canet-Juric, Andrés, & Burin, 2017, p. 3).

So memory maintains an active role in the understanding of written texts. In addition, feedback is bidirectional since, if memory influences the comprehension of texts, reading comprehension influences the expansion of memory “by forming new connections in the brain and strengthening existing ones” (Galindo & Martínez, 2014, p. 14). This translates to the fact that readers with a low reading

comprehension profile exhibit difficulties in the use of memory (Canet-Juric, Burin, Andrés, & Urquijo, 2013, p. 997). For this reason, training memory will improve reading competence, just as training reading skills will improve memory.

On the other hand, attention is another of the constructs of reading comprehension and is intimately related to an individual's ability to understand a written text (Rojas & Cruzata, 2016; Canet-Juric, Burin, Andrés, & Urquijo, 2013; Valera, Rueda, Pelayes, Reinoso, Muñoz, & Quiroga, 2010). In addition, it is a variable that, together with concentration, persistence and tolerance for frustration, helps the acquisition of reading competence (Tapia, 2016; Aguilar & Portilla, 2013; Alcaraz, 2014; Corners, 2009). Thus, attention is defined "as a cognitive control function responsible for the hierarchical organization of the processes in charge of elaborating the information" [Ison & Korzeniowski, 2016; Posner & Rothbart, 2014; Petersen & Posner, 2012; Portellano Pérez, 2005], enabling the understanding of the perceived" (Merchan-Price & Henao-Calderón, 2011) in reading a written text.

Therefore, a tool that combines reading speed training (as the basis of reading fluency), memory (involved in the process of understanding), and attention (understood as a cognitive process that favors the acquisition of skills as a reader) should be able to objectively train for reading comprehension at fundamental levels.

The purpose of this research is to demonstrate the effectiveness or not of the computer program, LeoBien de Supertics, which is based mainly on the training of memory, attention, and reading speed, to improve reading effectiveness as a basis for reading comprehension, in the target group, which includes the primary education level in Spain, that is, for children between 6 and 12 years. Thus it is anticipated that, in general, test results before the intervention will show lower scores than those obtained after training, and that this will hold true in particular for students in the first course, as it is the most mechanical stage where readers take a quantitative leap in speed.

2.- Method

2.1.- Participants

This transversal study involved 3,000 pupils aged between 6 and 12 years, of which 50% were boys and 50% girls. Of these, 500 students belonged to each of the primary education levels, of which 250 were boys and 250 girls. Students were selected from different educational centers across Spain.

2.2.- Design and process

The study used a quasi-experimental design of pretest–posttest repeated measures without control group. Before and after implementing the intervention program, an evaluation test was applied to the participants in order to measure the variables of both speed and effectiveness in reading on which it was hypothesized that the program would have an effect by offering an increase of reading comprehension for students.

3.- Results

In order to analyze change in the variables under study, descriptive analyses (means and standard deviations) were performed with scores obtained from administration of the pretest and posttest, as well as analyses of the posttest-pretest differences for the variables measured before and after the intervention.

Tables 1 and 2 show the data obtained in each of the sub-abilities that integrate the facets of reading comprehension evaluated: speed and effectiveness, before and after six months of intervention using the LeoBien program in first grade level of Education, differentiated by gender.

Tabla 1

Results obtained by first-year students of Primary Education in speed at the end of the training period in boys and girls in a differentiated manner.

SPEED	<i>Letter + phrase</i>	<i>Syllable + text</i>	<i>Word</i>	<i>Attention</i>	<i>Memory</i>	<i>Sequencing</i>
<i>Girls after 6 month intervention</i>	.345*	.264	.174**	.472*	.623*	.521*
<i>Boys after 6 month intervention</i>	.723*	.324*	.284*	.376*	.452*	.382

* $p < .05$ ** $p < .01$ *** $p < .001$

Tabla 2

Results obtained by primary school students in effectiveness at the end of the training period in boys and girls in a differentiated manner.

EFFECTIVENESS	<i>Letter + phrase</i>	<i>Syllable + text</i>	<i>Word</i>	<i>Comprensión</i>	<i>Velocidad</i>	<i>Attention</i>	<i>Memory</i>	<i>Sequencing</i>
<i>Girls after 6 month intervention</i>	.461*	.321***	.731**	.535***	.354***	.632**	.541**	.632**
<i>Boys after 6 month intervention</i>	.427***	.368***	.546**	.428**	.583**	.742***	.642***	.546*

* $p < .05$ ** $p < .01$ *** $p < .001$

As can be seen in Tables 1 and 2, through the Leobien program, students progress in comprehension, although in a differentiated way, the improvement in effectiveness rather than speed being much more prominent. Improvements occur in a similar way in the case of boys and girls, in terms of speed and effectiveness at the first grade level of primary education.

Tabla 3

Results obtained by the second-graders of Primary Education in speed at the end of the training period in boys and girls in a differentiated manner.

SPEED	<i>Letter + phrase</i>	<i>Syllable + text</i>	<i>Word</i>	<i>Attention</i>	<i>Memory</i>	<i>Sequencing</i>
<i>Girls after 6 month intervention</i>	.534*	.362	.268	.241	.734	.243
<i>Boys after 6 month intervention</i>	.646**	.283	.582	.534*	.672	.472

* $p < .05$ ** $p < .01$ *** $p < .001$

Tabla 4

Results obtained by the students of the second year of Primary Education in effectiveness at the end of the training period in boys and girls in a differentiated manner.

EFFECTIVENESS	Letter + phrase	Syllable + text	Word	Comprensión	Velocidad	Attention	Memory	Sequencing
Girls after 6 month intervention	.352**	.524***	.218***	.632**	.582**	.243*	.546***	.253***
Boys after 6 month intervention	.263**	.582***	.265***	.483***	.346**	.448**	.524***	.622**

* $p < .05$ ** $p < .01$ *** $p < .001$

Tables 3 and 4 show the data obtained in each of the sub-abilities that integrate the facets of reading comprehension evaluated: speed and effectiveness, before and after the application of the Leobien program at the second grade level of primary education, differentiated by gender. As shown, in second-year primary education pupils there is a very outstanding improvement in the facet of effectiveness, similar to what happened in the previous course, which is not observed in the facet of speed/dexterity, where progress is limited to the letter + phrase (see tables). with the first graders, there are no substantial differences in students' progress with respect to gender.

Tabla 5

Results obtained by third-graders of Primary Education in speed at the end of the training period in boys and girls in a differentiated manner.

SPEED	Letter + phrase	Syllable + text	Word	Attention	Memory	Sequencing
Girls after 6 month intervention	.325*	.437	.523	.334	.634	.452
Boys after 6 month intervention	.635	.361	.428	.342	.685	.375

* $p < .05$ ** $p < .01$ *** $p < .001$

Tabla 6

Results obtained by third-graders of Primary Education in effectiveness at the end of the training period in boys and girls in a differentiated manner.

EFFECTIVENESS	Letter + phrase	Syllable + text	Word	Comprensión	Velocidad	Attention	Memory	Sequencing
Girls after 6 month intervention	.435***	.327**	.546*	.481*	.417**	.472*	.461*	.487*
Boys after 6 month intervention	.516***	.254*	.634***	.512**	.365**	.534**	.387*	.502**

* $p < .05$ ** $p < .01$ *** $p < .001$

Tables 5 and 6 show the data obtained after the application of the Leobien program in the third year of primary education. As in previous grades, the improvement that the program provokes in speed is not significant, as opposed to what happens with effectiveness, where progress is relevant in all sub-abilities. Equally important are the lack of differences in terms of gender.

Tabla 7

Results obtained by the students of Primary Education room in speed at the end of the training period in boys and girls in a differentiated way.

SPEED	<i>Letter + phrase</i>	<i>Syllable + text</i>	<i>Word</i>	<i>Attention</i>	<i>Memory</i>	<i>Sequencing</i>
<i>Girls after 6 month intervention</i>	.253	.354*	.645*	.364	.324*	.534
<i>Boys after 6 month intervention</i>	.328	.534*	.423*	.435	.445	.423

* $p < .05$ ** $p < .01$ *** $p < .001$

Tabla 8

Results obtained by the students of Primary Education room in effectiveness at the end of the training period in boys and girls in a differentiated manner.

EFFECTIVENESS	<i>Letter + phrase</i>	<i>Syllable + text</i>	<i>Word</i>	<i>Comprensión</i>	<i>Velocidad</i>	<i>Attention</i>	<i>Memory</i>	<i>Sequencing</i>
<i>Girls after 6 month intervention</i>	.342***	.623**	.354*	.443*	.523***	.472**	.634*	.527**
<i>Boys after 6 month intervention</i>	.434**	.524**	.622*	.402**	.607**	.535*	.522**	.503**

* $p < .05$ ** $p < .01$ *** $p < .001$

Tables 7 and 8 show the data obtained after the application of the Leobien program classroom. They show a similar trend to that of the two previous courses: little relevance in speed and high influence on effectiveness. Neither do they denote gender differences.

Tabla 9

Results obtained by the fifth graders of Primary Education in speed at the end of the training period in boys and girls in a differentiated manner.

SPEED	<i>Letter + phrase</i>	<i>Syllable + text</i>	<i>Word</i>	<i>Attention</i>	<i>Memory</i>	<i>Sequencing</i>
<i>Girls after 6 month intervention</i>	.314	.254*	.402**	.532*	.522*	.514
<i>Boys after 6 month intervention</i>	.425	.326	.411*	.433	.623	.467*

* $p < .05$ ** $p < .01$ *** $p < .001$

Tabla 10

Results obtained by the fifth graders of Elementary Education in effectiveness at the end of the training period in boys and girls in a differentiated manner.

EFFECTIVENESS	<i>Letter + phrase</i>	<i>Syllable + text</i>	<i>Word</i>	<i>Comprensión</i>	<i>Velocidad</i>	<i>Attention</i>	<i>Memory</i>	<i>Sequencing</i>
<i>Girls after 6 month intervention</i>	.624***	.425**	.543**	.622**	.234**	.352***	.543**	.427***
<i>Boys after 6 month intervention</i>	.523**	.432**	.425***	.734*	.344***	.344**	.634*	.534**

* $p < .05$ ** $p < .01$ *** $p < .001$

Tables 9 and 10 show the data obtained after the application of the Leobien program in fifth year of primary education. They indicate that the trend of the previous courses is maintained, although this time the effectiveness of the program partially increases the results in the fifth grade students compared to the previous levels. In the same way, the effectiveness of the training is confirmed. There are no differences in this course regarding gender either. Both, fifth grade and the others, face at the same time these proofs.

Tabla 11

Results obtained by sixth graders of Primary Education in speed at the end of the training period in boys and girls in a differentiated manner.

SPEED	<i>Letter + phrase</i>	<i>Syllable + text</i>	<i>Word</i>	<i>Attention</i>	<i>Memory</i>	<i>Sequencing</i>
<i>Girls after 6 month intervention</i>	.412	.534	.452	.235	.471	.472
<i>Boys after 6 month intervention</i>	.352	.545	.521*	.326	.528	.525*

* $p < .05$ ** $p < .01$ *** $p < .001$

Tabla 12

Results obtained by the students of sixth grade of Primary Education in effectiveness at the end of the training period in boys and girls in a differentiated way.

EFFECTIVENESS	<i>Letter + phrase</i>	<i>Syllable + text</i>	<i>Word</i>	<i>Comprensión</i>	<i>Velocidad</i>	<i>Attention</i>	<i>Memory</i>	<i>Sequencing</i>
<i>Girls after 6 month intervention</i>	.452***	.461*	.623***	.402*	.553**	.502*	.553**	.492***
<i>Boys after 6 month intervention</i>	.534***	.376*	.634**	.506**	.634**	.431**	.635*	.539***

* $p < .05$ ** $p < .01$ *** $p < .001$

Tables 11 and 12 show the data obtained after the application of the Leobien program in the sixth grade of primary education. They confirm the tendency of little relevance in the component of speed and a high influence on improvement in effectiveness on this occasion for students in the sixth grade. Also note the continued lack of substantial differences in gender at this educational level.

4.- Discussion and Conclusions

The objective of this study was to verify the effects of intervention using the LeoBien training program, oriented to the improvement of reading comprehension. This software program, published in the Supertics platform, has been created to focus on development of the sub-abilities that comprise the speed and effectiveness of reading as pivotal in the improvement of comprehension capacity throughout the stage of primary education. The results obtained show that instruction through this program affects students differently in different facets of reading. It has been verified that the program has a very significant influence on improvement of the facets that comprise reading effectiveness, sustained along all the levels that compose this educational stage. Such influence has not been equally confirmed with respect to abilities that favor reading speed except at the first grade level, where improvements have been greater, probably caused by the qualitative leap that leads to an irruption in the reading process before consolidation in the higher grades. These data coincide with the contributions of other studies that have demonstrated the importance of mastery of the skills involved in learning written language from the earliest ages to improve reading acquisition (Gutiérrez & Díez, 2015; Gutiérrez, 2016).

The experience would be enriched in future research by providing a control group that would allow establishment of a correlation, or lack thereof, in the learning processes of reading between the groups and to estimate the extent to which gains in skill may be attributed to the intervention.

In summary, this work helps to facilitate understanding of the processes involved in the acquisition of reading comprehension during the first school years, to assist in selecting educational activities that will have a positive impact on building the skills identified as relevant to these processes.

The Mathematics Teaching Efficacy Belief Instrument Applied to Pre-service Elementary School Math Teachers

Radka DOFKOVÁ¹

¹Palacký University Olomouc, Faculty of Education, Department of Mathematics
Email: radka.dofkova@upol.cz

Abstract

Teacher efficacy is the degree of teachers' beliefs that they can control student achievement and motivation. It is not sufficient to prepare pre-service teachers of mathematics only in areas of content and pedagogy. The purpose of this paper is to determine mathematics teaching efficacy beliefs among pre-service elementary students of mathematics at the Faculty of Education Palacký University Olomouc in Czech Republic. We used for pre-service teachers Mathematics Teaching Efficacy Beliefs Instrument (MTEBI) that has been developed by modifying the original Science Teaching Efficacy Beliefs Instrument (STEBI-B). Items were changed to reflect future mathematics teaching beliefs. We collected data from 53 pre-service elementary school teachers. The present survey was only one of the many parallel researches and surveys the objective of which is to comprehensively map the perception of the self-efficacy and preparedness of students of Teaching at the 1st Level of Elementary School for teaching mathematics.

Keywords: teacher, training, mathematics, efficacy, beliefs

Introduction

From the didactic point of view teaching mathematics is a challenge mainly due to the fact that this subject is difficult for many students, and thus for teachers, too. This has given rise to an urgent need to find effective ways how to help children acquire the necessary knowledge and skills in order to teach them to apply the things they learn. In compliance with the principles of so-called realistic teaching of mathematics, which ensues from the historical understanding of mathematics as a human activity based on the reality of the surrounding world, it is necessary to put an emphasis on the practical use of mathematics, research and reflection, on group work and practical activities (Korthagen, 2011). According to Hans Freudenthal (1991) the resulting process of teaching is then understood as a process of guided reinvention.

Mathematical literacy is a term that is now more commonly used in similar contexts in the Czech Republic. It is obvious that such a teaching style requires a lot from the teacher's personality. Were we to apply the principles of realistic teaching of mathematics in the preparation of prospective math teachers, we would probably get the closest to the model proposed by the editors Atkinson and Glaxton (2001), the so-called *intuitive practitioner*. The authors put it in opposition to the model of so-called *craft-knowledge*, whose goal is to pass on only theoretical scientific knowledge to be applied in school practice (Lukášová-Kantorková, 2003).

It is important for prospective math teachers to feel completely prepared for their future profession, and to gain a positive attitude to it (Dofková, 2016; Dofková, Kvintová, 2017). Not only do they need to feel prepared in terms of their expertise, education and didactics, but to feel secure also in terms of their personality traits. Based on our experience with pre-gradual preparation of elementary school math teachers, however, these two aspects are closely related. A student not secure for whatever reason in terms of his/her expertise (for example having a negative attitude to mathematics due to bad memories regarding a teacher at any stage of education) feels insecure in terms of didactics (if someone does not understand fractions, he will hardly feel prepared to effectively teach this to his students). Thus the goal of our research was to identify the perception of own preparedness of prospective elementary school math teachers to teach mathematics effectively.

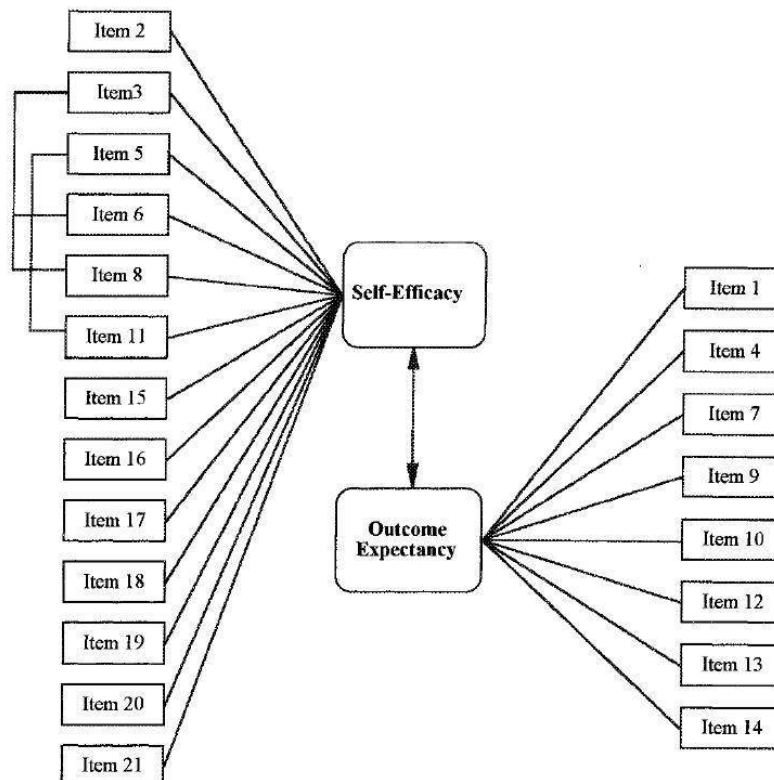

Method

The research tool used in our research project was the Czech version of the *Mathematics Teaching Efficacy Belief Instrument* (MTEBI). This questionnaire was created as a modification of the more general version *Science Teaching Efficacy Belief Instrument* (STEBI-B). The Science Teaching Efficacy Belief Instrument (STEBI) is used in many studies to measure science teaching self-efficacy and outcome expectancy in pre-service elementary school teachers. This 25-item instrument uses a 5-point Likert scale. The STEBI-A is the version recommended for use with in-service teachers; the STEBI-B is the version recommended for use with pre-service teachers.¹

Several adaptations of the STEBI questionnaire have been created in the past few years. We used its math form created by the authors Enochs, Smith & Huinker (2000). The MTEBI is composed of 21 items, out of which 13 deal with *Personal Mathematics Teaching Efficacy* (PMTE), and eight deal with *the Mathematics Teaching Outcome Expectancy* (MTOE). Figure 1 shows the division of items according to the respective categories.

Picture 1. Factor structure of MTEBI Scale Items (Enochs, Smith, Huinker, 2000)

53 full-time elementary school teacher program students (ESTP - 39) and elementary school and special education teacher program students (ESSETP - 14) took part in the pilot research project in April 2017. Answers were supposed to be made on the following scale: *strongly agree, agree, uncertain, disagree, strongly disagree*. The following work hypotheses were set:

1. There is no statistically significant difference among the students within the study groups.
2. Individual answers are mutually independent.

¹ Dostupné z: <http://stelar.edc.org/instruments/science-teaching-efficacy-belief-instrument-stebi>

Findings

Zero and alternative hypotheses were set in order to verify the first work hypothesis:

H₀: Students' answers do not vary based on the study group where they belong.

H_A: Students' answers vary based on the study group where they belong.

First, a frequency table was created for the individual groups. At first sight it was apparent that in case of both groups the answers would revolve around the mean value (Chart 1). The most positively assessed item in the ESTP group (the sum of the possibilities of strongly agree and agree) is in item 9: *The inadequacy of a student's mathematics background can be overcome by good teaching*, which was positively assessed by 97% of the respondents. The most negatively assessed item was item 15: *I will find it difficult to use manipulatives to explain to students why mathematics works* (82% of the answers).

Chart 1. Frequency of the respondents' answers from the ESTP group

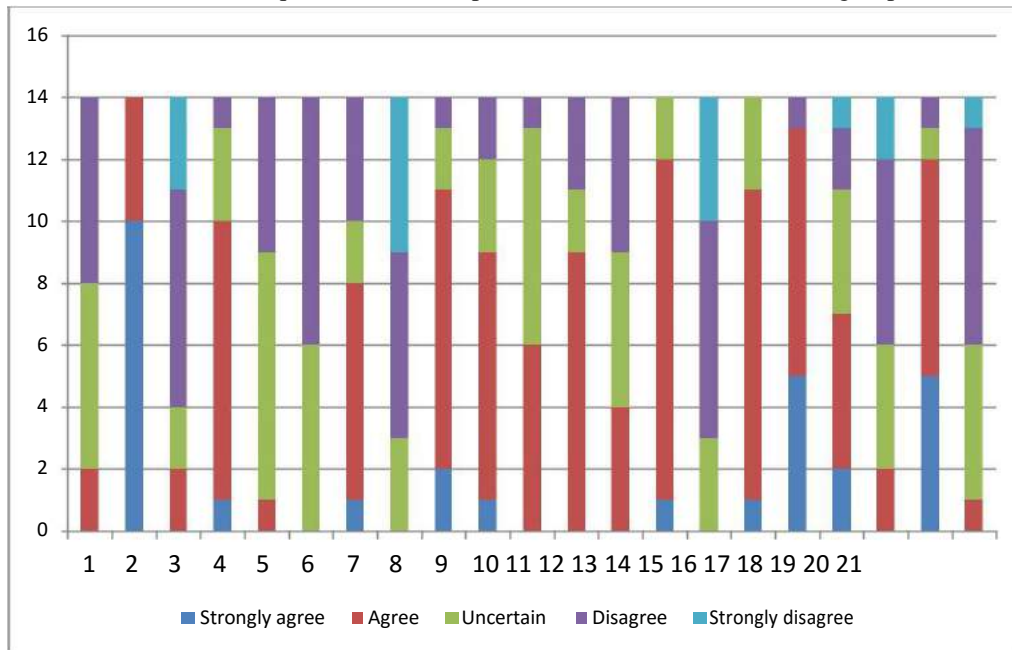

In the ESSETP group (chart 2) the most positively assessed item was item No. 2: *I will continually find better ways to teach mathematics* (100% of the answers). The two most negatively assessed items (79% of the answers) were: *I will generally teach mathematics ineffectively* (No. 8) and *I will find it difficult to use manipulatives to explain to students why mathematics works* (No. 15). However, it is necessary to point out the fact that item 8 was one of those that had to be reversed scored in order to produce consistent values between positively and negatively worded items.

Zero value very often appeared in the acquired frequencies, that is why the Fisher factorial test was used instead of Pearson's chi-square test. In case of all the tested items the calculated p-value was greater than 0.05, therefore zero hypothesis was always rejected, i.e. the answers made by the ESTP and ESSETP respondents did not differ.

Chart 2. Frequencies of the respondents' answers in the ESSETP group

Only in case of item 18: *Given a choice, I will not invite the principal to evaluate my mathematics teaching* the p-value = 0.054, therefore a closer analysis was carried out.

Table 1. Answers of both groups to item 18

Variables	Strongly agree	Agree	Uncertain	Disagree	Strongly disagree	Total
ESTP	4	3	15	13	4	39
ESSETP	2	5	4	2	1	14

It was apparent from the original table (Table 1) that the values also revolved around the mean value so that it was necessary to create a new four-field contingency table summing the values in the positive items, negative items, and the answer *uncertain* was left out completely (Table 2). Unfortunately, due to this necessary reduction in all the resulting tables we lost a large number of answers – here, for example, 38% in the ESTP group, and 29% in the ESSETP group).

Table 2. Answers of both groups to item 18 (modified table)

Variables	Agree	Disagree	Total
ESTP	7	17	24
ESSETP	7	3	10

With a certain reserve we can say that the answers to this item varied slightly based on the particular group. Once this difference had been specified, the odds ratio of 5.35 was calculated, from which it is clear that the chances for a positive answer were approximately 5 times greater in the ESTP group than in the ESSETP one.

Zero and alternative hypotheses were set in order to look into the pair dependency of items:

H₀: Answers to individual items are independent.

H_A: Answers to individual items are not independent.

In all the tested pairs of items the p-value was greater than 0.05, thus it was necessary to reject zero hypothesis. Only in the following pairs did we get a different result:

- In items 5: *I know how to teach mathematics concepts effectively* and 11: *I understand mathematics concepts well enough to be effective in teaching elementary mathematics* the p-value was calculated to be = 0.027, and zero hypothesis was not rejected, i.e. that there is a dependency between the students' answers to the items.
- p-value = 0.021 while testing item 7: *If students are underachieving in mathematics, it is most likely due to ineffective mathematics teaching* and item 13: *Students' achievement in mathematics is directly related to their teachers' effectiveness in mathematics teaching*. Again, we cannot reject zero hypothesis, i.e. that the answers to the given items are dependent. Here it was possible to determine the odds ratio value (the contingency table did not contain zero value). This chance ratio was 13.74, which can be interpreted as an almost 14 times greater chance for a positive answer than in item 13.
- The last pair of items that showed a dependency were item 1: *When a student does better than usual in mathematics, it is often because the teacher exerted a little extra effort* and item 10: *When a low-achieving child progresses in mathematics, it is usually due to extra attention given by the teacher*.

Conclusions and Recommendations

Based on the achieved results we can say that the assessment of preparedness for teaching mathematics does not differ between the ESTP and ESSETP groups of students, despite a different amount of time allocated for the didactics of mathematics in these groups (due to the specification of the ESSETP studies math didactics lessons are reduced in favor of other disciplines of special education).

If the students' answers already were in pair dependency, those were always items from two previously determined areas of PMTE and MTOE. Into the first area falls the conclusion that if students feel prepared to effectively teach mathematics terms, then they simultaneously feel that they understand them enough. Respondents in the other group believe that teachers are fully responsible for the success or failure of their students in mathematics, and that the teachers' special attention paid to the students leads to an improvement of their results.

We believe that the above conclusions may significantly contribute to improving the quality of preparation of prospective elementary school math teachers. In both of the areas that were the subject of our research (PMTE and MTOE) it was apparent that the students understood the significance of both the scientific preparation (adequate math preparation), and the educational preparation (teaching strategies). The most difficult task remains for the educators of prospective math teachers – to develop in them the necessary *self-efficacy* in order for them to consider themselves prepared also in terms of psychology and didactics.

The External Control Scale Applied to Pre-service Elementary School Math Teachers

Radka DOFKOVÁ¹

¹ Palacký University Olomouc, Faculty of Education, Department of Mathematics
Email: radka.dofkova@upol.cz

Abstract

The quality of the pre-service training of mathematics teachers is affected by multiple factors. We believe that in the Czech environment, there is a lack of focus on pre-service teachers of the primary school, a lack of interconnection of the field-specific didactics and psychology. One of most important issue is locus of control. Teachers with a high external locus of control believe that control over events during the teaching and what pupils do is outside them, and that they personally have little or no control over mathematics lesson. Therefore they should have been instructed during their pre-service to build positive attitude for their future teaching of mathematics. The aim of this paper is introduce the results of the survey among pre-service elementary teachers about degree how they are able to influence pupils achievement in mathematics. We used the short Norwegian External Control Scale which consists of five items. Responses were given on a six-point scale.

Keywords: external control scale, teacher, mathematics, training

Introduction

Locus of control is a concept that affects the subjective feeling of an individual's control over the impact of their behavior, with internality and externality being found at either end of the continuum (Rotter, 1966). Levenson (1981, pp. 15) states that “*the internal-external control construct was conceived as a generalized expectancy to perceive reinforcement either as contingent upon one's own behaviors (internal control) or as the result of forces beyond one's control and due to chance, fate, or powerful others (external control).*” Persons with an internal locus of control (so-called internalists) believe that their life develops mainly based on their abilities and effort, and that their lives rest firmly in their hands. Individuals with an external locus of control (so-called externalists) perceive the strengthening that results from their behavior and is independent of their own deeds. They ascribe the reward or punishment to outer circumstances that they cannot influence – e.g. chance, the power of other people, luck or fate (Rotter, 1966).

If we wanted to apply these characteristics on the personality of a math teacher, we could say that the teacher – internalist, feels that he has adequate abilities to influence the course of a math lesson based on his knowledge and his own initiative. These teachers are usually happier in their profession and handle stressful situations better. On the other hand, a teacher – externalist often thinks that he cannot (and is not adequately able to) influence the course of a math lesson. These teachers then often use passive strategies of coping with problematic situations during their lessons. They often feel helpless and feel like quitting (Výrost, 1989).

The goal of this article was to map external *locus of control* in prospective elementary school math teachers. This article freely ensues from the fact that *locus of control* is one of the psycho-didactic aspects, just like e.g. *self-efficacy*, which is a topic the author has spent years dealing with (Dofková, 2016, Dofková, Kvintová, 2017). However, here it is necessary to point out that these terms are not absolutely identical. As Veselská states in her diploma work (2016), according to Bandura (1997) there is a difference between these constructs mainly in the way behavior is activated. The belief as to how much situations around a teacher unravel from his own behavior might either be weakening or strengthening. Then we speak of *locus of control*. However, this depends on the level of his belief that he will handle the required activities (*self-efficacy*).

Method

At the start of the research the following work hypotheses were set:

1. There is no statistically significant difference between the students' answers within the individual groups.
2. There is no statistically significant difference between the ESTP students' answers before and after their teaching practice.

A total of 63 daily program students partook in our research (Table 1). The questionnaire was handed out to all the students once they had completed the subject of Didactics of mathematics for elementary school teacher program students (ESTP). At the same time the questionnaire was handed out to students of the 4th (ESTP4) and 5th (ESTP5) years. That means the students had had continual teaching practice by that time. Elementary school and special education teacher program students (ESSETP) were in their third year, which means before their teaching practice.

Table 1. The division of the participating students based on their field of study

Variables	Frequency
ESTP4	36
ESTP5	9
ESSETP	18

Two tools are normally used for measuring *locus of control*. The most frequently used one is the “*I – E Scale*” (Rotter, 1966), which consists of 23 items. There are two statements with each item that correspond to the two poles of *locus of control* – the internal one and the external one. The resulting value sets the placement of an individual between these two extreme points. This tool is modified using the *Internality, Powerful Others and Chance Scale* (IPC) (Levenson, 1983). The questionnaire consists of 24 items where the participant states on a scale of -3 to +3 the extent of his/her approval or disapproval, resulting in three areas: internal *locus of control*, external *locus of control* in connection to chance, and external *locus of control* in connection to powerful others (Veselská, 2016).

In our research we wanted to focus only on *external locus of control* so that we only used the Czech version of a *five-item scale* (Skaalvik & Skaalvik, 2007). Each item stated a limitation to what can be achieved through education concerning students' learning, achievement, motivation, or behavior. The limitations were described as students' abilities or home environment. Responses were given on a 6-point scale from *false* (1) to *true* (6) (Skaalvik & Skaalvik, 2007):

1. *How much pupils can learn in school is primarily determined by their abilities.*
2. *If the pupils have not learned discipline at home, there is not much the school can do.*
3. *A teacher cannot do much to improve students' achievements if they have low abilities for schoolwork.*
4. *It is practically impossible for a teacher to motivate a student for academic work if he or she lacks support and stimulation at home.*

Good teaching is more important to students' engagement in schoolwork than is their home environment.

Findings

First we created tables of frequencies for the individual groups. Due to the fact that the respondents in this test could not make their answers near the mean value, we wondered which items in both groups were assessed the most and which the least positively. The item that was assessed the most positively (Chart 1) in the ESTP group (the sum of possibilities *more true than false, mostly true* and *true*) was item 5: *Good teaching is more important to students' engagement in schoolwork than is their home environment*, which was positively assessed by 84% of respondents. The two most negatively assessed items were item 2: *If the pupils have not learned discipline at home, there is not much the school can do* and item 3: *A teacher cannot do much to improve students' achievements if they have low abilities for schoolwork* (80% of the answers).

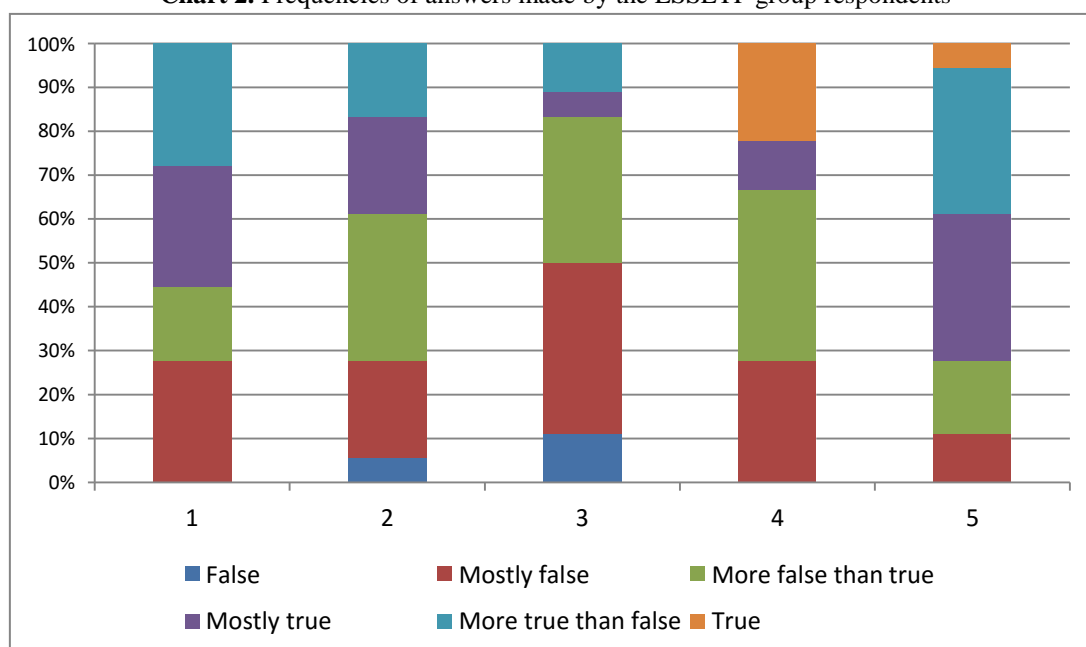

Chart 1. Frequencies of answers made by the ESTP group respondents

In the ESSETP group (Chart 2) the most positively assessed item was also item 5 (67% of all answers). The most negatively assessed item was item 3 (84% of the answers).

Chart 2. Frequencies of answers made by the ESSETP group respondents

Thus it was apparent at first sight that the students' answers in both groups did not differ. To verify this we used the Fisher factorial test. In case of all the items the resulting p-value was greater than 0.05, i.e. there is no dependency between the respondents' answers from both groups.

Chart 3. Frequencies of answers made by the ESTP4 group respondents

While scrutinizing the other hypothesis – whether there is a difference in the perception of *external locus of control* by the ESTP students before and after undertaking their teaching practice – frequency charts were made first. Chart 3 shows that the ESTP4 students assessed item 5 the most positively (86%), and they most disagreed with items 2 and 3 (in both cases 83%).

Chart 4. Frequencies of answers made by the ESTP5 group respondents

The ESTP5 students after undertaking their teaching practice also assessed item 5 the most positively (89%), and they most strongly disagreed with item 2 (89%) (Chart 4).

After applying the Fisher factorial test the resulting p-value was less than 0.05 only in case of item 5, i.e. that there is a statistically significant difference between answers to this item before and after undertaking the teaching practice.

Conclusions and Recommendations

The only statement that turned out to be statistically significant in our research was the one in which the students expressed their view of the connection between the teacher's teaching style and the students' home preparation. Despite the fact that most of them assumed that a suitable chosen educational strategy was the most important thing for the motivation of students, there were differences in the measure of agreement before and after undertaking their teaching practice. Those students that had acquired only theoretical preparation in math didactics did not consider this influence as important as those who had already undertaken their practice.

We assume that this conclusion agrees with those who call for an increased amount of time for students' teaching practice. In general, prospective math teachers understand the importance of theory as a means of support for practice, however, our research has made it clear that their psycho-didactic dispositions vary after undertaking their practice. Therefore we suggest that teaching math didactics be conceived in such a way that it reflects the real environment as much as possible.

The effectiveness of creative procedures when listening to popular music at school¹

Veronika ŠVONCOVÁ,

University in Hradec Králové, Faculty of Education, Czech Republic

Email: V.svoncova@seznam.cz

Abstract

Listening is one of the four elementary activities during music education. Modern popular music forms an important part of the teaching material for music education and continues to be a current topic for students. There is sufficient opportunity to include creative procedures when listening during music education. Application of creative procedures in connection with listening activities is represented by utilisation of a set of motivational games with music facts. Motivational games with music facts are formulated for students of the 2nd level of primary school (hereinafter “PS”). The goal of the specific research was to apply the aforementioned creative procedures by means of a set of motivational games with music facts in connection with listening, and to experimentally verify the effectiveness of creative procedures on parallel classes at the 2nd level of PS using the technique of working with an experimental and control group of students.

Keywords: Music, Education, Listening, Popular, Creativity

Introduction

Modern popular music (non-artificial music) forms a significant part of music education at schools in the Czech Republic (hereinafter the “CR”) and is currently no less important than classic music (artificial music). The importance of modern popular music (hereinafter “MPM”) in primary schools, primary art schools and comprehensive schools, continues to grow. In spite of the fact that MPM is a part of the educational system for music education in the CR, and is reflected in all music activities the same as classic music (hereinafter “CM”), its inclusion in music education classes frequently remains imbalanced and problematic.

Listening is defined as “*an active thought process in which sensory information is processed and evaluated*” (Herden, 1998, p. 27).

Listening is one element of the complex of elementary components of music education at schools, together with vocal, instrumental and motoric activities. Use of creative procedures in connection with listening is represented by utilisation of a set of motivational games with music facts. The motivational games with music facts specified below develop the musical thought processes of students, they can be applied in individual or group versions and can be used with students of various ages at adequate skill levels. Motivational games with music facts include: “The memory game”, “Domino”, “3+1”, “Risk!” and “The musicians want to go home”. The purpose of this article is not a detailed description of the progress of motivational games with music facts (Švoncová, 2016, p. 189 - 194), but submission of the results of the first phase of specific research, which concerns the effectiveness of creative procedures when listening to modern popular music in parallel classes at the 2nd level of PS using the technique of working with an experimental and a control group of students. Motivational games with music facts are valuable and easily utilisable particularly due to their motivational, playful and competitive character. The game element continues to be current at school and makes music education of all age categories of students more attractive.

Method

The formational experiment method, which monitored the changes that use of creative procedures utilising a set of motivational games with music facts made to traditional teaching conditions, was chosen for the research.

The purpose of the specific research was to apply the above-mentioned creative procedures by means of a set of motivational games with music facts in connection with listening activities, and to experimentally verify the effectiveness of creative procedures on parallel classes at the 2nd level of primary school using the technique of working with an experimental and a control group of students. In the experimental group, listening was realised in connection with creative procedures. In the control group, listening took place without creative procedures.

The key work hypothesis of the specific research was that the experimental group, in which creative procedures are applied during listening, would understand modern popular music better and would be capable of utilising the learned knowledge in other musical activities.

The first phase of specific research took place in two 9th year classes in the parallel year of primary school over a period of four months. In the experimental group, which consisted of 16 students, listening to MPM took place with utilisation of creative procedures. In the control group, which had 19 Students, listening to MPM was realised without application of creative procedures.

The experiment in parallel classes enabled comparison of the results of both classes, comparison of creative procedures to classic teaching procedures and derivation of the effectiveness of creative procedures. A questionnaire, a semantic differential, quantitative analysis, contingency table and graphs were used to compile and process the research results.

Findings

Students in both groups were engaged in musical portraits of performers, music bands, they discussed styles of music or compared differences in music, musical styles and periods.

In the experimental group, “The memory game”, “Domino” and “3+1” were motivational games with music facts used as creative procedures. In the control group classic filling in, linking and allocation procedures were used while listening to MPM. In both groups, listening to MPM was linked to elementary music activities (vocal, instrumental, motoric) or took place independently.

I give the results of two classes and the overall final listening retest of the first phase of specific research in both groups below.

During this class the students compared the characteristic style elements of reggae and rock music (reggae: the Bob Marley song “Buffalo Solider”, rock: the Rolling Stones song “Satisfaction”). In the experimental group, “Domino” was the motivational game with music facts utilised as a creative procedure and, in the control group, the classic procedure of filling in was chosen.

At the end of the class students were required to answer questions directed towards the characteristic style elements of reggae and rock music. Contingency tables show that the experimental group, in which a creative procedure was used during the class, achieved a higher point rating in relation to both music examples.

Contingency table 1 a - reggae			
Experimental group	boys	girls	total
total	0.75	0.75	0.75%

Contingency table 1 b - reggae			
Control group	boys	girls	total
total	0.71	0.50	0.61%

Contingency table 2 a - rock			
Experimental group	boys	girls	total
total	1.00	0.95	0.98%

Contingency table 2 b - rock			
Control group	boys	girls	total
total	0.81	0.67	0.74%

In the following class, the *semantic differential* was chosen as the research technique. When listening to samples of music, students marked their choice from the offer of precisely set polarity adjectives with a cross in order to identify how the music affected them at the specific time. The class focused on world music from the 1980s (music samples: the Enya song “Only time”). The “3+1” motivational game was the creative procedure applied in the experimental group, whereas, in the control group, classic filling in concerning the topic of the class was repeated. It is clear from the contingency tables that the experimental group, with a creative procedure applied during teaching, was again more successful in this class.

Contingency table - 3 a			
Experimental group	boys	girls	total
total	0.58	0.92	0.75%

Contingency table - 3 b			
Control group	boys	girls	total
total	0.38	0.53	0.45%

The final listening retest, which took place at the end of the first phase of the specific research, shows that the overall success rate was slightly higher in the experimental group.

Results, Conclusions and Recommendations

The purpose of this article was submission of the results of the first phase of specific research concerning the effectiveness of creative procedures when listening to modern popular music in parallel classes at the 2nd level of PS, using the technique of working with an experimental and a control group of students.

The abovementioned results of the first phase of specific research indicate that the experimental group, in which creative procedures were applied when listening to MPM by means of motivational games with music facts, has a better understanding of modern popular music and is better capable of utilising facts in other elementary music activities - vocal, instrumental and motoric.

Creative procedures by means of motivational games with music facts cannot only help achieve better results during the teaching process, but certainly make the teaching of music more attractive.

Abstract

The thinking about the Psychology Identity is the background of this study, that helps to the answer of this question: Which is the exclusive aim of the psychology intervention, that changes into singular when compared with any other profession or intervention? This statement, first research process stage more plural, disclose the process and the first products of a qualitative systematic literature review, grounded, explaining and describing all stages of the data collection and the synthesis. It is expose the first results obtained after the review of 202 studies, based on the qualification categories: published date, document typology, editor nationality, methodologic perspective, research method, sample size, publication impact factor and the citations quantity in the primary study.

Keywords: Psychology Identity, Roadmap, Systematic Review

Introduction

This research was developed from questions and thinking about the intervention paper recognizing of the psychological intervention in the nowadays societies. Considering the importance, the great psychological science development and the emergency of the activities associated in the same, it's urgent the delimitation of a professional identity of this class, as well as their action area. As there is a growing of the relevance of the understanding of the psychologist and the psychologic intervention.

Considering the major mediatisation of the activities in the titled field of parapsychology, frequently as a try of logical association and the wanted psychological science, being more and more urgent a profession identification, being clear their proceedings and the objectives, avoiding confusion by the general public (Costa-Lobo et al. 2017; Ricou, 2014). These considerations take us to the thinking about the psychologist professional identity in the actuality and, consequently, about the identity of the psychology. The professional identity is an important cognitive mechanism that affects the attitudes, the emotions and the behavior of the professionals in their workplaces. So, understand as the professionals think about themselves have been the focus of different past researchs (e.g., Ashforth, Kreiner, Clark, & Fugate, 2007; Ibarra, 1999; Kreiner, Ashforth, & Sluss, 2006; Kreiner, Hollensbe, & Sheep, 2006; Pratt, Rockmann, & Kaufmann, 2006).

The analysis of the main theorists of the professional identity allows recognize that this identity is defined as an professional auto-concept based on the attributes, in the values, in the motivations and in the people experiences (Ibarra, 1999; Schein, 1978). According to the review made by Valle (1997), the profession exercise assumes the domain of the disciplinary theoretical body and the acquisition of the technical and professional competences, directly related with the professional practice in a certain society. So, both presented as necessary to achieve the professional authority.

So, seems to be acceptable, according the Wenger (2001) research, state that professional identity is faced as the conscience and the evaluated significance that the person presents in the membership, involving a set of cultural rages interiorized, namely the elaborated significances that put in action the person daily where there is a permanent

participation in the future construction. This way, according with Dubar (2002), the professional identity is defined as a social category that can be part of the person. So, the professional identity, faced as a subjective construction, embody the personal compromise, the believes and the values associated to the profession, defined culturally (Lasky, 2005). In conclusion, the main literature assumes that professional identity changes according with the importance given to their profession in their auto-concept and, to quantify this importance, there is a possible help in the understanding of the individual attitudes and in their labor behaviors.

The present research aims to obtain the answer to the central question – Which is the exclusive objective of the psychological intervention, that be singular when compared with any other profession or intervention? This aims to achieve the following secondary objectives: study how the psychologists define themselves; how these are defined by the other professionals and by the general public; identify which are the difficulties of the psychologists in their professional tasks and identify how the psychologists understand and describe their functions.

Method

Research Design

The present research concludes a synthesis of the scientific production in the sub-domain of the psychology. So, it's defined as the objective to elaborate a literature systematic qualitative review aiming to collect and synthesize relevant information.

The definition of literature systematic qualitative review to this work in course was “A literature systematic qualitative review is the process to collect data, know, understand, analyze, synthesize and evaluate the group of scientific articles with the aim to create a art state about certain topic of research” (Levy & Ellis, 2006). This way, the literature systematic qualitative review is within the review studies, especially in the evaluation and synthesis category (Depaepe, Verschaffel, & Kelchtermans, 2013) and makes the difference through the formulation of the research question, definition of critical diagnostic strategies and exigence in the transparency to define the inclusion criteria and studies of exclusion (Davies, 2007). Literature systematic qualitative review groups the study's results, considering the proximities and the differences existent between the research growing the possibilities of interpretation, constructing and reconstructing the readings (Galvão, Sawada, & Trevisan, 2004; Hoefelmann, Santos, & Moretti-Pires, 2012) ensuring the descriptive validity, concerning the relevant studies identification, the interpretative validity concerning the correspondence between the synthesis made by the reviewers and the study matter, the theoretical validity, concerning the credibility methods developed, the pragmatic validity, concerning the utility, the applicability and to the transparence of the knowledge generated to the practice (De-la-Torre-Ugarte-Guanilo, Takahashi, & Bertolozzi, 2011).

Method: Selected Data Sources

The data composing the present literature systematic qualitative review were extracted from the database of the bibliography references, the database of the periodical publications, the database of the thesis and dissertations and the online library of the knowledge. In the database of the bibliography references it's included the *Web of Science* and *ELSEVIER Scopus*; in the database of the periodical publications it's included *Scientific Electronic Library Online – SciELO*, the *American Psychological Association PsycNet – APA PsycNet* and the Newspapers in Psychology - *Pepsic*; in the thesis and dissertations database it's included the *CAPE*S; and the online library of the knowledge - *b-on*. Facing the specificity of the selected sources of the data, it was decided to start the process of the “advanced research” in order to be possible to be delimited the best possible way the study object, without changing the sense and the defined the presupposes.

The inclusion criteria of the present research were the follow: published between 2007 and 2017; published in English, Portuguese and Spanish; indexed in database: *Web of Science*, *ELSEVIER Scopus*, *SciELO*, *APA PsycNet*,

Pepsic, *CAPEs* and *b-on*. The exclusion criteria was the topic of the work context doesn't be connected with the Psychology Identity.

Method: Materials

After exporting the studies of the different databases, assumed as parts of the present research, it was made the adjustment to the results through the software of the management of the bibliography references *Medley Desktop*. So, the results were consolidated in a single list, being excluded the double situations. After words, it was made the redefinition of the studies and it was made the appointments in the free space given by the software what allows organize the presented approaches presented to each study to posterior critical analysis.

The *Mendeley Desktop* selection allowed the automatic insertion of the bibliographic data from the documents in PDF format, the categorization and extraction of the references, the bibliography management according to the specific styles to publish and the share of the results with the other project researchers. In the next stage, after the extensive and intensive reading of the obtained studies, these were imported to the database of the software and qualitative data analyze *NVivo11*, as internal sources. The *NVivo11* is considered as a helpful instrument in the qualitative analysis, as the content study and the speech, as well as gives instruments to categorize the data, make notes, etc. (Lage, 2011). Nowadays there is a variety of the support varieties to the qualitative analyze. It was chosed the *NVivo11*, as it is an instrument to help the qualitative analyze of the data recognized in the scientific community, allowing importing, analyze and export the data obtained from the studies. So, this software supported the understanding and analysis, demonstrating their flexibility to follow all reformulations occurred during the process.

Method: Proceedings

The main point of the research was constructed in a clear and detailed way in accordance to all researchers. This way, the study aims to reply to the main research answer, Which are the exclusive objective of the psychological intervention that changes singular when compared to any other profession or intervention? In the aims definition, those to the literature systematic qualitative review were according to the project. So, with th methodology assumed was intention to achieve the following secondary objectives: analyze how the psychologists define themselves; how these are defined by the other professional and by the general public; identify which are the difficulties that psychologists have in their professional tasks; and identify how psychologists understand and describe their functions.

In the identification of the primary sources – that were articles and chapters published in the database of the bibliography references, in the database of periodic publications, in the database of the thesis and dissertations and in the *B-on*. In the strings of the research construction, it was followed the definition process – the test and the adaptation. It was necessary testing the combination of the terms referents to the research theme, as well as the way of operators *booleanos*, *and*, *or*, *not*, have been used. So, the research strings elaborated were the “identity *and* psychology”; identity *and* psychologists paper *or* psychologist functions”; “identity *and* dilemas *and* psychology”. Consequently, it was made the translation and the reverse translation of the research *strings* selected to English and Spanish. The reverse translation is concerned to the translation of the research *strings* that were already translated in the language in the original language. The objective of this translation was evaluate in which measure the translated version to English and to Spanish was in accordance to the linguistic coherence to original language. In the criteria definition of the inclusion and exclusion, having in consideration the selected objectives, were selected to the present research in the following inclusion criteria: published works between 2007 and 2017; published works in English, Portuguese and Spanish; and indexed in the database: *Web of Science*, *ELSEVIER Scopus*, *Scielo*, *APA PsycNet*, *Pepsic*, *CAPEs* and *b-on*. The exclusion criteria was the following: the topic and context of the work don't take us to the identity of psychology. In the qualification of the categories it was signalized and systematized the characteristics distinctive of the articles and the chapters included in the literature systematic review. The categories

of the qualifications profitable were: the indexed sources, the work date, the document of the publication, the perspective methodologic used, the perspective methodological used, the research methodology adopted, the citations quantity that primary study obtained, the sample size. Concerning the indexed sources capitalized: *Web of Science*, *ELSEVIER SCOPUS*, *Scielo*, *APA PsycNet*, *Pepsic*, *CAPES* and *b-on*. Concerning the work date, it was included published works from 2007 and 2017, having been achieved the research inclusion criteria. About the selected publication documents, the typology of the articles, it is related exclusively the magazines and the scientific events abstract books. concerning the used methodology, there were the following categories: quantitative, qualitative and mixt.

The systematization of the research methods adopted implied the used technics of the data collect, having emerged, the following categories: documental analysis, descriptive, exploratory, field research and experimental. In the definition of the method and instruments, the research method was defined as interactive, allowing refine the research. On the other hand, the instruments definition, it was opted by the software of management of bibliographic references *Mendeley Desktop* by the software of qualitative data analysis of qualitative data *NVivo11*. In the schedule construction, having in mind the defined objectives, it was avoided that literature systematic review should have the duration between 10 to 12 mouths, since the planning to their conclusion.

In the reading and analysis was realized the lecture of the primary studies and these were submitted to 3 filters of reading. The first filter of reading corresponds to the title and to the summary and to the keywords. In the circumstances, there was doubt concerning the studies, submitting these studies to the second filter. This reading filter included the introduction and the studies, to the following parameter was already analyzed in the first filter. The studies that don't attend the research objectives and the inclusion criteria were excluded in this stage. The third stage applied when the second was not enough, corresponds to the integral lecture of the studies. From this reading result the studies attending to the inclusion criteria defined initially what allowed to their inclusion in this literature systematic review. In the catalogation and storage the studies were included in the bibliograpy references management *Mendeley Desktop* and in the software of analysis qualitative *NVivo11*. In the bibliometric analysis of the studies, were evaluated scientific impact factors of the works and the sources impact indicators selected. Finally, in the synthesis and results stage, it was made the elaboration a critical synthesis of the bibliography studied, based on the qualification categories, specially, the publication work date, the typology of the document of the publication, the editor nationality, the methodologic perspective used, the adopted research method, the sample size, the magazine impact factor that are indexed in the *Web of Science*, in the *ELSEVIER Scopus* and indexed in *CAPES* as the citations quantity of the primary study.

Findings

The research developed in the different indexed sourced, according to the inclusion requirements, criteria referenced before, signalized a total of 350 studies, being 75 indexed by *Web of Science*, 45 by *Pepsic*, 30 indexed by *CAPES* and 60 indexed by *b-on* (cf. Figure 1).

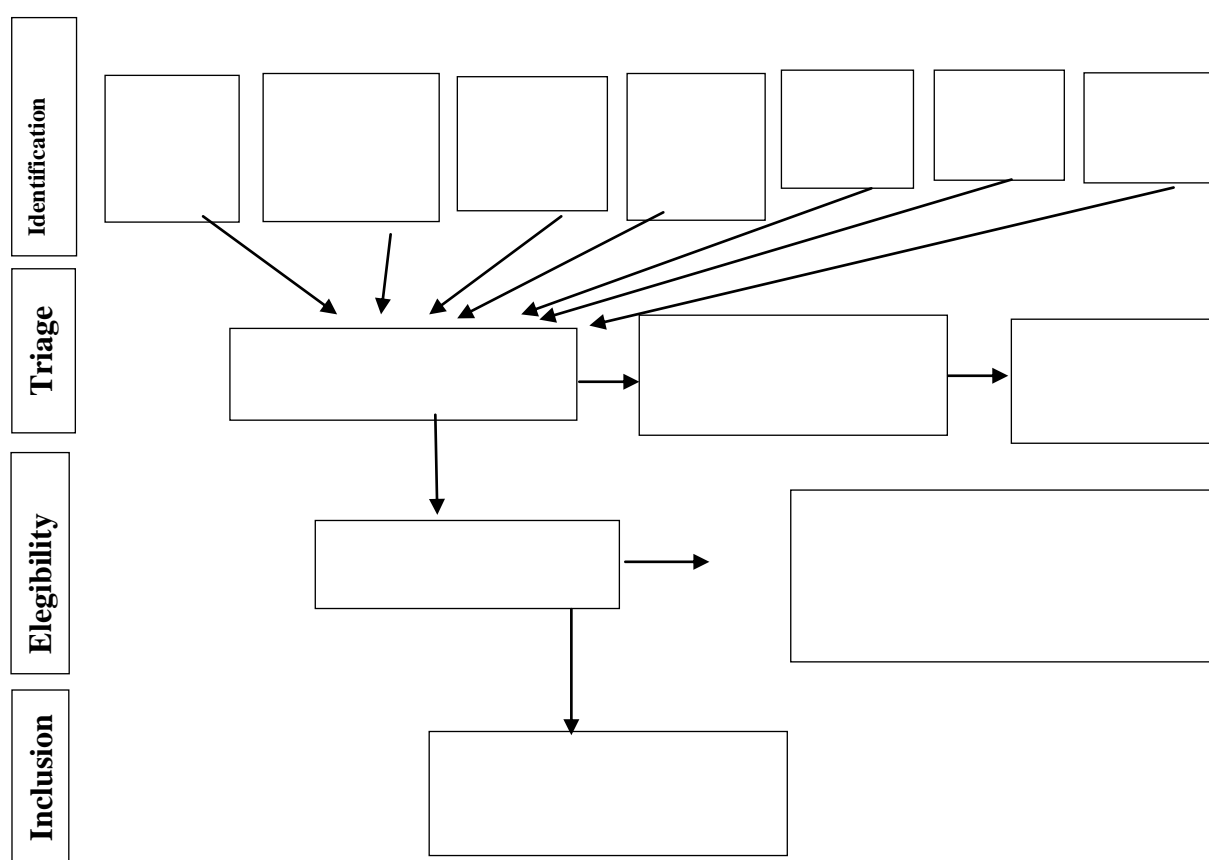

Figure 1. Number of studies included by indexed sources.

After the studies being submitted to the three filters of lecture defined before, excluded 120 studies, being selected 230 studies concerning the inclusion and the exclusion standard by the present literature qualitative systematic review. Within 230 studies, it were excluded 28 as they presented as doubled in several sources of the considered indexation. This means that 202 studies presented as being full papers accessed and eligible to the present research literature qualitative systematic review, where 37 indexed in *Web of Science*, 20 were indexed in the *ELSEVIER SCOPUS*, 66 were indexed in *Scielo*, five are indexed in *APA PsycNet*, 34 are indexed in *Pepsic*, 8 are indexed in *CAPES* and 32 are indexed in *b-on*.

Figure 2. Studies selection scheme to the literature systematic review

Afterword's it was made a critical synthesis of the bibliography selected based on the categories of qualification, namely: the work published date, the published document typology, the editorial nationality, the used methodology perspective, the adopted research method, the sample size, the Web of Science indexed magazine impact factor, ELSEVIER Scopus magazine impact factor and the CAPES impact factor, as the citations quantity that the primary study obtained.

Concerning the work published date and, considering the defined inclusion criteria, it was considered the studies after 2007 year. This way, it was possible to state that the number of the publications was not following the linear standard all over the years.

It was important to evidence that on the last 5 years there was a significant growing of the publications number, comparing the period of 2007 and 2012. So, let's concentrate the attention to the element of obtaining the major number of annual publications about the theme "psychology identity" in 2016 and 2017, the lower number of the

publications. However, the fact that in 2017 being considered the year when there was a lower number of the publications cannot be considered as an full pointer of the productivity in this year, as the both data are related with the obtained information in the first semester of this year. So, the complete year with a lower number of publications is the 2007, and the complete year with the higher number of publications is the 2016 year (cf. Figure 3).

Figure 3. Flouchart of the Studies Seleccion by Published year. *Year in course.

Concerning the typology of the document of publication, the 202 studies analyzed were published exclusively in magazines and scientific events abstracts books. So, from the 202 studies 199 presented as publication document typology, scientific magazines, and three presented as publication document typology, scientific events abstract books. The 199 studies that presented as publication document typology, scientific magazines, were published in 116 journals, from 19 different nationalities. The nationality of the editorial more frequently Brazilian (n=41), the nationality of the editorials with immediately frequency to follow is American (n=34).

According to the used methodological perspective, it was possible identify three different perspectives, mixt (n=10), qualitative (n=154) e quantitative (n=38). This way, it's possible to state that 4.95% of the studies presented a mixt methodology, 76,24% a qualitative methodology and 18,81% a quantitative methodology. The 154 studies with qualitative methodology presented the research method, the documental analysis (n=104), descriptive (n=16), exploratory (n=7) e field research (n=27). On the other hand, the ten studies with mixt methodology, the research methods were the descriptive (n=2), exploratory (n=2) and field research (n=6).

In the same line, from the 38 studies with a quantitative methodology, the research methods were the documental analysis (n=2), descriptive (n=19), exploratory (n=12), field research (n=3) and experimental (n=2).

Concerning the sample size, it was possible to verify that 55,9% of the studies don't present the sample (n=113), 29,3% of the studies presents the inferior sample to 100 (n=59), 6,5% of the studies presents a superior sample to 100 and lower to 200 (n=13) and 8,5% presents a superior sample to 200 (n=17). Finally, it was considered the indexed factor magazine in *Web of Science*, *ELSEVIER Scopus* indexed magazines and *CAPES* indexed magazines. So, it was possible to verigy that *Web of Science*, the magazine with higher index *JCR* is the *Personality and Social Psychology Review* (JCR=7.571) as the scientific magazine that presents a lower impact factor is *Educational & Child Psychology* (JCR=0.204) (cf. Table 1).

Table 1. Number of the published studies by Magazine, with evaluation according to the JCR da Web of Science Index

Magazine/Book of records of scientific events	Number of Studies	Index JCR
<i>Advances in Health Sciences Education</i>	1	2,462
<i>American psychologist</i>	1	5,880
<i>British Journal of Guidance and Counselling</i>	1	0,530

Concerning the scientific production of Brazilian programs of post-graduation studies, there is a stratification of the quality of that production by the *Qualis*, system of the *CAPES* responsibility. The quality stratification of the production is signed by alphabetical indicators ordered corresponding to the classification in the A extract to the more quality publications. In this system the stratification of the production quality, the C letter corresponds to the indication of less quality. According to the last annual evaluation, the index magazines at *CAPES* selected to the present quality systematic review of literature, are classified exclusively in the extract A and B (cf. Table 3).

Table 3. Number of the Published Articles by Magazine with Evaluation according to *Qualis da CAPES*

Magazine (Qualis)	Number of Articles	Author (data)
<i>Estudios Pedagógicos</i> (B1)	1	Costa, C., Sanhueza, G., Barra, M., & Villalobos, C. (2012)

Finally, according to the last qualification categories consigned, the quality of citations that the primary study obtained was verified that the study that had the major number of citations was “*Narrative and the Cultural Psychology of Identity*”, with 359 citations. By other side, 61 studies didn’t have any citation, and between 70 and 358 citations were not identified any studies (cf. Table 4).

Table 4. Number of studies by quantity of the obtained citations

Results, Conclusions and Recommendations

Discussion

Due to the growing significance of the psychological professionals in the last years and due to the existent inconsistent in the professional identity in this class, it's essential the existence of the universal ethical principles that could be responsible by the professional regulation (Ricou, Sá, & Nunes, 2017). The present research had as objective to collect, organize and analyze the published studies in the last decade, studies connected with the psychology identity theme. The majority of the studies analyzed presents qualitative methodology. So, according with the different studies analyzed, the research method more used was the documental analysis. It's important to state that by the conceptual point of view, the central study object more represented in the studies group is the group of the intentions of those who practiced the psychological act. In the group of the 202 articles included in these first stages of the literature systematic review concerning the last decade, the main analysis, with great influence: (a) the ideas and the significances existing within the exclusivity of psychological intervention, (b) the assumed functions by the psychologists in their different contexts of the professional insertion, in the different stages of their careers, (c) the recognized role, by the psychologists and by all the professionals, to the psychological intervention and (d) the users perspective, and the citizens less directly involved in this process, face to the psychological intervention need. It was possible to obtain the main conclusions of the original studies, what will be helpful to identify the gaps existents in the literature. This way, it was possible to state that there was a significant growing of publications about the professional identity of the psychologists in the last 5 years. In this context, this work is in line with Ricou, Sá e Nunes (2017) opinion. In the next stage of this research will be identified the relationships, the contradictions, the gaps and the existents inconsistencies in the psychology identity studies. Being the identity a construct non-physical, it's possible to considerer essential the existence of a bigger number of studies around the psychologist identity, in particular in the discussion of the exclusivity of the psychological intervention, with the psychologists' perceptions.

Education of military professionals: A case of operational art

Ján SPIŠÁK

Abstract

A goal of this article is to reveal opinions and arguments of senior military staff about the role and significance of operational art, which serves as a bridge between the military strategy and the tactics to plan and conduct the military operations. Participants of the research are officers in an active military service, temporarily studying the career courses at the University of Defense, Czech Republic. The data were obtained using the method of the structural questionnaire; including 13 questions related to the theoretical and practical application of operational art. The research comprised 50 officers from different military units and services of the Czech Armed Forces. The result showed that there is a considerable difference in understanding of the role and importance of operational art by the officers, depending on their experience from operations, the nature of the job position and the possibilities of its application in the practice. The findings of the study are as follows: 1. There are considerable differences in perception of the subject between the beginning and at the end of the study. 2. A self-study is a powerful tool to gain knowledge, experience, skills and competencies in the subject. 3. Understanding the importance of operational theory is beneficial for officers participating in planning and conduct of military operations. 4. The operational art is fully applicable at all levels of operations; strategic, operational and tactical level. 5. A theory of operational art, as a part of doctrinal publications and training manuals, is useful for an operational practice.

Keywords: Operational art, Questionnaire, Education, Career courses

Introduction

Education of military personnel is one of critical aspects that contribute to successful execution of military operations. Military professionals need knowledge, skills and competences necessary for solid and responsible performance of their duties. There are general trends focused on development of military education stemming from the Czech White Paper on Defense, stipulated by Ministry of Defense for the period of years 2012-2018. This document identifies the education of the officers as one of the priorities for their experience, practice and career growth. The Czech University of Defense plays the role the most important educational facility and the bearer of capabilities to prepare the military personnel within the accredited and non-accredited forms of education. The Centre for Security and Military Strategic Studies (CSMSS), as one of the core parts of this institution, educates the senior military staff of the Czech Armed Forces to be capable of critical and creative thinking for a purpose of solving the complex problems at all military levels.

Looking at the subject of operational art, which is from the theoretical and practical viewpoint placed between the domains of military strategy and the tactics, is necessary. Operational art is doctrinally defined as “The employment of forces to attain strategic and/or operational objectives through the design, organization, integration and conduct of strategies, campaigns, major operations and battles” (AAP-06). The other doctrinal publications define the operational art as “The application of creative imagination by commanders and staffs—supported by their skill, knowledge, and experience” (FM 3-0, 2008), “The cognitive approach supported by skill, knowledge, experience, creativity, and judgment of commanders and staffs” (JP 5-0, 2011), or “The use of critical and creative thinking exploited by commanders and staffs to design strategies, campaigns, and major operations” (JP 3-0, 2011). As simply visible, such documents add specific human characteristics to “the employment of forces” which made this subject much more complex and sensitive in terms of the human endeavor.

A broad debate on all the aspects related to the operational art should become a typical part of the preparation of higher ranked military professionals, both in peace and time of their deployment in military operations. There are unstoppable questions floating around to be answered; what is the role of operational art and what the balance between theory and practice is? What can be drawn from doctrines and how the officers look at the subject from their practical perspective? How and where are they familiar with the theory and practice of operational art? Do

they obtain basic information about the subject in units, during their self-study, or they receive the information discussed only in the career courses? These questions are very important and sensitive, not only for the officials at the General Staff and the headquarters of services and tactical commands but they are also crucial for academics at the military educational institutions.

There is a hypothesis that there are considerable differences in the views of the participants in the career courses on the importance of the operational art before its study and upon completion of the study of this subject. With regard to these aspects, the aim of this paper is to summarize the views of military officers about the role, importance, and applicability of operational art which they experienced during their study in the career courses in the academic year 2016-2017. Information from this research offers a suitable source for recommendations to a sophisticated approach to officers' education and also recommendations which may be utilized by unit commanders during the training of the staffs and units.

Method

Results generalizing opinions of students about the significance and applicability of operational art come from the questionnaire survey that students completed in two phases. The first phase of this survey was performed at the beginning of the study block "Operational art" during the first introductory lesson focused on the subject. At this stage, students had "no relevant information" dedicated to real doctrinal viewpoint or notion focused on the theory of operational art (presented during the later study). The second phase of the research followed after three weeks of the study, lessons, presentations, discussions and an exercise during which the core content of the education was aimed at historical background and contemporary understanding of the operational art, aspects of the planning, conduct and sustainability of military operations and the theory and application of operations design concepts which holistically completed the basic theoretical issues of the subject.

For the research, students had to determine the level of positive or negative opinion – statement, attached to the specific question in the questionnaire. A range of six consistent, disagreeable or vague statements was established. The research comprised 50 students attending the higher officer's course for senior officers in two stages (semesters), belonging to different services, with diverse professional focus, specializations, experience and length of the service in the Armed Forces.

Students could answer the questions by selecting the level of agreement, disagreement or vague proclamation, according to the rating scale. The scale defined six basic statements:

- a) Strictly Yes (SY)
- b) Yes (Y)
- c) Neither Yes Nor No (NYNN)
- d) No (N)
- e) Strictly No (SN)
- f) Don't Know (DK)

Findings

Information from the questionnaire survey provided a wide scale of different statements, based on experience, skills, knowledge acquired, professional specialization, and other characteristics of the students. Overall results of the survey are placed in the tables and the text below.

Table 1. Results of the questionnaire survey at the beginning of the study

Statement no.	The results of responses (%)						DK	f (%)
	SY	Y	NYNN	N	SN			
1. I have a clear idea about the subject of operational art	0	16	40	40	0	4	100	
2. I acquired knowledge about the operational art	4	20	16	52	8	0	100	

	during a self-study	0	8	12	52	28	0	100
3.	I acquired knowledge about the operational art at the unit/department I have worked in	0	16	16	56	12	0	100
4.	I applied the theory of the operational art during exercise or my operational deployment I have worked in development of the standing	12	32	4	40	12	0	100

9.	I you use doctrines, manuals and other publications dealing with the theory of operational art	4	20	4	56	16	0	100
10.	Dealing with the theory of operational art is necessary regardless of the size of the Armed Forces	16	56	16	8	4	0	100
11.	The operational art is applicable at the tactical level	12	64	16	4	0	4	100
12.	The theory of operational art described in doctrines is usable in my practice	0	32	32	20	4	12	100
13.	My knowledge about the issue of operational art will be more applicable after the course	12	40	16	20	4	8	100

Results, Conclusion and Recommendations

They were 48 men and 2 women in two career courses who completed the research. A majority of officers were in the ranks of captains and majors. The length of the service varied from 9 to 29 years, the average age was 38, 4 years and the average length of the service was 18, 2 years. 56 percent of officers had experience with deployment to military operations abroad. This colorful pattern provided a sufficient set of information that may denote the need for changes in both approaches; education in the career courses focused on the theory and practice of operational art and approach to officer's military training in units.

The results of the questionnaire showed several important facts. They revealed general views on the role of operational art in terms of its theoretical significance and, at the same time, practical application in the activities of commanders and staffs during a training, preparation, and participation in military operations. As far as the individual claims are concerned, they can be divided into two basic groups. The first group of statements or opinions is closely related to the theory of operational art itself, with which officers could get acquainted within previous courses or self-study, and thus gained the necessary knowledge, skill, and information. Therefore, it is important to compare and assess the students' view of operational art before the beginning of the study block, and then at the end, taking into account the lectures, seminars, and exercises already carried out. As demonstrated by the results of the questionnaire survey, a significant percentage increase of consenting opinions after the study block was found in this first group (statements no. 1, 2, 7, 8, 10, 11 and 13). As the result of teachers' discussions with students showed, the main reason for this increase was the intensive study of operational art theory from military doctrines, study texts, scientific books, scientific works and also conducting seminars and exercises. This is particularly the case in opinion no. 1, where the percentage of consent opinions rose from 16% to 76%. According to the students, they have sufficient space for their self-study, for which there is usually a lack of time in practice at units. This is particularly true in statement no. 2, where the percentage of consent opinions rose from 24% to 76%. Also the statement no. 7 has the very positive result; a percentage rose from 60 to the respectable 92 percent. It makes sense in a conviction of the lecturers that it is necessary to provide students with a doctrinal theoretical view on the theory, focused on the problem of the operations planning process, later applied during practical exercises. This approach can be called pushing information into the brains of students and convincing them that without the necessary knowledge of the planning process, they cannot handle the complexity that this process requires in practice.

Teaching and persuading students about the importance of operational art has also brought other positive results. Students have simply realized that knowledge of the subject increases their credit, self-esteem, and the belief that in practice they can better apply what they had learned during their studies. As seen from the tables, this is also confirmed by a positive percentage increase in other statements; statements no. 8 and 10 (an increase of 18 percent), statement no. 11 (28 percent) and statement no. 13 (16 percent).

The second group of statements in the questionnaire is more related to the practical application of operational art, closely connected to the routine training activities of the units such the issues of planning, preparation, and participation in military operations. As demonstrated in the questionnaire survey, related statements cover a significant percentage increase of consenting opinions (statements no. 1, 2, 7, 8, 10, 11 and 13). The opinion in the statement no. 3 confirmed that officers, in the context of his/her professional practice, are not sufficiently concerned with the theory of operational art. While the value achieved only 8 percent of the positive proclamations at the beginning of the course, the value was also very low at the end of the course; only 16 percent.

On the question, whether the students applied knowledge of the theory of operational art during their operational deployment, they answered in the statement no. 4. Even though 56 percent of them were deployed in military operations before, only 16 percent students claim they used some knowledge related to the theory of operational art.

Similarly, the low value was reached in the response to the statement no. 6. Only 28 percent of respondents are engaged with issues of preparation and conduct of military operations in their daily routines. Nevertheless, the results correspond to the professional focus of individual officers.

This research paper examined opinions about the significance of operational art, submitted by military officers who studied the career courses at the Czech University of Defense in the academic year 2016-2017. The overall findings from the research show following:

- There are considerable differences in perception of the subject between the beginning and the end of the study; a long-lasting study of the subject is more than necessary.
- A self-study is a powerful tool to gain knowledge, experience, skills and competencies in the subject; a self-study must be a part of the officers' training at units.
- Understanding the importance of operational theory is beneficial for officers participating in planning and conduct of military operations; good knowledge and skill of the subject help officers to overcome a severe operational reality.
- The operational art is fully applicable at all levels of operations; strategic, operational and tactical level; officers may recognize which elements of the operational art is useful to exploit, based on the level he or she works at.
- A theory of operational art, as a part of doctrinal publications and training manuals, is useful for operational practice; studying the publications should become a daily routine.

The application of the operational art theory and practice is necessary for the most of the officers in the Czech Armed Forces. It is recommended, that information from this research may serve as a suitable source to a sophisticated approach to officers' education during their studies at the University of Defense and also they may be utilized by unit commanders during the daily training of the staffs and units.

The Application of The Principles of Visual Hygiene as a Predictor of Joint Education of Visually Impaired and Intact Individuals

Kateřina Kroupov

Institute of Special Education Studies – Zizkovo nam. 5, 77140 Olomouc, Czech Republic

Email: katerina.kroupova@upol.cz

Abstract

One of the principles and the key pillar of working with people with visual impairment is the consistent application of the principles of visual hygiene. The role of visual hygiene and adherence to its principles is accentuated within education, so the text of the paper and its research dimension are related to the reference framework of the educational process. Visual hygiene can be defined as a set of methods, principles, guidelines, and procedures that need to be followed to avoid damaging visual perception. The aim of the paper is to present partial aspects of visual hygiene research from the point of view of both actors of the educational process - from the viewpoint of educators, even pupils and students with visual impairment. The research is then framed by the theoretical input into the chosen issue.

Keywords: visual hygiene, visual impairment, inclusive education, quality of life

1 Introduction to the issue

Visual hygiene can be defined as ‘a set of methods, principles, regulations and procedures that need to be followed to avoid damage to preserved visual perception. If visual hygiene is observed, students with visual impairment can easily engage in the usual learning process without any other adjustments or modifications (Růžickov, 2006, p. 48).’ It is a set of principles of working with persons with severe visual impairment that support the use of preserved visual functions without overloading them; at the same time the functions need to be protected to prevent their deterioration or loss (Finkov, Růžickov, Stejskalov, 2011). The basic measures of visual hygiene relate to the following:

- Lighting climate;
- Location of the workplace;
- Characteristics of the environment, material and technical equipment;
- Conditions of working with text and pictures;
- Specifics of the graphical expression;
- Time dimensions of visual work, and
- Application of special visual and compensatory aids.

Specific consequences in relation to the principles of visual hygiene and their implementation in the educational process from the students’ perspective are mentioned for example by Hankov, Potmšil, Tylšarov, Urbanovsk (2015). In a typhlotechnic context the issue of visual hygiene is described by Regec (2012) or Majerov and Malinovsk (2015).

2 Visual hygiene in research

The purpose of the research study, which was of a quantitative design, was to explore and describe the conditions of visual hygiene from the perspective of students with visual impairment and their teachers. Is observance of the principles of visual hygiene a routine part of the educational process? Do students with visual impairment follow the principles of visual hygiene in everyday situations? Which generally applicable principles are suitable for students with visual impairment? Which contemporary children’s illustrations are best for students’ subjective perception? What is the teachers’ opinion about the principles of visual hygiene and their observance by students with visual impairment? Which of the principles are difficult to apply? Are the principles of visual hygiene included in the individual education plan of students with visual impairment? Which principles of visual hygiene do teachers consider most important? These questions and many other assumptions were tested by means of a questionnaire survey carried out in 2016.

The primary research sample was formed by means of deliberate sampling; the acceptance criteria were presence of visual impairment (low vision or residual vision) and attendance of elementary school or secondary school. The secondary research sample consisted of the teachers of the students with visual impairment. The respondents in both samples were presented with a questionnaire including open and closed items. In the primary research sample the questionnaire used larger font size and the respondents had more time to complete the questionnaire. In terms of their content, the questionnaires focused on the area of visual hygiene.

In accordance with the objective of the research the following research assumptions were formulated:

- It is assumed that students with visual impairment observe the principles of visual hygiene in the educational process.
- It is assumed that the teachers of students with visual impairment apply the principles of visual hygiene as part of direct educational work with the students.
- It is assumed that the generally applicable principles of visual hygiene will be suitable for the vast majority of the respondents.

- It is assumed that the principles of visual hygiene are inherently included in the individual education plan of students with visual impairment.
- It is assumed that students with visual impairment are aware of the principles of visual hygiene.

The data analysed were presented by means of illustrative data projection methods such as tables and graphs. Regarding the size of the research sample it was impossible to perform statistical testing; therefore, the interpretation is primarily of a descriptive nature.

2.1 Data analysis and interpretation - primary research sample

What are the needs and experiences of students with visual impairment concerning the principles of visual hygiene and their observance? These and other aspects of visual hygiene were covered by a total of 13 items of the questionnaire. The first item focused on the age structure of the primary research sample.

The most numerous age category included respondents aged 15 to 22 years, i.e. adolescents, who are assumed to have a certain ability to observe the principles of visual hygiene, which in our opinion increases the validity of the results.

The next two items focused on the use of glasses and other optical devices to correct vision. In accordance with one of the research assumptions, more than a half of the respondents use glasses to correct their vision, on the other hand, almost 29% of the respondents do not wear glasses. This might be due to various reasons including an unrectifiable visual defect, use of contact lenses instead of glasses, or intentional non-use of glasses. In any case, correct application and use of prescribed correction is a prerequisite for optimum visual performance and reduced visual stress.

Interesting findings resulted from an item focusing on the use of optical devices. It is surprising that over 54% of the respondents do not use these aids to improve their visual performance. Among the remaining 42%, the most frequent aids included magnifying glasses, TV magnifiers, monoculars, handheld camera magnifier, and also software magnifier (ZoomText) or voice output. Items 4 to 6 of the questionnaire focused on the conditions of using text. The main focus was on text enlargement, lighting conditions and the use of a magnifying glass.

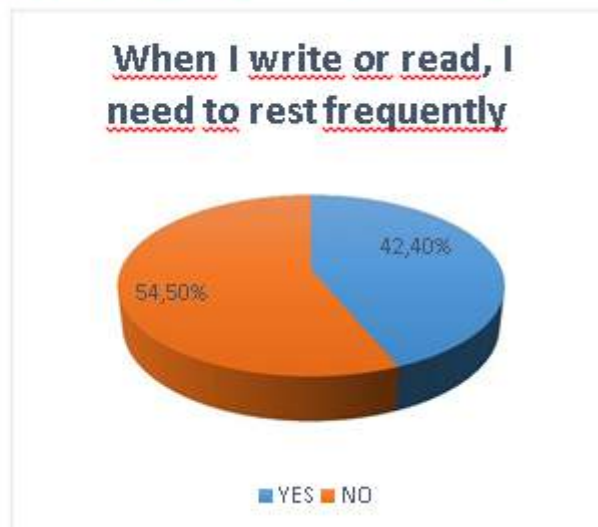

Graph 1. Conditions of using text; **Graph 2:** Lighting conditions in using text or pictures;

The question concerning text enlargement brought expected results; more than a half of the respondents use enlarged text. Negative responses or 'Other' might be explained by the use of compensatory devices. Students in the second stage of elementary school and in secondary school are assumed to use optical devices to enlarge texts; the use of large font in this age category is usual or desired.

More than 59% of the respondents did not confirm an increased need for light intensity in using text or pictures. This can be explained by photophobia or sufficient intensity of existing lighting. The remaining 39.4% of the respondents use a table lamp to provide additional local lighting; a suitable alternative is a fluorescent lamp.

Graph 3. Use of optical devices in working with texts; **Graph 4.** Level of fatigability

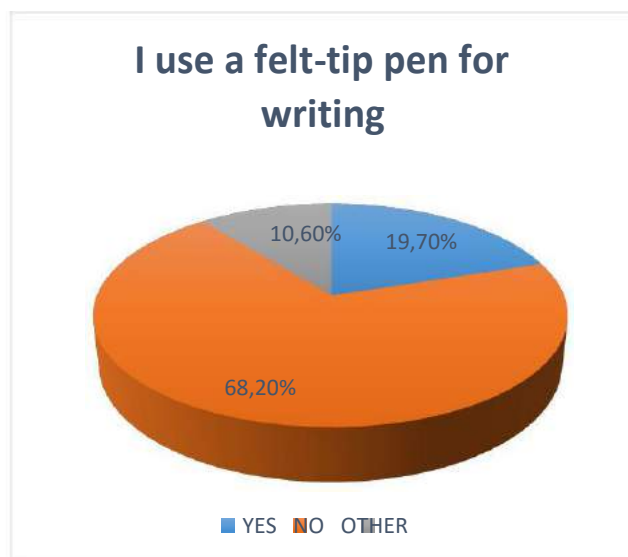

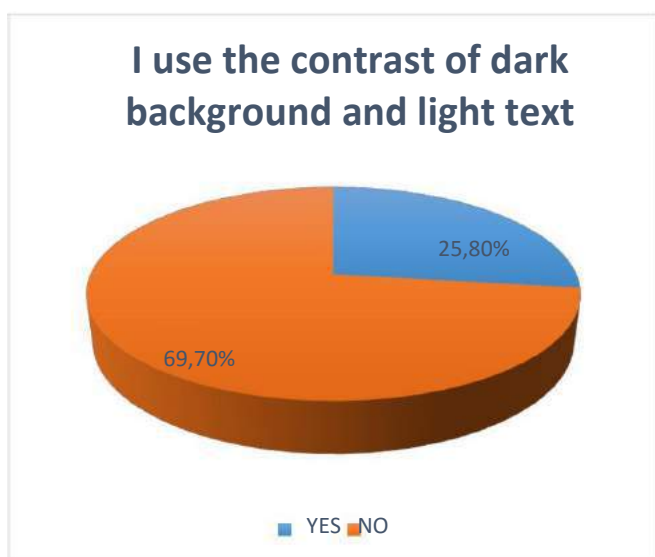

The usability of optical devices (magnifying glass) was investigated by item 6. Almost 44% of the students use a magnifying glass to enlarge text. In one of the previous items, a similar proportion of the respondents reported the use of optical devices.

The following item focused on the level of fatigability and the application of the principle of limited work at a short distance. Only 42.2% of the respondents reported an increased need for rest during visual work. In this context it should be noted that observing the principle of limited work at a short distance is one of the key principles of visual hygiene. It is assumed that almost 55% of the responses indicating ‘No’ will be reflected in the item relating to increased fatigability and asthenopic issues below. The eighth item of the questionnaire focused on working with a text from a different perspective – the question was whether the respondents work with texts or pictures under an angle using a tilting desk.

A tilting desk, which ensures better conditions for visual work, is used by only 18.2% of the respondents; 42.4% of the respondents do not adjust the angle of their desk. Such high proportion can be explained by either substandard material conditions and insufficient school equipment, or insufficient awareness about this possibility of improving visual performance.

The ninth item of the questionnaire focused on contrast conditions in working with texts. The main focus was on a combination of a light figure and dark background.

Graph 5: Contrast conditions in working with texts; **Graph 6:** Writing implements

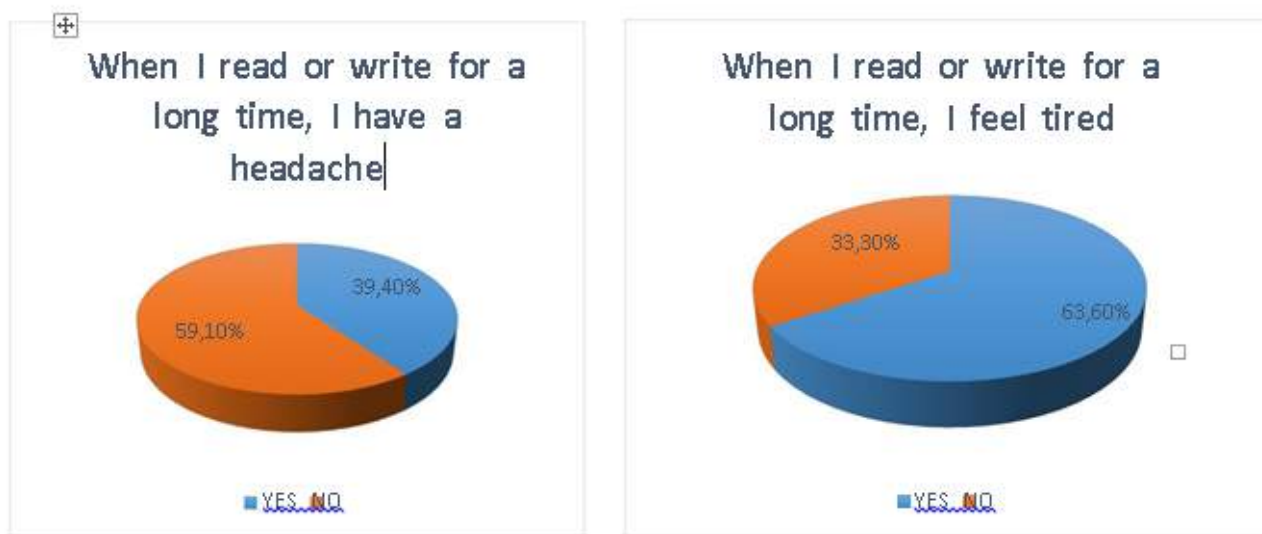

The commonly preferred contrast of a light figure and dark background is used by less than 26% of the respondents. It is assumed that these students use a software magnifying glass or television camera magnifying glass allowing these colour combinations. The remaining respondents (69.7%) either use a completely different contrast, or the usual black text on white background is sufficient.

The tenth item of the questionnaire focused on the type of writing implements used by the respondents.

Unfortunately, less than 20% of the respondents use writing implements that leave a wider line, which would facilitate visual perception. Unfortunately, the respondents did not make any comments in the item called 'Other'. The respondents might have misinterpreted the term 'felt-tip pen', which should have been specified in detail. However, it might be concluded that 68.2% of the respondents use usual writing implements not providing any special comfort for visual differentiation.

The penultimate and antepenultimate items focused on the area of visual fatigue and associated asthenopic difficulties.

Graph 7: Asthenopic difficulties in working at a short distance; **Graph 8:** Visual fatigue in working at a short distance

Asthenopic difficulties, which usually manifest as headache or eye pain, were reported by over 39% of the respondents. The remaining 59% of the respondents either do not suffer from any asthenopic problems or do not associate them with increased visual performance. This assumption is to some extent confirmed by the following item.

Increased fatigue associated with longer visual performance load is experienced by almost 64% of the respondents; however, more than 33% of the respondents do not report difficulties of this kind. Increased fatigability is of course dependent on the degree of visual impairment. Individuals with mild low vision need not experience any of these symptoms or do not associate them with visual perception.

1.2 Data analysis and interpretation - secondary research sample

In the introduction to this section it should be mentioned that in the case of the secondary sample of teachers who educate students with visual impairment the return rate was even lower than in the case of the primary research sample. The resulting number of respondents was 16. The outcomes and interpretations of these data are therefore of an informative nature and cannot be generalized. The teachers were asked about their professional experience, support provided to visually impaired students by the special educational centres, principles of visual hygiene - those that are applied most frequently and those that are difficult to observe, and a variety of other aspects related to the issue of observing the principles of visual hygiene in the process of education. In the first two items of the questionnaire the respondents indicated the length of their teaching experience and the level of school where they teach.

Table 1: Length of respondents' experience

Length of experience	Relative number	Absolute number (%)
Less than 5 years	3	18.75
5 – 10 years	1	6.25
10 – 20 years	2	12.50
More than 20 years	10	62.50
		Total: 16

In terms of the length of teaching experience, most of the respondents (62.5%) are in the category of over 20 years of experience. This aspect might be very significant in terms of data interpretation and conclusions, albeit not generalizable. It is assumed that the length of teaching experience causes a proportionate increase in the respondents' experience concerning students with visual impairment, which also improves the validity of our questions.

The following items focused on whether the respondents received some information about the principles of visual hygiene during their university study, and whether they were informed about the principles of visual hygiene by an educational counselling centre (special educational centre for the visually impaired).

Table 2: Information about visual hygiene from university

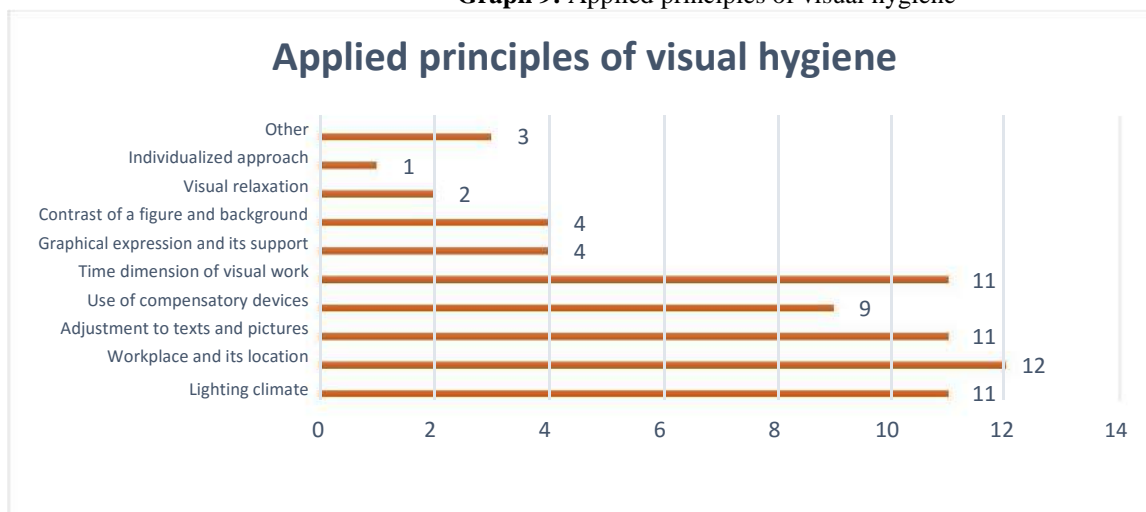

Information about visual hygiene from university	Relative number	Absolute number (%)
Yes	13	81.25
No	0	0
I do not remember	2	12.5
I have not taken a university degree	1	6.25

Table 3: Information about visual hygiene from special educational centre

Information about visual hygiene from special educational centre	Relative number	Absolute number (%)
Yes	10	62.5
No	2	12.5
I do not know	4	25.0

The fifth item focused on the principles of visual hygiene that are most applied by the respondents in the educational process. The structure and share of various principles of visual hygiene are shown in the following graph.

Graph 9: Applied principles of visual hygiene

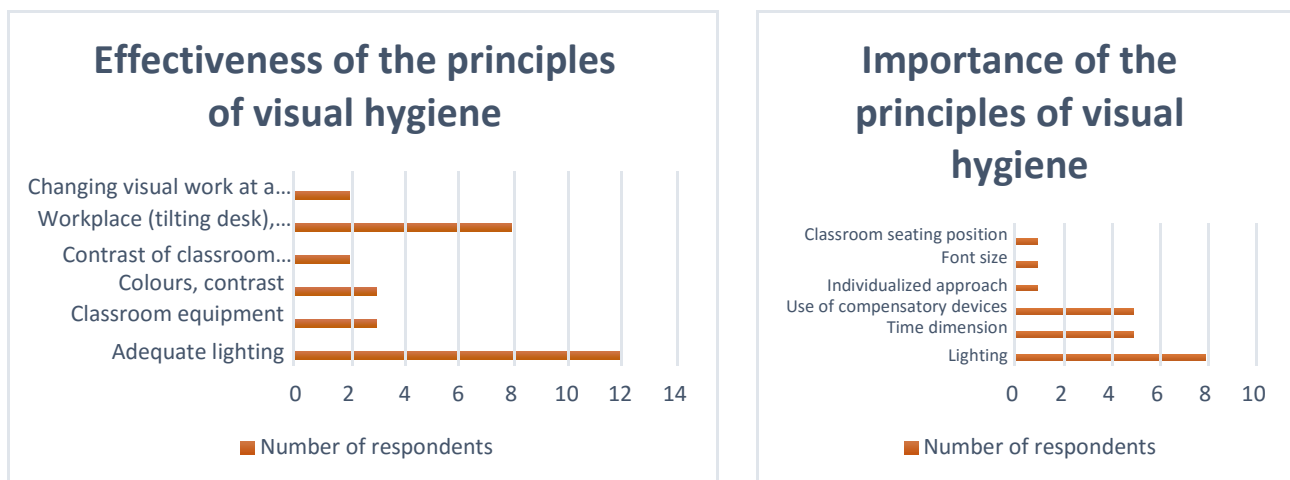

■ Number of respondents

Some of the principles of visual hygiene can be difficult for the teachers to apply in the educational process. According to the respondents, the principles that are difficult to apply surprisingly include for example cleanliness, wearing of appropriate glasses to correct vision. The respondents also have difficulty with the graphical expression of students with visual impairment, observing time limits for visual work at a short distance, application of the principles of using pictures, adjustment of the lighting climate or observance of an optimum working distance. Other problems included application of appropriate fine arts tools and materials or adaptation of visual hygiene to specific types of visual defect. Last but not least, the respondents mentioned the issue of using compensatory devices – very often the students avoid using them, they feel ashamed, using the devices is unacceptable and time consuming, they prefer excessive load on the visual analyser, etc.

The answers to whether the students are able to require or observe the principles of visual hygiene were almost identical – 13 out of 16 respondents believe that only some students are able to apply the principles of visual hygiene independently or to require their observance. According to the teachers, a prerequisite is independence, self-reliance, ambition, and awareness on the part of the student. These are usually students who have been taught to observe the principles of visual hygiene since their childhood in their family or in elementary school. In this respect, better results are usually achieved by students from schools for the visually impaired, but this is not always the case. A crucial aspect is guidance in the family and in previous school. Another precondition was adequate cognitive abilities.

The following graphs illustrate adjustments in terms of visual hygiene that are according to the teachers efficient and important.

Graph 10: Effectiveness of the principles of visual hygiene; **Graph 11:** Importance of the principles of visual hygiene

The first place is occupied by an optimum lighting climate. Other important principles include the principles of working time limits and the application of compensatory devices in the educational process.

The final item focuses on whether the teachers of students with visual impairment are able to find the required information about the principles of visual hygiene in the key student document – the individual education plan. The majority of positive responses (81.25%) is a satisfactory finding, especially with respect to the inclusive trend in education.

1.3 Results and discussion

Regarding the relatively low saturation of both research samples it is impossible to perform statistical testing of the research assumptions or generalize their validity. The outcomes are just informative and can only be generalized in relation to the theory. Therefore, the description of the results will be limited to a mere description of the data and their associations with the outlined theoretical framework.

During the stage of designing the project it was assumed that students with visual impairment observe the principles of visual hygiene in the educational process, both supported by their teachers and individually. To verify this assumption is not simple; a number of the questionnaire items require detailed specification and a deeper analysis. An example is wearing glasses to correct vision, where almost 30% of the respondents with visual impairment do not wear glasses. This can be supported by various explanations, but in the secondary research sample consisting of teachers a relatively frequent answer in this context was the students' reluctance to wear glasses, dirty or inappropriate glasses. Although the vast majority of the respondents in the primary

research sample were in the age category of adolescence and were assumed to have a degree of awareness about the principles of visual hygiene and possibilities of increasing their visual comfort, more than a half of the respondents do not use optical devices (various kinds of magnifying glasses, monoculars, turmons, etc.) However, this proportion could have been artificially increased by an insufficient definition of the category of optical devices – a number of the respondents might have excluded aids such as software magnifiers or screen readers. In this context, the issue of text enlargement should be mentioned. In accordance with theoretical knowledge, students from the second grade of elementary school should be able to work with normal-size print using appropriate compensatory devices. However, this assumption was not confirmed by the respondents in the present study as more than a half of them still use enlarged text. At the same time it should be noted that this aspect should not be assessed only in terms of negative consequences; a positive aspect is that the visual analyser is not subject to excessive load and the conditions for work at a short distance are individualized. The results of this item are also confirmed by a verification item focused on the use of the magnifying glass when working with text, where a similar percentage was achieved. According to the research sample of teachers, a crucial aspect is an adequate lighting climate. An analysis of the responses of the primary research sample suggest that increased light intensity is not a universal principle in this respect – 59% of the students do not require increased light intensity in their working environment. It is obvious that this area is also subject to individualization, especially with respect to photophobia. One of the key principles of visual hygiene is setting time limits for working at a short distance. This aspect was also supported by the teachers involved in the study. The application of time limits in the process of education brought positive results. A total of 42% of the students confirmed an increased need for rest. In an ideal case, the remaining 55% of the respondents do not feel this need, because they already apply this principle and receive adequate visual relaxation. However, 39% of the respondents suggest that they suffer from asthenopic difficulties, which manifest primarily as headache and might result from excessive load on the visual analyser. Increased fatigue associated with longer visual performance was confirmed by 6% of the respondents. According to the teachers, a significant aspect is to perform adjustments to the workplace, particularly by using contrast colours. However, only 18% of the students use a tilting desk to facilitate their visual performance, which might be attributed to insufficient material conditions but also low awareness about possible modifications of the working desk and measures to facilitate work with texts or pictures. Working with texts and pictures also depends on the use of the contrast of a figure and background. Individuals with visual impairment are generally recommended increased contrast of a light figure and dark background. Although the teachers believe that this aspect is of relatively great importance, the students did not confirm this need. Increased contrast is preferred by less than 26% of the respondents.

According to the principles of visual hygiene, the comfort of writing is inherently associated with writing implements leaving a wider, distinctive and sufficiently contrasting line. However, this assumption was confirmed by only 20% of the students. It should be noted though that the respondents might have misinterpreted the term felt-tip pen; unfortunately, they did not specify the writing implement in the 'Other' item.

One of the research premises assumes that the teachers of students with visual impairment apply the principles of visual hygiene as part of direct educational work with the students. The research sample of teachers did not confirm this assumption. A very positive finding is that the principles applied in the educational process also include the principle of an individualized approach or visual relaxation. At the same time it was assumed that the students with visual impairment have a degree of awareness about the principles of visual hygiene and are able to observe them or require their observance. The conclusions are not absolutely clear, but 81% of the teachers believe that students with visual impairment are able to observe or require observance of their specific needs in terms of visual hygiene depending on their personality and independence.

In designing the research it was also assumed that the principles of visual hygiene are inherently included in the individual education plan of students with visual impairment, which is the key document and source of information for the teacher. Although the results of the present research cannot be generalized, a positive fact is that the majority of the teachers refer to the individual education plan to search for any required information related to the principles of visual hygiene; alternatively, this information is provided by a special educational centre (60%).

A general assessment of the situation suggests that the principles of visual hygiene will always represent, as one of the teachers aptly described, 'a completely individual package of measures', which is also confirmed by frequent contradictory responses suggested by the primary research sample. However, a very positive finding is that the teachers involved in the research are aware of the principles of visual hygiene, apply the principles in the educational process, and understand their significance for efficient use of the preserved visual potential of students with visual impairment.

Conclusion and summary

Observance of the principles of visual hygiene is a key pillar in working with persons with visual impairment in order to ensure maximum protection of their preserved visual functions. The role of visual hygiene and observance of relevant principles is emphasised in the context of education. This text presents specific results of a quantitative research study among teachers and visually impaired students with a focus on visual hygiene and the application of relevant principles in the area of special education.

Abstract

There is much research on the learning of written language, especially in relation to reading, however, there are very few studies on the process of acquiring writing in early ages. One of the main reasons is usually because reading as well as writing are considered complementary skills and are developed jointly and interrelated as a consequence of the similarities and characteristics they share, since when reading we decode a message that comes from the spoken language and when writing we encode a message from the same language. In fact, it is usually common among teachers themselves to use the term literacy to refer to students' written language learning. However, it has been found that reading and writing involve different cognitive processes and that their learning does not occur identically in students. Initial literacy indicates that the acquisition of learning of writing takes place throughout an evolutionary process from the earliest ages, affirming that there is no clear moment when this learning is acquired. The purpose of this paper was to determine which variables facilitate the process of acquisition of writing in the first moments in which this learning is accessed, as well as to determine which moment is the most suitable for the development of this linguistic ability. A quasi-experimental design was used to compare groups with pre-test and post-test measurements. The study involved 224 students aged between 5 and 6 years of age. The results indicate that the development of oral language, phonological awareness and alphabetic knowledge are relevant variables in the acquisition of writing when students make contact with the written code and that the age of 5 years is the most appropriate time for the explicit stimulation of the skills that facilitate the learning of the writing system.

Keywords: writing, oral language, literacy, written language, text production.

Introduction

When analysing the process of acquisition of written language, we can observe that this is one of the most complex learnings and on which most of the school time is spent in the first school levels. So, it is not surprising that the study of reading and writing have become one of the priority facets in the field of research. Many years have been devoted to the study of these language skills.

As a result of recent studies, the relevance of the development of an adequate teaching model has been glimpsed, and the development of oral language as a basic premise to master the written code is very relevant (Gutiérrez- Fresneda & Díez, 2017).

Another of the characteristics that predominate in this learning is the conception of the concept of literacy as a unitary entity (Escotto, 2014), when it has been proven that reading and writing, although complementary skills, are equally domains that involve differentiated cognitive processes (Gutiérrez & Díez, 2016).

This work, unlike the numerous studies carried out concerning reading, focuses on the importance of writing for personal and social development, inasmuch as it constitutes an essential tool in personal communication which is characterized by making ideas, opinions, feelings, ... and ultimately, of promoting communicative exchange and the development of thought through the transcription of written messages.

However, learning to write does not occur naturally as it does with oral language; the individual, in the case of written language, has the skills which have to be developed to access the writing system. For many years, methodologies of diverse nature have been developed, all of them valid for access to writing acquisition, but not all have shown to be equally successful in this achievement. In order to develop effective methods, it must be supported by theories that explain the reasons for each action, and accompanied by joint reflection processes that allow analysing successes in a collegial and objective manner.

At the beginning of the process of teaching written language, we should indicate that the optimal development of oral language is a highly relevant factor and that shortcomings in this area will lead to difficulties in its acquisition. Similarly, when learners begin to have access to written language, they must be aware that the written system is based on the representation of oral language, so letters are graphic signs that correspond to the sound elements. However, understanding the link between spellings and sounds is not a simple task since children directly activate their meaning when listening to a known word, as if the sound form of the word did not exist. This difficulty resides in the spoken language since in pronouncing the words the sounds are articulated in a grouped way (Defior & Serrano, 2011, Gutiérrez & Díez, 2015).

The awareness of the elements that give rise to words is known as phonological awareness and the development of phonological awareness skills contribute to the interaction between oral and written language, which shows the close relationship between learning the written language and the development of the skills that lead to reflection and analysis on speech (Aguilar, Marchena, Navarro & Menacho, Defior, 2008; Feld, 2014).

In transparent alphabetic systems such as Spanish in which writing represents the phonological structure of speech, phonological development acquires a role of great relevance (Guarneros & Vega, 2014). However, it should not be forgotten that language is composed of a greater number of components: form (phonological and morph syntactic), content (semantic) and use (pragmatic), which act together in both oral and written language.

On the other hand, it has been proven that, as in the development of oral language and phonological knowledge, alphabetic knowledge is a highly important factor in the process of initial literacy, so it must also be taken into consideration between the variables (Diuk & Ferroni, 2012; Gutiérrez, 2017; Schatsneider, Fletcher, Francis, Carlson & Foorman, 2004). Consequently, in an alphabetical system, such as ours, one of the first requirements that children face when learning to write is to identify the letters that make up our alphabet and learn the sound that corresponds to each of them (Cuetos, 2009).

One problem with research devoted to the study of the learning of written language is that there is very little work dedicated to the study of writing in a specific way, since either they are oriented towards the acquisition of reading or are set within the term literacy, when curiously the greatest difficulties of learners occur specifically in the field of writing.

The purpose of this study was to analyse the effect that the intervention in phonological awareness along with oral language and literary knowledge jointly exercised present in the learning of the writing system.

To do this, we compare the acquisition of writing of two samples of children aged between 5 and 6, one group receives intervention in phonological awareness, stimulation of oral language and in learning the letters of our language code and another follows the traditional teaching program. Our hypothesis is that the students belonging to the group that is trained will obtain a better performance in the acquisition of writing.

Method

Participants

The study involved 224 students aged between 5 to 6 ($M = 5.42$, $SD = 0.38$), of whom 48.6% were boys and 51.4% were girls. These students belonged to four public and semi-private educational centres. Of these, two schools were assigned to the experimental group (114 students) and the other two to the control group (110 students). The contingency analysis (Pearson's chi-square) between condition and sex did not show statistically significant differences ($X^2 = 0.46$, $p > .05$). All of them shared the characteristic of being located in a middle-level sociocultural context.

Design and procedure

A quasi-experimental and longitudinal design with pre-test-post-test measures (four measurements) was performed with an experimental group (with intervention program applied) and a control group (following the official curriculum). For the analysis of the data the statistical program SPSS Statistics 20.0 was used. At first, descriptive statistics were obtained with the purpose of analysing the mean scores and standard deviations of the subjects in each of the measured variables. Subsequently, the main analyses of the study were carried out through a mixed ANOVA of repeated measures $4 \times (2 \times 2)$. The factors that were included in the model were the period of each evaluation (pre-test-post-test: E1, E2, E3, E4) and the group (experimental-control). Measurements were made at the beginning of the last stage of the Infant Education stage (E1) at the end of this course (E2), at the beginning of the first stage of Primary Education (E3) and at its conclusion (E4).

Evaluation instruments

In order to evaluate the dependent variables under study, three evaluation instruments with psychometric guarantees of reliability and validity were used.

. Test for the Assessment of Phonological Awareness (CEEC). (Ramos & Cuadrado, 2006). This test evaluates two levels of phonological knowledge (syllabic and phonemic), each of which consists of three distinct tasks: identification, addition and omission. It includes three subtests with syllables and phonemes (tasks of identification, addition and omission), with a total of 30 items (15 syllables and 15 phonemes). The maximum score that can be obtained is 30; 1 point for each correct answer and 0 for each error. The reliability, estimated through Cronbach's alpha coefficient, is 0.80.

. Revised Navarre Oral Language Test (PLON-R). (Aguinaga, Armentia, Fraile, Olangua & Úriz, 2005). For the evaluation of oral language, the PLON-R (2004) test was used, this is a standardized test for children between three and six years of age. Its purpose is to analyse the different components of language: form (phonology, morphology and syntax), content (semantics) and use (pragmatic), as well as to evaluate the three basic communicative functions: informational, regulatory or petitioning and

metalinguistic, which permits a total score on language development. This test presents a Cronbach coefficient of reliability of 0.87.

. Proesci-Primaria (Assessment Test of Cognitive Processes in Writing) (Artiles & Jiménez, 2007). For the evaluation of the degree of acquisition of writing, the tests related to the domain of the lexical processes were used, which include the tasks of: dictation of letters, generating words, dictation of words, dictation of words subject to orthographic rules and dictation of pseudo words. In each of these tests a point is awarded for each correct answer. According to the Cronbach procedure the coefficient of reliability is 0.85.

Results

Table 1 shows the descriptive statistics of the variables oral language, phonological knowledge and writing processes, with mean scores and standard deviations of the experimental group and the control group in the four evaluation periods. As can be seen, the same table includes the *F* statistics obtained from the mixed ANOVA of repeated measurements in the evaluation factor, group and the evaluation-group interaction.

Discussion and Conclusions

The purpose of this work was to analyse the effect that joint intervention in oral language, along with phonological and alphabetic knowledge has in the learning of writing. The results obtained show that the instruction in these skills significantly improves the process of acquiring writing in the early ages. It is observed in the collected data that the implanted intervention contributed to improve the development of the different components of oral language (form, content and use), a fact highlighted since there are numerous studies that indicate that written language is based on the domain of oral language (Guarneros & Vega, 2014, Gutiérrez, 2017; Ouellette & Haley, 2013), so that the greater the domain of oral language, the easier it will be to access the segmental units of spoken language and the association of phoneme-grapheme correspondence.

The relationship between the learning of writing and phonological awareness is also observed in the results of this work, as has been collected in previous studies (Defior, 2008, Núñez & Santamaría, 2014, Gutiérrez & Díez, 2015).

In relation to the learning of writing, the data obtained indicate that alphabetic knowledge did contribute significantly to the improvement of the different variables involved in the writing of words. There were specifically significant improvements in the ability to generate words, write words of different lengths and familiarity, write words without misspellings and write corrected pseudo words, which indicates that the students participating in the program achieved a remarkable improvement that

has allowed access to the representation of words quickly and accurately.

This would be explained by the management of phoneme-grapheme correspondence rules along with the development of oral language and the ability to analyse and manage phonemic units of words. Thus, the greater the development of these three components: oral language, phonological awareness and alphabetic knowledge, the faster and more effective it is to learn to write.

On the other hand, it was observed that greatest progress was made during the last stage of pre-school, and considers this period as the most suitable to begin teaching the writing system by stimulating oral language and the development of phonological skills.

In conclusion, from the results found in this work, at a practical level we suggest the design of programs oriented to the joint development of phonological awareness, oral language and alphabetic knowledge in early ages to achieve better learning of the writing system. Likewise, the monetarization of the evolution of the writer process of the students participating in the program in higher courses is recommended in order to check if the effects of the program are maintained over time.

Netcompetence – a sustainable need for the digitized working world and society

Jonas GEBHARDT

Res. Asst., Dipl. Edu. & Lecturer, Europa-Universität Flensburg (GER), Institute of Vocational Education, Work and Technology (shortform: biat)

Email: jonas.gehardt@uni-flensburg.de

Abstract:

Due to the effects of digitalization and globalization, as well as on- and offline networking, the working world and life are becoming more complex. The requirements on human learners of all ages and qualifications will rise. Basing on results of own scientific empiric researches on the day-to-day work of skilled workers (can be also named as specialised workers) and in the context of digitalization and the german-high-tech-strategy Industry 4.0 (ger.: Industrie 4.0) and cyber-physical systems, the construct of Netcompetence was further defined. Empiric observations and researches in the current and anticipated future working world makes it necessary to prepare humans to learn and reflect information of on- and offline networks, to enfold IT-competences as well for non-IT-qualified professions, to communicate interdisciplinary and international in on- and offline networks and to enlarge the operating with professional competences in on- and offline networks. Netcompetence is a human-centered need for the construction and didactisation for sustainable processes of education and lifelong learning.

Keywords: digitization, Industry 4.0, cyber-physical systems (CPS), future competence, Netcompetence, skilled work

1. Introduction

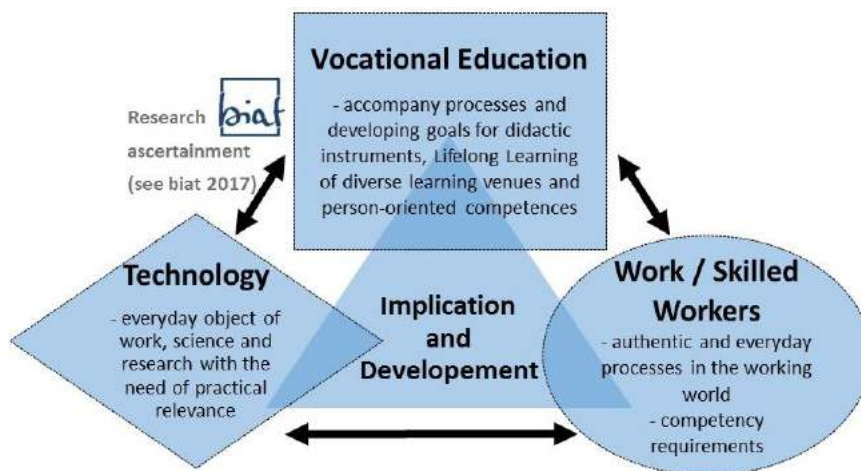

Internet of Things (IoT), Cyber-physical systems (CPS), Economy 4.0, Work 4.0 or Industry 4.0 (for a better reading the german term “Industrie 4.0” is translated to “Industry 4.0” in this article) are known as the abstract-looking superscripts of the high-tech visions of a digitally-networked working world and society. In the early days of the 4.0 debate, this kind of design was primarily based on a more technology-centric feasibility with still polarizing theses on the influence on the working world (BMW 2017). In the meantime, we increasingly need to focus more on the human-centered implementation and education possibilities. During times of an increasing complexity of access to information and academization, this contribution designs a perspective on requirements for future work 4.0, displays the effects on the sustainable strenghtening of the vocational educated skilled workers in Germany in terms of businesses and the dual-system auf vocational-education (Gebhardt et. al. 2015, 119-120). Let me show you a scenario, that is created on the findings of own surveys and observations of the Institute of Vocational Education, Work and Technology (shortform: biat, at the Europa-Universität Flensburg (North-Germany at the boarder to Denmark and at the Baltic Sea), during the researches of the project “PROKOM 4.0 – Competencemanagement for the skilled workers in the high-tech-industry” (PROKOM 2017), that is financed by the German ministry of education and science (shortform: BMBF), from January 2015 until December 2017. Although it is designed to show the everyday future work life of a skilled worker:

With the company-owned smarttablet, the Industrial Electronics Technician (skilled worker, non-academic) puts an eye on the work process during commissioning during an assembly operation while she is working in the Ukraine. In addition to digital circuit diagrams, she reads the data from the logo-control, interprets it, responds to possible problems, and sends a real-time feedback to the IT-engineer at the main company headquarters in Germany via a messenger app. In this decentral and networked way they discuss possible actions, alternatives and the further proceeding. The Ukrainian colleague is also informed about the status of this working-case, in a reduced English language, sometimes supported by a translator. To the evening of the event in the hotel, the company server is logged on quickly, materials are ordered, and the status of operational safety instructions required by the company are checked. This can be done by the electronics engineer, if necessary, decentral and according to his own managed time-periods. Then he will still be with the family before he goes to dinner, to which her Ukrainian colleague has invited.

At its core, the scenario shows that profession-related work of skilled workers is an interaction that is constantly changing, especially in comparison to the pre-digital time. In privacy as well as in all-day business, interaction and communication becoming increasingly digitized via mobile data networks and ICT (information- and communication technology), notably in former non-classical IT-spheres. On the path of digital transformation, to

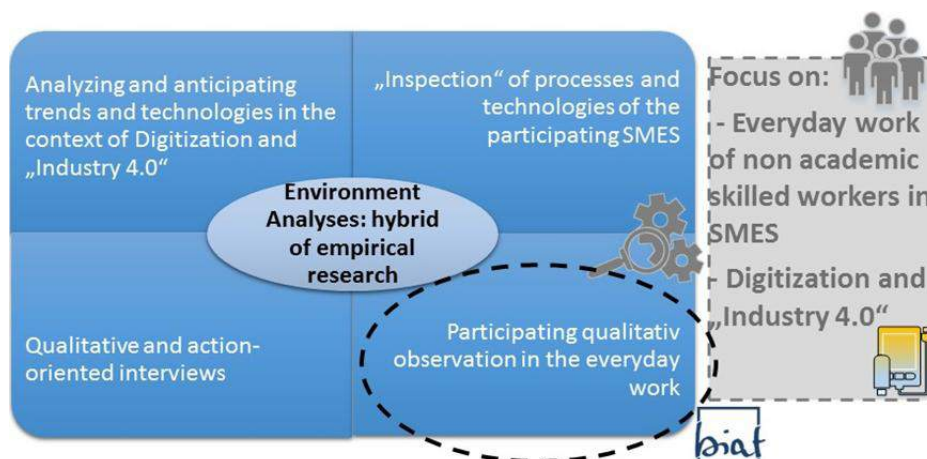

the Industry 4.0, this interaction will increasingly be not only a communication between humans, but also between human beings and machines, as well as between crosslinked machines themselves. The spatial boundaries will dissolve as well as working-contents, that have been once transparently defined. All processes and contents in work world and privacy will get more connected and may influence itself in different ways. This fact will happen on- and offline by the means of IT-network-technologies and general effects of a globalized and internationalized world. A future-oriented change management of operational processes, with regard to the implementation and the reorganization of physical and virtual instruments and machines of the manufacturing and service industry, means to digitize, automate and network, in a particular and person-oriented way. What will be the requirements of the digitized world and what kind of impact will they have on the working world and society? And how can the non-academic skilled workers, all employees and students be strengthened, to keep and expand their competences. The main goal needs to be to ensure the working- and design-ability of humans in the context of digital-transformation and Industry 4.0. This contribution gives an compressed introduction of requirements of the future-work and digitization and the resultant necessity of system thinking (Netcompetence) to strengthen skilled workers and employees for the future (Pfeiffer 2015, 39).

2. Research Design and Method

1 Research Ascertainment

There is a big need to know about the current real work of skilled workers in small and mid-sized enterprises (SMES). While the project PROKOM4.0 the researchers of biat are working intensively on the technical-social challenges for the future professional work and, consequently, for the education and vocational practice. All research processes of the biat are linked to the institutes research ascertainment to mind the interrelationships between Vocational Education, Work and Skilled Workers and Technology. The world is becoming more

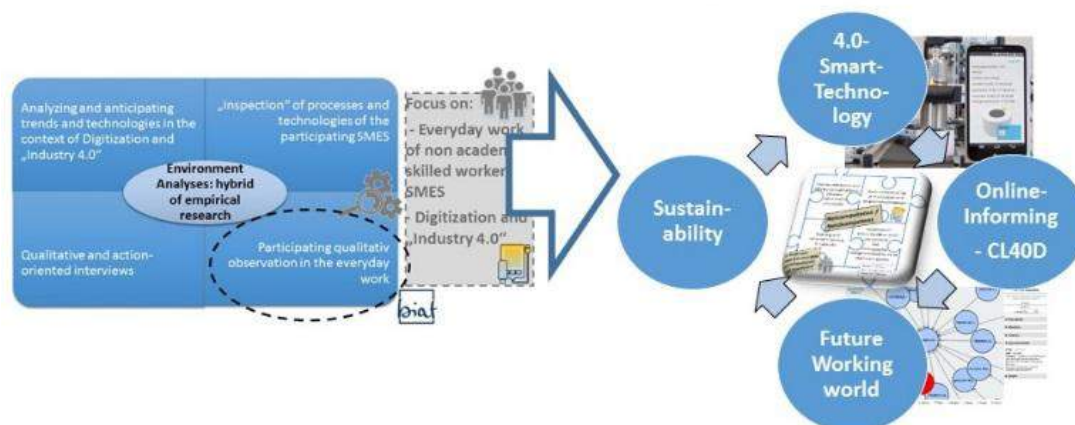

2 Hybrid research method 1

complex, so there is a need for hybrid-mixtures of different empirical research methods. The Flensburg subproject of the biat is aiming to document the performance of the skilled work in their everyday business as well as to recognize and assess the current and future demands of the working world (Drescher et al. 1995, 17; Becker und Spöttl 2008, 70ff.; Mayring 2000, 3ff.). The participatory work observations of the skilled workers at the operational implementation partners proved to be a promising instrument in the course of the project. The digitization, internationalization, developments of Industry 4.0, IoT, the current demographic evolution through escape-migration, as well as the respective operational context are included in the daily work observations of the working place. This hybrid qualitative survey form is particularly useful for gaining a practical insight view of the actual reality of the work processes, it`s technology and professional skills of the employees. The intercourse is fostered by interpersonal communication during the work process of the skilled worker. The logging participation in everyday work tasks of the observed skilled work is to be evaluated by the direct proximity of authentic and more purposeful, in contrast to work-process "blank" -Online surveys of the employees or even only the management level. The fusion of megatrends, such as digitization, networking, energy development,

1. Empirical Research: environment analyses > 2. Prototype: Netcompetence-Learn-Unit

demographic

3 Hybrid research method 2

change or internationalization, is thus identified in the working day of the professional work (bpb 2015). In this way it is possible to link the observations and the resulting findings with the working people the skilled workers. Through this form of "participation" at the workplace, the insight into the work process of the employees is achieved. The gaps between everyday coping strategies, the future of changing development requirements and the need to meet the demands of the workforce, respectively the skilled work, can be filled by analyzing and interpreting the observed persons with their practical experiences. Linking to the scientific analyzes carried out in the subproject, based on the 4.0 developments envisaged, provides a holistic view of future requirements both with regard to technological innovations and technological rearrangements as well as the social influence of almost omnipresent on- and offline networking, The need for an innovative competence management, namely, human-centered response to current developments, should be met by a subsequent conception and implementation of sustainable measures in education and training. It`s getting more essential to evolve and expand cross-sectional competences for the people and upcoming learning units. Basing on the findings of the interviews, observations and analyzes follows the concept, design and implementation of a person-centered vocational educational-prototype for the upcoming and current skilled workers. These arrangements should be a first step to sensitize for future developments in context of Industry 4.0 and digitization, conjunct to the main goal of PROKOM 4.0 to ensure the working- and design-ability of human workers. It`s didactization and

learning-contents have to regard to the real working practice and society of the learners, to backup the motivation and evolving of cross-sectional competences. The prototype is going to be implemented with vocational educational students and will be evaluated with quantitatively and qualitatively surveys, by the backing use and interpretation of the survey-instruments MAXQDA and EvaSys.

3. Findings

Formerly and apparently clearly defined responsibilities for occupational and / or qualification-related work and professional contents and interests will be weakened. The content of various disciplines and vocational actions will be mutually dependent on the present and further developments of digitization and Industry 4.0. Those contents will diffuse into each other. Reconstructing and classifying these contextual overlaps of different subject and professional areas as well as reflecting their own handling and design options will be enhanced by the increased in-formation-technological fusion and networking of processes. Over many years, linear, hierarchically structured workflows with precisely defined work requirements and clearly defined task areas had proved themselves in many areas of the company's specialized work. The developments towards a digitized world of work are the result of cyclical, interdisciplinary, openly participatory work organizations and workflows. The fusion of individual and collective life-worlds with comprehensive ICT has long been a reality (Filk and Grimm 2015).

„I learned this while working, basic programming is explained at YouTube. [...] The process with the software provided by the manufacturer took too long and I developed something myself. Now everybody can access the query at the same time in the process. [...] I then presented my program and it was found by the team and factory management for good and then I gave even the instruction for the employees.“ (Skilled Worker; an Electronic Technician for Telecommunications Systems, but no IT-qualification; own surveys 2016 and freely translated)

The above statement by a skilled worker without IT-Qualifications represents the substitute for the weakening of traditional professional boundaries by self-responsible work and design in online networks at the workplace. In this case, "Do-it-Yourself at Work" autodidactic of programming-languages was provided to optimize existing business processes out of the problem-oriented by his own motivation. In biat's investigations and surveys, with the look through the technological "4.0-glasses", it can be seen that digitalization and networking have arrived in real-life work processes by skilled workers and skilled workers, but in different ways and not in a holistic way diffusion of operational processes. The use of digitally networked technologies is sometimes less the result of a trend reference or the operational intention of self-attribution by the labels "Internet of Things" or Industry 4.0. The communication form of man-machine and man-man are dominating still. A purely machine-based self-optimization or design via IP networks does not yet take place. The human workforce is increasingly benefiting from the demonstrated handling of digital and virtual user interfaces. In the observed labor practices, man is at present still the decisive agency - especially outside of routine work activities. In the case of problem solving, the non-documented or implicit experience of the skilled work is still successfully accessed, yet non-systematically but purpose-oriented. The operational use of IT technologies extends from IT-supported documentation systems, communication via mail programs on smartphones or computer workstations, software operation and programming, right down to the location-dependent decentralized control, maintenance and commissioning via IP networks of clients and PLCs.

The findings on the technological status quo in the investigated SMEs are extended by the fact that differences in the degree of IT-fusion and use of digital technologies and / or software in the working day are still to be determined by skilled workers from different professions. In some cases, the growing IT-Fusion has already been shifted into "new" occupational reference frameworks. Digital user interfaces for process control and optimization are going to get implemented in the current operating practice along the objectives and with aspects

of usability. Even skilled workers from the field of electrical engineering, during external work processes, are now using smart terminals, e.g. via the mobile network and VPN tunnels to the company server. The digital and decentral coordination and information procurement for the goal-oriented execution of their job assignment. In this way, they procure circuit diagrams or instructions from operating servers or via telephone in a problem-solving dialogue and professional exchange.

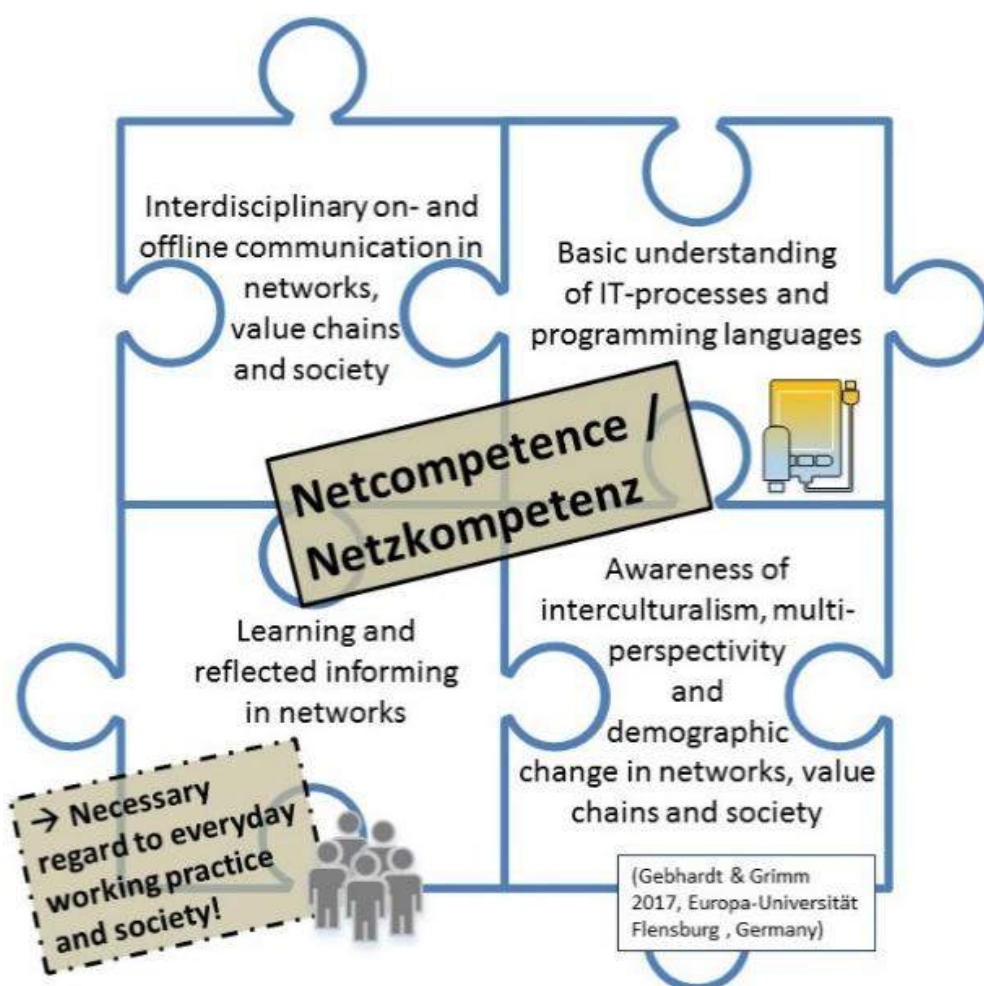

This communication is carried out in the investigated work groups via private smartphones of the skilled workers. In this case, safety-related concerns do not play a role for the users. The local operational infrastructure observed so far does not see any use of smartphones integrated in the work process, but the positive effects and experiences of the rapid exchange through the use of smartphones in the private sphere diffuse into the workplace. As a kind of coping strategy, its function is used to ultimately optimize the work process. With their own smartphones, for example, digital images of the current installations, in order to visualize and record the current state: free according to the specially interpreted motto "Bring your own device". These images then form the basis for a fixed, real-time communication, in order to exchange process and problem-oriented messages via messenger applications (such as WhatsApp), with company-internal as well as company-oriented colleagues, and to weigh up handling options in the work process.

In biat's surveys it was observed that skilled workers do work in self-government, auto didactically, high-level information technology during their working hours and favored through the opening from intranet to internet at the workplace. This is a singular observation, but its significance is sufficient. Because the increased IT fusion and presence in the workplace reinforce the assumption that a competent handling of IT also becomes a significant part of the future competency of non-"pure" IT-professionals. In the observed case, it is not a trained IT specialist and has no formalized IT qualifications. The frustration over the self-experienced faulty work process, served as a drive for the optimization of the same. In this case, a software-based logistic system was supplemented and optimized by specially programmed software. Self-paced learning took place via YouTube-tutorials. The results were communicated to the top and explained by the skilled worker and consequently also integrated into the process. The internationalization of value chains means that the introduction of new technologies or facilities in the observed factories is accompanied by further trainings and introductions in English language. Thus, English now avoids a former transport language of the international exchange of engineers and now also in isolation from the traffic language of the middle employment level and specifically from further education. In order to prevent communication and translation problems, some cases get support of a translator. In addition to the English courses in further vocational training, the employees also learn English instructions from international manufacturers or suppliers. It was observed in the SMEs that English manuals were translated into German by the present instructor. Online translation tools and technical dictionaries English-German were used in-house in addition to the growing interdisciplinary professional on-demanding and the internationalization of operating networks and corporate language, there is also a change and hence a need going round an awareness of different cultural and linguistic areas of future work and society designed. On the one hand against the background of work assignments of skilled workers and skilled workers abroad and on the current through the migration and integration of fugitives into society and through the training and in the workplace. In the latter field surveys of the biat also took place during teaching measures in the Chamber of Crafts with young fugitives. The aim of the measure is to provide young refugees with a technical and linguistic basis, with the aim of achieving the capability to train in the dual vocational education and training system. In this specific case, masters and training officers are thus confronted with new heterogeneous requirements of daily work, in terms of sensitization of other cultures and languages, as well as the difficulty of the lack of linguistic base-skills and the development of DAZ (German as a second language).

The construct of the Netcompetence (ger.: Netzkompetenz) is explained by examples from the observed working practice of the specialized work. These circumstances provide an orientation for the above-mentioned individual design of educational measures, in the course of a competence management for the training, further training and

operational personnel development, as basic prerequisites for innovations in the environment of 4.0. The concept and implementation of the prototype of the educational manual for the “Netcompetence-Learn-Unit and “4.0 Sensitization” are based on the findings of the PROKOM4.0 surveys of biat. These are subsequently made comprehensible by the necessary construct Netcompetence. The concept of Netcompetence was already marked in 2000 by Peter Wordelman. He used this in the context of the internationalization of the dual vocational training system and the growing challenges of internet use and globalization in working practice (Wordelmann 2000). The further development of this Netcompetence is based both on the findings from the scientific discourse, on the change in work through digitization, networking and demographic developments, as well as on the participating qualitative observation in the working practice of skilled workers in SMEs, in the course of PROKOM 4.0. The term “Net-“ refers to the networking of worlds, on the one hand in the working place and on the other in the whole of society and privacy. This networking takes place within and between organizations (divisions, departments) and

4 The construct of Netcompetence

systems, technical and social. The increasing interdisciplinary processes of ICT-use, which have been previously isolated from each other, are going to grow together during the work process now. Machines and products can be communicated on a physical or logical level, on- and offline, interpersonal, interdisciplinary, international and intercultural. This complex development of work and society leads to the need the Netcompetence. The construct of Netcompetence is open to developments and intended to develop an individual positioning, whereby people will find orientation and support in a digital-networked society and working world (Grimm 2017, p. 195). To

develop and establish this Netcompetence as a cross-sector competency is the core for the design of future-oriented and sustainable education and personnel development measures. It is intended to promote human capacity for action and development (Grimm et al. 2017, 150f.). These forms and actions of skilled workers and employees in general are also directly linked to the innovative and competitiveness of companies.

4. Results, Conclusions and Recommendations

For the Netcompetence can be categorized individually configurable content fields. The contents are not to be treated in isolation within a Netcompetence-teaching-learning-arrangement, but for the learners comprehensibly to each other. In this way, a sensitization can be achieved for the growing networking and requirements of the future working world and society - this fact applies to all person-centered education measures. The contents are oriented to the learners and thus practice-oriented in education and further training measures to integrate, with

regard to a competent lead to the requirements of the working environment of the future in the environment of Industry 4.0. In this case, four open-linkable content fields / categories of Netcompetence are mentioned:

- Evolve professional competence through interdisciplinary on- and offline communication in virtual and real networks and value-added networks
- Evolve learning and reflected information in networks
- Raising awareness of interculturality, multiperspectivity and demographic change
- Evolve a basic understanding for information technology processes (also for non-IT professions).

In order to establish Netcompetence through educational or personnel development measures for innovation processes, the aforementioned Netcompetence-Learn-Unit (4.0-teaching-learning arrangement) will be conceived and carried out as a short-term measure to prepare for the upcoming developments in the sphere of future megatrends and Industry 4.0. This measure is designed to further evolve Netcompetence. Netcompetence is intended to serve humans as a kind of compass for the human being and professional actions, in this case, the skilled workers. It strengthens the orientation for their own professional actions during the speed of digital-

transformation with the intention of securing their future action and design-ability. The stressed reference and instrumentalization of real technological elements and work placements are the bearers and multipliers of this practice-oriented framework of the Netcompetence-Learn-Unit developed by biat. The evaluation of this "4.0-Sensitization-Unit" points to a promising development of critical and innovative reflexively in context-adaptive contexts of one's own profession, operation and everyday life, with regard to the content of Industry 4.0.

5 Netcompetence-Learn-Unit

The implementation of this unit, as a PROKOM4.0 product of the Flensburg subproject at biat, is to be assessed as useful and purposeful. The basis for an innovative competence and change management can thus be created if

the idea of innovation of the 4.0 developments is thought by humans and an active participation of the participants is granted. The concept of a sensitization training in the environment of Industry 4.0, characterized by the "claim triangle" of vocational training, technology and (professional) work, is an adaptable instrument for the reflected preparation for the future change in the working world and society. Provided that the content of the content used is appropriately didactized and recognized and assessed as relevant by the participating learners and their perceptual milieu, the development of future-relevant network competence can be successful. This is additionally offered by a pass-accurate, short-term and low-threshold form, against alienated "technology voyeuristic" excursions and manufacturer qualifications in smart factories or 4.0 simulations in laboratory atmosphere. The participants learn a stationery on the subject of Industry 4.0 by dealing with the 4.0 context in groups independently. Two technological components, virtual and physical, of the "4.0-Sensitization-Measures" also enter the teaching-learning-arrangement of the Netcompetence-Learn-Unit. The virtual component is a web-based polyhierarchical ordering system. It is designed as a development-oriented information platform for the

6 "4.0 compact trainer" (Hofmann 2017)

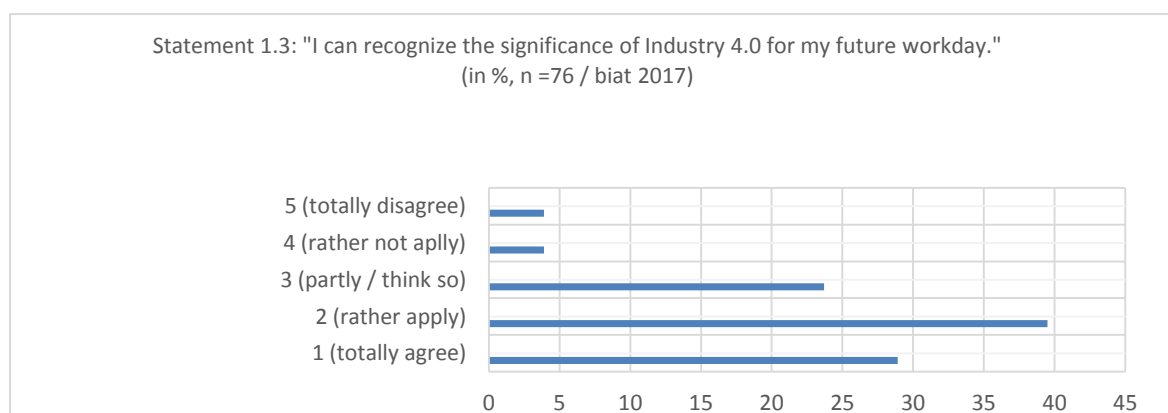

introduction into the networked context of terms and relations of Industry 4.0. This forms is a basic framework for an expandable ontology management. The learner can explore the virtual and graphical information platform with his or her private smartphones or the provided laptops or smart-tablets. In addition, they are dealing with a "4.0 compact trainer" from Festo-Didactic - this is the physiological component. This compact system presents the idea of an individualized Industry 4.0-production line with a lot size of one and practical technology components of all-day work. The 4.0 compact trainer, thanks to its technological rearrangement, the combination of the PLC, the RFID transponders and the smartphone control, provides an accessible insight into a possible operational situation of 4.0 implementation a hybrid of physical and virtual elements. The web-based

information platform and the "4.0 compact trainer" promote self-directed discussion and at the same time consolidate the role of the participants as acquiring customers in the context of networking in Industry 4.0.

The people in a democratic knowledge society and in the working world, which are increasingly influenced by shortened technological innovation cycles, must be able to empower and support competences sustainably. The development of Netcompetence is accompanied by effects that can strengthen the resilience of the human being. This resilience is achieved through the development of Netcompetence, in the sense of a safer and more secure location against the fast-paced nature of current and future innovations and the growing access to on- and offline information. The learning person has to be the focus of innovation measures and organizations. Its position can be maintained competently in conceivable and inconceivable scenarios of the work of tomorrow, as man-made mental relations are created and always renewed, so that networked processes can be comprehended.

There are evaluations of the surveys of over 100 participants (future skilled workers at vocational schools), in the exemplary case statement 1.3 with 76 entries, the mean value 2.1 and a standard deviation of 1 called. The evaluation took place following the described Netcompetence-Learn-Unit to sensitize for Industry 4.0 and digitization, which is successfully tested and evaluated. With 28.9% of the interviewers, it is true that a significance of Industry 4.0 is recognized for the future workplace. For 39.5%, it is more likely that a significance of Industry 4.0 is recognized for the future workplace; 23.7% say partly. Only 3.9% recognize rather no importance and only 3.9% do not recognize the importance of Industry 4.0 for their future workday at all. The negative nominations are comparatively low, respectively, of 3.9%, yet the reasons for this need to be investigated in order to optimize the

7 Part of Evaluation of the Netcompetence-Learn-Unit in April 2017

prototype of the Netcompetence-Learn-Unit. There could be several reasons why. For example, the possible technological "4.0-feasibilities" are projected directly onto the current state of technology of their company and workplace, which will not change in the direction of "4.0" from their assessment, and thus Industry 4.0 is less relevant. Further interpretative approaches to these negatives could be that these cumulative 7.8% assume that the classic manual human labor and production you know will always be preserved, or that perhaps a lack of imagination regarding the "4.0 developments" and their implementation in the working day prevails. However, it could also be assumed that these 7.8% were not activated within the teaching-learning-arrangement, or their current activities are now too far away from the familiar "4.0-developments". The success of this "4.0 sensitization measure" is dominated by the 92.2% of the positive nominations 1 -3. Within and in the aftermath of this unity, the participants recognize a relevance of the theme of Industrial 4.0 for their future workplace bound to their working and living environment. The observations during the measure and the qualitative statements of the skilled workers at the individual learning stations confirm the proactive discussion with the subject areas. A detailed description of the success of the learning unit can be found in the overall presentation of

the evaluation in the appendix of the "4.0-Sensitization Action" instrument for the development of Netcompetence.

The following subsuming hypotheses present summary findings of the overall evaluation of the teaching-learning arrangement / Netcompetence-Learn-Unit:

- 1) Participants call for ongoing practical and business-oriented education in the context of Industry 4.0 and future work.
- 2) Participants reflect the future viability of their company and their profession. (They have the design-desire for the innovation of business processes.)
- 3) "Digital Native" is not an integral quality feature for the competent handling of digitized and virtualized processes. (Using vs. Understanding)

The Netcompetence-Learn-Unit, as a product of the Flensburg biat, is to be assessed as useful and purposeful. It forms the basis for an innovative competence and change management in the sphere of lifelong-learning (Gebhardt 2017, 3). Thus can be created, if the idea of innovation of the 4.0-developements are going to be thought of by humans to guarantee their active participation. The concept of a sensitization training in the environment of Industry 4.0, characterized by the "claim triangle" of vocational training, technology and (skilled) work, is an adaptable instrument for the reflected preparation for future change in the working world and society. Provided that the used content is appropriately didactized and recognized and assessed as relevant by the participating learners and their perceptual milieu, the evolvement of the future-relevant Netcompetence can be successful. This is additionally offered by a pass-accurate, short-term and low-threshold form. The participants learn stationery on the subject of Industry 4.0 by dealing with the 4.0 context in groups independently.

The people in a democratic knowledge society and in the working world, which are increasingly influenced by shortened technological innovation cycles, must be able to empower and support competences sustainably during their whole life – at work and in privacy. The evolvement of Netcompetence is accompanied by effects that can strengthen the resilience of the human being. This resilience is achieved through the development of Netcompetence, in the sense of a safer and more secure self-location against the fast-paced nature of current and future innovations and the growing access to on- and offline information. The learning person has to be in the focus of all kinds of innovation measures and organizations and not the possible implementation of new technologies. Its position can be maintained competently in conceivable and inconceivable scenarios of the work of tomorrow, as man-made mental relations are created and always renewed, so that networked processes can be comprehended. The skilled work requires a holistic sensitization beyond the traditional idea of vocational professionalism. Such sensitization not takes place only through the imparting of knowledge of technological developments, but also by the reflection of politics, cultural spaces (also in front of the backdrop of current refugee-movements), languages, sources of information and, to an increasing extent, the Information assessment of digital sources.

“If all men had green glasses instead of the eyes, they would have to judge, the objects which they see thereby are green, and they would never be able to decide whether their eyes show them what they are, or whether they do not To add something to them which belongs not to them, but to the eye. So it is with the mind.” (Kleist 1801; lyricist, writer, dramatist; freely translated)

Economic and rationalizing interests primarily promote innovative change management in companies and in politics. Ensuring sustained employability is increasingly based on the insight of educators and entrepreneurs to actively promote the development of cross-cutting competencies, such as Netcompetence from the regular school through vocational training to company HR. Most recently, to prepare the work for future innovations and crosslinked processes offline and online, and to strengthen skilled workers as the basis for the innovation and

competitiveness of companies and against the academization of the professions. The active implemented and people-oriented construct of Netcompetence could reach to be a base-competence for general education of humans, children and adults, in link to the need of an increasing reflexivity and lifelong learning in enlightened, democratic and crosslinked societies (Gebhardt 2016). Linked to the timeless quote of Kleist above, virtual and real networks in work and privacy and internationalization provides the need to be able to look out over glasses earlier formed by rigid and traditional frames of the professional and vocational system as well of culture and society.

Personal brand of scholars. Selected aspects

Jarosław KINAL¹

¹Asst. Professor, University of Rzeszów, Faculty of Sociology and History, Institute of Sociology
Email: jkinal@ur.edu.pl

Abstract

Personal brand is a set of associations and impressions in the heads and hearts of people, memories and past experiences that you have given them. It is what people say and think about you that you have some contact with. Each of us has a brand, but only a few of them manage it. And they do what they want. Brand building a personal reputation, affect the image, relationships and professional life. A good personal brand is desirable, valuable, credible, unique and indispensable. Caring for your personal brand is an effective competition with your own unique identity. Personal branding is about the long-term goals you want to achieve - for example, being a well-known expert in some field or establishing a personal branding business.

Keywords: Scholars, Image, Public Relations, Personal Brand

Introduction

Alina Wheeler (2010: 2) points out, marketing itself is an attempt to tighten ties between customers and brands. Through marketing activities, the brand values the timelessness and uniqueness of the crowded market - the author uses the word "crowded" - the market. Offering these two elements ensures a strong attachment to the brand and its prioritization in the process of consumer choice. Brand is not only the domain of commercial products such as Apple, Google or Coca Cola, but also the brand covers a definitional units such as human. Doctor Brand, Brand car mechanic and scientist. In the literature, the image is defined in different ways. Firstly as someone's likeness in a picture, a photograph, a drawing, etc., and - in a second shot - as a way in which a person is presented and perceived by other people. The image is very broad. It refers to many subjects - one can talk about the image of a person, but also about the image of the community, state, institution or company image. More and more often used in the modern language is the return image with the suffix: media, political, business. It has become fashionable to take action towards building an appropriate image in the aforementioned areas. (Białopiotrowicz 2006) Most often, the image is identified with the external appearance of the person. This is - in the opinion of the author of this paper - a very narrow understanding of the notion of image. Such understanding of this notion does not reflect its total importance and importance. On the image of - seen today - by several factors, described below:

- (1) *Image* - the image, the perception of a person
- (2) Behavior - behavior with respect to a particular environment
- (3) Manners - Characteristic behavior of a person
- (4) Ability to make contacts - easy to communicate with others
- (5) Relationships with people - relationships between people
- (6) Communicating with others - keeping in touch with others
- (7) Professional qualification - knowledge and skills required to perform professional tasks
- (8) Experience - the knowledge gained while doing certain activities

E. Sampson (1996) defines the image as an advertisement of self. This is an external image that tells you what's inside. Image is also a commitment that what outside corresponds to the ability, ability and value that it advertises. Sampson also points to the fact that not only clothing is an element of an image that the author considers a precise mixture of external and internal factors that define one's own image, both visible and desirable. The image is valued because it can be both positive and negative. A person with a *positive image* inspires confidence in others. It is gaining the sympathy of consumers and it is easier for her to persuade

their supporters to take action in order to achieve specific objectives. A person with a *negative image of the* causes anxiety among consumers. Instead of gaining sympathy, they lose it. (Białopiotrowicz 2006)

P. Martineau has spread the image in relation to business entities. Paying attention to the importance of the image, he points out several groups of audience that are his audience. These are: shareholders, customers, prospective customers, distribution channel distributors, suppliers, local communities, and employees. SH Britt pointed out that the image is a public stereotype, and when it comes to shape, people are more influenced by it than by what is actually hidden under it. Treating the image in a stereotypical way assumes its social character. However, it is more individual than social, which is due to the elements of the image. (Dąbrowski 2010: 3)

M. Lebkowski (2009) defines image as "the image of the subject in the eyes of the people who judge him. It is created on the basis of the individual judgment and experience of the audience. "The image can be formed consciously or unconsciously. All actions affect how the subject perceives the image. Age shaping becomes more effective, the more conscious the image is affected by both the real and the false image. The image depends on the individual experiences, observations and desires of the person assessing it. It follows that even a deliberately created image will not be taken exactly as the subject wants it to. There are four types of images:

- (1) Ordinary - as the subject is perceived by the audience
- (2) Target - how the subject would like to be perceived by the audience
- (3) Mirror - the subject sees himself
- (4) Optimal - an image that can be achieved through the action of the subject.

In terms of understanding by a researcher, it is important to describe the phenomenon of *identity*. Identity is the characteristics and values that are represented by the subject. An image is the way in which this identity is perceived by the recipient. It also points to the elements of the image by which the subject has a chance to draw his attention by shaping his image:

- 1) Birth - origin, parents, social class
- 2) Childhood - school times, style of behavior
- 3) Environment - in which it rotates (eg political)
- 4) Appearance - the more beautiful a person is, the better they are received by the bouncers
- 5) Character traits - a set of characteristics distinguishing a person from others
- 6) View (fixed switch ne)
- 7) The level of openness to the media - this media element determines the popularity of the created image

It is worth mentioning also *email the image*. *E image* is a presentation of his own person using electronic media. It is a suitable and desired image created by the Internet. The Internet allows you to create an image among any group of people who use it.

Rules of effective creation of e-image according to M. Lebkowski (2009):

- 1) Analysis - When planning to create a web page, for example, you need to analyze what role this site will play, who the target group will be and how the group will use the Internet. Specify who will be updating the page.
- 2) Time - e-images work on the Internet is relatively cheap, but takes a lot of time. It should be managed so that the actions are effective.
- 3) Spotlight - creating an image on the web is based on the display of a feature, that is, the feature that the subject has and not visible to the competition. Dean and him, the image is clear and more effective.
- 4) Consistency - messages that are sent to recipients must be consistent. A large number of different messages introduce chaos rather than building an image. Remember to be consistent on both the coloring of the subject and his behavior. At the moment when the image carries a promise, it must be fulfilled.
- 5) Repeatability - e-image messages should be repeated so that the recipient can fix them. In the e-image message can not appear a lie, because at the moment it comes to light, completely discredited image.
- 6) Internet law - the network is governed by its laws, and in the foreground there is the right to two-way communication. An entity that creates an image on the web can find the target audience more easily and connect with it and receive a reply to the message.

Dimensions of media image

According to Małgorzata Gruchoły and Ewelina Kruczek (2013), the following image dimensions can be distinguished today:

- 1) Psychological - it tells how the image is built and how it exists in the mind of the recipient. Pay attention to the processes and mechanisms of understanding and data processing such as:
 - a) Perception - whether content that influences the image will be noticed by the audience
 - b) Identification - will the observed content be attributed as affecting the image of a particular object, and if so, within which cognitive schema will be processed?
 - c) Evaluation - whether the content recognized will qualify as credible or credible enough to be able to influence the mental representation of the subject matter
 - d) Interaction - how the previously fixed mindset will affect the build-up image
 - e) Memory - whether a particular image is fixed, will be pushed out of consciousness by new emerging content
- 2) Sociological - indicates the group and institutional affiliation of people in whose minds the image of the subject, typologies of these groups and institutions, As well as the types of interaction between these groups, institutions and individuals
- 3) Marketing - implies creating an image of measurable value for the person or company whose image already exists; also applies to procedures actively create an image with the help of promotional and advertising activities and to protect their own wizerun crisis
- 4) Communication - accepts communication channels, which information reaches the recipient (Gackowski, Łaczyński 2009)

According to Beata Ociepka (2003), a properly prepared image should be:

- 1) Synthetic - its purpose is to exert a certain impression
- 2) Credible - becomes pointless when people do not believe in it, should not cross the borders of common sense
- 3) Passive - must be adapted to reality, as it is a public image
- 4) Alive - should be bright and concrete, to draw attention
- 5) Simplified - simpler than the object to represent
- 6) Ambiguous - it is between imagination and sense, between expectation
And reality can not insult anyone

The image is the overall and subjective image of the individual

About a particular object. This imagery arises as a result of intentional communication activities involving a particular object that take into account its actual characteristics but also the desired image. The previously conceived image is also influenced by unintentional actions, from various sources of transmissions, and from the direct experience of the individual as a result of the direct contact of the individual to the particular object. The shaping of the image follows As a result of interactions between the three groups of related factors with: object, message and receiver unit.

Transfers are focused n intentional creation and assumed the image, which is derived from a person and are activities that have an impact on the audience. Unintentional transmissions are those which, from the viewpoint of the assumed image, are neutral and may even contradict it. These statements take the form of gossip or rumors. They may also provide an opinion about a non-source object. The impact of unintentional transmissions on an image is significant because they are generally viewed more reliably than intentional messages.(Dąbrowski 2010)

The image is shaped not only by the messages conveyed in the aforementioned messages reaching the recipients. No less important role is played by direct contacts of recipients with a particular object. The importance of these experiences is important because they affect the perception of a given subject more strongly than the messages contained in the communications. The messages that reach the recipients are individually interpreted by them, depending on the characteristics of the recipient (ability of perception, beliefs, attitudes, value systems or cognitive schemas, etc.) and his or her earlier imaginings. As a result of these relationships, messages can be ignored and modified by the recipients. The image does not necessarily reflect reality. It can only be her credible outline. This is mainly due to the fact that shaping the image is based primarily on communication. However, it can not be completely modified, because no one is able to completely control their messages. These transmissions come from many sources, and the media plays an important role in their

dissemination and creation. When shaping the image, the media plays a vital role. They reach a wide audience by disseminating information. At the same time, they have the ability to attract and focus public opinion on the people who have become the object of media coverage. (Dąbrowski 2010)

The media not only affect the perception of a particular object by placing it in the message and the manner in which it is presented, but also describing the object by placing more weight on one feature of the object and less on the other. Apart from the hierarchy of objects, there is also a hierarchy of its characteristics, through which a given category is characterized in the media message.

The impact of the media on the hierarchy of characteristics, through the prism of which an object is perceived, is the strongest in the spheres considered to be the most important for the audience. In the irrelevant or unknown spheres the influence of the media is weaker, as is the case when the audience themselves draw conclusions about the phenomenon based on their own observations and direct experience.

The image of people influences not only the presence of the object in the media, the intensity of the exposure, or the characteristics by which they are characterized. The context in which they are presented is also important. This context is created by using metaphors, phrases, underlines, image characteristics and titles, headings, images in the description. Depending on the context given by the media to a particular object, it may have a positive or negative effect on shaping the image of the object.

Scientists personal brand

Personal brand is a set of associations and impressions in the heads and hearts of people, memories and past experiences that you have given them. It is what people say and think about you that you have some contact with. Each of us has a brand, but only a few of them manage it. And they do what they want. Brand building a personal reputation, affect the image, relationships and professional life. A good personal brand is desirable, valuable, credible, unique and indispensable. Caring for personal brand is an effective competition with your own unique identity. Personal branding is about the long-term goals you want to achieve - for example, being a well-known expert in some field or establishing a personal branding business.

And the most common p ojawiającą the definition of the brand is to define it as: name, logo, symbol, design or a combination of these three elements, designed to identify the goods or services and to differentiate their offerings from the competition (Kotler 2013)

In the case of personal brands, the name will be the name and the sign, the symbol will be, for example, a personal signature, a paraphrase, in turn the figure can be a personal image.

Accepting such a brand definition would mean that each branded product would be branded and each person would have a personal brand. On the other hand, when we look deeper, however, it is different. To ensure that products and people are not only identified by name, but above all because of value or quality, attention should be paid to the other features the brand should perform. (Nitkiewicz-Janowska 2016)

Expanded the definition proposed by Jacek Kall, who defines it as "a combination of physical product, brand names, packaging, advertising and accompanying activities in the field of distribution and price" (Kall, 2011: 11). . This combination has the task not only of different products the marketer (Nitkiewicz-Janowska 2011) from competitive offerings, but also provide the consumer with outstanding benefits of functional and / or symbolic, so you create a loyal group of buyers and allow thereby achieving the offer / producer Kt leading market position (Kall 2011). In the case of researchers, the following personal brand elements may be distinguished:

- A) name and surname
- B) place of employment
- C) academic achievements
- D) Alma mater

The name of the scientist, often also the initials of the second name, is an inescapable feature, in which both positive and negative characteristics, such as supervisors' opinions, work reviews, student opinions, accumulate. The personal brand ecosystem of a researcher includes both media publications, such as interviews or expert articles as well as opinions expressed on the internet. The second element of a researcher's promotion is the

place of employment, the more prestigious a university the higher the position of a researcher in a professional environment. The third preferred by the author of a scientific output, which today is referred to the following indicators: (1) impact factor journals in which the scientist published (2) h-index (3) the number of monographs. In today's world more and more quantitative criteria (number of publications) are replaced by qualitative criteria (quality and place of publication). Thanks to the implementation of the Open Access paradigm, the researcher's brand is being developed transparently.

The need to use new communication platforms both as a tool to promote scientific achievements and a strengthening exchange of experiences posted Gustav Frohlich in his article *The (Surplus) Value of Scientific Communication* published in 1996 in the Review of Information Science pointing to the stagnation and repetition of the subject matter of scientific publications resulting from the lack of sufficiently open and fluid scientific communication (Frohlich 1996)

Today, the postulate of a model for the exchange of scientific knowledge is possible thanks to dynamically expanding Internet access and new technologies for the development and publication of content. The creation of a group of Open Access researchers (OA) aims to contribute to the development of this new way of scientific communication by making free scientific publications available to every interested reader.

Conclusion

The image of a scientist is a component of many factors: character traits, place in the university hierarchy, the type and type of university, the country of origin, and the country in which the University employs it. Increasing chances of breaking the standard division of the scientific world on the core and periphery (Rykiel 2013) gives the opportunity to present and publish on the Internet. This is, however, an operation that requires a great deal of both human and time factor. It is important to consciously build your personal brand, both through publication in Open Access journals but also by exposing your person and accomplishments on specialized social media platforms such as researchgate or academia.edu. It is also worthwhile in the branding process to include the pdf files of your work in university repositories so that they are available to students and researchers.

New Types of Writing Developed Via New Media

Hikmet ASUTAY

*Professor Dr., Trakya University, Faculty of Education, Department of Foreign Languages Education
Email: hikmetasutay@yahoo.de*

Abstract:

In this study, new types of writing that emerged with new media after 2000s will be discussed. Since the second half of the twentieth century, there have been rapid developments in mass media with transistor television and radio. From the eighties, with the progress and expansion of computer and the internet world and the increasing individualization of communication tools, it seems that the people's participation in sharing increases. As it is known, it started to be written and printed much more in the electronic media which appeared in 2000s and which developed very fast and especially in network environments. Blog writing, social media, chat rooms and so on can be just a few examples. Thanks to Android systems, mobile applications have emerged as well as many applications expected from a computer in a purely mobile environment and the computers have become comparable. Application, and shortly called Apps, offers many conveniences and innovations in almost every area and as an alternative to social sharing sites on the internet, WhatsApp chat / messaging application has emerged. This means that social networking networks are moved to mobile phones, which means that people cannot live without their mobile phones. All these technological developments have started to be used in education. In the context of this study, it will be mentioned about new and emerging types of writing and reading in terms of writing and reading activities we have discussed above. This includes apps that include a variety of writing and reading activities will be mentioned. In this frame, the literary-social movement named "Poem in Street" in the world of writing will be mentioned and the controversy of poetry will be discussed through the examples of rebirth in the new era. The basic viewpoint in this study is the new writing and reading activities and the emergence of a new understanding of literature or the reflections of technological developments to the world of literature and the readers.

Keywords: Writing, reading and writing, the Internet, mobile applications, new media.

1.Introduction

We live in a time when mass media, which we call new media, are highly diversified and technologies are developing very much. Therefore, all these technological tools, which have become very effective in almost every area of life, have entered the world of materials, culture, arts and literature and are also used very effectively. The most striking and up-to-date examples of this are the smartphone, PC-tablet, Android, iPhone systems and applications that we can use through these systems. Diversifications can be seen in the applications (Apps) lately. They also have many forms that are used in the world of literature. The debate here is what is present as novelty in terms of writing. In fact, there is not much new development in the context of writing. It is technological tools and technological tools that are close to existing innovations. All of this is in the world of writing, storing, archiving and most importantly sharing. The concept of globalization is actually expanding directly to all these technological tools. As a matter of fact, it seems that the accessibility to the world of writing and the sharing of the writings seems to have become very easy. The innovation that needs to be emphasized here is the fact that new types of writing have emerged in the world of literature. The application of Wattpad (Free books - Wattpad) which is a free story, poem, novel etc. reading and publishing activity is becoming increasingly prevalent. This change process, which begins with electronic mail, continues today as text messages. The subject that will be discussed in this study is the general discussion of the literature world shared with new technologies.

These developments in the world of literature have attracted attention of literature and naturally have been included in research fields and they have been subject as research object. In this context, it can be said that the methods of science, which is called as the name of literature, changed the methods and adapted itself to the age. Michael Hofmann (2006) for the field of literary science that includes such works as the concept of intercultural

literature¹. Matthias Luserke-Jakui, on the other hand, treats philosophies as a new literary science, indicating that their work now benefits from the use of communication sciences (Luserke-Jakui 2002).

2. Paradigm Shift in the World of Literature

It can be said that the reading culture began to occur from the time when the first person tried to understand the nature in which he was living and tried to understand a number of natural phenomena and the living creatures' traces. In this context, if the existence of the first manuscript can be described as the first literary revolution, the second will undoubtedly be the invention of the printing press. The third revolution is the online networks called the internet. Fourth, smartphones with operating systems like Android, iPhone (smartphone) should not be mistaken. All of these things should be considered only in terms of literacy and reading culture. Of course, there are technological inventions and developments which are so many that can not be counted, and each of them is a revolution in its own right; transistor², radio-television, computer, smart mobile phone, etc....

There have been many developments in the twentieth century regarding the mass media after the Second World War. 1970's years are shown as a radical and significant change in the writing world (Ewers 2002). In those years when student movements were heavily lived, radio and later through TV that developed more, the issue of sharing became more important in cultures and mass media became culture-carriers. This intellectual process of change has been very influential in TV culture, which has been widespread in the eighties, and change has continued to evolve with TV focus. In the nineties, it is possible that the real change has taken place when the computer and internet world begins to penetrate every aspect of life. With the online networking, which is called the Internet, it can be said that unlike the mass media, the form of individual communication has emerged. This is a way for individuals to access the masses, or social networks, thanks to the network, which is the greatest innovation. Thus, it is possible to say that not only the types of reading and the culture of reading but also fundamental changes in our writing culture have been realized. We read and write much more than the old. But no longer with the pen but by typing on the keyboard or touching the screen. This can be also said touch typing as a new typing activity. The above-mentioned Android and iPhone & smartphone software are already operating systems developed for touch devices.

3. Writing Through the New Media

The second half is actually much larger and widespread than the paradigm shift in the seventies that Ewers points to in years. It is online social media through the internet. Facebook, Instagram, Twitter etc. are the most popular social networks among youth cultures. When WhatsApp is added to mobile phones, an incredible sharing culture has emerged. Most of the society, and most of the youth, has started to share almost everything he sees, and the writing world took advantage of it. Short stories and poetry are especially preferred because they are among the literary genres and are the types of texts that can be easiest to share. Moreover, these kinds of literary texts are also being sent / shared as text messages via mobile phones. All these technical details lead to the use of a different and technological language as well as the touch-writing action. The everyday language used by adding symbols and short "msg" is now the new language we use in today's electronic devices and new media.

¹ interkulturelle Literaturwissenschaft (Hofmann 2006)

² One of the most important discoveries of the 20th century was the transistor, which was considered the vital part of electronic circuits in 1947. The team, made up of the world's largest telephone company Bell's research laboratories, chaired by William Shockley and John Bardeen and Walter Brattain, shared the Nobel Prize in 1956 for their new breakthrough in technology (wikipedia)

In the field of education, the aforementioned developments have started to be utilized and almost every technology has been tried to be applied in the field of education and it is observed that there is a certain increase in the studies carried out in this area (Göçerler, Yücel, Demir 2015). As a simple example of this, smart boards have been developed and can be worked on in classrooms with the tablet computer system. In these developments, I believe that WhatsApp application should have a different place in my opinion. In all applications, the application is a very different and sharing feature that allows students to create their own class groups and share any kind of audio, video or text files over the application. In this sense, the WhatsApp application performs many functions alone, and can be considered to have become a tool both academically and in terms of popular culture. Students are no longer photocopying, but sending or sharing pictures through WhatsApp. Today, physical photocopy pages have been replaced by PDF files in electronic form. In libraries, transferring PDF files to portable memory has actually been deployed instead of copying. The simplest transfer in this sense is the job of getting images with mobile phones. So much so that in everyday life too quickly settled and found a wide range of uses. Of course, WhatsApp shareware might try to play a pioneering role.

4. Smart Applications and Android Era

The concept of smart has started to be heard in daily life in the context of television technologies. The first patent on Smart TVs, also called Smart TV, was taken in 1994. The use of this technology on TVs lasted for five years. In this sense, online TVs are called smart TVs that can work with portable devices and computer-like functions. When used in connection with telephones, this concept also makes sense as a small computer, such as an Internet connection and various applications, as well as phone functions. In this context, the term smartphone is understood as mobile phones, nowadays called smartphones, which provide online connectivity as well as phone functions and can perform computer functions. Android (similar operating systems like iPhone and iPad are also available) is an operating system and has been developed for touch screen devices. Most of the smartphones we use today use this operating system. With this, we can download and use the applications mentioned in the abbreviation of Android (Application Software), which can be called mini computer functions or programs. In this sense, the first applications in 2002, simple e-mail, alarm clock and so on. . In terms of applications, the main milestone was realized by Apple in 2007 as iPhones. In 2013, applications are seen all over the world from the simplest to the most complex program software.

In terms of linguistics, basic application sites, similar applications, encyclopedia and numerous dictionaries and translation applications are seen. There are many practical examples in the field of language teaching. In the sense of literary text, all applications related to reading can include this group. For example, the "Gutenberg.de" writing site, created under the auspices of the Spiegel-Online magazine and serving for many years online, is one of the best examples. It is a widely used example where we can find information on almost all classical texts and authors who have no problem with copyright. The following is an example of a writing movement in the streets, which is a widespread use of a smartphone sharing program.

5. Poem in Street and Sharing Writing

"Poetry in Street" act comes from the phrase "Close the Book ... Poetry in the Street" which Rafet Arslan³ wrote on the wall during the "Gezi" boycott at the beginning of June. A string of Ece Ayhan is also located just below.

³ Rafet Arslan, May 12, 1972, Izmir. He is a writer-critic-contemporary performanceist who takes a cross-disciplinary look to Conceptual Art. Surrealism, New Wave Science Fiction, Erekte Poetry, Mutant Art. The writer of the book of Contemporary Art Manifestoları (6:45 Publication-May 2010). Destruction / Destruction 2011, Reality Terror, Coordinated Ubik Project exhibitions with Alper İnce, The first story book Ziggurat

The name and inspiration comes from here and of course from "Gezi". During the "Gezi" process, especially on the streets, it was written a series of poems from the "İkinci Yeni" Poems. Writing poetry on the walls was one of the ways people express themselves. This event, which existed before the "Gezi", increased with "Gezi". "Gezi" boycott could have been done every time without writing and without making distinction, with spray paintings or whitewash brushes, walls of buildings, pavement stones, tree trunks, etc. Nowadays, we are witnessing the rebirth of poetry these days when we are knit with technology. Social media has become one of the platforms where people share poems, poems and poems shared with each other, while poems written on the streets are shared with millions of people through the applications of the android revolution and online networks. The users, while occasionally costing the famous poets with unfounded lines, have made the old poems come back to the old poets. Forgotten books of poetry were downloaded and turned pages. Or at least it was keyed in the search engine. Social media users have gone a step further in sharing poetry. Not only the beautiful lines they found on the internet, they started to share poems that they came across in everyday life. With the influence of these exchanges, the writing of poems on the walls became widespread and became a great social movement. Now poetry was on the street. However, everybody was not satisfied with the poetry going out on the streets. Some artists and poets have argued that this will ruin the poetry and make art of poetry a craft. Those who say, "Poetry is beautiful on dusty pages, not on the streets," has declined war against this flow. Some even took the job so far that they took the paint chases and brushes to their owners and tried to cover up the poems on the walls. There have also been some accusers or others trying to justify being political because of "Gezi" incidents. Over time, however, poems began to move to schools, classes, with the great support of poetry lovers. Schools have begun to make "poetry in school" panels and corners. In this sense, poetry in terms of the world of literature has been mentioned, especially in the rebirth of the second new poems.

A photo from blogspot page

When we look at the movement "Poem in Street", it is seen that the majority of the bearers of this social movement are youth, and the vehicle is social networks with android mobile phone. In this respect, one of the best examples in the world to meet old and new (See Wagner: Goethe Institut 2015). In this context, the Goethe Institute of Germany distinguished 103th issue of "Art&Thought" in the context of literary movements around the world. The most important feature of the movement "Poem in Street" is that it is a communicative writing. Stories or sayings can be photographed after being written in various places and can be instantly shared with social groups online with new media tools. The Group has the following call at the blogspot internet address:

"We are taking it out on the street, poetry, we put it on the bus, we sit on the benches, we talk in the phone clubs, we make it with the voice of silent masses, we give it to the money, we drop it all while walking on the road, we wave it like a rebellion in shopping malls, We give it to you, we give

Terbiyecisi Kült Neşriyat. And his first personal exhibition "Subsequent Operations". Opened his personal exhibition, then exhibited the Babylonian Library.

the hand to poetry, we drink tea in the tea garden, we share it with the ones sitting on a bench alone, we go out with our book of poetry. So, we grow this love, more, from the hand. Poetry is not in the book, it is beautiful in the street. Poetry is beautiful among people. Speak with them, consoled, happy, hopeful. Poetry breathe, make you take it. Poetry will come and take us all from this world. Cover your books and take the poetry out of here. Put people together, poetry." (<http://siirsokak.blogspot.com.tr>).

Over time, this trend was as prevalent as schools, classrooms, poetry in universities, schools and so on. Panels or corners were started to be prepared under the headings. In this sense, the "poetry on the street" movement can be considered both to the world of literature, especially to poetry and poets, as well as to the contribution of education. In this way, students perform highly intellectual reading and writing activities while achieving positive beneficial meanings in terms of literacy, as well as realizing literary and cultural activities.

Edirne School of Social Sciences "poetry at school" board in the corridor

It is important to note that the effectiveness of a writing is not only in the streets. It is possible to try a new era in the world of writing by sharing people with each other through technical photography and photo sharing applications. The most important characteristic of this is that a new process has begun to take place, in which readers are directed by the media instead of people who are guided through the media.

Conclusion

As a result, we can speak of two important developments with two decades: the first is individualized mass media. That is why it is necessary to distinguish mass media from modern media today. Because all new media are for individual use. Mobile phones, tablets, computers, etc., which emerged with new technologies developing. And we can name new media for all of the tools such as online networks, internet and social networking. All these tools are already known as new media in the West (Ewers 2002). It can be said that, through the new medias, there is generally a social sense: there is an active role of new media in living facts, social events and especially in the field of sightseeing. As for the world of writing, the world of writing has been reborn through new media, and has increased the interest in literary and therefore books. "Poetry in the streets" remerged and the poetry was loved by the young. Not only that, but in the youth world it can also try to create new things with creative ideas. On the other hand, there are many poetry, novels, etc. in the sense of the world of literature. Writing websites have been created and added to them almost every day. On the other hand, blog writing has improved in literary sense and it is very popular. Amateur poets and writers have the opportunity to publish and share their works at no cost. The online Wattpad site is just one of the best examples in this sense.

The second development relates to the concept of "Publikum", which is defined in the western languages as readers, readers, or readers. In this sense, the traditional viewer / reader has become more and more remembered as a SHARING USER. What is new here is not changing the definition of viewer / reader but it can only try to change the function. Because users share something with individual new media tools. This is what is new in this sense. In the past, there was a mass of passers-by, such as the traditional media (radio and television etc.), who were receiving only the messages that were ready for themselves in a passionate position. However, with the nineties, the audience concept has taken its place and has left it to the sharing user today. In general, when we look at this way, we can say that there are masses of audiences formerly directed by the media, whereas today there are media that are shaped by the sharing users. This is very promising in terms of the momentum from the leadership, because it is productive. There is now an innovative and creative generation that shares its own productions with others.

Abstract

Persons with disabilities are people whose physical, psychological, intellectual condition permanently or temporarily limits or prevents everyday life, education, work and fulfillment of social roles. There are about 4.7 million people with different kinds of disabilities in Poland (12.2% of the population) (Skoczyńska- Prokopowicz, 2016). People with disabilities face major stigma and prejudice, although they form an important part of each society. In recent years, there has been a change in perception of possibilities and needs of people with disabilities in Poland. This improvement has not been seen in all aspects of everyday life of this group (e.g. job market, public life, some limitations connected with partial or full incapacitation). The Polish Constitution, as well as other legislation including UN Convention on the Rights of Persons with Disabilities (CPRD), provides a general protection from discrimination and exclusion and guarantees access to education, employment and care. There are some new organizational solutions that support people with disabilities (including those with an intellectual disability) and help them to participate in society as equal citizens. The education system and preparation to adulthood are a crucial stage to enable persons with disabilities to function as equal members of society with high quality of life. The article analyzes different aspects of family, educational and vocational situation of young adults with disabilities in Poland and shows main barriers, chances and recommendations to improve their access to social life according to assumptions of CPRD. There is still a need to develop a system of support and to improve cooperation between different entities like local government, educational bodies, employers, members of NGO and adults with disabilities.

Keywords: Adults, Disability, CRPD, Support

Introduction

According to the National Census of Population and Houses from 2011, people with disabilities account for 12.2% of the whole population of Poland. There are people with various disabilities (the most common are problems with circulatory system, locomotor system and neurological system). Young disabled people from the age of 15 to 24 account for 4.6% of the whole group, while people under 29 are twice as numerous. (GUS BAEL 2016). It is a group which is very diverse, not only when it comes to disabilities, but also in their educational activity, profession or their family situation. They are more prone to discrimination, when comparing to their peers without disabilities, two to five times more exposed to violence and two or three times more likely to be unemployed. Also, the probability of finishing university is two or three times lower than the general population (<http://eur-lex.europa.eu/LexUriServ/LexUriServ.do?uri=OJ:C:2012:181:0002:0006:PL:PDF>, 2012). This all means that the group requires comprehensive support in terms of treatment, rehabilitation, facilitation and adaptation of education, psychological assistance, educational and professional paths and also material support.

Family situation of young adults with disabilities in Poland

Family is an important element of life of people with disabilities, determines their educational, professional and social situation. Major problems connected with family and society are family dependence, social isolation (low

¹ Corresponding author.

E-mail address: agnieszkazyta@wp.pl

level of cultural life, superficial relations with friends), high level of life passiveness, material problems, low level of local society life (Raszeja-Ossowska, 2013).

People with disabilities appreciate honest and close relationship with family. In case of young people there is a fear sometimes if their disability would not be an obstacle in forming their own family (Bartnikowska, Żyta 2007), although there is a great need of it, regardless of the type of disability

A vast majority of young people with disabilities in Poland live in their families of origin and consequences of their condition affect not only the person him/herself but also other family members such as parents, siblings and children. There are several groups of problems which are common for these families, regardless of the type and intensity of disorders, but there are also problems that are the consequence of the very condition. Common problems include those of a social nature (how the society reacts to disabled people, where they and their families belong), financial nature (usually income of these families is on a relatively low level when comparing to needs of rehabilitation, education, therapy and treatment) and emotional nature (disorders acceptance, lack of social support, marginalization and low level of life quality). Specific problems are connected with the need of life organization when it comes to proper care, treatment and support. There are differences in various illnesses specifics, its level and how independent a person is. Families of people with intellectual disabilities (especially profound ones) and multiple disabilities are a special group. There is a problem with formal support due to gaps and barriers in availability which is mainly connected to family's lack of knowledge and awareness of available forms of help. They often need to wait for a place in existing facilities (especially those for adults with deep intellectual disability and multiple disabilities). Their financial problems result from big expenses on rehabilitation, treatment and special equipment as well as transportation – which is a problem, when such family lives far from a city. These families also complain about the support system, which is not sufficient and does not fulfil their needs (Hewitt, 2013). Intellectually disabled people are usually dependent on their families for their whole lives – 86% of these adults live with their family or their siblings (Krause, Żyta, Nosarzewska 2010).

Educational situation and life-long learning of young adults with disabilities

Continuous education that aims to build a knowledge-based European economy is an important priority for European Union, however, disabled people often face infrastructural and social barriers. There are architectural, transport, communication, cognitive, social and information barriers (Żebrak, 2012).

In case of higher education, an important form of support in Poland is forming a specialized Department of Disabled People at universities and in institutions of professional training. This structure offers support when health affects education capabilities. They mainly support students and candidates with disabilities and chronic diseases and teachers working with these students. They also help to adapt buildings to the needs of physically disabled students, offer transportation, computers and teaching aids and provide digital library for people with poor sight. The office can also assist in obtaining special fellowships and mediate between students and teachers to adjust the time spent to perform various works, projects, exams and aids, also in alternative formats. Some students obtain a personal assistance (Recommendations for Inclusion of Higher Education and Vocational Training for People with Disabilities, 2015).

Vocational activity of young adults with disabilities

The majority of people with disabilities in Poland does not work, 80% stay unemployed. Among young people aged 25-29 only one in four people works while 70% remain outside labour market (GUS BAEL). Important elements in vocational activation are early diagnosis and appropriate vocational training combined with taking up a professional job. These people, in comparison to their able-bodied peers, tend to have low levels of general knowledge, lack of social communication skills, lower IT skills, and low level of language skills. They often need personalized support through Centers for Education and Professional Activation of People with Disabilities, dealing with comprehensive but also personalized counseling, training, or placement services (www.aktywizacja.org.pl). Among problems related to professional activity of young people with disabilities there are: (1) professional orientation performed too late and (2) inadequate school preparation. Sometimes the problem with lighter degrees and forms of disability is a late diagnosis (e.g. at the secondary school stage) and lack of professional counseling. Another problem is the maladjustment of preparation for the needs of the local labour market or professional preparation not taking into account the specific conditions or disabilities of individuals with disabilities. Another obstacle is entering the labour market (often after the school graduation these people become unemployed) or fear of suspension or loss of social pension. Some people fear losing their

benefits so much, they do not want to work at all, or choose low-paying jobs that will not result in a loss of their pensions (Raszeja-Ossowska 2013). Statistical indicators show that, despite a number of measures to prepare young people with disabilities to enter the labour market, the employment rate of people with disabilities still remains low. Barczyński's analyses (2008) which were performed 2001-2007, have confirmed the declining trend in the employment rate of people with disabilities and the increase in unemployment and occupational inactivity to a relatively higher level than in the general population. Other works devoted to the professional activity of people with disabilities (Necel, 2007-2011) see a small yet systematic growth of this activity. According to GUS BAEL data, they reached level of 22.6%, 23.9%, 24.6%, 25.9% and 26.4% in subsequent years to fall again (Necel, 2013). Such fluctuations can be, according to the authors quoted, evidence of the short-term effectiveness of the existing mechanisms introducing this group into the labor market. Even though people of working age with disabilities represent 10% of the population, their real share in labour market is only 3.8%. Unemployment in this social group in Poland not only outperforms other groups, but exceeds these of other European countries (Chłoń-Domińczak, Poznańska 2007).

In 2015 according to GUS BAEL (<http://www.niepelnosprawni.gov.pl/p,80,rynek-pracy>, downloaded: 21.04.2016) coefficient of professional activity of disabled people of economically productive age (18-59/64) was 25,9% while employment rate was 22.5% and unemployment rate equaled 13.1%. Such data indicates that level of employment is stable since 2012 and unemployment rate is relatively lower when compared to the previous year.

It is assumed that not all conditions of inactivity are the same among people with disabilities and in the general population (Podgórska-Jachnik, 2014). The disability affects the social contacts, the quality of life, the financial situation, and the professional activity of a person (Brzezińska, Piotrowski 2008). At the same time, it is stressed that disability should not be regarded as a decisive factor that affects the dysfunction of an individual without taking account—social contexts at the same time. Jachimczak (2011, 38-39) says: ‘(...) support for medical, pedagogical, psychological, social and occupational rehabilitation could significantly minimize disability issues and allow disabled persons to obtain the necessary degree of self-sufficiency, economic independence and socialization to achieve social and occupational roles, as in the case of people without impairments. However, there are obstacles that cannot be overcome by a person with disabilities, such as: lack of competence in the people responsible for the education process, program content not adapted to the requirements of the modern world (including the labour market) and lack of legible and up-to-date choice of forms of education, employment and opportunities for participation in the social life of people with disabilities.’

Education and specialized support (especially job consulting) are important factors that increase chances for employment. Unfortunately, education of people with disabilities does not adequately fulfill its role of preparing them for effective entry and retention on the labour market, which is indicated by the report of the Center for Methodological Psychological and Pedagogical Aid of Ministry of Education for 2003-2008. The issues mentioned in the report include late start of education, early school leaving after junior high school, lack or inadequate necessary therapeutic support, lack of systemic solutions for vocational guidance for students at different stages of education with individual consideration of the planning of vocational education of a disabled pupil and many others (Kummant, 2008). Also, a study on the impact of direction and education level on occupational activity on people with disabilities performed by Pentor Research International in 2009 (http://www.pfron.org.pl/ftp/dokumenty/Badania_i_analizy/Raport_CZESC_1z6_final.pdf, downloaded: 21.04.2016) reaffirms the lack of education and qualifications of people with disabilities to the requirements of the labour market (including a high percentage of people completing primary and lower secondary education, lack of lifelong learning, entrepreneurship problems, flexibility and willingness to change, lack of social competence). The problem is also inflexible and constant for years list of professions offered by special vocational schools. Too narrow educational offer and the lack of opportunities and interests of young people, coupled with the lack of labour market opportunities, can lead to dissonance in the range of available educational offerings and the real needs of people with disabilities and employers in the area.

UN Convention on the Rights of Persons with Disabilities (CRPD) and the situation of young adults with disabilities in Poland

The most important legal act on the rights of people with disabilities is the UN Convention on the Rights of Persons with Disabilities of 2006, which was ratified by Poland in 2012. “The Convention aims to protect dignity of all disabled persons and provide them with a possibility of limitless exercising fundamental human rights on par with fully able people. General principles of the Convention, specified in Art. 3 thereof, include respect for inherent dignity, individual autonomy including the freedom to make one’s own choices, non-

discrimination, full and effective participation and inclusion in society, respect for difference and acceptance of persons with disabilities as part of human diversity and humanity, equality of opportunity, equality between men and women, or accessibility” (Radlińska, Bażydło, Karakiewicz, 2017, 27-28).

Article 23 (Respect for home and the family) contains important arrangements included in CPRD when it comes to family situation. It describes non-discrimination in all matters relating to marriage, family, parenthood, adoption as well as highlights the right of people with disabilities to marry, to start a family, and to make decisions about having children (their number and time of birth). The article also pays attention to the provision of access to information on procreation and family planning issues and the obligation to provide assistance in the care and education of children. The Convention was ratified with a so-called interpretative statement (on incapacitation) and a reservation on marriages. While the interpretative statement is alleged to be in contradiction with the Convention's objectives, because the Polish institution of incapacity does not meet the requirements of being equal in law, less controversy refers to the objection raised to the possibility of marriage. There is widespread consensus – acknowledged by both government and non-governmental organizations - on the need to amend national legislation in this area. Developed in 2014, "Draft Proposals for the Draft Law on Amendments to the Civil Code, Civil Code and Family Code Act, Civil Procedure Code, Family Support Act and Alternative Custody Act, and Certain Other Acts" (<https://legislation.Rcl.gov.pl/docs//1/208000/208001/208002/dokument104528.pdf>) assumes withdrawal of total incapacitation as an obstacle to marriage.

The most frequently mentioned deficiencies in the range of support for young families with disabilities in Poland are: - insufficient number of specialist family counseling (psychological, legal and therapeutic services), - insufficient number of sheltered dwellings (created for adults with disabilities), - too late delivery of help from the social services (lack of individual care plans), help most often in crisis / critical situations, and little emphasis on preventive actions, - lack of preparation of social workers to support families of people with intellectual disabilities or mental illnesses (these are groups at the bottom of the hierarchy of social importance, often exposed to social marginalization), (Szczupał, 2010), - financial barriers to the development of institutional and environmental assistance (the disparity between the results of state diagnoses and the distribution of public funds, often associated with poor management of funds, lack of monitoring and evaluation of the use of funds) (Gałęziak, 2009).

Art.24 of CRPD guarantees people with disabilities the right to education without discrimination and on the basis of equal rights. The education of students with disabilities in Poland takes place in inclusive education, integration schools and special schools.

For young adults, education itself concerns higher education and lifelong learning education. The analysis of the educational situation of people with disabilities in Poland shows that this is best achieved at the level of higher education. Universities have offices or attorneys for people with disabilities. Students are provided with a wide range of help with the adaptation of teaching materials, transportation, financial support and psychological help. This is the only educational stage where the concept of inclusive education has been fully implemented (Błaszczak, 2015). On the other hand, there are still some obstacles. Availability of specialized learning equipment, availability of textbooks, access to all university spaces (e.g. lecture halls, canteens, libraries, service offices, etc.) or adequate preparation of academic staff to teach people with disabilities (Żebrak, 2012). Lifelong learning education includes post-secondary education. It allows to acquire and improve skills, primarily professional but also social ones. The Convention (art. 24 law 5) highlights that persons with disabilities should have access to adult education and lifelong learning without discriminating and on an equal basis with others. In Poland for many reasons this access is unprotected or very difficult. The main barriers are architectural and transport barriers, which is also a violation of art. 9 CRPD. Lack of accessibility to the place of study often excludes visually impaired people from the very beginning.

Art. 27 (Work and employment) says about “the right of persons with disabilities to work, on an equal basis with others; this includes the right to the opportunity to gain a living by work freely chosen or accepted in a labour market and work environment that is open, inclusive and accessible to persons with disabilities” (CRPD, 2006). Poland, being a member of the European Union, successively implements international solutions for equal treatment in employment and non-discrimination, which apply to persons with disabilities. Persons with disabilities in employment may use four different independent systems in Poland: 1) rehabilitation (among others, Vocational Training Centers), 2) social assistance, 3) job placement (employment offices and employment agencies e.g. Centrum Vocational Training and Support for People with Intellectual Disabilities, 4) Social Employment (including social inclusion centers and clubs) (Klimczuk 2013).

The research shows that the problem in Poland is the cooperation of non-government employment agencies with public services and social, educational and scientific institutions. Ratification of the CRPD forces the integration

of social policy. Especially it is important in equality before the law, universal design (tailoring services, products and architecture to the needs of the individual), equal access to education, digital inclusion, participation of people with disabilities in elections, their access to justice service (Błaszczak 2015).

Conclusions and Recommendations

The analysis of the family, educational and professional situation of young adults with disabilities in Poland, in the light of the UN Convention on the Rights of Persons with Disabilities, allows to define certain directions of action and recommendations. The main focus is on moving away from focusing on the medical aspects of disability for implementing social inclusion and integration. In Poland ongoing work is being carried out on the development of a national strategy for the implementation of the provisions of the Convention (debates, quantitative and qualitative research, conferences involving both government officials, public and non-governmental organizations and, above all, persons with disabilities. (<http://www.pfon.org/wdrazanie-konwencji-o-prawach-osob-niepełnosprawnych-wspolna-sprawa?id=694>).

All people with disabilities (especially women, children and the elderly) are marginalized and need support in various areas of everyday life. Young adults are a very diverse group - their psychosocial situation depends, among others, on the type and degree of disability, education, presence or absence of additional health disorders, access to the support system, having a partner, residence, family financial resources. The Polish state, while guarding the equal rights of all citizens, cares for the interests of this group of citizens so that they can be independent, self-reliant and part of the social life. These services include:

- Work on the development and implementation of a uniform disability assessment system for education, work, social care and health care;
- The abolition of institutions of incapacitation and introduction of a model of decision support and self-determination;
- Empowerment of people with disabilities to face discrimination in various areas of everyday life;
- Continuous implementation and improvement of universal design principles in architecture, services, public spaces;
- Moving from institutional care (deinstitutionalization) towards community-based care;
- A larger number of personal assistants for people with disabilities;
- Promotion of alternative forms of communication in public space (e.g. easy-reading language, alternative communication, promotion of Polish sign language);
- Promotion of inclusive education at all stages of education for all groups of people with disabilities;
- Supporting employment on the open labour market and, where necessary, adequate protection of the financial needs of a person with disability and their family through a social security system;
- Access to rehabilitation services, equal rights and freedom of association (Błaszczak 2015).

The analysis of documents and actions devoted to the implementation of the CRPD in Poland highlights many positive steps towards equality and equal opportunities for this group of people, but at the same time demonstrates the need for continued and systematic actions, broadening public awareness and involving people with disabilities in the implementation of the goals of Convention in everyday life.

Conceptual Mapping As An Inspiring Strategy Of Mathematical Lifelong Learning

Martina UHLÍŘOVÁ¹

E-mail: martina.uhlirova@upol.cz*

Abstract

The paper summarises our experiences with the concept mapping strategy in mathematical education and classroom experiences. Most pupils did not have any experience with the concept of concept mapping. It was a new idea for teachers as well. We were wondering whether future teachers of mathematics at primary school know the strategy of concept mapping and how they evaluate it. The paper deals with the preliminary results of the partial results ascertained in the research entitled ACPM (Attitudes Towards Concept Mapping in Mathematics), which was practiced in 2016 and 2017. This research was focused on student attitudes to the using of the concept mapping strategy for a better understanding of mathematical foundations. We believe that if future teachers accept concept mapping as a strategy that leads to a successful understanding of mathematical fundamentals generally, they will pass on this progressive method in the future teaching profession. **Keywords:** Mathematics, Learning, Teaching, Concept mapping, Prospective teachers

Introduction

Lifelong learning is defined as learning that is pursued throughout life. Lifelong learning can develop creativity and individual skills needed for adaptability in a rapidly developing modern society. The school should provide pupils with strategies and methods to solve problems that are of general application. Teachers are expected to develop as professionals and they need to acquire new knowledge, become familiar with new didactics trends, learn about new teaching and learning methods.

Mathematics is a natural part of our everyday reality. Learning mathematics accompanies pupils from the very beginning of school education. The knowledge of mathematical laws and principles is a significant factor of the general literacy of everyone. Learning mathematics is necessary for an individual's complete development in today's complex society as a part of lifelong learning. Often, however, we encounter negative attitudes of people towards mathematics. The attitudes of pupils are similar. Pupils often refer to not understanding mathematics, they consider that school mathematics is too difficult for them. It is striking that we have encountered similar negative attitudes to mathematics in prospective first-level primary-school teachers who will themselves teach mathematics (Uhlířová, 2015). One of the reasons is that school mathematics often focuses on mere encyclopaedic knowledge and gaining "ready" knowledge and algorithms without a deeper understanding. Pupils and students learn individual concepts and mathematical topics separately without searching for mutual relations or building a deeper cognitive structure. In line with constructivism, the authors place emphasis on the active role of pupils in the cognitive process. One of the strategies based on the principle of pedagogic constructivism is the method of mental mapping, where pupils create their own ideas and build their own knowledge structures.

Mental mapping is a strategy that presents the subjective perception of reality on the basis of the reflection of an individual's inner thought processes. Fisher (Fisher, 2011) says that we organise our images of the world by converting our perceptions (what we see, hear, feel etc.) into words and ideas which we present through concepts. Concepts cover certain facts in order for us to be able to identify the diversity of relations and differences between phenomena. If we capture thoughts and concepts, we create a mental map that is "an external mirror of what is happening inside our heads" (Buzan, 2012). Therefore, a mental map is a graphic visualisation of mutual relations between thoughts or concepts. If we focus on concepts, the process is known in specialised literature as concept mapping and the visual presentation as a concept map.

Learning through concept mapping allows us to use the right and the left brain hemisphere at the same time. During learning, the use of the left hemisphere generally prevails. The left hemisphere controls functions such as speech, logic, sequencing and causality. The right hemisphere controls imagination and creativity. According to psychological researches (Pfeifer, 1990), true creative work is based on the interconnection of the left and the

right brain hemisphere. Mind maps that are based on this principle are thus not only creative tools of mental work, but also very strong stimulants of the development of creativity. It is necessary to realise that concept maps constitute a purely individual manifestation of one's personality and that they are not fixed structures. On the basis of new knowledge, the existing structure is repeatedly and dynamically reconstructed. The structure is expanded with new concepts and links, and concepts that have so far been isolated are connected.

Method

According to the input characteristics of concept mapping, we may distinguish between two types of concept mapping, in accordance with T. Janík (Janík, 2006):

- 1) Structured – there is a fixed list of concepts; the task is to arrange these concepts into a schematic structure. Such maps can be compared because they are identical in terms of their contents; they only differ in their structures.
- 2) Non-structured – only the key concept is given; the task is to compile a logical structure of concepts that are associated with the key concept.

Concept mapping plays the role of a multifunctional educational environment in the education process. Ficová and Žilková (Ficová, Žilková, 2012) state the following functions of mental mapping:

- Organisational function - arranging concepts in a meaningful structure, arranging and sorting thoughts, recording and summarising key concepts, defining relations and hierarchical levels;
- Inspirational function - supporting creativity, stimulating the creation of thoughts, ideas;
- Interpreting function - explaining complex problems, clarifying relations between concepts, deepening and expanding of problems;
- Effectiveness function - increasing the effectiveness of learning, increasing the meaningfulness of learning, improving language skills;
- Diagnostic function - analysing knowledge, evaluating the degree of understanding concepts and relations between these concepts;
- Presenting function - presenting thoughts with relevant arguments.

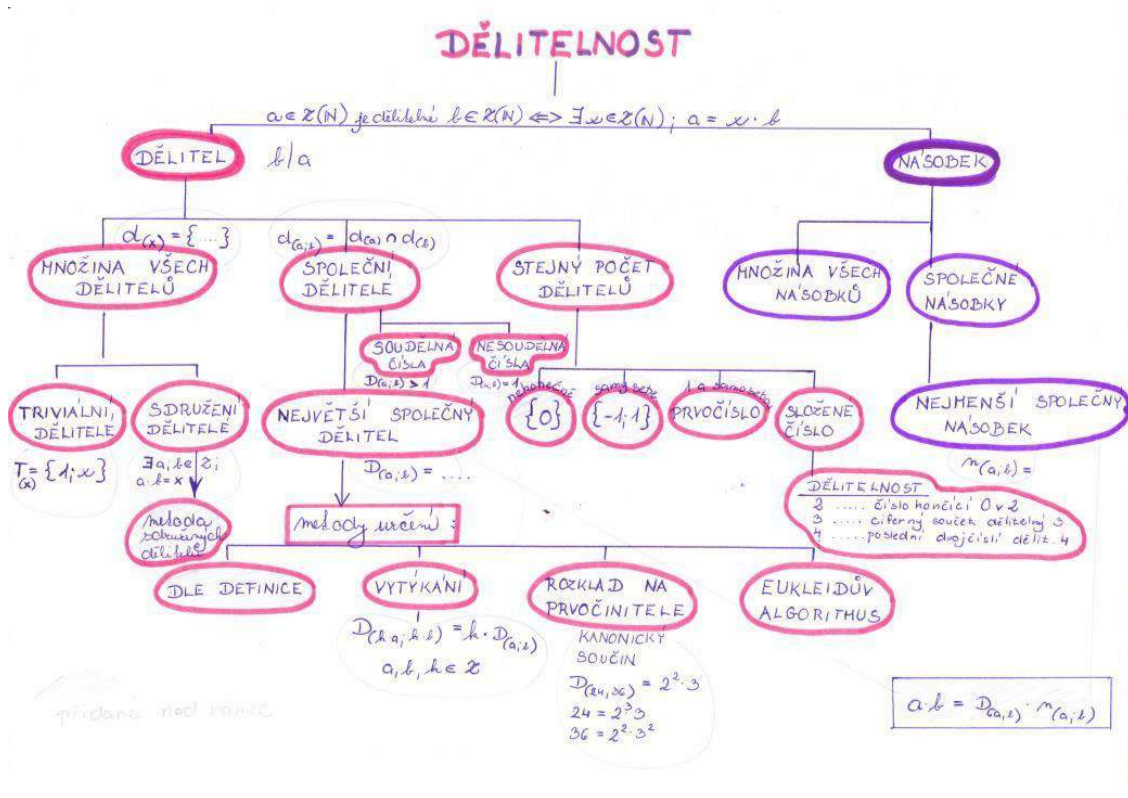

For the research, we chose the method of concept mapping in combination with a questionnaire. We included both structured and non-structured forms of concept mapping with an emphasis on the organisational, presenting and diagnostic functions.

The Attitudes Towards Concept Mapping in Mathematics (ACPM) research was conducted during the 2nd year of study of the programme Teaching at the 1st Level of Primary School at the Faculty of Education of Palacký University in Olomouc in the academic year 2016/2017. The research was focused on the identification of students' attitudes to the possibility of using the method of concept mapping to improve the understanding of mathematical topics. We were interested in whether the students would accept the concept mapping method as one of their learning strategies and whether they would include it in their teaching strategies. The research was conducted in 2 stages. The first stage was focused on practical experience of the students with creating concept maps as part of the thematic framework of the mathematical disciplines of Mathematics 2 and Mathematics 3. The students gradually prepared two concept maps with the following topics: Relations and operations, Divisibility. The students could choose whether to work individually or in pairs. The preparation of the concept maps and their presentation constituted one of the requirements to pass the course. An illustrative example of one of the prepared concept maps is provided in Figure 1. The first concept map was non-structured; the students only got a pair of keywords in the assignment, Relations and Operations. This was an assignment combining the completed discipline of Mathematics 1 (the 1st year of study) and the new curriculum of the 2nd year. The second concept map was structured - the students were assigned 20 concepts which they were supposed to organise into a cognitive structure. If necessary, they could add further concepts. All 62 students of the 2nd year participated in the stage of "active concept mapping", of which 58 were women (i.e. 93.55 %) and 4 men (i.e. 6.45 %). Given this unbalanced representation, we will not deal with gender differences. The second stage of the

research was conducted at the end of the 2nd year after the completion and submission of the concept maps. A non-standardised questionnaire was prepared for the purposes of the research. 49 respondents - 2nd-year students - participated in this part of the research. The respondent sample included 47 women (i.e. 95.92 %) and 2 men (i.e. 4.08 %). The remaining students were not present at the time of the survey.

Figure 1. An example of the created concept map

Findings and Results

In this section, we will focus on the analysis of the concept maps with the topic of *Divisibility*. It is an issue that is associated with a large number of concepts and is difficult for students. Our aim was to diagnose the level of mathematical knowledge which the students have in the field of divisibility, and to identify erroneous ideas. At the same time, we focused on the students' ability to create a graphical representation of their ideas in the given context. A total of 45 concept maps were evaluated.

In terms of the structure design, the maps can be divided into two categories. Hierarchical concept maps that are depicted using the root (tree) structure and “branch out” from the general concept to more specific concepts. It is interesting that the students generally opted for the vertical direction down from top (see Figure 1). On the other hand, spider concept maps have the general concept in the central position and the related concepts “branch out” in all directions. The evaluated concept maps have the minimum scope of 17 concepts and the maximum scope of 45 concepts, and 21 of the concept maps (i.e. 46.67 %) included only the assigned concepts. Some of the authors added shortened definitions, brief concept characteristics or calculation formulas. None of the students used the option of creating the map through a computer software.

Based on the content analysis of the concept maps, we reached the unhappy conclusion that many of the students had not created a correct concept structure on which to build further knowledge structures. The most frequent mistakes which we identified included:

- The students confuse the “to be a divisor” relation with the operation of division, and the “to be a multiple” relation with the operation of multiplication. They also confuse the characteristics of relations and operations.
- The students have not overcome the linear “isolation” of the concepts of divisor and multiple. The concepts in the students’ concept maps form separate units without being interconnected.
- The students chose an erroneous concept hierarchy. E.g. the concept “the highest common divisor” precedes the concept “set of all divisors”.
- The maps do not capture crucial links between concepts.
- The maps do not capture the analogies between concepts derived from the key concepts of “divisor” and “multiple”.

In terms of the questionnaire, we were interested in whether the students had already encountered the concept mapping method and the creation of concept maps. More than a half of the students (61.22%) only encountered the concept mapping method during the course Mathematics 2, where they created their first concept maps. The remaining students (38.78%) stated that they knew concept mapping from before. Most frequently, they had used concept mapping in psychology, foreign languages and in mathematics at primary or secondary school.

The students were then supposed to indicate the degree of agreement to 15 statements (items a – q), which we divided into 3 areas as part of the analysis: personal learning strategies, professional focus of the future teacher, and obstacles. The answers to the questions were scaled from 1 to 5, where 1 meant a complete disagreement and 5 complete agreement with the statement. The minimum point score for the individual statements was $n_{\min} = 49$, the maximum point score was $n_{\max} = 245$. The achieved point scores were within the interval of $n \in \langle 78; 194 \rangle$, the average score was $n_p = 136.9$. Table 1 shows the items that achieved the highest point scores.

Table 1: Comparison of statements according to the declining point evaluation by the respondents

Order	Topic (Item)	n
1.	Concept mapping may be useful to pupils (Item g)	194
2.	Concept mapping is a method that is suitable for pupils of the 1st level of primary school (Item n)	178
3.	I will use concept mapping in my teaching profession (Item h)	162
4.	Concept mapping helped me to organise concepts (Item a)	159
5.	Concept mapping was a meaningful activity (Item i)	156
6.	Concept mapping helped me to understand the curriculum (Item b)	148
7.	I will use concept mapping during my university studies (Item q)	144

The first 3 items (g, n, h) fall within the area of the professional profiling of students – future teachers. The next four items (a, j, b, q) belong in the area of the personal learning strategy. The benefit the respondents see in concept mapping in terms of their future profession is much greater than the benefit they see for their effective personal growth. This statement is also supported by items that achieved the lowest point evaluation. Item l I do not understand the principle of concept mapping at all ($n = 78$) and Item k I use concept mapping often ($n = 92$) show that the students understand the principle of concept mapping, but have not adopted the method as an active part of their learning strategy. What seems positive is that the students agree to the statement that they will use concept mapping in their university studies (Item q, $n = 144$).

The structure of evaluation of the items with the highest score achieved is depicted in Graph 1. The highest degree of agreement to the presented statement is apparent in the case of Item g and Item n. The other items were most often evaluated by the students with the neutral point value 3. In individual personal interviews, the students said that they would welcome a deeper and more intense work with concept maps. A positive attitude and interest of students in concept mapping constitutes a perspective basis for further development of this creative education strategy.

Graph 1: Structure of evaluation of selected items (in accordance with Table 1)

Conclusions and Recommendations

Concept mapping provides a wide range of educating tools for teachers as well as pupils. A significant benefit is the possibility of analysing the specific content of the given topic in its entire width and complexity, and understanding the possible hierarchical levels. We see the inclusion of the mental mapping method in the training of prospective teachers as very beneficial. In addition to improving the students' learning strategy, there is a positive influence on the teaching style of the prospective teachers. Only a teacher who himself/herself has motivation, belief, activity and creativity can teach his/her pupils in the same way. Only the teacher's creative work develops in pupils the ability to think creatively, increases the pupils' motivation and, last but not least, gives them the opportunity to examine their feelings when acquiring skills through self-expression. Creative skills and abilities should be part of the professional "equipment" of every teacher.

The paper was written under the support of the grant IGA_PdF_2017_007. Unconventional motivating environment for the development of logical thinking in pupils.

Abstract

This paper presents results of the research on mathematical literacy of pupils of the fifth year of primary schools in the Czech Republic and Egypt. A non-standardised didactic test for pupils of the 5th year of primary schools was created, containing ten mathematical problems with a choice of answers. In choosing tasks, due to the different socio-cultural environments in which pupils grow up in the participating countries, emphasis was placed on the clarity of the context of the tasks. The research results from the two countries are compared. An analysis of the success of individual tasks is done. The test was supplemented by a questionnaire survey to determine the subjective perception of the set of problems solved by pupils. The research survey brought interesting results. Although mathematics is universal in its nature, teaching mathematics, especially in elementary schools, is related to the social and cultural environment of the country.

Keywords: Mathematical literacy, Didactic test, Primary mathematics

Introduction

Mathematical education is one of the pillars of the educational system of all countries. Mathematical knowledge is essential for the success of each individual in the rapidly evolving digital society. In different countries, we meet different concepts of education. We consider international cooperation in the field of education a unique opportunity to find a common perspective on the future in the spirit of globalisation tendencies.

The international TIMSS research tracks the level of mathematical literacy in selected countries of the world. The Czech Republic has repeatedly participated in the TIMSS international survey since 1995. Czech pupils were placed in the second half of the final placements of the participating countries. Pupils did not have a problem with knowledge-based tasks. Their biggest problem was to solve application tasks with contextual understanding of the text. The Arab Republic of Egypt is not a partner country of the TIMSS research. Our Egyptian partner was interested in mathematical literacy. Together, we designed a research survey Mathematical Literacy across Borders (MLB) inspired by the above-mentioned research, with an emphasis on application tasks within the definition of mathematical literacy of pupils. The research was carried out by the Department of Mathematics, Faculty of Education, Palacký University in Olomouc, Czech Republic, and the Department of Pedagogy, Faculty of Education, University of Alexandria, Egypt.

The main idea of the joint MLB project was to create a comprehensive set of mathematical tasks for 5th-year pupils in the Czech Republic and Egypt and to compare the results obtained in the individual countries.

Method

When conceiving the Mathematical Literacy across Borders (MLB) research, the method of didactic testing in combination with a questionnaire survey was chosen. The research tool was a non-standardised didactic test supplemented with a brief questionnaire. For the purposes of the MLB research, a didactic test by J. Češková (Češková, 2012) was modified; this test had been primarily designed to identify the differences in the level of knowledge and skills of 5th-year pupils at primary schools in the Czech Republic. The resulting texts of the didactic test assignment and questionnaire were prepared in three language versions: in Czech (for Czech

pupils), English and Arabic (for Egyptian pupils). The translation from Czech into English served for the subsequent translation into Arabic as well as directly for some Egyptian pupils, who did the test in English.

The non-standardised didactic test contains 10 mathematical tasks reflecting the curriculum of the 1st-5th year of primary school in the Czech Republic and Egypt. Nine of the tasks are tasks with the selection of one correct answer from four offered answers (tasks 1-9). One task is an open task (task 10) - the pupil has to write the correct answer himself/herself. In terms of verbal expression, the test includes numerical tasks (tasks 1-5, 9, 10) as well as contextual tasks (tasks 6-7). When choosing the tasks, emphasis was placed on the comprehensibility of the assignment and the applicability of the context given the different socio-cultural environments of the pupils in the Czech Republic and Egypt.

The questionnaire was focused on the identification of the pupils and the establishment of their subjective perception of the set of tasks. The foreign partner decided to reduce the information to be learned from the questionnaire. In line with socio-cultural norms, only the subjective reflections of the pupils were established. Therefore, the overall evaluation does not analyse the results achieved in terms of the respondents' gender or their previous study achievements.

742 pupils of the 5th year of primary school took part in the questionnaire, of which 378 (i.e. 50.9 %) were Czech pupils and 364 (i.e. 49.1 %) were Egyptian pupils. The respondent groups were thus proportionally balanced. In Egypt, 193 pupils (i.e. 26 % of all respondents) did the didactic test in Arabic and 171 pupils (i.e. 23.1 % of all respondents) did it in the English translation. The respondents' gender was not established in the Egyptian part of the research. In the Czech Republic, 181 boys and 197 girls did the test. I. Hrubá (Hrubá, 2015) deals with a detailed analysis of the results of the Czech pupils in her diploma thesis.

Findings

Based on the evaluation of the didactic tests and processing of the obtained data in MS Excel, the basic characteristics were obtained. The success rate with respect to the solution of the set of mathematical tasks by the pupils as a whole is summarised in Graph 1. The minimum number of points is 0, the maximum possible score is 10. The average value of the achieved score in the case of the Czech pupils is 5.21 points, in the case of the foreign pupils 3.19 points. We can say that the Czech pupils achieved better results overall.

Graph 1. Relative frequencies of the total scores achieved in the test

Let us, however, focus on the success rate of the individual mathematical tasks in the test. The statistical evaluation is shown in Graph 2. The success rate in the individual tasks differs between the Czech and foreign pupils. The foreign respondents achieved a higher success rate only in task 10 (namely by 7.4 %). In all other cases, the Czech pupils were more successful. The most distinctive differences were recorded in task 6 (51.7 %)

and task 9 (37.8 %). The failure of the Egyptian pupils in task 6 might have been caused by not understanding the task context given the different socio-cultural background.

Graph 2. Success rate in the individual mathematical tasks

In the group of Czech pupils, the most successful tasks were tasks 3, 6, 9 (success rate in the interval of $< 67.5; 69.0 >$). In the group of foreign pupils, the most successful tasks were tasks 3, 7, 10 (success rate in the interval of $< 37.4; 58.2 >$). The highest values of differences in the success rate were seen in task 6 ($d = 52.7 \%$) and task 9 ($d = 37.5 \%$). In the case of the Czech pupils, these tasks rank first and second in terms of success. According to the subjective assessment by the pupils, neither group of respondents considered these tasks to be the most interesting, the easiest or particularly difficult (see Graph 4 and Graph 5). For illustration, the assignments of tasks 6 and 9 are shown in Figure 1.

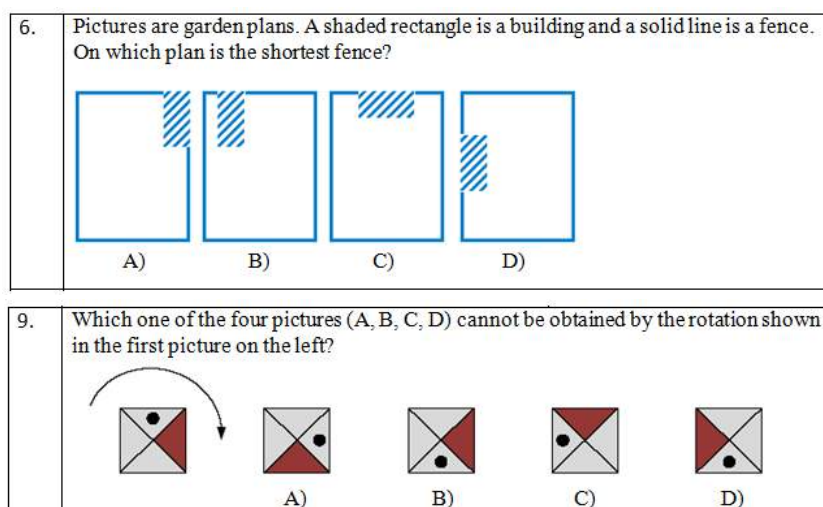

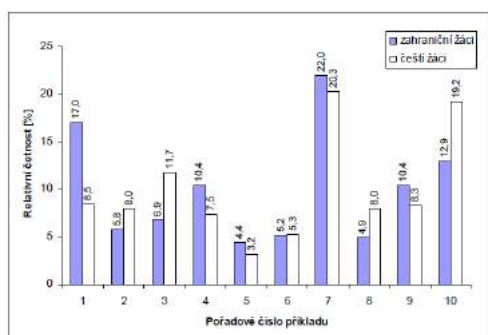

Figure 1. Assignments of task 6 and task 9

In terms of the subjective assessment of the tasks by the pupils, what interested us was which of the tasks was considered the most interesting (Graph 3) and which was considered the most difficult (Graph 4). We also wanted to find out which of the tasks seemed the easiest to the pupils (the evaluation of this aspect is not included in this paper).

Graph 3. Subjective assessment by the respondents - the most interesting task

An exceptional position among the tasks is taken by task 7 (see Figure 2). The Czech as well as Egyptian pupils considered it to be the most difficult task (20.3 %, 22.0 %, Graph 4). However, the Czech pupils also considered it to be the most interesting (21 %), and it was successfully solved by 28.7 % of the Czech respondents. In terms of a successful solution, task 7 ranked 5th. The fact that the unconventional context of the task has a strong motivating potential is reassuring. The Egyptian pupils evaluated task 7 as the 3rd most interesting; in terms of a successful solution, it also ranked 3rd.

Graph 4. Subjective assessment by the respondents - the most difficult task

7.		<p>Which order of assembly of the individual pieces is impossible?</p> <p>A) 2, 7, 5, 6, 4, 1, 3 B) 2, 7, 5, 1, 6, 4, 3 C) 2, 7, 6, 3, 4, 5, 1 D) 2, 7, 6, 5, 3, 1, 4</p>
----	--	--

Figure 2. Assignment of task 7

According to the Egyptian pupils (21.4 %), task 1 was the most interesting. (see Figure 3). In terms of difficulty, they considered it the second most difficult - this assessment corresponds to the success rate ranking. This task ranked only 8th. It was successfully solved by 25.3 % of the Egyptian pupils. In the assessment by the Czech pupils, task 1 was average. In terms of interest, the pupils ranked it 5th. In terms of a successful solution, it only ranked 6th (42.3 % of successful solutions). The reason may be that Czech pupils generally encounter similar tasks in mathematics textbooks, and tasks of this type are therefore nothing new to them.

1.	<u>Which number follows in the sequence?</u>
	
A)	127
B)	126
C)	81
D)	138

Figure 3. Assignment of task 1

Results, Conclusions and Recommendations

The MLB (Mathematical Literacy across Borders) research brought a number of stimuli and unusual comparisons. Mathematics has its universal dimension, but teaching mathematics is relatively closely associated with the socio-cultural environment of each country. Some conclusions were as expected, other findings surprised us. It was interesting to look at the “same” mathematics “in the eyes” of different cultures. In the future, we would like to continue in the research. In conclusion, we would like to thank especially prof. M. Nouha from the Faculty of Education of the University of Alexandria and his colleagues who actively participated in the MLB research.

The paper was written under the support of the grant IGA_PdF_2017_007. Unconventional motivating environment for the development of logical thinking in pupils.

Abstract

The aim of the research was to find out how students of mathematics at the beginning of their Bachelor's degree program can use their knowledge and skills of learning about functions in solving problems with functional content, if the success of students in solving problems with functional content at all faculties of education in the Czech Republic is the same, to propose appropriate steps to increase the level of functional thinking of pupils and students, to determine the rate of success of the individual test tasks, to analyse the set of respondents, students of mathematics of the first year of university studies at the faculties of education at the beginning of the study. Quantitative research has been proposed to achieve these objectives. The research confirms the need to further develop problem-solving skills for students.

Keywords: Mathematical literacy, Functional thinking, Non-standardised didactic test

Introduction

Functional thinking is among the cognitive processes specific to humans. As the name emphasises, these are processes involved in getting to know (i.e. cognising) the reality. It is an activity of the brain during which information is processed. It enables us in particular to analyse and synthesise properties and relations between objects and phenomena, and solve theoretical as well as practical problems.

Every human is born with certain inborn dispositions of intellectual abilities. To a certain extent, it is possible to work on the development of such intellectual abilities. The human brain likes to learn and develop, it is just necessary to make it pursue an activity. The crucial content of each upbringing and education, as the current textbooks of pedagogy say, includes especially the training of thinking. Where there is a lack of the tendency to develop the ability of thinking during upbringing, this lack will be manifested in focusing on easier learning methods.

However, it is impossible to think without knowledge. Schemes of arranged knowledge in our mind constitute a prerequisite for thinking. Upbringing and education at schools will ensure the development of thinking in pupils and will teach them to obtain information independently and assess it, sort it and work with it. The development of functional thinking positively contributes to increasing the level and quality of thinking and intelligence of the individual, and its level affects the attitude to gaining new knowledge. We can find the greatest emphasis on the development of functional thinking in teaching mathematics.

Ever since the ancient times, people have noticed differences between themselves and others as regards their comprehensive faculty, correctness of thinking, originality of ideas, alacrity and riches (Pietrasinski, 1965). Thinking is examined in terms of its main functions. These include forming concepts, recognising and finding relations, deducing conclusions from premises (inference), solving problems and creating something new (Plhánková, 2004).

Functional thinking is one of the constituents of mathematical literacy. Perceiving dependencies in day-to-day life, their monitoring and understanding and the ability to express their nature is associated with the ability to see the relations between quantities. The capability of quantitative expression of dependencies, the ability to transfer a dependency into a chart or table, and the expression of dependencies in reality are connected with mathematical literacy (Blažková, 2007).

If teachers at all levels of education content themselves with teaching facts to their pupils and marginalise the application, comparison, context, solving non-typical tasks and problem situations and schemes, they will limit the development of not only functional thinking, but also abstract, symbolic, combinatorial, logical and other thinking. Especially in the case of students of faculties training future teachers, we should pay considerable attention to the development of functional thinking in these students, which they will in turn develop in their pupils. A teacher with a low level of functional thinking does not meet the prerequisites for a correct development of functional thinking in his/her pupils.

Problem statement and sub-problems

At the Department of Mathematics of the Faculty of Education of Palacký University in Olomouc, we were examining functional thinking of new students, future teachers of mathematics at the 2nd level of elementary school, in 2012. Leona Salvetová, a student of the postgraduate study programme, conducted a research in order to establish the level of functional thinking in students of the 1st year of the Bachelor study programme at all the eight faculties of education in the Czech Republic (Salvetová, 2014).

Due to an insufficient knowledge and mathematical skills when solving tasks with functional contents and problems, shortcomings in the concept-forming process in students, and insufficiently developed mathematical thinking in mandatory lectures and seminars of the course Mathematical Analysis, the following research problems were formulated.

P1: Czech as well as foreign studies point to an insufficient knowledge and mathematical skills when it comes to functions and their application on solving application tasks and problems in pupils. Are these shortcomings manifested in the students of the first year of mathematics at the faculties of education in the Czech Republic as well?

P2: How does the type of the secondary school attended and completed depend on the level of the student's functional thinking?

P3: What other factors may affect the level of functional thinking in future mathematics teachers at the beginning of their studies?

The research itself was preceded by a pilot study and pre-research, the attempt was to establish the situation at the departments of mathematics of the faculties of education in the Czech Republic.

The main aim of the research was to find out how the students of mathematics at the faculties of education in the Czech Republic at the beginning of their university studies in 2012 were able to use the knowledge and skills with respect to functions in solving tasks and assignments with functional contents (Salvetová, Laitochová, 2012).

The research also had the following objectives:

- Establish how the students of mathematics in the first year at the beginning of their Bachelor studies are able to use their knowledge and skills in solving tasks and assignments with functional contents,
- Propose suitable measures in order to increase the level of functional thinking of pupils and students,
- Establish the success rate of solving the individual test assignments,
- Analyse the group of respondents, students of mathematics of the first year of university studies at the faculties of education at the beginning of the studies, according to pre-set criteria, i.e. factors that relate to the previous mathematical education of the student (such as the school-leaving examination in mathematics etc.).

In order to achieve the set objective, relevant theoretical materials were studied in the preparatory phase of the research, namely the current situation, basic concepts – thinking, mathematical thinking, functional thinking, mathematical abilities and skills, intelligence, visual literacy, ontogenesis of functional thinking, competencies in teaching mathematics, the relation between functional thinking and speech, the development of functional

thinking in relation to the school curriculum, the level of mathematical literacy of Czech pupils in the international PISA research, and the comparison of these results to pupils from other OECD countries.

Method

A quantitative research was designed to achieve the set objectives. The research tool of the research was a non-standardised didactic test and a non-standardised questionnaire, in which the students were answering questions relating to their previous studies at secondary and tertiary schools. A total of 305 respondents participated in the research.

Statistical methods to analyse metric data were used for the verification of the hypotheses. Student's t-test and the method of analysis of variance were used.

The aim of the non-standardised didactic test was to establish the current situation as regards the use of knowledge and skills when solving tasks with functional contents (Laitochová, Salvetová, 2015). Although the test was focused on the knowledge and skills of pupils of elementary and secondary schools, it was set to students of mathematics at the beginning of their studies in the first year of the Bachelor study programme at the faculties of education in the Czech Republic. The didactic test was compiled by the author of the dissertation thesis; the author found inspiration for the assignments in the international researches of TIMMS, PISA and the assignments proposed in the project by Eisenmann and Kopáčková (2006). The test contained 14 assignments, of which 5 were closed (assignments with a choice of answers) and 9 were open. The assignments in the test were focused on:

1. The examination of basic knowledge and skills (according to Fehérová (2010) - numerical skills, orientation and work with tables, work with diagrams and charts, graphic perception, function as a relation between quantities, the correctness of logical thinking).
2. The curriculum of functions in application mathematical tasks.

The following properties of the didactic test were examined. The reliability of the research tool was established using the Kuder–Richardson Formula; the sensitivity of the test assignments was established using the ULI coefficient, and the difficulty of the test assignments was ascertained by the index of difficulty.

The non-standardised questionnaire was another research tool to establish the factors that might affect the result of the test. The questionnaire contained 6 items, of which 4 items were dichotomic and 1 was an item with a choice of answers (three answers). The questionnaire items were related to the student's personality and his/her previous studies at a secondary school or university.

Findings

The overall success rate of solving mathematical tasks in the didactic test containing 14 assignments set to students of the first year at the beginning of their Bachelor study programme Mathematics with a focus on education reached the average value (arithmetic average) of 7.9 points out of the total of 14. The results with respect to the success rate of solving the individual assignments by all the test respondents are shown in Chart 1.

Chart 1: Overall results of the test assignments

This paper includes only a summary of the results of the statistics obtained in the research.

1. We assumed that the level of functional thinking in mathematics students at the faculties of education in the Czech Republic at the beginning of their university studies did not correspond to the level according to the standards of elementary and secondary education. According to the research results, we can say that the level of development of functional thinking of the respondents does not correspond to the expected level according to the standards of elementary and secondary education.
2. We believed that the students' results in the didactic test of mathematics would correspond to the median value at the individual faculties of education in the Czech Republic. However, this assumption was not confirmed; on the contrary, we must say that the success rate of solving tasks with functional contents as part of the didactic test differs in the respondents at the faculties of education. There is at least one group of medians which is not the same. In Chart 2 (box plot), the faculties are marked with numbers 1-8, as it is not our aim to assess the levels of the individual faculties, but rather the functional thinking of the students of these faculties.

Chart 2: Average results of individual faculties in the test

3. The average to slightly below-average results inspired us to think about the factors that might be the cause of the decreasing level of functional thinking in secondary-school graduates. We assumed that the respondent's gender did not influence his/her level of functional thinking. Our belief was not confirmed, and we had to accept the alternative hypothesis that the success rate of solving tasks in the didactic test differed in men and women; the men achieved a higher average number of points than the women. We must conclude that the respondent's gender does influence the success rate of solving mathematical tasks with functional contents. There is a statistically significant difference between the average number of points in the didactic test in the group of men and the average number of points in the didactic test in the group of women. The identified differences cannot be attributed to chance.
4. We assumed that the level of functional thinking depended on the type of the secondary school which the respondent completed. Namely, that graduates from grammar schools would be more successful in the test than graduates from secondary vocational schools. The research conducted proved that there were statistically significant differences between the achieved averages in the didactic test in the group of graduates from grammar schools and in the group of graduates from secondary vocational schools. It follows from the research results that the type of the secondary school which the respondent completed affects the success rate of solving tasks with functional contents. The identified differences in the average numbers of points in the test cannot be attributed to chance. We conclude that the average number of points in the didactic test in the group of graduates from grammar schools really is higher than in the group of graduates from secondary vocational schools.
5. Another factor considered in the research was the school-leaving examination in mathematics. We assumed that the students who passed their school-leaving examination in mathematics would achieve better results in the didactic test in mathematics than students who did not sit their school-leaving examination in mathematics. According to the results of the research conducted, our assumption proved correct; we adopted an alternative hypothesis. There are statistically significant differences between the achieved averages in the didactic test in the group of graduates from grammar schools and in the group of graduates from secondary vocational schools. The identified differences in the average numbers of points in the test cannot be attributed to chance. We conclude that the average number of points in the didactic test in the group of graduates from grammar schools really is higher than in the group of graduates from secondary vocational schools. The passing of the school-leaving examination in mathematics influences the success rate of solving mathematical tasks in the didactic test.
6. We also assumed that the success rate in the didactic test had a statistically significant relation to the length of the period that had lapsed from the school-leaving examination. There are no statistically significant differences between the results of the groups of students in the didactic test of mathematics. The year of graduation from secondary school does not affect the success rate of solving mathematical tasks in the didactic test.
7. We expected that the result of the respondent's test would be influenced by whether that respondent had completed another university before starting at the faculty of education. This was not confirmed. The identified differences in the average numbers of points in the test in both the examined groups can be attributed to chance. The results in both groups of students come from the same basic set. The fact whether the respondent had completed another university before starting at the faculty of education does not affect the success rate of solving mathematical tasks in the didactic test.
8. The last factor taken into consideration in our research was the level of the state school-leaving examination in mathematics in the years 2011-2012. We assumed that the level of the state school-

leaving examination influenced the test result of the respondent. There are statistically significant differences between the average number of points achieved in the didactic test in the group of those who sat a higher level of the school-leaving examination in mathematics and the average number of points achieved in the didactic test in the group of those who sat a lower level of the state school-leaving examination. The identified differences cannot be attributed to chance. The average number of points achieved in the test in the group of those who passed a higher level of the state school-leaving examination really is higher than in the group of those who sat a lower level of the state school-leaving examination. The level of the state school-leaving examination sat at secondary school influences the success rate of solving mathematical tasks in the didactic test.

Results, Conclusions and Recommendations

Benefit for teaching practice

We see a benefit for this area especially in the processing of the topic of functional thinking at university level. To this date, there are no researches or studies dealing exclusively with the level of functional thinking in university students; research respondents are frequently pupils of elementary and secondary schools.

This paper constitutes evidence of the need to change the existing approach to teaching mathematics, i.e. shift from the transmissive style of teaching to a constructivist style.

The paper also confirmed the necessity of developing the ability to solve problems and communicative competencies in students. Everyone finds themselves in problem situations on a daily basis, and communicative competencies enable one to understand different types of texts and depictions, respond to them and use them in a creative way.

The results of the research also indicate that functional thinking may have a major connection to visual literacy that is manifested by the ability to understand and use images and think and learn in terms of images (Hortin, 1980).

Recommendations for further practice in teaching mathematics

On the basis of the data obtained, we concluded that the decreasing level of functional thinking may be connected to insufficient knowledge and skills as regards functions. The students often solved the set tasks without thinking, and their solutions were frequently based on the similarity of a known function, the graph of which they remembered. The choice of solution was based on the formal knowledge gained at elementary and secondary school.

Another recommendation following the analysis of the students' assignments is to focus more on solving problematic tasks and tasks with functional contents that aid the development of functional thinking. These types of tasks are formed by a combination of school mathematics and situations of everyday life.

We recommend a correct posing of questions by the teacher according to Bloom's taxonomy of a hierarchically arranged system of education goals in relation to the level of thought processes. Gradually shift from simpler questions requiring only one's memory to more difficult questions that require assessment, evaluation and analysis for the formulation of the correct answer.

Also, when forming mathematical concepts, place emphasis on obtaining a sufficient number of separated models and gradually and smoothly lead students to the generic and abstract models.

It is necessary to continuously check whether students actually understand the topics taught and give them room for comments; the teacher will thus make sure that the student has understood the essence of the topic.

Recommendations for further development of the didactics of mathematics

Our research concerning the analysis of functional thinking in students of mathematics at the beginning of their university studies may serve to enrich the university pedagogy, which might use this source to specify the initial requirements for university students - future mathematics teachers at the 2nd level of elementary school.

It may also be assumed that teachers who teach first-year students at university will have to deal with a low level of functional thinking, and it is necessary to introduce a course in the first year in which the students would revise the elementary- and secondary-school curriculum as regards functions; the students should in particular solve problematic tasks that eliminate formalism and encourage thinking.

The aim of our attempt was to establish the diagnostic values of the test assignments that may serve as an inspiration for the creation of a test of study prerequisites. We used a non-standardised didactic test as a tool to measure the students' knowledge at the beginning of their studies.

As our research did not include students of the combined form of studies, it may be assumed that the factors that did not affect the results of the full-time students or affected them only partially, for example the period that lapsed from the school-leaving examination, previous university studies etc., would intervene in the results of students of the combined form of studies more. Nevertheless, this assumption would have to be verified in a new research.

Visual stimulation as one of the conditions for successful development of a child with visual impairment

*Veronika Růžičková, Institute of Special Education Studies – Žitkovo nám. 5, 77140 Olomouc, Czech Republic;
veronika.ruzickova@upol.cz*

Abstract

The birth of a child with visual impairment, a sudden interference by a child's health condition that affects his visual function or the progression are circumstances that affect both the child himself and his family. The child is suddenly needed to approach differently. One of the important tasks for both parents and early care workers is the need to consider whether and how the vision and visual functions of the child can develop and then do so. The technique we are talking about is called visual stimulation, and we want to present it not only theoretically but also practically - from the perspective of the parents of children with visual impairment. The paper will present the results of an investigation carried out between parents of children / young people with severe visual and combined disability related to early care and related services - visual stimulation.

Keywords: Child with visual impairment, visual stimulation, early intervention, family

Introduction

Healthy development of children depends on many circumstances, which include health, family, medical care, surroundings of the family, etc. In a child with visual impairment this healthy development is determined by other variables including the fact that it is desirable to develop the child's residual vision as much as possible, teach the child to use it, and explain the child's parents what the child can do, and what the child should achieve under their guidance. One of the techniques used to develop visual functions in children with severe visual impairment is visual stimulation.

Matoušková (in Baslerová et al., 2012, p. 80) claims that 'visual stimulation represents a set of all visual stimulation techniques, methods and procedures making use of compensatory devices, which, if applied in an intensive way, might lead to an improvement in visual perception through the impaired visual function of the eye. The objective of visual stimulation is to support and develop residual visual functions, to train visual looking and the ability to use residual vision in everyday life as much as possible, and to train processing, storing and recalling of visual perceptions; to develop visual skills (attention, localization, fixation, transfer of attention, motion tracking, eye-hand coordination, spatial orientation, surface orientation), to develop the ability to identify light, direction of light, shadow, colours and shapes.' Visual stimulation can be both passive and active; the passive form primarily includes adjustments to the environment, the active form includes stimulation of vision and visual functions in a child with remaining light perception.

1 Introduction to research methodology

Visual stimulation is a set of techniques that help develop residual vision in young aged children. This technique is offered by early intervention centres. For the purposes of the present research, which was performed as part of a monograph entitled *Visual training* (Růžičková, Kroupová, Kramosilová, 2016), the authors addressed parents of children with severe visual impairment, who had undergone visual stimulation, and asked them about early intervention services. The recruitment procedure was performed through visual therapists, early intervention centres, special education centres, students of special education, and a conversation group for parents of children with visual impairment on social networks.

1.1 Method

Regarding the potential emotional aspect of the issue, the primary data collection method was a questionnaire mostly consisting of open items that provided space for free responses. To increase the validity of the survey the authors used the triangulation of methods approach – the questions were followed by an individual structured interview.

Regarding the fact that parents are often flooded with questions and interviews, the survey was deliberately narrowed down to a survey questionnaire in order to achieve a high return rate. The authors believe that the relatively low number of questions and recruiting through persons who are trustworthy to the parents resulted in a relevant sample of respondents, who were willing to provide a sufficient body of information about visual stimulation and its effect on their children with severe visual impairment.

The questionnaire survey included a total of 17 families with children with visual or multiple impairment. The research sample is considered appropriate to provide relevant results. The age of the parents included in the sample was 30 to 73 years, their level of education varied from secondary school with certificate of apprenticeship to university degree.

In addition to the parent's age, another significant aspect was the current age of the child, who at the time of the survey had undergone or was undergoing visual stimulation. The age range of the children was from one year to fifteen years of age. This information suggests that the questionnaire was completed by both groups of parents; those whose children had completed visual stimulation and those whose children were still undergoing visual stimulation.

The children were diagnosed with the following visual defects (according to the parents – mostly mothers):

- Nystagmus;
- Optic disc hypoplasia;
- Type 3 ROP – practical blindness;
- Retinal pigment epithelium dystrophy (Bardet–Biedel syndrome);
- Developmental defects of the brain, grade 4 mental retardation, physical disability – crawling and moving on a wheelchair, visual impairment in both eyes;
- Spastic quadriplegia cerebral palsy, epilepsy and vision;
- Severe cerebellar atrophy, microcephaly, epilepsy, partial optic nerve atrophy, hypermetropia, CVI;
- Optic nerve coloboma, nystagmus, strabismus, amblyopia, one eye smaller, dioptric defect;
- Optic nerve atrophy, and corneal astigmatism;
- Suspected Leber congenital amaurosis;
- West syndrome, spastic diparesis, TMR, CVI;
- Albinism, nystagmus;
- Blindness with light perception.

Some of the visual defects were repeated in the questionnaires, but here they are listed only once. This list suggests that visual stimulation is known to the parents of children who only work with sources of light as well as those who should learn to read on a symbolic level. The following set of questions focused solely on the experience of parents (mostly mothers) from all over the Czech Republic; both from cities with over 100,000 inhabitants and rural areas.

Regarding the fact that the questions were asked by means of questionnaires and interviews, the authors decided to leave the questions open and leave space for the respondents' comments on the issue in order to receive a wide range of responses, which might sometimes be contradictory. The results of the questionnaire survey are presented by means of clustering of statements that have the highest response relevance.

Table 1 Categorization of questions for the parents of children with visual impairment

Category	Statement
Experience with visual stimulation	We have positive experience with visual stimulation.
Place of first experience with visual stimulation	We learned about visual stimulation through an early intervention counsellor, who showed us everything, after that we did it ourselves at home.

Parents' associations concerning visual stimulation	Certainly do it, although it's a small move, it's worth it.
Frequency and location of visual stimulation	As needed – we were shown how to do it, then we did it at home.
Challenges of visual stimulation for the parents	Learn to work with signals that my child sends to me.
Challenges of visual stimulation for the children	Concentrated work.
Progress as a result of visual stimulation	The progress is visible and important for us as motivation for further work.

2 Data interpretation and discussion

This subchapter analyses the results obtained by means of the interviews and questionnaires. The table in the previous section of this chapter shows the categories and most frequent responses.

In this section the statements are described in context:

Experience with visual stimulation

- Most of the parents (mothers) suggest that visual stimulation is a good therapy and that they have rich experience with this approach, although their children are not always willing to cooperate and sometimes they have to commute to a distant location.
- In this category, the respondents commented on various aids required for visual stimulation, time demands, and the period that their child has been subject to visual stimulation. One of the statements that contains all answers is as follows: Our child has been subject to visual stimulation for quite a long time – since we discovered the visual defect. At that time, early intervention counsellors came and explained what to do. Now after practising visual stimulation for some time, we can develop our own aids and toys that motivate our child for visual work.
- In this category, an interesting finding was that once the child starts attending a preschool facility or even school, the parents rely on the institution and no longer perform visual stimulation at home.
- Already in this introductory section, all of the parents suggested a very significant role of a third person – in case of young children this person is the early intervention counsellor, who explains the beginnings, shows the procedures of visual stimulation and checks what the parents are doing; in case of older children these are kindergarten or elementary school teachers who perform visual stimulation with the child and present an authority, with whom the child cooperates better than with the parents.

Place of first experience with visual stimulation

- The category of the first experience with the concept and practices of visual stimulation included only two types of responses – early intervention centres and their employees. It should be noted the parents mentioned both types of visual stimulation – consultations in early intervention centres and visits of their staff at home.
- In two cases, the responses were somewhat surprising. These parents heard the term visual stimulation for the first time from a doctor in a healthcare institution where they stayed with their child.

Parents' associations concerning visual stimulation

- The next question focused on what visual stimulation means to the parents, what are their associations and what they would like to share with other parents or other people. Most of the parents gave the following answer: 'Do not hesitate because it makes sense to develop this area and give it the required time, the same applies to physical exercise.' 'Go for it whether your child has healthy eyes or not.' 'It's a long journey which is definitely worth trying.' These three statements clearly show that the parents are aware of the time demands, but still they consider visual stimulation helpful and worth trying.
- Some of the parents also mentioned negatives of visual stimulation – 'More visual stimulation aids should be available.' 'Visual stimulation requires adjustments to the surrounding environment, one should know that less is sometimes more.'

- Last but not least, visual stimulation was aptly summarized by one of the mothers: 'It is a wide range of exercises and a variety of visual skills that help improve visual skills of a visually impaired individual.'
- The points listed above suggest that visual stimulation raises various associations – some of the respondents highlight the time demands, practical aspects, or effectiveness, while others emphasise the need for appropriate aids, adjustments, and trying not to overstimulate the child. All these aspects are part of visual stimulation, which is a time-consuming and long-term process with uncertain results, a process that requires adjustments to the environment, toys and aids.

Frequency and location of visual stimulation

- In this question, two possible types of responses were anticipated and eventually confirmed by the respondents – one group of parents focused on the time spent at home performing visual stimulation themselves, the other group defined the time spent in an early intervention centre or the time that an early intervention counsellor spent at home with them.
- The following responses were given in the case of stimulation methods shown by early intervention counsellors: once a week, three times a year, once every two months, or once a month or two months.
- In the case of performing visual stimulation at home the parents suggested that if their child was healthy, visual stimulation was performed daily or as advised by the early intervention counsellor.
- Visual stimulation is or was performed by the parents as frequently as specified provided that there was no subjective or objective barrier. A large proportion of the respondents consider the duration of visual stimulation (not elements of visual stimulation) the time that the early intervention counsellor spent with them showing the stimulation techniques or the time that they spent in the early intervention centre.

Challenges of visual stimulation for the parents

- Although visual stimulation consists of techniques and methods that help children develop their visual functions as much as possible, it brings not only advantages but also some negatives. The following text describes some of the difficulties that the parents and their children have to face.
- According to the parents, the most difficult aspect for them is the work with their child – to be able to identify whether the procedure is performed correctly and whether the child cooperates. ('The hardest thing for us as parents is to recognize whether our son is looking, whether he is cooperating. He doesn't fix his eyes, it's just a short blink and his eyes turn away.' 'Making our daughter cooperate.' 'Getting the right distance from our son's eyes.')
- Another area identified as difficult is the time spent commuting if visual stimulation is performed by other professionals than the parents themselves ('Commuting.' 'It's difficult to commute to Liberec, and an hour later back to Jablonec to kindergarten, but if that's what he needs, we don't mind.')
- The last group of responses is represented by a statement of one of the mothers – 'Understanding the correlations between visual functions.' This statement demonstrates that visual stimulation is difficult for the parents because they do not understand why they should do an activity and why it is important. But when they look back, they understand, and consider visual stimulation a technique that they would definitely use again.
- The last statement that forms a separate category is as follows: 'This therapy made me happy, because the therapist always gave me clear and concise recommendations, advice, aids, and when I understood what to do and my son reacted, it was great.' This mother's response demonstrates all problems, strengths, advantages and benefits of visual stimulation, and is so well-formulated that it deserves to round off the category of difficulties of visual stimulation for the parents.

Challenges of visual stimulation for the children

- The parents of visually impaired children are not the only ones that have to cope with the challenges of visual stimulation. The following text explains whether there are any difficulties for the child. The statements made by the mothers were used to form several areas, as suggested below.
- It is not surprising that the most frequent statement made by professionals who work with visually impaired children is that they do not know. This is documented by the following statements – 'It's hard to say.' 'I don't know.' 'I can't specify.' These responses occurred several times.

- Another area includes techniques, aids and well-being of the child and the parents, which is demonstrated by the following statements: 'Appropriate positions – he hates sitting in the lap, he enjoys moving on his belly, so it is difficult to find a suitable working position.' 'Eye patch.' 'Constantly searching for something motivating.' 'Mutual cooperation.'
- The last of the major areas was again related to commuting and time consuming nature of the technique, should the child undergo visual stimulation in a different location.
- The very last area is demonstrated by the following statement – 'Fixation, that's what we're still practising.' This area shows that every child is different, children's visual skills and possibilities vary, not every child is able to advance to the tenth stage of visual stimulation. This implies that visual stimulation is strongly individual; some children advance quickly, the pace of others might be slower, they may even fail to reach some levels.

Progress as a result of visual stimulation

- The last part of the questions of the interview or questionnaire again focused on the subjective perceptions of mothers / fathers, but also measurable and objectively observable phenomena – whether the parents believe that visual stimulation has helped their child and that the child has made some progress.
- This category is demonstrated by a single statement – yes. This statement is aptly illustrated by the following responses: 'Both vision and visual perception improved.' 'He still can't look at me straight, but he can see and distinguish colours in the distance, differences, details, concentration, using a tablet – controlling.' 'After a year he began to notice toys and better reacts to us parents.' 'In two years we managed to equalize visual acuity of the weaker eye, improve looking into the distance, and calm nystagmus at a short distance. Incredible progress that no one will believe.' 'After two and a half years he can fix a light object for a certain period.' 'After about four months of visual stimulation, he can easily identify the right side, left side, up, down, back, front, he learns shapes...' 'At the beginning our daughter did not see virtually anything, she couldn't fix an object, she couldn't take anything by her hand, she had no eye contact, gradually through large pictures she has made considerable progress, she can now identify pictures 5x5 centimetres in size, she practises gripping small objects, she loves working on iPad, her eye contact improves.' 'After about a year he managed to 'place the lion inside the cage' - those who ever tried this know what I mean, this requires cooperation of both eyes and this improved a lot.'

Conclusion

Visual stimulation is a set of techniques and practices that can help children in their further development. The research clearly suggests that all parents of children with severe visual impairment are familiar with visual stimulation and that they consider it beneficial for their child. After being trained by a professional they perform visual stimulation themselves at least once a day. In the context of visual stimulation, most parents think of pictures, techniques, light and many other areas.

Visual stimulation forms the basis for the development of visual functions in young aged and preschool children. Visual stimulation is a set of practices, methods and techniques that help children with preserved light perception develop their visual functions as much as possible so that these preserved functions help the child in everyday life, movement in space and visual work. The present study confirmed that although visual stimulation presents some challenges and difficulties to the child and the parents, these are outweighed by the progress made by the child in practical life.

Introduction

To form a more exact idea of the procedure, effectiveness, results and system of further / lifelong education of teachers in information and communication technologies (ICT), let us summarise selected results of several researches that dealt with this issue. A report of the Czech School Inspectorate describes the results of the TALIS2013 research (Kašparová, V., Boudová, S., Ševců, M. & Soukup, P., 2014), in which 34 countries of the OECD and partner countries participated, and which involved all Czech teachers at the ISCED2 level, i.e. the 2nd level of primary school and the lower years of six-year and eight-year grammar schools.

Teachers in the Czech Republic mostly (65 %) participate in professional training focused on facts and knowledge in subjects that they teach; skills in the field of information and communication technologies (hereinafter referred to as ICT) necessary for teaching (53 %).

Teachers in the Czech Republic are mostly aided in professional training by having the training financially covered in full (this fact was declared by 77 % of teachers); two-thirds of teachers also stated that they were given time off work. What teachers see as crucial is especially the need of specialist training in ICT skills, necessary for teaching (15 %); however, this result was below the TALIS average, which was about 19 % (see p. 29).

As regards education in ICT as such, the evaluation of the effect of professional training on the teaching of teachers in the Czech Republic and on the international average (the percentage of teachers who stated that the relevant training had a positive or medium-positive influence) reached about 83 % in the case of ICT skills (which was a higher score than the TALIS average, which was around 80 %). But there is only 40 % (in international average) of teachers participated in TALIS, who stated that their students use ICT in teaching. So there is a large group of teachers, who are not inclined to use ICT and ready to use them in teaching (MŠMT, 2015).

A relatively interesting finding that applies not only in the Czech Republic is that those teachers who have already participated in professional training in the form of courses feel a greater need for further learning compared to teachers who have never taken part in this form of professional training. In terms of the inclusion of work with ICT in lessons, Czech teachers do not differ from the international average.

For informative purposes, let us supplement the results of a research focused, among other things, on subjectively felt causes of the failure of the respondents to participate in further ICT education,

In order to be able to formulate, on the basis of the findings, our own subsequent conclusions and recommendations to introduce innovative elements in the system of further training and lifelong education of mathematics teachers provided at our faculty, our research was oriented at the area of using digital tools in teaching mathematics, namely at the creation and modification of teaching materials and digital learning objects (DLOs). Therefore, we focused on establishing the teachers' opinions on this matter and the issues associated with the use of DLOs in teaching their pupils.

A sample of quantitative research consisted of elementary-school mathematics teachers in the Olomouc Region (Bártek, K., Nocar, D. & Laitochová, J., 2017).

- The research was carried out between November and December 2016.
- The questionnaire consisted of 10 questions, 6 closed, 3 semi-closed, where respondents could choose "Another" answer and 1 open answer.
- At the end of the questionnaire, questions related to respondent data were given, namely gender, length of practice and the class in which the interviewee teaches mathematics.
- The questionnaire was created using Google forms, which created a link to fill in the questionnaire.
- We received 104 answers from the teachers (female = 83; male = 21).

Problem 1

The key question for all innovative changes in education offers focused on the creation of DLOs for mathematics was to what extent DLOs were actually used in practice, and whether there were differences between men and women in using them in teaching.

The questionnaire item was formulated as follows and we also indicate the frequencies of the individual attributes, see the table 1.

How often do you include DLOs – digital teaching objects in teaching mathematics? (presentations in PowerPoint, Excel files, animations, simulations, didactic games etc.)

We set the following research hypotheses:

H1₀: There are no differences in the degree of usage of DLOs in teaching between the groups of men – mathematics teachers and women – mathematics teachers.

H1_A: There are statistically significant differences in the degree of usage of DLOs in teaching between the groups of men – mathematics teachers and women – mathematics teachers.

Table 1. Utilization of DLOs in teaching mathematics.

	Absolute frequency	Relative proportion to the whole	Men Absolute frequency	Men Relative proportion in the group of men	Women Absolute frequency	Women Relative proportion in the group of women
A. I do not use	13	12.5 %	2	9.5 %	9	10.8 %
B. Rarely – not more than 25 %	44	42.3 %	14	66.7 %	30	36.1 %
C. Sometimes – 25 % - 50 %	28	26.9 %	3	14.3 %	25	30.1 %
D. Often – 50 % - 75 %	0	0 %	0	0 %	0	0%
E. Very often – 70 % - 95 %	16	15.3 %	2	9.5 %	14	16.8 %
F. All the time – more than 95 %	3	2.8 %	0	0 %	3	3.6 %

We verified the hypothesis using the Mann Whitney U test in the STATISTICA12 program (see table 2); the p-value was higher than the set value of $p=0.05$, that was why we did not reject the zero hypothesis. There are no statistically significant differences in the degree of usage of DLOs in teaching mathematics between the monitored groups.

Table 2. Mann-Whitney U test.

Variable	Sum of sequence	Sum of sequence	U	Z	p-value	Z modified	p-value	N group 1; Women	N group 2; Men	2*1 side exact p
Usage of DLOs Min=0 Max=5	457.5	912.5	681.5	1.534463	0.12492	1.61817	0.105628	83	21	0.12454

Problem 2

Another element significant to us was to establish whether there were significant differences in the usage of DLOs in teaching between groups of teachers with varying lengths of teaching practice. We divided the examined set of teachers into 4 subgroups, see table 3.

Table 3. Groups of teachers – lengths of practice.

	Absolute frequency	Relative frequency
Less than 3 years	6	5.8 %
3-10 years	14	13.4 %
11-19 years	29	27.9 %
More than 20 years	55	52.9 %

We set the following hypotheses:

H_{20} : There are no differences in the degree of usage of DLOs in teaching between the groups of mathematics teachers in connection with the length of their teaching practice.

H_{2A} : There are statistically significant differences in the degree of usage of DLOs in teachings between the groups of men – mathematics teachers and women – mathematics teachers.

Again, we verified the hypothesis using the STATISTICA12 program; we used Kruskal-Wallis ANOVA, see table 4. The p-value was, once more, higher than the set value of $p=0.05$, that was why we did not reject the zero hypothesis H_2 . There are no statistically significant differences in the degree of usage of DLOs in teaching mathematics between the monitored groups.

Table 4. Kruskal Wallis ANOVA; Independent (grouping) variable: length of teaching practice;
 Kruskal-Wallis Test: $H(3; N=104) = 3.209896; p=0.3604$

Dependent: Usage of DLOs	code	Number of valid	Sum of sequence	Average sequence
Less than 3 years	1	6	271.0	45.16667
3-10 years	2	14	599.5	42.82143
11-19 years	3	29	1,692.0	58.34483
More than 20 years	4	55	2,897.5	52.68182

Problem 3

We were interested in the reasons why the respondents did not use DLOs in teaching. Of those who do not use DLOs (13), 8 respondents state the reason “A. I do not see DLOs as useful teaching tools.” Only two of the respondents gave the reason “B. I have no time, creating DLOs is time-consuming”. Three of the respondents stated the reason “E. I do not have the necessary software tools at my disposal”.

We also wanted to find out what the proportions of respondents who did not create or modify any DLOs were in the relevant group (respondents who do not use DLOs in teaching). The proportion of those who do not create or modify any DLOs is thus understandably the highest in the relevant group, see the table 5.

Table 5. Creating DLOs – respondents who do not use DLOs in teaching

	Total number	Percentage share in the group (n=13; respondents not using DLOs in teaching)
A. I do not create any	9	69.2 %
B. I create – MS Word documents etc.	3	23.1 %
C. I create – MS PowerPoint documents etc.	1	7.7 %
D. I create MS PowerPoint documents using animations...	0	0 %
E. I create – interactive objects...	0	0 %

The same number and the identical respondents who do not create DLOs do not modify them. The remaining 4 respondents modify DLOs at the level of textual documents (MS Word etc.). Other levels of this attribute recorded a zero frequency.

On the other side of the spectrum, there are mathematics teachers who use DLOs in their lessons “*Very often*” or “*All the time*”. There were 19 of these respondents in total (16 “*Very often*” and 3 “*All the time*”).

What is possibly a little surprising is that the group has a larger percentage of women; in absolute terms, they were 17, which was 89.4 % of the group (they use DLOs in their lessons “*Very often*” or “*All the time*”). Women in this group thus formed 20.4 % of the total number of the women and 16 % of the number of all the respondents, compared to the men, who were only 2 and formed the remaining 10.6 % of the group, in comparison to the women mere 9.5 % of the total number of men and 1.9 % of the total number of respondents, see table 6.

Table 6. Teachers who use DLOs in their lessons “*Very often*” or “*All the time*”.

sex	absolute	Relative share n = 104	Share in the group according to gender	Share in the group Use DLOs in lessons “ <i>Very often</i> ” or “ <i>All the time</i> ” (n = 19)
women	17	16 %	20.4 %	89.4 %
men	2	1.9 %	9.5 %	10.6 %

There seem to be interesting results in the degree of usage of DLOs in teaching in connection with the length of teaching practice of the respondents. This subgroup consists of 1 respondent with practice shorter than 3 years (17 % of teachers with teaching practice shorter than 3 years), 2 with practice between 3 and 10 years (in this case, the percentage is even lower, not even 15 %). There were 6 teachers with teaching practice between 11 and 19 years in this group, which was almost 21 % of teachers with this length of practice; teachers with practice longer than 20 years were 10, i.e. 18 % of teachers with a practice longer than 20 years. When we compare the groups of teachers with the shortest and the longest practices, we can see that the respondents constitute a similar part in relation to their group. Whereas in the case of older teachers (meaning teaching with a long teaching practice) this relatively low percentage may be attributed to, among other things, the perception of one’s own PC skills as insufficient (although this is explicitly stated only by 2 respondents, i.e. 7 % of the teachers, who do not

use DLOs or use them only rarely), other teachers in this category primarily state lack of time (13 respondents, i.e. 46 %), and there is also a strong representation of the opinion that DLOs are not useful tools (12 respondents, i.e. 42 %). In the case of teachers with a short practice, this relatively low proportion may be caused rather by insufficient temporal or material means; however, none of the respondents in this group consider DLOs inefficient teaching tools.

Nevertheless, even among respondents who create DLOs themselves, we can find those who declare that this activity is somewhat limited, see table 7. It is no surprise that identically in both groups of respondents (those who do not use DLOs at all and those who use them very often or all the time), the most frequent reason why DLOs are not created by teachers or why they are created but the teachers have a problem is lack of time (77 % and 26.3 %).

Table 7. Question:

“If you do not create DLOs for your lessons, or you create or modify them only rarely, where do you see the main problem?” (multiple answers possible)

Teachers who use DLOs in their lessons “ <i>Very often</i> ” or “ <i>All the time</i> ”.	Absolute	Percentage share in the group N=19
A. I do not see DLOs as useful teaching tools.	0	0 %
B. I have no time, creating DLOs is time-consuming.	5	26.3 %
C. I do not enjoy the creation of DLOs.	2	10.5 %
D. I do not have the necessary skills.	2	10.5 %
E. I do not have the necessary software tools at my disposal.	1	5.3 %

A positive finding is that of this group of 19 respondents, there is a rather high proportion (11, which is 58 %) of the respondents who are able to create higher-level DLOs (Bártek, K., Nocar, D., 2016) – interactive presentations, animations, simulations etc., see table 8. Interestingly, although such a proportion could have been expected, considering the previous findings, there is a high proportion of women among the teachers who are able to create, create and modify DLOs with the greatest degree of interactivity (this six-member group included 5 women).

Table 8. Levels of created DLOs.

Teachers who use DLOs in their lessons “ <i>Very often</i> ” or “ <i>All the time</i> ”.	Absolute	Percentage share in the group N=19
A. I do not create any	0	0 %
B. I create – MS Word documents etc.	3	15.8 %
C. I create – MS PowerPoint documents etc.	5	26.3 %
D. I create MS PowerPoint documents using animations...	5	26.3 %
E. I create – interactive objects...	6	31.6 %

A surprisingly high percentage of teachers from this selection state that they do not modify any DLOs created by other people (4 respondents, which is 21 %), see table 9.

Table 9. Modifying DLOs

Teachers who use DLOs in their lessons “ <i>Very often</i> ” or “ <i>All the time</i> ”.	Total number	Percentage share in the group N=19
A. I do not modify any	4	21 %
B. I modify – at the level of common textual documents (MS Word documents etc.).	3	15.8 %
C. I modify – at the level of common presentations (MS PowerPoint documents etc.).	7	36.8 %
D. I modify MS PowerPoint documents using	2	10.5 %

animations...		
E. I modify – interactive objects...	3	15.8 %

Conclusion

For the purposes of further structuralising and a better orientation of the offer of teacher lifelong education courses at the intended target groups, we addressed the question of whether there were significant differences in the usage of DLOs in teaching mathematics between teachers in terms of gender and the length of teaching practice. Despite the general assumptions and evidence (Schumacher and Morahan Martin, 2001; Lucas, 2003; Tømte, 2008; Wang and Dostál, 2017) that men have a different, frequently even a more positive, approach to ICT and their usage and learning new skills in this area compared to women, we did not observe this difference in the monitored group, as was the case with other researches (Klement, Dostál, Bártek, 2017). Neither were any differences manifested in the usage of DLOs between groups of teachers with different lengths of teaching practice, where a more positive approach to technologies might have been expected on the part of teachers with a shorter practice. The present findings may therefore form a basis for targeting the education offer at the entire general mathematics teacher population.

Surprisingly, younger teachers (i.e. teachers with a shorter practice) do not consider DLOs useless tools, while using them less than we expected. The main reasons for this are apparently temporal and material factors, in particular insufficiently equipped schools in terms of software (“I do not have the necessary software equipment”) as well as hardware (free answer – “There is no computer classroom” or “There is no technology in my classroom for presentations”). Teachers with the longest practice (20 and more years) state, as the main reason, lack of time, and they do not see DLOs as useful tools in mathematics education. Unfortunately, according to the analyses conducted (Bártek, K., Nocar, D., 2016) the DLO repositories in the Czech Republic do not contain enough “advanced” DLOs (meaning comprehensive interactive systems or applications) that teachers could use as inspiration or that they could use in teaching at primary as well as secondary schools or recommend to pupils for home preparation.

On the other hand, our experience and the experience of our colleagues from other universities and fields, from the Czech Republic (Brandejsová, J., Brandejs, M., 2007) or abroad (Busstra, C., Feskens, E. J. M., Hartog, R. J. M., Van't Veer, P., and Kok, F. J., 2008; Halverson, R., Williams, C., Wolfenstein, M. & Rockman, Ch., 2009), with the use of DLOs at university level in the training of students or teachers involved in lifelong education courses confirms our belief that comprehensive and interactive DLOs are very efficient education tools. As far as we know, in the system of teacher lifelong education, there is no education offer focused on the creation of interactive educating materials or interactive digital educating objects using other tools than the available office applications or software for interactive boards.

DLOs may play a significant role for example in the home preparation of pupils, which is extremely important in mathematics. Unfortunately, today's social climate does not really favour home preparation and homework. Teachers say that it is very hard to force pupils to do homework and that they do not get much support from state authorities either, e.g. the Czech School Inspectorate (Smetáčková, I. In Rendl, M., Vondrová, N. et al., 2013). In addition to other benefits, DLOs have the potential of increasing motivation and interest in mathematics, and might enable children to build knowledge themselves, in their own ways and at their own pace. Another important, positive benefit is the immediate and time-unlimited availability of DLOs.

We see considerable reserves in the area and a potential in the preparation of teachers for creating advanced interactive DLOs, promotion and discussing the usage of DLOs in mathematics, which may be implemented in further or lifelong education of mathematics teachers as an addition to the already completed field-specific and didactic education.

Abstract

Currently all children in the United States (U.S.) have access to free public education beginning in kindergarten or at the age of five years. However, research has shown that children who are afforded earlier formal preschool education experience multiple long-term benefits (Hard, 2011). Although many children attend preschool in the U.S., it is most often privately funded with limited publicly funded access. In 2013, Barack Obama, then President, proposed that all children have universal access to preschool, which is a significant change to early childhood education (ECE). The purpose of this study was to identify existing facilitators and barriers to implementing a systems wide change in the education of young children through conducting a comprehensive needs assessment in the State of Connecticut (CT).

Keywords: Early childhood education, leadership

Introduction

Currently all children in the United States (U.S.) have access to free public education beginning in kindergarten or at the age of five years. However, research has shown that children who are afforded earlier formal preschool education experience multiple long-term benefits (Hard, 2011). Although many children attend preschool in the U.S., it is most often privately funded with limited publicly funded access. In 2013, the 44th President of the United States, Barack Obama, (Scott, 2013) had proposed a federal initiative to assure that all children have universal access to preschool, which is a significant change to early childhood education (ECE) policy. Then President, Barack Obama called for an expansion of quality preschool access through an investment of resources to support a series of new initiatives beginning at birth and continuing to age 5 years.

Specific focus was on identification of resources, teacher qualifications, financial implications, administrator training, coordination of systems and the design of common core standards. Both teacher and administrator groups were surveyed to identify strengths, weaknesses, and areas of concern. Two focus groups were held with representative members of each group to further examine key considerations for readiness to change. A systems approach was utilized to identify programmatic needs to meet combined new requirements with a basis in the integration of research and practice. Innovative strategies and alternative methodologies to meet proposed future changes in the educational system are explored. The goal is to create a systems-thinking model that demonstrates the impact on current ECE programs with improved outcomes for all preschool children.

A goal of this proposed *Preschool for All Initiative* (The White House, 2013) was to partner with all 50 states to fund programs through the Department of Education (DOE) to local school districts for low- and moderate-income four-year-olds at or below 200% of poverty. Simultaneously states were encouraged to establish public preschool services for four-year-olds from middle-class families. This cost sharing model was intended to increase access and ensure that all children had the chance to enter kindergarten with a higher chance for success. In order to qualify for

this new initiative, preschool programs across the states had to meet common consistent standards for quality across all programs, including: well-trained teachers, who were to be paid comparably to Kindergarten to High School (K-12) staff, small class sizes and low adult to child ratios, rigorous curriculum, comprehensive health and related services, and effective evaluation and review of programs (Scott, 2013; The White House, 2013).

In response to this initiative, one state, Connecticut (CT), created a new Office of Early Childhood (OEC) as a cohesive and consolidated early childhood system of care and services. The state's population has rapidly changed with services provided to a range of socio economic and culturally diverse families. This new agency was phased in over a year, unifying state services for young children that had traditionally been spread across multiple separate state agencies. Previously, ECE funding and oversight was provided to programs based on type. For example, Head Start came under the Office of Head Start Collaboration, Child Day Care was under Social Services and the DOE oversaw school readiness programs. The second phase of this transition in 2014 moved Child Care and Youth Camp licensing and a federal home visiting grant into the new agency from the Department of Public Health, Early Childhood Special Education moved from the DOE, and the Children's Trust Fund and Care 4 Kids moved from the Department of Social Services.

Method

In these current economic times, ECE programs are experiencing instability in funding, job security and staffing, which impact upon their ability to deliver services. Bronfenbrenner (1977) in a seminal paper described a mesosystem as the interactions or relationships among settings that revolve around children; including the classroom, agency, community and additional external environments. At the same time these new proposals were developed to facilitate universal preschool access, many early childhood education and care programs continue to experience funding crisis, and are witnessing long term staff retire, and be replaced by younger staff members with more credentials and who often have different expectations and communication styles. Furthermore, with the aging of ECE professionals succession planning is key. Survival of any one program may largely depend on the skills of the leaders of the organization and the degree to which they have the insight and ability to anticipate change. Muijis, Aubrey, Harris & Briggs (2004) concluded after a review of literature on leadership in early childhood (EC) that there is a clear need to identify what effective leadership practice is in terms of processes and outcomes. Aubrey, Godfrey & Harris (2013) identified and tested different models and characteristics of leadership with the goals to identify, describe and analyze what leadership meant to key EC participants; to consider roles, responsibilities and characteristics; to investigate core components; to capture practice and judge how it was understood and enacted. Hard (2011) explored the concept of leadership in the ECE field with particular emphasis on gender, workforce issues, and generational differences. Hard (2011) further suggests that collaborative and relational style leadership approaches may be more effective than traditional, hierarchical models in ECE.

Table 1. Types of learners by generation

Matures	born	prior
The term was coined by marketing researchers, Yankelovich Partners, Inc.	to 1946	
Baby Boomer Generation		
Landon Jones, author of <i>Great Expectations</i> , a book chronicling the Boomer generation, 1946 coined the term.	1964	1964
Generation X	1965	1980
The term was coined by author Douglas Coupland in his novel, <i>Generation X</i> .		

The Millennials		
Sociologists Neil Howe & William Strauss coined the term. Alternates include 1981	1999	
Generation Y, Generation Why?, Nexters, and Internet Generation.		
Generation Z or Homelanders	1999	2015

Center for generational studies (2017)

Addressing these challenges' impact upon future ECE programs necessitates an innovative approach to planning for early childhood programs. The business sector has traditionally relied on data from consumer spending and anticipated trends in the marketplace to survive in a highly competitive field. The business system analysis methods developed present an innovative approach to developing solutions to challenges. Knowing both the current and future needs of the programs is paramount to achieving success.

Findings

The purpose of this study was to identify existing facilitators and barriers to implementing a systems wide change in the education of young children. Although this would be a national mandate, each state is allowed to develop its own educational standards, policies and procedures, which present a major challenge to leaders in early childhood education. The major goal was to implement a comprehensive needs assessment in the State of Connecticut (CT) to evaluate the potential impact of such a change across educational domains. Specific focus was on identification of resources, teacher qualifications, financial implications, administrator training, coordination of systems and the design of common core standards.

2.1 Study Design

This descriptive quality improvement project utilized a web based survey design to identify existing facilitators and barriers to implementation of such a systems wide change in ECE. Both teacher and administrator groups were surveyed to identify strengths, weaknesses, and areas of concern. Two focus groups were held with representative members of each group (administrators n=4, teachers n=4) to further examine key considerations for the readiness to change. The survey was anonymous and did not include any identifying data. It took approximately 20 minutes to complete and participation was voluntary. A pilot survey was sent to two experts to determine content validity, initial reliability, and clarity of questions. Inclusion criteria included: All participants must read English, be at least 18 years of age, and be an ECE professional in the State of CT. Institutional ethical review approval was obtained from the University.

2.2 Procedure

A convenience sample of ECE professionals in CT was emailed an 18-question web based survey that this investigator developed. An unsigned informed consent for the web-based survey was included electronically with completion of the survey implying consent. An email reminder was sent out at one week prior to the 2-week deadline for survey completion.

2.3 Analysis

Both quantitative and qualitative methods were used to analyze the data. A team of two experts identified common themes of the open-ended responses coding by frequency and relevance until saturation occurred. Final themes were determined based on consensus of experts.

Results

Thirty-five members (n= 35) of a state based ECE professional association were queried through an 18-question web based Survey Monkey questionnaire. Of these, 22 respondents indicated they were administrators with 2 self identified as teachers, and 10 noting other roles including consultant and student. ECE programs were described as private agencies (n=9, 25.71%), corporate (n=2, 5.71%), community based (n=5, 14.29%. Of these programs 11(31.43%) were described as non-profit, n=9 (25.71%) as not for profit, n=4 (11.43%) as for profit with n= 12, (34.29%) indicating other types such as university or grant funded. When asked, “If there were to be a national mandate for universal access for preschool ECE, how ready is your center to implement such a systems wide change?”, the responses were divided with n=10 (28.5%) indicating ready for change, n=9 (25.7%) not sure, another n=9 (25.7 %) very ready or could get ready and n=6 (17.1 %) not ready at all. Five respondents skipped the question. A majority of participants reported they utilized a variety of technologies in their daily routine with work, noting n=28 (87.5%) smart phones, n=14 (43.75%) iPads, n=10 (31.25%) whiteboards, n=9 (28.13%) WebEx for meetings and n=4 (12.5%) blogs wikis. Nine respondents (28.13%) listed other technologies including cameras and computers. A large majority, n=24 (92.31%), would be interested in learning new technology tools. Participants were then asked to rate their awareness of generational differences. Twenty-one or 63.64 % replied they were familiar with the term ‘baby boomers’, 23 or (69.7%) acknowledged awareness of the term ‘generation x’, n=25 (75.76%) noted familiarity with ‘generation y’ but only 13 (39.39%) ever heard of ‘millennials’. Nineteen individuals indicated workshops could provide training to address these generational differences. When asked minimal qualifications for administrators, thirty respondents equally proposed a minimal bachelor or master’s degree, noting needed expertise in ECE closely followed by a business degree. Twenty-one described the best-suited type of leadership to be strong, visionary, and futuristic, commenting experience is also key.

Most of these respondents (n=20, 71.43%) indicated there exists no succession plan to replace teachers, professional staff and or administrators with only n=8 or 28.57% acknowledging any type of succession planning. Of interest, 28.57% or n=8 admit to any formal mentoring program for some specific roles, teachers (n=8), administrators (n=7), and (n=20) for professional staff. Most ECE rely on a board of directors to support decision-making and provide long-term vision for the organization. When queried as to the optimal composition of boards of directors, respondents identified ECE professionals, business representatives, and parents. The respondents clearly indicated funding (n= 23 of the 25 respondents) is the number one priority to implement future systems wide change, followed by training (n= 1) and cooperation (n= 1). Finally, respondents noted a variety of network support needed for their own ECE professional development, such as trainings, workshops and regular support groups. Funding, adequate salaries and qualified staff were both the top 3 positive factors reported that would facilitate such a systems wide change in ECE as well as the top 3 challenges that might serve as barriers. Interesting to observe that funding was also the number one resource that might be needed to implement such a systems wide change in ECE followed by adequate training and qualified teacher.

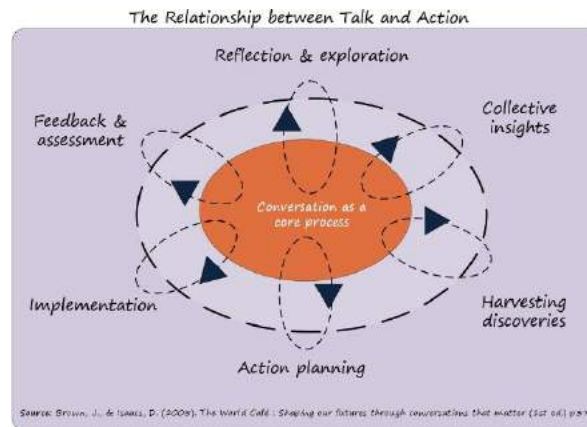

Conclusion

This paper focused on clarifying systems in place and identifying the many aspects of change occurring within ECE field in one state (CT) in the U.S. A goal was to describe a systems management approach to identify the impact on leadership in early childhood programs as a result of a proposed universal preschool implementation. Until a few years ago, no national ECE accreditation system existed. There was a paucity of funding available. Technology had not yet gone through such monumental growth with cell phones, wireless computers and even desktop computers in the future. Baby boomers existed, but Generation Xers had not entered the workforce and Generation Ys were not yet born. Utilization of a systems approach to identify programmatic needs to meet combined new requirements with

a basis in the integration of research and practice will better situate ECE programs for future change. Mistry, Sood and Mistry (2012) suggest that newer ECE practitioners are better prepared for leadership from formal educational training in comparison to more experienced ECE practitioners with less academic preparation. Innovative methods for staff advancement and recognition are warranted. *CT Charts A Course* is an early childhood career ladder program that has demonstrated success offering scholarships to move teachers along the career ladder. However, increased compensation is currently not tied to the career ladder. Generation X professionals value a balance between work and life, flexibility and collaborative models of leadership (Center for Generational Studies, 2017). A central point for programs to access benefits such as insurance and workman's compensation results in a larger finance pool, reducing cost to individual small programs, and freeing up money to allocate toward salaries. Provision of flexibility in scheduling, inclusion of more technology, salaries commensurate with educational credentials, and succession planning are evidence-based strategies that will facilitate change. Northouse (2015) and Schein (2010) describe alternative leadership styles that address gender, generation and philosophy of the ECE workforce and promote communication between administration and staff.

Fig. 1. The relationship between talk and action.

Recommendations

Innovative strategies and alternative methodologies to meet proposed future changes in the educational system should be explored. The goal is to create a systems thinking model that demonstrates the impact on current ECE programs with improved outcomes and effective ECE for all children. According to Senge (2006), "An organization's ability to learn may make the difference between its thriving or perishing in the years ahead."

Negotiation Ethics as Integral Part of MBA Curriculum

Velga VEVERE¹

¹*Professor, the University College of Economics and Culture, Lomonosova 1/5, Riga LV-1019, Latvia
Email: velga.vevere@gmail.com*

Abstract

The process of negotiations plays ever-growing role in the global business environment. There are many factors that should be taken into account, so students who are working on their MBA degree has an excellent opportunity to master negotiation techniques and to be successful in the negotiation process. At the same time, negotiations always involve important ethical issues, that is, danger of unethical behavior. The purpose of the present paper is to investigate graduate students' attitude to ethically marginal tactics in the negotiation process and to work out proposal for the micro-insertion module "negotiation ethics". The research questions are the following: (1) What is distribution of MBA students' attitude to ethically marginal negotiation tactics? (2) What is relation between number of years of students' work experience and attitude to ethically marginal negotiation tactics? Using a questionnaire derived on the basis of SINS scale ("Self-reported Inappropriate Negotiation Strategy Scale" created by R. J. Robinson, R. J. Lewicki and E. M. Donahue) MBA students rated 16 deceptive negotiation tactics using 5-point appropriate-inappropriate Likert-type scale. After that the factor analysis were completed by the means of descriptive statistics, that included the main 5 factors: (1) traditional competitive bargaining; (2) attacking opponent's network; (3) false promises; (4) misrepresentation; (5) inappropriate information gathering. Analyses of scale ratings yielded results that students' evaluation of ethical/unethical behavior in negotiation process depends on their work experience, as well as on their cultural background (the research was conducted among international students), although their criticism of inappropriate negotiation strategies does not always lead to the appropriate behavior in their actual negotiation performance. The article works out suggestions how to incorporate issues of ethical negotiation strategies within the MBA curriculum (in such courses as business ethics, negotiation skills, management, marketing, international marketing, organizational psychology, sales management, etc.).

Keywords: Negotiation Ethics; SINS scale; Business Ethics, Micro-insertion Module

1. Introduction

The topic and the scope of the present research has grown out of the author's involvement in teaching such courses as Business Ethics and Negotiations in Intercultural Business Environment courses to MBA students. During the study process, it has become clear that these two subjects are closely intertwined, since any managerial decision; any agreement is always value-laden. In other words, the business ethics course includes themes on bargaining and negotiation, whereas the negation strategy and tactics in many cases involve ethically marginal business behavior. C. Menkel-Meadow distinguishes five common ethical issues in negotiation related to: (1) telling truth or lying; (2) choice of negotiation tactics; (3) duties to stakeholders; (4) desirable outcomes; and (5) social influence. (Menkel,-Meadows, 2004) The questions posed are like this: Can negotiation be ethical in principle since it always presupposes some game plan? Should all parties involved have to have full information? Do the parties share expected criteria for assessing outcomes? These and similar issues naturally arise in discussing cases with MBA students during the individual and group assignments in the courses of business ethics and negotiation. These discussions have led to author's decision to work out a special micro-insertion module "negotiation ethics" that can be included in such courses as sales management, international marketing, organizational psychology, corporate communications, and others. Namely, this micro-module (6-8 hours) is compatible with all study courses related to people's interactions in the business environment. However, in order to design the module for MBA students, it is important to know students' attitude towards ethical/unethical decision-making practices while negotiating, that is, what they perceive to be acceptable or unacceptable actions. The paper first examines the nature of negotiation, then – the ethical issues involved in the negotiation process and the possibility of teaching negotiation ethics. Using a questionnaire derived on the basis of SINS scale ("Self-reported Inappropriate Negotiation Strategy Scale" created by R. J. Robinson, R. J. Lewicki and E. M. Donahue) MBA students rated 16 deceptive negotiation tactics using 5-point appropriate-inappropriate Likert-type scale. After that the factor analysis were completed, that included the main 5 factors:

(1) traditional competitive bargaining; (2) attacking opponent's network; (3) false promises; (4) misrepresentation; (5) inappropriate information gathering.

2. Literature review

The theoretical framework of the current article, according to its purpose, falls into three broad categories: basic concepts of negotiation (definitions, actors, processes, tactics, and strategies); negotiation ethics (appropriate and inappropriate negotiation tactics); and teaching negotiation ethics (integrative and/or non-integrative approaches).

There is extensive research literature on different aspects of business negotiations: on the process, on the participants (actors), on the expected outcomes etc. Let us mention a few aspects relevant for the current research. The first and the most logical starting point is the definition that sets the stage for further investigation. Negotiation is a process where two parties with differences, which they need to resolve, are trying to reach agreement through exploring for options and exchanging offers – and an agreement. (Fells, 2009) This definition pinpoints main aspects of negotiations, i.e., existence of at least two parties with differences in opinion, in final goal to be reached, in preliminary and strategical and tactical plans, etc. Moreover, the process of negotiation itself, give or take, consists of certain stages. And, finally, there is certain outcome than can be satisfactory or dissatisfactory to the parties involved. (Lewicki et.al., 2003) The whole situation of negotiations can be characterized by the term interdependent relationship. That is, in negotiations both parties need each other, there is no negotiation possible if there is just one side without opposition. R. J. Lewicki and others (2002) stress that one of the most important features of the interdependence is the existence of interlocking goals - within the negotiating team itself (different team members may have their personal interests that may comply with the team general strategy or may not comply with it), as well as outside the team (the goals of opponents). Each party can influence other party's decisions and actions, and the choice of the strategy. Theoreticians and practitioners distinguish among several styles (strategies) of negotiation. Thus, for example, D. Goldwich (2010) talks about five styles employed during the process of negotiation. In sum, they can be described in the following way: (1) avoiding – the negotiator tends to avoid any confrontation and is apt for putting off discussions, whenever encounters the opposition; (2) accommodating - the accommodating negotiator is primarily concerned with preserving his relationship with the other party, ready to sidestep under certain circumstances; (3) competing – the negotiator is focused upon his/her personal goals primarily and is ready to play somewhat dirty, though within the limits of the game; (4) compromising – the accent is put on the fairness and ethical negotiation tactics; (5) collaborating – the negotiator tries to reach the optimal outcome. Whereas other authors (Lewicki et. al., 2003, Fells, 2009) distinguish between competitive (distributive) and collaborative (integrative) styles. The first one is characterized by attempts to gain optimum value at the expense of the other party and is commonly referred to as the “win-lose” approach, when engaged in this style, the parties may use different tactics to win like: persuasion, argument, power, or even threat. The latter or “win-win” style means the negotiating parties have reached an agreement after fully taking into account each other's interests, such that the agreement cannot be improved upon further by any other agreement. As we can see, the distributive style is particularly subjected to ethical transgressions since the aim is to win at all costs, even on the expense of other people. The process of negotiations involves four phases: preparation, exchanging information, bargaining and closing commitment. (Shell, 2006) The negotiators can meet ethical challenges during each phase. Hence, for our purpose, it is necessary to describe briefly each phase. During the preparation phase the negotiator(s) become familiar with the facts of the problem, identify and prioritize the goals, attempt to clarify what the other party can and cannot accomplish and investigate the behavioral styles of the opposite parties. Though there can be a few ethically challenging moments, we would like to mention the one of information gathering. It goes without saying that to be successful in negotiations we have to have all possible information about our prospective opponents, their expectations, the situation, still the question is about the way of information collection, it can be quite dishonest. The interaction phase includes activities of trust building, exchanging points of view and perceptions in order to clarify differing perceptions of the issues and identifying areas of agreement and common ground. The heart of many negotiations is in bargaining, the adjustment of what is being traded until both parties are satisfied with the

arrangement. This stage can become heated and use many competitive negotiation tactics, especially if the parties have a win-lose attitude. The final closing phase (combined with the execution phase) is the point where the consensus is reached or, vice versa, there is no agreement whatsoever.

Works on the ethics of negotiation form the significant corpus in the literature devoted to business ethics. In the current literature review, we aspire to describe the main directions of the research. It has been widely admitted that in the line with today's business developments the ethical of bargaining issues play ever-growing role. The authors, for example, ask such questions:

- How to be deceptive without being dishonest? How to be assertive without being offensive? (Craver, 2010)
- Is business bluffing ethical at all? (Allhoff, 2003; Carr, 2004)
- Is lying (or so-called Machiavelli strategy) acceptable during the negotiation process? (Reilly, 2009; Shell, 2004)
- How the marginal and deceitful bargaining tactics play upon the trust and corporate image issues in the long run? (Strudler, 2004; Yu-Te, 2013)
- What are the moral effects of empathy and perspective taking in deterring deceitful negotiation? (Cohen, 2010)

In sum, majority of the authors mentioned above admit that some bluffing and/or deception cannot be avoided while negotiating business matters. However, at the same time they stress that it is necessary to pay attention to the negative effects of such practices, for instance, - spoiled image of a person or a company, reputation crisis, severed relations between negotiating parties, etc. It is worth mentioning though that in the sharp contrast to these critical remarks there stand out the conception developed by A. Z. Carr (2004). When his seminal article "Is Business Bluffing Ethical?" came out first in 1968, it created quite a controversy, since the author advocates here a "game-strategy" view of business where ethical considerations are not taken into account; like in a poker game deceptive tactics are appropriate within the business context. Among the sharpest critics, we can mention F. Allhoff (2003), R. J. Sullivan and others (1984), B. Morris (2014). To illustrate the point let us mention a few arguments against the bluffing theory put forward by B. Morris. According to the author, Carr's poker game analogy involves a confused notion of ethics (he offers the compartmentalized approach instead of the holistic one), as well as the disregard of the value/fact distinction, these confusions may lead to unpredictable consequences. C. Alavoine (2011) defines what can be considered as an "ethical negotiation". He states that the ethical negotiation occurs when the parties involved are willing to find a fair solution in an acceptable manner without abusing their bargaining power through straightforward or hidden lying, threatening, etc. Still, there are some general basic ethical principles underlying the whole quest for being ethical in the negotiation save the situation if the original intent is cheating someone (such case we cannot exclude altogether). D. Lax and J. Sebenius (2004) delineate three areas or three complexes of ethical issues: the appropriateness of certain tactics, the distribution value created by agreement and the possible effects of negotiation on those not at the table (externalities). The grounds for the ethical tactical choice can be answers to two simple questions about the possession of sufficient information by the all parties involved and the possibility to enter and to leave the situation freely. Whereas the fair distribution of values rests upon the equality of position of the parties. Moreover, finally, the absolute imperative is not to harm those, who are not included into the negotiation process. H. Raiffa (2004), in his turn, talks about ethical decisions based on the moral empathy, that is, ability to put oneself in the certain situation rather than asking the abstract questions, for example, "Is it morally righteous to do this or that, to act in this or that way?". The empathy makes it possible to personalize the situation and to think it through. This could be one of the most important aspects in teaching the course (short or long) of negotiation ethics.

K. Gibson proposes the new canon of negotiation ethics. He states that the educators have to deal with three ethical elements: students' personal moral beliefs, issues that arise in the problem-solving process and wider ethical context (justice, rights, equality, etc.). Contemporary teaching, according to the author, have to facilitate students' reflections on their own moral "bottom line", as well as, to advise them on the tricks of the trade

(bluffing, deception, evasion, aggression, etc.), in order they could recognize the potential pitfalls and traps set by opponents. (Gibson, 2004) Approaches to teaching business ethics (and negotiation ethics among other issues) can be divided in two broad groups – the integrative and non-integrative ones. The first group of researchers (Rache et.al., 2013; Acevedo, 2013; Tello et al., 2013; Rajeev, 2012) represents the opinion that ethical issues should be essentially integrated within various subjects in a targeted manner (in accordance to industry needs, for example), it presupposes also adding the philosophical reasoning to every-day case studies and analyses. Although there are many good reasons to require a standalone business ethics course in the BBA and MBA curricula, this is not always the case, since business ethics professors are often criticized for being isolated from the industry issues. Whereas the latter approaches stress the importance of the stand-alone business ethics course, perhaps differentiated according to needs of BBA and MBA students – thus, there is a proposal to offer bachelor students the experience based education, with aim to create self-awareness, while master students are to take a special course drawing on their previous learning and work experience. (Felton & Sims, 2005; Sims & Felton, 2006) The innovative teaching methods, including lectures, interactive studies, guest lectures are required to fulfill the aims of the subject. (Rajeev, 2012) In addition, D. Collins (2006) offers ne new course design based on the stages of moral development. Still, for the purpose of the present investigation, among publications on the ethics education, we would like to single out the one entitled “Teaching Business Ethics Through Strategically Inserted Micro-insertions” (Slocum et al., 2014) The authors of the publication stress the importance of the micro-insertions that are defined as “small scale insertions of ethics instructions” throughout a course, producing a larger number of ethics mini-lessons during a semester, each taking only a few minutes. (Riley et al., 2009) In other words, particular themes are developed and delivered by the ethics professor or by the guest lecturer amidst the rest of the themes as a workshop, a seminar, a lecture, a class activity, etc. The micro-insertion offers a way to communicate ethics using a “low-dose” approach. In our opinion, the micro module of negotiation ethics is a promising way of engaging students in discussions of ethical issues.

It accounts for the purpose of this study to investigate graduate students’ attitude to ethically marginal tactics in the negotiation process and to work out proposal for the micro-insertion module in negotiation ethics.

The research questions of the current investigation are:

- (1) What is the distribution of MBA students’ attitude to ethically marginal negotiation tactics?
- (2) What is the relation between number of years of students’ work experience and their attitude to ethically marginal negotiation tactics?

3. Method

Method of research. In order to investigate students’ attitude to ethically marginal negotiation tactics, we chose a quantitative research design – the formalized survey of participants. Approaching the students involved in the graduate business ethics and negotiations courses provided a first-hand account of what negotiation tactics they felt to be more or less ethically appropriate. Students were approached with the request to be questioned about their opinion during the class, they were given certain time to fill out the questionnaire without any interruption and control of the professor. The respondents received all necessary information about the purpose and procedure of the research, as well as their anonymity was guaranteed. The questionnaire was developed based on the literature study; it consisted of 16 questions divided into five groups according to 5 factors; the questions were presented in the mixed order to get truthful responses from the surveyed students. Each question had five-point value varying from the answer “not at all appropriate” (value – 1) to “very appropriate” (value – 5). The design of the questionnaire was adaptation of the SINS scale (“Self-reported Inappropriate Negotiation Strategy Scale”). (Robinson et al., 2000) Besides that, the current investigation studied also the practical application of the aforementioned SINS scale. (Lewicki & Robinson, 2004; Rivers et. al., 2003) The following factors were put forward: (1) traditional competitive bargaining; (2) attacking opponent’s network; (3) false promises; (4) misrepresentation; (5) inappropriate information gathering. The survey included statements (the statements and their mean value are depicted in the findings part of the present article). MBA students were asked also open-ended questions regarding their gender, age, nationality and work experience. The present analysis included just the latter indicator.

Population sampling. Once the research design was established, it was necessary to make a decision about the sampling unit (a unit of population chosen during the sampling process; the unit should contain one or more

elements describing the population). Participants of the survey were chosen according to the principle to include the international MBA students taking the courses in business ethics and negotiations in two private business schools in the study year of 2016/2017. This procedure can be described as a purposive sampling, i.e. single stage procedure where sampling unit contains only one element, namely, involvement in the classes of business ethics. (Smith & Albaum, 2012) Altogether 40 MBA students were surveyed.

Analysis techniques. The participants were asked to rate each negotiation tactic on a 5-point Likert scale, indicating how appropriate they believe each tactic was in negotiation (1 = not at all appropriate, 7 = very appropriate). The descriptive statistics were applied to calculate the means and standard deviations for the appropriateness of each group of factors (Table 1). The tactic means were ordered by the decreasing appropriateness accordingly. After that the comparative analysis of the results was performed. In order to answer the second research question, we made comparison between means for five factor SINS scales and the number years of work experience (Table 2).

Limitations of research. Reliability of data. The fact that only those students who were enrolled in courses on business ethics and negotiations were surveyed set some limitations for the research; namely, they already had some preliminary knowledge on the subject. The second factor to be mentioned is that only international MBA students were surveyed. This was done deliberately, since there is certain relation between years of work experience and attitude to the ethically marginal negotiation tactics, the result was influenced also by the respondents' nationality, but this correlation we will be investigated in the next research article. Despite these limitations, we think that our research was representative, it demonstrated prevailing tendencies. The obtained data can be employed (all respondents were first or second year business students) and it has exposed some tendencies that should be taken into account when designing the micro-insertion module "Negotiation Ethics".

4. Findings and discussion

After the respondents rated 16 negotiation tactics that were divided into 5 groups and presented in the mixed sequence, we compiled the table "Means and standard deviations for the five factor scales" (Table 1). The results were presented in the decreasing order – the higher the evaluation, the more positive attitude towards the negotiation tactic.

Table 1. Means and standard deviations for the five factor scales

Factor	Means	Standard Deviations
1. Traditional competitive bargaining	2,60	0,46
2. Misrepresentations	2,13	0,63
3. Inappropriate information gathering	2,02	0,15
4. False promises	1,82	0,14
5. Attacking opponent's network	1,57	0,43
All factors (16-item average)	2,03	0,38

Means are calculated from 5-point Likert-type scale, where 1=not at all appropriate, and 5=very appropriate

Examination of this table indicates that the highest mean (2,60) was assigned to the factor "Traditional competitive bargaining". It has to be noted that the standard deviations in factors in most cases are less than 0, 5, save the one of "Misrepresentation" (0,63). This makes it possible to conclude that differences among answers within each factor are insignificant. In the real life business situation, bargaining is always a competition among different parties, that involves presenting the initial offer, the procedure, then, finally, the outcome that is usually more or less favorable to one of the actors. But if, in the procedure complies with two basic conditions, that is, that each party has fair amount of information in its disposal and that all participants can freely enter and leave negotiations, the traditional competitive bargaining tactics are regarded as somewhat appropriate by the respondents. Among tactics the highest value in the scale of appropriateness is assigned to the one of making the opening demand far greater than the negotiator hopes to settle for in the end, whereas the lowest – to the tactic of undermining opponent's confidence in his/her ability to negotiate, and the standard deviation comes up to 0,46.

The second place in the rating takes the factor "Misrepresentation", the mean is 2,13 respectively. The students were presented 4 statements regarding the negotiation tactics. All proposed tactics here revolve around the negotiator's intention – be it misrepresentation of starting information, the nature of negotiations, the

progress of negotiation process, as well as denial of the validity of opponent's information on the negotiating party. However, the standard deviation of 0,63 demonstrates that there exists some inconsistency in valuation of appropriateness that could require our attention. Thus, the statement: "Intentionally represent the progress of negotiations to your constituency in order to make your own position to appear stronger" was rated at 2,77, while the statement "Intentionally misrepresent information to your opponent in order to strengthen your negotiation argument or position" exhibited the mean of 1,26. The possible explanation for that lies in the fact the MBA students feel the accountability to their constituency to be more important than the ensuring the fair negotiation process. It could be rather a short-term solution, since the disinformation of the stakeholders, if negotiations do not yield the expected result, can harm the company reputation and image.

The factor "Inappropriate information gathering" takes the third position with the mean of 2,02. This factor includes such tactics as (a) putting the time pressure upon the opponent; (b) the offer of personal favors that somewhat borders a bribery; (c) recruiting or hiring the opponent's teammate. The standard deviation regarding this factor is highly insignificant (0,15). Although the sample size (40 respondents) does not allow making broad generalizations, it still demonstrated the tendency, that the ethically marginal negotiation tactics are almost appropriate. Not to put any value judgement regarding these results, we would like to state that the class discussions within the micro-insertion module of negotiation ethics could make the reevaluation of the current position possible.

The fourth rated factor the one of the "False promises" (the mean of 1,82) exhibits the same characteristics as previous one, including the standard deviation of 0,14. This factor involves such tactics as (a) delivering false promises that would never be kept whatsoever; (b) offering the future concessions that would not occur; (c) guaranteeing that the respective constituency would uphold the settlement, though it would not be the case.

The lowest rated factor, the one of the "Attacking opponent's network" seems to require a special interest, since the mean of 1,57 differs from the higher valued factors. The can be explained by the formulation of the statements themselves, since their tone is straightforward aggressive and there is no doubt that employing them would inevitably lead to the ethical violations during the negotiation process. This factor includes such tactics as (a) attempting to get the opponent fired from his/her position; (b) threatening to make the opponent to look weak or foolish in front of his/her boss or constituency; (c) talking directly to people the opponent is accountable to in order to undermine their confidence in the existent negotiator. Whereas the standard deviation comes up to 0,43, that is explained by the students' high rating of the item (c) of this factor. The author of the present article cannot offer the comprehensive explanation for the fact that respondents rate as somewhat appropriate going behind the back of the opponent, in order get better opening position in negotiations at the moment. This aspect should be researched more deeply, possible by the means of the semi-structured interviews or focus group discussions.

The students were asked also a question about their previous work experience. Although the study "Extending and Testing Five Factor Model of Ethical and Unethical Bargaining Tactics: Introducing the SINS Scale" (Robinson et al., 2000) reports a negative strong correlation between work experience and the use of unethical negotiation tactics, namely, people with more general work experience are less apt to use marginally ethical tactics, our investigation didn't yield the conclusive results depicted. In other words, there is no a clear pattern. The results are depicted in the Table 2.

Table 2. Relation between the means for five factor scales and number of years of work experience

Factor	up to 3 years	4 – 6 years	7 – 10 years	11 years and more
Traditional competitive bargaining	2,35	2,90	3,0	2,70
Attacking opponent's network	1,59	1,60	1,43	2,30
False promises	1,90	1,90	1,10	2,30
Misrepresentations	2,16	2,30	1,50	2,75
Inappropriate information gathering	2,0	2,2	1,70	3,0
All factors (16-item average)	2,0	2,18	1,75	2,61

Means are calculated from 5-point Likert-type scale, where 1=not at all appropriate, and 5=very appropriate

All respondents were divided 4 groups according to the years of work experience: up to 3 years (17 students), 4 – 6 years (10 students), 7 – 10 years (8 students), 11 years and more (5 students) accordingly. These groups were juxtaposed with the means of each factor. All groups, except the one (11 years and more) rated the factor “Traditional competitive bargaining” as the most appropriate. All groups assigned the lowest rating to the factor “Attacking opponent’s network”. Analyzing the 16-item average means of all factors, we can see that the group of 11 years exhibit certain inconsistencies, thus, for example the factor of the information gathering is rated as the most appropriate, then follows the factor of misrepresentations and only after that – the traditional competitive bargaining. Besides that, the latter group demonstrated the inclination for using the unethical negotiation tactics. This could be explained by the fact, that the respondents were MBA students (the majority coming straight from the bachelor studies) and there were differences among number of respondents in each group that gave more weight to each answer of the respondents representing the most experienced group. Still, we believe that the results can serve as the background information in designing the micro-insertion course on negotiation ethics.

5. Results, conclusions and recommendations

The purpose of this study was to investigate the graduate students’ attitude to the ethically marginal tactics in the negotiation process and to work out proposal for the micro-insertion module in negotiation ethics. In order to attain this goal we carried through the survey of the MBA students. The data were collected using the five point Likert scale, the results were interpreted by the means of the descriptive statistics – the means and the standard deviations were calculated for the each factor. The theoretical background of this investigation consisted of three broad groups of literature, and they were the publications on: (1) negotiations; (2) ethics of negotiations; (3) teaching business ethics and negotiations. The questionnaire that consisted of 16 statements (items) regarding the marginal ethical tactics of negotiations, based on the SINS scale (“Self-reported Inappropriate Negotiation Strategy Scale” created by R. J. Robinson, R. J. Lewicki and E. M. Donahue). The population sample was the purposive one, the sample of convenience (MBA students involved in the courses of business ethics and negotiations). Two research questions were put forward: (1) What is the distribution of MBA students’ attitude to ethically marginal negotiation tactics? (2) What is the relation between number of years of students’ work experience and their attitude to ethically marginal negotiation tactics?

The answer to the first question goes as follows: the highest mean (2,60) was assigned to the factor “Traditional competitive bargaining”. It has to be noted that the standard deviations in factors in most cases are less than 0, 5, save the one of “Misrepresentation”. This makes it possible to conclude that differences among answers (items) within each factor are insignificant. The lowest rated factor, the one of the “Attacking opponent’s network” seems to require a special interest, since the mean of 1,57 differs from the higher valued factors. The can be explained by the formulation of the statements themselves, since their tone is straightforward aggressive and there is no doubt that employing them would inevitably lead to the ethical violations during the negotiation process.

The second research question regarded the relation between the tactical preferences and the number of years of work experience. To answer this question we divided all respondents into 4 groups: up to 3 years (17 students); 4 – 6 (10 students); 7 – 10 years (8 students); more than 11 years (5 students). The current research did not the strong negative correlation, as it would be expected according to the literature (the more years of experience, the less choice of unethical bargaining tactics). It did not show the clear patten. Partly this can be explained by the unequal number of respondents in each group, the explanation for this – the respondents were the MBA students with shorter or longer pauses in between the undergraduate and graduate studies.

Nevertheless, the results demonstrated a few tendencies: the higher regard for the traditional bargaining techniques and the lower – for the direct and open attacking the opponent’s network; the controversial issues (readiness to violate the ethical standards and procedures). All these factors can form the core structure of the proposed micro-insertion module “Negotiation ethics”. The advantage of the module proposed lies in the fact that it is the autonomous module that can be inserted in various MBA courses: marketing, management,

negotiations, business ethics, organizational psychology, economic diplomacy, culture diplomacy, etc. In the conclusion, the author of the present article puts forward the possible structure of such a course.

Module title: Negotiation ethics

Module type – Micro-insertion, cross disciplinary

Pre-requisite: None

Compatibles: Marketing, International marketing, Management, Business Ethics, Organizational Psychology, Human resource Management, Negotiations

Incompatibles: None

Number of academic hours: 6-8

Level: MBA (possibly also BBA)

Instruction form: lectures, seminars, group discussions, case studies, group and individual assignments

Form of testing: students' conference – presentations, discussions and answers to the questions

Description: This module is designed to provide course participants with the necessary conceptual tools to analyze ethical dilemmas and problematic situations that arise in the negotiating process in the business world. It will train and enhance students' skills in applying ethical reasoning to the real life situations related to negotiating. Students examine the core concepts, approaches, strategies and tactics. Through active participation in class work and individual and group assignments MBA students will improve their capacity of ethical analysis and critical evaluation of negotiation situation. In the end, students will participate in the study conference presenting their findings regarding negotiation ethics.

Learning outcomes:

1. Demonstrate a systematic understanding of relevant ethical principles and values
2. Apply ethical bargaining strategies in the business environment
3. Display a critical understanding of unethical bargaining practices
4. Apply certain ethical decision-making models

Themes to be covered during the course:

1. Theoretical framework of negotiation ethics – procedure, actors, different approaches.
2. Ethical dilemmas during negotiation process, problem- solving models
3. International and intercultural aspect of bargaining
4. Ethical/unethical bargaining tactics – application and analysis

A PLS-SEM of Factors Affecting the Sustainability of Music Programs within Thai Private Universities

Pannawit Sanitnarathorn

*Lecturer, Department of Music Business, School of Music, Assumption University of Thailand
Email: porr.ps@gmail.com*

Abstract

As indicated by the present aging population and fewer children situation, the number of Thai youngsters has been radically diminishing contrasted with the earlier decades and this prompts the insufficient number of students enlisting in the university level. It has influenced both public and private university however the second one has gotten a higher effect as Thai parents and children have a typical social esteem that graduating from the public university will get more pride and respect to the family. Programs in music have been popular in the recent year; however, for the private universities offering a degree in music is attempting to survive. This paper therefore investigated a multitude of factors both the direct and indirect factors affecting organizational sustainability of Thai private university's music programs. From the 280 Thai administrative members in the private universities surveyed and analyzed by use of a structural equation model by PLS-Graph software. This research also concluded that business strategies were not influenced directly through organizational sustainability but instead was indirectly influenced through organizational performance. The innovation process and innovative marketing affect potential competitiveness which in turn affects organizational sustainability. Strategies within the university must also be stated clearly, which also meets the needs of the learners with cost management being imperative as well. It was determined that organizational performance affects organizational sustainability to the greatest extent due to monetary and non-monetary factors with an intermediate input into innovation, the business environment and business strategies. Organizational performance is also influenced by innovation and business strategies.

Keywords: innovation, business environment, business strategies, organizational performance, organizational sustainability, SEM

1. Introduction

According to National Economic and Social Development Board of Thailand, in 1980 the number of school age children (< 21 years) represented 62.3 percent of the population but by 2040, this number will drop to 20 percent of the population. The reasons are varied and complex but the reality is many Thai universities are entering a period of where change and flexibility are becoming a matter of institutional sustainability. According to education officials, in 2015's admissions period, Thai universities had up to 156,216 spots open for prospective students. However, only 105,046 applied to take the entrance exams, leaving more than 50,000 places empty (MAA, 2016). If the trend continues, academics fear that some universities may be forced to close their doors.

According to the Office of the Prime Minister (2012), Thai fertility rates plunged from 6.3 from 1964-1965 to approximately 1.82 from 2000 - 2005, which is considered lower than the replacement level and it continued to decline to 1.62 in the 2005 -2010 period. The resultant change to Thailand's demographic structure has thus become a threat to sustainable economic and social development (and universities) with the aged population rapidly increasing, whereas the working-age population and school-aged children have been declining rapidly (Searchinger et al., 2013).

As noted above, in 2015 there was less number of students wishing to enter a university program as compared to the available seats. The future appears also bleak as student enrollment in primary and secondary schools also had 800,000 empty seats throughout the country (Sakworawit, 2016). Of the 170 Thai universities, the Rajabhat University system is the mostly likely candidate to face the crunch due to a trend shift in the majors chosen by students, with changes in the labour market having a large impact on non-scientific programs.

Further supporting data for the coming crisis in social science enrollment was seen in the 2015 as the number of participants who entered the national entrance exam dropped to 91,813 students with total availability at 151,000 seats (Numman, 2016). The knock-on effect will eventually be a decrease in graduate students and PhD candidates that are available for academic and research positions. This is already being played out in 2016 by the government's decision to spend 34.3 billion baht to produce 12,290 post-doctoral researchers to meet the development of 10 targeted industries (not the social sciences) and the concept of "Thailand 4.0", which focuses on technological development and innovation (Bangkok Post, 2016). In the 2016 plan, of the 1.07 billion baht earmarked for 300 scholarships, 60 scholarships are slated for ASEAN and six other countries.

According to statistics from the website of International Association of University Presidents of Thailand, among the top 100 university programs in 2015, music was not listed. The academic pursuit of music is always considered an optional choice by university students with most viewing music as a risky profession in terms of employment and income potential as compared to professions in medicine, engineering, or business.

Enrolments in Thai university music programs continue to drop and with the subsequent competition in both public and private institutions ever increasing, the standard of quality of students that become enrolled often times becomes suspect and can with time lead to lower standards and/or disqualified students. There also appears to be a relationship between whether a student pursues a music degree from either a public or private institution and how this is viewed by families and society (Chareonwongsak, 2016).

The bottom line is the competition for music students is fierce as enrolments have plummeted due to population demographics, more competitive foreign programs, and online courses which are often significantly lower campus attended tuition rates. Many Thai universities are struggling, particularly private ones, with financial concerns becoming first and foremost the greatest concern of university and program administrators. The ratio between lecturers and students is not in balance and especially, private universities which mainly rely on tuition fees of students. Therefore, some weak programs will need to be shut down in order to stabilise the organisational structure. It is a time to prepare for change in higher education. Things need to be done now to change the business of education before the corridors are empty and the music has stopped.

The researchers used a structural equation model (SEM) to develop and understand the music programs in Thai private universities and the variables affecting its sustainability within 74 registered private institutions nationwide. This research will focus on factors that affect sustainability of Thai private university's music programs. There are dramatic changes affected by the decreasing number of population and social value. Survival and to sustain in such a situation in the present circumstance is complicated and difficult and it leads to the main objective of this research.

2. Literature Review

2.1 Innovation

Birkinshaw et al. (2008) defined innovation as the creation and introduction and use of new and modern ideas, their processes, related structures and techniques which can further an organization's goals. According to Hamel (2006) company innovation can produce seismic shifts in industry leadership through management breakthroughs giving companies a potent advantage, whereas technology and product innovation tend to deliver limited small-caliber advantages. Put simply, management innovation changes how managers do what they do. This is consistent with the OECD (2005) 'Oslo Manual' which indicated the importance of management's strategic vision on the ability for an organization to learn. Further emphasis was placed on communications, information flow, skills transmission and the accumulation of knowledge, both within and outside the organization. Organizational innovation management (OIM) is another component which consists of the organization's culture and beliefs which need to be flexible, simple and uncomplicated, focused on decentralization with an ear tuned towards acknowledging the opinions of others which helps achieve continuous improvement (Wong and Chin, 2007). And finally, according to Schaltegger and Wagner (2011), sustainable entrepreneurs and sustainability managers are shaping markets and society through their innovation.

The literature review has thus led to the creation of the following two hypotheses:

H1: Innovation directly affects Organizational Sustainability

H2: Innovation directly affects Organizational Performance

2.2 Business Strategies

The Business strategy alludes to the instruments that organizations use to judge the competition in the business sector compared to its rivals (Meskendahl, 2010) which is the competitive strategy, business strategy, or corporate system, is the fabric of verbal and non-verbal communications in business setting the behavioural standards for the business long-term orientation (Johnson et al., 2011) In that capacity procedure ought to influence day by day activities however only or mostly those related to the organizations' expectations of its main activities on a more distant horizon (Porter, 1996) and expressed that a country's competitiveness relies on

upon the limit of its industry to innovate and update. The Balanced Scorecard (BSC) was created as a managerial device to support the introduction of successful organizational strategies, while also helping with the monitoring of organizational performance against strategic goals (Kaplan, R.S. and Norton, 1992). The BSC's four perspectives are: financial, customer, the internal process, and the learning and growth perspective (Figge et al., 2002). The BSC has been adapted into what is called the 'Sustainability Balanced Scorecard' (SBSC) which was created to help overcome limitations with use of the BSC in areas such as environmental and social management systems. According to Figge et al. (2002) there are three key elements of sustainability which include economic, environmental and social.

The literature review has thus led to the creation of the following two hypotheses:

H3: Business Strategy directly affects Organizational Performance

H4: Business Strategy directly affects Organizational Sustainability

2.3 Business Environment

According to Jiao et al. (2011) discussed emerging markets while using the resource-based view and determined that sustainability within the business environment was critically linked to flexibility. Lewin et al. (1999) posited that environmental aspects such as environmental dynamism and competitiveness moderate the relationship between both types of innovation and performance. They also indicated that organizational units operating in more dynamic environments increase their financial performance by pursuing exploratory innovations.

The literature review has thus led to the creation of the following hypothesis:

H5: Business Environment directly affects Organizational Performance

2.4 Organizational Performance

De Waal (2007) focused on the distinguishing variables that decide the consistent achievement of a high performance organization and according to a broad review of the study which included non-financial performance, better financial performance, and sustained growth compared to long-term orientation and over five year's better results. Kaplan and Norton (1992) changed traditional concept of organizational performance measurements with the balanced scorecard. The balanced scorecard indicates that if organizations wish to increase their successful performance they must adhere to the three main ideas of sustainable development which includes economic, environmental and social. Also, according to Figge et al. (2002), sustainability management need not be concerned with economic crises if they are economically solid.

The literature review has thus led to the creation of the following hypothesis:

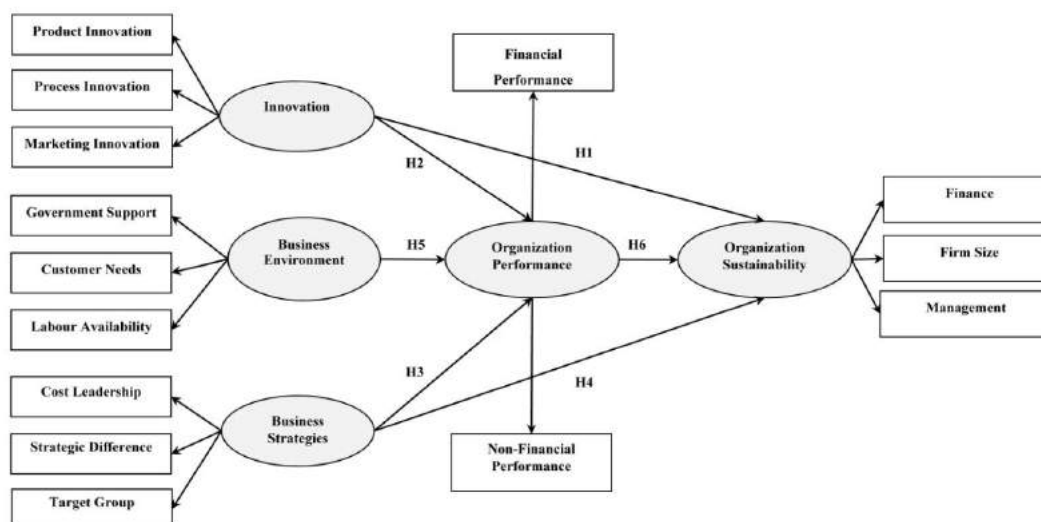

H6: Organizational Performance has a direct effect on Organizational Sustainability

2.5 Organizational Sustainability

Organizational sustainability has been contended to be an essential objective or goal every firm must set. It was expressed to be almost the top of the management plan and it reflects strategic planning and financial results of the organization (Rothwell, 2010). Bertels et al. (2010) reported that a UN study of global CEOs indicated that 93 percent viewed survival as crucial for their firm's success and furthermore indicated from their own report that the key importance to corporate sustainability was organizational culture. Epstein et al. (2014) added that enterprise sustainability depends on the daily effect that a firm has on society, the surrounding environment and the financial impact of the local community.

Figure 1. Conceptual Framework

3. Methodology

The research focuses on the factors affecting the sustainability of private university's music programs in Thailand. The population in this study is 280 administrative members within the total 74 private universities and colleges in Thailand which have been registered and licensed by the Office of the Higher Education Commission of Thailand.

3.1 Data Collection

It is suggested a 15:1 to 20:1 subject-to-variable ratio as a rule of thumb can be used structural equation modelling (Schumacker and Lomax, 2010; Worthington and Whittaker, 2006; Cunningham, 2008; Weston and Gore, 2006; Meldrum, 2010). As the study had 14 variables, a 20:1 ratio was used to determine the sample size of 280 which was selected by multi-stage random sampling, with the population divided into six regions distributed throughout Thailand, selected in proportion to the population of each group within each region.

3.2 Measurement

Samples used for the study included 280 executives and administrators randomly sampled from 6 regions in Thailand. To gauge both content validity and reliability of the survey, 5 experts consisting of scholars and industry executives were chosen to evaluate the consistency of the content and confirm it was valid for the purposes of the research. Additionally, Rovinelli and Hambleton (1977) developed the Item-Objective Congruence (IOC) which was used to carry out the screening of the survey questions.

3.3 Variables

3.3.1 Dependent variable

Organizational Sustainability (Sustain) was analyzed by use of a 7-Point Likert Scale (Likert, 1932) which measured Finance, Firm Size, and Management (Management).

3.3.2 Intermediate variables

Organizational Performance was analyzed by use of a 7-Point Likert Scale (Likert, 1932) which measured Financial Performance (FinanPer) and Non-Financial Performance (Nonfinan).

3.3.3 Independent variables

Innovation (Innovation) was analyzed by use of a 7-Point Likert Scale (Likert, 1932) which measured Product Innovation (Prod_in), Process Innovation (Proc_in) and Marketing Innovation (Market_in).

Business Environment (Bus_envi) was analyzed by use of a 7-Point Likert Scale (Likert, 1932) which measured Government Support (Govern), Customer Needs (Customer) and Labour Availability (Labour).

Business Strategies (Strategy) was analyzed by use of a 7-Point Likert Scale (Likert, 1932) which measured Cost Leadership Strategy (Cost), Strategic Difference (Different) and Target Group (Target_group).

4. Analysis and Results

Henseler et al. (2014) indicated that PLS is an important statistical tool for research. PLS-Graph software was used to discover the causal relationships of the structural equation model (SEM) as presented in Figure 2 (Piriyakul, 2011). This involved defining the observed or manifest variables with the latent variables, which were then analyzed for their accuracy and reliability of the measurement.

Measurement results showed that the mean correlation was reliable ranging from 0.725 to 0.856. All values had statistical significance (Table 1) by ($|t| \geq 1.96$) (Lauro and Vinzi, 2004; Henseler et al., 2009).

In Table 3 discriminant validity and the scale reliability were analyzed from Composite Reliability (CR) as well as the Average Variance Extracted (AVE). The CR value should be maintained above 0.60 while the AVE values be lower than 0.50. Additionally, the coefficient of determination (R^2) value should always exceed 0.20 (Lauro and Vinzi, 2004; Henseler and Fassott, 2010).

Table 1. Convergent validity of the latent variables

Construct/Item		Loading	t-stat
Organizational Sustainability (Sustain)			
Finance	Finance	0.8531	42.6629
Manage	Management	0.8870	55.0902
Size	Organizational Size	0.8643	46.8357
Organizational Performance (Performance)			
FinanPer	Financial Performance	0.9078	77.4380
Nonfinan	Non-Financial Performance	0.9031	77.5605
Innovation (Innovation)			
Prod_in	Product Innovation	0.8721	44.6352
Proc_in	Process Innovation	0.9011	51.0742
Market_in	Marketing Innovation	0.9224	96.8576
Business Environment (Bus_envi)			
Govern	Government Support	0.9321	93.1261
Customer	Customer Needs	0.9572	117.8708
Labour	Labour Availability	0.9256	101.5733
Business Strategies (Strategy)			
Cost	Cost Leadership Strategy	0.9351	95.3369
Different	Strategic Difference	0.9551	121.4790
Target_group	Target Group	0.9391	125.1222

Organizational Sustainability (Sustain) was determined to be affected by Finance (Finance), Management (Manage), and Organizational Size (Size) which had a confidence level of 95% ($|t| \geq 1.96$). These variables have a direct positive influence on *Organizational Sustainability* (Sustain) (Figure 2).

Business Environment (Bus_envi) was determined to be affected by Government Support (Govern), Customer Needs (Customer), and Labour Availability (Labour) which had a confidence level of 95% ($|t| \geq 1.96$). These variables have a direct positive influence on *Business Environment* (Bus_envi) (Table 3 and Figure 2).

Business Strategies (Strategy) was determined to be affected by Cost Leadership Strategy (Cost), Strategic difference (Different), and Target Group (Target_group) which had a confidence level of 95% ($|t| \geq 1.96$). These variables have a direct positive influence on *Business Strategies* (Strategy) (Table 3 and Figure 2).

Organizational Performance (Performance) was determined to be affected by Financial Performance (FinanPer), and Non-Financial Performance (Nonfinan) which had a confidence level of 95% ($|t| \geq 1.96$). These variables have a direct positive influence on *Organizational Performance* (Performance) (Table 3 and Figure 2).

Innovation (Innovation) was determined to be affected by Product Innovation (Prod_in), Process Innovation (Proc_in), and Marketing Innovation (Market_in) which had a confidence level of 95% ($|t| \geq 1.96$). These variables have a direct positive influence on *Innovation* (Innovation) (Table 3 and Figure 2).

Table 2 shows factor analysis results affecting Thai private university’s music programs’ sustainability with composite reliability in Table 2 greater than 0.60 with the AEV values also greater than 0.50. Coefficient of determination (R^2) values are also higher than 0.20, representing the reliability of the measurement (Lauro and Vinzi, 2004; Henseler et. al., 2009). Reliable measurements can be found in the column of interest which is higher than the cross construct correlation values in the same column.

Results from the analysis of structural equation modelling of the sustainability of Thai private university’s music programs is shown in Figure 2 and Table 3.

Table 2. Statistics showing the discriminant validity

Construct	CR	R ²	AVE	cross construct correlation				
				I.	B.E.	B.S.	O.P.	O.S
Innovation (I)	0.926		0.808	0.899				
Business Environment (B.E.)	0.957		0.881	0.801	0.939			
Business Strategies (B.S.)	0.960		0.890	0.742	0.882	0.943		
Organizational Performance (O.P.)	0.901	0.8235	0.820	0.828	0.833	0.862	0.906	
Organizational Sustainability (O.S.)	0.902	0.6201	0.754	0.701	0.723	0.702	0.780	0.868

Figure 2. Final Model

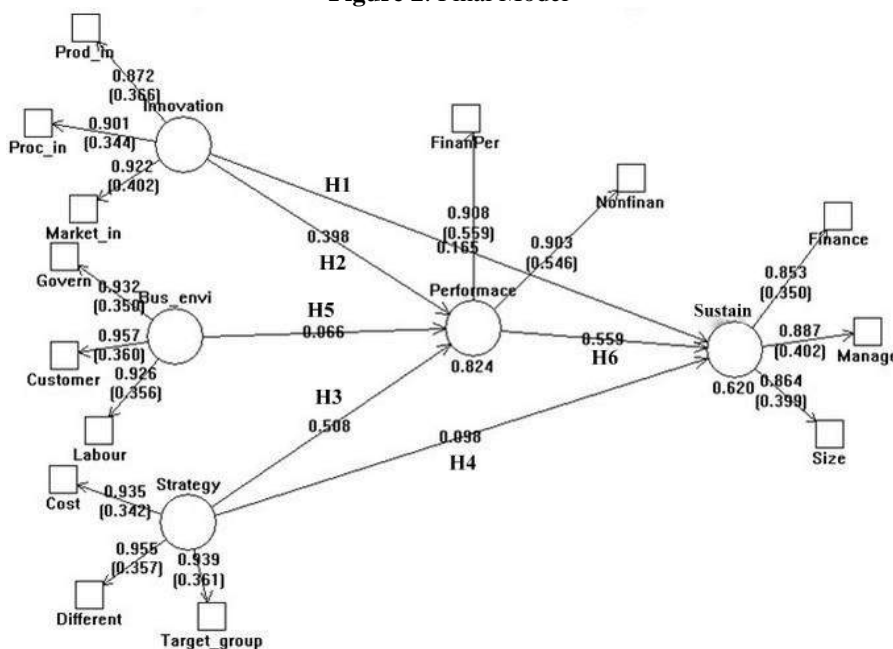

Table 3. Results of hypotheses testing

Hypotheses	coef.	t-stat ¹	Results
H1: <i>Innovation directly affects Organizational Sustainability</i>	0.165	2.0906	Supported
H2: <i>Innovation directly affects Organizational Performance</i>	0.398	9.4282	Supported
H3: <i>Business Strategy directly affects Organizational Performance</i>	0.508	7.7875	Supported
H4: <i>Business Strategy directly affects Organizational Sustainability</i>	0.098	1.1393	Not Supported
H5: <i>Business Environment directly affects Organizational Performance</i>	0.066	.9106	Not Supported
H6: <i>Organizational Performance directly affects Organizational Sustainability</i>	0.559	5.1254	Supported

¹ |t| ≥ 1.96, means significance at $p \leq 0.05$.

Influence of each of the variables that affect organizational sustainability of Thai private university's music programs is shown in Table 4 below.

Table 4. Direct and indirect effects of the independent variables

Dependent Variable	R ²	Effect	Independent Variables			
			Innovation	Business Environment	Business Strategies	Organizational Performance
Organizational Performance	0.824	Direct Effect	0.398	0.066	0.508	N/A
		Indirect Effect	0.000	0.000	0.000	N/A
		Total Effect	0.398	0.066	0.508	N/A
Organizational Sustainability	0.620	Direct Effect	0.165	0.000	0.098	0.559
		Indirect Effect	0.222	0.037	0.284	0.000
		Total Effect	0.387	0.037	0.382	0.559

From Table 2, it was found that the variables that influence organizational sustainability the most are innovation, business strategy and business environment, in which the three variables are influenced by variations in organizational performance.

5. Discussion and Conclusion

Research concluded that organizational performance *directly affects* organizational sustainability to the greatest extent due to monetary and non-monetary factors. It also has an intermediate input into innovation, the business environment and business strategies. Cohen (2014) has indicated that the transition to sustainability is an impetus for an enterprise to embrace innovation and change. Epstein et Al. (2014) nine principles of sustainability included the idea that organizations must focus on environmental protection and promote sustainable development with products, processes, and services.

This research also concluded that business strategies were not influenced directly through organizational sustainability but instead was indirectly influenced through organizational performance. The innovation process and innovative marketing affect potential competitiveness which in turn affects organizational sustainability. Management of the enterprises must be perceived as creating and producing innovative products.

Organizational strategies must also be stated clearly, which also meets the needs of the learners with cost management being imperative as well. It was also discovered that *business strategies* are aligned with organizational *innovation* which therefore affects *organizational performance* leading to *organizational*

sustainability. Within the *business environment* there must also be governmental support and each enterprise has the ability to reduce the negative impact of the *business environment* if they develop an ability to determine their own destiny and success when the *business environment* changes.

Educational Paradoxes as a Part of Field Didactics of Citizenship Education

Tomáš HUBÁLEK¹

¹ Assistant Professor, Palacky University, Faculty of Education, Department of Social Sciences
Email: tomas.hubalek@upol.cz

Abstract

There is a whole range of factors influencing the educational process. Educational paradoxes belong undoubtedly among the phenomena of educational reality that affect both the formal and the informal curriculum. We perceive those paradoxes as a part of the educational process that has been not much discussed by experts and the professionals in pedagogical field are not sufficiently informed about them. At present, we face antinomy because the paradoxes of education can be identified in the educational practice, but there is a lack of further work with the results of scientific analyses and there is no feedback given to the teachers. Our study mainly deals with the educational paradoxes that directly affect the field didactics of social sciences. The paper presents the decomposition of the educational paradoxes into the elementary parts, which are analysed from the perspective of two subjects: Citizenship Education and Social Sciences, on the basis of the current national researchers and international connotations. The aim of the article is to summarize the approaches to the research of educational paradoxes, both from general and Citizenship Education point of view, and open discussion on further development of pedagogical research in this field. Individual paradoxes will be described in more detail, including basal implications in educational practice. We want to contribute to a more structured systematization of educational paradoxes topic in the field didactics of social sciences and to frame the whole problematics of social sciences didactics by the introduction of the realized researches, because it is relatively new in the Czech Republic. Another positive implication of the study is the enrichment of the teacher's portfolio with the knowledge mentioned in the text which can improve his / her profession.

Keywords: pedagogy, educational paradoxes, field didactics, citizenship education

Introduction

This text refers to a theoretical outline of the issue, which is even more wide and related quite specifically to the educational process. However, the literature still does not cover the so-called educational paradoxes and their theoretical or practical characterization.

In the last years, there has been a gradual establishment of the field didactics as the independent scientific disciplines in the Czech Republic. It is proved by the intense publishing activity in scientific journals, but also by the establishment of the Commission for the Field Didactics under the Accreditation Commission of the Czech Republic at the beginning of the second decade of the 21st century (it is necessary to specify that the aim of the commission was primarily to “*take care of the quality of the university education*” and to “*evaluate the activities of universities and the quality of accredited activities*.”¹ The Accreditation Commission of the Czech Republic formally ceased to exist on 31st of August, 2016 and its successor, the National Accreditation Office for Higher Education was established.

However, not all the field didactics clearly define their subject and professional interest. The situation may seem clearer for science-oriented subjects (e.g. mathematics, chemistry, physics), where can be found the first attempts to analyse the content of individual field didactics. Unfortunately, for social sciences, the attempts to constitute the erudite specifics of the field didactics seem more difficult. In the context of the Czech Republic, the field didactics of social sciences is the most complicated.

Social sciences also have different forms of the educational system curriculum for different types of schools (classification ISCED-F 2013 and education level 2, 3). However, the main difficulties are in their multidisciplinary, because they include knowledge from the major humanities disciplines. The problem of the more difficult scientific framing of the social science didactics can then be reflected in the practical level of the educational reality - instead of an attractive and modern teaching, larger amounts of knowledge are transferred from the teacher to the pupil without verifying of the complete content learning and understanding. The situation is also complicated by the professional discussion on differentiation and content concretization of the subject and field didactics².

Our article aims to contribute to the stabilization of the field didactics of social sciences by presenting one of the possible issues as a challenge to more detailed pedagogical research in this field. This theme or challenge are the so-called paradoxes of the education in the field didactics of social sciences. In the following passages, we want to briefly present the genesis of the current research in the Czech Republic and the theoretical basis of the problem.

1. Paradoxes in the Educational Process

Generally, educational paradoxes have been discussed by e.g. R. Palouš in his monography. His work could be thematically classified as a theory of philosophical education (according to the classification of J. Průcha³). Palouš considers totally 10 areas that influence the pedagogical theory and practice of current reality⁴:

- a) Inspiration and topicality of Comenius
- b) Paradoxes in the moral education
- c) The eco-harmony
- d) The „location“ paradox
- e) The importance of authority
- f) Knowledge and education
- g) The role of the universities
- h) The educational absurdity
- i) Truthfulness
- j) Geronto-pedagogy

¹ see <https://www.akreditacnikomise.cz/cs/>.

² The theme is more discussed in T. Janík, I. Stuchlíková (2010, 2015), T. Janík (2013), Z. Beneš (2013), A. Staněk (2013, 2015) etc.

⁴ The author's classification corresponds to the each chapter of Palouš publication, but the names of the points are a reflection of the contents of each chapter rather than a literally taken text.

Palouš takes a very close look at the interaction between the educator and the educated, and in this context he mentions the role of the teacher in relation to the pupils, that should : *"release the pupil from the curse of his/her prejudices, of a false self that does not have a notion about being in the falsehood."*⁵

There is space for a few questions in this point. When we accept the thesis that a teacher as a personality is a professional but cannot be infallible, then the logical implication of the proposition predicts the conclusion that the educational process cannot avoid the situation that may not be desirable from the official curriculum perspective. However, as we discuss later, it is not possible to perceive all the paradoxes in a purely negative connotation. On the contrary, some of them may encourage teachers e. g. to extend their qualifications, to analyse their performance in more detail, or to develop deeper understanding of their pupils.

For example, the democratic system is characterized by the free elections, which are repeated at a certain period. The teacher, in accordance with the curriculum, supports the idea of democracy and participation in the electoral act in the lessons. However, what if he decides to be active in this process and becomes either a sympathizer or a party nominee for a particular function. Is this fact going to affect his/her pedagogical work

Under the influence of our pedagogical professionalism, we can argue that the teacher must separate his/her potential public activities from the work in the classroom. Thus, a good teacher does certainly not have an intentional influence on the class from this point of view. But how is it with the unintended action?

No matter if the answer of the individual teachers, who find themselves in a similar situation, is positive or negative, the scientists who try to define this reality, suddenly face a paradoxical paradox, because it is difficult to verify such a statement empirically. The problem is not so much in the field of research methodology, but in the potential of authenticity of the respondents' answers. Are we able to get a reflection of reality or a subjective assessment of this reality from the perspective of the educational process actors?

A. Staněk suggests in his work that the degree of reflection and the perception of the educational paradoxes presence changes in relation to the length of the teachers' practice. Therefore, it can be assumed that the longer the teacher works in his professional field, the better he/she is prepared to manage the educational paradoxes. However, we cannot accept this premise globally without any comments. The following part of the article therefore focuses on more specific issues of the paradoxes.

Educational Paradoxes in the Citizenship Education

The previous part of the article mentions one of the possible general classifications of the educational paradoxes. Now we would like to present one of the outputs from an empirical survey that has already been realized in a certain area of teaching - in the citizenship education.

The educational paradoxes in the citizenship education represent a current and innovative topic from the perspective of social science didactics. It is connected to the requirement of ensuring a successful result of the educational process for all its actors. The problems of the educational paradoxes are more or less constantly confronted by the educators who are professionally focused on the citizenship education (Civics, Basis of Social Sciences).

⁵Palouš, 2009, p. 89.

⁶The question is not academic, because the expected answer would be obvious. We look for a real reflection of the reality. Moreover, this example is only illustrative and simplified, but it points out the principle of this issue.

During the process of “prejudice release⁷”, these teachers should not substitute one phenomenon by other one, which is not quite desirable as well. In other words, they should not force the pupils to look at the outside world through their optics, they should not persuade them of the correctness of their own worldview, but they should lead the pupils to the active democratic citizenship, active participation and social engagement⁸.

A. Staněk names and characterizes nine paradoxes of the citizenship education in his habilitation thesis⁹:

- a) Doubts – reflect the teacher’s uncertainty: how much is he entitled to impose his concept of life on others and how much he knows enough to know what is good, what is true, and whether he understands the right educational aims and pedagogical ideals.
- b) Helplessness of the powerful one – reflects the teacher's conflict of a real power and the helplessness of education, the risk concealed in education as a powerful instrument of ideological indoctrination, and finally the perception of education as a helpless instrument of the non-transferable life experience of the teacher.
- c) A conflict of an ideal and reality - This educational paradox describes the educational process during which the teacher reveals the contrast between the ideal and the actual state of the described phenomena before his pupils.
- d) A socialized individualist - this paradox conceals the latent contradiction that must be overcome by a teacher in the educational process. He/she must concern both the general cultural patterns of behaviour that are socially desirable and the development of his/her pupils’ uniqueness and individuality.
- e) Enslavement - the educational paradox puts the teacher in front of the antithesis of education for the occupation and education for the humanity, which means the contradiction between the general and professional education.
- f) A change of the unchangeable – there is the teacher's uncertainty again hidden in the educational paradox in finding the answer to the question whether his/her educational activity is not against the nature itself, whether he/she is doing everything possible to cultivate student humanity.
- g) Social – the merit of this educational paradox lies in the teacher’s confrontation of the openness on one side, which awakens the tendency towards social, cultural and ethnic closeness on the other side.
- h) Acceleration - in connection with this educational paradox, the teacher realizes how the information explosion, which is characteristic for the 20th and early 21st century, has accelerated the development of knowledge but also has caused its fragmentation.
- i) School pseudo-democracy - the teacher is confronted in this context with a reality, where the lack of clear rules in the process of the school practice democratization significantly limits the personal responsibility and responsibility of the pupils for participating in this process. Finally, there is no forming of liberal democracy, but some forms of pseudo-democracy called defective democracy.

⁷ See R. Palouš in the previous part.

⁸In more detail see Staněk, A., Habilitation thesis, Pdf UP, 2012.

⁹Ibid., p. 32-33.

Conclusion

According to the current researches, the teachers are aware of the educational paradoxes presence of different intensity in their practice, which is the necessary condition for dealing with them (the awareness of the problem or the presence of a particular paradox). However, some teachers underestimate or overestimate these risks, which can also negatively influence the teaching of citizenship education (most of the teachers underestimate or feel insecure about the possibility to transfer their own opinions to the pupils and students.)

It is a remarkable fact that the current market of professional pedagogical literature is saturated with manuals for novice teachers describing the specifics and difficulties of the educational reality. However, the issue of the educational paradoxes in teaching is covered only in minimum of this quantum, although the novice teacher is threatened by the presence of paradoxes in his teaching the most (as we have already pointed out). We therefore see the urgent need to stimulate a discussion on this issue among the pedagogical professionals and the public to and to draw the attention to other phenomena that influence the educational practice.

Didactics of the Social Sciences and Methodology of the Educational Paradoxes Research

Antonín STANĚK¹

¹ Associate Professor, Palacky University, Faculty of Education, Department of Social Sciences

Email: Antonin.stanek@upol.cz

Abstract

The aim of the scientific study is to present one of the possible approaches to a methodologically sophisticated empirical research in didactics of social sciences on the example of a specific pedagogical survey with a subject-didactical impact. The didactics of social sciences as a scientific discipline uses scientific research methods to create not only scientific knowledge reflecting objective reality, but also to use the principles of our thinking to correctly explain and purposefully transform the given, objectively existing reality. In this context, the need for high-quality methodologically sophisticated empirical research appears as a prerequisite. The insufficient methodological sophistication of many surveys of academic institutions in the Czech Republic causes a major problem for the further development of didactics of social sciences. The current challenge for academic institutions developing the didactics of social sciences in the Czech Republic is to look for ways to improve and expand the themes of field-didactical research and to improve their methodological basis. Only high-quality research, which is sufficiently methodologically prepared, has a chance to compete with others and extend the knowledge of the realization of the educational process through social science subjects. We attempt to contribute to the discussion on possible approaches to empirical research in didactics of social sciences by describing the methodology of a specific survey of our study focused on examining the reflection of educational paradoxes by teachers of Civics. In addition to traditional areas such as the theoretical background of research, definition of the research problem, the formulation of research hypotheses and the definition of terms, we emphasize the choice of research methods and techniques, especially the Statistical Implicative Analysis (SIA), including its Cohesive Hierarchical Implicative Classification (CHIC). In the conclusion of the study we explain why the use of Statistical Implicative Analysis (SIA) is perceived as an innovative work with high potential for future research projects in the field of interpreting research data of empirical research focused on social sciences.

Keywords: Cohesive Hierarchical Implicative Classification, didactics of social sciences, subject didactics, pedagogy, Statistical Implicative Analysis, educational paradoxes.

Introduction

The current challenge for academic institutions developing the didactics of social sciences in the Czech Republic is to look for the ways to improve and expand the themes of field-didactical research and to improve their methodological basis. Only high-quality research, which is sufficiently methodologically prepared, has a chance to compete with others and extend the knowledge of the realization of the educational process through social science subjects.

We attempt to contribute to the discussion on possible approaches to empirical research in didactics of social sciences by describing the methodology of a specific survey of our study focused on examining the reflection of educational paradoxes by the teachers of civics. In addition to traditional areas such as the theoretical background of research, definition of the research problem, the formulation of research hypotheses and the definition of terms, we emphasize the choice of research methods and techniques, especially the Statistical Implicative Analysis (SIA), including its Cohesive Hierarchical Implicative Classification (CHIC). The aim of the scientific study is to present one of the possible approaches to a methodologically sophisticated empirical research in the didactics of social sciences on the example of a specific pedagogical survey with a field-didactical impact.

In the conclusion of the study we explain why the use of Statistical Implicative Analysis (SIA) is perceived as an innovative work with high potential for the future research projects in the field of interpreting research data of empirical research focused on social sciences.

1) Theoretical definition and characterization of the research field

From the social sciences didactics perspective, the educational paradoxes in the citizenship education represent a topical and innovative issue¹. It is related to the need to ensure the successful result of the educational efforts of all the participants in the lessons of Civics and the basis of social sciences. Before, The teachers, especially of civic education and basis of social sciences, have to face the problem of educational paradoxes every day. It is necessary for them to show the world in the right colors to the pupils in the classroom without distorting the reality or slipping into the ideological indoctrination and also without forcing their personal vision of the world. Nevertheless, the teachers should be able to prepare their pupils for deliberate, active and democratic citizen life and active citizen participation in the democratic society.

The following text wants to present the key outcomes of the research on the teachers' reflection of educational paradoxes of selected social science subjects in the Olomouc region and to illustrate the benefits of the applied methodology.

It is a fact that our research has a regional character and we generalize its results only in the Olomouc region and not in the whole of the Czech Republic. We limited the selection of respondents to the Olomouc Region, because Palacký University represents a significant catchment area for the selection of potential students but also their subsequent use of the skills in practice. It is also the region where most of the future teachers of Palacký University have their compulsory practice.

Our aim was to identify the degree of familiarity of the pedagogical public with the pedagogical paradox phenomenon as a reason for reducing the effectiveness of the educational process (see Staněk 2009, p. 80).

In the process of considering the extent of the problem we have realized that that there is a large number of variables which can intervene to a greater or lesser extent in solving the problem. That is why we have chosen to focus on three influences in our research from this broad spectrum: the length of pedagogical practice, the qualification of the teacher and the type of school.

¹ See Palouš, R. 2009, Staněk, A. 2012, Hubálek, T. 2016.

Regarding the length of pedagogical practice, we can assume that in the first three years of the novice teacher stage, the intensity of the educational paradoxes reflection is not significant and the influence of the educational paradoxes is underestimated by the teachers. At the mid-stage of the teacher's professional identity construction (between 4-7 years of his teaching practice) we can assume that progressive teachers² perceive the risks of educational paradoxes more intensely than pessimistic teachers³. It is related to the fact that this group of teachers has not undertaken a fundamental turn in the relationship between the subject (the teacher) - object (the pupil) and rather focuses on his/her subjective problems while pupil stays aside of their pedagogical and professional considerations. It is interesting to observe the intensity of the educational paradoxes reflection in relation to the increasing length of the pedagogical practice, i. e. the teachers with 8-10 years of practical experience and those with more than ten years of experience. Can this long practice negate the teacher's alertness and bring him/her to a stage where, in view of his professional identity, the risks associated with educational paradoxes will be overlooked or flouted?

In relation to the teacher's qualification, we can assume that the qualified teachers - those who have a degree in basis of social sciences or major in civic education – do not differ from teachers without qualification in the reflection of the risks of educational paradoxes. Both groups of teachers perceive the risks of educational paradoxes with equal difficulties. The certificated teachers are guided by their social sciences specialization, non-certificated teachers by their life experience or instinct.

Regarding the type of the school, we consider that the risks of educational paradoxes in relation to education for citizenship are experienced the most by the teachers at grammar schools, followed by teachers at secondary vocational schools and vocational schools. These risks are perceived the least by teachers at primary schools. Our statements at this stage are based on these arguments. The teachers at grammar schools, secondary vocational schools and vocational schools have to overcome the significant influences of pupils' misconceptions (preconceptions) combined with a strong inclination of pupils to criticize mainstream social views. During the process of transformation of the relevant social science content into the forms that are pedagogically efficient and at the same time acceptable to the pupils' abilities (in the process of forming the didactic content knowledge), these teachers get more aware than others of the risks that are hidden in the educational paradoxes.

2) Formulation of research hypotheses, basic set and selection

We assume that the teachers' qualification to teach selected social science subjects does not affect the teachers' reflection of the educational paradoxes. We have formulated a research hypothesis for our empirical survey.

H1 „The teachers qualified to teach selected social science subjects perceive the risks of educational paradoxes in their teaching more intensely than the teachers without this competence“,

² Progressive teacher has decided to develop his/her professional competencies after the novice teacher's phase and slowly turns his sight away from himself and his problems to the pupils and their needs. (Staněk 2010, p. 108).

³ Although the pessimistic teacher has decided to stay in the teacher's profession after the novice phase, he resigned to the fundamental changes and transformations of his/her professional identity, especially to his/her need for the professional social science specialization (Staněk 2010, p. 108).

which will be subsequently verified. For the purpose of verifying our premises, we have formulated zero (H₀) and alternative (H_{alt}.) hypotheses:

H₀: The qualification of the teachers to teach selected social science subjects has no effect on the teachers' reflection of the educational paradoxes.

H_{alt}.: There is at least one case where the qualification of the teachers to teach selected social science subjects affects the teachers' reflection of the educational paradoxes.

It is necessary to define a basic set to make the research successful and credible. We have considered all the teachers of civic education, respectively the foundations of social sciences at elementary schools, grammar schools and secondary vocational schools and vocational schools as suitable for our research. However, from the very beginning it turned out that its exact definition would not be easy at all, and so we had to proceed to its more detailed definition (characteristics).

The basic set for our research has been consisted of:

teachers teaching civic education, respectively the basics of social sciences at primary and secondary schools in the Olomouc Region in the school year 2011/2012. There were a total of 426 primary and secondary schools in the Olomouc Region including 328 primary schools (77%), 19 grammar schools (4.5%) and 79 secondary vocational schools and vocational schools (18.5%). Based on these facts, we have determined the size of the sample of teachers to 150 including 105 teachers from primary schools, 15 teachers from grammar schools and 30 teachers from secondary vocational schools and vocational schools. After returning all the questionnaires, the reality has been like this:

Total of 103 questionnaires have been returned from teachers of primary schools, grammar schools, secondary vocational schools and schools in the following structure:

57 teachers from the primary schools (55 %),

29 teachers from the grammar schools (28 %),

17 teachers from secondary vocational schools and vocational schools (17 %).

From the above mentioned overview is clear, that we have used the method of random sampling. With regard to the interconnection of data collection with schools organizing the practice of future teachers and the teachers who led students during their practice, we could also refer to so-called method of purposive sampling. Due to the real return of the questionnaires, it has been not possible to guarantee the same probability of selection for each element of the core set. We are aware of these facts and take them into consideration when formulating the conclusions of our research. However, we are convinced that with regard to the objectives of our research, the sample selection has not significantly affect the final results and it is possible to continue the work with them⁴.

68.6% of respondents from the research sample have corresponded to the definition of "the teacher qualified to teach selected social sciences". Other 31.4% of respondents have been identified as non-qualified.

⁴ The definition of the basic set or the acquisition of the choice (if the basic set is very large or too complicated for the researcher) is the stumbling block of most empirical researches of pedagogical phenomena, not only in didactics of social sciences.

3) Choice of research methods and techniques

For our research, we have chosen a relatively often used research design in the social sciences - the exploratory method (see Pelikán 2007, p. 103). We have chosen a questionnaire from the techniques offered by this approach. The questionnaire itself has consisted of 23 questions. Eighteen of them have been focused on their own research and have had a closed parametric character. The five remaining questions have been auxiliary (identifying questions) that have helped us to get information about the respondents. These questions are closed, non-parametric. The choice of these types of questions has been also purposeful. Although the closed questions do not allow the respondent the freedom to answer, they have enabled us to make a statistical processing of these answers.

We processed the data by mathematical and statistical approach⁵ using nonparametric statistical methods⁶ that were used with respect to the fact that we did not expect a normal distribution. In addition to previous analyses, we decided to process the empirical data obtained from our questionnaire survey through a statistical analysis of implication by R. Gras⁷. This method is not commonly used in the social sciences including pedagogy⁸.

Our aim was to identify possible implicit relationships between individual assertions based on respondents' answers. That is why we have focused our attention on the eighteen statements submitted to the respondents in the questionnaire for the research of The Perception of the Educational Paradoxes. Individual statements are variables (variable 1 to variable 18). Other variables, such as respondents' gender, length of practice, etc., have already been used only as auxiliary variables. Before describing and interpreting the results of the Statistical Implications Analysis (SIA) in the data of our questionnaire survey, we briefly describe the nature of this method, including its Cohesive Hierarchical Implicative Classification (CHIC).

CHIC is an analytical tool for statistical data processing based on Statistical Implicative Analysis (SIA), a statistical analysis of implications. Its purpose is to discover very important (relevant) relationships between variables on the basis of implication. The method offers two different ways to put these relationships into a unified system. The first is a hierarchical implicative tree, the second is an implicative graph. In addition, a similarity tree is constructed based on the probability of the links between the variables. The main features and uses of CHIC in practice are described in, for example, Couturier (2008), Gras and Kuntz (2008) or in Statistical Implicative Analysis: Theory and Applications (2008) by team of authors.

Statistical Implication Analysis was first used by Régis Gras (Polytechnic Graduate School of Nantes University, France). The main aim of this non-parametric statistical method was to define the way of answering the question: "If an object has any attribute, then does it have more than this one in consequence?" Of course, the answer is rarely positive. However, there are cases where this tendency is possible. SIA (Statistical Implication Analysis) is focused on highlighting such a trend in a set of attributes. SIA (Statistical Implication Analysis) can be considered as a method for forming of the clustering rules. Compared to other methods, the SIA (Statistical Implication Analysis) differs by providing nonlinear procedures.

⁵ A special statistical software Statistica was used for data processing.

⁶ Specifically Westenberg-Mood median test, Kruskal-Wallisov H test, Kolmogorov-Smirnov test (K-S test), Mann – Whitney U test.

⁷ prof. Régis Gras, since September 1998, emeritus professor at the Polytechnic Faculty of the University of Nantes and until 1998 also a research director at the Institute of Mathematical Research at the University of Rennes.

⁸ With the practical use of SIA, we met, for example, with Benedetto di Paola, a student of the “”Scuola Interuniversitaria Siciliana di Specializzazione per l’Insegnamento Secondario of Palermo, Italy, class 47A (Mathematics), who, as stated in his article *Some experimental observations about passage from the arithmetic thought to the algebraic thought* (Age: 14-18 years) used this method as one of many methods for data.

The method is based on the intensity of the relationship between the statements, one of which is the result of the other (the statement of the form "if A, then B") when measuring its degree within a rule (regularity). That is the reason why some trivial rules, which are potentially well known, are omitted from such an investigation. In fact, the rule "A => B" is considered trivial if almost all objects "A" have the "B" attribute. In this case, the intensity of the relationship between the statements, one of which is the result of the second, is near 0, and in this case does not generate a surprise and cannot be considered as significant. Conversely, as the intensity of the relationship is close to 1 (i.e. 100%), it means that almost no object "A" has the attribute "B". Then the rule in the form "A => B" is surprising and it is not trivial.

4) Conclusion

Our research at the level of the Olomouc Region confirms that the teachers of this region are influenced by their qualification (i.e. the ability to teach civic education and the foundations of social sciences based on a master degree in civic education) in their reflection of educational paradoxes during the teaching process. In addition to this key conclusion, some other facts have been confirmed during the empirical survey.

It includes the choice of research strategy, research methods and techniques, containing those for the processing of measured data. The implicative analysis turns out to be a beneficial for the further development of empirical research in the field of didactics of social sciences and allows the identification of possible implications between individual assertions, thus pointing to new relations between variables (our research was focused on the intensity of relations between statements, when one was in consequence with the other). We have succeeded in pointing out the relationship in which the forms of reflection of some educational paradoxes (the reactions to the statements) statistically point to a reflection on another educational paradox, which is the consequence of them. In this way, we have been able to identify the inner insecurity of the teachers presented in the form of doubts about themselves.

As can be seen from the results of our research, the qualified teachers have the ability to perceive educational paradoxes more sensitively, they are aware of their risks, and more often they operate with them carefully in their educational activities. However, at the same time, it has been shown that this certainty can weaken their alertness in the perception of some educational paradoxes impacts (especially in relation to the risk of an ideological indoctrination of pupils that can be practiced through civic education). On the other hand, non-qualified teachers show that their reflection of educational paradoxes in relation to citizenship education is highly fragmented. The results of the application analysis of the research data then point to other significant phenomena - the teachers of civic education and the foundations of social sciences do not agree internally with retreating from the process of humanization in education and regard this tendency perceive as negative for the pupils. There have also been some evidences of conflicts in the teachers' professional life and his / her private life, which is reflected in the doubts about the effectiveness of his / her profession, including the possibility to pass on his/her own life experiences. Teachers' doubts about themselves have been proved to be a very significant trend by the application analysis.

The use of implicative analysis is perceived in the field of interpretation of research data of socially-oriented empirical research as an innovative step with a great potential for the future research projects.

Abstract

The aim of this study is to research the attitudes and beliefs that future teachers studying at Palacký University Olomouc have about modern educational technology, and also about technology in general that could be used in the course of education. Teacher beliefs are one of the integral and important components of teacher's personality and they influence the whole education process: from how teachers behave in the classroom to what materials they choose to use. Different beliefs of each person also influence their attitude towards the educational technology and their opinion on whether it is beneficial to use it in teaching or not. The research was conducted via a questionnaire that was distributed to students of Faculty of Education in Olomouc, Czech Republic. This article presents the results which were achieved via this research.

Keywords: education, technology, students, teachers, beliefs

Introduction

Technologies are an essential part of the world and they have a great impact on people's lives. As schools are part of a public space, they are naturally influenced by technology, in a way how schools present themselves but mainly in their actual use of technology during a teaching process. While using modern digital technology, not only in schools, it is important to realize that even though technology can make lives easier, according to Spitzer (2014) using too much of it can have a negative impact on one's life by being too reliant on technology.

The aim of our research is to discover how using technology for educational purposes is perceived by future teachers. Our research is based on the proposition that teachers use modern educational technology not because it brings better results in a teaching process than other tools and methods that do not use such technology, but they use technology because they have a positive relationship with it and they themselves are personally convinced about the positive impact of educational technology. However, it is necessary to deal with a theoretical background of the issues which were dealt in the research; it is dealt in the following paragraphs.

The conducted research study explained in the following article focuses on the perception of future teachers of using technology for education. It is, therefore, crucial to give an account about the theoretical background behind the study, starting with the description of what is considered educational technology and ending with an outline of the workings of teachers' character and beliefs concerning the usage of educational technology. The term educational technology can be described as technical devices and gadgets that are used for educational purposes (Palán, 2002). In the same online dictionary, there can be found possible representatives of educational technology, such as: "... projection devices, sound devices, devices that enable recording and reproduction of sound and images, overhead projectors, language laboratories, teaching devices and simulators, computers, computer networks, devices for magnifying pictures and things, etc...". Nosková (2011), on the other hand, classifies educational technology into the following groups: displays, projection technology, auditory technology, TV and information technology.

The concept of modern (educational) technology is not very obvious and the distance and boundaries between modern (educational) technology and the classic one are unclear. For the purpose of this article, modern educational technology is considered as educational technology based on computing technology using microprocessors and integrated circuits. Taking this into consideration, modern educational technology can be further divided into first, computer technology (meaning hardware - a computer as such and its software parts, such as computer system, specialized programs, etc.) and second, modern educational technology (henceforth as MET) for which computers are not necessarily needed, for example: reprographic devices, TVs, e-books, etc.).

Each person tends to deal with various problems and questions differently, whether those are trivial matters that are part of an everyday life, or whether more serious matters that could potentially change an individual's life. It is the same for teachers. Even the future ones who are still training to become professional teachers at faculties of education have to make decisions about what their classes are going to look like, what attitude they are going to adopt towards education including their attitude to modern educational technology and its use during their classes. A teacher's take on education and the use of MET is influenced by the knowledge he gains during his studies, his skills and potential as a teacher, and, last but not least, his behaviour and personal characteristics. All these parts make what can be called teacher's personality.

A question arises as to what exactly determines teacher's personality, and what, or maybe even who, stands behind a teacher's attitude to MET. It generally depends on their own subjective perception of the matter, whether they themselves have a positive outlook on technology or rather a realistic or pessimistic, which is all connected to their personality. As stated by Čáp (1993, p. 83) there is a specific personality structure integral to every person and every teacher makes decisions that are in harmony with their personality structure. Every teacher can also be psychologically categorized by answering several questions connected to their internal structure.

First question is directed towards motivation – why a person does what he does and what motivates him to do it. Second question is focused on abilities – how well is a person able to do something. Next question is about temperament – if a person performs an activity with excitement, relentlessly and if he ceases doing the activity when obstacles arise. The last question is about a teacher's work ethics – how hard he works and if he is reliable, diligent with his work and what relationship he has to children and people in general. All these questions help identify what personality type a teacher is.

There are several definitions that explain the term teacher's personality. According to Dytrtová and Krhutová (2009), these are the constituents that create teacher's personality:

- mental resilience
- adaptability (an ability to create alternative solutions in various situations)
- adjustability (mental flexibility)
- ability to adopt new knowledge
- social empathy
- communicative competence

Several researches were conducted in order to find out what a teacher should be like. Fontana (1997, p. 364) introduces a research done in the US in 1960 by Ryans who said that a successful teacher should have a warm personality and be understanding, friendly, responsible, systematic, creative and excited for the job he is doing. According to Průcha (2002, pp. 189–192) it is, however, important to realize that there is no universal definition of a good and effective teacher as everybody is too different.

One of the principal factors that is part of the teacher's personality are teacher beliefs or thinking that influence how a teacher behaves in a classroom, how he makes decisions and what methods and forms of teaching he uses. Pedagogický slovník (in English: Dictionary of Education) defines teacher beliefs as a complex of professional ideas, attitudes, expectations, wishes and judgments that create a cognitive basis for teacher's behaviour, his perception and creation of educational process (Průcha, Walterová, Mareš, 2003, p. 261). Teacher beliefs influence everything that is done in the classroom. Williams and Burden (1997) claim that teacher beliefs are fairly stable and teacher's behaviour can be predicted based on his beliefs. They add that teacher's thinking and attitudes form in the early stages of life and his beliefs are connected with the culture in which a teacher grew up and lived in and it is probable that these beliefs are resistant to big changes. Williams and Burden (1997) also agree that a person's belief about how teaching and learning should be conducted appears at the time when a future teacher comes to the university and his beliefs are more connected to what he thinks is right instead of reliable knowledge.

Calderhead (1996) suggested five main areas into which teacher beliefs and thinking can be divided, these are: beliefs about a student and their learning; beliefs about teaching; beliefs about a specific school subject; beliefs about pregradual training for teaching and lastly, teacher beliefs and thinking about himself and his role as a teacher. It is possible that teacher's personality does not correspond with his teaching style which the teacher thinks is the best. This can lead to frustration and it is important for every teacher to realize his own expectations and beliefs he has of students and connect his pedagogical thinking with his current teaching practice (Williams et al., 1997)

Teacher beliefs of different teachers and future teachers influence their attitude towards information technology and its use for educational purposes. Ertmer (2005, p. 26) even thinks that teacher's belief about the usefulness or unsuitability of ICT for education is essential for its actual use. If a teacher is convinced that technology does not bring anything useful or interesting to the lessons, he is simply not going to use it. Research in this area has proven that a style of teaching can differ with each teacher based on their beliefs about the educational process even though their knowledge and skills are similar (Pajares, 1992). Another research study in 2011 (Hammond, Reynolds and Ingram) done among future teachers confirmed Pajares' research results and showed that willingness to use information technology in students' future teaching careers is influenced by their own attitudes towards technology in general. Pajares (1992) even suggests that teacher beliefs are more influential in a teacher's career than the knowledge the teacher has learnt during his studies.

Even though that there is a proven connection between teacher beliefs about technology and its real use in practice, other studies suggest that there are inconsistencies between what teachers say their beliefs about technology are and its utilization in their classes (Judson, 2006). Ertmer (2005) explains it by a combination of factors such as school curriculum, teacher's colleagues and lastly, expectations of parents and headmasters on how the lessons are conducted. All these contribute to a teacher's decision on whether to use educational technology or not, even though he himself is confident about its positive impact. This discrepancy between teacher beliefs about technology and its implementation in his teaching was also confirmed by a research by Chen in 2008 who states that another factor that influences a teacher's decision is his limited knowledge in the field of constructivism.

Teacher beliefs can be considered a form of subjective reality which comes from what a teacher believes is right. It influences his whole teaching process and it is a part of teacher's personality which is often difficult to change since it is anchored in a teacher since their start of studies. It is, therefore, important to discover and analyse teacher trainee's beliefs and attitudes towards educational technology in order to possibly modify how educational technology is presented to them in the course of their studies and their future teaching careers as well.

Since the topic of the article is now theoretically anchored, it is possible to actually introduce the questionnaire which was used to discover the attitudes and beliefs held by students in teacher training with regard to MET.

Method

As it was already mentioned, the purpose of this article is to present results from a research which took place at Faculty of Education, Palacký University Olomouc – the research sample consisted of 110 students of the first year of their studies at the very faculty. The initial outline of the research was already described in the previous article of the same project of the authors (Čihánková, Gregar Sittová, 2017) The empirical research was performed in a form of online questionnaire (the questionnaire itself might be found at <http://bitly.com/questionnaire-met>). The purpose of the research was to find out the students' awareness of the MET, their previous experience with this means of technology and their attitudes to its employment. The last mentioned issue is the subject of this paper. Although the questionnaire was composed in the Czech language, its text and all of the responses were translated for the purpose of this paper and for the purpose of further research (see section “Results, Conclusions and Recommendations” below).

The questionnaire was divided into items of general and professional nature. There were seven general items whose aim was to define and delimit the research sample (items e.g. age and sex of the respondent or their previous education). Additionally, there were nine professional items whose aim was to discover and describe the attitudes and awareness of the future teachers of the field of MET.

While the first items were dealing merely with the concept of the MET (which is not dealt in this paper), in the other part (in form of scaling), the respondents were asked to express their agreement (or disagreement) with presented statements by choosing one of possible responses of the scale “I strongly agree” – “I agree” – “I neither agree nor disagree” – “I disagree” – “I strongly disagree” (see Table 1 below). This part of the questionnaire consisted of 24 statements and results of a selection of them are presented in the “Findings” section of the present paper.

Table 1. Possible responses and the scaling of the attitude-based part of the questionnaire

Assessing statement	I strongly agree	I agree	I neither agree nor disagree	I disagree	I strongly disagree
Grade	1	2	3	4	5

To discover attitudes of the students (i.e. the future teachers) to MET, the responses were further processed. Every assessing statement of the scale of every statement was assigned a value from 1 point (assigned to the statement “I strongly agree”) as a maximum to 5 points (assigned to the statement “I strongly disagree”) as a minimum. The score was calculated as an arithmetic mean of a total number of points at the specific statement divided by the number of respondents who responded on the item.

There were, however, four statements at which the arithmetic mean was calculated conversely (i.e. 5 points for the response “I strongly agree” as a maximum and 1 point for the response “I strongly disagree” as a minimum) - these were statements no. 3 (“The skills of contemporary basic-schools' pupils and secondary-schools' students greatly surpass my skills”), no. 10 (“I am afraid to use unauthenticated applications (software)”), no. 11 (“Operation of new applications (educational software) is difficult for me”) and no. 12 (“I think that operation of modern educational technology will be difficult for me”) due to the nature of the statement (see Table 2 below).

Table 2. The reversed order of grades for possible responses and the scaling of attitude-based part of the questionnaire

Assessing statement	I strongly	I agree	I neither	I disagree	I strongly

statement	agree	agree nor disagree	disagree
Grade	5	4	3
			2
			1

This processing method of the obtained empirical data via assigned points was chosen because of the simple processing of results and their further comparison with sets of various numbers of respondents. Therefore, the results of the empirical research are transformed on a mark which expresses the assessment index.

The assessment index of quality was calculated based on the assignment of the specific value to a specific assessment opinion. Individual absolute frequencies of the assessment opinions in specific categories were multiplied by the number of points, and its sum was divided by the number of respondents assessing the particular category. By doing so, the comparable indicators of quality have been achieved – those are not dependent neither on the number of respondents nor on the number of responses of individual groups of respondents.

The values might therefore be interpreted according to a certain critical interval (see Table 3 below).

Table 3. Overall assessment of the attitude-based part of the questionnaire

Interval	Assessment
Grade 1 – 1,50	Highly positive assessment, expression of respondents' absolute agreement with the assessment ("I strongly agree")
Grade 1,51 – 2,50	Positive assessment, expression of respondents' relative agreement with the assessment ("I agree")
Grade 2,51 – 3,50	Indecisive assessment, expression of disability to make a decision or the lack of knowledge of the topic ("I neither agree nor disagree")
Grade 3,51 – 4,50	Negative assessment, expression of respondents' relative disagreement with the assessment ("I disagree")
Grade 4,51 and more	High degree of the disagreement with the assessment ("I strongly disagree")

Findings

This section provides a selection of results of the research of statements no. 2, no. 12, no. 13, no. 14, no. 16., no. 19, no. 22 and no. 24. The statement no. 2 ("I can create a website on my own.") was included in the research since the subject matter dealing with the ability to present information in a form of a website is included in the governing curricular document of the Czech educational system – the Framework Educational Programme for Elementary Education (Millerová and Miller, 2013, p. 34). Therefore, it might be argued that the university students should be able to create a simple website on their own. It brought rather negative responses since the majority of 64 respondents does not agree with this statement (while 27 of them strongly). The minority of 36 respondents (to some extent) agrees with the statement and the rest (10 respondents) does not give a clear answer since they do not consider themselves being neither able nor unable to create a website on their own. The total score at this item is 377 which, when divided by the number of responses (110) gives the result 3.4 (grade), which is, sadly, according to the Table 3 (see above), an overall indecisive assessment – the students do not consider themselves neither able nor not-able to create a website on their own.

The purpose of inclusion of the statement no. 12 ("I think that operation of modern educational technology will be difficult for me") in the questionnaire was to encourage the respondents to self-evaluate their current and

possible future ability to employ the means of MET in their careers and general life. 48 respondents do not agree with the statement while 16 more of them do not agree with the statement strongly. Therefore, it is possible to say that the responses indicate that the students think that the operation of MET will be rather easy. The total score at this item was calculated 276 and the grade 2.51, which is on the line of positive assessment.

In the statement no. 13 (“I am glad when I can use modern educational technology”), we tried to find out whether the inclusion of MET makes the students in teacher training happy, whether they like to employ. This was confirmed by the majority of 72 respondents (17 of them even strongly agreed with it). Therefore, it is possible to declare the positive approach to the employment of MET (confirmed even by the grade 2.3).

The statement no. 14 “I am able to use interactive white board” was included to the fact that in the interactive white boards were introduced on a massive scale in previous years in the Czech Republic (Neumajer, 2008). Therefore, the authors of the present paper considered the ability to use the interactive white board to be necessary for future teachers. The outcome of this item was rather positive – 46 respondents agree with this statement and 20 agrees strongly (the grade is 2.4 at this item).

The positive assessment is present also at the statement no. 16 (“I am glad when my teachers use interactive white board”) confirming the popularity of interactive white boards among students – 54 of them agree with the statement and 27 respondents agree strongly with this statement which results in the grade 2.1.

The statement no. 19 (“The teaching with the support by modern educational technology is more interesting for the pupils (students) than the teaching without the support of modern educational technology”) takes a different approach. It lets the respondent think if the inclusion of MET actually makes a difference in the teaching and in its results. However, it is not a surprise that the majority of respondents gave the answer that this statement is agreeable (54 of them agreed and 33 of them agreed strongly) while the grade at this item is 2.0 (i.e. a positive assessment, the second lowest grade in the results in total).

The results of the next statement, presented in this paper – statement no. 22 (“The faculties of education should train future teachers to use efficiently modern educational technology in their teaching”) – evidence the conviction of future teachers that the means of MET should be taught at faculties of education. This thought is held by the vast majority of respondents (50 agree and 42 agree strongly). It is also necessary to note that at this item there was the lowest number of respondents who did give an indecisive answer (only 11 of them), i.e. the majority of 92 respondents held a positive attitude to the inclusion of teaching about (and with) MET at the faculties of education (the grade at this item was 1.9 – which is the lowest grade within the whole questionnaire as well).

Results, Conclusions and Recommendations

This article follows on the already mentioned treatise by the same authors (Čihánková, Gregar, Sittová, 2017) which dealt with the research and questionnaire at a general level. The most striking result of this questionnaire is that despite the overwhelming majority of 92 respondents (out of 110 respondents in total) held a positive attitude to the inclusion of teaching about (and with) MET at universities preparing future teachers (see statement no 22 above), they do not know if the actual inclusion of MET at schools is beneficial for the pupils’ (and students’) education – which is evidenced by a statement of 65 respondents at statement no. 24 (“The results of pupils’ (students’) education are better when they are using modern educational technology”) who neither agree nor disagree with the statement. Therefore, there emerges a question if the students are indecisive due to a lack of their actual experience or due to the fact that this field is not adequately researched. However, the number of students giving indecisive response was the highest at this item.

Therefore, the next question should be – why the future teachers think that they should be taught about means of teaching when its outcome is (at least) debatable. This issue should be addressed as soon as possible in order to avoid a blind alley (some similar researches are presented in Spitzer, 2014).

The future teachers also show uncertainty and general unawareness of its possibilities and one's abilities in this field – this is evidenced by the total grade 2.81 (an arithmetic means of all of the grades of individual items). Since the electronic devices, PCs, tablets, cell phones... are omnipresent, it is surprising that the future teachers do not know whether to use these means and how, or to not use them at all.

The question of actual equipment of schools (which certainly does influence the conviction of the future teachers of their possible employment in their teaching) is subject of the next articles of the authors of the present paper while they compare the material equipment of various schools of the Czech Republic, Austria and Indonesia (with a possible inclusion of China in the research as well).

Acknowledgements

The article was created with a financial support of the project of Grant fund of the Dean of the Faculty of Education, Palacký University Olomouc, 2017 in the framework of the project “The Significant Educational Categories, Phenomena and Means in the Process of Shaping of Professional Teacher Beliefs”.

Mobile Application as an Innovative Tool for the Agricultural Industry: A Conceptual Perspective

Pannawit Sanitnarathorn

Lecturer, Department of Music Business, Assumption University of Thailand,

Email: porr.ps@gmail.com

Abstract

Agriculture has been practiced in Thailand since the ancient past and continues to be practiced today. This is because Thailand is a biologically abundant nation. Furthermore, Thailand's income primarily results from the agricultural sector. Farming has been developed from the household level up into enterprises. And one highly important cash crop is "rice". Thai rice is accepted for its quality and flavor worldwide. Rice supplies flooded the market as a result of the aforementioned policy and exceeded consumer demands, leading to domestic prices to be greater than prices on the international market. Consequently, Thai farmers faced a severe crisis in rice sales and created for political gains that finally provide benefits to middlemen. Moreover, the farmers' problems are always the basic problems of the nation. In response to the aforementioned problems, the rice trading mobile application has been developed to provide assistance to farmers for their sustainability through ICT. It has been initially created to allow farmers to sell their rice crops by letting consumers and producers directly communicate through the application. The researcher related concepts, theories and research for adoption in the application to reach target groups through the theory of diffusion of innovation and the technology acceptance model. Quantitative data is being obtained from a proposed sample of 240 Thai farmers who have experiences accessing to the internet via mobile phones are anticipated for the survey sampled from 6 regions in Thailand with qualitative research being conducted with 10 executives by the use of purposive sampling. Analysis will be conducted using Partial Least Square (PLS-Graph) software to apply Structural Equation Modeling (SEM).

Keywords: Rice Trading Mobile Application, Theory of Diffusion of Innovation, Technology of Acceptance Model (TAM), SEM

Introduction

Agriculture has been practiced in Thailand since the ancient past and continues to be practiced today. This is because Thailand is a biologically abundant nation. Furthermore, Thailand's income primarily results from the agricultural sector. Farming has been developed from the household level up into enterprises. And one highly important cash crop is "rice". Thai rice is accepted for its quality and flavor worldwide.

According to rice export statistics from the Office of Agricultural Economics and the Customs Department from 2012-2016, Thailand was the largest exporter of rice in 2011 with an export value of 1.742 billion USD. Thai rice exports, however, have been declining due to policies to promote and insure produce prices with the greatest impacts occurring in 2014 when the export value was only 1.49 billion USD and the lowest export volume occurred in April (Rice Department of Thailand, 2016). As for the situation of domestic rice trading in Thailand during the rice subsidy policy, according to the weekly rice situation report by the Rice Monitoring and Situation Analysis Center, Rice Department of Thailand, in October 2014, jasmine rice was sold in Thailand at 958 USD per ton. This was a decrease from the rice price in 2013 by 20 USD. And in October 2015, the domestic price of rice was 292 USD per ton. The aforementioned statistics are consistent with the situation regarding confidence in domestic and international trade resulting from the policy to promote and insure rice prices (Office of Agricultural Economics, 2016).

Rice supplies flooded the market as a result of the aforementioned policy and exceeded consumer demands, leading to domestic prices to be greater than prices on the international market. Consequently, Thai farmers faced a severe crisis in rice sales. Their crisis became a national crisis as stated by Prof. Dr. Prawet Wasi, Thai health public scholar, who stated that the farmers' problems are the basic problems of the nation (Isra News, 2014) and that the farmers' plights are the source of the country's weakness. Thailand's view of farmers usually involves poverty and difficulty. Furthermore, the country's policies are not conducive to the prosperity of farmers. Even though the government has created policies to assist farmers, the majority of these are only on the surface and do not seriously solve problems. Instead, they are only created for political gains that finally provide benefits to "middlemen".

Therefore, there is a clear imbalance in the agriculture sector. The majority of products are seasonal. Agricultural products have little flexibility while food rates and consumption remain stable. Furthermore, natural imbalance such as droughts and floods occur, and prices are still dependent on demand and supply. Farmers are impoverished because of high production costs and uncertain prices. In addition, small-scale farmers and agricultural institutes and cooperatives remain weak, lacking in their own land to make a living. Moreover, the soil has deteriorated, farmers do not work in clusters and have inequality, and farmers do not have sufficient access to resources, innovations, technology and financial resources. Hence, government policies are unable to quickly steer agriculture, despite it being the heart of Thailand.

In response to the aforementioned problems, a research has been developed to provide assistance to farmers. A rice trade mobile application would allow farmers to sell their rice crops by letting consumers and producers directly communicate through the mobile application. This application can be because of its convenience, speed and ability to broadly reach the younger generation. With the advantages of technology, it is possible to reduce the gap between farmers and consumers and thereby lead to a new form of rice trade and stability and sustainability for domestic trade. The research objective is to help farmers to adopt new innovative technology and is based on the desire to directly assist farmers without going through middlemen which the application to become a trade medium for rice between buyers and rice farmers (producers) in order to allow farmers sell quality rice at fair prices without going through middlemen for the sake on their sustainability throughout ICT model.

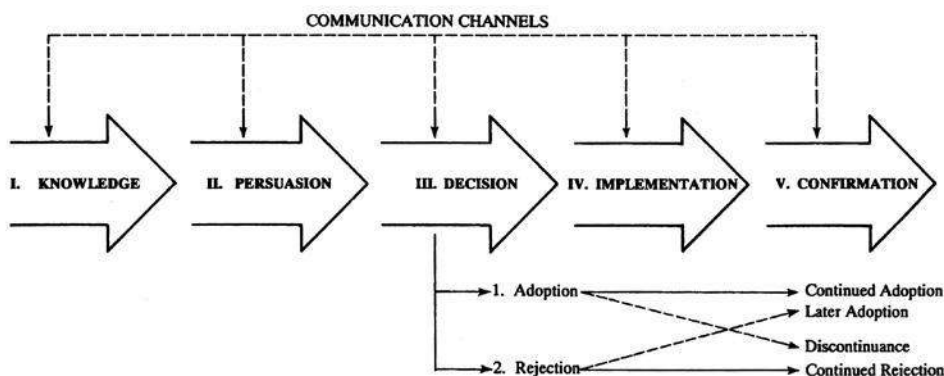

Literature Review

Furthermore, with the desire for the application to become a primary source of rice trade, the mobile application acts as a direct rice trading hub with farmers who produce agricultural products, regardless of whether the farmers offer only a single strain of rice or are traders of a wide range of agricultural products, and to allow producers (farmers) and consumers, who are rice buyers, to easily communicate with one another and obtain detailed information about products as well as provide them a sense of safety through the application. Hence, the researcher related concepts, theories and research for adoption the application. Hence, the following theories, diffusion of innovation and technology acceptance model were made:

Theory of Diffusion of Innovation

Everett Rogers (1962) described the theory as being related to the diffusion of innovation via various communication channels between members of society over a given period of time to induce social and cultural changes. There are five primary components as innovation, adopter, communication channels, time and social system. Rogers (1962) further described the innovation acceptance process as one of the processes for diffusion of innovations. It is a psychological process composed of the five steps as knowledge, persuasion, decision, implementation and confirmation (as shown in Figure 1). Furthermore, he mentioned the people in society who will accept the diffusion of innovation and divided them into five groups as innovator, early adopters, early majority, late majority and laggards.

Figure 1. A Model of Five Stages in the Innovation-Decision Process (Rogers, 1962)

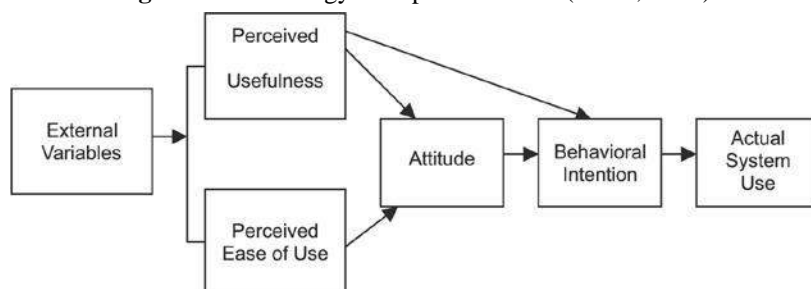

The researcher used the Theory of Diffusion of Innovation because it is consistent with the application and can be used to describe the spread of the aforementioned application. According to Peshin et al. (2009), the Theory of Diffusion of Innovation has been applied to the agricultural industry for half a century. By referencing the Theory of Diffusion of Innovation and the research of Stephenson (2003), the early adopter farmers once they have accepted the innovation, they will implement it in their lives and pass to early majority farmers.

Technology Acceptance Model (TAM)

This theory was developed from the Theory of Reasoned Action and was proposed by Fishbein and Ajzen (1975). Based on the essential content, before humans take any action, guidance, i.e., subjective norms have to take place first along with attitudes toward the aforementioned behaviors. The theory was further reinforced by the Theory of Planned Behavior, which was subsequently proposed by Ajzen (1985). Subjective norms influence attitudes. The person follows the norms follows groups that are important to them. In particular, the more a person follows the reference group, the higher intention that person will have to perform the behavior. This is independent of rights and wrongs with morals. Furthermore, the intention to take any action is also dependent on the strength of the reference group, which results from the surrounding environment and the motivation for the intention to follow the reference group (Ajzen, 1991). Conversely, if the reference group is unimportant, there will be no impacts to the decisions to engage in actions of the person (Miller, 2005).

The Technology Acceptance Model (TAM) is a theory that discusses users' acceptance of the use of given technologies that are suitable to users were offered new technologies. One of the factors that influence acceptance is perceived ease of usage of the technology (Chaweasuk and Wongchatupat, 2012). Davis (1989), the originator of the theory, described perceived ease of use as the feeling of users who believe that the use of a given system as being free from difficulty. Davis and colleagues who created the theory said that because new technologies such as computers are complex and difficult to use for ordinary people without significant technological knowledge, problems occur in accepting usage, and if users encounter obstacles and difficulty after usage, they accumulate negative attitudes and the usage of the technology fails (Bagozzi, Davis and Warshaw, 1992). Previously, a study was conducted by Tornatzky and Klein (1982) on the Theory of Diffusion of Technology, which found indicators on perceived ease of use such as consistency, benefits of the technology used and complexity. Subsequently, Venkatesh (2000 & 2003) proposed new indicators, namely, basic technological competence of users, anxiety caused by the use of technology and enjoyment from the use of new technology. Hence, if new users perceive that systems to be used are not complicated and can be used easily, they will accumulate positive attitudes and future determination. Furthermore, if users believe that the technology will provide convenience in their work and create benefits, whereby perceived benefits is based on knowledge about one's own technological competence (Bandura, 1986), perceived benefits from usage will occur directly and indirectly in terms of the quality of outcomes from the use of new technologies and positive images resulting from usage. Hence, if new users perceive that technology benefits them and promotes their positive image, positive attitudes and usage determination will also occur (as shown in Figure 2).

Figure 2. Technology Acceptance Model (Davis, 1989)

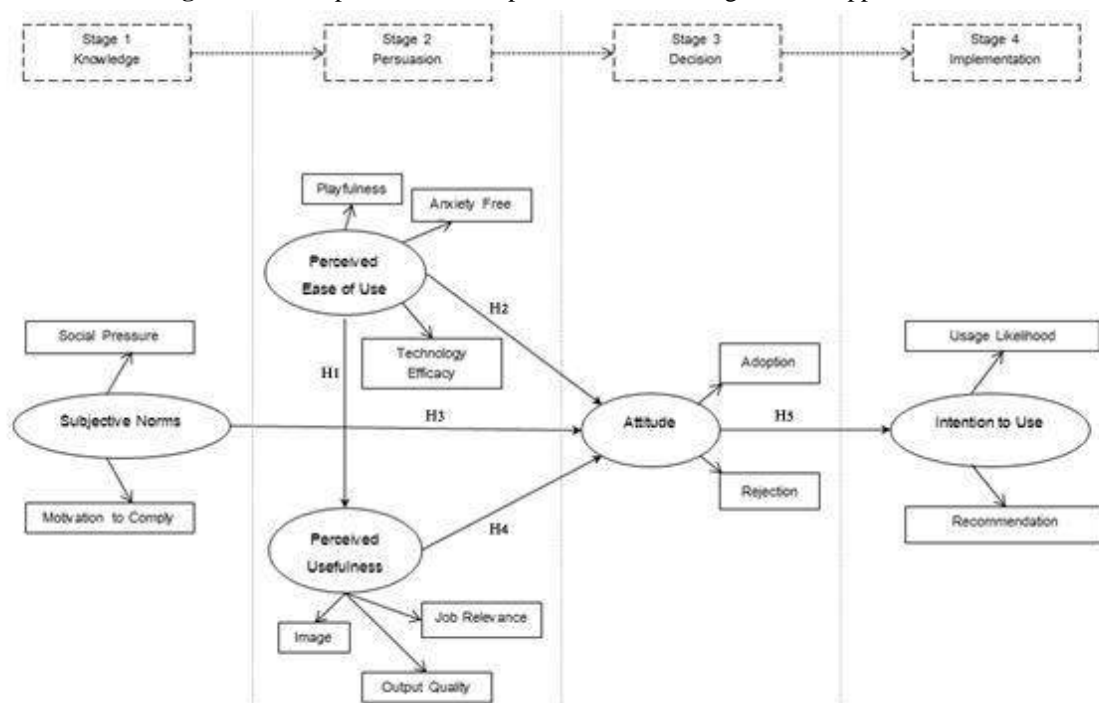

The Technology Acceptance Model is geared toward usage intention leading to actual usage, whereby perceived ease of use, perceived benefits and attitudes are variables that influence usage intention. The Technology Acceptance Model was further revised, and two more variables were added to become TAM 2 (Venkatesh et al.,

2000 & Venkatesh, 2000). In this model, external factors that influence usage motivation were discussed such as subjective norms, image, job relevance, output quality and result demonstration, which lead to perceived usefulness, attitudes and usage intention.

Next, Venkatesh et al. (2003) further developed the Technology Acceptance Model into TAM 3 as an extension of Venkatesh et al. (2000). It mentioned external factors on the computer proficiency of users, perceived external control, computer anxiety, playfulness, perceived enjoyment and objective usability. These are factors that impact perceived ease of use of new technologies.

From the Technology Acceptance Model, it can be concluded that the key factors are perceived ease of use, perceived usefulness, attitudes and behavioral intention to use, which lead to actual use. Additionally, a highly important factor is subjective norms. Therefore, once the Theory of Diffusion of Innovation and Technology Acceptance Model are combined, the model for the development of the application was obtained as shown in Figure 3.

Figure 3. Conceptual Model adapted for Rice Trading Mobile Application

Research Hypotheses

- H1: Perceived Ease of Use directly influences Perceived Usefulness
- H2: Perceived Ease of Use directly influences Attitude
- H3: Subjective Norms directly influences Attitude
- H4: Perceived Usefulness directly influences Attitude
- H5: Attitude directly influences Intention to Use

Methodology

This research focuses to model the structure of the factors that influence the Thai farmers' adoption to rice trading mobile application. The researchers have therefore set out to determine the details and procedures of the methods as follows:

Data Collection and Analysis

It is suggested a 15:1 to 20:1 subject-to-variable ratio as a rule of thumb can be used structural equation modelling (Schumacker and Lomax, 2010; Worthington and Whittaker, 2006; Cunningham, 2008; Weston and Gore, 2006; Meldrum, 2010). As the study had 12 variables, a 20:1 ratio was used to determine the sample size

of 240 which was selected by multi-stage random sampling, with the population divided into six regions distributed throughout Thailand, selected in proportion to the population of each group within each region.

Samples used for the study included 240 Thai farmers who have experiences accessing to the internet via mobile phones are anticipated for the survey sampled from 6 regions in Thailand. To gauge both content validity and reliability of the survey, 5 experts consisting of scholars and industry executives were chosen to evaluate the consistency of the content and confirm it was valid for the purposes of the research. Additionally, Rovinelli and Hambleton (1977) developed the Item-Objective Congruence (IOC) which was used to carry out the screening of the survey questions to a group of 10 initially in the pilot study. The research will then proceed to select items that have an IOC index higher than 0.5, which will be considered acceptable. The measurement instrument or questionnaires will utilize a 7-Point Likert Scale (Likert, 1970) as a tool for research.

Data Analysis

Henseler et al. (2014) indicated that PLS is an important statistical tool for research. PLS-Graph software was used to discover the causal relationships of the structural equation model (SEM) (Piriyakul, 2011). This involved defining the observed or manifest variables with the latent variables, which were then analyzed for their accuracy and reliability of the measurement. Discriminant validity and the scale reliability were analyzed from Composite Reliability (CR) as well as the Average Variance Extracted (AVE). The CR value should be maintained above 0.60 while the AVE values be lower than 0.50. Additionally, the coefficient of determination (R^2) value should always exceed 0.20 (Lauro and Vinzi, 2004; Henseler et al, 2009).

Preliminary Conclusion

The focus is placed on modern farmers who are familiar with today's technology (early adopters). The adoption to rice trading mobile application is only in the beginning stages of its usage. It is necessary to wait for responses from users to develop and make improvements to the application to meet the requirements of users as much as possible. In the future, this application can be expanded to cover other agricultural groups for the benefit of Thai farmers and provide convenience to product distribution without leftover produce and with reduced poverty and with products sold at fair prices. As for consumers, they benefit by having access to quality products at fair prices and by saving time in the search for high quality agricultural products. In addition, relationships are formed between buyers and sellers, thereby reducing burdens of the government to subsidizing the prices of agricultural products, to achieve stability, prosperity and sustainability for Thai farmers in the future.

Integration from the point of view of foreign students as an important factor during the formation of value of education

ŠEMBEROVÁ Markéta, PLISCHKE Jitka, GREGAR Jan

Email: sembma00@upol.cz

Abstract

This article focusses on students of a different ethnicity living in the United Kingdom, it mainly focuses on how these students are being integrated into the majority society, also on how the school and teachers reflect their needs. The main aim of the research is to find out what value does education have for the students in the land that their parents came to live in from different reasons. The first partial aim is to find out what were the reasons for the family to move to the United Kingdom, what languages does the family speak and how educated are their parents. The second aim is to describe in what way were the families making effort to integrate into the majority society, whether the students went to the common British schools and what obstacles they had to overcome. We also focused on whether the students had enough knowledge (since some of them came from the same country of origin as the first generation) and whether they feel fully accepted by society and surroundings. The last aim of this research is to find out what value does education represent to them and their parents, how are they planning to represent this value to their children one day and what does obtaining of a degree diploma in the United Kingdom represent for them. For this research, I picked a qualitative approach with a method of semi-structured questions. The obtained data will be analyzed by the card unloading technique. The results will be described in the open, axial and selective codes.

Keywords: students of different ethnicity, value of education, integration, qualitative research, semi-structured interview.

Introduction

The article deals with the issue of value of education among the students from different socio-cultural environment. The present research is a part of a larger complex whose purpose is to research the value of education not only in countries with a large percentage of immigrants in the total population (e.g. the UK, the Netherlands and Belgium), but also from the perspective of foreigners in our country (i.e. the Czech Republic) – e.g. Ukrainian immigrants in the Czech Republic. The authors decided to deal with the target group – students of the UK universities – while they assume that the value of education is rather permanently anchored in their hierarchy of life values. Due to the fact that the authors still focus on the students from different socio-cultural environment, they aim their attention to the students that are not British (i.e. that are of different ethnicity). Therefore, they deal mainly with so-called 1.5 generation which includes the descendants of people who came to the UK. The main aim is to determine the reason why the student's family decided to come to the UK, which type of education had their parents achieved, and which languages are spoken by the students and their families. The second aim is to discover the ways how the family strived to integrate within the majority society and the problems which they struggled with. The third (the last) aim is the question dealing with the student's education and which value they add it themselves, or in various situations in their life (e.g. in choosing of their partner or while raising their children). In the first part of this article, the authors therefore deal with the theoretical anchoring of the terms *value*, *value of education*, *attitudes* and *socio-cultural environment*. The second part deals with the methodology of the research while the third part describes the outcomes of this research.

The *values* (as described by Průcha in *Pedagogický slovník*, 2009) are subjective pricing or a degree of importance which the individual assigns to certain things, phenomena, symbols, other people, i.a. Popovič (in: Cakirpaloglu, 2004) states: ... *values represent social standards by which activity and behavior of people in the society is*

regulated. The values determine what needs to be done, appreciated, what should be aimed to; whereas the norms regulate how, i.e. the way of behavior during the realization of a value, or the behavior in general.

M. Rokeach (1970) speaks about individual's *system of beliefs*, which is not possible to be studied as individual beliefs, but only as their manifestation in individual's behavior. The degree of individual's beliefs about various facts is changeable and more or less central or marginal. Rokeach sees this as the difference between values and attitudes since the values are (in his concept) in the center of individual's system of beliefs – this is the reason why there are fewer values than attitudes. This concept of a value as a belief is accepted by e.g. Cakirpaloglu (2009) or Schwartz (2015). According to the latter (Schwartz, 2015), the values are, however, the central element of individual's self-concept. The value represents *a specific psychological category which constitute rather stable and permanent personality structure which is important for individual, social and historical realization of an individual* for Cakirpaloglu (2009, p. 277) as well. Schwartz, on the other hand, understands the value rather as a component of the subject than a component of the object: "*Value is in the eye of the beholder, not in the object of perception.*" (Schwartz, 2015), while he calls them motivational constructs which express the things that is considered important by the individual while they consider various objects, situations, events and individuals more or less valuable only based on their values.

Sereno (2012) states that value is something that helps people to aim their life in a certain direction or to lead it. As an example, Sereno gives us an individual with a plenty of ideas and wishes, and another individual with only a few wishes. The second individual keeps the wishes as the most precious things in their life which makes them to strive for them even more. Sereno classifies the values as instrumental (abstract values determined by an individual to lead their life according to them, e.g. trustworthiness, honesty, etc.) and terminal (aims – broadly speaking – which an individual strives to achieve, e.g. a degree from USC). The question if it is important for the students to achieve a certain degree of education and knowledge, or if it is important to get the diploma is therefore included in our research as well. The question therefore is whether the students perceive the value of education merely as a form of instrumental value (i.e. as an acquisition of knowledge), or as a form of terminal value (i.e. the receiving of the diploma). Therefore, the *education* is in the text of the present article as a *summary of knowledge, skills and attitudes which is acquired by an individual in the course of their life in the process of education which is mediated by educational institutions*. The individual's attitudes (in the concept mentioned above) to the education are constituted based on the values.

In order to understand the relationship between the individual and the value, it is necessary to begin the description of the issue at an individual and their experience. It is obvious that every research of values suffers from a certain reduction which is necessary to perform e.g. a research itself. Therefore, the content of the evaluation and the way how is this content changing are more interesting than the things that are evaluated. The fact that something is more valuable for us than something else means that we have good experience with it and therefore it makes us happy or satisfied. A set of values which is hierarchically arranged which is constituted by individual's attitudes, interests, experience and behavior is called *value orientation*. This set regulates both the individual's behavior and the behavior of the whole society. The value orientation belongs among the most important characteristics of our personality while the important fact i.a. is that it changes with age. The value orientation is therefore influenced by both internal factors and external factors – it is possible to mention here mainly the material conditions, influence of educational institutions or politically economic situation of a country.

The content of attitudes is constituted by the relationship to values. According to Hayes (1998), the values are *rather stable personal preconditions which lie in the very basis of the attitudes*. The attitudes are most commonly derived directly from the basic value system of an individual. The individual who is aware of the relationship to the education creates permanent attitudes to the education which are important for them. The cognitive needs (needs of self-realization, cognition and understanding) play a significant role in the relationship to the educational aims as well the performance needs. However, that would lead to a result which favors the students which prefer the acquisition of knowledge to the receiving of the diploma and disprove the urge to receive just the diploma.

For the purpose of this research, also the term *different socio-cultural environment* is used which is an umbrella term for a broad field of terminology. It is necessary to point out the fact that contemporary terminology is ambiguous in the delimitation of the extent and content of this term. First of all, we agree with the Mohanty's definition, who includes

not only habits and traditions in the term *culture* but faith and behavior as well: „*Culture is a human group which shares a number of essential aspects of daily life. Language, customs, traditions, religion and values are some of the shared products that define each cultural group. Each human group creates both material and non-material culture. Material culture for example includes physical objects (money, homes, cars) while non-material culture addresses the beliefs, values and behavior shared by a particular group. Taken together, this material and non-material culture shapes emotional, cognitive, spiritual, and social experiences of individuals within the group*” (Mohanty, 2005). The terms *social* and *cultural* are often linked to national or race differences, language barriers, health handicap, low social and economic status, socio-pathological family (or community) environment, or to institutional (correctional) education (Slowik, 2007). Therefore, we focus on the socio-cultural environment while we include the *religion* in the definition of the term *cultural* and the ethnicity in the term *socio*. Based on this, there emerges our question – i.e. how may the socio-cultural awareness and background of an individual (and also their different ethnicity) influence the creation of their value of education.

Methods

Method of the research

In the course of this paper, the qualitative research design was used while the semi-structured interview was chosen as a method.

Population sampling

For the purpose of this research, we had chosen the UK since there live almost 8.3 million immigrants. This figure has risen by more than 4 million people since 1993. The British stats distinguish between immigrants which were born in another country and came to the UK (these, therefore, do not have British citizenship) and those, who were born in the UK, therefore, have the British citizenship – hence becoming 1.5 Generation (Humby, 2016). The first group includes often people from Poland, India, Ireland, Italy and Pakistan while the second group mainly consists of people from India, Poland, Pakistan, Ireland and Germany.

Therefore, the authors chose as respondents those students who come from a different socio-cultural environment, who study in the UK (therefore in a country other than the one which they consider a country of their origin), who have experience with multiple educational systems, and whose country of origin is “culturally” very distant to the country of their current residence.

Data collection tools

In order to select respondents, the authors used the snowball sampling. All of the students were asked the same questions while additional questions were added as necessary. All students were explained the purpose of the interviews; they were also briefly introduced to the topics which were dealt. Their responses were recorded, transcribed and coded. The first stage of the analysis was the open coding while the second stage was the axial coding.

Analysis techniques

The *open coding method* is employed in order to process and analyze the text in depth while it also able to discover the meanings which are not obvious at first sight. It is an inductive method which creates its terms and categories based on the acquired data – in our case – the responses from the interviews. Therefore, new groups and terms are created while they are subsequently grouped according to their similarity.

The following codes were created during the open coding of responses of selected students:

- 1) *Demographic data*
 - name,
 - age,
 - origin,

- religion.
- 2) *Arrival at the UK*
 - Reasons for family's coming to the UK,
 - Criteria to choose the particular country (i.e. why the UK?).
- 3) *Comparison of the UK with their country of origin (if possible)*
 - general differences between the countries,
 - differences in terms of education, attitudes to children, schools.
- 4) *Language competence*
 - language used when communicating with parents, friends,
 - preferred language,
 - communication with other people from their country of origin.
- 5) *Education*
 - education of student's parents,
 - place of parents' studies,
 - quality of education of the student's parents,
 - time and place of the start of the respondent's studies,
 - type of school,
 - way of the first contact with the classmates,
 - majority of the friends' ethnicity,
 - use of other classmates' (or educators'),
 - problems at school due to its curriculum,
 - problems at school due to bullying,
 - causes of the bullying (due to ethnicity, different accent, etc.),
 - ambitions related to the education (degree of education of the respondents),
 - parents' influence on the respondent's studies,
 - importance of the education and self-education,
 - importance of the graduation (receiving of the diploma),
 - importance of the education of the future children of the respondents,
 - importance of the support of one's future children in their studies,
 - willingness to move in order to provide one's children better education,
 - importance of the education in the process of choice of a partner.
- 6) *Faith*
 - role of the faith in the course of respondents' studies,
- 7) *Integration*
 - parents' integration,
 - problems in the ordinary life (outside of school) due to different ethnicity,
 - possibility of living in a different country,
 - possibility of living in the country of their origin,
 - the UK as a home.

Axial coding

Based on the open coding, it is possible to observe the relationships between the codes – this is called *axial coding*.

Its purpose is to discover possibilities to merge some categories and their clear organization.

In the case of this paper's coding, the central point is the *student* (i.e. phenomenon) of a different ethnicity. They are influenced by three contexts (i.e. the influences): their *faith*, *family* and *life circumstances*. As causal conditions (i.e. conditions that are in the spotlight and directly influence the respondent's development), the authors chose the *education*, the *value of education* and the *student* themselves. As a so-called category of consequences, the authors chose the category of *troubles* which may influence both the students' integration and their study results as well. This coding resulted in the following Figure no. 1.1:

Figure no. 1.1: Axial coding.

Findings

In the present part of the article, the results based on the open coding are discussed. Based on categories which emerged during the coding in the above stated chapter of the paper, we proceed gradually also in the findings' interpretation. The most substantial results are summarized here together with comments of respondents themselves.

Demographic data

The number of respondents (asked in the UK) is 17 in total. It is possible to see the respondents' overview based on their ethnicity in the Figure no. 1.2 below.

Fig. 1.2 Respondents

Out of these 17 respondents, 11 of them are believers of various religions: seven Hindus (two of them Sikhs), one Buddhist, one Christian and two Muslims.

Arrival at the UK

Eleven respondents stated that their parents came to the UK due to job offers. Three families came in order to get better education and one due to the civil war in Syria. Both Czech families came to the UK to work there, however, one family came back to the Czech Republic.

Comparison of the UK with their country of origin (if possible)

According to students who were able to compare the countries (since they had spent at least several years in the country of their origin), education in the UK is more free and open. The education in the country of their origin, on the other hand, goes with the traditional education – considering even the teacher's status as an authority. The education is stricter, academic and focused on accuracy; however, the education in the UK brings a possibility to develop creative and critical thinking as well as the argumentation. An Indian, who stayed in India for several years and attended there a basic school as well, stated the following: „Yeah..so...the schools in India focus more on memorizing as much information as possible... On the other hand in England, more focus is put upon teaching methods and using that knowledge in practice... If I had to choose which country has better schooling, I'd have to opt for England ... In fact, with the strength, emphasis and resources the government can provide English schools I'd actually say the top ranked schools in India would compare with the lower ranked schools in England.... Child treatment? Hmmm.... I would probably say it depends on the family, actually even in England there have recently been laws put in place on child abuse. From what my English friends say, since the rules were put in place, child treatment in England has significantly improved. With no such rules in India yet, I'd compare child treatment over there to how it was in England about ten years ago. Hopefully India can catch up with England's improved laws as soon as possible.... For me personally then, let's just say... hmmm... laws or not, if I deserved it mum would definitely still give me a spanking. Moral of the story, don't talk back to my mum.” Considering the homeland memories, the respondents mainly remember the family members, scents and sounds, or the weather.

Language competence

All respondents stated that they are bilingual: while they know their native tongue, English is their second language. The surprising fact is that despite all the respondents are bilingual, they use both languages when communicating with their parents, not the native tongue solely. An Indian (living in Scunthorpe) said: “At home we normally speak in Hinglish...We say half of a sentence in Hindi, then finish it off in English. However, with Grandma we speak only in Hindi as that's what she prefers, and of course what Grandma says goes. My brother on the other hand, like me, has been brought up in England, so we only really chat to each other in English. Even though mum and dad speak to him in Hindi, unless he's getting told off, he'll just reply in English...”. Four respondents even stated that they speak with their parents only in English despite the fact that they are able to speak also in their native tongue. However, the respondents are used to speak with other family members which live in the country of their origin only in their second language.

Education

Fourteen respondents stated that their parents graduated and all of those were studying (at least for some time) also in their native country. Nine respondents started their compulsory school attendance in the UK at the age of four or five, the rest of respondents started to attend school in the UK later due to a fact that they were not living in the UK yet. One respondent (originally from the Czech Republic) stated that she started to attend a university in 2011.

Out of the total of 17 respondents, twelve of them stated that they attended state funded schools; on the other hand, five of them attended fee paying private schools. All but one respondents stated that their classmates were of various ethnicities and origins. A student from London (originally from India) stated the following (when commenting his classmates' ethnicity): “There were literally people from everywhere...Indians, Asians, Muslims, white people, black people... simply everyone. I do not even remember ever going to a school where it

would be mostly just one race...”. One respondent (residing in Manchester, of Pakistani origin) stated: *“At my primary school I was the only non-white person there...haha...oh, yeah! There actually was also one Indian girl... Yeah it was a private school.”*

All respondents stated that it was not difficult for them to make new friends. On the other hand, eleven respondents stated that they experienced discrimination or bullying. The majority of respondents did not want to talk about their unpleasant experiences, however, one respondent (of Syrian origin, living in London) was willing to give us some examples: *“Yeah, some children were... I guess...I dunno. Some of the worst things said were like my dad being called a terrorist, targeting me hurt but targeting my family was just plain low. I heard many jokes like that... Once on my desk someone wrote, “Your dad is a terrorist”. I felt so humiliated and embarrassed... I just remained silent and didn’t tell anyone. If I told my parents they’d worry, if I told the teacher then the kid would get in trouble, leading to me getting even more grief for being a “tad-tale”. One time the teacher took us aside and asked me whether I was okay, of course I didn’t say anything... so that was pretty much it. On the other hand, I wasn’t the only one... I remember kids even bullying the Caucasians... Now when I look back I wish I actually caused more drama around that issue ... but for instance my parents don’t know anything about it, I was too humiliated and ashamed, you know?”*

The education is important for all of the seventeen respondents while they also stated that their parents support them and encouraged them to study. All of them also stated that it is important for them to acquire new knowledge and the self-development itself. Four students stated that the graduation and the university degree is not important for them, however, that they want to have the knowledge. Twelve respondents stated that the education of their partners is not important for them, while sixteen respondents stated that they wish their parents to be educated as well. Nevertheless, thirteen of them stated that they want to support their children mainly in order to lead a happy life – regardless their university studies. If the children are happy without the university, the respondents will respect their decision.

Faith

Eleven respondents (out of the total seventeen) stated that they believers. Seven respondents stated that the faith did not mean nothing else than just the traditions and habits that were passed on by their parents. Four of them stated that they adopt the faith from their parents while now they practice it on their own. Two students stated that the faith means more to them now, when they are grown up, than it used to. For both Muslims, the faith is something that should be preserved and respected while it is an integral part of their everyday life. A respondent (of Pakistani origin, Manchester resident) stated: *“Religion to me is something that became increasingly important to me with age... When I was younger with a less independent mind I’d follow my parents’ footprints, print for print. With age, reading, maturity and experience I started thinking about what life actually means to me. Though I am less practicing than my parents, which I would put down to my environment, religion is essential to me. I firmly think religion should be private and a not a public show, my five prayers a day are only between me and Allah. By all means, ask me anything, I love a nice conversation, but don’t go around unnecessarily preaching. If you expect society to respect your beliefs, you must respect theirs also. Though I am a Muslim, there is a Biblical quote I live by supporting this notion, “Do unto others as you would have them do unto you.”*

Integration

All of the seventeen respondents stated that their family and themselves tried to integrate. Their parents associated with parents of their classmates, organized various events for children together, they invited neighbors (or their colleagues) over for a dinner, etc. Six respondents stated that they cannot imagine themselves living in their native country or that they do not want to live in their native country. However, fourteen respondents stated that they can imagine living in another country (i.e. not in the UK).

Conclusions and Recommendations

The aims of our research, i.e. the discovery of reasons of families coming to the UK, the question of their integration and troubles, the attitudes to the value of education and to the education in general, are fulfilled. Firstly, the authors discovered the reasons why the respondents' families came to the UK, secondly the education of respondents' parents. The authors also achieved to describe the students' perception of the UK in comparison with their country of origin, concerning both – general or educational aspects. Another aim was achieved while researching the integration of families and troubles which may occur during this particular process. The families struggled with a negative (and even discriminatory) response as well as open arms. The achievement of this aim smoothly overlaps into our last aim – i.e. discovery of the value of education, respondents' own view on the education and the troubles which they had to deal with. Besides the language-related and the knowledge differences, there emerged also the troubles caused by their different ethnicity. From the interviews with respondents, there emerged the fact that the respondents really appreciated the education and possibilities to educate – it may, therefore, be stated that their view on education is accompanied by a great deal of humbleness. This is often true among respondents of Asian origin. They tend to perceive education as something which is “facilitated” or “enabled” by their parents by the very arrival in the UK, therefore, the large effort of respondents to achieve their dreams or to satisfy their parents is clearly manifesting. The answer to the question whether the students perceive the value of education as the acquisition of findings and knowledge, or rather as receiving of a diploma, might, therefore, based on the answers of the respondents, be generalized as a combination of both. The value of education does not represent only the non-material perspective (the desire for knowledge), but the material perspective as well – the receiving of the diploma and the degree as well as the vision of better future.

From the research, many interesting findings emerge which might be used as a basis for further research. The creation of the comparison between the teachers' approaches and authority in the country of their origin (or in the country of respondents' origin) and in the UK might be inspiring, since even the respondents see a great difference in this field. Another issue might be the question of comparison between European countries' and Asian countries' concept of education since those two differs a great deal (based on the research presented in this article). This is also linked to the issue of perception of education and its value in the eyes of people. The fact that the possibility to study should be appreciated was undebatable, however, the question is whether it was influenced by their parents coming to a foreign country for better conditions, or if it is caused by generally different value ladder.

Now, the main question for us is, however, the faith support during the studies. This thought was suggesting itself more than once in previous researches for a deeper examination, that was the reason we decided to focus our attention there in our further research, mainly because of different attitudes to the faith of e.g. a Hindu and a Muslim. Therefore, it is interesting to research which role does their faith play in their studies, if they see a support in it, if it is more or less important for them when facing a difficult life situation (or even a difficult study situation).

A complex (and therefore not-easy-to-be-researched) element to research was the question of integration – mainly the struggles which the families had to face. The respondents had difficulties to talk about this issue, however, the topic of discrimination and bullying at schools (which is rooted in racism) is not less topical while it encourages to a deeper examination in more detail which we want to devote our time in the future. Due to a fact that this contribution is a part of a larger research (as it was already mentioned), the comparison with countries that we want to focus on in the future (i.e. the Netherlands, Belgium and with Ukrainians in the Czech Republic) suggests itself.

Psychological Traits in Teacher and Pupil Mutual Communication

Inguna GRISKEVICA

Abstract

Many factors contribute to a pupils' academic performance. Studies suggest that, between school-related factors, teachers matter most and have two to three times larger impact than any other school factor. Researchers provide various lists of necessary traits for the effective teacher. Fewer lists are provided on required traits for the effective pupil. The problem is that ideas about necessary traits of the effective teacher or effective pupil differ from the point of view of the viewer. This research examines pupil - teacher and teacher - pupil expectations about the necessary personal traits in the educational process. Participants are pupils (N=125, age 7 - 18) and teachers (N=30, age 32 - 64), all from the same regional school. A structured questionnaire developed on the basis of the theoretical studies was used. Ten traits for the effective pupil (discipline; freedom; will power; courage make mistakes; curiosity; goal; comprehension; belief in self; responsibility; politeness) and effective teacher (strictness; friendliness; high expectations; sense of humor; enthusiasm; care; explanatory; positivism; organized; politeness) were measured with ordinal and nominal scales. Results demonstrate significant difference between expectations and actual state evaluation concerning the teachers - for pupils about: care, strictness, high expectations, enthusiasm; for teachers about friendliness, enthusiasm, sense of humor and care; concerning the pupils - for pupils about: curiosity, belief in self, responsibility, politeness, freedom, courage make mistakes, comprehension; for teachers about freedom, curiosity, responsibility. The results suggest that difference in mutual expectations between teachers and pupils may interfere with the common awareness of the educational process. **Keywords:** Teacher, Pupil, Communication, Expectations, Traits.

Introduction

Hanushek (2011) has found that effective teachers raise students earnings. A teacher one standard deviation above the mean effectiveness annually generates marginal gains of over \$400,000 in present value of student future earnings (Hanushek, 2011). There have been numerous studies about the traits of the effective teacher (Hildebrand et al., 1971; Triana 1999; Stronge, 2007; Ko, Sammons & Bakkum, 2013). Effective teachers reach classrooms with preparation for teaching and possess optimistic attitudes about teaching, pupils and set no limits since they believe everyone can be successful (Walker, 2008). The top quality international teachers chose is to grade student work fairly (McCall, 2008). It is found that the qualities of an effective teacher are similar regardless of nationality in which teachers are described as effective as long as they have good personal or affective characteristics such as enthusiastic (Malikow, 2006; Walls, Nardi, von Minden, & Hoffman, 2002), respectful (Walker, 2008), and enjoys teaching (Walls, Nardi, von Minden, & Hoffman, 2002). Research claims three dimensions of expert teachers' behavioral traits that are suggested to be especially important - a challenge, deep representation, monitoring, and feedback (Hattie, 2003).

Teachers are not alone and they interact with pupils who need certain learning qualities to meet the demands of a modern, globalized world (Arnot et al., 2003). The most required traits for the effective pupil of the 21st-century school are the ability to built positive social relationships, ability to take responsibility for own learning, creativity, flexibility, the ability to express opinions, courage for innovations and initiative (Manefield et al., 2007; Alismail & McGuire, 2015). Although there are different perceptions and expectations between teachers and pupils about the most required traits in the education process and not always they match. Research has stated that the ideas about necessary characteristics of the participants in the effective education process differ from the point of view of the viewer (Holdsworth, 2005; Lyle et al., 2010; Wilson & Sproats 2009).

Method

This quantitative pilot study research was conducted in the framework of the project Erasmus+ K2 "Wind of Change" with the aim to introduce research-based practice in the school for the development of the dialogue between teachers and pupils (Wilson, 2002; Wilson & Sproats, 2009). This research examines pupil - teacher and teacher - pupil expectations about the necessary personal traits in educational process and comparison with the actual state evaluation.

Participants are pupils (N=125, age 7 - 18) and teachers (N= 30, age 32 - 64), all from the same regional school. A structured questionnaire developed on the basis of the theoretical studies was used (Hattie, 1989, 2003; Ko, Sammons & Bakkum, 2013; Manefield et al., 2007).

Ten traits for the effective pupil (discipline; freedom; will power; courage make mistakes; curiosity; goal; comprehension; belief in self; responsibility; politeness) and effective teacher (strictness; friendliness; high expectations; sense of humor; enthusiasm; care; explanatory; positivism; organized; politeness) were measured. Teachers and pupils had to rate in the hierarchy of traits the desired expectations for medium teacher and medium pupil within the ordinal scale from 1 to 10, and evaluate in the hierarchy of traits the actual state for medium teacher and medium pupil within the nominal scale from 1 to 10.

For data analysis Statistical Package for the Social Sciences (SPSS) predictive analytics software was used. The Mann-Whitney U-test was used to compare differences between two independent groups when the dependent variable is ordinal, but not normally distributed. For representation the number of standard deviations between each data point the mean Z-scores, and for a probability of observing result from a sample, p-values are reported.

Findings

Teachers' and pupils' expectations differ significantly concerning the teacher in hierarchy of traits about friendliness ($p < .05$), high expectations ($p < .05$), care ($p < .001$), organized ($p < .001$). Analysis of the results is shown in Table 1.

Table 1. Differences between teachers' and pupils' expectations about what should be the teacher

Variables	U	Z	p
Strictness	804.50	-.381	.703
Friendliness	473.00	-2.829	.005*

Results, Conclusions, and Recommendations

Results demonstrated that pupils have a significant difference between expectations and actual state evaluation concerning the teacher in the hierarchy of traits about care, strictness, high expectations, enthusiasm. Pupils expected to care, strictness, high expectations, and enthusiasm to be less expressed as required traits for teachers than it was valued to be displayed by teachers in the school routine.

Teachers demonstrated a significant difference between expectations and actual state evaluation concerning the teacher in the hierarchy of traits about care. Teachers expected care to be the less required trait for a teacher but valued it as the most displayed in the school routine. Results demonstrated that teachers have a significant difference between expectations and actual state evaluation concerning the teacher in the hierarchy of traits about friendliness, enthusiasm, sense of humor. Teachers expected friendliness, enthusiasm, and sense of humor to be a more required trait for a teacher than it was valued to be displayed in the school routine.

Results show that teachers' and pupils' expectations differ significantly concerning the teacher in the hierarchy of traits about friendliness, high expectations, care, and organization. Friendliness was the most expected trait from the teacher by pupils, while teachers rated it as one from the less important traits. High expectations were one from the most expected trait from the teacher by teachers, while pupils rated it as one from the less important traits. Care pupils rated as more important trait than teachers. Being organized was the most expected trait for teachers from teachers, while pupils did not see it as a very important trait.

Results demonstrated that pupils have a significant difference between expectations and actual state evaluation concerning the pupil about curiosity, belief in self, responsibility, politeness, freedom, courage to make mistakes and comprehension. Pupils expected from themselves to have more curiosity, belief in self, responsibility, and politeness than they valued these traits to be displayed in the school routine. Contrary, they expected that freedom, courage

make mistakes and comprehension are not important traits for pupils, while valued to be strongly expressed by them in the school routine. This suggests, that there are many traits about which pupils do not feel adequate in the school routine. The traits that are connected with the free personal expression they value more negative in the school context and are critical about traits that are connected with learning motivation.

Conclusions suggest that pupils may have a very different picture from teachers about what is expected from them as pupils. Teachers may expect different traits from pupils than pupils think, what teachers expect from them. Pupils may undervalue such important traits for learning process like freedom, courage to make mistakes and comprehension. Teachers agree with the pupils that curiosity and responsibility are important traits, that are expected from the pupil, but not enough displayed in the school routine. Results demonstrate that teachers have a significant difference between expectations and actual state evaluation concerning the pupil about freedom, curiosity, responsibility. Freedom by teachers was rated as the least important trait for the pupil and the most displayed in the school routine.

Recommendations suggest noting that difference in mutual expectations between teachers and pupils may interfere with the common awareness of the educational process. Obvious that pupils want to see teachers more friendly, careful and less formal, while teachers underline organizational traits. Interesting that meanwhile enthusiasm is not highly valued by both - pupils and teachers, which may lead to the deprivation of the excitement in the learning process and to the formalization of the school activities (Malikow, 2006; Walls, Nardi, von Minden, & Hoffman, 2002). If freedom is seen as a more negative trait for the school environment, we may miss the development of curiosity, responsibility, courage to make mistakes and comprehension, which are essential traits for the teaching and the learning process.

Abstract

This study has been conducted with the aim of examining the technological pedagogical content knowledge of teacher candidates who study Pre-school Teaching in Faculty of Education, Sakarya University, based on variables such as age, gender, grade level and access to the technology. The target population and sample of the study is comprised of 316 teacher candidates (16 male, 300 female) who is currently studying in Sakarya University, Faculty of Education. In the study, data was collected by means of "Technological Pedagogical Content Knowledge (TPACK) Scale", which was developed by Schmidt, improved by D.A., Baran, E., Thompson, A.D., Mishra, P., Koehler, M.J. ve Shin, T.S., (2009:140), and translated into Turkish by Horzum, Akgün and Öztürk (2014). The data analysis was implemented by SPSS 20.0 Statistics Package Programme. Kolmogorov-Smirnow test was applied in order to figure out normalisation of the data. Mann-Whitney, Kruskal-Wallis test and correlation analysis were used in the analysis of percentage, frequency, arithmetic mean, standard deviation values throughout the data analysis. It was discovered at the end of the study that technological pedagogical content knowledge of pre-school teacher candidates was quite adequate.

Key words: TPACK (Technological Pedagogical Content Knowledge), Pre-school Teacher Candidates

Introduction

A change from the technology-based approach into a pedagogy-based approach is observed today. The utmost goal of the pedagogy-based education model is that teachers, and teacher candidates should associate their technology use which they attain during the education period with their pedagogical knowledge, while the technology-based education model aims at letting teachers and teacher candidates attain every sort of information, skills and experience. (Yurdakul, 2011:400).

The most significant assistant technology from which teachers get support in order to make learning more efficient and permanent when they prepare learning environment is training technologies in pedagogical sense. It is only with the help of adequately received pre-service training to be able to succeed in this field.

During the pre-school education phase where children have got the biggest curiosity and wish to learn everything, teachers who have undergone education in this field, and teacher candidates who are still undergoing education in this field have to improve themselves in terms of both technology and pedagogy, to be open to changes and to include training technologies in the classroom setting for most of the time. This study can be considered to be crucial, in that it will contribute to the studies conducted on pre-school education where our children have their first experiences in the educational setting. This study will reveal techno-pedagogic competences of pre-school teacher candidates during the pre-service training who will have an important part in students' lives as their first architects and lead the way to other studies which would be conducted in this field with a view to covering up deficiencies in this field.

Problem

What level is pre-school teacher candidates' techno-pedagogic content knowledge at?

Sub problems

Is there any reasonable differentiation between pre-school teacher candidates' levels of technological pedagogical content level in terms of their gender?

Is there any reasonable differentiation between pre-school teacher candidates' levels of technological pedagogical content level in terms of their grades?

Is there any reasonable differentiation between pre-school teacher candidates' levels of technological pedagogical content level in terms of the level of their technology use?

Method

Information on the model, target population and sampling, data collection and analysis is available in this part.

The study is relational screening model and submits a descriptive quality. Screening model aims at describing a past or present situation as it is. (Karasar, 2012).

The target population and sampling of the study are comprised of 316 teacher candidates who study in Sakarya University, Faculty of Education, Department of Pre-school Teaching in fall/spring semesters of 2016-2017 educational year.

Technological pedagogical content knowledge test was used in order to measure teacher candidates' self-efficacy perceptions regarding their own technological pedagogical content knowledge. This scale is made up of 5 Likert 51 items. The scale was developed by Horzum, Akgün ve Öztürk (2014:257) in a way that it could be comprised of 7 sub dimensions which would measure self-efficacy perception on technological pedagogical content knowledge.

The sub factors of the scale are "technology", "pedagogy", "content", "technological content" and "technological pedagogical content knowledge self-efficacy". Internal consistency parameters of the factors of the scale were found as .86, .85, .89, .79, .90, .90 and .90 successively. Kaiser-Meyer-Olkin (KMO) and Bartlett test were applied for the behalf of the construct validity of the scale. KMO value is used with the goal of measuring proficiency of the sampling on conducting factory analysis and this value should be at least .60 (Büyükoztürk, 2010). KMO value of the scale was measured as .78 in the study. The result of Bartlett test (Barlett test of Sphericity), which illustrates the statistical relevance of the general correlation matrix which shows correlations between the variables which are put into factor analysis, should also be statistically relevant (Büyükoztürk, 2010). Bartlett test was found relevant at the end of the applied analysis.

The data attained in the study were analysed through SPSS 20.0 Statistical Package Programme. Kolmogorov-Smirnow test was applied with the aim of testing whether the data showed normal distribution or not, and non-paramethic tests were carried out, since the data was discovered not to distribute normally. Percentage, frequency, arithmetic mean, standard deviation, Mann-Whitney, Kruskal-Wallis tests and correlation analysis were used in the analysis of values throughout the data analysis related to the sub-problems.

The significance level was accepted as .05 in the testing phase of the significance of the differences. Moreover, the items were grades as follows; "1"- Not Adequate (1.00–1.80), "2"- Almost not adequate (1.81–2.60), "3"- Barely Adequate (2.61–3.40), "4"- Quite Adequate (3.41–4.20), "5"- Very Adequate (4.21–5.00).

Findings

Averages and standard deviations of pre-school teacher candidates' points from technological pedagogical content knowledge (TPACK) are presented on Table 1.

Table 1. TPACK points of Pre-school teacher candidates

Sub-dimensions	N	\bar{X}	Ss
Technology Knowledge	314	3.73	.71
Pedagogical Knowledge	314	3.91	.60
Content Knowledge	314	4.03	.60
Technological Content Knowledge	314	3.88	.60
Pedagogical Content Knowledge	314	4.01	.61
Technological Pedagogical Knowledge	314	3.99	.61
Technological Pedagogical Content Knowledge	314	3.98	.62

From the dimensions of the scale regarding technological pedagogical content knowledge, the average of technology knowledge was found $\bar{X} = 3.73$, pedagogical knowledge $\bar{X} = 3.91$, content knowledge $\bar{X} = 4.03$, technological content knowledge $\bar{X} = 3.88$, pedagogical content knowledge $\bar{X} = 4.01$, technological pedagogical knowledge $\bar{X} = 3.99$, technological pedagogical content knowledge $\bar{X} = 3.98$.

When arithmetic means for the sub-dimensions of the scale are checked, it can be noticed that the arithmetic mean of all the dimensions is 3 or 4 points higher than the average value, which shows that the technological pedagogical content knowledge of pre-school teacher candidates is above the average. Furthermore, the facts that the dimension of "content knowledge" is of the highest score and the dimension of "technology knowledge" is of the lowest score have also come into existence.

Table 1a. TPACK Significance Values to Gender

		Kolmogorov-Smirnov		
		Statistics	sd	p
Technology Knowledge	Female	,122	297	,000**
	Male	,213	17	,039*

	Male	,127	17	,048*

*p < .05; ** p < .01

Table 1a illustrates that the scale scores are not normal distribution in terms of gender, since the level of significance is lower than 0.05 as Kolmogorov-Smirnov test has shown.

The results of Mann Whitney U test, which was applied in order to identify whether there is any significant difference between the scores of female and male pre-school teacher candidates on the technological pedagogical content knowledge, are illustrated on Table 1b.

Table 1b. TPACK scores of teacher candidates to gender

Dimensions	Gender	N	\bar{X}	Mean rank	Mean total	U	p
Technology Knowledge	Female	297	3,73	157,45	46762,50	2509,500	,967
	Male	17	3,70	158,38	2692,50		
Pedagogy Knowledge	Female	297	3,94	161,69	48023,00	1279,000	,001**
	Male	17	3,41	84,24	1432,00

	Male	17	3,64	111,24	1891,00		
Technological Pedagogical Content Knowledge	Female	297	4,00	160,16	47568,00	1734,000	,029*
	Male	17	3,64	111,00	1887,00		

*p < .05; ** p < .01

No significant difference among teacher candidates' technological pedagogical content knowledge related to the dimensions was found in terms of the gender variable just in the sub-dimensions, "Technology knowledge" and "Technological content knowledge" (p > .05). As to the other dimensions, the scores of female pre-school teacher candidates on the technological pedagogical content knowledge were discovered to be relatively higher than men's.

Table 2a illustrates that the scale scores are not of normal distribution in accordance with the grade level, since the significance level is lower than 0.05 according to applied Kolmogorov-Smirnov.

The results of Kruskal Wallis, which was carried out with a view to identifying possible significant differences among the scale scores among the teacher candidates who study in different grades, are exhibited.

Table 2b. TBACK scores of pre-school teacher candidates to grade level

When Kruskal Wallis test on Table 2b is examined, the scores of pre-school teacher candidates on technological pedagogical content knowledge related to the dimensions were found to vary significantly in terms of their grade (p < .01; p < .05). According to the results of Mann Whitney U test, which was carried out with the aim of identifying to what grade this differentiation pertains, it was discovered that, as the grade of the teacher candidates increases, their level of technological pedagogical content knowledge also increases.

	Adequate	,127	269	,000**

*p < .05; ** p < .01

The data on Table 3a reveals that the scale scores are not of normal distribution in terms of gender, since the relevance level, according to Kolmogorov-Smirnov test, is lower than 0.05.

The results of Mann Whitney U test, which was applied with a view to identifying whether there is a significant difference in their self-efficacy levels in technological pedagogical content knowledge related to the dimensions, are presented on Table 3b.

Table 3b. TPACK scores of pre-school teacher candidates to their level of using the technology

Dimensions	Tech. Use	N	\bar{X}	Rank Mean	Rank Total	U	p
Technology knowledge	Not Adequate	44	3,1 2	69,68	3066,00	2076,00	,000*
	Adequate	269	3,8 8	171,28	46075,00	0	*
Pedagogy knowledge	Not Adequate	44	3,6 3	100,75	4433,00	3443,00	,000*
	Adequate	269	3,9 6	166,20	44708,00	0	*
Content knowledge	Not Adequate	44	3,8 3	120,17	5287,50	4297,50	,000*
	Adequate	269	4,1 1	163,02	43853,50	0	*
Technological content knowledge	Not Adequate	44	3,4 5	96,99	4267,50	3277,50	,000*
	Adequate	269	4,0 0	166,82	44873,50	0	*
Pedagogical content knowledge	Not Adequate	44	3,8 5	111,48	4905,00	3915,00	,000*
	Adequate	269	4,0 7	164,45	44236,00	0	
Technological pedagogical knowledge	Not Adequate	44	3,5 9	76,61	3371,00	2381,00	000**
	Adequate	269	4,0 5	170,15	45770,00	0	
Technological pedagogical content knowledge	Not Adequate	44	3,6 1	94,49	4157,50	3167,50	,000*
	Adequate	269	4,0 1	167,22	44983,50	0	*

*p < .05; ** p < .01

According to what Table 3b shows, a significant difference was attained in the scores of pre-school teacher candidates in technological pedagogical content knowledge related to the dimensions in terms of the variable of the level of using the technology ($p < .01$). It was discovered that the technological pedagogical content knowledge scores of the pre-school teacher candidates who consider themselves competent in using the technology are significantly statistically higher than those of teacher candidates who do not consider themselves competent in using the technology. In other words, it can be said that, as pre-school teachers' level of using the technology increases, the competence of technological pedagogical content knowledge also increases.

Discussion, Conclusion and Suggestions

Applied analyses;

- Illustrate that self-efficacy perceptions of pre-school teacher candidates, regarding the technological pedagogical content knowledge are above the average. Furthermore, it has been discovered that “content knowledge” is of the highest score, while “technological knowledge” is of the lowest score. Self-efficacy perceptions related to technological pedagogical content knowledge in all sub-dimensions in general has been figured out to be in the level, “quite adequate”.

- Self-efficacy perceptions of pre-school teacher candidates based on technological pedagogical content knowledge related to the dimensions has been found to be relatively higher for female pre-school teacher candidate teachers in all dimensions except for the sub-dimensions, “Technological knowledge” and “Technological content knowledge”.
- Moreover, the result that, as the grade of the pre-school teacher candidates increases, their level of self-efficacy on technological pedagogical content knowledge also increases has been figured out.
- The other result is that, as the pre-school teacher candidates’ level of using the technology increases (which means they consider themselves competent), their level of self-efficacy perception for technological pedagogical content knowledge will also increase.

As the domestic studies which have been conducted in this topic are taken into consideration, in the studies which were conducted by Aksin (2014:20) in order to investigate TPACK level of form teachers, it figured out that the form teachers’ TPACK level was higher than the medium level. It was also discovered that their lowest level of knowledge belonged to technological one and the highest level of knowledge pertained to the knowledge associated with their own field.

In another study which was implemented by Kiylik (2016:4), it was ascertained that TPACK level of students of associate degree was high; however, their technological, pedagogical and field knowledge were higher than the medium level. Furthermore, in Kiylik’s study, contrary to this study, grade level and technology use were not of any effects on TPACK level of the students. On the other hand, another result of this study which is parallel with this study was that gender is not a distinguishing variable.

The foreign studies conducted in this topic show that Koh and Sing (2011:740) analysed TPACK levels of teacher candidates in terms of various variables; while other variables, as they do in this study, show significant differences in TPACK levels of the teacher candidates, demographical features such as age and gender were not of any distinguishing qualities.

Based on the results attained in this study, suggestions for further studies in this topic can be listed as follows;

- It was observed that the department on which is studied the least is pre-school teaching when TPACK screening was carried out. Further studies can be implemented in this topic regarding pre-school teaching.
- Our teacher candidates were discovered to have been given theoretical lessons rather than practical ones related to how to integrate technology into classroom settings in pre-service trainings. Teacher candidates can be provided with more opportunities of experience in pre-service training through which they will have more application opportunities.
- Teacher candidates can be demanded to prepare many more technological applications during practicum phase, and technology can also be integrated with the assessment aspect.
- While almost every teacher candidate today has got more access to the technology, this variable has been able to present any qualities. This topic can be more scrutinised in further studies.
- This study is only limited to Hendek district of Sakarya province. Further studies can be implemented in various provinces and geographical districts in order for the study results to be compared and popularised.
- Only quantitative measurement instruments were used in this study. Qualitative measurement instruments can also be added to further studies in this field.

Abstract

Intellectual disability is characterized by significant limitations in both intellectual functioning and adaptive behavior that is expressed in conceptual, social and practical skills (Schalock, et al., 2010). Being labelled as an individual with an intellectual disability has got life-long consequences both for the child and his/her family, influencing experiences in many aspects of their lives (Parchomiuk, 2007), including the child's education. This paper examines mothers' perspective on education of their children with intellectual disabilities. The authors made an attempt to answer two research questions: What is the mothers' of children with intellectual disabilities perception of education of their children? What contributes to the mothers' of children with intellectual disabilities perception of education of their children? The findings are based on a secondary analysis of a qualitative data (Corti & Thompson, 2007; Johnston, 2014) gathered in four previous research projects (Bartnikowska & Ćwirynkał, 2013; Ćwirynkał & Żyta, 2014; Kimbar, 2015; Szczepański, 2017). In total, 25 in-depth interviews with mothers of children with intellectual disabilities were analyzed. In the analysis two main categories of description referring to education emerged: (1) places (a dream and a real school, kindergarten or institution for a child with an intellectual disability, a place of living as a determinant of parents' choice of an educational institution), (2) persons (teachers and specialists whose work influences the quality of a child's education, their attitudes and competences, a child's typically developing and disabled peers and mothers themselves as their children's animators and educators). Based on the categories, the authors presented answers to the research questions. Implications for practice are also discussed.

Keywords: intellectual disability, education, mothers

Introduction

Intellectual disability is characterized by significant limitations in both intellectual functioning and adaptive behavior as expressed in conceptual, social and practical skills (Schalock, et al., 2010). Being labelled as an individual with an intellectual disability has got life-long consequences both for the child and his/her family (Kwaśniewska, 2005, Parchomiuk, 2007, Pisula, 2007, Kaniok, 2011, Żyta, 2011).

The diagnosis of an intellectual disability in a child induces complex feelings in mothers. Mothers of intellectually disabled children, who are often their main caregivers, are often prone to suffer from anxiety, depression (Quasir, et al., 2015, Chandravanshi, et al., 2017) and excessive stress (Abbeduto, et al., 2004, Burke & Hodapp, 2014) that may cause burnout (Bilgin & Gozum, 2009). This may be due to the fact that they face numerous challenges that refer to more difficult economic situation (Twardowski, 1999), care and rehabilitation burden (Pisula, 1998) as well as the deprivation of needs, desires and expectations (Twardowski, 1999). The need to change certain aspirations and expectations referring to a child with a disability (especially if this is an intellectual disability) also involve the sphere of the child's education. Nonetheless, there is little research available on mothers' perspective of their intellectually disabled children's education.

In the current research report the authors illustrated the result of secondary qualitative data analysis based on 4 datasets and 25 transcripts of interviews with Polish mothers of children with intellectual disabilities. The main aim of this enquiry was to examine mothers' perspective on education of their children with intellectual disabilities.

Method

Secondary Qualitative Data Analysis

Archived qualitative data as a source of research material, although often unexploited and uncommon, is considered to be rich and unique (Corti & Thompson, 2007). There are several advantages of the reuse of qualitative raw materials, e.g. it may cut costs and accelerate the pace of research (which is important for researchers with limited resources and time), avoid duplication of effort, gain methodological and substantive insights (Corti & Thompson, 2007, Johnston, 2014). Reanalysis of the qualitative data allows either reinterpretation or investigating new research questions and the importance of this method is emphasized both in case of reanalyzing other researchers' material (Corti & Thompson, 2007) and one's own material (Åkerström, et al., 2007).

Since secondary analysis is a systematic method, certain procedures and steps can be distinguished in the process of conducting the research. According to Johnston (2014) the steps include the following tasks: (1) developing the research questions, (2) identifying the dataset, (3) evaluating the dataset. The authors applied this model in the present study.

Step 1 Developing the research questions

The aim of this research was to gain an in-sight view into mothers' perspective on education of their children with intellectual disabilities. In the study two research questions were developed:

Research Question 1: What is the mothers' of children with intellectual disabilities perception of education of their children?

Research Question 2: What contributes to the mothers' of children with intellectual disabilities perception of education of their children?

Step 2 Identifying the datasets

In the process of identifying the datasets to reuse in order to answer the research question, the following criteria were taken into account:

- participants of the primary study: mothers of children with intellectual disabilities,
- methodology employed in the primary study: qualitative character, interviews as a method of collecting the data,
- time of data collection: the material no more than 5 years old,
- availability of the raw primary research material: access to transcripts of the interviews.

As a result, four datasets based on primary research projects were chosen for the analysis.

Primary research project 1

The first research project (Bartnikowska & Ćwirynkało, 2013) was designed to explore the situation of adoptive and foster families with children with disabilities of different types, e.g. intellectual disability, autism, hearing impairment, visual impairment, serious chronic disease. In total, adoptive and foster parents from twenty families were included in the research. The authors used an interpretative paradigm (Husserl, 1989) and a phenomenography (Paulston, 1993) as a method in this qualitative study. In the process of coding the transcripts from the interviews grounded theory by Charmaz (2009) was applied.

For the purpose of the present study only 8 interviews with 4 adoptive and 4 foster mothers raising children with intellectual disabilities were taken into account for the analysis. The mean age of these participants was 46.25

(minimum=30, maximum=60) and the mean age of their children with mild to profound intellectual disabilities was 12,45 (minimum=6, maximum=23). Six interviewees raised one child with an intellectual disability, one had 2 and one – 3 children with this type of a disability. In order to identify the mothers in this study, they were given symbols from P1-1 to P1-8.

Primary research project 2

The aim of the second research project (Ćwirynkało & Żyta, 2014) was to gain in-depth view into the experiences of mothers of children with Down syndrome. Unstandardized, unstructured, face-to-face interview (Gudkova, 2012) was utilized for data collection and a phenomenographic approach (Morton, 1981) was applied to gather different ways of understanding and experiencing the phenomenon of having a child with an intellectual disability. To code the transcripts, elements of grounded theory were used (Charmaz, 2009).

The purposive sample consisted of 10 biological mothers of children with Down syndrome. The mean age of the participants was 39.36 (minimum=31, maximum=56) and their children – 7.18 (minimum=1, maximum=16). For the purpose of this study, the authors used symbols from P2-1 to P2-10 to identify the mothers interviewed in this project.

Primary research project 3

The purpose of the third research project (Kimbar, 2015) was understanding the motherhood as described by mothers of children with a profound, multiple intellectual disability of a child. The specific research problems referred to mothers' reactions to the diagnosis of their children's disability, their difficulties, level of satisfaction with being a mother, relationships with their children and perceptions of the future. In the study a qualitative strategy (Rubacha, 2008) and an unstructured interview (Gudkova, 2012) was applied in order to show unique, individual experiences of the mothers. The sample consisted of three mothers (aged 38, 43 and 45) of children with profound, multiple, intellectual disabilities (children's ages respectively: 8, 5 and 16). The symbols used for the mothers' identification in this study were P3-1, P3-2 and P3-3.

Primary research project 4

The last primary research project (Szczepański, 2017) was aimed to analyze the process of coping with an intellectual disability of children by their mothers. Specifically, the author analyzed the mothers' reactions to the diagnoses of their children, the changes after the children's birth as well as resources and support that mothers received and needed. In the project in-depth, face-to-face interviews were utilized for qualitative investigation. Data was collected using a semi-structured questionnaire prepared by the author. The purposive sample consisted of 4 mothers, aged 45, 52, 55 and 72, of children with a severe or moderate intellectual disability. The mothers' children's ages varied from 8 to 49. In the present study the symbols used to identify the mothers from this primary project were P4-1 to P4-4.

Table 1 presents the summary of the datasets used for secondary data analysis.

Table 1. *The Datasets for secondary data analysis*

Dataset	Primary interviews with mothers of children with intellectual disabilities
Dataset 1: Bartnikowska & Ćwirynkało (2013)	8
Dataset 2: Ćwirynkało & Żyta (2014)	10
Dataset 3: Kimbar (2015)	3
Dataset 4: Szczepański (2017)	4
Total: Four Datasets	25

Source: Inspired by Long-Sutehall, T., Sque, M. & Addington-Hall, J., (2010). Secondary analysis of qualitative data: a valuable method for exploring sensitive issues with an elusive population? *Journal of Research in Nursing*, 16(4) 335–344

Step 3 Evaluating the datasets

Ethics of primary data collection

Questions of confidentiality and agreements necessary to make at the time of fieldwork remain the prime anxiety of researchers (Corti, et al., 2000). In each of the primary research projects (Bartnikowska & Ćwirynkało, 2013, Ćwirynkało & Żyta, 2014, Kimbar, 2015, Szczepański, 2017), the participation of the interviewees was voluntary and anonymity was guaranteed. The participants were informed about the aims of the research, gave written consent to take part in it, to record and transcribe the interviews as well as to code and store the data. The consents were either created by the primary researchers or based on the form proposed by Rapley (2010). Each of the interviews in the projects was performed in a suitable physical environment.

Ethics of secondary data collection

The ethical issues of secondary data collection are partially associated with the researchers responsible for collecting the material in primary research projects and the entities to reuse the datasets. In the first two research projects (Bartnikowska & Ćwirynkało, 2013, Ćwirynkało & Żyta, 2014), the authors of the present study participated in collecting and analyzing the primary data and were entitled to dispose it. In case of the latter two (Kimbar, 2015, Szczepański, 2017), these were Bachelor theses written under the supervision of Ćwirynkało, a co-author of this study and the researchers were granted permission to access the raw material and supporting documentation from the projects from the University of Warmia and Mazury in Olsztyn, Poland where the theses were prepared.

Coding and categorization analysis

Coding and categorization proposed by Flick (2010), Kvale (2010) and Gibbs (2011) was used in the analysis of the current research. The analysis involved five steps:

- coding of words generated from verbatim data of 25 transcripts of interviews from 4 datasets,
- categorization: grouping the codes generated from verbatim data into broader categories,
- comparison of categories and examination of their relations to the research questions,
- categorization: segmentation the verbatim data according to the research questions,
- presentation of the results in a text (Kvale, 2010, Bartnikowska, Ćwirynkało & Borowska-Beszta, 2017).

Findings

The process of the analysis of the verbatim data started with generating the codes and grouping them into broader categories. As a consequence, two main categories of description of education of a child with intellectual disabilities in the perception of mothers were distinguished. These are:

(1) places: the category included two subcategories: (1a) places of living and (1b) places of education,

(2) persons (main people influencing the process of education): three subcategories: (2a) specialists (teachers), (2b) children' peers (with and without disabilities) as well as (2c) mothers themselves.

In the next step the comparison of categories and examination of their relations to the research questions took place.

The categorization of the verbatim data according to the research questions allowed us to answer them.

As far as Research Question 1 (What is the mothers' of children with intellectual disabilities perception of education of their children?) is concerned, the interviewees presented their visions of both real and ideal

educational institutions for their children with intellectual disabilities. The visions were located mainly in the subcategory 2b: places of education.

Below we present some mothers' statements that refer to the desirable or dream places of learning for a child with a disability:

"I used to dream that David would go to a mainstream school" (P2-4)

"I think all these groups [in kindergarten] should be inclusive. All the children in her [the interviewee's daughter's] group are really cool but they all have some disadvantages" (P2-8)

"I would like her to attend this school here, where we have classes organized by our Association [on Down Syndrome]... Here there are only a few students in the class. And these classrooms are really well equipped" (P2-9)

These statements are very diverse and reveal the hierarchy of values of particular mothers and their dreams. The dreams refer to interviewees' desires for a child to be either included in a public school or to find an ideal specialist centre that would support a child with (a certain type of) a disability. It is worth noting that the options to choose from are considered with taking into account the positive impact the institution may have on a child's development.

The dream educational institution can be either very different or quite similar to institutions that children actually attend (or attended) to. The first situation can be illustrated by two mothers of children with Down syndrome::

"Now he is in an integration class, third grade. There are 5 children with statements there but he's the only one with Down syndrome. I know they [teachers] would love to get rid of him. This school is a sort of fiction. They would like to have students with minor disorders [...] And kids like my son cause a problem. He needs more time, more attention, they need to look after him so that he didn't leave" (P2-6)

"This is a group for children with profound intellectual disabilities. I also have my objections. He was the youngest then [...], everyone admired him, because he's not aggressive, nice, not very absorbing... But he's been there for so many years and they don't know that he goes to the toilet by himself, and they take him when they feel like it..." (P2-11)

In both cases mothers perceived schools of their children as places that require improvements. Some interviewees, however emphasized only good aspects of the schools their children went to:

"I believe that it's really great when a child goes to an integration class and keeps in touch with various people and since the very beginning they're looked after. (P2-2)

"I like it that she is here in this [special] kindergarten. I can see all these kids playing. The older help the younger. They have such good relationships. (P2-9)

An interesting theme that emerged in the analysis was connected with the choice of school/kindergarten (mainstream or special) or educational institution for a child with an intellectual disability. Actually, this was the theme that in many ways joined all the categories distinguished in the study. The mothers' decisions and desires referring to their children's education were varied: some of them decided on mainstream, others on special institutions for their children. What is more, their desires did not always match the reality they encountered. Generally, the choice of a certain school or kindergarten depended on such factors as:

- the place of living: a long distance to school/kindergarten was considered as a limitation – problems with transportation, sometimes connected with the necessity of choosing a boarding school;
- mothers' views on the role of peers: perceiving the peers either as abusers who might hurt a child with an intellectual disability or children who would be good models and would motivate children with disabilities to learn,

- mothers' opinions about specialists (teachers/therapists): their competences and attitudes towards children with intellectual disabilities,
- availability of professional support for a child with an intellectual disability: therapy, didactic aids etc.,
- the functioning of their children: their abilities and competencies,
- mothers' expectations about educational institutions: the therapies they offer and the process of teaching (including the aim of teaching).

Looking for the answer to Research Question 2 (What contributes to the mothers' of children with intellectual disabilities perception of education of their children?), we distinguished several factors that refer both to places (category 1) and persons (category 2).

The place of residence determines the place of a child's education, which is clearly illustrated in the statements of mothers:

"There are some cool schools near here, these special ones" (P1-4)

"Over there, in O., there are more possibilities. There are schools and everything... And here we have nothing... The closest school is in B., and this is a boarding school. My Paul attends a normal school in K., but this is only because there are no special schools" (P2-6)

"This is a small village and it's definitely different from a big city (...) There is no special school here. There is just one, quite far away, somewhere in the woods, far away from the people. An old communist institution, because they built it this way then" (P2-1)

As the analysis of the interviews shows, the place of living of a family is the first limitation in choosing a child's educational institution. Mothers analyze local resources and look for optimal solutions for their child and family. The distance from the place of residence to an educational facility as well as the possibility of transporting a child appear to be essential factors in choosing a school or kindergarten. The choice is often dictated by purely practical and logistical considerations.

On the one hand, the statements reveal the determinism of the place of living, but, on the other hand, some mothers reveal their active attitude towards finding the right school / kindergarten for their child. In these cases, not only logistical considerations, but also an appropriate offer that would fulfill the child's needs appears to be important. Mothers make a kind of 'profit and loss' balance and on this basis they make decisions about the child's education. This is illustrated in the following quote:

"Our elder daughter goes to school in the village, and the younger to this kindergarten on P. Street. Earlier she used to go to this [special] kindergarten in T., but all the extracurricular activities were here and it was really tiring to go there so far. And now she's got everything in one place" (P2-5)

The second category highlighted in the interviews and related to the Research Question 2, refers to persons. This category was divided into three subcategories: (1) specialists (teachers, therapists), (2) peers and (3) mothers.

Subcategory 1: Specialists

Beneath there are two distinctive statements about specialists:

„It all depends on the people who work there. It can be fantastic in a mainstream kindergarten, with wonderful people, where a child will be fantastically welcomed and will feel great, and there can be a hopeless integration kindergarten. It all depends on the people who work there. (...) There is, for example, a wonderful therapist here – she runs sensory integration classes. Children love her and she says: 'I'm having a great time with the kids and I get paid for it!' And that's how it should be" (P2-2)

"There was an amazing Mrs. Karolina who started working with David. At first she was scared, but now she is his favorite teacher." (P2-4)

These narratives refer to the therapists' ability to get on well with the child and the child's feelings about the therapists. Apparently, the interviewees perceive the teacher's involvement and his / her attitude towards the child as a basis for learning. These elements are usually described in more detail, which may indicate the importance of the relationships between teachers / therapists and children to the mothers.

The therapists' attitudes towards parents are also important which is illustrated in the following statement:

"A school psychologist who is a specialist in the rehabilitation of such children helped me a lot. I can always count on her advice or support from her. This is a wonderful woman" (P4-3)

It depicts yet another relational aspect that refers to education: the ability to interact with the parent and support him or her. It turns out to be more important than the type of an educational institution (public, integration or special).

The second element referring to specialists is their competence and the specialized support they can offer to their child:

"There are two form teachers and an assistant. And there are additional speech therapy and sensory integration classes" (P2-5)

"Celinka has been attending private sensory integration classes for a year and she has a speech therapy at school" (P1-2)

"At school, a psychologist and a speech therapist take care of my daughter. She also attends hippotherapy, hydrotherapy. We also go to a therapist and he works with her to improve her relationships with friends." (P1-6)

Interestingly enough, although the interviewees reported on numerous and various therapies their children attend, they did not emphasize this as much as the attitude of the teacher / therapist towards the child. Furthermore, some of them critically evaluated the place of education of the child in this respect:

"We still have to fight with teachers. They would love to relinquish him [a son with a disability] to another institution. (...) We [parents of children with disabilities] often organize different trainings or suggest what can be done" P2-1

In this case the teachers' behaviour is a source of disappointment for the mother. She perceives them as people rejecting children, feckless, and lacking a creative approach to the child.

Subcategory 2: Peers

Peers (both able-bodied and disabled) form another group of persons that contribute to the quality of education of children with intellectual disabilities. The statements of the mothers concerning this topic are extremely extensive. The interviewees separately described their children's contacts with typically developing and disabled peers.

a) Typically developing peers

Some statements do not refer to actual contacts of the mothers' children with peers but rather to the ideas of parents who would like their children to be in touch with their typically-developing peers:

"I think she would develop better among able-bodied peers" (P1-4)

"I would very much love Jake to go to an integrative kindergarten so that he was with his healthy children, but at the same time there would be a rehabilitation and a speech therapy (...). I would like these children, at least once in a while, to come to other groups, to have fun, to play, do something they normally do. I have a dream that an integration is not just about learning, but more about spending leisure time, having fun together." (P2-2)

Contacts with typically developing peers are perceived as beneficial for children with intellectual disabilities by their mothers. This – as they convince – can be due to the availability of appropriate role models and the children's desire to be as good as peers. Unfortunately, only two of the mothers surveyed reported positive child-to-peer relationships and confirmed the above mentioned scenario:

"Children are incredibly concerned about him, they take care of him very much. They've known from the start that David was different, that he had to be helped. The previous group was also in love with David" (P2-4)

"In contacts with other people, with friends, she is more open, not afraid to go to friends or school dance" (P1-2)

However, more statements illustrate the negative (or not necessarily positive) experiences of a child with an intellectual disability resulting from his or her contact with able-bodied peers:

"But he doesn't play with anyone, only group plays maybe... I think he's aware that he's different... Somehow he's afraid of these children. He just stand or sits aside and watches" (P2-10)

"When she had been reading before in front of class, she was making mistakes and kids making fun of her, so now she's afraid of it" (P1-1)

"There are unpleasant incidents at school because of her impulsiveness. She's got problems with relationships with her peers. She's getting more and more aware of her otherness and it results in her lower self-esteem and lower self-confidence." (P1-6)

"Sometimes when I go out with the child for a walk, other children often stare at him, make remarks and come closer to see" (P4-2)

It appears that a child with a disability experiences various difficulties in relationships with able-bodied peers. The difficulties derive from: 1) different behaviors of the child, 2) a sense of difference in the child with an intellectual disability, 3) emotional disturbance of the child with disabilities, e.g.: anxiety, intimidation, 4) negative behaviors of typically developing peers, 5) victimization of a child with an intellectual disability in a peer group. This shows that including a child with an intellectual disability in a group of able-bodied peers requires special attention and good guidance from adults.

b) Peers with disabilities

One of the interviewees stated:

"I like it that he's here at [special] school. I see how these kids are having fun. The older help the younger. They have such a specific contact. No one will convince me that in a normal school older children make friends with kids like ours... No one..." (P2-9)

The desire to pursue a normal or typical 'scenario of life' for a child with an intellectual disability is to ensure that the child has got good relationships with the peers, is accepted, and has typically developing friends. Some of the mothers' statements, however, reveal a modified 'scenario' in which the experiences of rejection of a child by able-bodied peers (or self-anticipation of rejection) have made the mothers appreciate the education of their child in special care facilities and notice positive aspects of their relationships with other children with intellectual disabilities. In these cases an ideal situation they were hoping for was replaced by a realistic one.

A different case is presented below:

"I remember these mildly retarded kids, these tinkers, as I call them... They were stealing lunches and they were laughing at our kids. And I'm very scared of this (...) of these pathological children so that they didn't hurt him. I'm not scared if these children who are really handicapped... Not at all... Because I know that even if he is hit by one of them, he can handle it and will hit back. I'm also a bit scared that David will start copying their behaviour. I can't stand this kind of behavior, I hate it" (P2-4)

This mother points to two more aspects of relationships of an intellectual disabled child with a group of children with different disorders. First of all, she notices that some children (children with mild intellectual disabilities) cause potential danger for her child with a deeper intellectual disability. These are children who may follow pathological patterns of behaviour, and a child with a deeper intellectual disability may become their victim. Second, she pays attention to the aspect of learning children from each other, but in a negative context: learning undesirable behaviours from children with deeper intellectual disabilities. In case of contacts with typically developing peers a child with a disability would be exposed to learning positive behaviours, skills and attitudes from them, here this learning process appears in a negative context.

Subcategory 3: Mothers

The third important category of people contributing to children's education are the mothers themselves. In this case two subcategories can be distinguished: (a) mothers' (parents') beliefs and (b) their commitment to the education of the child.

a) Mothers' beliefs

"I'm thinking of an optimal school for Jake all the time... And I come to conclusion that it should be a special school" (P2-2)

"Such a child [with an intellectual disability] is lost when he or she goes to a mainstream school, where children behave like animals nowadays. when a child with a disability goes to a regular school, they will certainly be treated badly." (P2-7)

"Well, I would never insist to make my child go to such a [public] school. Because I'm not the kind of person who thinks my child is supposed to learn in a normal school no matter what." (P2-6)

Parents' views are an important aspect of the whole education of a child with a disability, because in Polish system of education, parents make a final decision about the place of their child's education (counselling centres only suggest the type of school for a child in their statements, leaving decisions to parents). As a consequence, parents' beliefs seem crucial. In the above mentioned statements mothers' fears and disbelief that a public school could be a suitable place for a child with intellectual disabilities are revealed. Another aspect refers to concerns about a child's abilities to study in a mainstream school. Generally, legal regulations guarantee that a curriculum should be adjusted to a child's abilities regardless the type of school he or she attends. It is plausible, however, that the experiences of mothers and other people in their surroundings indicate that these requirements are not fulfilled by (some) public schools.

b) Mothers' commitment

"From the age of three we've been going to a speech therapists to O." (P2-4)

"We are aware that in fact he will only learn this what we will teach him... So we work a lot with him at home... We're stubborn and we're considered to be difficult parents. We fight for his rights." (P2-1)

"Mother is such a machine to love" (P4-3)

"She reacts when she sees me, she knows that mom means food (...) I'm afraid that for her mom is also a pain of rehabilitation" (P3-1)

"Now I help her with homework by myself. I'm trying to motivate her to work." (P1-4)

"Before she went to school, Agnieszka and I regularly went to a speech therapist (once a week) and we practiced at home every day – that was my job because Dad had to work long hours to support us" (P1-1)

In their statements mothers show their engagement into the process of their children's education and rehabilitation. On the one hand, they give children unconditional positive feelings ('machine to love'), on the other hand, they follow teachers' / therapists' recommendations to maximize the children's achievements. Some statements also reflect mothers' self-efficacy and engagement. Internal beliefs that it is the right and only way to

make efforts for the well-being of the child make the interviewed mothers very active (as indicated by when they mention rehabilitation time: 'from the age of three', 'every day'). Furthermore, most interviewees indicated that they were the main persons in families who were involved in supporting the development of the children. Interestingly, they did not emphasize this, which may suggest that they treated this situation as obvious or natural.

A greater involvement of mothers was usually perceived as a chance to obtain better results of education or rehabilitation of children with disabilities, but the interviewees also talked about the costs:

"Taking care all the time is very difficult, you get really tired" (P2-5)

"Sometimes I would like to go back in time and do something for myself, you know... I gave up my job, and if someone helped me with Greg, then maybe I could go back to work?" (P4-1)

"My doctor offered me psychotherapy and I agreed. I had to help myself... In order to help my children, I have to be strong myself. Sometimes it happens that I have bad days, I have no strength to get out of bed or even brush my teeth (...) If only someone could replace me just for a few hours" (P4-2)

"A disabled child needs more care and involvement, and above all you need to adjust your own life to the child. For me it meant the resignation of my own dreams or desires" (P3-2)

These statements emphasize an enormous need for support of mothers of children with intellectual disabilities. Their great engagement may be associated with a great risk of exhaustion and burnout. In order to avoid this risk, they should be enabled to make their own dreams come true and to devote time to other activities (work, self-care, passion).

The categories mentioned and described above are not the only ones that appeared in the process of the analysis. Additional (non-dominant) themes referred to: (1) legal regulations appearing in two contexts: (a) requirements for parents (mainly involving parental activity necessary to obtain a child's statement of special educational needs); (b) adjustments guaranteed by Polish educational law for a child with a disability (for example, parents' right to choose either inclusive or special educational institution, the local authority's obligation to enroll a child with a disability to a local school as well as their obligation to help parents with transporting the child to and from school); (2) the functioning of a child with a disability – his or her limitations, abilities, weak and strong points, the educational stage in the context of a child's ability (or disability) to meet the requirements; (3) educational goal – parents verbalize the goal of education in relation to their child's abilities, i.e. the category usually refers to a child's autonomy and sustainability; 4) other adults that have an indirect impact on education (non-pedagogical school staff, parents of other typically developing and disabled children).

Conclusions and Recommendations

The secondary data analysis of the raw material from the research by Bartnikowska & Ćwirynkało (2013), Ćwirynkało & Żyta (2014), Kimbar (2015) and Szczepański (2017) gave us an in-depth view into mothers' perceptions of education of their children with intellectual disabilities. The findings reflect a diversity of mothers' views on their intellectually disabled children's education.

Answering the research question, we found that the degree of mothers' satisfaction with the school their children attend/attended to is varied. On the one hand, some of the interviewees seemed to be happy with these educational institutions. These results are in line with other research (Gasteiger-Klicpera et al., 2009, Ćwirynkało, Włodarczyk-Dudka & Arciszewska, 2015). For example, Gasteiger-Klicpera et al. (2009) indicated that an overall degree of satisfaction with the schooling is high and it depends on the degree of an intellectual disability and on the type of school (higher satisfaction with inclusive settings). On the other hand, however, there is a group of mothers who perceive the children's educational institutions as imperfect, unprepared to teach

students with more complex developmental disabilities. Similar findings can be found in the study by Walker et al. (2012).

The study has several implications for practice. Some of them relate to mothers/parents of children with intellectual disability and some relate to schools and (especially) to teachers/therapists.

- Mothers are significant persons who have real influence on their child's education. They need to be treated seriously by specialists who should take into consideration their knowledge and beliefs about disability (not only a condition of a child with an intellectual disability).
- Some mothers claim they are overtired. There is a real risk of burnout syndrome and depression in the group of parents of the children with intellectual disability. Similar results were indicated in the studies by Abbeduto, et al. (2004), Burke & Hodapp (2014), Bilgin & Gozum (2009).
- A support network for mothers/parents should be organized.
- There should be more educational institutions (with a wider choice of both mainstream and special schools, kindergartens and centres) available for children with disabilities. The findings show that the place of living can be an important limitation as far as the access of children to good quality education and rehabilitation is concerned. Polish educational law allows parents (or legal guardians of a child) to choose the type of school they want their child to attend regardless his or her disability. Nonetheless – as the results of our research indicate – sometimes they do not have real choice, especially if they live more remote areas, far from cities.
- Teachers and therapists should be trained not only to conduct various therapies and acquire teaching skills but also (and maybe especially) they should improve their relational/social skills (to found and maintain good relationship with a child) because mothers emphasize these competences as vital. The results are also consistent with the findings from other studies about the role of relationships in the teaching and learning process (Spitzer 2017, Żylińska 2013).
- From the mothers' point of view peers are another important group that contribute to the quality of education of children with intellectual disabilities (which is in line with the studies by: Skorek, 2000, Webster & Carter, 2007, Rudek 2007, Baraniewicz, 2009, Zamkowska, 2014). The interviewees noticed the role of positive attitudes of other children and its impact on a child with a disability. Nonetheless, we believe that it is the role of a teacher/therapist who should moderate relationships between students in a group/class. Teachers/therapists should realize not only educational/therapeutic but also social goals.

Clearly, the current research has a potential limitation as well. It is associated with the method used. In the primary research projects the data were collected for some other purposes and therefore they might not give a thorough insight into the phenomenon analyzed in the present study. In this project, however, the researchers avoided the pitfalls connected with secondary data analysis by either participating in (Bartnikowska & Ćwirynkało, 2013, Ćwirynkało & Żyta, 2014) or supervising (Kimbar. 2015, Szczepański, 2017) the primary research design. Furthermore, although the participants were generally a diverse group (the sample consisted of biological, adoptive and foster parents, the ages of participants differed from 30 to 72, the ages of children from 1 to 49, and children's level of intellectual disability from mild to profound), the sample size was relatively small. Therefore, the results cannot be generalized.

Abstract

According to the Convention on the Rights of Persons with Disabilities states (CPRD, 2006), people with disabilities are defined as „those who have long-term physical, mental, intellectual or sensory impairments which in interaction with various barriers may hinder their full and effective participation in society on an equal basis with others” (Art.1). Nonetheless, they form a unique group that are overlooked in many areas of life due to lack of or inadequate systemic support (Dogbe et al., 2016). One of these areas is the penitentiary system. International literature, especially from Western Europe and the United States provides a lot of data on prisoners with disabilities. Little is known, however, about the phenomenon in other countries, including Poland. This paper is aimed to fill this gap. The need for various forms of treatment of certain groups of prisoners has been expressed by various authors for years. In case of prisoners with disabilities it can be considered of even greater value. There are about 78 thousand prisoners in Poland and official statistics show that about 6% of them have at least one type of disability, mainly physical, sensory (visual and hearing) and speech impairments (Szłęzak-Kawa, 2014). Furthermore, some studies show that the prevalence rates of various minor impairments, for example intellectual deficits are much higher than this (Dąbkowska, 2017). The authors investigated the statistical data on the prevalence of different types of disabilities among prisoners in Poland, the analysis of their situation, forms of support available for them, the role of professionals in supporting the prisoners as well as the effectiveness of the system in supporting them. Implications based on the literature and statistics reviews are also analyzed.

Key words: prison, disability, criminals, treatment, penitentiary system

Introduction

As the Convention on the Rights of Persons with Disabilities states (CPRD, 2006), people with disabilities are defined as „those who have long-term physical, mental, intellectual or sensory impairments which in interaction with various barriers may hinder their full and effective participation in society on an equal basis with others” (Art.1). People with disabilities form a unique group that are sometimes overlooked in many areas of life due to lack of or inadequate systemic support (Dogbe et al., 2016).

The subject of the present paper are prisoners with disabilities. International literature, especially from Western Europe and the United States provides a lot of data on prisoners with disabilities (numbers, types and causes of disabilities, forms of treatment/rehabilitation, effectiveness of programs available for them and others) . Nonetheless, little is known about the phenomenon in other countries, including Poland. This paper is aimed to fill this gap by analyzing scant but various sources that deal with the phenomenon .

The prevalence rates of disability among prisoners in Poland

The prevalence rate of disabled people has been steadily increasing and constitutes around 15% of the world population (Dogbe et al., 2016). As the results of the European Health Interview Survey – (EHIS) show, in 2014 about 3.8 million disabled people lived in Poland and 7.7 million found it difficult to perform everyday activities (this group is considered to be biologically disabled), so the population of people with disabilities in Poland oscillates between 10-20% (Biuro Pełnomocnika..., 2015). Similar tendency is present within prisoners’ population. In Poland, there are about 78 thousand prisoners in general and official statistics from 2014 show that 4283 of them (about 6%) had at least one type of disability (Szłęzak-Kawa, 2014). The number increased and in 2017 there were 4827 of prisoners with at least one type of disability (Niepełnosprawni..., 2017). Although the analysis of the above mentioned data indicates that the prevalence rates of disability are lower among prisoners as compared to general population , it also worth noting that according to some studies (e.g. Dąbkowska, 2017; Reingle et al., 2016) there is a number of prisoners who are not diagnosed as disabled but do have or report some impairments. Also, research from other countries suggest that people with disabilities are over-represented in prisons (Mackay, 2015, Dogbe et al., 2016, Reingle et al., 2016).

Types of disabilities among prisoners in Poland

As far as the types of disabilities of inmates in Poland are concerned, the statistics show that on 13 October 2014 out of 4283 inmates with disabilities, 1203 – had a motor disability, 750 – a visual impairment, 543 – a physical disability – arms, 352 – a hearing impairment, 280 – a speech impairment, 116 – other forms of noticeable disabilities and 1597 – had an unnoticeable disability (Szłęzak-Kawa, 2014). In comparison, most recent data from 10 July 2017 indicate that generally there were 4827 inmates with disabilities and out of them 1320 – had a motor disability, 799 – a visual impairment, 592 – a physical disability (arms), 356 – a hearing impairment, 250 – a speech impairment and 2168 – an unnoticeable disability (Niepełnosprawni..., 2017).

The data indicates that physical, sensory (visual and hearing) and speech impairments are most common noticeable disabilities among prisoners in Poland. It is also worth noting that some serious physical disabilities are rather uncommon. For example, on 17 September 2014, there were 42 prisoners moving on wheelchairs, 258

– on crutches (Szłęzak-Kawa, 2014). However, some studies show that the prevalence rates of various minor impairments, for example intellectual deficits, are much higher than this (Dąbkowska, 2017). In her study, Dąbkowska (2017) examined 114 sexual abusers – inmates of Polish penitentiary institutions. Having conducted Wechsler test with the participants, she stated that the vast majority of them were characterized by non-harmonious development. The least developed cognitive skills – on a level of an intellectual disability – included: academic knowledge, arithmetic skills and working memory. The data also showed that the inmates' abstract thinking was on a low level. The analysis of their files of criminal cases as well as the findings on their cycle of life research indicated that the deficits in their intellectual functioning were mainly of environmental origin.

The higher prevalence of intellectual disability among prisoners as compared to general population might indicate that this type of disability can be one of the reasons for committing crimes. According to Ciosek (2001, p. 210) limitations in intellectual functioning are not a source of a crime itself, but may facilitate antisocial behavior. These people often have a feeling of being harmed and inferiority complex, which might result in adapting the attitudes of ungodliness, jealousy, and hostility towards other people. Such attitudes can cause and manifest in aggressive behaviour, as well as theft and destruction of property. Furthermore, criminal activity of this group of people can also be associated with their credulity, suggestiveness and the need for a relationship with a stronger personality, which may lead to subordinating to persons who are already depraved (Ciosek, 2001).

It is also worth noting that a high prevalence of disability among prisoners might be connected with the phenomenon of self-aggression and self-harm among this group of people. As Braun (2013) notices, we can distinguish two different groups among them: one consists of prisoners who had disability before incarceration, the other group are prisoners who became disabled while being imprisoned as a result of illness or self-harm behaviors (Braun 2013).

In comparison, in Ghana the commonest disability was physical (81.8%), followed by visual, hearing, speech, mental and albinism. As far as the causes of disabilities are concerned, the vast majority of them were acquired (95%). Most of the disabilities were the result of trauma (68.8%), infection (16.7%) and drug-related mental disabilities (Dogbe et al., 2016). Similarly, in the US, about 3 in 10 federal states and federal prisoners and 4 in 10 local jail inmates had disabilities (hearing, vision, cognitive, ambulatory, self-care, independent living) (Jennifer et al., 2015). Another study (Reingle et al., 2016) indicates that over 40% of prisoners report a disability, most commonly, learning disability. In England and Wales it was estimated that 36% prisoners had disability (18% with anxiety and depression, 11% with physical disability, 8% with both). More women reported they had a disability (55%) than men (34%) (the authors claim that women were overrepresented in the anxiety and depression category). Prisoners with a disability more often admitted that they used drugs and alcohol, and they experienced abuse or observed violence during their childhood (Cunniffe, et al., 2012).

It also needs to be emphasized that some types of disabilities among prisoners (or adults in general) are difficult to identify without conducting psychological tests. One of them is an intellectual disability. The prevalence rates of intellectually disabled people among prisoners vary significantly across studies, but the analysis of international research suggests that it is between 7 and 10% (Hallenbach, 2017). Other studies, however, suggest that the percentage of prisoners with intellectual disabilities is small, and, for example, in Australia, reaches 1.3% (Holland & Persson 2011), and seem to be consistent with the prevalence of intellectual disabilities within the general population. Nonetheless, it is important to recognize prisoners with intellectual disabilities because they have special social needs and are at risk of having some health problems e.g. heart disease, hearing impairment (Dias, et al., 2013). Furthermore, sometimes intellectual disabilities are connected with Autistic Spectrum Disorders that

cause additional problems (Paterson 2007). Problems with empathy can cause delinquencies but very often such types of disorders (autism, Asperger syndrome, Pervasive Developmental Disorder) are not recognized in the prison population (Robinson et al. 2012, Geluk et al. 2012). Definitely, this group of prisoners should be especially supported in the process of transition out of prison (Bhandari, et al., 2015).

The situation of prisoners with disabilities in Poland

An inmate with a disability requires an adjusted cell, appropriate rehabilitation, special treatment and various other adjustments. Concurrently, a prisoner with a disability should not be isolated from other able-bodied prisoners (Rada Europy..., 2011; Bulenda 2011).

This, however, still seems to be a goal rather than a reality. As Szlęzak-Kawa (2014) convinces, there are no penitentiary institutions in Poland that would be fully adjusted. The lack of or insufficient architecture adjustments is partly due to financial barriers but also low numbers of inmates with severe physical disabilities that require major adjustments. For example, taking into account that there are 155 penitentiary institutions and about 40 prisoners moving on wheelchairs, in a lot of these institutions money is spent on other, usually more urgent, purposes first. As a consequence, in 2014 only 84 cells (for 248 people) were fully adjusted to the needs of prisoners with physical disabilities (Szlęzak-Kawa, 2014). The numbers did not increase much in the following years since on 10 July 2017 there were 98 cells (for 297 prisoners) fully adjusted to the needs of inmates with physical disabilities (Cele..., 2017).

Not only do the physical adjustments are essential as far as the situation of prisoners with disabilities is concerned. It is also important to consider their social status in a group of prisoners. In Poland prisoners create an informal social system in which people with a disability are at risk of being at the lowest level (e.g. Szaszkievicz, 1997; Ciosek, 2001; Moczyłowski, 2002; Przybyliński, 2005).

For years Polish prisoners have been facing a destructive phenomenon that is in contraposition to the process of resocialization of sentenced persons. This is the phenomenon of prison subculture, which is also known as „the other life“. Within the community of prisoners – with varying degrees of intensity depending on the place and time – three subcultures of prisoners can be distinguished, i.e. (1) „stand-up guys“ („cant-guys“, „the man“) – 1st league, (2) „non-cant guys“ („losers“, „non-man“) – 2nd league and (3) „victims“ („punks“, „fags“,

„catchers“) – 3rd league. This is a traditional division within „the other prison life“, but the groups mentioned above are not the only groups organized by persons deprived of their freedom. For example, one of the youngest and so far not very well-diagnosed group is a group of „smoothies“. The most influential group, however, from the point of view of the prison subculture are „stand-up guys“, called „cant guys“ or „the man“. They usurp the right to a leadership role and consider themselves as the most important in the subcultural prison world. They perceive themselves as aristocrats among others who should – as they claim – subordinate to them. As a result, they consider the others (who are out of their elite) to be worse and less important. They have their inmate code (a set of values and norms) which needs to be followed and if anyone disobeys it, this can lead to tragic consequences. It seems they are in the minority nowadays, but their prison life is still based on the strength and exploitation of others, potentially weaker prisoners. The next group, which is basically not involved in subcultural relations, usually with a desire to complete a jail sentence quietly, are „non-cant guys“, also called

„losers“, „lower-class men“ or „non-man“. There are large numbers of them, but because of lack of internal consolidation and guiding ideas as well as an indeterminate group goal and a consolidated leadership, this group cannot prevail in a prison subculture. The last group are „victims“ (also called „punks“, „fags“, „whores“ and with other degrading expressions). This is the group into which prisoners with disabilities are most likely to be placed. Inmates that belong to the group are perceived very negatively and treated disrespectfully by the whole community in prison. They are often humiliated and deprived of their humanity. They are basically at the bottom of the prison hierarchy where they face numerous difficulties. They are inmates who function and live in separate places in prison and are unlikely to meet other convicts. There is a number of reasons why one might join this group and be considered as a „punk“. In particular, they include: sexual crimes, atypical sexual preferences, intellectual deficits, unsettled financial commitments, testifying against fellow inmates in court, earlier connections with the judiciary, the police, or the prison service (Przybyliński, 2005, p. 27-43).

According to Petruk (1994, p. 135) in the group of „victims“ there are (a) prisoners with psychological and physical deficits that determine their tendency to subordinate, (b) convicts who are physically fit but have severe

mental deficits, and their fecklessness is so visible that even a physically weak person can bully over them, (c) inmates that are physically weak and have no psychic disorders but who have been raped by members of another group or are said to have been raped. It shows that this group of prisoners needs special support.

Similarly, studies from other countries also suggest that the situation of prisoners with disabilities is more difficult than the situation of non-disabled inmates and it does not refer specifically only to the conditions in prison. As Reingle et al. (2016) indicate, prisoners with at least one disability come from more disadvantaged backgrounds and have more criminogenic risk factors than prisoners without disabilities. For example, prisoners with intellectual disabilities are known to be more susceptible to bullying, segregation, anxiety and depression (Murphy et al., 2017). They also report a high prevalence of poly -drug use, unsafe tattooing, unsafe sex and HCV infection, although differences between this group and „mainstream“ prison population turned out to be non-significant (Bhandari et al., 2015). Another study shows that prisoners with hearing and mobility impairments often lack access to various forms of support and rehabilitation which deprives them of their rights to progression of the conditions (Hauland, 2015).

Supporting prisoners with disabilities

It is often stated in literature that there are two purposes of serving a sentence : one is punishing a person who has been found guilty of a crime and the other is rehabilitation to prevent repeated crime (Hauland, 2015). This means that, on the one hand, a sentenced person is a subject of certain security measures and restrictions and, on the other hand, he or she needs to be offered some opportunities to educate, get involved in various tasks and/or work so that he or she did not commit other crimes in the future.

Among thousands of prisoners in Polish penitentiaries and remand centres there are those who undoubtedly require specific treatment and need to be provided with the right conditions during their incarceration. People with a disability/ disabilities who have broken the law and have been found guilty of crimes belong to this group. This is not only due to the disability itself but also because they often join an informal group of „victims“ and thus become victims of harassment from other convicts.

In the Polish penitentiary area, prison service have intensified their activities focused on persons with different types of disabilities in recent years . In accordance with the current Ordinance No. 19/16 of the General Director of the Prison Service dated from 14 April 2016 (Zarządzenie..., 2016), the procedures for conducting penitentiary activities focused on prisoners with specific needs resulting from disabilities were regulated. The initiatives should encourage social inclusion and adaptation of persons with disabilities to independent living. § 55 sec. 2. states that the following penitentiary activities referring to prisoners with disabilities should be conducted in particular:

- „1) sensitizing the general population of inmates to the special situation of people with disabilities and developing the attitude of acceptance and respect for otherness;
- 2) undertaking actions aimed at eliminating prejudices and stereotypes about people with disabilities;
- 3) active inclusion in all the forms of resocialization programs as well as cultural and educational activities available for all the convicts;
- 4) employing, vocational training and enabling participation in sports activities, taking into account medical recommendations referring to an individual’s state of health;
- 5) organizing occupational therapy when possible;
- 6) supporting the linguistic identity of deaf people through the creation of sign language learning opportunities;
- 7) co-operating with the prison service on implementing health promotion programs;
- 8) organizing vocational courses to qualify convicts to become carers of disabled people;
- 9) cooperating with institutions and non-governmental organizations whose activities are aimed at helping people with disabilities“ (Zarządzenie..., 2016).

In Polish prisons a number of different special programs focusing on supporting persons deprived of their freedom are implemented every year (Marczak, 2009). Generally, they refer to three groups of stakeholders: (1) prison staff workers, (2) able-bodied prisoners and (3) prisoners with disabilities.

1. Supporting prison staff workers

Braun (2013) claims that unfavorable situation of disabled prisoners is connected with insufficient skills and knowledge of the staff in prison. According to the author, the penitentiary staff need some training in dealing with prisoners with disabilities and supporting them in the field of rehabilitation. They also need more intensive cooperation with specialists: psychologists, special educators, sign language translators etc. This can lead to improve situation of prisoners with disabilities both in prison and later on, after leaving the prison.

Successively in Polish prisons, adequate trainings are provided for correctional officers working in penitentiary and therapeutic units, whose aim is to train them how to work with a group of prisoners with disabilities and respect their rights under isolation. To give an example, in 2016, 230 trainings for 3670 officers and other Prison Service workers were organized in penitentiary units (information obtained from the Penitentiary Bureau of Central Management of Prison Service – Biuro Penitencjarne Centralnego Zarządu Służby Więziennej in Warsaw).

2. Programs for prisoners (both without and with disabilities)

Actions are also directed towards the prison community. The Prison Service promotes educational meetings and programs for resocialisation, antidiscrimination, teaching tolerance, respect and acceptance. In 2016 there were 159 programs like that and 2438 convicts took part in them. Prisoners from various penitentiaries participated in volunteering work in the Hospices and in the Social Assistance Houses where they had an opportunity to work with people suffering from illnesses, dying or disabled (2016 – 57 programs and 416 participants) (information obtained from the Penitentiary Bureau of Central Management of Prison Service – Biuro Penitencjarne Centralnego Zarządu Służby Więziennej in Warsaw). In this context, it should be pointed out that the project entitled „Voluntary service of convicts in Poland” was submitted to the competition organized by the European Commission's Directorate General for Justice, Freedom and Security and the Council of Europe's Directorate-General of Human Rights and Legal Affairs and received the European „Crystal Scales of Justice” prize for innovative practice in civil justice organisation and procedure in the courts of Europe in 2009 (Kryształowa..., 2009).

Interesting initiatives include vocational and social trainings for people at risk of social exclusion, with a particular emphasis on people with disabilities. In 2016, there were 166 convicts with disabilities who were employed in Polish jails. Out of this number 64 persons had a paid employment and 102 persons worked free of charge (in accordance with the Article 123a of the Executive Penal Code) (information obtained from the Penitentiary Bureau of Central Management of Prison Service – Biuro Penitencjarne Centralnego Zarządu Służby Więziennej in Warsaw).

The prison staff workers are also trying to organize support for disabled prisoners through the involvement of other prisoners. It is important to choose an appropriate cellmate who wants to support a disabled person. Nonetheless as the practice shows – it is difficult. For many prisoners this is a huge challenge, others are discouraged by a disabled person's attitude, his/her expectations and claims (Braun, 2013). Some of them are passive, focused on their disability and do not want to engage in proposed activities by prison's staff (Łupińska, 2012). Sometimes disabled prisoners refuse to be involved in therapeutic system.

Some programs are also focused on convicts' professional work with people with disabilities. The examples include such programs as 'Duet', 'Four Seasons' and 'Bona', thanks to which prisoners learn to fulfill social roles by working with people with disabilities (Marczak, 2009, p. 58). It is plausible that thanks to working and interacting with people with disabilities, convicts „develop positive self-esteem, sense of meaning and purpose of life through the experience of helping and being needed. Through mutual contacts (a convict – a person with a disability), the isolation and monotony of the lives of the convicts as well as the disabled are broken. In this way, the prisoner becomes a partner and a companion of the disabled person. Thanks to spending time with people with disabilities, the convict has an opportunity to acquire skills in the care of people with disabilities and to fulfill basic social roles. These activities should direct inmates towards changing themselves and should also be a powerful impetus for observing and then constituting in their minds skills and abilities necessary for social functioning after leaving the prison” (Marczak, Przybyliński, 2010, p. 227).

Activities carried out in penitentiaries and remand centres in Poland result from implementing § 55 sec.

3. of Ordinance No. 19/16 of the General Director of the Prison Service of 14 April 2016 (Zarządzenie..., 2016) according to which physically disabled convicts who cannot live independently and require support need to be provided with the help of prisoners with appropriate qualifications as carers of the disabled. As a consequence, trainings for able-bodied convicts are organized. In 2016 25 special trainings were attended by 227 convicts who

were qualified as carers of the disabled or the elderly (information obtained from the Penitentiary Bureau of Central Management of Prison Service in Warsaw).

3. Programs directed specifically to prisoners with disabilities

There are also some specific forms of treatment offered to prisoners with disabilities. Although they are not always common, they can be examples of good practice. This can be illustrated by a penitentiary institution in Bydgoszcz, which is the only prison in Poland with a sector for prisoners who are visually impaired, especially those who lost their eyesight. It was founded in 1985 and its aim is to prepare inmates to live in a new situation (after partial or thorough eyesight loss). Therapeutic activities conducted in this institution include:

- Spatial orientation training – this form of support is considered to be essential because mobility problems can lead to other negative consequences, e.g. sense of inadequacy, deterioration of self-esteem and total dependency on others (see: Hojan, et al., 2012). The courses last 50 hours, takes place in residential buildings and on walking squares and finish with an exam after which prisoners come back to prison. The program is financed by the Fund for Postpenitentiary Support and Help for the Disadvantaged (Szłęczak-Kawa, 2014; Braun 2013);
- Teaching Braille – a tactile system used for reading and writing by blind and visually impaired people (Braun 2013);
- Social and practical skills training – mobilizing inmates to take actions to receive a disability pension, attend a spatial orientation course and/or join the Polish Association for the Blind (Szłęczak-Kawa, 2014).

Other penitentiary institutions also offer such programs as:

- Art therapy – especially in a treatment of intellectually disabled prisoners (Kurlak, 2016, Florczykiewicz 2012);
- Speech therapy programs for inmates with aphasia or other speech impairments – the aim of such programs is to improve participants' communication (including verbal communication) skills (Szłęczak-Kawa, 2014).

Unfortunately, there is no systematic knowledge on prisoners' with disabilities access to various forms of treatment and activities in Poland.

A study from Norway (Haualand, 2015) shows that inmates with disabilities (hearing and mobility impairments) often fail to take part in rehabilitation activities like education, work or group activities. As a consequence, they are more likely to experience isolation than prisoners without disabilities. It is a real problem especially for prisoners who have problems with communication (deaf or hard of hearing, with aphasia). As Miller's research (2004) shows, this group is very diverse even if we focus only on the deaf community. The prisoners' linguistic competences (in sign language and speaking) as well as their level of literacy should be recognized.

IMPLICATIONS

The analysis of the data presented above allows the authors to make several implications. First of all, there is a need for systemic knowledge on the situation of prisoners with disabilities in Polish penitentiary system. A cross-sectional study could be conducted in order to gain information on the numbers of inmates with disabilities, types and causes of disabilities they have, their experiences, needs and access to various forms of support. Second, practices of screening prisoners for disabilities would be of great value. This is especially important in case of some hidden forms of disabilities, e.g. intellectual (see: Murphy et al., 2017). Third, there should be more focus in prisons to provide opportunities to educate, work and group activities to all prisoners, including those with disabilities as the lack of such access may lead to more acute feeling of isolation (Haualand, 2015). In various treatment programs (e.g. alcohol and drug treatment programs) agencies responsible for their organization should try to meet the needs of all prisoners (McGillivray, 2016). Third, certain forms of rehabilitation aimed specifically at prisoners with disabilities should be offered since they form a group that is disadvantaged and more susceptible to bullying, depression or anxiety (Murphy et al., 2017). Moreover, they are identified as an at-risk group for recidivism which may be due to both their pre-incarceration experiences and limited vocational and work-related treatment in prison (Reingle, et al., 2016). There is a need for governmental and non-governmental agencies to develop policies that would improve the quality of life of prisoners with disabilities.

Advantages and downsides of children ICT use in Spain: the parent's perspective

Jesús PLAZA-DE-LA-HOZ

Researcher, Universidad Internacional de la Rioja (UNIR), Faculty of Education

Email: jesus.plaza@unir.net

Abstract

This paper aims at understanding the expectations of a group of parents, about possibilities and problems Information and Communication Technologies (ICT) present for their children. The article consists in a qualitative study, through the in-depth interview technique. Participants were twenty fathers and mothers with children from 9 to 18 years of age, studying at private and state schools of Teruel (Spain). All of them are concerned about the subject, because have been selected after attending several discussions and classes about technologies and students organized by cultural and educational associations. Computer Assisted Qualitative Data Analysis Software (CAQDAS) was used, by means of Atlas.ti7 program. The findings show a similar amount of advantages lightly higher than the number of downsides. Parents appreciate ICT mainly as a way of communication and cooperation, in addition to entertainment. Regarding daily downsides, the fundamental ones are related to the deterioration of social and family environment, different levels of addiction –in a broad sense- and the uncertainty they notice to face with possible damages, because of the difficulty to foresee and control. In conclusion, due to the fact that nowadays ICT make impossible a strict monitoring of their potential risks, parents must improve their teaching and training skills to prevent unwanted effects, and empower their children with autonomy and self-control. The best way for it could be precisely the strong communicative components associated with parent-children relationship. The benefit for having interviewed only involved parents is at the same time its major limitation; even though further research will be necessary, these results shed light on one of the most interesting issues related to ICT: the key role of family.

Keywords: Education, Family role, Influence of technology, Student empowerment, Communication skills.

Introduction

The importance of a positive family relationship in the long term for children development is a common place showed in recent research (Preston et al., 2016; Calvo, 2011; Albertos et al. 2016) because reinforces cohesion enhancing social parent support, generates a positive self-concept of the child, improves their academic performance, and limits different conflicts and problems of behavior. In this sense, Information and Communication Technologies (ICT) appear to be ambivalent regarding family environment, because are able to increase communication among their members and deteriorate at the same time the traditional direct contact.

And so we could expect that parents acquired a special role as mediators in a proper ICT use. In this sense, there are many authors that focus on the necessity of a critical learning, beyond the technical one. The main issue is to empower children to deal with risk (Pereira, 2016); an active parent supervision is required when they are younger (Plowman et al. 2012), and even when they grow as adolescents (Hernando, Oliva, & Pertegal, 2012; Lindqvist, Kostenius, & Gard, 2012), because, despite knowing what is good for them, not always do they act in a healthy manner.

Recent research complaints about the lack of more studies related to the implication of parents (Lau & Yuen, 2016), family dynamics involved (Gomes-Franco & Sendín-Gutiérrez, 2014), the role of these technologies in families (Kalibová, 2016) or the specifically ICT use for family communication (Rudi, Dworkin, Walker, & Doty, 2015; Hernández-Prados, López-Vicent, & Sánchez-Esteban). And at the same time a paper written in 2012 (Baytak, Akbiyik, & Usak) already pointed out some features of the matter, such as neutral attitudes of parents, their deep concerns and worries about internet, waste of time and playing games, the necessity of some norms and conditions, and their doubts about ICT integration for a better instruction.

There is, however, more literature about the importance of educational style by parents. First of all, the digital context of our technological society entails a multiplicity of models (Bauman, 2012) and a tendency to get lost under an excessive quantity of information (Mínguez-Vallejos & Hernández-Prados, 2013) or being diverted by technological unleashing to a neoliberal perspective (Gordo, Parra & D'Antonio, 2013; Díaz-Mohedo & Vicente-Bújez, 2011). Parent's authority suffers from the superiority of new ways to be informed, and become useless only forbidding in the face of ICT risk for children. The proper attitude is now to give example, show prestige and a good balance between loving and demand (Rumayor, 2016; Tejedor & Pulido, 2012; Plaza-de-la-Hoz, in press). So, different researchers gather findings about the best educational style for parents to deal with ICT at home: joining fondness and control (Cerezo, Casanova, & de-la-Villa, 2011; Osoro & González-Camara, 2016), in a less hierarchical negotiation (Haddon, 2012), neither permissive, nor authoritarian, but in a democratic style.

However quantitative investigations reveal a lack of training from parents of younger children (Manzano, 2016; Fraga & Duarte, 2015), possibly due to an absence of appropriated competence and little supervision and control (Expósito & Manzano, 2013; Berrios, Buxarraís, & Garcés, 2015; Muñoz-Miralles et al., 2014), or a state of unconsciousness about the risks involved (Sureda-Negre, Comas-Forgas, & Morey-López, 2010; Chele, Lucinschi, & Stefanescu, 2014). Gentzler et al. (2011) even suggest a possible link between social-networking sites as a way of communication with parents and higher levels of isolation, distress and family argument.

But, what about the main positive characteristics of these technologies? Indeed communication is considered in some articles as a mean of increase family connections and cohesion (Cortada, Badilla, & Riera, 2012; Walker & Rudi, 2014; Torrecillas-Lacave, Vázquez-Barrio, & Monteagudo-Barandalla, 2017); but on the other hand, as a manifestation of a socio-cultural gap (Garrido-Lora, Munté-Ramos, & Busquet, 2016) that needs digital literacy intergenerational (Aguilar-Ramos & Urbano, 2014) in order to provide children with the ability to face problems (Garmendia, Casado, Martínez, & Garitaonandia, 2013; Muñoz-Miralles et al, 2016), self-regulation and autonomy (Gairín et al, 2014; Gil, 2012).

Regarding lights and shades ICT present in family context, this article focus on the parents perspective about pros and cons these technologies offer to their children today and in the future, and which measures could be the best way to empower them.

Method

The qualitative methodology used to deal with the aim of this paper takes into account the context of Grounded Theory, whose key point consists in obtaining theories and hypothesis from data in an inductive way, more than checking previous theories (Gibbs, 2013). The technique chosen was the interview with parents to produce data, and their further processing by means of Computer-assisted qualitative data analysis software (CAQDAS), with ATLAS.ti7-data management tool.

The interest was centered in families having two or more children using technologies at home, and concerned about their consequences. The sample came from people attending conferences about ICT and their influence in children and adolescents, received in high schools or cultural associations. Twenty of them agreed to be interviewed, and the interviews ranged in duration from forty five minutes to an hour and a half. All participants gave fully informed consent for recording their talk.

Statistical generalization is not the intention of qualitative method and the validity of its data is based on other basis, adding a sort of more comprehensive understanding that enlighten quantitative results from other studies (Corbetta, 2003, Yin, 2006). In this way, it is the singularity of situations and participants

with their proper circumstances which enables a deeper meaning, and so can be useful and always available for the scientific community.

Families of this sample have between 2 and 4 children, an average of 4.5 members, 0.7 points more than the average of families with children in the city (3.8) (Instituto Aragonés de Estadística [IAEST], 2016). The average age of parents is 52.6 for fathers and 48.7 for mothers. Parents selection have prioritized quality over quantity and so it is thought to be wide enough (Stake, 2007).

Guidelines of interviews were prepared based on other researchers: Naval, Sádaba and Bringué (2003) about youth and ICT, and Hernández, López and Sánchez (2014) about communication, ICT and families. The main areas questioned were ICT use at home, expectations about ICT, influence of ICT (in social relations, family and learning), adverse effects, and training.

According to its aim, this article focuses on the sort of advantages and fears ICT symbolize for parents. The data obtained from semi-structured dialogue was systematized in order to content analysis. The study of conversations transcribed follows this type of analysis, categorizing in the face of different areas of interest mentioned, as well as their connection in several levels of semantic relation (Gürtler & Huber, 2007).

The use of ATLAS.ti7 program has been conducted to a previously word analysis, and then to the codification process, highlighting the frequency of categories, showing their importance, even though the main approach is qualitative not quantitative.

The reliability of data is supported regarding the process of systematization and analysis of information through methodological work (Flores, 2003). The findings are showed classified by means of Figures and corresponding tables including verbatim examples from declarations of participants.

Findings

A first study about terminology has been performed through word cruncher by means of Atlas.ti7 program. So we realize which are the main interests of parents, generally speaking, related to what kind of people, and regarding the technological area.

The full recount of words reveals 80653 terms; once the irrelevant ones are removed (adverbs, prepositions, etc.) those words semantically related can be brought together. For the sake of clarity three figures have been distinguished: verbal forms (Figure 1), groups of people (Figure 2) and technological words (Figure 3).

Figure 1. Frequency of verbal forms by parents (f >200)

The analysis of frequencies indicates some interesting points such as the relevance of knowledge (1952 replays) and communication (“say” has 865 replays), among the most referenced verbal forms in discourses. ICT are useful devices to gather information about the world, and for staying in contact. Another detail is the more importance given to entertainment (“play”, with 278 replays), compared to “work” (191), taking into account younger children of the sample and the centrality of home over school. In fact, parents find ICT for working most appropriate for older children.

Figure 2. Frequency of references to groups of people (f >45)

If different groups of people becomes the focus of our interest (Figure 2), we can observe the orientation to children (1783 allusions), especially the own sons and daughters (771). This could have been expected, as the main concerns of any parent are their children. But just after themselves (489 references) the relevance of peers (“friends”, 428) is showed, whilst “teachers” only have 47 references. Dealing with ICT it seems to parents that young people are protagonists ahead of parents and, above all, of teachers. What fits with their perception that kids have a better knowledge of these tools.

Figure 3. Frequency of references to technological terms (f >25)

As for the technological area (Figure 3), we can observe the great relevance mobile phone has (595 references), the double than computer (205); some parents even comment that their sons barely use the family computer.

“...it’s a fact that they use the computer less often” (Lourdes, P3-938);

“at the weekend...they don’t turn on the computer at all, don’t use it” (Ann, P4-049)

The first networking site mentioned is without discussion Whatsapp (165 allusions), and the two main uses are taking photos and watching videos (127/114 references, respectively). Therefore, children are using their smart phones as computers, mainly for sending messages through Whatsapp, and for entertainment.

The following analysis will consider the process of coding and subsequent relations between codes. Establishing codes is a first step after reading the text to think about their interpretation (Gibbs, 2013). As deductive codes we have determined “advantages” and “drawbacks” ICT present to parents, and explained along the interviews. Besides these codes, the analysis reveals other ones, inductively, as manifested in Table 1. First of all, after counting of references the balance is slightly in favor of the positive aspects of technologies (53.8%) according to the negative ones (46.1%).

Table 1. Conceptual and *in vivo* codes

ICT advantages	ICT drawbacks
Communication/cooperation	Family and social deterioration
Entertainment	Abuse and dependency
Homework	Lack of control
Information	Thoughtlessness of repercussions
Working	Desactivation of effort
Control	Immaturity
Motivation	Bullying
Technical ease	Waste of time
Implication	Cause confusion
	Insecurity
	Scattering of attention
	Damaging contents
	Others (Sight harm, Lost of privacy, Technical issues)

Advantages pointed out by parents (Table 2)

More than 40% of references related to positive aspects deal with communication code. ICT open all kind of forms to spread contacts, keep them when people were already acquaintances, and cooperate in many ways. Less than a half of these references are the allusions to entertainment (19.4%), what tell us that parents perceive ICT as the new form their children find to spend their free time.

“they’ve always had many toys at home and barely have used them, however they have played a lot of Wii games... and all kind of technologies, despite so expensive it is, but they play with them” (Matilda, P1-028)

The same amount of references aims to do homework, get information and working (8.5%), though the influence of the parent’s use is greater here, at least regarding their will of keeping up with the news and their job. The next level is depicted by control code (3.8%), including the parent’s concern about what their children do or where they are, and as a way of being informed in case of problems. By contrast the less important codes are those of motivation, implication and technical ease (up to 2%).

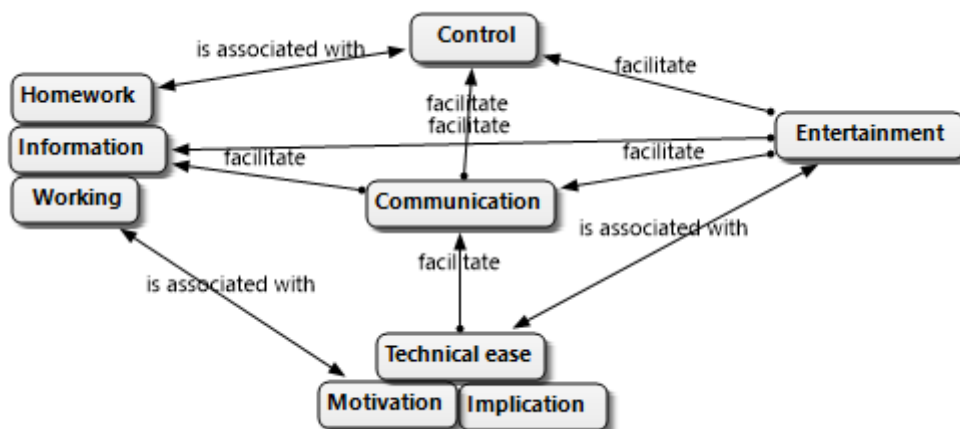

Table 2: Advantages parents notice due to ICT use: 598 (53.8%)

Code “Advantages” Subcategory (level 2)	Rate	Sample text
Communication/cooperation	255 42,6%	“Right now Jesus is connected with George, with Jack, and with I don’t know who... and they are playing with those games of...” (Pilar3, P8-102)
Entertainment	116 19,4%	“She likes to see cooking videos, videos about making hairdos, or choreographed dancing... videos for girls” (Lorraine, P7-108)
Homework	51 8,5%	“Perhaps she sends a message to her friends saying ‘I don’t understand that, and so on...’ and then they start explaining the exercise each other...” (Pilar2, P6-096)
Information	51 8,5%	“and it is what we say: ‘what it’s not on the Internet, doesn’t exist’, and basically it’s true; right now you want to look for whatever... you go on to the Internet, and you find a lot of things...” (Pilar, P5-193)
Working	49 8,2%	“those who don’t know how to handle a computer are not going to find a job anywhere” (Jack, P4-104)
Control	23 3,8%	“It’s very useful to have her more controlled... and I know whom she phones, at what time she makes a phone call, which messages she sends... her expenses... I have her controlled” (Gerhard, P3-031)
Motivation	12 2%	“I think it’s more entertaining, if you want to search something, I think it is, and look at this, if you have to study something, or see something, you watch it on screen, and so you learn it better than seeing it on paper...” (Mary, P2-235)
Technical ease	8 1,3%	“The ease of access to whatever knowledge, i.e., you can enter webs of History, Science, Geography, everything... it’s like an encyclopedia” (Allen, P1-172)
Implication	2 0,3%	“They (her daughters) were who learnt how to record, to select, to search...” (Matilda, P1-021)

If we put together all this codes through semantic relations (Figure 4), communication gets the central place, due to its character of facilitation for homework and control; at the same time, it increases with entertainment –online games-, and the attractiveness ICT add through motivation and technical ease. In the end, all these codes tend to produce or improve communication or are implemented through a better use of communication skills.

Figure 4. Semantic network related to positive codes.

Drawbacks pointed out by parents (Table 3)

When it comes to speaking about fears parents show about ICT regarding their domestic environment, the main worry is the deterioration of family and social relations (21.5%). We have put together both aspects because reveal a similar pattern: the online contact prevails over direct contact (having dinner, staying with friends, attending a social meeting, etc.), though parents focus on the family side. As a consequence of this issue the following code is abuse and dependency (16.4%); parents speak of obsession, excessive concentration, forgetting the passing of time, the need to answer immediately all messages, being hooked, even addiction; all those circumstances facilitate cases of bullying.

“What I’ve noted sometimes is that anxiety, or frustration of saying ‘I want to play and I can’t’; how is it called? anger, frustration, anxiety? I don’t know” (Paul, P9-296)

Another downside reflected in discourses is the difficult to control (13.5%) facing the openness of the Internet and the variety of ways children can access to everything the web hosts, behind the parent’s backs. In this same group we can include the deficit of training parents recognize, the immaturity of children and the insecurity they experiment. If we put together the tendency to an excessive use and the lack of control, the result can be damaging contents, sight harm, and misunderstandings, fears that parents refer to. Another group of negative aspects are related to working, mainly the demotivation of effort (6.7%), along with wasting time and scattering of attention. Finally, unconsciousness (8.2%) of repercussions and loss of privacy are semantically related to immaturity and can entail problems for both, peers and family.

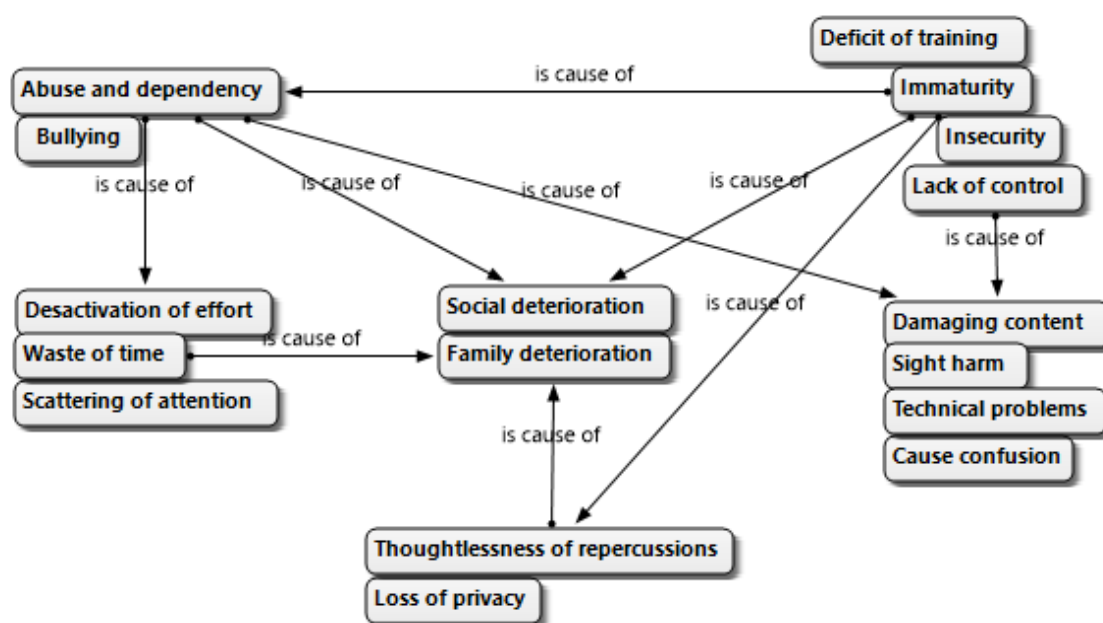

Table 3: Difficulties parents notice due to ICT use: 512 (46.1%)

Code “Downsides” Subcategory (level 2)	Rate	Sample text
Family and social deterioration	110 21,5%	“you have to fight...’get the mobile phone out of here, switch it off, leave it’... and have to say it twenty times” (Pilar2, P6-098)
Abuse and dependency	84 16,4%	“In fact, when their smart phone has broken they get desperate, totally crazy, because their mobile phone has broken” (Jack, P4-224)
Lack of control	69 13,5%	“It’s a constant tug-of-war, in which parents have everything to lose, because when you get home tired from work, you don’t feel like fighting with your kids” (Allen, P1-159)
Thoughtlessness of repercussions	42 8,2%	“They are unconscious about the transcendence what you write has, because it’s never deleted” (Lorraine, P7-138)
Desactivation of effort	34 6,7%	“If you ask him later... he hasn’t got a clue, because he only wrote it down and nothing else... simply to get out of homework” (Pilar4, P10-195)
Deficit of training	26 5%	“The problem is that parents don’t know clearly what a mobile phone is, it’s not a toy, that’s the problem, and for young people is an icon, something forbidden” (Paul, P9-358)
Immaturity	20 3,9%	“It’s a problem of the lack of personality, education or training the person managing that device has” (John, P5-094)
Bullying	20 3,9%	“It’s a fact that they always bully the weakest kids” (Victoria, P8-158)
Waste of time	19 3,7%	“nowadays they are all in Instagram, so many photos and so on... to me is a great waste of time, and so I don’t like networking sites at all” (Frederick, P2-080)
Cause confusion	18 3,5%	“I have a bad experience with Whatsapp and I really realize that it cannot be used for... telling certain things... that way” (Pilar2, P6-069)
Insecurity	14 2,7%	“There are some people that show themselves as they are, and you notice right away, and other people don’t” (Pilar3, P7-123)
Scattering of attention	13 2,5%	“If you surf on the Internet and go from page to page, at the end you don’t do what should have...” (Matilda, P1-180)
Damaging contents	10 1,9%	“They can go on the Internet, where some networking sites and other things can be dangerous” (Pilar, P5-195)
Sight harm	4 0,8%	“I fight with them... saying that they are nearsighted, because I’ve risked my sight due to computers..., but they ignored me” (Manuel, P6-103)
Loss of privacy	4 0,8%	“I don’t get any sense that people upload photos for everybody and see you and what you are doing” (Mary, P2-086)

These semantic relations are showed in Figure 5. Social and family relations are placed in a central position being affected by an excessive use of ICT, unconsciousness and immaturity of children. Abuse and dependency seems to be also the main origin of others issues such as deficit of attention and effort along with wasting time. So, any measures that may be adopted must take into account both, the primary cause and the ultimate consequence.

Figure 5. Semantic network related to negative codes.

Conclusions and Recommendations

As an exploratory study about the parent’s perspective of children ICT use, the first conclusion is that communication is in the centre of both, advantages and downsides. It is the need of keeping in contact with their peers what forces parents to give them access to ICT.

“...the motive?... they are constantly demanding it (mobile phone), a lot of times, because all their friends already have it...” (Joachim, P8-038);

“it’s a fact that if they haven’t got a mobile phone, they don’t feel ‘cool’” (Constance, P9-223).

It is the possibility of being in contact what makes parents feel secure about their children; and it is the improvement of communication what challenges them to educate kids about these new technologies, facing the declining of the quality of communication itself that ICT use entails.

Parents recognize their lack of training, even the failure to control every chance for youngsters to misuses ICT and get harmed. At the same time, it is clear they notice the irreversibility of our network society and its demand for technological skills. An active supervision not always is possible to implement, and much less when adolescents. So they grab every possible opportunity for fruitful teaching, when children enjoy playing online games, get together through networking sites, complain about more time to play, misbehave in family meetings, etc.

“Sometimes they have taught us things, and other times we have taught them” (Paul, P9-206);

“...with her I’m always worried, saying over and over... ‘watch out for what you upload, what kind of photos..., this one out!’... and insisting her that everything remains...” (Pilar2, P6-053)

So, their educational task is, as always, tiring, demanding, even exhausting. On the one hand, they feel that cannot resign to their duty as the main reference for their children, establishing (at least, verbally) norms and limits they reckon as reasonable and healthy, above all taking into account the immaturity of preteens; but on the other hand regarding the potentiality of these tools, their accessibility and range, it is very difficult to avoid all risks or secure a full control. So, communication emerges as an excellent, if not the only, way to orientate children in managing ICT, time, spaces, contents, and so on.

“You cannot avoid it, and besides they are very boring... but it must cost him something, and so, what am I getting? that he has to read, to read quite a lot (before using the tablet)” (Paul, P9-075)

It is interesting to observe that parents develop in this sense a democratic style as previous researchers have pointed out, dealing with norms, problems and different situations, but always facing good results from homework and school reports of their children. Many of them assure not to imagine how they acted in case their kids were bad students. Therefore, the question is if the possible supervision and above all, the constant training, even the fight to delay the purchase of devices, have been the better conditions for good results, confidence, and absence of great problems, related to ICT; or perhaps these are lucky parents whose children are naturally predisposed to a good use of ICT, despite all the available risks.

What seems to be clear is that committed parents often talk with their children, insist on basic norms to be performed by kids themselves, are conscious about a necessary autonomy for the young together with their evident lack of experience, and are able to generate confidence in case of serious problems.

“I don’t know how many things remains of all that I usually say to her, and I say to her a lot...” (Lorraine, P7-392);

“It’s a problem of education... because you cannot be in front of her every time she writes something in Whatsapp, it’s impossible... it cannot be avoided” (Gerhard, P3-229);

“...in the end, it is they who have to do, to realize... to know what is good or bad” (Manuel, P6-060);

“it’s never sounded an alert because they’ve tried to enter such a website... we speak sincerely with them and so far it works” (Jack, P4-118)

To sum up, the key role of parents is proven, by means of a good use of the main characteristic of ICT: communication skills developed from the very beginning, not in a technical sense, nor a critical one only, but in order to build properly their own character. Because every child is different needs different measures to be implemented by intense dialogue.

“about my daughters, more than the age is the character... they are quite different, in every respect, how to dress and behave..., in their relations...” (Gerhard, P3-117)

“Nancy has always been more prudent, from the beginning, I think that it’s the way of being each one” (Pilar2, P6-075)

“girls are different, the problem is... they don’t want to play, are more sociable, and so, my daughter doesn’t have a mobile phone, and when she has, I don’t know what are we going to do” (Paul, P7-147)

“Carla use it more for works, George for watching and enjoying... videos about how can you do...” (Jack, P4-144)

But this issue, the training of children’s character through ICT use at home could be the aim of another article.

Investigating Cultural Competencies of Elementary Teachers

Ganime Aydın

Istanbul Aydın University, Education Faculty, Istanbul Turkey

E-mail: ganime31@gmail.com

Abstract

Over the years, the competencies of teachers have been enhanced and standardized, and teacher education programs have been changing in many countries while many art and sports classes have been eliminated. Elementary teachers differ from other teachers because they are responsible for more than one subject, and thus they need to adopt multi-disciplinary and inter-disciplinary approach based on a wide range of competencies. The aim of this research is to determine cultural competency level of a sample group of eighty-seven elementary teachers and to analyze the reasons for their lack of competencies. The research was undertaken using a mixed method. The quantitative analysis consisted of two parts. One part comprised demographic information about the participants such as gender, age, parent's education level, the type of school the participants graduated from, and their professional experience. The other part included data on cultural competencies such as the number of visits to cinemas, museums, concerts, and theaters together with the number of books the participants had read in a year. In the qualitative analysis, the reasons for attaining cultural competencies were investigated using face-to-face interviews. The results were discussed in the following parts.

Keywords: cultural competencies, elementary teachers, teacher education

Introduction

This research drew inspiration from the discussion with pre-service elementary teachers that only six out of seventy have seen a theater play in the previous month and they talked about their behavior to watch theater was passed especially through their mothers during their childhood period. One week later, I addressed the question "Are you taking your students to museums or theaters?" to elementary teachers who were attending my science master course. All of them answered as "No." Also they indicated that even with second grade students, they were doing mathematic lectures by solving multiple choice questions during elective courses. Elementary teachers differ from other teachers because they are responsible for more than one subject, and thus they need to adopt multi-disciplinary and inter-disciplinary approaches based on a wide range of competencies. Researchers investigating teacher competencies and qualifications have emphasized that increasing the competencies of teachers will result in students being better educated and more qualified for further study and work life. The Organization for Economic Co-operation and Development [OECD] (2012) noted that teachers need to help students acquire not only the skills that are easiest to teach and test but more importantly ways of thinking (creativity, critical thinking, problem-solving, decision-making and learning), ways of working (communication and collaboration), tools for working (including information and communications technologies), and skills concerning citizenship, life, and career together with personal and social responsibility relating to the success of modern democracies. The role of the elementary teachers in the aspects of modelling and reflecting in acquisition of cognitive, psychomotor, and affective skills that are rather fundamental for the academic success of a student, especially in the upcoming years, is an indisputable fact. Alterations in family, school, education system, and society within today's rapidly changing socio-cultural structure add new extents to the competencies expected from elementary school teachers, in fact from all teachers. In many countries, teacher qualifications are being redefined, certain standards are being introduced and teacher training programs are amended for future teachers as particularly art classes are being eliminated in education programs. For example in the USA (MCTS, 2012), the competencies of teachers on application of knowledge and skills were indicated with the statement that "Teachers need to be able to impart global skills and dispositions on learners, particularly in the areas of problem solving, curiosity, creativity, innovation, interpersonal skills, the ability to synthesize across disciplines, global awareness, ethics, and technological expertise. There is an emphasis on cross-disciplinary skills, including communication, collaboration, and critical thinking as teachers must design learning experiences that draw upon multiple disciplines" (p.6). In this statement, cross-disciplinary skills, interpersonal skills, multiple approaches for students with different cultures, language, and disabilities are vital competencies for teachers. Adding new lessons to faculty of

education's curriculum or applying different methods and technics is not adequate for the use of these competences. Like many other countries, children from families with low socio-economic level, the youngsters who were raised in small cities and towns, enroll in education faculties. Moreover, faculties of education have been founded in many cities that are not culturally sufficient, especially after 2006. I believe that competencies especially related with cross-disciplinary, communication, collaboration, and critical thinking skills can be achieved with the cultural skills of teachers who read books, playing instruments, who are related to art, sports, theater, and museum. Gunduz (2014), Arnon & Reichel (2007) indicated that the personal skills of teachers were more vital competencies rather than professional skills on behalf of young students. Smith (1995), commented that teachers and teaching need to be creative to engage students in learning and Holt (1964), pointed out 'creative classrooms' which reflect the teacher's knowledge, enthusiasm, and responsibility to motivate students about learning. Teachers personal skills related to cultural competencies are vital factors for the creativity of teachers in order to produce creative classrooms and environment, and for ability to use different instructional strategies depending on culture and properties of students, contextualization of concepts with daily life, asking good questions to improve critical thinking skills of students. Also, if self-efficacy level of teachers depending on music, art, sports are high, they will improve the self-efficacy of student's cultural competencies. Therefore, the aims of this research are to see the competencies of elementary teachers in the case of cultural competencies and to analyze reasons into three themes; individual, socio-cultural and educational system.

Problems of this research:

- 1-What was the level of cultural competencies of elementary teachers in the case of sports, playing an instrument, going to concerts, museum, theatre, and cinema, and reading habits?
- 2- What were the effects of their bachelor education on their cultural competencies in the case of social clubs, cultural trips, and vision improvement?
- 3-What were the relations between cultural competencies and age, professional experience, education level, types of undergraduate institution, education level of the mother and the father?
- 4-Were they finding themselves sufficient about cultural competencies?
- 5- What were the reasons behind inadequacy in cultural competencies of teachers?
- 6- What are their requirements to improve their cultural competencies?

Teacher's competencies

The meaning of competence is the capability, specific knowledge which provides the power to do the job (tdk.gov.tr). Competency is the professional knowledge, skills, and attitudes that are necessary to perform the specific task in a professional field, performing the expected roles along with qualitative and quantitative qualifications, gaining knowledge and abilities to do a behavior (MoNE, 2008). The roles of teachers and schools are changing, and thus expectations about them too: Teachers are asked to teach in increasingly multicultural classrooms, integrate students with special needs, use ICT for teaching effectively, engage in evaluation and accountability processes, and involve parents in schools (OECD, 2009). Also OECD (2011) noted that "teachers need to help students acquire not only 'the skills that are easiest to teach and easiest to test' but more importantly, ways of thinking (creativity, critical thinking, problem-solving, decision-making and learning), ways of working (communication and collaboration), tools for working (including information and communications technologies), and skills around citizenship, life and career and personal and social responsibility for success in modern democracies." The teacher competencies including knowledge, skills, values and attitudes may need different contents depending on societies, in other words nations (EC, 2013). The elementary teachers are differentiated from other teachers because they are responsible for more than just one subject. This requires the teacher to have multi-disciplinary and inter-disciplinary approaches based on competency. Researchers working on teacher competencies and qualifications emphasized that increase in competencies of teachers as content knowledge level, acquisition of certifications, year of experience, and reading skills will cause to a more qualified education for students (Tas, 2004; Barnett, 2002; Darling-Hammond, 2000; Gozutok, 1995 and Gurkan, 1993). Also teaching standards require not only a basis of knowledge in the areas of study and instruction, but also a greater understanding of pedagogy, child development, and methods of evaluation (Korthagen, 2004). There were several

studies up to the present, from the first years of the Republic (1982, 1989, 1993, 1995, 1996, and 1998) about teacher training with an experience of over 150 years in Turkey. In addition to these studies in 2002, the quality of the teaching profession reevaluated in the sub-headings; general competencies, general culture, specific field, and training and teaching competencies (Demiral, Baydar & Gonen, 2010). In year of 2006, Ministry of Education [MoNE] identified the competencies as general competencies and specific field competencies for all teachers, and they were collected into a book by MoNE in 2008. In the book, there were six main competencies, thirty-one sub-competencies, and 233 performance indicators for general competencies of all teachers (MoNE, 2008).

The competencies mentioned in the book that were related to this research were:

- Extracurricular activities: Teachers plan, organize, and implement the activities to visit theaters, museums, factories, and parks for the students according to their age and the aims of learning facilities.
- Making the school a culture center: Teacher plan, apply, and support the facilities to make the school culture center of region.

The competencies related with elementary teachers were:

- Art and aesthetic: having general knowledge about fine arts, using art facilities during learning processes, applying aesthetic vision in learning environment.
- Improve Linguistic skills: gaining and ingratiating students with reading habit.
- Physical Education and Security: improvement of dance figures within the music and development of individual and knowledge and ability for team sports.

Which factors affect the development of cultural competencies?

When we look at the factors affecting cultural competencies that the teacher have, we can sort them in the following order; education level (undergraduate, post graduate, in service training), institutions of education received (village institutes, teaching schools, teacher high schools, regular high schools), the area that the person has grown up in (rural, urban region), education status of the person's family, socio-economic status, friends one contacts with, work and social environment. Bourdieu & Passeron (1964) indicated that the economic capital is directly associated with the possibility that one is able to receive higher education, and with the departments one chooses to pursue in higher education. This situation still preserves its effectualness for many world countries and Turkey. While trying to determine the factors affecting cultural competencies of teachers in this study, teacher education will be emphasized with the obtained results. In this context, the teachers who participated in this research were questioned about the educational status of their parents, the reasons of not being able to improve their competencies on areas such as art, sports, music, and reading. The attempt to explain this extent of the research will be through the concepts of economy, capital cultural capital, and social capital. Economic capital is the accumulation, and source of economy for each individual. Class structure based on division of the economic capital, even if it gets complicated at times in the process of dividing this capital, reflects the class differences generally in a way to process it in a parallel fashion, reproduces, and legitimizes them (Bourdieu & Passeron, 1970). It is stated that economic level indicators, along with being acknowledged as one's income, occupancy, and education (White 1982), can change with factors as health data (Smith 1999), total population in the family, inclusion of grandparents to the family (Bradley & Corwyn, 2002), therefore, socio-economic indicators change according to culture and ethnic groups (Williams & Collins, 1995). The socio-economic level data in this study are confined with the education status of the mother and the father. Cultural capital is an attainment which begins with linguistic and physical skills we acquire starting from each of our childhood periods, consisting of knowledge and skills that we accumulate benefiting from art, science and such products. Social capital, on the other hand, is an attainment formed of social links between people, the connection among people within social relationships, affiliation to groups, and privileges, trust, respectability and such values arising from given correlations. The interaction between these three versions of capital describe the role of an individual in social life and these three capitals usually show parallel development and tendencies to one another (Bourdieu & Passeron, 1970; Wacquant, 2007). The economic, cultural, and social capital acquired are the factors that determine the social origin of a person. In social origin, education life reflects on one's acquirements and outputs from professional life and even from private

life. Students who are the utilizer of this system are a product of the system at the same time, and all attitudes and competencies obtained in all education periods carry the characteristic of all past acquirments (Bourdieu & Passeron, 1964, p.31). For example, cultural capital cannot be established by going to the theatre, museum or concert only when the school organizes or just attending these social events seldom, but by going them regularly (Bourdieu & Passeron, 1964, p.37-38). It has been ascertained that the high school students from bourgeoisie of Paris go to the museum and theatre without any compulsion, and read any book as they wish since they naturally acculturate with the culture of their families, and that the acculturation in reading, museum visiting, and teaching programs in school are not artificial yet sustainable (Bourdieu & Passeron, 1964). In this context, it can be hypothesized that teachers also reflect features of the social class they belong to in everything that defines the relation they pursue with the education system. However, teacher and school environment gain importance in order to improve cultural competencies of especially students at young age in the extent which exploring, modelling and repetition are significant in forming a behavior in human. It also has been identified by a number of researchers that these skills, though within certain limits, mediately enhances academic achievement (Jennings & DiPrete, 2009; Lamm, 2000). In this study, through analyzing the reasons of cultural competencies of teachers, suggestions for solutions have been asserted.

How do cultural competencies of teachers affect the teaching in primary schools?

Vygotsky, one of the pioneers of social constructivism theory, aside from adopting ideas put forward by Piaget's, argues that learning does not solely occur through cognitive processes, but it should also include social, cultural and material processes. (John-Steiner & Mahn, 1996). Depending on socio-cultural perspective, Vygotsky asserted that human learning cannot be understood without the social and cultural forces. In Vygotsky's view, individuals use physical, cultural, and psychological tools to learn and to regulate their activities, and their language. Conceptual and cultural learning occurs through dialogue in what he called a 'Zone of Proximal Development (ZPD)'. "Young people learn under the guidance of their teachers, peers or families, or in collaboration with peers (Vygotsky, 1978, p.86)." Through this perspective teachers are the most reflecting model and guidance for the young students. Lamm (2000) indicated that the one of the four core competencies of teachers to be a good teacher is: acculturation which means that good teacher is a provider of culture. They must be cultured people, with a wide range of general knowledge who are well acquainted with the wealth of culture and its values and be able to convey these to students. The acculturation mentioned here coincides with the teacher competencies partaken in MoNE (2008) stated above. If the teachers, especially in kindergarten and elementary schools, are well equipped with music, sports, art, museum visits, theater plays, and reading skills, how do they affect their students? Having high levels of cultural competencies not only for elementary teachers but for all teachers will contribute them to establish a connection between daily life and learnt concepts, to use creative and different instructional strategies, and most importantly preparing fun classes corresponding to social lives of students.

Making music is a cognitive process (Wilson, 2007) which enables "pattern recognition and development, mental representations of what is observed or imagined, allegorical and metaphorical representations, careful observation of the world, and abstraction from complexity" (Sousa, 2006, p. 26). The students in pre-school and elementary school have the highest capacity to increase neural connection with the activities such as dancing, singing, and drawing engaging all senses (Wilson, 2007). Playing an instrument especially before the age eight stimulates many parts of the brain including left and right parts, it leads to creativity and Tramo (2001) indicated music education can improve math, reading, and spatial skills. Even though all those affects musical education, it also improves children's physiological and psychological development.

Keen reading habits, as it contributes to the logical development of the individual and to the economic growth of the system the individual inhabits in (Phillip, 2005), causes the ability to think fast, and thus the ability to find solutions fast (Ozdemir, 1997), to learn many things about life without experiencing it, to learn more about negative incidents or state of affairs before encountering with them (Leppanen, Aunola & Nurmi 2005). Cunningham & Stanovich (1998) indicated that students who started reading early read more over the years and

their comprehension skills and cognitive development were developed better than the others. Teacher candidates who read more have better writing skills (Benevides, 2006). In many studies, while it has been discovered that the family is influential on adopting reading habits, it has been determined that teachers are also influential on students acquiring reading habits (Myette, 2006) through their experiences about reading books, their guidance to students, inclination of students towards reading and feeling of motivation (Baccus, 2004). Arıcı (2005) remarks that 57,3 percent of the students claimed that they obtained the concept of reading from their teachers. In the same survey, the rate of those who claimed that they gained the habit by observing their mothers is 17,9, and from their fathers is 13,4. Thirty-five percent of students says their teachers are the ones who gave them their first book (p.61). An individual's education received in childhood period from home, school, and environment of childhood period play important roles in improving reading habits (Yılmaz, 2006). Batur, Gulveren & Bek (2010) revealed in the study they carried with 420 teacher candidates that female students have more positive attitudes toward reading than male students. According to the study conducted by Ari & Demir (2013), it was put forward that the ratio of teacher candidates reading an average of 0 to 7 books was approximately 58,3 percent, the ratio of candidates reading 8 to 12 books was 23,4 percent, and the ratio of candidates reading 12 books and above was 18,3 percent. Moreover, it was implied that the reading competencies of teacher candidates were not at a sufficient level. When sorts of the read books were examined, it was specified that 28,8 percent was themed love-affection, 27,6 percent was adventure-science fiction, 17,6 percent was self-help books, 13 percent was religious books, 7,9 percent was history books, and 5 percent was art-culture themed books.

In the theory of self-efficacy asserted by Bandura, there are four sources as mastery experiences, vicarious experiences, verbal persuasion, and physiological state. Mastery experiences signify the past achievements of an individual. If an individual achieved a task in the past, he or she will think that it can be achieved again. Vicarious experiences signify an individual's analogical evaluation of his or her own performance as against other people's performances. Observing people with outstanding performance can enhance one's self-efficacy belief, whereas observing people with low performance can reduce this belief. Verbal persuasion defines motivating verbal messages coming from the influential people (such as mother-father, teacher, friend, etc.) in one's life. However, these messages should be received from dependable people and be realistic in order to enhance self-efficacy belief. Physiological state signify one's evaluation regarding whether or not the physical environment of the individual is suitable to perform a task. If the individual evaluates this environment as positive/sufficient, his or her self-efficacy belief enhances, when a negative/insufficient evaluation reduces the self-efficacy belief (Feltz & Chase 1998). Researches indicate that primary school teachers think that they cannot perform in physical education classes as they should, in other words they find themselves insufficient in this respect (Beydoğan & Sirin, 1998; Pehlivan, Donmez & Yaşat 2005). It has been observed that according to teachers, the foremost cause behind not being able to perform properly is absence of gym, equipment, and material. These results show how determinant is physical state in terms of self-efficacy (Ipek & Bayraktar, 2009). The main objective of physical education and sport classes are to help improving each student's movement capacity by ensuring education and training through physical effects of students, notably their movements. Physical education have features as equipping children with knowledge and skills, forming a healthy life, developing psychomotor skills of school students, instilling rules and strategies (Sirinkan & Gundogdu, 2011).

In the report of 'The Arts and Human Development' (2011), it was stated that young children who have the opportunity to learn and participate in the arts develop critical thinking and metacognitive skills and can learn to think creatively. Furthermore, there is a fundamental assumption that this type of art engagement promotes changes in the brain, which, in turn, support creative thinking and creative expression (p.18). The twenty-first century teacher, in addition to being a technician who conveys the existing information to new generations in the best possible way, has to be someone who is creative so as to produce knowledge. It is important how much the teacher assigned to train creative individuals are trained to be creative through this program. If it is a fact that education is a whole and that science, technic, and arts are all equally significant for education of an individual, it naturally cannot be anticipated for a primary teacher to be creative who was trained without studying such lessons as

philosophy, sociology, and aesthetics even on a basic level (Ilhan, 2003). Furthermore, painting class, which is scheduled only one hour a week in primary education, is described as restrictive, hampering (Demirci & Katiranci, 2003).

Method

The research was done by mixed method. Creswell and Plano-Clark (2007) defined mixed methods research as a set of designs and procedures in which both quantitative and qualitative data were collected, combined, and analyzed in a single study or series of studies. Only one form including structured questions was used for interview questions. The quantitative part included two parts. The one part was composed of demographic information about the participants like gender, age, education level of mother, education level of father, types of graduated school, professional experience. The other part included data about cultural competencies like number of books read, number of visits to cinema, museums, concerts, and theater that participants attended in one year. Qualitative data were obtained from the open-ended questions to see the reasons of cultural competencies

The participants who were elementary school teachers (n= 87) were selected randomly from the primary schools of Istanbul during an education seminar of a researcher with their own volunteering. The demographic data about participants were given in Table 1.

Table 1. The demographic data of participants

Gender	Female	63	72.4%	Age	20-25	25	28.7%
	Male	24	27.6%		26-33	35	40.2%
	0-5	22	25.3%		34-41	17	19.5%
	6-11	24	27.6%		42-	10	11.4%
Professional Experience	12-17	11	12.6%	Kinds of Graduated Schools	Education Institute	5	5.7%
	17-22	6	6.9%		Education Faculty	33	37.9%
	22- 27	6	6.9%		Science and Literate Faculty	41	47.1%
	Bachelor's Degree	66	75.9%		Other	8	9.2%
Education Level	Master	17	19.5%	Education Level of the Mother	Non-educated	4	4.6%
	Doctorate	1	1.1%		Literate	7	8.0%
	Other	3	3.4%		Elementary School	35	40.2%
	Non-educated	1	1.1%		Secondary school	12	13.8%
Education Level of the Father	Literate	2	2.3%	High school	20	23.0%	
	Elementary School	29	33.3%	University	9	10.3%	
	Secondary school	19	21.8%				
	High school	19	21.8%				
	University	17	19.5%				

The data were collected through an interview which was prepared with the addition of advices from a sociologist researcher who was a professor and an expert in the area of culture. The interview including quantitative questions and open-ended qualitative questions were done by face to face with the participants who were elementary teachers in 2 months period in the year of 2015. Quantitative data were obtained from the open-ended questions like: Are you playing any instrument? Do you have any certification on any sport branch? The qualitative data were removed from the same open-ended questions like: 'If yes, which instrument? Are you using this property in your activities with your students? Can you give examples? If No, would you please explain your reasons? Would you like to

play an instrument? (If it is yes) Why didn't you learn? The sample of questions like; How many times did you go to museum in this year? Can you say their names? Did you take your students to any of them? Why?

The quantitative data were analyzed by SPSS statistic program to see the general percentages of cultural competencies of teachers, t- test to compare cultural competencies with demographic information and variance analysis. The content analysis was done by a researcher with two other experts that are specializing in qualitative research. Depending on open and cross coding analysis three themes were identified: individual reasons, socio-economic reasons and education systems. All themes were managed using the Miles and Huberman reliability formula (1994). Reliability = Consensus / (Consensus + Disconsensus) was used and reliability was calculated as averaging 92%. This result indicates that codes of researchers were reliable. Teachers were identified only by using numbers like 5 or 87.

Results

Quantitative results

In this part generally cultural competency level of elementary teachers were tried to be determined in the order of interview questions and also relations between cultural competencies of teachers with age, professional experience, education level, kinds of undergraduate school, education levels of the mother and the father.

Table 2. The percentages and frequencies of answers.

	Yes		No	
	f	%	f	%
Do you have any certificate in any sport field?	23	26.4	64	73.6
Are you playing any musical instrument?	29	33.3	58	66.7
Are you applying music instrument into your class?	15	17.2	72	82.8
Are you related with chess, ebru art, photograph, theater, dance, ceramic facilities?	60	69.0	27	31.0
Did you visit any museums last year?	51	58.6	36	41.4
Did you go to the cinema last year?	64	73.6	23	26.4
Did you go to any theater plays last year?	31	35.6	56	64.4
Did you go to any concerts last year?	39	44.8	48	55.2
Did you go read any book in last year?	73	83.9	14	16.1
Do you have any facility with students' extracurricular activities?	52	59.8	35	40.2
Did you attend any social clubs during your bachelor education?	39	44.8	48	55.2
Did you attend any cultural trips during your bachelor education?	36	41.4	51	58.6
Did your bachelor education contribute your vision on sports, arts, culture?	39	44.8	48	55.2
Do you find yourself sufficient about cultural competencies?	29	33.3	58	66.7

As shown in the table 2, 23 (%26, 4) participants have certificates in one area of sports, while 64 of them ((%73,6) have no certificates. 29 (%33,3) of them were playing an instrument but only 15 of them (%17,2) were applying these abilities in their classes. 60 (%69) participants indicated that they were related with one of the activities like chess, marbling, art, photography, theater, dance, ceramic facilities. 51 of them (%58,6) were going to museum and only 18 of them were visiting museums with their students. 64 of them (%73,6) were going the cinema, other 23 (%26,4) were not going. 31 elementary teachers (%35,6) were going to theater in a year but 56 participants (%64,4) did not go to theater in last year. 39 participants (%44,8) were attended a concert while 48 (%55,2) of them did not attend any concerts in last year. %16, 1 percent (f=14) indicated that they did not read any books, 73 of them (%83, 9) read one or more books in a year. %59.8 percent (f=52) were doing extracurricular activities. 39 (%44, 8) of the elementary teachers were joined a social club and 51 of them (%58, 6) didn't join any cultural trips during their bachelor education. The %44, 8 of them (f=39) mentioned positive improvements of their bachelor education on their cultural competencies. They answered the question "Are you feeling adequate about cultural competencies?" as: 29 of them said (%33, 3) "Yes", 58 of them (%66, 7) said "No".

Table 3. The results of t- test between gender and cultural competencies of participants.

*p< .05

There was a significant difference between the gender of elementary teachers and the cultural competencies concerning going to cinema ($t(87)=2.011, p < .05$), reading book ($t(87)=2.075, p < .05$) and doing extracurricular activities ($t(87)=2.102, p < .05$). The female teachers have higher average than males in these three properties. There was no significant difference in other activities; sport certifications, museum visits, musical instruments, theater, concerts and individual interests.

*p < .05

Depending on the t-test results between cultural competencies and graduated bachelor school of participants, which was shown on Table 4, there was no significant difference between the participants graduated from education faculty and faculty of science and literature, but there was a significant difference ($t(87) = 3.412, p < .05$) between participants graduated from faculty of science and literature and education faculty as to their bachelor education's improvising to their vision.

There was no difference between the cultural competencies and the professional experience (0-5 years, 6-11 years, 12-17years and 18-22 years, 22-) as shown in table 5. The significant differences ($F(6, 80) = 2.751, p < .05$) were obtained in the case of vision improvement and going to cinema related with their professional experience. As result of post-hoc test, the young teachers (0-5 years) believed that education faculties provided their vision improvement and they were going to cinema more than others.

Table 6. The variance analysis results of cultural competencies depending on bachelor, master, and doctorate education level of participants.

According to table 6, there was no significant difference between education level (bachelor, master, and doctorate) and the cultural competencies of participants. There was only significant ($F(3, 83) = 3.170, p < .05$) difference between education level (bachelor, master, doctorate) and going to cinema. The teachers having master and doctorate degree were going to cinema more than the others.

Table 7 shows the significant difference between the mother's education level and teachers museum visit ($F(5, 81) = 2.552, p < .05$) and going cinema ($F(5, 81) = 2.893, p < .05$). When the mother's education level is increasing from primary school, secondary school, and to the university degree, the number of teachers attending the cinema and museum was increasing. There was no significant difference between mother's education level and sport certificate, playing music instrument, theater, extracurricular activities, concert and individual interest of primary teachers.

There was no significant difference between father's education level and the cultural competencies of participants as shown in Table 8.

Qualitative results

In this section, the research concerns as the reasons of inadequate cultural competencies, why teachers were finding themselves inadequate and the requirements to improve their cultural competencies were tried to be answered.

Table 9. The reasons of inadequate cultural competencies

Quantitative results	Individual reasons	Socio-cultural	Education System
64 (73.6%) participants had no certificates of any sports	3-I attended a course but receiving a certificate was not my aim, I had no interest in any kind of sports	8.My family does not have enough financial power 11.Nobody motivated me 18.There was no sport club	33.Unfinished exams 57. No opportunities in the schools, We

		<i>27-I wanted but my age was too old to start any branch of sports, I had health problems</i>		<i>had no ball to play with</i>
58 participants (66.7%) couldn't play any instruments		<i>12 There was no time, 18.I couldn't be successful 54.I have no ability</i>	<i>8: I had no money to buy any instrument 26: I should have started at an early age We weren't discovered</i>	<i>52. There was no support during the university education period</i>
27 (31%) participants weren't related with dancing, ceramic, theatre, photography, chess, local arts.		<i>I am not talented, it never interested me. I feel like now it is too late. I think of practicing photography and such. My partner really wants to learn dancing so we might start folk dancing.</i>	<i>These things require money, we are paying mortgage, it is hard to buy these supplies on one salary, I wanted to play chess a lot but no one has taught me</i>	<i>We were not familiar with anybody practicing these stuff around us, and nobody guided us. We had to finish School first, there was family pressure about it. I wanted to play chess a lot but noone has taught me.</i>
30 (41.4%) participants didn't go to any museum.		<i>I do not like it, I get bored in a museum when I do not have the knowledge. I cannot find time I do not have the habit</i>	<i>Our teachers organized trips to other cities but I could not attend We had no money Some of its entrance fee is expensive I work at a private course in the weekends</i>	<i>Our teachers didn't take us to there much either There was no museum in where I grow up, The legal procedure to take kids to museum is too much like permission, transportation, Controlling student in museums is quite tiring</i>
48 (%55.2) participants didn't attend any social club or cultural activities during bachelor education.		<i>I am not quiet social. I was involved as much as my own means let me.</i>	<i>I have studied in a period when a lot of student upheavals were happening, the clubs were not active in our university Because I studied outside of city Faculty was away from the campus</i>	<i>Our School was not that successful about clubs We didn't have a multidirectional education system I didn't study in a University that was very active There was not such activities in our schools Our School wasn't equipped properly, they didn't encourage the students</i>

48 (%55) participants didn't go to concert.	<i>I cannot find time.</i>	<i>Costs are high, It is hard for us to go by family Returning to our residence is not easy at nights</i>
23 participants didn't go to cinema.	<i>I do not have the habit. Theatre is a culture and unfortunately I don't have it My partner doesn't like it and it affects me too</i>	<i>We have to pay a rather high cost to afford it if we go by family I work at an extra job, I don't have the time</i>
56 participants didn't go to theatre.	<i>I don't have the time to read I like Turkish movies and subtitles are tiring</i>	<i>Our house is located far away from these facilities Books are very expensive</i>
14 participants didn't read any books.	<i>I watch dubbed version on TV</i>	<i>I watch movies online</i>
58 (%66.7) participants didn't find themselves adequate about cultural competencies	<i>11: Because I believe one has to be more equipped 67: I have to contribute myself a lot more things, I believe teachers have to be competent in every field, 55: I'm not equipped about this subject, because I didn't train myself properly in schools....</i>	<i>81: Children from high-income group can get education on many subjects, as you look into lower classes impossibilities (financial-moral) come to existence 55: Because I couldn't raise myself sufficiently and schools are also unsuccessful (in training students and education) 75: Faculty of education is not adequate for artistic and cultural activities, I consider myself not educated sufficiently, I wasn't educated about these competencies in university</i>
Their requirements	<i>12: To be guided at an early age for these activities 24: To be certificated to improve oneself culturally and be beneficial to students Swimming, tennis courses to be initiated 15: No exam stress 9: To have the time</i>	<i>12: For schools to have more opportunities 13: To have money 24: To have the sports facilities 51: To be guided toward sports or arts in high school or in university 9: To be active in these activities instead of living focused to school</i>

Conclusion

The teacher competencies related with the cultural properties like concert, cinema, art, music, reading skills are reflecting students cultural development were grounded from family structure, social structure, and education system. All the results will be discussed in the light of literature. The fact that the teachers participating in this research were graduated from faculty of science and literature or faculty of education did not make a significant difference in terms of cultural competences. Teachers with only 0 to 5 years of experience emphasized that faculty of education has contributed expanding their vision. When cultural competencies by gender is analyzed, it can be

seen that there has been a significant difference in favor of women only for going to the movies, reading, and extracurricular activities. When we look into reading habits of teachers, %16.1 percent of participants ($f=14$) indicated that they didn't read any books, 73 of them (%83.9) read one or more book in a year and also female teachers were reading more than male teachers. While Batur, Gulveren & Bek (2013) found the reading capacity of teacher candidates to be not adequate, and they ascertained that women also read more books than men among teacher candidates. Aslanturk & Saracaloglu (2011) found that reading habits of pre-service teachers was at intermediate level. Therefore, similar results were obtained in class teachers as the case here. The results obtained are thought-provoking in terms of representing a model to form reading habits in students by the teacher (Myette, 2006; Baccus, 2004). When attitudes of teachers towards visiting museums are analyzed, it has been determined that participant go to museums ($n=51$); however, they happen to be rather unsuccessful in taking students to museums. The reason for this has been implied as the intense procedure to get the necessary permissions, and the difficulty to keep the students in control. The education in museums, the stimulating function of museum materials, in addition to coincide with behavioral approach theory in terms of draw attention of the visitors, respond to cognitive enhancement approach in terms of providing an active exchange among student and the surrounding, to the theory of multiple intelligences as it enables learning for many types of intelligence, to exploratory learning approach, which enables learning through inactive, iconic and symbolic designs as in the science museums (Cited: Onur, 2012). The understanding that museum visits are early acquired behaviors (Bourdieu & Passeron, 1964) has also been discovered in this study While the occupational experience, gender, age, postgraduate education, the attendance to faculty of science and literature or to faculty of education of teachers do not influence the frequency of Museum visits, it has been found out that as the education level of the mother increased the ratio for teachers to visit museums also escalated. Likewise, as the education level of the mother increased the ratio of going to the movies also escalated. The habit of going to the cinema has been found to be at a higher rate within the participants continuing their undergraduate, masters, and doctorate education, and in young teacher with 0 to 5 years of professional experience. When we examined the music competencies of the teachers participating in this research, it was determined that fifty-eight of the teachers did not play any musical instruments and forty-two teachers did not go to any concerts within a year. They stated their reasons as lack of time, being untalented, and lack of support. It has been implied that seventy-two teachers do not use any skill about music during their lessons. Teachers who cannot be educated to be qualified with the required qualities for various reasons in the education programs in which they are graduated from either do not include music lessons to their teaching schedule at all or teach music class on in accordance with their own understanding, outside of the purposes and principles of the program in the schools they work. In order for classroom teachers to become qualified on music education and training, it is necessary to increase the number of class hours, to organize seminars about the programs and courses for instrumental/vocal education (Kucukoncu, 2007). When competencies of classroom teachers in the field of sports are examined, it is determined that sixty-four teachers did not hold any documents like certificates showing any sports competencies. The fact that participants thought that they were not guided to the sports at an early age demonstrates that our consciousness about playing sports as a society is also not sufficient. Sports are significant for psychological and social development as well as physical development. We must also be aware that in children growing up with sports, self-confidence formation, teamwork, and competence of taking responsibility also improve. Looking into the undergraduate program of classroom teaching, it can be seen that Physical Education class in the second year is four hours and Physical Education and Game Teaching in the third year's spring semester is 2 hours a week. Teachers have expressed its reasons, the fact that they did not have the ability and their schools or university's lack of facilities with such statements as "there were no balls in School", "clubs were insufficient", and "the faculty was located far from the main campus". Similarly, as sixty teachers were interested in one of the activities such as chess, ceramics, marbling, photography, theater, dance, twenty-four of these teachers used these proficiencies during their lessons. Furthermore, studying the rate of participation to University social club activities throughout their bachelor education, it was determined that forty-eight teachers did not attend any social club activities during their undergraduate education. The reasons behind this were predicated to be socio-economic and efficiencies of universities with such statements as 'I have studied in a period when a lot of student upheavals were happening, the clubs were not active in our university'. Necessity of art classes in faculty of education, demand to

increase elective courses, insufficiency of University club activities reveal that the auxiliary budget should be reserved by university administration for these kinds of trainings. Moreover, it put forth that social support of local authorities, in which the University is located, has importance.

The most significant cause for teachers to feel incompetent is their low self-efficiency believes. When we look into the reasons for not being able to improve their cultural competencies generally, participants stated the facts that they feel like they are too late, they do not trust themselves about their abilities, they do not have the time or they just are not interested in. Socio-economic reasons; on the other hand, were stated as the education level of the family, not having the financial possibility throughout their education life and not having the opportunities in the place lived in. When taking part in the profession, again the same phase of financial possibility inadequacy comes into prominence. For example, "I'm paying for home mortgage, I cannot afford to buy required supplies with single salary, and I work as a course teacher at weekends." Analyzing its affects in terms of education system, the causes coming to forefront are the examinations in their student lives, not being guided by their teachers efficiently, financial and social impossibilities. Herein, again the effects of the economic capital, social capital, and cultural capital come forward (Cited; Yücel et al.; 2013, Bourdieu and Passeron, 1970, Wacquant, 2007). Gelbal (2008) attained such findings that success has increased with increasing opportunities at home, the level of mother's education has had a significant effect on success and, success decreased with the increase in number of siblings one had. Despite these results, the fact that there were teachers improving their competencies throughout their undergraduate education with claims as "I have attended many activities owing to school's central Location.", "It contributed watching theatre plays and reading books" depicts that undergoing circumstances can be altered as long as teachers are willing to improve themselves in fields like sports and arts. Training teachers with high self-efficiency culturally and thus becoming a positive model for their students in increasing self-efficiency (Bandura, 1982) will bring solutions to statements of teachers processed in this research as "I wanted to play chess very much but no one has taught me", "There were not anyone to guide me sufficiently", "Our talents were not discovered", "There were no one around us that practiced these". Influence of sports competencies of learning environments on improving academic success and attitudes of student conducted in this survey is also significant in terms of questioning equipment of education faculties (Fraser, 1998 Despite the detailed and complex nature of this research, and its underwhelming results obtained, I have abiding belief that when we train qualified teachers, we will be able to train qualified students (Bourdieu & Passeron, 1964). As Mellou indicated (1996), young children's creativity can be nurtured through educational settings in three respects: creative environment, creative programs, and creative teachers and ways of teaching.

Recommendations

For primarily improving cultural competencies of teachers, it is advised for universities to increase the number of sports, arts and culture classes in the educational program especially for preschool and classroom teacher candidates (education at museums, crafts, etc.), diversification of elective courses or to ensure to be certificated on sports, arts and culture, infrastructure and social opportunities of university administration of education faculties (provision of supplementary budget for equipment, classroom, lecturer recruitment, cultural trips, and such activities), to provide economic support to social clubs. It is suggested to initiate certification programs by cooperating with universities, especially with the ones that have fine arts faculty, and for universities to show support on site and costs, as with the city theatres of local authorities, on behalf of teachers who are active in the profession. It is recommended for school administrators to support classroom teachers in conveying teachings through using competencies to students in free activity classes.

Professional learning of leadership as a prerequisite for kindergarten development

*Edita Slunjski¹,
Karmen Pavlic²,
Darinka Vrbanec³*

Abstract

The demands of leading an educational institution are increasingly growing and are becoming more complex. Nevertheless, preparation for leadership, either at the initial level of education or professional training, is still largely at an inadequate level in the Republic of Croatia. It is often reduced to personal experience of the educational staff, i.e. to *ad hoc* dealings with complex managerial challenges. In this paper we discuss the most common forms of professional learning about leadership and its disadvantages, as well as the possibilities of conceptualizing the conditions for better professional learning of leadership. These include encouraging the culture of learning at the institution itself, which involves a large number of subjects, not just the principal. In particular, we highlight the value of professional learning of leadership at the institution itself, and this includes professional expertise of the employees and it is incorporated into the day-to-day practices of the institution that relies on the power of the group of other employees. Such forms of leadership learning take into account different structures and institutional contexts of the institution, as well as the value of employee co-operation. In this paper we present the action research we undertook in a number of kindergartens. Action research is a specific type of empirical research that is carried out with immediate pedagogical action. This is a scientifically based change of the pedagogical process in which the main organizers and creators of this process appear simultaneously as researchers. In that sense, it was based on the connection and collaboration between the members of the academic community and practitioners as equal partners. The aim of this research was to become acquainted with and to improve the quality of leadership in the real context of the institution, which means that the research and the learning opportunities of leadership that grew out of this research were highly personalized. In this regard, employees were enabled to experience the research of the quality of their own leadership in the real context of the institution and the integration of various skills required for continuous questioning and (self)evaluation. The results of this research are noticeable in acquiring new knowledge and improving the management process in kindergartens involved in the research. At the same time, the results could also represent the basis for redesigning the program of professional learning of leadership by competent institutions. In that sense, the kindergarten could become a learning center for better practice and quality leadership, through formalization of the approach that has been developed through its own practice.

Keywords: action research, learning culture, leadership, kindergarten

Introduction

Although the demands of leadership in an educational institution are becoming increasingly complex, leadership preparation, either at the initial level of education or vocational training, is still inadequate (Hujala et al., 2013). This preparation for leadership is often reduced to the personal experience of working in an institution without a proper foundation in modern theory and research practice. Leadership skills are self-implied, which is the result of the misguided belief that leadership is taught “along the way.” Therefore, there is a growing need for adequate vocational guidance for leadership, i.e. the formation of a “new generation of leaders,” which is a major challenge for the relevant structures of the educational system. Most countries recognize that this issue implies the need for a deep-rooted change of these structures and a reconsideration of the program of initial training and permanent learning about leading educational institutions. Although terms such as “training” and “development” are used in the context of the professionalization of leadership roles⁴, Anderson and Cawsey (2008) prefer the term “learning” when it comes to institutional leadership. This is explained by the fact that it covers a wider spectrum of formal and informal activities than those previously mentioned.

In educational institutions, leadership is a multi-dimensional and multi-faceted concept, strongly determined by the features of the institution itself, but also by the leader’s values, goals, beliefs, and skills. All this needs to be taken into account when shaping the concept of professional learning about leadership. Typical forms of ineffective leadership learning are, according to O'Brien (2007), one-off workshops held outside the institution, as well as all other courses developed around the idea of separating learning from the workplace and the

⁴ The principal and other leadership personnel within the kindergarten are considered as leaders.

immediate experience gained from it, especially those that are organized as one-time encounters. Instead, the aforementioned author apostrophes the value of leadership learning in the workplace, i.e. learning through experience and professional expertise of leaders, which permeates everyday practice.

Contemporary conceptions of leadership, which include dealing with situations of uncertainty and ambiguity, contradictions and paradoxes (Duignan, Anderson and Cawsey, 2008) require such approaches to professional learning which would prepare them for dealing with uncertainties, ambiguities, and contradictions. For these reasons, the content and methods of contemporary professional learning of leadership differ significantly from the outdated ones, which are often reduced to the consumption of executable leadership programs. Good quality leadership training programs should take into account the different structures and institutional context of the institution, values of cooperation (Davis et al., 2005), and specific (existing) skills of leaders. This requires the connection and co-operation between various professional associations, practitioners, and members of the academic community as equal partners, whose task it is to design professional leadership programs as well as to evaluate their quality.

Therefore, some of the basic characteristics of the contemporary approach to learning about leadership are to keep it in the real context of the institution and for it to be personalized. This should take place in the real context of the institution in order to enable leaders to integrate different skills and to provide the possibility of continuous discussion and (self)evaluation. The advantage of such an active way of professional learning about leadership is also to give each leader a sense of guidance and practicing leadership in an authentic, i.e. unique way. The primary advantage of such a form of learning is what happens in an environment that is familiar and relatively comfortable (MacKay 2006). This cannot be accomplished quickly, easily or through informal intervention; instead it requires long-term and systematic building of the learning culture within it.

The most popular contemporary concepts of leading an educational institution can be summed up into two main theses. The first of these, emphasized by Fullan (2010), is that leadership must be focused on creating conditions in which the value of learning equally applies both to the individual and the collective. The second, highlighted by Lambert (according to Anderson and Cawsey, 2008), stems from the idea that leadership of an educational institution is much broader than actions made by a single person, the definition of its role, and the set of individual procedures. On the contrary, it is incorporated into the community of the educational institution as a whole, which requires the common responsibility of all employees to achieve a common purpose. For this reason, the learning need for leadership refers not only to the principal but to a much larger number of employees among whom tasks, influence, and power are distributed. Leadership is not the property of a person, but is distributed throughout the organization and therefore represents a group function (Dinham, according to Anderson and Cawsey, 2008, Southworth, 2010, Yukl, 2006).

One of the most powerful strategies for learning about leadership is **action research** (Cohen et al. 2007; Somekh, 2006; Koshy, 2009), which contributes to the development of higher levels of organizational abilities through solving real problems and within the context of the institution. Quality strategies of such an understanding of learning include the development of key knowledge, specific activities, and practices that benefit the institution, i.e. ensure the development of deeper understanding and conceptual expertise of the leader. They include the development of a wider repertoire of understanding and skills related to the concepts and practice of running the institution itself as well as all other processes of leadership within it.

Method

With regards to the theses presented in the introduction, we chose action research as a methodology for simultaneous research and improvement of the educational practice, with particular emphasis on the processes of leadership as its main component. Action research is aimed at bridging the gap between theory and practice, i.e. overcoming the limitations of traditional research to influence or improve the practice (Cohen et al., 2007). This is the reason why it is always carried out in realistic situations, i.e. in the educational institution itself. This characteristic of action research coincides with the view of a number of authors (Malaguzzi 1998, Rinaldi 2006), according to whom there is only one place where effective professional development of the educational staff can take place – in the institution itself.

During action research, participants are encouraged to question, problematize, and modify their own leadership practices, to build a deeper understanding of this phenomenon, and to assume responsibility for actions geared towards developing its quality. In other words, it helps them to better understand the essence and meaning of their own activities related to leadership, i.e. to raise awareness of the values on which it is based. There is often a great discrepancy between the practitioners' proclaimed attitudes and realistic actions, i.e. between what they say and what they do (Gobo 2011). They can declaratively opt for different contemporary ideas and concepts, and in practice do something that is contrary to them. Precisely the development of research and reflexive competences allows the leaders to gradually build the quality of their leadership, and consequently new leadership theories.

Various contextual conditions of kindergartens and some special leadership skills that determine the quality of leadership were the subject of our research. Given the specific characteristics of the educational practice, namely nonlinearity, complexity, and unpredictability (Kinsler and Gamble 2001; Strozzi 2002) as well as its holistic nature, we relied on an interpretative, i.e. holistic, naturalistic, and phenomenological research approach that relies on qualitative research methods.

Holistic characteristics of the qualitative research approach enabled us to observe the whole, i.e. the interactive action of various contextual factors in the institution and some special skills of leaders who specifically define and shape the processes of leadership within it. The qualitative approach allowed us to recognize the authentic characteristics of different institutions, since each of them represents the web of a multitude of interactively linked organizational structures determined by their culture. Namely, the culture of a given kindergarten represents the framework that determines what is considered to be feasible and desirable or impossible and undesirable, which does not have to hold true in another kindergarten (Vujičić 2011). Precisely for these reasons, leadership characteristics in different kindergartens, and ultimately the quality of these processes, are very different.

In this paper, quality leadership constraints will be considered as *contextual conditions of the kindergarten* (room structure, social relations, organization of time, and deeper values of cultural institution) and some *special leadership skills* (building the vision and articulating the direction of institution development, encouraging continuous professional development of employees, the skill of mobilizing the staff's existing energy, and the skill of developing purposeful collaboration).

With this research we wanted to establish the existing quality of the process of kindergarten leadership and to gradually improve the possibilities of its development, since quality can only be changed from the inside, based on identifying the problems and solving the need for change within the institution itself (Kinsler and Gamble 2001). The aim of our research was not only to establish the existing quality of the leadership process but also to train leaders to conduct research and gradually improve the quality of leading.

For these reasons, we opted for action research, as a methodology for simultaneous research and change of the educational practice, which relies solely on the development of research and the practitioners' reflexive skills, as well on the holistic approach to improving their practice (Cohen et al 2007). Namely, "action research is a specific type of empirical research that is carried out with immediate pedagogical action. It is a scientifically based change of the pedagogical process in which the main organizers and creators of this process appear simultaneously as researchers" (Bognar and Matijević 1993, 285).

We undertook action research in two kindergartens⁵, i.e. in eight facilities, during three pedagogical years, and included their principals, members of professional teams (pedagogues and speech therapists), kindergarten teachers, and in some segments even the children. During the research, we collected the data directly, i.e. by participating in observations and discussions with the subjects of the educational process, as well as by obtaining various ethnographic records, such as photos, videos, transcripts of their conversations, and other narrative forms. We paid special attention to the collection of the research participants' discussion transcripts, which were used at all stages of the research as a basis for a joint analysis, i.e. reflections with all subjects involved in the research.

⁵ Kindergartens "Didi" near Zagreb and "Čarobna šuma" from Križevci.

During the action research we relied on the Lewin spiral model (according to Kemmis and McTaggart 1981) consisting of several cycles of planning, action, and results evaluation. Thus, we started by reviewing concrete conditions and establishing the existing state of practice with an emphasis on the quality of leadership. Based on this we made decisions in collaboration with the leaders on the general action plan. This then led to making concrete and feasible steps and jointly devised ways of tracking their effects as a basis for new planning. Each initial plan was revised in light of new information, forming the foundation of new actions. Thus, during the research, we followed and supported the advancement of different contextual conditions and some special leadership skills that influence the quality of leadership, which we will elaborate in further text.

Findings, Result and Conclusions

The initial quality of the teaching process in the kindergartens involved in our research was different, and it also differed after three years of research. However, in each of them there is an evident rise in quality, given its specific abilities and characteristics, and the different skills of the leader. In this paper, we will not describe in detail particular stages of the research, as this would exceed the given working framework. Here we will show the most important insights we have gained, for which we feel that they have more powerful implications for the quality of managing a kindergarten.

During this research we established that the quality of kindergarten leadership is greatly determined by the contextual conditions of the institution and some special skills of the leader.

a. Contextual conditions (room structure, social relations, organization of time, and deeper values of cultural institution)

During our research, we found that different contextual conditions are significantly, i.e. reciprocally correlated to the quality of leadership and that this impact can be observed in both directions. Different contextual conditions of kindergartens (and in each kindergarten individually) determine the possibilities of educational work within them in a number of ways, thereby shaping the business of the kindergarten and all its pedagogic processes in a particular way. At the same time, the way in which kindergartens and pedagogical processes are managed affects the change or retention of existing structures of kindergartens. In this respect, the prospect and quality of leadership determines the ability of leaders to understand the structure of kindergartens and their impact on the quality of practice, and to align their personal way of leading with the significance of these structures. This particularly applies to the structure of social relations and the deeper value levels of kindergartens, i.e. employees' attitudes and beliefs. The leader's failure to understand this dimension of the institutional context, i.e. the mismatch between the leader's expectations and those of the staff, i.e. their current abilities, competences and motivation, mostly results in such forms of leadership that often additionally aggravate the current condition. At the same time, understanding and appreciation of the existing situation in this part of the context is the basis for designing such forms of leadership that have a positive impact on the development perspective - both of the institution and the leadership process. Thus, we have confirmed our assumption that quality leadership is contextually defined and that access to the leaders' professional learning should be contextually diversified, i.e. personalized.

b. Special leadership skills

During our research we found that some special leadership skills strongly determine the quality of the kindergarten and other pedagogical processes in it. Each of them will be briefly described.

We were convinced that *building a vision* and *articulating the direction of institutional development* are among of the most important preconditions for successful leadership. Namely, we found that the staff is motivated to achieve those goals that are of particular importance to them. Therefore, the goal of successful leadership identifies not only those goals that are important to the institution itself but that this should be done in a manner that some employees can engage in achieving goals by identifying them as their own. Otherwise the goals of the institutions do not have a motivational value and the prospects of their achievement are greatly reduced. In this regard, as demonstrated in our research, the art of leadership is expressed through the measure in which the leader can focus on the individual and collective work of the staff, and together identify and articulate the vision in accordance with the group's goals. Of course, the perspective of these processes is also determined by the level at which the leader has an articulated vision, i.e. the level at which he understands which direction of institutional development is worthwhile. These leadership competences can be quite different, even within the same institution. What is particularly important for our research was that declarative orientations of the leader

regarding the vision and the direction of institutional development can greatly vary in relation to what they do in their practice, which can be completely different from their declared vision and direction. For this reason, during our research, special attention was directed not only at the ways in which the institution's vision of development can be enhanced, but also at strengthening the reflexive skills of the leader.

Orientation to foster continuous professional development of employees is a particularly important skill of leaders, regardless of the function which they play within the institution and at what level of hierarchy they are acting, because continuous learning is *conditio sine qua non* of the contemporary educational institution and applies to all its employees. During our research, we found that leadership aimed at encouraging professional learning of a particular employee or a certain number of employees has a lesser effect than leadership aimed at fostering a learning organization as a whole. Namely, leadership directed at fostering the learning of the entire organization leads to the creation of its stability and it significantly enhances development opportunities. We have also come to the conclusion that creating infrastructures that enable researchers to explore forms of learning has a greater potential than those that occur once or occasionally. And finally, those forms of learning that are continuous and take place in the institution itself have a more powerful potential of developing the employees' professional competence and institutional development. Such forms of professional training of employees also strengthen the common vision of kindergarten development. All three aspects of promoting professional development of employees reflect, to some extent, the motivation, preferences, and competences of leaders who decide on them. That is why we are highlighting them here as special leadership skills.

We also identified *the skill of mobilizing the staff's existing energy* as an indicator of successful institutional leadership. Namely, during this and several previous researches (Slunjski, 2011, 2015) we came to the conclusion that people cannot be changed by force, nor can they be forced to work better. Likewise, we came to realize that motivating people with rewards has a limited impact on their work, as it can only lead to short-term changes. In this regard, we focused in particular on the ways in which a leader can empower the existing inspiration of the staff as a possible driver of longer-term changes. We found that a leader can do this by empowering them through a sense of purpose, i.e. by encouraging the staff to engage in activities which they consider as meaningful. Likewise, we found that leadership is effective to the extent that it provides the staff with a sense of contribution to some improvement. Over a longer period of time we were convinced that such an approach to leadership contributes to the institution's capacity for new improvements. Finally, we noticed that a leader could mobilize the existing energy of his employees by securing a certain degree of autonomy in order for them to gain and practice the experience of (self)assessing the achieved progress. Our research has shown that leadership focused on empowering intrinsic motivation of employees directly increases the collective capacity of the institution, thus creating the foundation of sustainable change in the long run.

And finally, *the skill of developing purposeful collaboration* in the collective has proven to be particularly important for the quality of kindergartens and all processes in it. On the path to institutional development, the co-operation among people in the institution is particularly important because the interconnection and exchange of information between employees can facilitate the learning of new knowledge and the formation of productive processes. However, not every co-operation is useful for the development of an institution; in fact some forms of connecting and collaborating with the staff on institutional development may have a destructive effect. In this regard, the quality of leadership, as we were repeatedly reminded during our research, is the ability of leaders to recognize and strengthen the functioning of the team and the groups working on introducing positive changes, thereby enhancing the collective development capacity of the institution. The measure in which the leader encourages purposeful cooperation is reflected in two mutually connected forces of change: knowledge of employees about innovative ideas and practices, and the development of their common identity. We have noted that the success of leaders in encouraging these processes, i.e. the development of a collaborative culture of kindergartens, largely determines its authenticity, i.e. the consistency of its proclaimed attitudes with the actions it undertakes. We consider providing support to leaders to heighten and discourage this discrepancy as one of the most important goals of our research.

Recommendations

This research shows that the contextual conditions of the institution strongly determine the quality of leadership and are at the same time under its direct influence. We have also come to understand that the quality of leadership determines several special skills of leaders, namely, building the vision and articulating the direction of institutional development, orientation to foster continuous professional development of employees, and the art

of developing purposeful collaboration within the collective. The common characteristic of all leadership skills is that they cannot be gained through direct teaching or developed in a short period of time. On the contrary, this is a long-term process of forming the conditions and processes that will lead the leaders to acquire such skills. Also, in order to develop them it is necessary to build upon the research and reflective skills of leaders in practice so as to overcome the possible discrepancy between declarative and realized values and practices.

The perspective of these processes is also determined by the depth of the common understanding of all employees within the institution, which cannot be achieved either by one-off or individual forms of training. On the contrary, it can be achieved on the basis of the colleagues' insights and expertise, which are used to confirm success or correct what needs to be corrected, relying thereby on the very strength of the group and common learning. That is why we can conclude that the development of leadership skills in everyday practice, which has a continuous and explorative character, needs to be built for the development of the quality of leadership. Performing action research has proved to be one of the more effective strategies for developing such skills, and, on the other hand, as a possible way of building new knowledge and practice theory that are derived from practice.

Abstract

Objectives: to identify and recognize the analysed problems of childhood pedagogy in Master's theses, to detect the actualized contradictions in upbringing and education of the modern child as well as to reveal the practical opportunities in execution of sustainable pedagogical approach. Problem of the Research: Implementation of the pedagogical strategy that supports sustainable development in pre-school education. Research Methodology: Implemented research of evaluation, by systemizing the scope of Liepaja University Master research problems to be solved within the context of childhood pedagogy and by assessing the within Master thesis applied pedagogical approaches of children upbringing and education. Research Methods: theoretical comparative analysis, content analysis of Master theses. Research Base: theoretical sources, defended Master theses of 25 students. Research Findings: systematized conceptual theoretical insights and empirical experience in realization of sustainable pedagogical approach within the process of developing child's personality that reveals the essence of upbringing and educating activity and influences the quality of pedagogical cooperation in the modern institution of pre-school education. The paper focuses on the prevailing contradictions among pedagogical practices as well as describes the pedagogical approaches in resolution of the current problems in Latvia pre-school education.

Keywords: upbringing, child as value, child-focused approach, sustainability, pre-school education.

Introduction

The quality of education is an important precondition for sustainable development of society. Nowadays the ongoing social transformation of society and family has a significant impact to childhood research studies in social sciences around the world, which largely proves the unique status of child as a value. Childhood is a specific period of human life, and its research leads to a series of unknown and unconscious research dimensions. In the sphere of research, the complicated childhood phenomenon attracts with its uniqueness, dynamism and unpredictability, as well as with its social and pedagogical topicality.

The European Union and national documents, such as ETUCE Policy on Early Childhood (2012), NAP 2020, Guidelines for the Development of Education for 2014-2020, Sustainable Development Strategy of Latvia until 2030, emphasize that in the childhood pedagogy it is crucial to improve the teaching and learning environment and the educational content so that it is in conformity with the contemporary requirements in order to promote creativity of pre-school teachers and children, to provide cooperation between the pre-school educational institutions and families and to enhance the professional competence of teachers.

The pedagogical practice reveals various contradictory views of how adults (parents and teachers) see children's life activities and their self-fulfilment opportunities, which often points at teachers' lack of awareness, incomprehension, and confusion, sometimes indifference and even avoidance of responsibility, creating ongoing problem situations in the upbringing process. It often causes unnecessary destructiveness and aggression in the adult and children's mutual relationship system leaving negative consequences in the process of forming a unique child's personality, as well as creates soil for frustrations forming the foundation for the development of childhood complexes, the consequences of which are felt in the later stages of life. Preschool education teacher A.Grinberga (2013) in her Master's thesis (MT) points out that today's children are stressful and get tired quickly; they are having difficulty with discipline and compliance to the rules often due to the parents' misconceptions about all-permissive education. But pedagogue A.Brauna (2013) suggests that in the pedagogical practice "it is common to face the situations when the child is uncertain about how to handle the present

situation, as maybe to date no one in the family has spoken with him/her about the existing phenomenon or behaviour, or paid attention to it" (Brauna, 2013, 6).

To a large extent the future of society depends on how the children are raised. Every child is born with endlessly wide developmental potential and opportunities. For a full development and growth, a person not only needs a multi-faceted, creative and harmonious pedagogical process that does not limit the children's possibilities for expression, but also competent and motivated educators, positively stimulating and supportive pedagogical activities, as well as development-promoting social environment. In order to allow and help the children to develop their individuality, it is required to have an appropriate educational environment, unconditional parental love, responsibility and active participation in the work of pre-school educational institutions, as well as purposefully planned and guided collegial cooperation of pre-school teachers. The sense of responsibility at all levels of pedagogical activity promotes the need for a personality to develop and gain knowledge, and to acquire on daily basis such roles as parents and educators that help the children to grow up free and happy so that they can become members of sustainable society.

In the Master's theses of practicing pre-school teachers, different pedagogical approaches and strategies are analysed offering professional solutions to problems of childhood pedagogy. A pre-school teacher J.Kehre-Baika, describing the possibilities for promoting children's creativity, says that "in order to develop the children's self-initiative for seeking the knowledge and acting creatively on their own, it is necessary to create an appropriate learning environment and provide a diverse material-technical basis" (Kehre-Baika, 2014, 5). According to the pre-school education teacher M.Culkstane (2014), it is pedagogically important to respect the needs of the child. In order to implement a child-centred approach the teachers must know the individual development of each child (Dalecka, 2016). In turn, A.Engele (2015) believes that it is important to improve the methods and tools of teaching, as well as to introduce innovations in the lessons making them interactive. The above mentioned ideas confirm the value of pedagogical beliefs on upbringing of children for promoting and securing the maximum capacity of the child.

The purposeful qualitative analysis of childhood research and the systematization of the research data for the purposes of educating the parents and ensuring the quality of the family education processes is one of scientifically based ways of how to purposefully influence the formation of the young parents' attitude towards their child as a unique value and how to raise the public awareness about the topical issues of children development, promoting the increase of adult responsibility both when solving family and society related problems in the context of sustainable development of the society.

The aim of this publication is to reveal and characterize the childhood pedagogy problem issues analysed in Master's theses, to identify the contradictions and practical possibilities of children's upbringing and education while implementing the sustainable pedagogical approach.

The novelty this empirical research can be characterized by the following aspects: for the first time in Liepaja University a targeted qualitative and hermeneutic analysis of 25 Master's theses (MT) is carried out for the research purposes in order to clarify and systematize the problems and solutions of childhood pedagogy actualized in the MT, as well as pedagogical ideas of practicing pre-school teachers – the authors of MT are summarized, which provide insights in the dimensions of childhood pedagogy problems and allow to set out the prospects of potential goals and tasks for pedagogical work in order to promote the sustainability of society.

The research basis and methods

In the contemporary scientific discourse, the childhood education research is strongly influenced by the predominant qualitative research approach, which is still purposefully accepted encouraging discussions amongst the teachers on the research methods: "when revealing the child as an active subject in his or her life's environment, also the discussion expands on methodological approaches and methods in the childhood research"

(Špona & Jermolajeva, 2015, 15). The methodology for this particular study is based on the qualitative research traditions, as it focuses on exploring the pedagogical experience of pre-school teachers in cooperation with the children and their parents. In the research process an assessment research study is conducted, systematizing the range of childhood pedagogy problem-issues raised by LiepU Master's level students in educational sciences and assessing pedagogical approaches of children's upbringing and education described in the Master's theses.

Methods of research: theoretical comparative analysis, content analysis of Master's theses. The basis of research: theoretical sources, 25 defended Master's theses. The pedagogical observations show that the child's behaviour varies substantially even in the same environment and under the same conditions, and the interpretation of these differences forms the research basis, encouraging adaptation of individual research approach to each situation. The specialization and professional competence of childhood pedagogy researchers greatly influence the research context and focus emphasizing the importance and potential of qualitative research, because the qualitative approach, in contrast to the quantitative, focuses on in-depth, comprehension and comparison, as well as characterization of individual traits. This approach assumes that "the most important aspect of internal structures is the representation of each person's individual history, which the person constructs, based on the particular experience of his/her life" (Kroplijs & Raščevska, 2004, 17). As the qualitative research design tends to dominate in the studies of childhood pedagogy problems, and as also evidenced by the analysis of Master's thesis elaborated in Liepaja University, various employed theoretical and empirical methods give opportunity to pre-school specialists to analyse and summarize the research information in the topical dimensions of childhood pedagogy.

It is important for the authors of this publication to become acquainted and to describe the understanding and ideas of the Master's students – practitioners involved in the field of pre-school professional activities about the potential improvement of practical childhood pedagogy activities. Therefore, the content analysis of MT (verbal reporting forms) was chosen as the research method because it is the social and psychological-pedagogical interpretation of the research data obtained by Master's students that offers and reveals their specific understanding and vision on how to solve pedagogical problems. The following general guidelines for analysing the qualitative data were chosen: the themes of the MT, research subjects, research objectives, hypotheses, conclusions and recommendations. The goal of the hermeneutical analysis of the statements expressed by Master's students is to understand what exactly the authors have stated as their pedagogical ideas and vision, as well as what changes and innovations they see needed in their work. This means that the authors of this article, interpreting the research data, take into account the specific objectives, content and particular conclusions and recommendations of each Master's paper.

In Liepaja University, the problem issues of child development and upbringing are addressed in five Master's level study programmes – in accordance with the specific research context of each programme. These programmes are: in the field of higher academic education – Master of Educational Sciences in Pedagogy (hereinafter MESP), but in the field of higher professional education – General Education Teacher (GET), Career Consultant (CC), Social Work (SW) and Music Therapy (MT).

Conceptual theoretical findings of childhood pedagogy

One of the four priorities identified under Agenda 21 was "Education, Public Awareness and Training for Sustainability". The task manager for this process and for conducting the educational work of the CSD is UNESCO. One of its key responsibilities is teacher education, which is seen as one of the most significant areas for action. Further background of the project is outlined by Hopkins (2001). The purpose of the project undertaken by UNESCO on behalf of the United Nations (UN) is to re-orient teacher education to address sustainability.

Pre-school is a part of early childhood education, but it is vitally connected to primary education. In any case, pre-school can be defined as a phenomenon too. This is based on 1) the analysis of psychological theories of early development, learning theories and didactic theories, 2) the ideas of philosophers/pedagogues, and 3) analysis of definitions of modern early childhood education specialists, which allows presenting a new systemic definition of pre-school. Pre-school in life means pre-school practice (care, education, and teaching), preschool-oriented science (preschool as a part of ECE field of science), pre-school as a subject, pre-school thinking united in a comprehensive system, and an object for research. The systems model facilitates the determination of an object for research, helps to develop pre-school theory, plan pre-school teaching, develop pre-school practice and outline pre-school thinking. The new dimension of the pre-school concept – the pre-school thinking – will be the link between theory, practice and the subject in a way that will exclude any contraposition between them (Härkönen, 2003).

The purpose of childhood research is to promote the understanding of the developmental stage of children and adolescents in the context of various education issues. The actual discourse of "children's research" has emerged at the beginning of the 20th century as a "children's research movement", when important research studies were conducted on psychology of children's development (Hall, 1907). The socially constructed understanding of childhood encouraged studying childhood as a specific period with emphasis on child's social rather than developmental structure. In the childhood research process an interdisciplinary and integrated approach, so acknowledged in today's research, was introduced at the end of the 20th century (Baacke, 1993). The two aforementioned approaches form the basis for implementing a sustainable pedagogical approach in the pre-school.

Today's pedagogy of childhood is based on the notion that already in pre-school age it is important to help the children to acquire the world of human values in a targeted and systematic way in connection with their social status, types of activity and the main content of age-related sensitivity (Коломинский, 2007, 39), since today's children learn democracy from their very young age, but democracy means the equality of rights and opportunities. Utilization of the child's potential goes hand in hand with the child's self-initiative, which is one of the basic principles of democracy. When educating the young generation of a democratic society, pre-school teachers can model the child's behaviour that promotes self-initiative and also create an environment that gives the child the opportunity to initiate his/her own activities (Hansena, Haufmane & Saifers, 1998, 17). This means that when a teacher invites the child to choose from a variety of activities, the child is offered a variety of choices. When a child is helped to choose a particular activity and engage in it, the importance of self-initiative is encouraged. The self-assurance, which a child builds when choosing an activity, which has allowed learning or creating something, is a manifestation of his/her personal self-initiative and the value of choices.

However, this is possible only in an environment which provides the child the opportunities to cooperate, to solve problem situations, to find answers to the questions of interest while negotiating, and where the teacher focuses on how the child feels, responds, and works together with other children or adults. Supporting the wishes, interests and strengths of the child and the teacher's ability to analyse these criteria are the most important aspects of modern childhood pedagogy: "In environment where the teacher encourages children to act in accordance with their interests, children develop a strong sense of meaning and self-initiative" (Hansena, Haufmane & Saifers, 1998, 26). It is also fully in line with the ideas of developing a sustainable society. Education for sustainable development in its broadest sense encompasses the improvement of the quality of primary education, the reorientation of education towards sustainability, the promotion of civic awareness and education in all groups and sectors of society.

The social aspect of the sustainable development concept of the society stresses pedagogical attitudes as the aspect of pedagogical interaction, which includes feelings, images, thoughts about the child, and the pedagogical activity in general. First of all, every child feels it as an emotional experience. Secondly, it is the portrait of a child that a teacher has created. Thirdly, these are thoughts and judgments about the child. Pedagogical communication is teacher's behaviour which creates, changes, and develops his/her relationships with children

(Коломинский, 2007, 39). The environment of democratic pedagogical relationships is an important part of sustainable development. The teacher promotes the child's new revelations and the process of learning – he/she asks, supports, encourages and purposefully contributes to the implementation of teaching guidelines, creates and develops an environment in which individual findings are obtained ensuring continuous dialogue with the learners.

Looking from the perspective of children's rights and opportunities, the classroom space of the contemporary pre-school educational institution is an environment in which the child discovers and explores the surrounding world, learns the basic regularities of nature and society development, takes on different roles and develops social skills, cares about others, and takes responsibility. In turn, teachers are responsible for matching the environment with the needs, showing respect for children's ideas and using them when drawing up a curriculum. They also collaborate with children, observe them, listen to their conversations, record and evaluate their observations when planning and personalizing the future work with children.

However, each new step in the child's personality development is directly determined by the previous step – all what was formed and achieved in the previous stage (Виготский, 2003, 192), and it is rooted in the attitude change of the child towards the environment, in particular – in change of the needs and desires that drives the child's behaviour. When moving from one developmental stage to the next, the child generates new needs, new motives, because the child's behaviour is determined by revaluation of previous values and by changing his/her attitude towards the environment.

Also pedagogue A.Mudrik (2006), describing personality as a pedagogical concept, on the one hand examines it as the child's attitude towards the world but on the other hand as an attitude towards oneself, because the attitude reveals the personality development influenced by external conditions (environment, upbringing) and simultaneously reflects the systemic personality development in this environment. The child's attitude towards oneself greatly affects his/her attitude towards the surrounding world and determines the self-realization ways and aspects, but self-realization ways and aspects affect the child's attitude towards the outside world and towards oneself. So the attitude marks "the conditional stability of a person and at the same time also his/her potential for change or development" (Мудрик, 2006, 10). As the child develops, he/she perceives the impact of those external conditions that he/she encounters – the child not only perceives these conditions, but also to a certain extent transforms them, and only then the external conditions become his/her own – internally accepted and learned. In this way, the child learns the culture of society, its norms and values, which directs the development of his personality, including self-confidence, self-determination and self-assurance. Thus, a child can be analysed as a subject of self-development (Мудрик, 2006, 17).

The constructivist theoretical approach focuses on individual competencies. The child actively constructs the knowledge that takes place in a social context. A socially constructed childhood is a new theoretical perspective that supports the concept of a capable and independent child's image. The capable child's image concept transforms the goal of upbringing from obedience to advancement of the child's capacity, which take place in cooperation between the children and adults and in respectful family relationships, when the child him/herself actively constructs his/her daily experience. A capable child is perceived by adults as a human person who is aware of his/her needs and rights, and who is a competent and independent constructor of his/her own identity (Dinka, 2014, 16-17). All developmental qualities of the child are equally important in the personality formation process of a future citizen.

The previously mentioned childhood pedagogy knowledge reveals the diverse and complex nuances of the upbringing and education of modern children, which requires pedagogical competence, dialogic relationships for child development (Herzka, 1989), individualization and socialization oriented towards the formation of the unique personality of child, because "upbringing is a common path ..." (Roge, 2008, 7).

Research results and discussion

The empirical data was collected analysing the content and problem-issues of the Master's theses elaborated and defended in previously mentioned study programmes of Liepaja University, Faculty of Education, and Social Work, looking at the research topic, the research subject and the theoretical analysis of the criteria that characterize the dimensions of childhood pedagogy problems and their solutions. For the analysis and comparison of empirical findings on childhood pedagogy problems (CPP, see table 1), 25 Master's theses, defended in the period from 2012 to 2016, were selected, which in the terms of thematic selection and the essence of the content are in line with the context of childhood pedagogy research (see 1 Table.).

Table 1. Amount of defended master's thesis

Study programme	2012	CPP	2013	CPP	2014	CPP	2015	CPP	2016	CPP	CPP together
MESP	7	1	9	3	12	3	-	1	-	-	8
GET	2	-	11	1	7	3	11	9	2	2	15
CC	11	-	11	-	11	2	6	-	-	-	2
SW	14	-	11	-	12	-	12	-	-	-	-
MT	1	-	6	-	1	-	7	-	-	-	-
Together:	35	1	38	4	43	8	36	10	2	2	25

As it is seen in Table 1, from the total number of Master's thesis (MT) analysed for this study (N = 154), 25 of them are dedicated to exploring childhood pedagogy issues, characterizing and analysing the problems related to life, development, education and upbringing of pre-school children, focusing on the uniqueness of their personality and the importance of quality assurance in the pedagogical processes of pre-school. According to the data summarized in Table 1, the choice of the MT topics each year increases in the direction of actualization of humanistic and child-centred pedagogy (CPP), thereby confirming that amongst professionals there is an adequate understanding about the importance of the early years of the child's life and about the insufficient use of this period for child's self-realization and development of his/her potential. The thematic and content analysis of the MT was implemented in January 2016, when the defence of MT took place only in one study programme, which explains the small number of defended theses in 2016, but both of these thesis were elaborated analysing the problem issues of childhood pedagogy.

In the child-centred approaches of contemporary pedagogy each child seen as a "skilled, inquisitive, responsible, and free member of society, who must be treated with respect. The child him/herself manages his/her own learning process. Respect and trust contribute to the children's desire to learn, become independent and responsible" (Rudzroga, 2016, 49).

These 25 selected MT analyse childhood pedagogy problems and understanding of the formation of child's personality, reflecting it also through the keywords, which characterize the child as a unique individuality and draw attention to the child's emotional states and the development of creative imagination and fantasy. The MT, which focus on childhood pedagogy issues such as children's needs and their fulfilment, emotional self-expression and well-being, explore the promotion of emotional communication, free and creative child's activity, social interaction skills, the system of pedagogical techniques for reducing communication difficulties, implementation of the individual approach, the child's self-initiative to seek knowledge and work creatively, their achievements.

The MT devote much attention to the pedagogical competence and professional dialogue of pre-school teachers, as well as to the motivation to collaborate and to promote the team work that is necessary for ensuring the quality of the upbringing process and is one of the most important keys for solving holistic upbringing problems and ensuring the feedback. As it is emphasized by A. Brauna, the author of a MT, in the pedagogical practice it is

important to “educate with a true belief that all what is done is the best and the most needed for the children for their personality development as well as for the future life in the society” (Brauna, 2013, 57).

The contradictory nuances of pedagogical practice described in MT clearly reflect the range of issues to be addressed in the pedagogical process. For example, A.Grinberga expresses a grounded criticism analysing the pre-school and primary school teachers' opinions on possibilities to assess children's achievements: "The current assessment system of children's skills, abilities and knowledge is very fragmented, it is not organized and there are no criteria specified which must be described in the child's assessment when graduating a pre-school educational institution" (Grinberga, 2013, 66). Pedagogue A.Grinberga, supporting the need for assessment models in the transition period from pre-school to primary school, theoretically develops and also appropiates in practice a physical fitness assessment model "Pre-school learner's achievements in sports" for learners of Liepaja pre-school educational institution.

Analysing the MT, which correspond to the field of childhood pedagogy according to their content and research subject as well as the aim of the research, all papers provisionally can be classified in three thematically unified groups (see Figure 1). The MT of the first group (6 papers) reflect on methodological directions of pre-school educational institutions and specific topicalities. The MT of the second group (14 papers) reveal, describe and appropiate the innovative approaches of implementation of pre-school education curricula. The MT of the third group stresses the promotion of child's individuality development in the pre-school pedagogical process in the context of a holistic child-centred approach.

Picture 1. Thematic groups of analysed master's papers (N=25)

Although it is possible to classify the MT in three thematic groups according to its basic direction and defined research subjects (see Figure 1), it is necessary to note that their content analysis confirms the social and pedagogical topicality of the chosen problem issues and also the offered solutions, as well as it shows the link with the theoretical research and practical orientation of solving the childhood pedagogy issues. As M.Culkstane suggests, in order to promote the children's intellectual and mental well-being in pre-school education establishment, it is important to promote their interest to explore and be curious, engage them in play, but the pedagogues must be mindful, emotionally open and knowledgeable" (Čulkstāne, 2014, 51).

The authors of MT, analysing the innovative approaches of implementation of the pre-school education curricula, in their research focus on the topical issues of contemporary pre-school education: pedagogical collaboration in the upbringing of pre-school children (2013), a system of pedagogical approaches for reducing communication difficulties of pre-school children with autistic spectrum (2014), pedagogical activities for ensuring the emotional well-being of the child in a pre-school educational institution (2014), pedagogical work with hyperactive children in a pre-school educational establishment (2014), outdoor activities in the environmental education (2015), opportunities for ensuring the variability of didactic methods for developing reading and writing skills at pre-school age (2015), quality perfection when implementing the integrated pre-school curriculum content (2015), the team work in pre-school educational institutions (2015), the project method for implementing child-centred approach in pre-school educational establishment (2015), the implementation of individual inclusive education programs in the pre-school (2015), a learning portfolio for

assessing the individual growth of pre-school children (2016), and the implementation of the pedagogical approach "Forest School" in pre-school educational practice (2016).

Summarizing the ideas of methodologically innovative approaches, it is possible to agree with J.Kehre-Baika's opinion that not only in artistic, but in all practical pre-school lessons "the use of non-traditional forms develops creativity in children – courage to make mistakes, open-mindedness, sense of security. Freedom, fantasy and imagination provide children with an unconventional artistic activity that opens the door to a world full of wonders, and encourages the children to engage in activities" (Kehre – Baika, 2014, 62).

Researching the possibility of ensuring the variability of didactic methods in pedagogical practice for acquiring reading and writing skills at pre-school age, pedagogue A.Engele (2015) states that the obtained data shows that there are still some pedagogues in certain preschool institutions who relate to the child as a learner who needs to be given the information as much as possible in accordance with the requirements of the programme, the frontal teaching methods are selected – similar to a school, the control is used paying more attention to the learning material but less to each child's psychic, physical and social needs for self-assurance, communication, changing of roles, and active, free and creative activities, which are essential ingredients for each lesson. The personal work experience of this author confirms that the pre-school teacher is able to cross over from information, organization, control and examination approach exercised in November to counselling, assistance and observation exercised in January, thus making the learning process for children more interesting and more engaging. As feedback, children reflect on their positive emotions in different ways when assessing their activities: with drawing smiles, jumping, raised hands, etc. (Engele, 2015, 52 - 57).

For ensuring the quality of education and for perfection of children's cognitive processes and individual growth, the pedagogical initiatives of the teachers are not enough. I.Grīsele (2015) points at complex didactic tasks saying that "in order to improve the implementation quality of the integrated pre-school programme, it is necessary to review if the content is relevant with the psychological and physiological peculiarities of pre-school children: the quantity and complexity of tasks do not stimulate the quality of education" (Grīsele, 2015, 62).

Development and approbation of new pedagogical approaches and methods prove their productivity: "When implementing the project method, the benefit for children is promotion of independent thinking and assessment skills, which include: independence from other opinions, the search for one's own personal truth, the ability to logically arrange one's own thoughts, formulate and argument them, as well as develop self-education skills, ability to listen, understand the opinions of others, and cultivate patience" (Merca, 2015, 57).

According to six authors, for ensuring the quality of preschool education a special attention should be paid to the methodological work of the pre-school educational institution. In this group of MT, the professional responsibility spheres and possibilities of pre-school methodologists are described, and the research studies are related to the development of emotional interaction skills of the children, the improvement of pedagogical competence of pre-school teachers, satisfaction with work and assessment of the work quality, and to the issues of ensuring the collegial co-operation.

The authors of MT who pay purposeful and nuanced attention to promotion of child's individuality development in the pre-school pedagogical process implementing the child-centred approach in practice, reveal the pedagogical correction possibilities of aggressive behaviour of pre-school children, describe the possibilities for assessing the pre-school children's physical fitness in the pedagogical practice, analyse the pedagogical value of toys for personality development of pre-school children, explore how the understanding about professions develops in pre-school age, and address the child's behaviour correction options in the mixed age groups of pre-school education institutions.

The aim of education for sustainable development is to develop young people's knowledge, values and competences that are essential for the development of society. Promotion of sustainability and sustainable development must be at the heart of all educational programs – a significant and integral part. Education is the

greatest hope and the only practical option for building a sustainable future. It is the teacher education institutions that must become the courageous agents for bringing the change in education and in the society in order to ensure as sustainable future as possible. The secret of growth and development is learning in cooperation with the forces of change: "The future of the world is the future of learning" (Fulans, 1999, 7).

Conclusions and recommendations

In the pedagogical process the sustainable development of society is ensured by implementation of various educational perspectives. It is manifested through individualized child-centred and development-oriented approach which ensures the understanding of society and nature as united, inter-disciplinary and integrated approach in acquiring the learning content, and implementation of democracy for promoting the social and civic factors in the school environment.

In the context of sustainable development of education, the topicality of contemporary child-centred pedagogy is the development of child's capacity, learning to live in democratic society since the early years and developing such important personality traits as self-initiative, self-regulation, citizenship, tolerance, empathy, responsibility, emotional and social intelligence, curiosity, creativity, etc.

Using their professional competence and implementing the ideas and values of sustainable development of society, the pre-school education teachers become the mediators between the accumulated cultural and historical experience of humankind and the children by encouraging and supporting their self-development in knowledge acquisition journey, developing their talents, abilities and skills, and by developing attitudes towards moral, ethical and aesthetic values, towards oneself, the surrounding environment and the society.

In their Master's theses the authors research, analyse and discuss important and topical issues of pedagogical practice: the innovative and pedagogical approaches for implementing the pre-school education curriculum, reflecting on of how the concept of sustainable development of society and the child-centred pedagogical approach are applied in praxis, and about professional development possibilities of the professionals of pre-school institutions.

The analysis of these selected MT confirmed that in the pedagogical practice when solving the childhood pedagogy problems, the essential elements are: coherence in requirements, succession ensuring the child's development, highlighting the dialogue between parents and teachers, promoting collaboration motivation and the team work, promoting the development of understanding, personal attitudes, and practical activities in supporting the sustainability of society.

The pedagogical ideas expressed by the authors of MT reflect and confirm their beliefs, proved in practice, about the uniqueness of each child's development and the need for children's self-initiative in their search for personal identity, emphasizing the need for the conformity of pre-school education and upbringing methods and forms to ensure the development of children's capability, independence, and creativity in modern pedagogical practice. Identification and assessment of interactions between child's upbringing, education and socialization processes in the context of globalization opens up unlimited opportunities for further research studies in the field of childhood pedagogy.

The future challenges and the developmental processes that take place in society determine the need for accepting the diverse intellects and individual growth opportunities as well as for promotion of multidimensional learning styles and development of new competences, which, in turn, require new personality traits and attitudes, courage and self-initiative for ensuring the sustainability of society in the aspect of intercultural diversity and interaction, enrichment of cultural traditions and learning languages, in social integration and inclusion and the development and implementation of inclusion as a principal approach to education and society as a whole.

Abstract

The present study is based on research regarding bullying in the workplace, specifically aimed at elementary schools teachers in the Czech Republic. The sample consisted of elementary school teachers who had been exposed to regular bullying by their colleagues or superiors for at least half a year. Based on in-depth interviews and subsequent coding and categorization of statements, the main aim of the research was to reflect the strategies used by teachers as victims of workplace bullying used to defend themselves and resolve aggression from their colleagues. These can be classified into passive strategies (such as non-response, misplaced problem, humour) which are the most common forms of defence against escalating aggression, and active defence strategies (e.g. engagement of leadership, legal defence), which were found to be rather uncommon.

Keywords: School, school climate, aggression, bullying in the workplace, defence strategy

Introduction

Modern schools are expected to be democratic, humane and liberal institutions, which provide an appropriate environment for the education and personality development of adolescents. At the same time, there are numerous circumstances that prevent or make it difficult to achieve these expectations, such as loose morals and changed life values, decreasing teacher authority, increasing student aggression with teachers becoming the victims.

The quality of the educational process is closely linked with the overall school climate and interpersonal relationships; a frequent term in relation to the school environment is mobbing, i.e. a form of mental attacks between colleagues. It is obvious that the presence of this negative phenomenon in the school environment is a serious ethical problem, which may significantly affect the quality of the school climate and functioning of the school as an educational institution.

Mobbing is generally defined as a specific form of bullying which takes place between individuals in similar social positions. In some countries, for example in Poland or Germany, this term is used as an equivalent of bullying in various forms, but in terms of understanding and establishment of the concept in Czech professional terminology, bullying does not fully encompass the principle of mobbing and these two cannot be confused. For the purposes of general understanding, a possible Czech equivalent of the term is *workplace bullying*; in a narrow context mobbing is used to describe mental violence between persons in identical or similar occupational positions. This model is based the concept of mobbing in German-speaking countries (see for example Leymann, 1993; Leymann, 1996; Vartia, 2003); where the understanding of the term is closest to the Czech Republic. The principal differences between bullying and mobbing are in three areas: the environment and society where mobbing primarily takes place, the form of aggression in relation to the victim, and the features of the attack. The differences are summarized in the following table.

Table 1. Features of bullying and mobbing

In Terms Of	Bullying	Mobbing
ENVIRONMENT AND SOCIETY	Takes place in simple societies such as schools (between children), or military environments	Takes place in developed social environments with a more elaborate system of social relations
FORMS OF AGGRESSION	Represents simpler forms of aggression consisting mainly of physical attacks	Predominantly mental attacks with mostly mental and psychosomatic injury
ATTACK SPECIFICS	More impulsive, spontaneous, more primitive, apparent	Cunning, insidious, less conspicuous, hidden, more difficult to prove compared with physical violence

Although the concepts of bullying and mobbing need to be distinguished, in terms of their nature they have a few common features that are crucial to the focus of the present text. Both represent humiliating behaviour of an individual or a group towards another individual (or a group), who is unable to avoid this situation, and is unable to use effective defence mechanisms. Both have the following features:

- Repeated, long-term hurting;
- Helplessness, inability to defend oneself;
- Asymmetry (Einarsen, Raknes, & Mathiesen, 1994; Einarsen, Hoel, Zapf, & Cooper, 2011).

This issue is therefore a serious problem and phenomenon, which includes violation of social norms associated with limiting fundamental human rights with possible tragic consequences for the victim and the victim's personality. The term mobbing was spread particularly by a German professor Heinz Leymann (1932-1999), who lived and worked in Sweden from 1955 and in the early 1980s worked as a doctor and psychologist and took care of patients with communication and relationship issues in the workplace. He performed observations together with Anneli Gustafsson between 1982 and 1983 in Sweden and concluded that in many cases employees were like a pack attacking their colleague at work (Leymann, 1996; Einarsen et al., 2011).

In a broader sense, mobbing is understood as a form of psycho-terror in the workplace; in a narrower sense, this term denotes mental attacks with the mentioned features by persons in a similar occupational position. A specific form of mobbing is *bossing*, whose initiator is a superior employee. Bossing is considered a more dangerous form of psycho-terror in the workplace because the primary duty of a leading employee is to ensure favourable working conditions for subordinate employees. As a result of their position, superiors have a degree of power over their subordinates, which they abuse in the case of bossing. In such position and with respect to the expectations from such function this behaviour is unacceptable (cf. Beňo, 2003, p. 10, 126). According to literature, another form of mobbing, which is not so frequent, is *staffing*. In the case of staffing, subordinate employees organize attacks in order to discredit or destroy their superiors, management, or all HR or corporate policy (Kratz, 2005, p. 16).

The above mentioned knowledge on mobbing suggests that this is a form of mental maltreatment with systematic, deliberate and especially repeated attacks on an individual. This form of psycho-terror uses discriminating and degrading approach, excessive criticism, ridicule, and minor or major intrigue, which the victim is unable to prevent by means of usual volitional mechanisms. The victim's mental balance is disrupted, which is reflected in work performance and might lead to serious personality integrity disorders in the *mental* area (depression, concentration disorders, self-doubt, anxiety, and even psychiatric syndromes with suicidal thoughts), *psychosomatic* area (cardiac and blood circulation disorders, astringent breathing, headache, neck pain, back pain, skin diseases and diseases of the gastrointestinal tract), *psychosocial* area (inability to establish social relationships and ties, isolation, degradation of interpersonal relationships, distrust, disruption of private life, etc.) and last but not least in the *economic* area in the form of decreased work performance, increased morbidity and associated high treatment costs (Cakirpaloglu, Šmahaj, Dobešová Cakirpaloglu, & Zielina, 2017; Huber, 1995, Svobodová, 2008). The authors also state that the consequences of mobbing are devastating both for the victims of mobbing and for the whole society, especially in economic terms. Paradoxically, the consequences are also reflected in the aggressor's personality – fear of being revealed and punished, atypical social ties and dubious pleasure from the suffering of others result in a lack of concentration on work, and their actions lead to a dysfunctional working environment.

Given this definition of mobbing, the following crucial question is formulated: Can the phenomenon of mobbing be considered a problem affecting the environment of elementary schools? The issue has been previously addressed by the authors of the present paper in different research studies (Zábrodská & Kvetoň, 2012; Cakirpaloglu et al., 2017).

For illustration purposes, the conclusions of a quantitative study by Čech (2011) are mentioned below:

- Throughout the period of their teaching career, 29.7% of teachers felt to be victims of some of the forms of workplace bullying (from colleagues, superiors, or both); 17.2% of teachers were victims of mobbing and 23.1% of teachers were exposed to mental pressure from superiors (9.9% repeatedly). It is important to define the criteria for differentiating between individuals who are bullied and who are not. For these purposes, loose and stringent criteria are applied. According to the loose criterion, an employee is subject to at least one negative act once a week for a period of six months (Leymann, 1996). According to the stringent criterion, an employee has been subject to two negative acts at least once a week during the past six months (Mikkelsen & Einarsen, 2001).
- Of all teachers subject to mental terror, 33.9% were subject to mobbing and 43.3% to bossing for a period exceeding one year.
- In accordance with the definition of mobbing, 18.4% of teachers were subject to some form of bullying, 9.3% of all respondents representing the teaching population in the Czech Republic were exposed to mobbing and 14.3% to bossing.
- In the academic year of 2008/2009, 10.6% of teachers were exposed to mental attacks according to the loose mobbing criterion; of this group an identical number of teachers (7.1% of teachers, N=78) were subject to mobbing and bossing, i.e. they felt to be victims of psycho-terror in their current workplace.
- In accordance with the definition of mobbing pursuant to the stringent criterion, 5.8% of teachers were exposed to bullying, of this group 3.7% were subject to mobbing and 4.1% to bossing of all respondents involved in the research.

Considering the fact that the results have not changed significantly during the period of less than 8 years after the research, in the context of the entire population of teachers there are thousands of teachers, whose personality is regularly subject to mental attacks by their colleagues and superiors. It is clearly a serious ethical issue with negative effects on the school environment and the whole society. In the case of the teaching profession, this issue is even more serious compared with other professions, mainly because the following takes place:

- Abusing power and superior position (in the case of bossing) by those who have been entrusted with responsibility for the functioning of the school including the school climate and interpersonal relationships;
- Abusing education, brainpower of teachers and serious ethical misconduct regarding the teachers' mission in the society;
- Discriminating victims in the workplace including possible serious consequences for the victim in the mental, psychosomatic, psychosocial and economic areas;
- Violating fundamental human rights;
- Secondary consequences in terms of the quality of the educational process and transfer of interpersonal conflicts between teachers to students.

The results suggest that the mentioned adverse phenomena occur in elementary schools, present a burden for many teachers and are a cause of not only serious personal problems, but also affect the quality of the teacher's performance including teacher-student relationships. The results indicate a necessity to seriously address the issue; therefore a logical step was to carry out a qualitative survey on the phenomenon of mobbing in elementary schools. On the basis of the previous research, a total of 13 teachers were selected who had been victims of bullying in the workplace and who had provided their consent with their participation in a follow-up research study, the results of which are presented in this paper.

Research objectives

The main objective of the research was to perform a qualitative assessment and analysis of the responses of elementary school teachers who have personal experience with workplace mobbing. These content analyses were used to identify specific defence strategies of teachers against these undesirable forms of behaviour.

Method

In the present qualitative research, the data collection method was a semi-structured interview. The collected data were processed by means of the embedded theory method with subsequent data decoding for the purposes of data interpretation, conceptualization and subsequent integration. Three types of coding were used in the context of the embedded theory method – open, axial and selective. The validity of the research was ensured by means of triangulation through multiple-source statements (Gavora, 2010, p. 149), for example correspondence, police records, newspaper articles, etc.

Sample

The research sample consisted of 13 elementary school teachers who had personal experience with workplace bullying. This was deliberate sampling characterised by the following criteria: regular bullying behaviour by colleagues or superiors, at least once a week for a period of at least six months. As already mentioned, this research is a follow-up of a quantitative research on mobbing in elementary schools (Čech, 2011), one of the outcomes of which was identification of teachers as victims of mobbing.

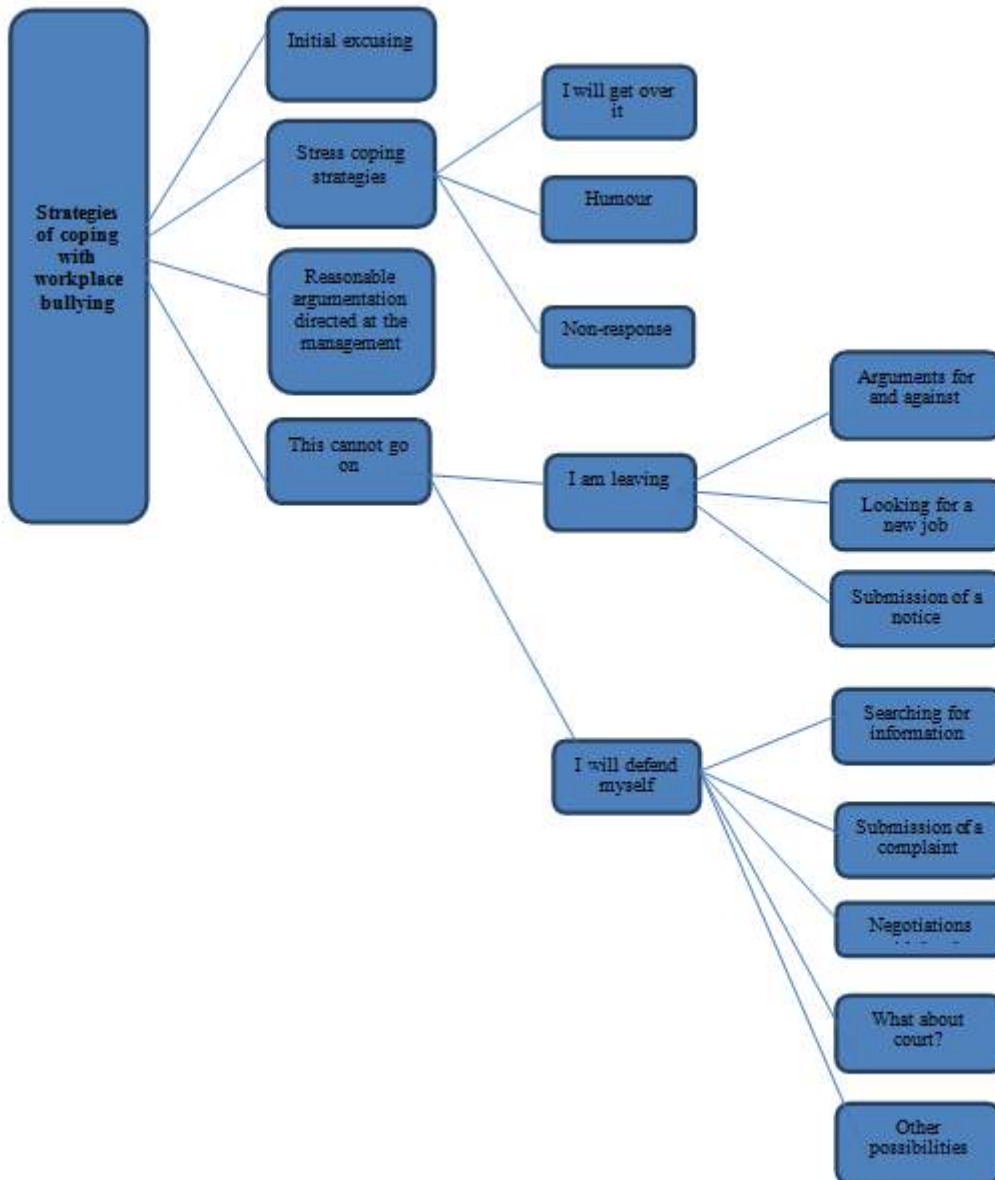

The analysis focused on data excerpts and core statements that contain regularities and repeating statement patterns. In some cases, less frequent categories of statements are analysed, but any such case is duly justified.

Regarding the fact that this is a relatively extensive qualitative research study, only a part of open coding is presented. It should be noted that the victims of bullying are also affected by other intervening variables acting from their external environment, which are not directly related to the bullying behaviour but have a determining or modifying effect on the actions and behaviour of the victim.

Results, conclusions and recommendations

Based on an analysis of the teachers' responses, three main categories of coping with bullying behaviour were identified; these strategies were used especially in the initial stages of mobbing and bossing, when the teachers believed that everything can be resolved in a usual way by means of negotiation. The categories are as follows: *'Initial excusing'*, *'Coping strategies'* and *'Reasonable argumentation directed at the management'*. After a reasonable solution is found to be ineffective, the victim proceeds to the category *'this cannot go on'* and either leaves or takes various defence strategies. The arrangement of the categories and subcategories is clearly shown in the following diagram (see Graph 1.)

Graph 1. Strategies of coping with workplace bullying

Analysis and categories and subcategories

Category: Initial excusing

One of the first reactions of teachers to workplace bullying is *initial excusing of the aggressor, refusing to believe the situation and efforts to quickly overcome this unfortunate period*. Victims usually believe that everything will turn better again. These are usual reactions used in coping with minor or major problems, both in occupational and personal life. They are based on an assumption that the other person is actually good, but only this time it does not work. This may also include adaptation to a stressful environment, which may use unconscious defence mechanisms such as trivializing, denial, rationalization of aggressor’s behaviour, etc.

(Pugnerová, Kvintová, 2016). This initial excusing is obvious especially in victims who had known the aggressor for a long time and where bullying developed creepily under the influence of multiple factors. In contrast, in the case of problems with a new superior, teachers usually do not use these excusing and adaptation strategies.

Category: Stress coping strategies

Once teachers find out that various attacks are not rare but fairly common, they start to reconcile themselves to the situation and try to *cope by means of usual adaptation mechanisms* to avoid stress as much as possible. These ways of coping with these situations that are difficult in terms of communication were used not only at the beginning of the attacks but throughout the whole period; the strategies often changed or overlapped and new strategies were gradually added – these were deliberate actions in order to cope with the adverse situation and protect oneself. The main stress coping behaviours included ‘I will get over it’, ‘humour’ and ‘non-response’.

Subcategory in the category ‘Stress coping strategies’: I will get over it

One of the first usual ways of coping with unpleasant situations is ‘*I will get over it*’. This type of behaviour is characterized by acceptance of authoritative leadership although it is unpleasant, because this is the simplest and least energy-demanding way of coping with the situation. Such acceptance of the situation and an effort to forget about the unpleasant part was the most dangerous type of behaviour, because the victims knew very well that if they had defended themselves, it could have had serious implications, including dismissal.

Subcategory in the category ‘Stress coping strategies’: Humour

Another very effective means of coping with stress is *the use of wit humour and laughter*. These relief strategies were reported by the respondents but it should be noted that they were used at the beginning of bullying or at the end, when the respondents felt relief, e.g. in the case of planned termination of employment. When the attacks were most intensive, they were most tormenting for the victims and laughter came only after some relief.

Subcategory in the category ‘Stress coping strategies’: Non-response

Another method, which is similar to avoidance but has a stronger escape tendency, is maximum possible non-response. This includes non-responding to attacks, getting out of the aggressor’s way, not provoking any conflicts, not even by well-intentioned activity. Some victims learned to cope in this way (Karel), but most victims began to resolve the problem in an active way.

Category: Reasonable argumentation directed at the management

The boundary that marks violation of a person’s dignity is individual. This boundary of dignity also depends on what a person might lose if the boundary is exceeded. Younger teachers ‘have nothing to lose’ and at the same time for this reason they do not usually tolerate bullying behaviour, especially in the long term. On the other hand, older teachers with decades of experience need longer time to pluck up the courage to defend themselves against the attacker or to use constructive argumentation. Reasonable argumentation directed at the management does not automatically imply direct defence and declared war on the management, but rather a preparatory step – assertive communication with clear requirements. Both directly to the attacker or indirectly to the attacker’s closest collaborators. The purpose of this argument is to try to understand the situation, settle the triggering conflict and determine acceptable conditions for all parties.

Category: This cannot go on

Once the situation has reached a critical point and mobbing or bossing started to have *a negative effect* not only on work, but also *on personal life and especially the victim’s health*, the respondents began to think about what to do next. The first thought was obvious: ‘*This cannot go on. I must do something, otherwise it will destroy me.*’ But it was not quite clear which of the possible solutions was the right one, whether to escape or counter attack. Some teachers immediately began to consider voluntary termination as the only possible solution. However, some teachers considered termination as the last option. After the aggressor went beyond their internal boundary,

they decided to defend themselves and searched for help. It should be noted that in many cases both options mingled and these teachers thought about which one is the correct one.

Subcategory in the category ‘This cannot go on’: *I am leaving*

Leaving school was seriously considered by most of the respondents. However, they suggested that this step was extremely difficult to take. It was preceded by a long period of *considering arguments* about the appropriateness of this solution, followed by active *searching for a new job* and only then *submitting a notice*. In some cases, the teachers did not take all three steps, because sometimes the situation was resolved by communicating the intention to leave, sometimes leaving was the only possible alternative.

Subcategory in the category ‘I am leaving’:

❖ *Arguments for and against*

According to the teachers, the main arguments and counter arguments in relation to submitting a notice included *consideration of the risk of unemployment* and financial security of the family, complying with family duties and plans. Some of the circumstances that the respondents considered in different ways included to have or not to have children at university, to be or not to be a single parent. In addition to concerns about the financial security of the family, an important role was taken by the *continuity of professional work* carried out by the teacher, *established professional position and naturally friendly relationships and ties*. Another aspect was the need to repay thousands of crowns for courses that the school had paid in return for teachers’ commitment to stay and teach for a certain number of years. However, the greatest *motivation to leave* was mainly *a peaceful and happy life without stress and fear*, which was usually stronger than all other counter arguments.

❖ *Looking for a new job*

In the case of many teachers, submitting a notice was preceded by *searching for a new job* and a certain security. This means that during the period of attacks, some teachers actively searched for schools offering a job. In one case, the escape from hell was not a new job but maternity leave.

❖ *Submission of a notice*

It could be assumed that once the teachers decided for the solution *I am leaving*, they submitted a notice but this was not always the case. Some teachers, who had been looking for a new job, did not eventually submit a notice because the local government had changed the school management. Others, who believed in a change until the last moment, submitted a notice and thus finished their fight against the aggressors and evil. Here, the submission of a notice is a clear manifestation against inappropriate behaviour; especially in the case of multiple notices the teachers later used this to prove the truth. In the interviews, the respondents confirmed their attitudes by pointing to other colleagues leaving and thus pointed to a cyclic problem.

Subcategory in the category ‘This cannot go on’: *I will defend myself*

The second way of responding to excessive load, mental attacks and long-term stress caused by bullying is the previously mentioned *defence*. Many teachers did not know what to do in an inappropriate situation, so their first reaction was to collect information. At the same time they approached various institutions with a complaint about the head teacher’s behaviour and asked for help. They also informed the local authority, took court action, collected evidence, turned to the Ministry of Education, media and non-profit organizations. This was all performed under growing intensity of bullying, daily attacks in work and under the scrutiny of the public. In all of the subcategories under this subchapter, there are many more complex statements, but only a few were selected and simplified for clarity reasons.

Subcategory in the category 'I will defend myself':

❖ *Searching for information*

One of the first activities of those respondents who felt to be in the right and believed in standing against the attacker was to search for information about the phenomenon that they were experiencing. For this purpose they used primarily the Internet, where some of them came across a non-profit organization that deals with mobbing and bossing. Here they also found the most information. Another source of information was legal advice, which is mentioned in the subcategory '*What about court?*' It should be noted however that an important aspect in this context is the period in which bullying was experienced. This is greatly influenced by modern communication technologies, which bring sufficient information unlike the totalitarian period or the period right after the revolution.

❖ *Submission of a complaint*

When the teachers decided to do something about the situation, they had to file a complaint to receive moral, formal, legal and financial satisfaction. The teacher's complaint and supporting documents were submitted to the School Authority (i.e. local government), Czech School Inspectorate, Regional Authority, and the Labour Inspectorate. The responses of these institutions were different, but mostly, with few exceptions, without much success.

❖ *Negotiations with local authority*

As was previously mentioned in the subchapter *Reaction of the Mayor*, negotiations with the school authority took a long time and some teachers believed they would be successful. These negotiations were constantly disrupted by other influences – by the aggressor, who tried to thwart these efforts by identifying them as slandering, by the local government as a result of various reasons and pressures, sometimes even by the trustworthiness of the aggressor, etc. In one case, the situation could not be resolved by the local Department of Education, who believed that the case should be referred to the court.

❖ *What about court?*

The issue of court proceedings was mentioned by the respondents several times. However, only in one case the victim succeeded and won a court case assisted by a non-governmental non-profit organization. Another legal action was allegedly taken by a respondent's colleague, but the respondent did not take the action himself.

According to other respondents, they thought about a legal action and even consulted a lawyer. However, the lawyer warned about the complexity of the legal action, excessive length and a low chance of succeeding. This made most of the teachers abandon the idea of resolving the matter by means of a court case.

Nevertheless, many teachers followed the recommendations for a possible court case. Collect evidence, make a copy of everything, be able to prove everything. Although many believed that a court proceedings would be difficult, they were willing to present a large body of evidence, records and pictures during the interview on this issue. This was likely in response to the fact that they encountered considerable distrust, or kept the information just in case.

❖ *Other possibilities*

Besides negotiating with the aggressor, representatives of the local authority, school inspectorate or other controlling authorities, the teachers also used other ways of addressing this difficult situation. Especially after all other options failed. Some teachers have experience with *negotiations with the Deputy Minister of Education* and the Department of Complaints, others contacted the *Ombudsman for human rights*. Some teacher frequently thought about or contacted the media, etc.

To conclude, it is obvious that mobbing (including the form of bossing) is a serious ethical issue, which affects the life of current schools and significantly influences the personality of the teacher-victim and the teacher's

work performance and private life. The research suggests that the teacher's reactions to workplace bullying are different with respect to other circumstances of their professional and personal life (age, gender, taking care of the family, possibility to find a new job, existential dependence on the current job, etc.); most of the cases have a similar development but a different result.

Having stated this, the issue is surely not resolved. For the purposes of prevention it is recommended to increase the teachers' awareness, not only in terms of the phenomenon itself, but mainly in terms of defence mechanisms and knowledge of legal norms. Therefore, the authors of the present paper believe it is necessary to investigate this phenomenon, inform about the results and implement them into the curricula of undergraduate teacher training. At the same time, each school should adopt an ethical code for teachers and acknowledge mobbing as an unacceptable form of behaviour in a school environment.

Acknowledgements

The study is dedicated to the following project. Internal grant of the Faculty of Education, Palacký University: Dean's grant 2017 Risks and protective factors among teachers in undergraduate preparedness and IGA_PdF_2017_033 Analysis of life satisfaction and self-concept in relation to the use of social networks in pre-service teachers.

Abstract

Workplace bullying is a subtle manifestation of disturbed relationships in the workplace and it is considered an extreme type of social stressor at work. The present study verifies a psychological survey on a sample of N = 258 teachers in the Czech Republic, using a questionnaire of negative acts NAQ-R (Negative Act Questionnaire-Revised) and a status questionnaire. According to stringent evaluation criteria, the highest prevalence of workplace bullying of 7.75% was determined by means of behavioral measurement; according to self-evaluation measurement the prevalence was 2.33%; the lowest prevalence of workplace bullying of 1.94% was obtained by combining the behavioral and self-evaluation measurements.

Keywords: workplace bullying, prevalence, NAQ-R, victimization

Introduction

During the past 20 years, workplace bullying has become a widely discussed and examined issue. The terminology concerning this issue is not unified. Various terms are used such as bullying, harassment, mobbing, or abusive behaviour. The authors tend to incline to the definition used in English-speaking countries, i.e. workplace bullying, although in the Czech Republic the commonly used term is mobbing (Čech, 2011). Workplace bullying represents a serious form of harassment, which is considered an extreme type of social stressor in a work environment (Zapf, 1999). According to Leymann, such behaviour represents hostile manifestations of aggression in the workplace; an employee is systematically exposed to hostility from one or more individuals, while experiencing helplessness and fear of being excluded from the group of co-workers (Leymann, 1996, p. 168). Another definition is presented by Einarsen et al. (Einarsen, Hoel, Zapf, & Cooper, 2011, p. 22), according to whom this behaviour involves harassment, offending and social exclusion of an employee or negative influencing of the employee's work. An activity can be considered bullying if such behaviour is regular (e.g. once a week) and repeated (e.g. during the past 6 months). During this escalating process, the victim is getting into an inferior or subordinate position and is the target of constant negative activities (Einarsen, Hoel, Zapf, & Cooper, 2011). Research studies emphasise a relationship between workplace bullying and negative health-related consequences for the bullied individual, such as a high level of psychological distress, a generally lower level of health (e.g. Høgh, Hansen, Mikkelsen, & Persson, 2011), and mental issues such as depression, anxiety disorders, or post-traumatic stress disorders (e.g. Nielsen & Einarsen, 2012; Cakirpaloglu, Šmahaj, Dobešová Cakirpaloglu, & Zielina, 2016; Leymann, 1996). In addition to the impacts mentioned above, research studies reveal other correlations, specifically between workplace bullying and absenteeism (Nielsen & Einarsen, 2012), decreased organizational commitment (Hoel & Cooper, 2000), a lower level of work satisfaction (e.g. Nielsen & Einarsen, 2012; Kvintova, Dobesova Cakirpaloglu, & Sztokowski, 2017), and last but not least a higher staff turnover.

Studies on the prevalence of workplace bullying point to a large variability between countries and within individual countries. These differences in the estimated prevalence of workplace bullying are often associated with methodological, conceptual, organizational or cultural differences, which are specific to various research studies. The generally reported value is 1 to 4% of bullying between employees (Zapf & Gross, 2001). However, this estimate differs by countries and continents, for example in Sweden the prevalence is 3.5 % (Leymann, 1996), in Denmark 2 to 4% (Mikkelsen & Einarsen, 2001), in Norway 11 to 18% (Nielsen, Skogstad, Matthiesen, Glasø, Aasland, Notelaers, & Einarsen, 2009), in Spain 18.9% (Carretero & Luciano, 2013), in Ireland 6% daily and 17% occasionally (O'Moore & Lynch, 2007), in the UK 50% (Rayner, 1997), in Austria

7.8% (Niedl, 1996). In the USA 38 to 90% (Glendinning, 2001) or 27% (Workplace Bullying Institute, 2014), in Turkey 56.2% (Akar, Nilgün, & Sarvan, 2011), in Japan 15% (Giorgi, Ando, Arenas, Shoss, & Leon-Perez, 2013).

From a methodological perspective, in surveying the prevalence of bullying behaviour in the workplace it is important to define the criteria for differentiating between individuals who are bullied and who are not. For these purposes, loose and stringent criteria are applied. According to the loose criterion, an employee is subject to at least one negative act once a week for a period of six months (Leymann, 1996). According to the stringent criterion, an employee has been subject to two negative acts at least once a week during the past six months (Mikkelsen & Einarsen, 2001). The application of this definition significantly decreases the prevalence of workplace bullying. For example, a meta-analytical review by Nielsen et al. (2010) indicates that the above mentioned criteria resulted in an average prevalence of mobbing of 12% in Scandinavian countries and 14% in other European countries. As far as the prevalence of mobbing in the Czech Republic is concerned, research is rare, especially in terms of the teaching profession. The estimate of the overall prevalence of mobbing in the Czech Republic is 7.79% (Cakirpaloglu et al., 2016), while in the group of academic staff in Czech universities the prevalence is 7.9% (Zábrodská & Květoň, 2012). A unique research study on workplace bullying was performed among elementary school teachers. The study applied the stringent criterion and reported a bullying prevalence of 5.8% among teachers in the academic year of 2008/2009 (Čech, 2011). Of this group, 3.7% of the respondents reported being bullied by colleagues in an identical or similar position; 4.1% of the respondents indicated being subject to bossing, i.e. the initiator of systematic aggression was the headteacher or another superior employee.

Research objective

The main objective of the present research study is to extend the database of knowledge on the issue of workplace bullying and to determine the prevalence of mobbing in a specific sample of employees – elementary and secondary school teachers in the Czech Republic. A partial objective is to identify the most frequent forms of mobbing in the monitored sample.

Method

To identify the prevalence and forms of workplace bullying the Negative Acts Questionnaire-Revised was used (referred to as NAQ-R), which includes a total of 23 items (Einarsen, Hoel, & Notelaers 2009). This questionnaire can be administered individually or in groups. The advantage of the NAQ-R questionnaire is time effectiveness and an opportunity to measure two complementary aspects of mobbing, i.e. behavioural and self-evaluation. The behavioural measurement criterion forms the basis of items 1 to 22 of the NAQ-R and focuses on selected manifestations of negative behaviour in the workplace. A specific feature of these items is that their formulations do not include any indication that they measure mobbing. The responses are indicated on a five-point Likert scale, suggesting the frequency of bullying behaviour, i.e. how often the respondents have encountered this type of behaviour during the past six months. While the behavioural criterion is included in the first 22 items, the 23rd item focuses on self-evaluation measurement. The respondents are asked to describe their own experience or perception about whether they feel as victims of mobbing according to the theoretical definition specified in the introductory part in item 23. In this respect, meta-analytical studies confirmed that estimates of the prevalence of workplace bullying based on self-evaluation are usually lower than estimates based on behavioural measurement (Agervold, 2007; Nielsen, Matthiesen, & Einarsen, 2010). A possible explanation is that subjective assessment includes additional factors such as personality traits or defence mechanisms, but also refusal to perceive oneself as a helpless and defenceless victim. By combining the behavioural and self-evaluation approaches according to the stringent criterion, a combined estimate is achieved. The advantage of this approach is a more accurate estimate and a lower number of errors; this applies especially to overestimation or underestimation of the number of bullied employees (Nielsen et al., 2009, Cakirpaloglu et al

2016). In the present research, the method of double translation was used to ensure content quality of the NAQ-R questionnaire. The English version of the NAQ-R questionnaire was translated to Czech and then back to English. The translation of the questionnaire and its application in the research was approved by the authors of the questionnaire in advance. Individual versions of the translation were compared with respect to language and cultural differences. Cronbach's alpha for 22 items of the Czech version of the NAQ-R questionnaire achieved $\alpha = 0.94$; this confirms a high degree of reliability of this method and the fact that it can be reliably used for measuring mobbing also by means of a smaller number of items.

Research sample

The research sample comprised a total of 258 respondents. The sample included elementary and secondary school teachers, citizens of the Czech Republic, aged 21 to 68 years, who were employed at the time of data collection. In total, the sample included 67 men and 191 women. The average age was 42.23 years (ME 42; SD 11.03). The average period of employment in the current position was 14.8 years. In terms of the respondents' academic degree, 11 individuals (4.25%) had a secondary school graduation certificate, and 247 respondents (95.55%) had a university degree. In terms of the type of school facility, 80 respondents (30.89%) worked in elementary school and 178 individuals (68.99%) were secondary school teachers.

Research study

Data collection was conducted in 2016-2017 by means of online surveying. The electronic version of the questionnaire was administered using the SurveyMonkey system, which meets the methodological and research criteria of online research relevance (high degree of security, archiving and encoding during data transfer, access via generated password, etc.) A total of 661 respondents were invited to participate; of whom 258 fully completed the questionnaire.

Methods of data processing and analysis

In the first stage, the data were transformed into an xls format compatible with MS Excel 2013, which can easily handle data exported from the electronic questionnaire. During the second stage, the data were formally and logically checked. Incomplete questionnaires or questionnaires with logical contradictions or incorrectly completed fields were excluded. Further data processing was performed using the STATISTICA programme, version 12. This stage was followed by the calculation of significant descriptive statistic values, especially the arithmetic mean, standard deviation, analysis of variance and mean error.

Findings

The first part presents the basic findings concerning the numbers and proportions of mobbing of elementary and secondary school teachers in the Czech Republic. Considering the total number of 258 NAQ-R questionnaires, Table 1 includes three categories of mobbing prevalence – behavioural, self-evaluation and combined. In addition, for each category of mobbed individuals, both the loose criterion (at least one negative act at least once a week for the past six months), and the stringent criterion (twice or more) are specified.

Table 1. Prevalence of workplace bullying of teachers according to behavioural, self-evaluation and combined measurement (loose and stringent criterion)

total	Behavioural estimate		Self-evaluation estimate		Combined estimate					
	Loose criterion	Stringent criterion	Loose criterion	Stringent criterion	Stringent criterion					
N	n	%	N	%	n	%	n	%	n	%
258	45	17.44	20	7.75	33	12.79	6	2.33	5	1.94

Legend: Loose criterion - at least one act once a week, stringent criterion - at least two acts once a week, combined criterion - combination of the stringent behavioural and self-evaluation criteria

In terms of percentage, the highest prevalence of workplace bullying was suggested under the loose criterion. The behavioural measurement suggested 17.44% of bullied individuals, while the self-evaluation estimate was significantly lower (12.79%). Significantly lower prevalence values in the same order were suggested by the stringent assessment criterion. Accordingly, the highest prevalence of bullied individuals was suggested by the behavioural measurement (7.75%), followed by self-evaluation (2.33%). The lowest workplace bullying prevalence was suggested by the combined estimate (1.94%), which was a combination of the behavioural and self-evaluation approach. The reason for using the combined estimate was to avoid overestimation or underestimation of the number of mobbed employees, which regularly occurs as a result of biased interpretation of the results using the behavioural or self-evaluation measurement. The combined approach allows more sensitive identification of the core group of mobbed individuals, who meet both criteria of the phenomenon (Cakirpaloglu et al., 2016, Nielsen et al., 2009).

An analysis of the different forms of workplace bullying identified the most frequent types of bullying of elementary and secondary school teachers. These included the most frequent types of behaviour with a frequency of Daily or Weekly. The most frequent forms of workplace bullying were '*Spreading rumours and excessive amount of work*'. Both types of behaviour were experienced by 5% of the respondents. Other acts included '*Repeated exaggeration of mistakes and work-related humiliation and ridicule*'. Both types of behaviour were experienced by 4% of the respondents. In contrast, the following forms of workplace bullying were not reported at all: *intimidation (pointing the finger, violation of personal space...), playing tricks, excessive ridicule, sarcasm, threats or physical violence*. This does not mean that these forms of behaviour were not observed by the respondents, but they were not frequent enough to be included in the defined mobbing criterion.

The mentioned typical forms of bullying of teachers do not considerably differ from those investigated by Čech (2011), who (using a different method of assessment) reported the following frequent forms of attacking a victim: *insufficient appreciation of the victim's work* (reported by 55.2% of all bullied teachers), *continuous criticism of work* (53.7%), *ridicule and gossip* (43.6%), *assigning nonsensical tasks or assigning no tasks* (36.9%) and *ignoring the victim* (29.9%). The following responses exceeded a twenty percent threshold: *assigning duties not matching my qualifications* (29.3%) and *offensive and humiliating statements* (21.3%). Other forms (*shouting at the victim or continuous interrupting, criticism of the victim's private life, verbal, telephone or written threats*) are less typical and are usually slightly below ten percent, but are undoubtedly significant. A satisfactory finding of the mentioned research is that the least frequent types of workplace bullying among teachers include serious behaviours such as *sexual overture or making sexual proposals, assaulting as a result of religious or political convictions or assigning harmful work*. Threats of physical violence are represented by a negligible number of cases amounting to less than one percent. This finding is fully consistent with all mentioned definitions of workplace bullying and bossing as a form of psychological violence, where threats of physical violence occur in exceptional cases.

Limitations

The Internet as an instrument for relevant data collection has some limitations, which need to be considered in the interpretation of the results. This primarily relates to the motivation for participation in a research study on mobbing; in this case the questionnaire was completed by less than a half of the 661 individuals who were invited. Some limitations are also caused by the selection of the questionnaire instrument for researching a complex and sensitive phenomenon such as mobbing. Although the Negative Acts Questionnaire (NAQ-R) has satisfactory psychometric features, the method of questioning cannot discern motivational, emotional and other mental processes of the main actors of mobbing. The results obtained by means of the NAQ-R questionnaire from various countries may be misleading in performing comparisons due to socio-cultural differences (e.g. Scandinavian countries, Italy, Japan, South Korea, Turkey, etc.)

Results, Conclusions and Recommendations

The main objective of the research study was to identify the prevalence of workplace bullying in a sample of respondents comprising elementary and secondary school teachers. The research instrument was the revised version of the Negative Acts Questionnaire NAQ-R, which offers two methods of measurement – behavioural and self-evaluation approach, which can be further classified by the loose (Leymann, 1996) and stringent (Mikkelsen & Einarsen, 2001) criterion. The prevalence of workplace bullying differs according to the criterion used (loose or stringent). Moreover, the prevalence of workplace bullying is affected by the application of the behavioural or self-evaluation measurement approach. The highest prevalence of bullying is associated with the behavioural loose measurement, which suggested 17.44% of mobbing in a sample of 258 teachers. This finding is consistent with an empirical estimate by Eurofound 2015, according to which the Czech Republic together with Austria and Finland are among EU countries with the highest prevalence of mobbing (Giaccone, Nunzio, Fromm, & Vargas, 2015). In the previously mentioned research study, Čech (2011) reported the proportion of teachers exposed to aggression in elementary schools in 2009 of 10.6% judged by the loose measurement. The difference might be caused by the application of a different non-standardized tool and a more compact sample (elementary school teachers). However, if the stringent criterion is applied to the prevalence of workplace bullying using the behavioural measurement, the proportion of bullied individuals decreases significantly to 7.75% in comparison with the original estimate. Similar findings were suggested by most foreign studies that used the same NAQ-R questionnaire. For example, in the above mentioned research, Nielsen et al. (2010) reported the average prevalence of workplace bullying of 12% in Scandinavian countries and 14% in other European countries. Similarly, Giorgi et al. (2013) reported 15.2% of mobbed employees in Italy. The estimated prevalence of mobbing in the Czech Republic according to the self-evaluation measurement is significantly lower, both in terms of the loose (19.82%) and stringent (11.19%) criterion (Cakirpaloglu et al., 2016), which is consistent with the general tendencies to underestimate the severity of mobbing, as reported by foreign authors (Nielsen, Matthiesen, & Einarsen, 2010; Hogh, Hansen, Mikkelsen & Persson, 2012; Buunk, Franco, Dijkstra & Zurriaga, 2016). Čech (2011) used a different questionnaire and reported the already mentioned proportion of 5.8% of bullied individuals in the school year of 2008/2009. The prevalence values indicated in the present study might also have been decreased in the context of the self-evaluation approach especially by non-acceptance of the image of a helpless and defenceless victim by the bullied employees, which is jointly suggested Nielsen et al. (2010) or Agervold (2007). The measurement of the behavioural and self-evaluation tier of workplace bullying in the NAQ-R offers a combined estimate under the stringent criterion. An empirical advantage of this approach is a reduced number of errors, which occur during standard interpretation of the results of different measurements; this applies especially to overestimation or underestimation of the number of bullied employees (e.g. Agervold, 2007; Nielsen et al., 2010). The combined estimate in the present research achieved a value of 1.94% of bullied teachers. These are a group of employees who face frequent hostile acts in the workplace and at the same time identify themselves with the role of a victim. Similar results based on the combined workplace bullying measurement using the NAQ-R were presented in an extensive study by Cakirpaloglu et al. (2016), who reported bullying in 7.79% of employees; a meta-analytical study by Nielsen performed in 2010 suggested that this method of measurement ensured finer classification of the group of bullied individuals.

During the past 20 years, workplace bullying has become a widely discussed and examined issue. Workplace bullying represents a serious form of harassment, which is considered an extreme type of social stressor in a work environment (Zapf, 1999). According to Leymann, such behaviour represents hostile manifestations of aggression in the workplace; an employee is systematically exposed to hostility from one or more individuals, while experiencing helplessness and fear of being excluded from the group of co-workers (Leymann, 1996, p. 168). An activity can be considered bullying if such behaviour is regular (e.g. once a week) and repeated (e.g. during the past 6 months). The main objective of the present research study is to extend the database of knowledge on the issue of workplace bullying and to determine the prevalence of this type of behaviour in a specific sample of employees – elementary and secondary school teachers in the Czech Republic. A partial objective is to identify the most frequent forms of workplace bullying in the monitored sample. The research instrument was

the revised version of the Negative Acts Questionnaire NAQ-R, which offers two methods of measurement – behavioural and self-evaluation approach, which can be further classified by the loose (Leymann, 1996) and stringent (Mikkelsen & Einarsen, 2001) criterion. The prevalence of workplace bullying differs according to the criterion used (loose or stringent). Moreover, the prevalence of workplace bullying is affected by the application of the behavioural or self-evaluation measurement approach. The research sample comprised a total of 258 respondents. The sample included elementary and secondary school teachers, citizens of the Czech Republic, aged 21 to 68 years, who were employed at the time of data collection. In total, the sample included 67 men and 191 women. The average age was 42.23 years (ME 42; SD 11.03). The average period of employment in the current position was 14.8 years. In terms of the respondents' academic degree, 11 individuals (4.25%) had a secondary school graduation certificate, and 247 respondents (95.55%) had a university degree. In terms of the type of school facility, 80 respondents (30.89%) worked in elementary school and 178 individuals (68.99%) were secondary school teachers.

According to stringent evaluation criteria, the highest prevalence of workplace bullying of 7.75% was determined by means of behavioral measurement; according to self-evaluation measurement the prevalence was 2.33%; the lowest prevalence of workplace bullying of 1.94% was obtained by combining the behavioral and self-evaluation measurements. An analysis of the different forms of bullying identified the most frequent types of workplace bullying of elementary and secondary school teachers. These included the most frequent types of behaviour with a frequency of Daily or Weekly. The most frequent forms of workplace bullying were '*Spreading rumours* and *excessive amount of work*'. Both types of behaviour were experienced by 5% of the respondents. Other acts included '*Repeated exaggeration of mistakes and work-related humiliation and ridicule*'. Both types of behaviour were experienced by 4% of the respondents. In contrast, the following forms of workplace bullying were not reported at all: *intimidation (pointing the finger, violation of personal space...), playing tricks, excessive ridicule, sarcasm, threats or physical violence*.

Abstract

The sphere of retail trade has always played significant role in every country national economy. The grounds of success of a retail trade enterprise is formation of customer satisfaction and loyalty to the enterprise. Process of attracting new customers involves spending more money and energy. In order to retain existing customers and ensure their loyalty, one of the basic tasks of the enterprise is to know the factors that influence their satisfaction and the satisfaction level itself. Market globalization influences retail trade enterprises more and more, this makes them look for possibilities to ensure and raise their competitiveness. To identify factors of competitiveness the authors put forward the goal to research the measurement methods of satisfaction and loyalty in retail trade enterprises. To reach the goal the authors employ the monographic method to explore the theoretical background of the satisfaction and loyalty; besides that the authors analyze the tendencies of the retail trade in Latvia and by the means of the expert interviews, the customer and manager surveys help the identification of the application level of the satisfaction and loyalty research in the retail trade companies in Latvia. The present article will give the retail trade enterprises understanding of necessity of research in the process of customer satisfaction formation and its specific features in the retail trade sector. The authors have summarized the existing approaches and defined their approach to application of satisfaction and loyalty measurement. The authors conclude that by using customer satisfaction and loyalty research, it is possible to manage the customer attitude formation, and this can be one of the instruments for ensuring competitiveness.

Keywords: customer, retail, research methods, customer satisfaction, loyalty

1. Introduction

Market globalization influences retail trade enterprises more and more. This makes them to look for solutions how to ensure their competitiveness and development. In the contemporary situation of market saturation with products, the main task for enterprises is becoming competitive. Orientation to customer satisfaction is customer-oriented approach of company management. There are various criteria and principles in determining customer satisfaction; still they have a common aim, i.e., supporting the competitive and sustainable sales enterprise development. In the scientific literature related to the field of interest (Fornell, 1992: 6 - 21; Prass, (b.g.); Fischbein, 1967: 389 - 400; Vavra, 1997: 384 - 385; Brandt, 1987: 61 - 65; Shostak, 1987: 34 - 43; Gummesson, Kingman-Brundage, 1992: 101 - 114; Bitner, 1993: 358 - 370) we can find several sources, models and methods of customer satisfaction evaluation. The current research focuses upon the application of customer satisfaction evaluation in the retail trade. It is important because the customer satisfaction evaluation and measurement fulfills such interrelated functions:

- information gathering about customer satisfaction and quality level of the offer;
- determining cases of dissatisfaction in order to eliminate them in due time;
- determining positive and negative results of customer satisfaction in order to work out methods for staff stimulation and punishment.

By acquiring knowledge about customer satisfaction level and applying this knowledge to practice, enterprise earns customers' trust can significantly raise its competitiveness. To identify the factors of competitiveness the authors put forward the goal to research the measurement methods of satisfaction and loyalty in retail trade enterprises. To reach this goal the following tasks are to be solved:

1. To analyze the theoretical aspects of customer satisfaction and loyalty research methods.
2. To characterize the retail trade sphere and its development in the Baltic countries.
3. To determine the use of customer satisfaction research in the Baltic retail trade enterprises by the means of survey.

In order to determine tendencies in evaluation of customer satisfaction in the Baltic countries and put forward proposals for its improvement, we have conducted survey of managers of retail trade enterprises. There are such limitations of the current research: it concerns mostly methodological aspects; therefore, size and location of the enterprises included in the survey have not been taken into account. Research data were collected between January 1 and March 1, 2017 by applying the following methods: the logically constructive one to carry out comparison of empirical results with theoretical conceptions; the graphical one for visual interpretation and analysis of research data, as well as customer survey. The methodological background of the article consists of publications of foreign authors (R. Brandt, M. Fishbein, T. Vavra and others) on customer relation formation factors and processes.

2. Methods of customer satisfaction research

The satisfaction of the economic category is an element of the system of customer relationship management. In order to determine competitiveness of an enterprise and its underlying factors both from theoretical and practical perspectives; it is necessary to evaluate the system of customer relation management as such and its particular elements. The next step is carry out evaluation of the results of existing system of customer relation management according to specific criteria, in order to determine system advantages and disadvantages and to make decision about future actions (to improve the system, to leave it intact, to stop the operation, etc.)

In the special literature, we can find several resources, models and methods to evaluate the customer satisfaction. It is important, since the evaluation and measurement of customer satisfaction fulfill these closely related functions:

- information gathering about customer satisfaction and quality level of the offer;
- determining cases of dissatisfaction in order to eliminate them in due time;
- determining positive and negative results of customer satisfaction in order to work out methods for staff stimulation and punishment.

Analysis of publications in the field (*Fornell*, 1992, 6–21; *Prass*, (b.g.); *Fischbein*, 1967, 389–400; *Vavra*, 1997, 384–385; *Brandt*, 1987, 61–65; *Shostak*, 1987, 34–43; *Gummeson, Kingman–Brundage*, 1992, 101–114; *Bitner*, 1993, 358–370), make it possible to conclude that all sources of information regarding evaluation and measuring the customer satisfaction can be divided in two broad groups:

- 1) Processed data – previously gathered information for different research aims;
- 2) Primary data – first time information gathered for the purpose of specific project.

The table 1 depicts specific sources of information according to both groups of data. 1.

Table 1. Data sources for evaluation and measuring customer satisfaction

Processed data sources (performance indicators of the company)	Primary data sources (qualitative and quantitative investigations)
Turnover	Customer survey
Market share	Expert survey
Income	Staff survey
Expenses	Observation
Profit	In-depth interview
Liquid assets	Focus group discussion
Fixed assets	Data base of complaints
Other indicators	Customer survey

Table 1 depicts only data sources that allow gathering necessary information. Nevertheless, it is very important to process and analyze data in order to make conclusions and apply them in practice.

Table 2 reflects the main methods for processing and analysis of primary data of customer satisfaction.

Table 2. Methods for processing and analysis of customer satisfaction

Primary data gathering sources	Methods of primary data processing and analysis
Customer survey	Determination of customers' attitude to product/brand (M. Fishbein's model)
Expert survey	Determination of importance of satisfaction factors within overall satisfaction. Determination of penalty/reward factor
Observation	Service Blueprinting
Staff survey	Analysis of contact situation
Interviews	Method of sequential events
Focus group discussion	Critical incident technique
Customers' complaint data base	Processing and analysis of customer complaints

Surveys of customers and experts can be used to evaluate their attitude toward company product/brand in general and to its specific characteristics.

Attitude is the assessment of a product/brand and hence - a background for choice of possible action. Attitude can be characterized as positive, negative or neutral one. Of course, each enterprise is interested in the stable positive attitude to its products/brands; still competitors' activities have to be taken into account as well. Therefore, it is appropriate to carry out the research to find out customers' attitude to product quality, assortment, situation of brands and consumption that all create a definite satisfaction level.

Instability of the attitude means that, it can easily change from the positive to the neutral or even the negative one. For instance, the customer dissatisfied with the specific product/brand would buy something different altogether in future. If the attitude is stable, it characterizes the customer satisfaction level. The Fishbein's quantitative model is very useful for calculation of it. (Fishbein, 1967, 389–400):

$$A = \sum_{i=1}^n b_i e_i, \quad (1)$$

where:

A – attitude to product/brand;

b_i – stability of attitude, that the product/brand exhibits the quality i ;

e_i – evaluation of the quality i of the product/brand;

n – a number of significant qualities.

This model rests upon two basic elements:

- 1) **The stability of attitude** – the level of trust in the particular qualities of the product/brand and its interaction with the customer satisfaction;
- 2) **The evaluation of the product/brand qualities** – customers' views about significance of the product/brand qualities within the overall satisfaction.

The method of identification of significance of the satisfaction factors within the overall satisfaction consists of division of the factors into two groups (Vavra, 1997, 384–385):

- The explicit factor significance;
- The implicit factor significance.

The explicit and implicit significance dimensions of the product/brand are determined by the regression analysis of the survey results, by correlating levels of satisfaction with particular qualities of the product/brand and the overall satisfaction. (Vavra, 1997, 384–385) In the retail trade it can consist of the product quality, the assortment, the placement of goods on shelves, the variety of service offered by the enterprise.

Division of factors according to their explicit and implicit significance makes it possible to determine three groups of factors underlying the satisfaction/dissatisfaction:

- 1) The expected attributes, that form provision of minimal needs of the enterprise offer;
- 2) The desired attributes create customers' satisfaction, if performance is up to the expected level, and dissatisfaction if expectations are not met; thus customer satisfaction is directly dependent on the expected level of performance

- 3) The exciting attributes are not specifically required and expected by the customer; lack of these attributes does not lead to dissatisfaction, whereas their presence can raise satisfaction level above the expected satisfaction level.

Division of the satisfaction/dissatisfaction attributes into three groups can be accomplished through involvement of consumers. By processing and analyzing survey results, it is possible to create a matrix where the explicit and implicit significance of attributes are juxtaposed with three factors underlying the satisfaction/dissatisfaction. (Vavra, 1997, 384–385).

The research of satisfaction/dissatisfaction factors and their evaluation serve to identify the advantages and disadvantages of the enterprise in order to make correct decisions in the realm of customer relations. R. D. Brandt proposes another method of evaluation of the satisfaction/dissatisfaction factors. The background of the method is a hypothesis that penalty factors are the attributes of the company offer the lack of which or the poor performance (for instance, low quality of the produce) inevitably cause customers' dissatisfaction. Whereas reward factors are such characteristics of the company offer that raise satisfaction level and the lack of which do not have a significant impact on it? (Brandt, 1987, 61–65).

The principal aim of the method is to identify penalty/reward factors by the means of customer survey and regression analysis. Moreover, in the process the well-known Likert five-point scale (from "very dissatisfied" to "satisfied") is replaced by the value "0", but other assessments by the value "1". Whereas in determining the reward satisfaction factors the Likert scale (from "very satisfied" to "satisfied") is replaced by the value "1", but other assessments with the value "1". Consequently, the penalty satisfaction factors include only the lowest assessment, but the reward satisfaction factors – only the highest assessments.

Three methods of the evaluation of customer satisfaction based on surveys (see. table 2) can be applied also to the retail trading, but there are features of the realm to be taken into account. Firstly, there are specific satisfaction attributes. Secondly, we have to pay attention to characteristics of the target audience (different segments, loyalty degree, etc.). Thirdly, the methods have certain disadvantages:

- survey results depict each customer's subjective opinion, that can change in the foreseen future;
- scientifically valid survey (representation of respondents, differentiation of the target audience, periodicity, etc.) can be quite costly therefore often inaccessible to the small and medium sized enterprises;
- survey provides information mostly about the situation in the concrete enterprise, but it doesn't give opportunity of comparison with situation in other enterprises, including the competing ones.

Other customer satisfaction assessment and measurement methods are based on observation and company staff surveys. These methods are based on an analysis of the contact situation between consumers and employees of the company. Following the identification of the contact points, all possible contact situations between the buyers and the company's personnel are systematically recorded (for example, in a supermarket they may have contacts with personnel related to the search for products, cashier at the cash register, employees of the information office, etc.). For this purpose it is appropriate to use the Service Blueprinting method. (Shostak, 1987, 34–43) The company must set up a service process diagram that graphically reflects the various contact situations between the buyer and the company's employee. In addition, the entire service process is divided into two zones, in which the diagram divides the so-called Line of Visibility:

Zone 1 reflects the service process visible to consumer

Zone 2 reflects the service process hidden from consumer.

Identification of contact situations enables to calculate their number in the service process, to analyze the staff performance in each contact situation, to evaluate the environment of a particular service and to compile a process improvement plan.

The Blueprinting method is also suitable for the company (including retail) staff education and training. The data resulting from the use of the Blueprinting method serves as the basis for **a method for analyzing a contact situation**, the aim of which is to find out how all contacts in the service provision process are realized, from the point of view of the consumer (Barth, et. al., 1994, 40). For this purpose, all real contacts/events are divided into two groups

- 1) ordinary or normal events;
- 2) critical or extraordinary events.

Data sources can be the passive non-participation or active participation observation. Customers who are being monitored may be aware of it (open observation) or do not be aware of it (hidden observation).

In the case of passive non-participation observation, the researcher records the obvious events of the service process (for example, in the retail sector - a line at the cash register) and makes conclusions about the existing problems and/or failures. The advantage of the method is that the observer can capture the manifestations of the subjective consumer satisfaction, but the disadvantage is that there are such contact situations that cannot be observed without knowing it by the subjects. Consequently, both consumers and employees of the company, knowing that they are being monitored, can act differently than usual.

In the case of the active participation in the services process, the observer participates as a buyer (Silent Quest), simulating a real situation. Taking into account the fact that the staff is not aware of the observation to be carried out, the results are more effective. However, the result may be influenced by the subjective perception of the observer's situation, and not all aspects of service quality are covered.

Data obtained by the means of the Blueprinting method constitutes the basis for a sequential event method grounded in the belief that a service process consists of a series of subsequent events or contact situations (Stauss & Weinlich, 1996, 49-58). Each event or contact situation can lead to the satisfaction or the dissatisfaction, which ultimately leads to an assessment of all service process.

From the Blueprinting data the researcher selects only the most significant contact situations from the point of view of the consumer; they are separated by the Line of visibility and marked with certain symbols or images. Data can be gathered by the means of consumers' interviews with open structured questions (explaining the definitions and concepts if needed) or discussions in focus groups that are formed, for example, from visitors to the store. The customers involved in the research are given relevant material that enables them to remember the whole process of the service process and to express their thoughts about positive and negative events, feelings and problems encountered in the contact situations.

The advantage of the sequential event method is the acquisition of relatively complete and specific information on individual aspects of service quality and the causes of quality problems. However, the method also has drawbacks - it is time consuming and relatively expensive, which limits the periodicity of its use, and complicates the processing of non-standard response data.

Critical incident technique applies both to positive (especially satisfactory) and negative (especially dissatisfactory) events (Bitner, et al. 1990, 71-84). The planned in-depth interviews with consumers are used for the data collection, the consumers are asked to share their especially positive and negative experience related to company service process. This method differs from the method of sequential events with the content of the questions – the consumers are not asked to remember the entire service process, but rather - to describe some positive and negative situations only. Before the interview, it is very important to prepare the substantiated questions so that the consumers' narrative would contain material necessary for the service evaluation:

- events must relate to a specific "consumer-company staff" interaction;
- events should reflect the contact situation that led to a degree of satisfaction or dissatisfaction;
- reflection must be detailed and meaningful so that the interviewer's treatment can be fixed and processed.

After the event is determined, there follows its evaluation, that is, events are divided into the thematic groups, highlighting the most common positive and negative contact situations.

The critical incident method provides specific information on shortcomings and positive experiences in the company service process that are important for decision-making on improvement measures. However, the method also has weaknesses - complex processing of interviews and relatively high costs, which limit the frequency of service evaluation. In order to research the company service process in the retail trade, it is possible to apply all methods of the satisfaction assessment and measurement, based on such sources of information as observation, interviews, discussion in focus groups, etc.; still the following conditions must be taken into account:

- each method has both advantages and disadvantages. Sometimes shortcomings can be addressed (for example, using a combination of methods), but sometimes there are no such opportunities (for example, due to the lack of human resources and/or lack funds). Therefore, before using any method, it is necessary to calculate its usefulness and utility for the company;
- all satisfaction assessment methods, based on the research of the service process, can render only partial information about satisfaction of visitors to any trading venue, that is, factors that depend on the activities of the company's staff. Nevertheless, in the retail sector, due to its specific character, there are factors that only partially dependent on the retailer (for example, the impact on the producer or the discontinuation of cooperation in the case of supply of low quality products) or they do not depend at all (for example, the location of a supermarket). Therefore, it would not be appropriate to limit oneself to the study of the service process, but it is imperative to use satisfaction assessment methods based on a broad survey of respondents, processing and interpretation of results.

In order to determine the satisfaction level, it is possible to compile the **data base of consumers' complaints**, to process and analyze them thereof.

The study conducted within the limits of the USA program *Technical Assistance Research Program (TARP)* (Brand, 1987, 61–65) demonstrates that approximately 95% of the dissatisfied consumers avoid submitting their claims due to various reasons. Thus, a possibility of submitting the claim depends on the significance of the problem for the consumer, on the expected result, on the psychological factors, etc.: consumers who complain often remain loyal to the company even if their problems are not resolved. It can happen in such cases, for example, awareness that solving a problem does not depend on the company's staff, not willingness to harm employees, etc. On the other hand, it would also be unreasonable to underestimate the need for the creation and use of a complaint database. Most dissatisfied consumers do not complain, but go to the competitor without revealing their reasons for dissatisfaction. It is therefore important that most dissatisfied consumers address their concerns in the form of complaints. The above-mentioned TARP study shows that most consumers complaining remain loyal to the company if their problem is resolved and disseminate positive information about the company through the word of mouth communication.

Unfortunately, many company managers try to motivate their employees to avoid taking complaints altogether or to make the process of complaining more difficult, they tend to scale down the significance of the problem or to solve it only partially. Hence, the negative effects (consumers' leaving, negative information about the company) are not being averted at all.

Assessment and measuring of loyalty perform such functions:

- provision of information about the level of consumer loyalty to the company/product/brand;
- identification of the cases of the decreased loyalty, in order to determine the causes and evaluate the tendency;
- identification of the cases of the increased loyalty, in order to determine the causes and support this tendency.

3. Retail trade and its development features in the Baltic countries

The retail trade is an intermediary (a channel of distribution) between producers and/or retail traders that deliver goods to consumers. The retail trade ensures customer service in traditional shops, outside them and on the internet sites, that is, the retail trade ensures service or complex of intangible products that cannot be in possession of the buyer. Therefore, to satisfy customer's needs, the retail trade has to influence producers and whole traders (orders and transactions), as well as to cooperate with them. The retail trade adds definite value to the tangible products – goods since it ensures sorting, prepacking, packing of goods and so on. Besides that, selling goods of other producers using their brand name, the retail traders add to them the definite value.

It follows from specific features of the retail trade that customers have to be satisfied both with tangible (goods) and intangible (service) products. This influences practically the whole process of satisfaction management. The degree and intensity of this influence depend on the level of service (supermarket or shop of exclusive items, etc.), mode of sales (traditional shop, sale outside the shop) and other factors.

In order to comprehend the situation in the sphere of retail trade in the Baltic countries, the attention is paid to one of the macroeconomic indicators of the retail trade – the product value. It is the amount of production or services rendered, including changes in inventories, and fixed assets and intangible assets produced by own means minus the goods and services purchased for resale. (Latvijas Statistikas gadagrāmata 2013, 297) Figure 1 depicts the volume of production value and development trends in the Baltic countries.

Figure 1. Production value in the retail trade in the Baltic countries from 2005 till 2014 (mil. Euro). (The figure was created on the basis of data from the Latvian Statistic Yearbook, 2014, 297 and n www.eurostat.eu)

Assessing development of the value of production in the Baltic countries within the time period in question, we can conclude that in Lithuania there was a rapid development in the years between 2005 and 2008, the deep fall (for 37%) in 2009, the growth till 2011, and finally, the rather stable development from 2012 till 2014. Nevertheless, even in 2014 this indicator did not reach the level of 2008. In Latvia after a period of rapid development between years of 2005 and 2007 there starting with 2008 already was a downslide, the growth was determined only in 2011, although the level of 2007 was not reached even in 2014. Estonia also experienced the drop of the value of production, but not as drastic as Lithuania and Latvia. Consequently, the pre-crisis level (the one of 2007) was attained already in 2012. Despite the different volumes of production (which is explained by the different population and, accordingly, the turnover in the Baltic countries), there are essentially similar trends in the development of indicators; this can be seen in the figure 1. Despite the current total retail growth rates, internal competition within the industry is growing. On this basis, retailers need a tool to ensure competitiveness and create a buyer's desire for re-purchase and continuous relationship with the company, product, and brand.

4. Use of customer satisfaction research in retail trade enterprises of the Baltic countries

During the time period between 1 January, 2017 and 1 March, 2017 there was carried out a survey of the retail trade enterprise managers of the Baltic countries. The survey questions were designed on the basis of theories of the determination and measurement of customer satisfaction. The sample consisted of 127 leading specialists of the retail trade enterprises. All filled out questionnaires were admitted as valid for the current research.

The survey results shows that 92% of the surveyed Baltic retail trade enterprises have carried out the customer satisfaction research within last 5 years, but 18% of the enterprises have not done that unfortunately. Asked about the way how these surveys are conducted, representatives of companies who are undertaking customer satisfaction surveys, 43% answered that the company conducts these studies itself, 1% said that they employ only research agencies, and 56% admitted that they do both – they render the service of the agency and do research themselves.

Table 3. Methods of customer satisfaction evaluation

Methods of customer satisfaction evaluation	% of all (127) respondents
Customer survey	98
Expert survey	24
Observation	73
Staff survey	17
In-depth customer interviews	8
Focus group discussions	2
Formation of customer data base, its processing and analysis	67

According to the identified research methods the retail trade enterprises use to investigate customer satisfaction we can see that the most popular method (98%) is the customer survey, it is followed by the observation (73%) and the formation of customer data base, its processing and analysis (67%), whereas the least popular method is the focus group discussion (2%).

In order to evaluate customer satisfaction with data processing, analysis and interpretation, as well as the use of results for performance improvement the respondents were asked to evaluate these indicators according to the Likert scale in 10-point system, where 1 means very bad, but 10 – very good. Then the mean was calculated at 3, 78 ($\bar{X} = 3, 78$), that can be regarded very low. Overall, we have to admit that there is quite large amplitude of evaluation, this point at different situation in different enterprises.

Apart from that, the respondents had opportunity to evaluate the situation in the sphere of customer claim processing and analysis in the enterprise. The situation here appears to be more positive in comparison with situation in the realm of research data analysis. Here the Likert scale was used as well known in 10-point system, where 1 designates very bad, but 10 – very good. The mean was calculated at 5, 07 ($\bar{X} = 5, 07$), that is a little above the average; here also is a high variation in amplitude, since there are differences in claim processing and claim analysis in the enterprises.

Conclusions and Recommendations

The company staff responsible for evaluating and measuring the consumer satisfaction has to use both the processed and the primary data (see table 1). In order to determine the consumer satisfactions and the satisfaction attributes, one can use consumer surveys, in-depth interviews, expert surveys, observation, company staff surveys, focus group discussions and customer complaint databases.

The important step in the customer satisfaction research, apart from the actual surveying of them, is the analysis and interpretation of the results that helps to identify the underlying factors influencing the increase/decrease of the customer satisfaction.

The findings of the research can be broken down into the satisfaction/dissatisfaction factors, penalty/reward factors or into the attitude of buyers according to the Fishbein model. One can also employ the contact analysis method or the sequential event method that can be relevant at the retail level particularly for the evaluation of the service process, since the service process in retailing can be viewed as subsequent events and series of contact situations. Through in-depth interviews with buyers, the critical event method can be used to identify both positive and negative events in the shopping process. There are no positive or negative data analysis and evaluation methods, but it is important to choose the most appropriate approach for problem identification or resolution.

The retail trade is an intermediary between manufacturers or wholesalers and buyers of goods with a significant role in each national economy. In order to understand the retail development in the Baltics, a macroeconomic indicator of the value of production in the period from 2005 to 2014 (see Figure 1) was considered, indicating the amount of service that retail sales add to the sales process. The value of production in all three Baltic countries is very similar to retail, and it can be seen that the retail sector is developing in a similar way to the overall economy of these countries.

A survey of 127 Baltic retailers demonstrates that 92% of them have performed customer satisfaction surveys, while 18% have not made any customer satisfaction surveys that would enable them to identify the factors for competitiveness. By asking questions about conducting research, it was found that 43% of companies carry out these studies on their own, 1% use only research agencies, and 56% of studies are joint ventures of the research agencies and companies.

In order to determine the consumer satisfaction, the retail companies in the Baltics most often use the customer survey (98%), followed by the observation (73%), the database formation, the processing and analysis of the customer complaints database (67%) and the expert survey (24%), but the least used methods are the company staff surveys (17%), the in-depth customer interviews and the discussions in focus groups (2%). These results point at the situation that companies opt for the methods that require less effort to carry out this research, but do not always allow themselves a deeper insight into the problem.

A very critical situation is the field of data processing and analysis, the respondents evaluated this with the mean value of 3,78 and in the case of processing and analyzing customer complaints in the company, respectively - 5,07 according to the 10-point Likert scale. This demonstrates the dramatic nature of the situation, still also opens up a possibility by identifying the factors of customer satisfaction in order to develop the further action plans for creating a long-term relationship with customers. Such a system can serve as the basis for the competitiveness of the retail company.

The authors of the present study recommend that, based on the results of the research, the retail companies develop the customer satisfaction research plan for a particular time period, critically evaluate their ability to carry out research independently and, if necessary, choose a research agency. It is also important to define the suitability of the research method for the problem identification, as well as to assess the suitability of the methods for data analysis and interpretation. In conclusion, it is important to develop a plan for improvement, taking into account the shortcomings identified in the research.

Abstract

Globalization trends are one of the major causes of general changes in the world and one of the most visible consequences of globalization is rapid market growth. In these market conditions, companies focus on ensuring their competitiveness. In today's business environment, there are no uniform standards or models that provide business development and effective use of existing resources. There are different standards, models, systems of management support; however, the unifying criterion of these systems is a satisfied customer and reduced costs that provide long-term competitiveness. Thus, lean management and enterprise competitiveness have become decisive growth factors in ensuring sustainable development of SMEs. In order to identify factors enhancing the competitiveness of SMEs, the authors of the current article have explored the basic factors of lean management. To achieve the goals set the authors have examined the theoretical background of the lean management using the monograph or descriptive method, analysing SME sector development tendencies in Latvia, and empirically researching the application of lean management in the Latvian SMEs. This study will give companies an understanding of the theoretical and real factors of the lean management. Analysing theoretical aspects, the authors have defined the unified approach to lean management from the viewpoint of its essence. Finally, the authors conclude that lean management factors can be used by enterprises to manage processes and is one of the instruments in ensuring competitiveness of enterprises.

Keywords: lean management, small and medium-sized enterprises (SME), competitiveness

1. Introduction

Globalisation is one of the most significant grounds for overall changes in the world and one of the most visible consequences of globalisation is the rapid growth of the market. Over the last few years global problems and global socio economic processes have ever increasingly affected small and medium enterprises directly or indirectly (hereinafter SMEs). On the one hand enterprises have access to open markets worldwide but on the other hand the pressure of competition has intensified. Therefore lean management has become a deciding growth factor for ensuring the sustainable development and competitiveness of SMEs. Since the start of the transformation process in Central and Eastern European countries about more than 20 years ago the economies of these countries have undergone huge changes. These processes could only be compensated by the impressive boom of emergence of small and medium sized enterprises. These dramatic changes were faced in particular by countries such as Latvia, Lithuania, Estonia, Bulgaria, Romania, Slovakia and the Czech Republic where no form of private enterprise existed before the start of these economic changes. In fact SMEs formed the basis of their economies. SMEs comprise the majority of all enterprises in Latvia, Europe and the whole world. With the growing significance of global competition questions arise regarding the long term activities and development of SMEs as they form the basic element of the economic system and the sustainable development of the country and the region is dependent on their ability to function in the long term. How competitive SMEs are in global and EU markets has an immeasurable significance in ensuring overall economic development and growth in the level of the welfare of inhabitants. Taking into account the dynamic nature of modern business environment, issues related to the long term operations of SMEs have become a priority as the efficient management of technology, infrastructure and human capital significantly enhances the economic growth prospects of enterprises as well as the national economy. In the long term in order to ensure the competitiveness of SMEs and their development, lean management has to become a priority for each and every individual enterprise in their move towards a low-carbon and resource-efficient economy. The long-term existence of any enterprise is dependent on its ability to use resources rationally and make a profit. Enterprises face problems as a result of improper, incompetent action or even due to their inaction. SME operations have been constantly studied and analysed. Economic and statistical research of SME operations, scientific publications and surveys conducted by entrepreneurs help identify key issues that impact the

development of SMEs. However, there are not many fundamental research projects on the development prospects of SMEs in rapidly changing environment in Latvia in contrast to the majority of other European and World countries. It is necessary, therefore, to carry out comprehensive research of SME operations using the latest statistical data and scientific publications to gain in depth insight of all SME problems and possibilities of preventing them. The present research will help identify strategic tasks related to the introduction of lean management concepts in SMEs that would enhance their competitiveness and ensure their long term development. The goal of the research is to evaluate the level of use of lean management principles in Latvian SMEs.

The following tasks were determined to achieve the goals:

1. Analyse the theoretical base of lean management principles;
2. Characterise the significance of SMEs for the EU and Latvian national economy;
3. Identify the prerequisites for the introduction of lean management principles and enhance the level of use in Latvian SMEs.

Research limits: The management of 167 Latvian SMEs of the private sector were surveyed to identify the trends in Latvia and put forward recommendations for the introduction and maintenance of lean management concepts. The following research limits were set taking into account the specific features and multifaceted nature of lean management and its management aspects: lean management issues were studied mainly from the methodological and organisational perspective and the areas of operations, size etc. of the respondent enterprises was not taken into account within the framework of this research. The results of the survey are reflected in the content of this paper. The research period: 1st May 2017 to 1st August 2017.

The following research methods were used: monograph or descriptive method and logical constructivist method – comparison of theoretical material and empirical results; survey of the management of enterprises was carried out to identify the level of use of lean management principles in Latvian SMEs; graphical method – illustrate and analyse visually summarised information; document analysis – research and summary of internal documents of enterprises.

The research works and publications, theoretical and practical concepts of foreign economics scholars and specialists (A. King, S. Ahmadi, J. Wormack, D. Roos, J. Krafcik, G. Taylor, T. Ohno etc.), results of operations of SMEs, assessment of factors influencing them, as well as proceedings of scientific conferences and seminars form the theoretical and methodological base for this research.

2. Theoretical aspects of lean management

The long term existence of any enterprise is dependent on its ability to rationally use resources and generate profit. Problems arise due to improper, incompetent actions even due to inaction and the assessment of these problems are in turn based on a retrospective approach i.e. the analysis of past actions. The system of assessment of actions could significantly impact and provide the support for organisational development of SMEs as it is first of all necessary to understand the existing situation in order to usher in the necessary changes to enhance and improve the enterprise's value creation processes. Efficiency should flow through all the business processes of the enterprise and the overall assessment should be based on criteria that are related to the specific sphere of operations, specific production technology and include not just processing processes but also organisation and management of the enterprise. Regardless of research implemented in the field of assessment of performance of SMEs, all problems are yet to be resolved as specific issues arise for instance at the specific sector level. Moreover, there are several debatable issues, e.g. regarding the possible use of adaptation of performance assessment models worked out for the needs of large enterprises to SMEs. This just proves that research of the above mentioned problems and the search for solutions needs to be carried on. Summarising the concepts put forward by theoreticians and practitioners (King, 1994; Ahmadi, 1997 etc.) regarding the advantages of SMEs and their essential differences from large enterprises the authors wish to underline that all enterprises regardless of their size need to understand the important value generating processes and resources, evaluate the costs related to the creation of value and should orient towards the management of the enterprise's internal operations using lean management concepts.

There is a wide variety of methods and tools that could be used to analyse, organise and enhance an enterprise's internal processes. One of them is the so called lean management approach that distinguishes traditional cost cutting from true efficiency enhancement (Lean manufacturing, b.g.). Lean is not divided into separate tasks but looks at the process flow on the whole identifying how changes in one stage impact all the rest of the stages (Lean primer, b.g.). It is a management method that creates added value for customers with the least amount of resources. This approach has gained popularity worldwide and is widely used in enterprises in various different sectors. The word may have a variety of meanings but if you understand the nature and significance of the approach the name does not matter. The authors offer to use the word Lean further for purposes of clarity. The term Lean was first used in 1998 in John Krafcik's article „Triumph of the Lean Production System”, and its further development and popularity was as a result of the popular book by James Wormack, Daniel Jones and Daniel Roos "Machine that Changed the World" (History, b.g.) in 1991 based on research of the automobile industry conducted at the Massachusetts Institute of Technology. Frederick Taylor's "scientific management" and Henry Ford's manufacturing process innovations laid the foundations for mass production. Sixty years ago, Toyota executive Eiji Toyoda understood that mass production would not work for Japan. Together with his production manager Taiichi Ohno set up a system that created "Just in time" (Toyota Production System Terms, b.g.). For instance capital insufficiency prompted the creation of flexible set of devices of the right size, their quick set up and customisation. Restrictions on employee lay outs created the basis for the formation of an in-house society and the intensive involvement of employees in the problem-solving process. Thirty years were needed to define the principles and foundations of the system at that time, involving all of Toyota's factories and suppliers. Lean manufacturing, Lean production, also known as the Toyota Production System (TPS) emerged in the 50s of the previous century and its essence is best expressed by the words of the automobile industry giant Toyota's President Fujio Cho: "Other companies try to hire excellent executives to manage chaotic processes. Toyota, in turn, has streamlined its business processes so that ordinary people can achieve outstanding results using them." At the beginning of the 21st century, in a rapidly changing environment, one of the most topical issues reported in various mass media and sparked discussions between politicians and business executives was austerity. Therefore it is no wonder that enterprises are looking for answers to a very essential or even an existential question: how to cut costs without losing the company's competitiveness or its human resources? This question has become the priority for modern day enterprise management – how to organise the enterprise to function more rationally and to achieve more with the same resources? Innumerable conferences and seminars have been conducted and many books have been written on that issue. In a crisis situation, when business volumes and company income are decreasing, the natural reaction of the manager, especially the financial director, is to reduce costs. This is very often understood as limiting the company's budget in equal proportions for almost all positions, incl. human resources. Such optimization is based on the assumption that all the costs that the company had until their reduction equally contributed to the creation of value and therefore, with the decrease in demand the company should evenly reduce all costs. But does everything we do in the company and resources we spend create value for the consumer? We often speak about increasing efficiency when reducing wages or the number of people in the company? But does cutting remuneration or reducing staff also change work processes? Do we review and throw away the apparently non-value-adding activities? In an effort to achieve greater efficiency, companies often (less often in times of crisis) innovate - buy more powerful equipment, more advanced comprehensive software programs, etc. But do we fully utilise the equipment we got as a result of such innovations? One of the answers is the Lean Management approach that differs from traditional cost reduction by true enhancement of efficiency. Lean Management is a practical method to efficiently organize, improve and continuously improve business processes. The introduction of principles covers all processes on the whole, such as production, work with suppliers, partners, and employees and, above all, customers. On the basis of theoretical research results one can say **that the philosophy of Lean Management is to acquire skills of management decision-making on the basis of rational thinking, intuition and practical skills; create an understanding of how a company can shift to lean production and services based on new thinking principles, teamwork, avoidance of various types of waste, innovative approaches to the production process, staff training, and new business relationships.** The long term manager of Toyota Motor Corporation Taiichi Ohno is considered to be the author of the concept of Lean Management although lean principles were used in practice since much earlier times. From the 40s -70s of the 20th century Toyota constantly worked on

the development and improvement of the system creating even more new Lean management methods and principles. Gradually TPS became popular not only in Japan but also in the USA and Western Europe mainly among manufacturing enterprises. However at the end of the 20th century and the beginning of the 21st century an ever increasing number of service providers and state administrative institutions started showing interest towards lean production methods and principles and attempted to adapt those to the service and public administration sector thereby developing a lean management system that would be suitable for organisations that produce, provide services as well as ensure the provision of public services.

Lean production can be described at various abstract levels: it could be defined as a philosophy or as a combination or set of principles. For instance, Womack (Womack, 1994) defined lean management as a business and production philosophy that shortens the time period between ordering and the delivery of supplies with negligible losses in the value of the product flow. The key visions of lean management are based on a set of principles described, for example by Spear & Bowen (Spear & Bowen, 1999.). The prevalent opinion, however, in the description and measurement of lean management is the sequence and instruments that are used to avoid waste (Pil & MacDuffie 1996, Shah & Ward 2003, Li et.al. 2005., Narasimhan et. al. 2006.). Although scientists disagree with the established principles and their number, there is a consensus that there are four key aspects of lean management and often similar sets of principles. There are principles related to quality management, "pull" production, preventive maintenance and human resource management (Flynn et al. 1995, Cua et al. 2001, McKone et al. 2001, Shah & Ward 2003). The empirical research of lean management involves studies that examine the principles individually (Pil & MacDuffie 1996, Narasimhan et al. 2006), factors of combined principles (Flynn et al. 1995., Sakakibara et al. 1997, Cua et al. 2001, McKone et al. 2001), and combined principles (MacDuffie 1995, Shah & Ward 2003). Previous studies looked at issues such as the empirical evolution of lean management constructs (Whetten, 1989, Shah & Ward 2003), organizational factors that influence the implementation of lean management principles (MacDuffie 1995, Shah & Ward 2003) and the link between lean management and operational performance (Flynn et al. 1995, Cua et al. 2001, McKone et al. 2001, Shah & Ward 2003).

Table 1. Development of Lean management principles (Hines, Holweg & Rich, 2004)

Phases	Mid 1990-2000 Quality, costs and supplies	Mid 2000-2005 Value system	Mid 2005– present Customer oriented competitive value system
Literature topics	Value stream, lean enterprise	Capability at the system level	Promote lean management, Lean six sigma
Focus	Costs based on processes to support streams	Value and costs from tactical to strategic, from integrated to supply chain	Customer oriented values, small volumes, high turnover
Basic business processes	Order execution	Combined processes, order execution and new product development	Unified purchasing, production, order execution process
Industrial sector	Industry generally – often focuses on repeat production	Large and small scale production, stretching in service sector.	Flexible production, changing demand
Main scholars	Lammin (1993), MacBeth & Ferguson (1994), Womack and Jones (1994, 1996), Rother & Shook (1998)	Bateman (2000), Hines & Taylor (2000), Holweg & Pil (2001), Abbas et.al. (2001), Hines et.al. (2002)	Shelden (2005), SAP White Paper (2005), Herox Global Services (2005), Carreira & Trudell (2006), Aberdeen Group (2007), CARoll (2008)

Benefits from lean management concepts must be enhanced by focusing on the lack of any lean principles, e.g. lack of statistical analysis, interaction and optimisation of processes, systematic problem solving. By integrating lean management methods at an enterprise, it is possible to promote production efficiency with precise, timely and decisive information related to production resource planning, production capacity planning and the production schedule. Enterprises have to work out a unified competitive production system model that comprises lean management principles.

It stems from the above mentioned that lean management is a tested method to minimise waste and rationalise operations. Lean management adapts production levels to real customer demand. Lean management is a systematic approach to identify and avoid waste by carrying out constant improvements, product flows consistent to customer demands and tending to achieve the best. Lean management emphasises the organisation of production processes and its constant improvement. The goal of lean management is the prevention of irrational use of time, actions and materials. Summarising lean management is: to correctly identify and increase value, to determine the value stream for each product and to eliminate redundant activities, to create a continuous product flow, to allow the customer to demand value from the manufacturer and to strive for the ideal (Womack, 1996). There are many tools available to implement lean production. Lean management is action oriented; it focuses employees only on activities that add value to the product. Lean management helps in particular to reduce costs and provide a competitive advantage, due to less volume of work in progress, greater inventory turnover, increased capacity, shorter cycle times and higher customer satisfaction. Traditional mass producers can reduce order execution time by 90%, inventory by 90%, quality costs by 90%, and increase productivity by 50%. Lean management can help reduce waste by 40%, reduce costs by 15-70%, reduce the required space and inventory by 60%, increase productivity by 15-40%, while reducing process changes by 60%, and it is claimed that the product order execution time was reduced by 11%, product travel time by 90% and inventory by 82% (Liker & Franz, 2011). A general study of the 72 Australian manufacturing companies allows us to conclude that 66% felt that a strategic advantage was created by adapting lean management and that significant improvement was achieved through competitive positioning on the market (Sohal & Eggleston, 1994). A study on the productivity in the United States and Britain conducted by the Engineering Employers' Federation (2001) - EEF found a clear link between lean production and increased productivity and profitability. Bicheno (1999), Liker (2003) and Womack (Womack, 2003) argue that a number of companies that have adapted lean principles demonstrates its popularity in the car industry (Taj & Berro, 2006). However, everyone adheres to lean principles (Emiliani, 2006). One of the basic principles of lean production is "genchi genbutsu" (from Japanese, which literally means "go and look with your own eyes") (Genchi Genbutsu, b.g.). The essence of Genchi Genbutsu is that only by seeing the on-site production processes themselves, managers have an impression of the true state of affairs, which allows them to make informed decisions and make in-depth conclusions. This is as opposed to the customary practice when managers make decisions based on reports or interpretations by other people. Therefore, managers of lean enterprises before solving a problem, starting production of new products or evaluating the productivity of employees apply the concept of "go and look with your own eyes" that requires observing everything personally (Huntzinger, 2005). Lean management measures include process cycle efficiency, ratio between adding value and not adding value, overall order execution time and inventory turnover. Lean management, however, also has its drawbacks: no statistical analysis, no problem-solving approach, and no emphasis on reducing process variations.

From the lean producer's perspective, the seven traditional losses are: defects, overproduction, transporting, waiting, inventory, motion, over processing; they are collectively known among practitioners as "DOTWIMP". Toyota's production system also usually defines an eighth type of major loss: the underutilization of employees. These traditional forms of production losses are well explained in the "Toyota Way" (The Toyota Way, Richard, Liker, 2004). From this traditional lean management perspective environmental losses are not addressed separately. However, many studies have shown that the transfer of various lean principles can improve business success, for example, MacDuffie (MacDuffie, 1995). A new strategic management system that includes the lean management system and where methodological approaches, management approach, elements of corporate governance structure, analysis methods for strategic issues, strategic elements are worked out is needed to improve the company management system. To improve the strategic management of the company and improve the quality of the strategic plan, it is useful to integrate lean management as an element of the company's management system, which envisages assessing all processes, functions and structures of the company in relation to their need for the company as a whole, for each individual subsystem of the company and the need for this approach at all. Although there are companies that try to implement lean management methods, they cannot be simply copied, because it is a philosophy that requires changes in the culture of a company. Implementing real lean management is only possible if all people in the company have

understood the philosophy of lean management. Without this understanding there is no continuous improvement process, which is one of the most important principles of lean management.

The significance of a market-oriented enterprise culture and flexible planning strategy is also important for SMEs. Alpkın, Yılmaz and Kay have highlighted these factors as ones providing a competitive edge in their scientific publication, pointing out that this allows the company to respond quickly to environmental fluctuations and maintain its competitiveness (Alpkın et al., 2007). The development of SMEs is affected by the lack of skilled labour. Education and training should be even more closely linked to labour market requirements and it is necessary to regularly study and implement changes in education and training programs in accordance with the needs of the labour market as well as attract entrepreneurs in the development and implementation of training programs.

3. The role of small and medium-sized enterprises in the national economy

The huge role of SMEs in economic development is acknowledged across the world. This significance is demonstrated by the annual *Eurostat* statistical data – micro enterprises provide as much work places as all the large enterprises combined (~40%). The European Small Business Act was adopted to support SMEs in 2008. The Act underlines the necessity to support the needs of SMEs, „improve the overall policy approach to entrepreneurship” (EU legal enactments, b.g.). Its main goal is to firstly integrate the thought of small businesses into the process of preparing policy documents, to improve the overall policy approach to entrepreneurship, in particular by promoting the development of small and medium-sized businesses and helping to prevent barriers to its development. Similar to the rest of Europe, SMEs in Latvia form a large part of the economy and play an important role in generating gross domestic product and employment (www.ekonomikasministrija.lv, b.g.). The high proportion of small and medium-sized enterprises in both the European Union (EU) and the Latvian economy points out to the need to assess the results achieved by these enterprises. Enterprises, both large and very small, are generally the driving force for economic growth. Economic globalization will scatter value chains around the world. The globalization of value chains affects not just large companies. An ever-increasing number of SMEs are shifting their activities to other places, especially to Asia. Many SMEs are learning new forms of business and looking for specific competences around the world. These developments give rise to complications, especially for SMEs located outside of the metropolitan area.

At present, there are 19,575 companies in Latvia with a turnover ranging from EUR 100,000 to EUR 2.0 million last year, thus meeting the status of a small or medium business. Of these, 12,911 or 65.96% were registered in major cities of Latvia, while more than half of all small and medium-sized Latvian companies were registered in Riga (LR Ekonomikas ministrijas Uzņēmējdarbības vides uzlabošanas pasākumu plāns 2012.gadam, 2012) [Ministry of Economics, Business Environment Improvement Action Plan for 2012, 2012].

The average age of SMEs in Latvia is ten years. Comparing the financial indicators of companies registered in Latvia's largest cities and regions in the past year, it is evident that their average turnover is similar, i.e., the SMEs registered in the districts last year had an average turnover of EUR 437 700, while those in the cities registered a turnover of 449 250 EUR. Significant differences arise from the analysis of profit and loss indicators - the average profit of SMEs registered in the districts last year was equivalent to EUR 16,500 but SMEs registered in cities, despite the higher turnover worked with an average loss of EUR 28930. (LR Ekonomikas ministrijas Uzņēmējdarbības vides uzlabošanas pasākumu plāns 2012.gadam, 2012) [Ministry of Economics, Business Environment Improvement Action Plan for 2012, 2012].

The growth and development of SMEs is an essential prerequisite for Latvia's overall growth and competitiveness in the near future. The development of SMEs is a national policy issue, and Latvia's main task is to increase the proportion of SMEs in the Latvian economy, gradually moving closer to the EU average (50 SMEs per 1000 inhabitants) (www.ekonomikasministrija.lv, b.g.). In fact, it is SMEs in Latvia, the basis of the national economy, that are most at risk from various risk factors - both the external and the internal influence of the environment. One of the most important signs of effective and

long-term activity of SMEs is lean management of the company, which includes the coherent operation of the company's internal processes and resources, which is similar to the functioning of a clock: everything is logical; all the parts are essential; they fulfil their functions, which are not duplicated; the owner receives a predictable and positive result over a long period of time - the precise time. Latvia joined the European Charter for Small Enterprises 2002, whose main goal is to create friendly support policies for small and medium-sized enterprises. The Small Business Act of 2008, which was adopted in support of SMEs stated that it was necessary to support the needs of small and medium-sized enterprises, "to improve the overall policy approach to entrepreneurship" (EU legal enactments, bg.).

Interest in managing the problems of SMEs was highlighted in the work of the Bolton Committee established in the United Kingdom (1971), which found that the size of the company was relatively related to the size of the sector in the market and the number of competitors in that particular sector of the economy, and outlined the characteristics of such group of enterprises: 1) relatively small market share; 2) the company has no opportunity to influence the level of market prices; 3) decisions related to the management of the company are taken by the owner personally; 4) employees are barely involved in the decision making process; 5) the business is institutionally independent, but the freedom of decision making may be restricted to its existing participants (family business, corporation). Summarizing opinions of theoreticians and practitioners regarding the advantages of the existence of small businesses and the significant differences from large companies, the authors conclude that all enterprises, regardless of their size, should identify the most important value generating processes and resources, evaluate the costs associated with value creation and focus on cost management using efficiency indicators. As global competition grows, issues relating to quality management of SMEs are becoming more and more important as the company is a key element of the economic system, and the sustainable development of a country or a region is dependent on its ability to function in the long term. This issue becomes particularly relevant in the context of a comprehensive economic downturn. The high proportion of small and medium-sized enterprises in both the European Union (EU) and Latvian economy points out to the need to evaluate the results achieved by these companies with the aim of finding appropriate tools for measuring and managing performance. Taking into account the modern day dynamic business environment, issues of efficient management of SMEs have become a priority because quality management of technologies, infrastructure and human capital can significantly improve the prospects of economic growth both at the individual company as well as national economy level. Factors affecting the performance and effectiveness of SMEs form conceptual impact correlations. In addition to the traditional classification of the factors affecting the company's operation, the effects of factors can be combined with their inherent manifestation and environment that sustain these factors, thereby enabling the identification of performance indicators according to their significance and management of the process of continuous improvement of performance. The impact of certain external environmental factors on the long-term activity of enterprises related to the age of the company is not uniform, as companies in Latvia are located in different regions, their development is cyclical and the influence of one factor can be aggravated or weakened by another factor, as well as there are new factors, whose existence or significance has not been evaluated beforehand.

Table 2. SMEs in Latvia (Table designed in 2011, based on data for 2005– 2009 from Structural Business Statistics Database revised, Eurostat)

	No. of enterprises		Employment				Added Value		
	Latvia		Latvia		ES-27		Latvia		ES-27
	No.	Proportion	No.	Proportion	Proportion	Proportion	Billions €	Proportion	Proportion
Micro	70 011	87.7%	148 382	27.1%	29.6%	1	16.4%	21.2%	
Small	7 313	9.3%	144 307	26.4%	20.6%	2	22.8%	18.5%	
Average	1 408	1.8%	131 148	24.0%	17.2%	2	26.6%	18.4%	
SME	78 732	99.8%	423 837	77.4%	67.4%	5	65.8%	58.1%	
Large	195	0.2%	123 743	22.6%	32.6%	3	34.2%	41.9%	
Total	78 927	100.00%	547 580	100.00%	100.00%	8	100.00%	100.00%	

Lursoft IT information on business development trends from 2007 to 2017 shows that the number of small and medium-sized and micro enterprises has increased in recent years. The smallest number of small and medium sized enterprises, as well as micro enterprises, was founded in 2008 and 2009. Starting from 2010, the number of new enterprises has increased considerably.

The national tax policy has a major impact on the activities of SMEs. It must foster business development. Increasing taxes, changing fiscal policy, and a complicated tax and reporting mechanism, which takes a lot of time are a big challenge for entrepreneurs. In a few years, Latvia has lost its competitiveness significantly, because it was necessary to consolidate the budget, raise taxes and dismiss public sector employees, thus affecting unemployment and labour force emigration. Competition has further declined in the Latvian domestic consumer and supply markets. The business environment plays a key role in business development. As indicated by a World Bank study, significant improvements are needed in Latvia in areas such as business start-up, tax payment, foreign trade, contract execution and regulation of legal relations. It is necessary to continue to support the availability of loans for small and medium-sized enterprises, to simplify access to European Union project funds and state support programs in order to provide start-up capital for start-ups, as well as secure funds for investments in business development, introduction of new technologies and implementation of creative ideas.

4. The concept of lean management for SMEs in Latvia

The authors conducted a survey of 167 managers of various companies in SMEs during the period May 2017 - August 2017. The questionnaires were developed based on self-assessment model criteria and were drawn up to identify the use of principles of the lean management concept. The respondents' sample: 167 executives selected on a random basis from databases accessible to the authors. All data obtained from the survey was considered valid for the study. All the identified companies meet all the SME criteria.

The questionnaire for SME managers is divided into three parts: managerial education and competencies and strategic planning of the company. It is possible to evaluate several elements in each section using the Likert scale on a 10-point system, where 1 is very bad, and 10 is excellent. The authors have presented the results of the survey as a summary of two main parts: company management and strategic planning (refer Table 3).

Table 3. Assessment of elements of the lean management concept

Assessment of elements of the lean management concept	Arithmetic mean	Standard error of Mean	Median	Mode	Standard deviation	Skewness	Range	Maximum	Sum
Education and competences of the enterprise management	5.33	0.78	5.00	4.00	2.35	5.5	4.89	9.00	48.00
Strategic planning at the enterprise	3.22	0.70	3.00	2.00	2.11	4.44	7.27	8.00	29.00

As can be seen from the table the arithmetic mean regarding the education and competences of the enterprise management is slightly above the average (\bar{X} = 5.33; Me = 5.00; Mo = 4.00., which could not be regarded as positive to ensure the implementation of lean management concept. Indicators regarding the strategic management of the enterprise (defining objectives, strategy development, etc.) is also very low (\bar{X} = 3.22; Me = 3.00; Mo = 2.00), which indicates very big problems in enterprises in this field.

In order to be able to evaluate real business activities in terms of the lean management concept, the authors of the study reviewed the concept of productivity and its significance. Productivity or

production efficiency/productiveness is a concept in economy that characterizes the relationship between the products (service) produced and the resources used for this purpose. In economic theory, various mathematical models are used to analyse economic development trends. One of the most commonly used model is the production function. It helps analyse the economic development mechanism. In the simplest case - in one factor model - economic development is reflected by the resource-product ratio. In practice multi factor models are typically used for modelling economic processes. One of the historically first models was the Cobb–Douglas production function - a two factor model - where work and capital as factors of production, or resources. The ability of these two factors to promote economic growth characterises productivity at the macroeconomic level. (Socioloģisko pētījumu metodoloģija, metodika un tehnika, 1981) [Sociological research methodology, Methods and Techniques, 1981].

The production function, or other mathematical models derived from it, are widely used in microeconomics as well. For example, at the enterprise level, different resources, work (human resources), capital (land, buildings, structures, equipment, working capital), energy, etc., with some or the other technology, are combined in the production process, eventually resulting in one or more products which are marketed at a certain price. Productivity in this case can be measured by comparing production costs with revenue. One of the most commonly used ways to estimate the productivity of a particular company is to compare items in its profit and loss account. Items included in the profit and loss statement are also used in the analysis of other performance indicators. (Socioloģisko pētījumu metodoloģija, metodika un tehnika, 1981) [Sociological research methodology, Methods and Techniques, 1981].

The following is a summary of the interviews conducted with company managers and an analysis of their profit and loss calculations:

- All managers acknowledge cost cutting as an advantage provided by the use of lean management elements;
- A small turnover of personnel can be observed in enterprises that apply elements of the lean management concept;
- Processes are organised and it facilitates the work of its employees in enterprises that apply elements of the lean management concept;
- The lean management concept is an effective management tool to ensure competitive performance.

In conclusion, the greatest benefit of the lean management concept is the reduction of costs and increase in productivity.

The concept of lean management is an effective tool for ensuring efficient management of the enterprise. In order to ensure efficiency it is also possible to use the methodology of lean management system which would include the following elements:

- The comprehensive use of innovation and information technology, focusing on the use and development of existing resources.
- Development and assessment of management and personnel competences and development of personnel management audit. In turn, management competence comprises the development of personnel assessment and audit based on employee productivity measurements.
- Process management demonstrates how the company identifies, manages and improves its core processes that are focused on performance. The key aspect of process management is to develop and implement a company strategy and policy that fully satisfies the needs of customers and other stakeholders and creates added value.
- Management skills and knowledge - to increase the company's productivity. The company's manager must be able to formulate and implement the mission, vision and values necessary for the company's long-term development.

Lean management is based on identifying costs, accounting and management, and is one of the most important processes in defining the company's goals, since the opportunity to reduce costs leads to a

reduction in the price of the product, to additional profit due to these savings and to being socially responsible and competitive.

Conclusions:

Several conclusions and recommendations can be put forward by summarising the research results:

1. The concept of lean management is one of the most important factors for ensuring competitiveness of a business and promoting economic growth.
2. The enterprise management can reduce company costs and ensure competitiveness by implementing a lean management system.
3. The authors recommend the review of the definition of EU SMEs so that it includes only small and medium-sized enterprises, which are really in need of support of Funds, because the existing definition of SMEs in the European perspective is too broad and practically includes all companies in the European Union (~ 99%). Consequently, companies that are really small and in need of funding are not always able to access it.
4. The general economic development and welfare of the population of Latvia is directly dependent on the extent to which SMEs are sustainable and competitive in the global market. One of the main problems hindering the development of SMEs in Latvia is the business environment. The competitiveness of the SME sector cannot develop without a business-friendly environment; this is largely determined by the degree to which national tax policies are competitive, capital market, infrastructure, education systems and State aid are effective, as well as by an organised and stable business legislation. Further improvement of the business environment and business support measures are necessary to make use of the full potential of SMEs.
5. Accessibility to financial services hinders the development of Latvian SMEs. Although the possibilities for obtaining external financing have increased significantly in recent times, access to operational and equity financing remains as a major obstacle in increasing entrepreneurial activity and competitiveness of SMEs as well as start-ups.
6. An SME's development strategy for increasing profits and economic growth must be linked to the obligation to create enough jobs, to implement sustainable development and to ensure prosperity. It is important that SMEs develop the promotion of knowledge-based innovation in the future.
7. Due to the large proportion of small and medium-sized enterprises in Latvia, it is necessary to pay attention to efficient self-assessment and promote the implementation of the concept of lean management.
8. Latvian SMEs need to continue to manufacture products with higher added value, using the latest technologies and developing science based products.
9. An essential condition for ensuring sustainable development of Latvian SMEs is the ability to analyse achievements and the desire to continuously improve in order to achieve excellence.
10. The relatively small number of enterprises that have introduced elements of the concept of lean management can be explained by the lack of awareness of the effectiveness of its implementation, and due to the fact that the purpose of the companies have not been defined precisely. It is necessary to develop and implement a unified lean management model based on the objectives and tasks of lean management.
11. In order to implement the principles of lean management in practice, Latvian SMEs need to promote the integration of lean management training in higher education institutions in Latvia.

Abstract

In this research we would like to introduce you to the first results of music therapy research that is done in Latvia. We present the work with a patient who has a secondary hemiparesis after left side head injury with all its implications (motoric aphasia, right side spasticity etc.), emphasizing the importance of parallel/ simultaneous work of rehabilitating team members (speech therapist, physiotherapist, music therapist etc.). In this article we will juxtapose music therapist work results with analysis of literature and methodical concept. **The aim** of research was to address the possibilities of music therapy in brain injury cases, accompanied by the speech engine aphasia, mental retardation of development, variety of emotional disorders, and particularly commonly seen speech, language disorders, as well as memory impairment. The following music therapy method will be used: particular vocal therapy method created by S. Shushardzhan (doctor, music therapist), combined with breathing exercises of Strelnikova – further explained in text.

Key words: trauma, speech, memory, music therapy, rehabilitation

Introduction

Music therapy today has a very broad range of applications. The list of medical problems of neurological patients that can use music therapy includes: memory deficits, problems with balance, problems with motor skills, challenging / aggressive behaviour, sharp or chronic pain, poor attention, decreased vocal projection, severe speech loss, poor motivation, muscle relaxation, Alzheimer's disease, multiple sclerosis, Parkinson's disease, stroke, etc. Music therapy as a therapeutic agent for use in people with neurological disorders has enormous potential because there are different ways how the musical characteristics often cause expected neurological reactions.

The rehabilitation process is different for different patients, and the rehabilitation program has to be individualized, according to specific needs of each particular person. In the rehabilitation process, it is important to utilize the natural rehabilitation possibilities of the organism; and the rehabilitation process of the brain should be maximally quick and effective. The treatment methods and technologies improve rapidly, as also our knowledge about the brain activities advances every year. The goal of rehabilitation is to help a person to achieve the maximal possible level of independence.

It is very important to start rehabilitation early. Practically, it should start in the department of intensive therapy. Early started rehabilitation in department of intensive therapy allows shortening the time of hospitalization. Rehabilitation starts from the moment, when the health condition for the patient becomes stable. Then a patient would start to participate in the rehabilitation program for some hours a day. This program usually includes activities together with rehabilitation specialists (physiotherapist, ergo therapist). The more time has passed after the brain injury, the more patient has to spend time in activities with different rehabilitation specialists. It is important to remember, that not always bigger amount of activities means better results.

In different periodicals and in the works of several authors (Darow and Starmer, 1986; Cohen, 1992; 1993; Aldridge, 2001; etc.) we can find excellent descriptions of use of music therapy methods. In our description we used the publication by Jeanette Kennelly, Leonie Hamilton, and Jill Cross (Kennelly et al., 2001), where experience of several music therapists is summarized.

Singing and conversation – those are two the most direct ways of person's self-expression (Cohen, 1993). Singing allows to express oneself and to use different sound fluctuation possibilities in order to follow the melody and rhythm, at the same time phrasing music and regulating the breathing without a particular concern about it. It can be done easier in a song as in speaking, and that is advantage of music. Also the songs texts contribute to this process, especially in the spheres of articulation and memory.

Speaking about the common mechanism of impact of music therapy methods, the essential is the following. We all have memory where the actual information is stored; similarly, we all have memory or "motoric patterns" for physical movements. With the help of music, these motoric patterns can successfully be "reanimated", called out of memory, even in the cases when muscles or a part of body get paralyzed. A person can lose his/her ability to create

movements, but by stimulating another - similar but neurologically different - physical action, music with its active rhythm can create a spontaneous movement, as the result of which the extremities and joints are not subjected to atrophy and cramps. In the process of treatment music and its particular rhythm can be essential, because it provides the necessary signals for reintegration of movement meaning. Loss of neurological functions can make compensatory mechanisms more active, and one can gain the control over the nonexistent functions. This phenomenon is known as “plasticity of nerves¹.” There are very many alternative nerve connections, which can be used for restoring the behaviour. As D. Aldridge (Aldridge, 2001) states, the neurological function includes involvement of particular nerve connections depending on the type of stimulus and reactions that come as the result of it. People with hemiparesis can “stimulate the alternative motoric “patterns” with the help of correct music/rhythm”. For example, in marching and dancing different schemes of postures are involved, although they both are physical movements. With the help of music therapy it is possible to help the patient to gain back the lost understanding about the movements (Aldridge, 2001).

Keith and Aronson (1975) in their work state that as early as 1736, O.Dalin has described interaction of music and verbal communication in some clinical cases and how they impact each other. There are cases where people could not say a word but could sing hymns and recite well-known prayers. In 1940 Loebell described a case study of a six and a half year-old boy who could not speak but expressed his desires and feeling by humming the beginnings of certain songs. He knew many songs and selected appropriate melodies for each communication in such a manner that pertinent text made obvious what he wanted (Keith and Aronson, 1975).

In the 1970's there were numerous reports of stroke patients, where singing was the catalyst for the return of verbal communication. The same authors, Keith and Aronson (1975) have described a patient who regained functional communication after singing therapy.

Rogers and Fleming (1981) has documented information about a 48 year old woman with severe oral apraxia whose speech first came with music therapy (*Rogers and Flemming*, 1981).

Perhaps the most known method, which integrated speech pathology and music, was Melodic Intonation Therapy (MIT) as first described by Sparks, Helm & Albert (25) and today is also used by music therapists in rehabilitation settings. MIT was developed to assist the global aphasic who had little if any useful language. This therapy relied on the three elements - melodic line, rhythm and points of stress (Baker, 2000).

The use of music therapy to address pediatric speech delay (Seybold, 1971) and disorder (Hibben, 1991) supports the significant role that this discipline has to play in addressing acquired neurological speech and language disorders in children. Both authors concluded that the use of music therapy for such children facilitates interaction in a group setting, the ability to tolerate longer periods of closeness, acceptance of responsibility for behaviours and may help to effect emotional change.

In the literature we also find materials on the use of singing as therapy for patients with traumatic brain injury (1992); and cerebral palsy (1993) etc. Cohen (1992) describes several components for music therapy sessions. The singing interventions reported in his study included: physical exercises to increase relaxation of head neck, shoulders and trunk to improve pre-articulatory movement patterns; rhythmic speech and singing drills using pacing and rhythmic patterns to address disorders of rate; breathing exercises to improve breath control, phrasing and volume; vocal exercises focusing on pitch to improve intonation; vocal exercises focusing on diction to improve articulation and lead to increased intelligibility. Results from Cohen's studies were generally positive with reported changes in rate, pitch variability and intelligibility (Cohen, 1992.; 1993).

In the scientific literature we find information also about role of music therapy in addressing speech disabilities (motor aphasia etc). In the Journal of Australian music therapy, D. Erdonmeza (Erdonmez) has gathered some research material, also in pediatrics, where music therapists (Krauss and Galloway, 1982) have helped children with speech development disorders. Results show that after the therapy there was improvement in speech fluency and rate; voice quality and intonation; vocabulary development, and articulation. Roskam (1979), using music, has improved reading skills and ability to differentiate sound heights in non-verbal communication for 6 – 9 year old children. Other research studies show that children with sensory damages could improve their phonematical hearing/

¹ **Neural plasticity**, which is also known as neuroplasticity, brain **plasticity**, cortical **plasticity**, and a variety of other names, is the changing of the structure, function, and organization of neurons in response to new experiences. **Neural plasticity** specifically refers to strengthening or weakening nerve connections or adding new nerve cells based on outside experiences. As some areas are damaged or injured, other areas increase activity so that the organism can continue functioning. This is known as **plasticity**. The amount the brain is able to heal itself or maintain function using healthy areas depends on the illness or injury which caused the initial damage and how much of the brain was impacted.

perception with the help of vocalization (Darrow & Starmer, 1986). Staum (1983) has researched the influence of music (rhythm particularly) to movements of children. He has observed that the rhythmical stimuli promote movements of the patients with such illnesses as hemiparesis, spastics and arthritis (Erdonmez).

From all above mentioned, we can gain idea about the wide usage of music therapy in diminishing different disorders (physical, psychical, psychological etc). In every case, music creates active emotional reactions in the patient/ client; its acoustic units influence the emotional centres of the brain. The right hemisphere has the leading role in perception of music (my patient had injured the left hemisphere). It is well known that music influences person's subconsciousness. The musical archetypes are generalized; therefore there is no need for special knowledge or skills for their interpretation. They have genetic roots in every person's consciousness, and that helps children to perceive music better. It is possible that music operates directly to child's subconsciousness. Together with resonance of music, subconscious images intensify and become accessible (Ворожцова, 2004).

The process of listening to music requires a very intense activity of the psyche and can create positive emotions. If music is used skillfully in the therapy process, all the negative, torturing and unpleasant affects can be relieved and turned into the opposites.

Aim of our research: To address the possibilities of music therapy in brain injury cases, accompanied by the speech engine aphasia, mental retardation of development, variety of emotional disorders, and particularly commonly seen speech, language disorders, as well as memory impairment; to help a patient with hemiparesis to eliminate the trauma aftereffects, using scientific research materials and doing practical music therapy. **The goal of music therapy was:** to build/ create music therapy relationship; integrate patient's limited expressive abilities; heighten musical self-experience of the patient; improve motoric speech abilities with putting in motion the vocal resonators, fostering differentiation of sound height with the voice, relaxing the patient emotionally. **Research hypothesis:** if in the after-injury period a patient is timely provided with music therapy within the individual rehabilitation program, the aftereffects of injury are diminished, and motoric abilities of the speech are improved.

Materials and Methods

This is research about the case study and music therapist work experience with 10 years old girl, who has obtained her invalidity after cerebral trauma caused by a falling rocket at the fireworks in New Year's Eve. The rocket fell on the girl's head. As the result, the left hemisphere of brain was operated/ trepanned. This heavy trauma created secondary hemiparesis with its implications (motoric aphasia, right side spasticity, motion support disorder etc., as it is later stated in anamnesis. **Doctor's diagnosis:** very severe, open injury of left brain hemisphere; cerebral coma; damage of left side forehead/ temple/ brain-box bones after the injury and trepanation; secondary healing of the wound; subdural collection of liquid in the area of left lobe of forehead; spastic hemiparesis of right side with features of anchilosis in the right side and joint of the elbow; sensor motoric aphasia; organic mood disturbances

We have used ascertaining/single case statistics (individual therapy), and comparative statistics as well. For ascertaining statistics we chose description of anamnesis, medical after-trauma diagnosis, and also the conclusions of physiotherapist and speech therapist that were drawn at the beginning of all the sessions and at the very end. Theoretical (analysis of literature) and empirical research methods: video analysis, observations, music evaluation, listening, diagnosing, analysis and interpretation of results – were used.

The process of music therapy: Length of therapy: six month 20 sessions, session once a week in IBAC (Liepaja Interdisciplinary Center of Children Development)

During process of music therapy we used practical individual music therapy methods: integrating patient's motoric and voice activities in common musical process, improvising in regulating speech and breathing, forming breathing and voice height perception in connection with actuating the head resonators, transferring the state of emotional experiences.

The following music therapy method will be used: breathing and forming perception of sound's height connecting it with putting the head resonators in motion, which is a particular vocal therapy method created by S. Shushardzhan (doctor, music therapist). This method is successfully combined with the breathing exercise of Strelnikova, which helps to achieve the improvement of differentiation of sound's height and also advancement of motoric abilities of speech after cerebral trauma. Russian opera soloist Aleksandra Strelnikova (1912 – 1989) created a new and very fruitful system how to teach breathing. This complex of exercises could be used only by non-medical people, as it was contradictory to generally accepted canons of breathing. Strelnikova was looking for answers to the following questions: where and how to take breath?

The shape of lungs, without going into any anatomical details, is conical: upper parts of lungs are narrower, lower parts – wider. Lungs expand more at the back, where the "lung bags" are located. When inhaling, it is important that air fills up not only the upper part of the lungs but enter also in the lower segments. Strelnikova created exercises,

which would help the air to get in the back (some call it “backpack”), filling the lungs all the way from the top to the bottom, and leading the air to the lung periphery – in small bronchi with alveoli at the end.

At the basis of those exercises there is an active, short, hissing, emotional inhaling through nose, that is done in the movement – bending forward and compressing the thorax. That way air pervades maximally deeper and wider. She was looking for a curing inhalation to treat her lost voice. Going non-traditional path, she discovered that inhalation is more important than exhalation. Her exercises restore the most complicated function of breathing – singing voice (Лавров, 2003).

Russian doctor and music therapist S. Shushardzhan (Шушарджан, 1990) created his vocal therapy method, basing it on previously mentioned exercises. This method helps to put in motion the head resonators, where the sound (vocal) by its vibration does a slight brain massage, which means helping to feed oxygen to the blood and clearly improving brain activity. It is particularly important after cerebral trauma and in the cases of brain plasticity (overtaking compensatory abilities).

As the patient had some particular motoric support disorders, it was necessary to use other therapy forms as well, adjusting them to the breathing therapy method of A. Strelnikova and vocal therapy method of S. Shushardzhan. We used a trampoline, because then we could fulfil the conditions created by Strelnikova – to perform simultaneously vocalizing and physical activities.

Results

To the first session, the girl came on a wheelchair, and with the help of her mother she was taken to the chair next to the drums that she could participate in music therapy session. The girl was shy and confused, but from the very beginnings it was already clear that her intellect after the trauma is not damaged. She did everything with a great interest, and as we later understood from the conversation with her Mom, both of them – the girl and her Mom, had a serious motivation and belief that the girl will be able to walk independently, and also move and speak, and that the therapy process will bring positive results.

Results after music therapy session: vocal resonators are actuated; partial improvement of motoric speech abilities (planning); seldom, but success in ability to differentiate the sound’s height with the voice; patient is emotionally relaxed. Now the patient attends music therapy sessions once a week together with patients of Youth Day Centre. She is emotionally more relaxed, able to communicate in the group, call others by name (3-4 syllables). Her right hand is still spastical. She is able to attend school, grade 1, works with computer (she can write words but struggles to pronounce them), visits ergo therapist and physiotherapist. Altogether, the significant diminishment of post-traumatic consequences can be observed, which is certified by speech and language therapists and a physiotherapist as well.

There was no **control research** done, but observations and video analysis give clear evidence about the dynamics of patient’s advancement. The conclusions of physiotherapist and speech therapist, as well as the conclusion of medical specialist after the sessions replace the control test and also the control research.

Discussion

Human brain is the most important organ, which provides and coordinates life processes in the body; head injuries can result in brain trauma. The amount of damage depends on the severity of injuries. Brain injury rehabilitation process is different for each specific person. Rehabilitation program must be personalized, appropriate to the particular person's specific needs. Rehabilitation aims to help people achieve the maximum possible level of independence. Significantly, the loss of neurological function may lead to activation of compensator process to partially or completely gain the upper hand over the void function. This phenomenon is known as a "nerve plasticity”.

Music, in any case, leads to active emotional reactions from a patient; the language of music’s original emotional acoustic units affect the emotional centres of the brain. Music therapy methods and range of applicability is broad, and can be customized virtually for any neurological impairment mitigation. Important is parallel/simultaneous work of the rehabilitation team (speech therapist, physiotherapist, music therapist, psychiatrist, psychotherapist, etc.). This certainly should be done in the early disease period of the patient.

According to the research, children with hand function disorders have also more severe speech disorders. (Tubele and Steinberga, 2004) This case is similar - speech disorders create difficulties for a child to communicate with others, and this fact negatively influences the child development.

The consequences of the brain damage influence the emotional sphere of the teenager very negatively. Particularly severe is a case, when a child has obtained trauma at the age that is mentioned in this case – at the moment of injury the girl was 10 years old. Possibly, her psychological characteristics before trauma were congruent to what was described above, but after the trauma, her development was delayed. 10 months after the trauma, as it is stated in the conclusion of the therapist, the patient understands everything but is very frightened and insecure.

Exactly rapid mood changes and delayed reactions, as well as emotional and willpower disorders were characteristic to our patient. Similarly it was with the patient, when she, after a half a year spent in Rehabilitation centre, arrived at Interdisciplinary Children Development Centre to start her rehabilitation with the specialists, such as children neurologist, Vojta therapist, physiotherapist, music therapist and speech and language therapist. The late (II) stage of rehabilitation would be needed for the patients, who have achieved good results in the early stage and who have shown the progress of their functional conditions. For such people, day centres, ambulatory rehabilitation centres or rehabilitation departments within the health care centres could be very useful.

As it was mentioned in the theoretical part of this work, similar therapy cases were described by Cohen - cases of traumatic brain injury (1992); and cerebral palsy (1993) etc. Various components that Cohen added to his music therapy sessions correspond to our practice of music therapy.

The research results of Cohen were positive and witnessed improvement of articulation, diction and general organization of language/speech. In the research literature we find the description of a case based on Cohen's research, similar to the case with our patient: 12 year-old girl with brain injury, coma situation and language disorders. After a motor vehicle accident she lacked emotional motivation to eliminate the post-traumatic consequences and improve her condition. Music therapist was using previously described work experience of Cohen. Also he was using the songs of the favourite group of the girl - "Spice Girls". Similarly it was with our patient Liana – she relaxed when listened to songs of her favourite group - "Prata Vetra". Liana could not sing, but when she heard familiar Latvian children songs, such as "Maza, maza meitenīte", "Kur tu teci gailīti manu", "Kā rūķītis konfektes stādīja" etc, she expressed her emotions in active and rhythmical body movements. We want to emphasize that in the praxis of therapy each case is individual; therefore discussion can take place only about the basic conceptual issues.

Conclusion

We believe that during the course of this work the hypothesis mentioned in the introduction has been proven. Both theoretical and practical studies have shown that, if during the pre-trauma period an individual was provided with a rehabilitation program that includes music therapy, it contributes to the mitigation of post-traumatic effects, including the promotion of speech motor ability and improvement of memory.

Usage of music therapy with the patients with neurological disorders has a great potential, because it opens many different possibilities of how to get the desired reactions with the help of musical elements. Within this work, the possibilities of music therapy were described in the case of hemiparesis, which is accompanied by motoric aphasia of speech and other secondary implications brought by brain injury: delays of psychical development, different disorders in spheres of emotions and willpower, and especially speech and language disorders. Our conclusion is that music with its rhythmicality and structure can help in promoting the motor speech abilities, as there is a correlation between the severity of the speech defects and the level of hand function disorders.

It is important to acknowledge that the loss of neurological functions can create the activation of compensatory processes, in order to gain control over non-existing functions fully or partially. The compensatory process can be activated more successfully with the help of vocal therapy. It is possible to do a qualitative vocal therapy using breathing exercises of A. Strelnikova.

In any case, music creates active emotional reactions in the patient; the emotionally acoustic units of music language work directly on emotional centres of the brain. There is a wide spectrum of music therapy methods and their usage: it is possible to adjust music therapy for diminishing the consequences of almost all neurological disorders.

The simultaneous work of rehabilitation team members (speech and language therapist, physiotherapist, music therapist, etc.) is crucially important. That has to be started in the early period of the illness.

Abstract

The security, credibility and growth of a country, corporation or product are many times measured by ratings given for certain entities, for instance, the risk notations periodically published by major rating agencies. As a matter of fact, the investor's guide their investment strategy by such classifications. The present research enable us to develop a careful "free" review of the 2007/2008 financial crisis causes, consequently we can state that their ratings had some correction problems that would be manipulated by "hidden" interests and "actors". It's required to find out new measurement techniques of the corporate and countries investment risk. To develop our research, we chose to analyze the political and credit risk. Considering the extremely volatile political risk, it would occur in an unexpected concern, as well as, would be supported in a revolution or in riots, and, it would be a change through a Government change and/or laws changes implemented.

Keywords: Political Risk, Credit Risk, Credit Default Swap, Risk Measurement

Introduction

The credit ratings reflect the credibility and strength of a corporation, country or product. In this paper, we will try presenting an alternative to credit ratings to measure that credibility and strength, giving investors a new method of risk measurement, which is based on the CDS market trading, and this new credit rating score is independent of rating agencies. So, we'll try to establish a link between the funds flows and spreads of *credit default swaps*, in order to measure the credit market pulse, to demonstrate that *credit default swap spread* can be used as instrument or tool to measure and anticipate a country's political risk or credit risk.

Types of risks: default risk and political or sovereign risk

Credit risk depends on the creditworthiness or liquidity of the obligee and is "the risk of non-fulfillment of the corresponding obligation by the debtor, also said, therefore, the risk of the counterparty."¹ Credit means reputation or trust, hence credit risk is closely linked to the possibility of breach of the debtor's trust or reputation. The risk will be all the greater when as the evolution of the debtor's situation deteriorates, and even if this deterioration does not necessarily lead to default, it is sufficient that this probability is increased so that there is a credit risk. The nature of this risk cannot be confused with the nature of market risk, since market price variations, whether of shares, bonds or commodities, are expected and inherent in the functioning of the market, while credit risk relates more with the situation that a given credit position assumes in the context of the debtor's financial situation of the obligation, which is a slower and more independent development. Counterparty credit risk means the risk of default by a counterparty in a transaction before the final settlement of the respective financial flows. This risk generally encompasses all the relations between two parties. In the event of default in the fulfillment of one of the obligations it legitimates the valuation in respect of all other transactions that the parties retain. That is, the delay in relation to a credit portfolio operation legitimates a correlation with the other obligations belonging to the credit portfolio relative to that debtor, since the counterparty risk is verified and is related to the debtor and not in relation to a specific obligation. With the exponential growth of the credit default swaps market, counterparty risk increased in parallel. Indeed, one of the major concerns was precisely that the largest *dealers of credit default swaps* served as counterparties to others and therefore were interdependent.

So, regarding the credit risk, the hazard is that the debtor may fail to fulfill his payment obligation. There are many variants that may determine the fluctuation of that risk in each moment.

Understanding and anticipating the credit risk of certain entities becomes vital for the pursuit of any good investment policy. In this regard, Noro said “the last two decades have been characterized by several financial disasters; large institutions collapsed proving that an insufficiency of financial risk management can cause huge losses and ripple effects throughout the financial markets. Quantitative approaches to risk management gained popularity and have been widely adopted. Nowadays firms need to understand their ability to face risks and to manage them carefully. Above all, the financial markets turmoil highlighted the importance of counterparty credit risk which is one of the many complex areas of financial risk”¹.

We speak of political risks whenever the ideologies pursued by a country in terms of investment policies are restrictive or prohibitive, making it difficult to invest abroad and the consequent outflow of capital from the country. We will also consider it as a political risk whenever the internal governance stability of a country is at stake, as is the case at the moment with Brazil.

This political risk is always exacerbated in electoral periods, given that there is always a certain amount of uncertainty that is not compatible with investment purposes. However, even after the election period, the political risk can be maintained, especially when a change of ideology or political party occurs. In these cases, in the initial moments and after the takeover of a government, there is still a considerable degree of uncertainty that increases the political risks, since the elected government does not always recognize and accept the obligations assumed by the previous government.

Political risks still exist in so-called nationalization processes because they are generally burdensome for a country's financial structure.

This risk no longer has its origin in the financial situation of the counterparty, but rather in the location where the counterparty is located, that is, the political risk is affected by reference to the location of the counterpart in the economic area.

Rating Agencies

The rating assigned by the rating agencies presents itself almost as an absolute truth, never questionable, while *gatekeepers* of the financial markets. However, in this particular case, the rating agencies only assume the actual situation of an entity when there is a default situation.

Browning said that “the credit rating agencies play a vital role in the financing of firms in our economy. The difference of a single rating category can often mean a 100 basis point differential. Thus, even the smallest drop in rating category could cost firms very significant amounts in financing”².

In fact, because of the wrong ratings assigned by the rating agencies to certain financial products marketed that were the basis of the systemic risk spread of the negative effects of the financial crisis in 2007/2008 in the United States of America, we believe that this behaviour should be subject to scrutiny by the courts, that is, the responsibilities of the managers of these companies should be ascertained. It is almost practically impossible to continue to have a complacent attitude in relations to the mistakes of the rating agencies, which seem gross in the face of the data that those entities could and should have in order to formulate their ratings. In other words, the

² Vide Browning, L. (2017). *An Examination of the Association of Firm Credit Ratings with Real Activities Manipulation, Audit Quality, Corporate Governance, and Credit Default Swaps*. (Electronic Thesis or Dissertation). Retrieved from <https://etd.ohiolink.edu/>.

rating given by rating agencies can no longer be overvalued. This raises the need to find new ways of measuring the credit and political risk of certain entities in order to guide investors.

New forms of measuring political and credit risks: *credit default swap*

The *credit default swap*, created by Blythe Sally Jess Masters of JPMorgan Chase & Co. in 1994, translates into a financial instrument used to speculate or *hedge* against the risk of default by a reference entity, which may be a company or a country, allowing the swap of the credit risk of a fixed income product between the parties, where the risk of bankruptcy of the reference entity is transferred from the buyer of the product to the seller of the *swap*³. The reference entity is not a part to the contract. In simpler terms, the *credit default swap* is used to prevent your buyer from the risk of defaulting on an asset by your debtor. It is essentially designed to avoid credit risk.

The *credit default swap* is a bilateral agreement as it gives rise to obligations for both parties, and the buyer's obligation (*protection buyer*) translates into the obligation to pay a certain amount at certain predetermined periods of time to the seller (*protection seller*).

We can thus define the *credit default swap* as a "*credit derivative contract in which one of the parties - protection buyer - transfers the credit risk associated with an underlying asset - which it may not own - to another party - protection seller - by means of the payment of a premium - a single premium, at the head or staged, which assumes the risk of default on the underlying asset credit.*"⁴.

Credit derivatives make it possible to separate the credit risk from other risks and their value depends on the creditworthiness of a given entity and, in these particular credit derivatives, the underlying asset will be a reference credit and for which the creditor intends transfer to another party the risk of non-performance by the debtor in that legal credit relationship.

Thus, the greater the risk of default by the reference entity or the greater the likelihood of insolvency of that entity, the higher the *credit default swaps* price for that entity. The underlying principle is the same as for example in life insurance, where the higher the age of the insured, the more expensive the insurance premium becomes, which is calculated on the basis of the level of risk.

We ask, do the protection sales people in the CDS have an interest in disclosing "news" that places the reference entity in a critical situation, regardless of whether this corresponds to reality? This situation is made possible by the predetermined information and commissioned by the agents whom it takes advantage of, and the unclear connections of these to certain *rating* agencies were unraveled after the financial crisis of 2007.

In fact, Kiesel and Spohnholtz said that "*the empirical analysis shows that logarithmized CDS spreads and issuer credit ratings by agencies have a linear relationship. The new CRS provides market participants with an alternative risk assessment, which is solely based on market factors, and does not rely on credit rating analysts. The results indicate that our CRS is able to anticipate agency ratings in advance. Moreover, the analysis shows that the trading volume has only a limited influence in the anticipation of rating changes*"⁵.

In exchange for this promised payment, the protection seller receives a periodic premium payment from the buyer".

⁴ Vide ALMEIDA, António Pereira, *Valores Mobiliários, instrumentos financeiros e mercados*, vol. II, 7ª edição reformulada e atualizada, Coimbra, Coimbra Editora, 2013, p. 88. ISBN 9678-972-32-2191-6.

⁵ Vide Florian Kiesel, Jonathan Spohnholtz, (2017) "CDS spreads as an independent measure of credit risk", *The Journal of Risk Finance*, Vol. 18 Issue: 2, pp.122-144, <https://doi.org/10.1108/JRF-09-2016-0119>

But how then can the *credit default swap* serve to assess whether there is too much risk in investing or not in a particular entity or country? We verified above that this agreement serves to cover a credit risk, that is, that the investor is aware of the risk that his investment does not offer him any return or gain, due for example to the insolvency of the debtor of that return. Thus, the greater the probability that the debtor is unable to meet its obligation and thus realize the investor's gain expectations, the more expensive the credit default swap premium will be on that investing entity. The same reasoning we can carry for life insurance. The higher the age of the most expensive insurer is the life insurance premium, because the risk of death, being uncertain its date, is closer and real, according to the rules of experience and probabilities, that is, it represents a risk premium, so the insurance premium for the protection of this risk is also more expensive⁶.

With this parallelism, we can measure the risk of investing in certain entities, since the more expensive the credit default swap is, the more patent the credit risk is on that reference entity in which it is intended to invest. This reasoning must be considered by investors since the protection seller, when determining the premium payable for the protection they grant through the conclusion of credit defaults, has already determined and analyzed the economic and financial reality in which the referral entity is dipped .

Conclusions

So, after our research, we can formulate some conclusions. One of them is that if the investors don't find or use others methods to measure de credit risk or political risk of a country, corporation or product to select their investments, they are hostage to ratings dictated by rating agencies, which are not always correct as we have seen. Besides, that ratings affect some States investment values.

Thus, it is clear from the foregoing that it is essential to consider new ways of measuring investment risks. For us, credit risk and political risk can be perfectly measured by credit default swaps trade and their respective spreads. The difference between this risk measurement (credit default swap and their spreads, and the ratings assigned by the rating agencies is that this one needs analysts while the first, as the most important, is the market factors, and these elements are independent of those analyst's intervention, moreover, in this new method, the risk fluctuation may be known before the risk notation given by the rating agencies.

We are conscious that this method isn't free of fails, especially if this credit derivative negotiation is abusive; as it would be observed in the US financial crisis in 2007/2008 happened. However, having another risk measurement method is helpful for investors to gauge the timeframe of their investments based on it.

Abstract

Considering the Human Rights paradigm change in the present century, the international legality, as the education, needs and proceedings, it's important to understand the reasons of this renew human, and consequently social, context, translated in the legality as in the way of living. The terrorist attacks and the extremely security international measures; the anti-Semitic ideology proliferation, the racism and discrimination dangerous rates; *renew* Refugees *waves*; the economic crisis conducting millions to the real poverty; social capacity absence to understand and (re)act according to the needs, facing the violence and Rights violations are the most important causes of the change analysis of this research. The European Union faces these problems and changings according the Human Rights protection law despite the different difficulties. However, all over the world, there is an important dichotomy between legality and social needs that should be a priority to the “powers” aiming the Human Rights promotion.

Keywords: Human Rights, Education; European Union; Policies; Legality; Dichotomy.

Introduction

The XXI century has changed the Human Rights paradigm by different reasons: terrorist attacks and the extremely security international measures; the anti-Semitic ideology proliferation, the racism and discrimination dangerous rates; *renew* Refugees *waves*; the economic crisis conducting millions to the real poverty; social capacity absence to understand and (re)act according to the needs, facing the violence and Rights violations.

Considering the evidence of the EU Education for Human Rights policies as a procedure/obligation and a political strategy, it must be a priority assumed developing structured programs.

The present research confirmed the EU Refugees Crisis, which real dimension is not possible to identify now, would be an opportunity to develop the social democratic intervention by pedagogical programs to engage the citizens as a political and social actor within democratic concern. The xenophobia, racism and discrimination are serious problems, EU is facing without the control need, would be decreased by the Human Rights “scientific” knowledge and understanding for humanitarian social general behavior.

According to the needs diagnosed, the political rhetoric is not enough to change Public Opinion but it's a start points to promote an overview and Human (re)conceptualization of contexts and happenings, pedagogically controlled by the reeducation for “new” perceptions, “positions” generating (social and individual) behaviors away of the controversy and negative complexity. So, in fact we have sufficient international, regional and national (EU members) policies for Human Rights Education, but those realities permit to state the legal procedures and social needs dichotomy. It's urgent to act looking for European social development among the national governments connected with EU Institutions, to denounce the violations, identify the realities, developing an Education program for Human Rights structured for the need and achievable results.

Research, study and results

At the present moment, world and Human, research and study the Human Rights, considering the differences, the complex contexts and all the variables, from the Occident to the Orient, it's a central problem and an urgent question to be rethink, legally adjusted, culturally understood, a political priority aligned with the policies within the international, regional and national strategies, object of a structured education for a citizenship with conscious of the realities and the most different manipulations.

Concerning the historical perspective, these questions affecting the Human Rights are charged of complex and "non-understood" (manipulated) meanings and concerns, especially due the missing scientific study about the dichotomy between the legacy and social needs. Consequently, there wasn't an international strategy to develop a real diagnostic to develop the fundamental education to protect and to promote the Human Rights all over the world according each need. Considering the UN system behind, it would be a priority, and despite the legal procedures, some actions and programs aiming the needed education to help millions of people suffering, contribute to solve problems, promote new social behaviors based on certain moments facing the difficult problems and/or human/social crises. However, there wasn't a concerted project to achieve as many people as it would be. So, in the contemporary history this context without Human Rights Education implementation had contributed to deepen the problems at the most different areas, at individual and social levels in the most different world areas.

Nowadays the Human Rights are enounced as never before, but there are serious dangerous human actions with the worst consequences; information spread without the need contextualization, grounded in facts and legal proceedings, as well as the explanation adapted to the target public (individual or groups/societies) in their different realities. So, the Human Rights are in the democratic states Agenda, in the Media priority, in the social (official and non-official) discusses, in the countries, regional groups/Organizations, International Organizations (no or governmental) aims and actions, but, in the terrorist groups discourse as a "flag" to achieve their "recruitment" followers in name of some values completely distorted within the worst objectives. This problem is affecting the non-democratic states, mostly authoritarian, having in fundamental rights in their national legal documents, as in their rhetoric, despite their most condemned violation of the Human Rights.

This way, having in consideration the possibility to determine legally the Human Rights in the United Nations (UN) system, beginning by the Universal Declaration of Human Rights from 10 December 1948 (for *all* Human Beings in the world) as all the UN International legal documents, recognized and adopted by the UN members. However, the fundamental rights are considered those that are legally recognized in each country or regional organization legal order/system, as the European Union.

It's undoubtable that International Relations, the International Policies, with a democratic background, are developed supported in the Human Rights with their values modeling discourses as well as actions promoting reactions. Despite all adversities and problems, by a world vision, it's possible to state that predominately it's not need more laws but their effective implementation, meaning the existing Human Rights legal instruments and judicial articulation and procedures, aiming the effective living within these rights, controlling judicially all violations and punishing those (persons, countries or organizations) who doesn't reach the legacy normative.

Nevertheless, obviously there are many countries/governments that need to adopt in their legislations the Human Rights, democratizing their policies to protect their citizens from all violence, violations and suffering in the most different dimensions.

Though, there are many democratic countries that protect and promote these Rights, but have the challenge of a renew social construction through a rethinking of the criteria of the political, social, economic and cultural actions to implement a democratization by a serious and realistic plan, avoiding the problems known, foreseeing the possible problems, identifying all the "actors" in the society and political "scenery", acting to proceed with a qualified Democracy from all to all citizens. This is a realistic and scientific perception argued, by Laurence

Whithead¹ in a conference in Bucharest 2017², based in the idea that the rule of the world should be the democratic aims by the justice and social system through the legal Rule of the Law, never undervalued the cultural context and system within the political structure and actions. So, the vulnerability of the protection, promoting and implementing the Human Rights system would be in the democratization but in the quality of the Democracy. If it is in the *lower* level, surely the political regime will not be able to achieve the values and rights to an active and protected citizenship.

The present research identified the Geopolitics as an actor in the international relations field contributing positive or negative to the democratization within the policies, implemented, debated, protected or violated. In two points it's possible to identify perspectives:

1. "The physical realities that underpin national and international politics are too often disregarded both in writing about history and in contemporary reporting of world affairs. Geography is clearly a fundamental part of the "why" as well as the "what". It might be the determining factor, but it is certainly the most overlooked."³
2. "We live in a time when democratic nations are in retreat in the realm of geopolitics, and when democracy itself is also in retreat. The latter phenomenon has been well documented by Freedom House, which has recorded declines in freedom in the world for nine straight years. At the level of geopolitics, the shifting tectonic plates have yet to produce a seismic rearrangement of power, but rumblings are audible. (...) Today, as always, democracy is a fragile flower. It requires constant support, constant tending, and the plucking of weeds and fencing-off of the jungle that threaten it both from within and without. In the absence of such efforts, the jungle and the weeds may sooner or later come back to reclaim the land."⁴

The Political Scientists have no doubts about the importance of the Geopolitics, however there are several decisions about the International Relations and the promotion of the Human Rights policies that don't give, or prefer to ignore, the potential of this unavoidable element. So, it's easy to find out some explanations for the success or unsuccessful political, cultural, economic or social measures, at international dimension. For instance, in order to protect as many Human Beings as possible, those who are in the situation of refugees, especially in Europe, would have a different "treatment" if the geopolitical concerns were always been taken in consideration, included in the diplomatic deals, international organizations strategy, the humanitarian, solidarity, the protection and, in particularly, the UN Human Rights legal implementation, it would be prevented millions of deaths and people suffering in all dimensions.

Another illustration is the nowadays fight against Terrorism. There are International Relations and Diplomatic expertizes presenting the "Geopolitics of the Terror(ism)" as a renewed perspective and action proposal aiming to prevent the proliferation of the *hate* but the spread of the *peace* ideology by the understanding of the need of a concerted action and behavior by politics, governments, international organizations and citizens from

⁴ "Is the democracy in decline? The Weight of Geopolitics": Article by Robert Kagan in <https://www.brookings.edu/articles/is-democracy-in-decline-the-weight-of-geopolitics/> accessed June 4, 2017.

everywhere in the world. It's not an easy or simple question/action but it has to be considered in by the political decision makers.

Having the focus the Human Rights International context and its system, there are an essential question that exists in the most democratic governments, Organization and it's identified by the societies: Education for Human Rights. It's an apparently simple issue but complex to be understood and especially difficult to be implemented. It's not a new need or question for the International laws and Relations, after the 11/09/2001 (WTC Attacks in New York, USA) with the renewal conceptualization of the Terrorism and the Human Rights protection systems, the Education has been, progressively until now, a matter in the Political agenda: by the International Organizations (Governmental, as United Nations, Regional Organizations, as European Union), the Democratic States/Governments, as well as, by the International Associations and Movements which aim is promote and protect the Human Rights.

It's undoubtable there is a change of the Human Rights paradigm as well the needs of its legal and effective interpretation, by the violence and international and national "legal" violations known or through undisclosed liabilities, there are needs perfectly identified perfectly identifiable. So, there is two different perspectives:

- the needs to achieve the implementation of the policies already approved and recognized juridical and judicially by the Governments (mostly Democratic) that intend to protect and promote the Fundamental and Human Rights. In this case, the need aims to develop the strengthening of the policies / laws as well as the citizenship denouncing the violations and violence sometimes concealed (deliberated or not).
- the needs of millions Human Beings suffering the most different violence and international laws violation, including being murdered and tortured. Ones are legally protected but there are not effective Human Rights mechanisms to defend neither the possibility to denounce or ask for protection. Others are living the states where the Democracy is not a reality, so there is a hard work to develop to achieve the political power, so the education is in two vertices: the political and law changing (hard, complex and sometimes utopia mission) as well as the society knowledge of their Rights (Human and Fundamental) and the strategies of their own protection and all problems denounce.

The world is facing several, serious and worried problems, living not only within the worst contexts, as wars, authoritarian or dictatorships, as well all the severest human living conditions. The declared intervention need for the democratization, in the major human values, aiming to protect as much human beings as possible, solving the major problems. It's an effective *state of the art* in the world society that leaves open a difficult but need way to move on. This should be a mission from and to everyone, but unfortunately there are millions who don't have enough information, who didn't receive any kind of education to be a Human Rights protector, promoter and activist. There is no special movement but the active citizenship and a responsible human action as a mission. This is not idealist but the international law implementation. There is an important role that is part of the International Relations developed in the most different concerns: organizations, countries and special movements would be concerted to aim the most important values that support that relationships. However, the history has showed there the human beings are able to completely change the best and the worst actors in their own protection. In fact, in spite of all the difficulties and hindrances, the humanity showed whenever there are truthful and legitimate wish, with strategies defined, joining the needed and the strong stakeholders, it would need time (long or short) but it is possible achieving different, partial goals, but positive results. The action is the key.

Presently, it's obvious that there are two worlds where we have a life: the real one and the virtual. Both are places to protect and/or to attack the human beings. There are important connections and powerful instruments. Concerning the virtual world, the Humanity has a powerful instrument to achieve millions in seconds. Surely, we cannot say it's all humanity but each one is important. So, it's known the radical groups, as Dahesh, find out the powerful internet social networks to recruit millions, with the worst objectives aiming violence and terrorist actions. So, the Education for Human Rights would have, in this "place", the instrument to achieve has many

people, groups and governments. There is already work developed in this aim, but it would be implemented the effective education work according to the special needs of each world area, political regime, social groups, knowledge level, culture and religious contexts, economic as all different needs but promoting and protecting Human beings, as well as, giving effective instruments to denounce the violation(s). The problem of the investment in this education (by governments and/or societies can be analyze by the Ignacio Ramonet when he states, “We assist to a permanent tension between the “absolutely sovereignty consumer” and the citizens’ wish of the democracy guaranteed”.⁵

So, there are several *actors* who have the responsibility to develop the Education for the Human Rights: International Organizations; the countries: politics and political procedures; social (in all engagements) – in individual action as well in social groups; the pressure groups (known/identified or not) and the Media. The Media, in all communication supports, is one of the most important and powerful instrument to construct the Public Opinion and to develop the social education. Meanwhile, there is two points of view/action based in the manipulation. There are manipulated media and media that manipulate the public. This is dangerous with serious and the worst consequences to the violation of the Human Rights. Despite all kind of the influence groups behind the media, images, texts, speech, ideas and ideologies spread, there is a social education promoting several misunderstood “positions” away of the promotion and protection the Human Rights. The Media is controlled, ones positively, others negatively. Fortunately, there are media who develop their work aiming to proliferate values and rights within the International Law, but, in spite of all national, regional and international laws ruling and controlling, there are too much manipulation defining the media action with human consequences that needs to be identified, legally and correctly controlled, denounced and judicially punished and, obviously, published. There are strengths and interests difficult to identify and denounce; the manipulation in the most different dimensions, but it’s important to be aware of the details aiming prevent be manipulated and all kind of manipulations. In most of the cases we can affirm there is no need of more legal supports but the implementation, juridical and judicial control.

The United Nations have promoted the Education as a priority within the Human Rights, specially through the UNESCO activities. The International Labor Organization stated the education of the values and Human Rights in the labor concerns. The European Union has the Education as a priority, developing legislative procedures to protect and to promote the Human Rights adopted as fundamental rights, listed in the legal documents, especially in the Charter of Fundamental Rights of the European Union. The Arab League adopted the UN Human Rights International Legal Documents, as the Universal Declaration, incorporated in the Arab Legal States. Thus, the International Legal system, recognize not only the Human Rights but having the Education as a mission. Once again, there are countries that adopted and recognize these legal and judicial international instruments but there is violation, mostly, without the consequences previewed by the law, as well as, they aren’t identified or known. As a result, the education is not developed and the violations are not condemned. The results are always the worst to the victims as to the human behavior, based in non-sense/manipulated or false information, would have discrimination, xenophobia, racism, violence and all Human Rights violation as consequence, promoting suffering, murders and all the dangerous political, social, cultural and/or religious misunderstood actions.

Consequently, the research emphasizes another important detail in this important context reinforcing the need of the development and implementing the Education for Human Rights: the discourse and rhetoric. As an important strategy, specially by action of the political, cultural and religious social communication, there are important details that would be misunderstood, generating ideas, behaviors and dangerous attitudes. If there are “innocent” (not planned) discourses/rhetoric without serious or negative consequences, it’s possible to state that huge part of the worst problems, discussed, wrong ideas and opinions, opposite behaviors, not only between citizens but including the International Relations in all the dimensions, have their actions supported in the manipulated or not prepared and clear messages, (or not understandable by those who are the recipients). In theory, these are simple questions, but in the practice, it is important to identify all details, the construction, the non-declare information,

⁵ RAMONET, I. (1997). Geopolítica do caos. Rio de Janeiro: Editora Vozes. p. 139

the messages under the first “image” generate. The subliminal messages/ideas/ideologies are more important than the visible ones. In the Human Rights system field this is so common that it’s a worry to all who study and/or are responsible to understand it. There is too much negative consequences provoked by the manipulated information/communication. So, the development of the education for Human Rights is one of the main strategies with important results. There are too many work to do in this area but despite the complexity, with education adapted to the real needs aiming to achieve as many people as possible with effective results in the understanding, interpreting and acting in line with realities.

After all this explanation, it’s possible to validate the title, in fact there are theories against practices within the democratic education for Human Rights and the International policies. However, to illustrate the ideas exposed and the need of the education for the Human Rights, it’s important to analyze some actual study cases based in complex social and political areas: culture; religion; refugees and terrorism.

Conclusions and recommendations

There is a dangerous ideologies and ideas being spread for all the communication channels, as within simple societies relationships, generating violence, discrimination, racism and xenophobia, as well as, political positions and actions by governments and by European Union.

The entitle “crisis” of the Refugees in the world, and in Europe in particular, would had a different treatment specially since the Arab Spring, political, social and cultural measures avoiding the massive not controlled human movements, the huge and terrifying deaths.

There is no concerted and effective answer to the real and dramatic situation, by the political European powers by the EU and each country, consequently there are millions “lost” in the way to find out a surviving position. Despite all the policies, the international laws – juridical and judicial regulations and actions – the violation of the democratic values and the Human Rights in its essence, there are another serious problem associated: Public Opinion.

Although the inherent freedom and the right of a free position, in fact, there is so many important and fundamental questions that *common sense* as well all those: who doesn’t have legal information, who cannot understand due missing explanation of the international policies and the political behaviors, who doesn’t know the unsustainable contexts that promote the need of escape to be possible to survive, who doesn’t have access to the real numbers of the people dying in seas, deserts, in the way before arriving to the “safe” countries, who doesn’t know the real and (too much) unhuman conditions where millions are living in the Refugees camps, who doesn’t have the correct explanation of the source of the money to help these human beings, especially when it comes from International Organizations, Funds or Associations Non-Governmental.

So, the “corruption is a difficult mix of consequences of a certain mentality, political culture, geopolitics, and economic development”.⁶

The scientific research developed allows to state that the Education for Human Rights is one of the most important support / “Key” for the development of the Democracy in the most different contexts and social realities, as well as, it is the support of the change of the perception and understanding what the Human Rights are and the fight against the violence, violations and human suffering. This is a mission for all actors in the International Relations, an audacious and difficult process, which complexity is involved in the most difficult and hard interests and coercions, but no one (people individually, Organization or Government) can leave this audacious, complex, hard and with all kind of obstacles, as we can save and protect Human Beings. In fact, if we

⁶ RADU, B. & VÉGH, Z. (2017). *Frontiers of Democracy: Embebing Democratic Values in Central and Eastern Europe*. Hungary: Central European University. p. 121

believe and live the Democracy, we understand the political power has responsibilities but all of us are “politics” with our responsibility as citizens, as Humans. We can conclude that we need to go further the “theories” to make Human Rights a reality lived by as people as possible.

This research allows to identify the problem of legality and social needs dichotomy, contributing negative deeply affecting the Human Rights in three dimensions: policy, law and education. The European Union has all legal, social, cultural, social, policies and political structures to protect and promote the Human Rights, not only within the EU members citizens, but by the International Relations. According to the UN system integrated in philosophy and behavior of EU, despite all the Human Rights violations, terrorist attacks, discriminations, etc., denounced, or not, despite the dangerous information manipulation, consciously or by naïf acting, it’s urgent to implement an education strategy to avoid the evolution of social behaviors against these rights, preventing violence and promote knowledge to develop understanding competences to live the real democratic citizenship and Human Rights.

The Formal Model of Publicist Style as a Tool for University Teacher's Competence

Zdenka KUMOROVÁ

*Res. Asst., University of Ss Cyril and Methodius, Faculty of Arts, Department of Slovak Language and Literature
Email: zdenka.kumorova@ucm.sk*

Abstract

The paper analyses auditive records of the spoken speeches of selected lecturers giving lectures at a particular university. The subject of research interest is to observe basic properties of the publicist (oratory) formal model: fineness, objectivity, subjectivity, suggestiveness, clarity and distinctness. Most significantly, all these features are presented through linguistic and extra-linguistic expressive means in speeches of the expedients. The analyses will help evaluate the effect of the speeches – persuasion – on the addressees. The subject of the study is to investigate the current state of the publicist formal model in the analyzed lectures. All these characteristics become a potential model and a motivational factor for future teachers studying at our Faculty. For this reason we need to serve as models to future teachers during their pre-gradual preparation, we must apply all possible optimal tools for developing cultivated teaching style, that becomes a standard model for future generations of Slovak teachers.

Keywords: Formal Model, Publicist Style, Teacher, oratorical style

Introduction

The subject of this study is to determine the current state of the publicist (oratorical) formal model in analyzed lectures. Interpretations of the analyzed audio recordings can offer a certain model of lecturing that can serve as a useful tool for students of teaching subjects during their pre-gradual study and their preparation for the teaching profession.

The paper analyzes audio recordings of the oratorical performances of selected teachers giving lectures at a particular university. The subject of research is to observe basic properties of the oratorical formal model: fineness, objectivity, subjectivity, suggestiveness, demonstrativeness and explicitness. These features are most significantly presented through linguistic and extra-linguistic expressive means in speeches of the expedients. The analyses will help to evaluate the effect of the speeches – persuasion – on the addressees. The analyses can be supported by a standardized questionnaire inquiry among addressees.

A lecturer's verbal performance is a manifestation of his/her oratorical style, of the verbal part of his/her live speech in a particular environment and in a certain situation. Oratorical performances in the academic environment possess the character of a subjective-objective style of public interactions. This character of academic speeches reinforces the pragmatic aim of the lecture as it enables an interaction between the lecturer and the listener while the listener can adequately interfere with the lecture and modify its content as well as the style of the lecturer's discourse. In the study we evaluate the basic characteristics of the oratorical formal model of the teachers' performances. Further, we study the subjective-objective style of university lecturers in the analyzed texts, which possess a higher level of subjectivity. Lecture is a specific form of a dialog between two quantitatively asymmetric "persons" (an individual and a group) while only the former realizes an oral demonstration. The level of subjectivity is determined by the relationship between the lecturer (expedient) and the listener (percipient). Despite the presence of the addressee, the lecture usually has a form of a verbal monologue prepared in advance in writing. The lecturer mediates his demonstration via linguistic and extra-linguistic expressive means – postures, facial expressions or kinetics. There is a rule, that the extra-linguistic means are perceived by the listeners as more personal, attractive and effective. The more conspicuous visual and acoustic means are often used at the expense of the more hidden verbal tools (compare Mistrík, 1997, Findra 2013). However, to increase the efficiency of his/her talk the lecturer can choose from a number of technological, graphic and other tools. In order to achieve percipients' optimal reaction, particular tools and means should be adequately combined.

Problem statement and sub-problems (hypotheses)

In our research we are going to start with the following assumptions:

H1: We suppose that the chosen verbal demonstrations are going to possess basic characteristics of an oratorical formal model.

H2: We suppose that the expressive linguistic means in the analyzed performances are going to correspond with the oratorical subjective-objective style of academic environment.

Partial targets (sub-problems) – to monitor the characteristics of the oratorical formal model in the audio recordings:

1. Subjectivity: reflection, use of expressive and emotional stylistic units, the presence of allegories and figurative expressions
2. Objectivity: the presence of facts, argumentation, the prevalence of neutral, non-indicative linguistic devices
3. Suggestiveness: use of belletristic techniques such as literary description, narrative, artistic and essay-like style (decorative and dramatizing elements), figurative expressions
4. Demonstrativeness: examples, concretization, catchiness (quotations, phraseological expressions, similes, demonstrations)
5. Fineness: the presence of decorative speech elements in form as well as in content (poetic devices, decorative constructions, figurative expressions)
6. Explicitness: repetition of words and expressions
7. Dramatizing tools: polysemic and homonymic expressions, question forms, antitheses, rhetoric questions etc.
8. Addressing the audience: contact words (salutations, dialogical grammatical categories, situational categories, subjective-situational words, conversational speech, dialogs with oneself)

Method

Methodologically we proceeded in three stages: 1. Collecting the research material (with the help of a Dictaphone) from randomly selected lectures of educators at a chosen university, 2. Processing and evaluating the collected audio material using the content analysis of the texts and 3. Collecting and processing the questionnaire data aimed at determining the satisfaction of students with the lecturers' teaching styles.

Population sampling: The research sample consisted of a stratified selection of the basic pool (university teachers of the chosen Faculty of Arts of the University of Ss Cyril and Methodius in Trnava). Altogether we monitored the teaching process of 22 educators from 5 different departments (The Departments of Historical Sciences and Middle-Europe Studies, The Department of Slovak Language and Literature, The Department of Pedagogy, The Department of Philosophy and Applied Philosophy) who taught the teaching study programs during the summer semester of 2016/2017. We studied the linguistic and extra-linguistic elements used during their lectures and seminars and we recorded them using a Dictaphone. These audio recordings were further analyzed through text content analysis. We observed the frequency of linguistic devices that in regards to the recipients demonstrate the signs of the subjective-objective style:

- a) more frequent use of stylistically indicative words
- b) use of correct literary language
- c) use of understandable, clear, unequivocal expressions
- d) belletristic, decorative, expressive-emotional elements or the features of contrast should be used marginally
- e) use of syntactic dynamic elements such as exclamatory clauses or interrogative clauses

Lectures as oratorical texts of the monologic genre will contain:

- a) high standard of contentual, compositional and linguistic form
- b) trichotomic segmentation
- c) prevailing instructional style
- d) new information and knowledge
- e) rich mental content submitted through less complicated expressions and descriptions
- f) syntactic national expressive tendency with prevailing monotone declarative sentences

Acoustic and kinetic extra-linguistic features – in didactic instructional speeches they should be represented:

- a) in a significant proportion
- b) via demonstrative and illustrative tools that incite the listener's visual perception
- c) via clear intonation, articulation, rhythm, pace and pause

In the standardized questionnaires collected from the percipients (addressees of the lectures) we monitored their reactions to the properties of the oratorical formal model of the expedients (lecturers). The questionnaire-type inquiry of students' satisfaction was realized on a pool of respondents counting 52 students of the bachelor and master teaching studies. All data were evaluated by using the statistical mathematical method.

Findings

In our research we recorded the frequency of appropriate argumentation used by the chosen sample of respondents. The lecturers demonstrated highly developed skills in argumentation. The more precise the inventive and dispositive phases are, the more efficient the speech itself becomes. In a scientific speech the memorizing phase is not a necessary part of the educator's preparation for the lecture, because the acoustic realization of our respondents' lectures had the character of a combined speech. It is a type of speech during which the lecturer alternately reads his/her text and freely talks about his/her subjects while relying on his/her concept. In composition the chosen lectures had a character of a classic form of monologic genres, which was in 15 cases (15 various lecturers) interrupted by dialogue genres - discussion and debate. In our recordings we noticed that the unidirectional flow of information from the expedient to multiple addressees, as is common in a classic lecture, was reinforced by the addition of bilateral discussion. This helped to turn the lectures into an efficient form of oratorical performance. We observed a frequent use of dialogue type grammatical categories: all lecturers used the first and the second person category, situational elements: they rarely, but functionally, alternated the tenses and conversational discourse with the listeners or themselves. Another phase we monitored in our research was the stylistic preparation – the style norm of the speeches corresponded to the overall character of the performances. Our recordings have a character of public speeches, public communication, therefore there is a necessary condition to apply linguistic elements adhering to the norms of standard literary language. They also need to be stylistically neutral (corresponding to linguistic stereotype). The most prominent shortcomings occurred in the lexical area. We observed the use of many long term recurring substandard words such as “profesný” (correctly “profesijný” = professional) (it was used 11 times), “dopad” (“vplyv” = influence) (occurred 19 times), “obtiažny” (“namáhavý” = difficult) (9 times), “odozva” (“ohlas” = response) (occurred 23 times), “menovanie” (“vymenovanie” = appointment) (3 times), “obdržať” (“dostať” = receive) (2 times), “zahájiť” (“otvorit” = open) (4 times), “činiť” (“predstavovať” = represent). Inadequacies were found in the stylistic area as well – the frequent use of stereotypical individual formulations or inadequate prepositions including incorrect noun-preposition collocations. When speaking of linguistic inadequacies we should also mention that Slovak language is, from morphological point of view, very inflective. In the recorded texts we have found mistakes caused by the influence of the Czech language as well as the English language (which isn't inflective). Substandard language was sporadically used in some lectures as an element of update, this concerned mainly the use of foreign language expressions. In our recordings they culminated at a level of 1-2 foreign language expressions per paragraph, in general their occurrence did not impede the understanding of the text as a whole. These were mostly internationalisms or neologisms of the francophone or Latin origin.

Lecturers use these foreign language expressions for various reasons: either they suppose that they are speaking to an educated group of listeners having no problem with understanding foreign words or it is a purely pragmatic function, when the instructional style requires the prevalence of foreign technical terms. However, we can also mention one particular case, when a lecturer purposefully used foreign words as a tool of distinguishing himself from common expressions and putting himself into a position of an erudite speaker. Domestic expressions,

however, outnumbered the foreign ones and any new terms were submitted with an explanation and a corresponding domestic equivalent.

Literary and scientific linguistic devices were also frequently used in our instructional speeches. We found out that there were between 10-14 foreign words per one integrated paragraph. Literary expressions had a much lower frequency of occurrence, 1-3 per paragraph. Expressive devices rarely occurred in monologic speeches and their rate of occurrence was 1-2 emotionally-expressive words per integrated paragraph. They were most frequently used when our lecturers slid into a contemplation and during supplementary descriptive passages not bearing any essential scientific information, they were used merely to add certain data with a retardatory character. Similar retardatory character was observed with formulations like: Do you know how this might continue? Do you know the cause of these contingencies? Would you like to know the source of these facts? They, however, caused no barriers in understanding and were not considered disturbing. Students, in fact, appreciated them, because they drew the lecturer closer to them as an individuality with a subjective viewpoint of the issue. This also helped to make the lecture more graspable.

The questionnaires expressing the students' satisfaction with the teaching process of chosen lecturers confirmed that the retardatory passages full of reflections containing expressive words were more common with teachers giving more engaging lectures – 75,5 % bachelor students (BC), 84 % master students (MA). On the other hand, their dissatisfaction rarely stemmed from finding the language substandard, they more frequently criticized negligent and inadequate choice of linguistic devices from the functional point of view. Most students confirmed that teachers only rarely use substandard neutral expressions – 62,5 % BC students, 63 % MA students. It means that many percipients are sensitive to chosen language from both linguistic as well as expressive point of view. However, it is necessary to add that the character of scientific lectures have changed when compared to the past, today a more lively communication and direct improvisation full of creative and interesting observations, although carefully prepared in advance, is preferred. Lecturers are trying to get closer to the listeners also linguistically in order to make their speeches more understandable and attractive. However, this goal should be optimally adjusted to the norms of standard language, so that, as an official public speech, it complies with the conditions of the standard literary language.

From linguistic point of view lectures included in our research predominantly contained devices of the instructional style, therefore it could be stated that the lecturers were aware of the need to use adequate syntactic and lexical structures. Devices used in our recordings were understandable despite containing higher number of technical expressions (on average 10-12 words per 10 sentence paragraph) and various complex parts of speech. All our respondents (22) alleviated the informational saturation and difficulty of their texts by introducing examples and by explaining the technical parts. The more difficult passages were interpreted through auxiliary meta-linguistic formulations such as: it can be compared to...; it is also called...; so called... etc. The students were also able to evaluate the quality of speech, which is considered understandable based on the choice of sentence types, style or logical division and text structure. In our questionnaire 88,5 % of BC students and 84 % of MA students rated the texts as meeting the criteria of textuality with a logical succession. Simple sentences, or a terse style, or long sentences and a lengthy style were reflected in the first questionnaire item. When asked about the use of appropriate sentences (in length and structure) all students reacted collectively with the answer: sometimes. When considering the adherence to the criteria of text cohesion respondents mostly gave an affirmative answer (78 % BC, 70 % MA), which means that the structure of ideas in the texts corresponded to the function and the style of the speech. On the other hand, frequent breaking of the sentences and incongruity of ideas reflected the opinion of 22 % of BC students and 30 % of MA students, when asked about the text cohesion.

In our research we also evaluated the segmentation of instructional speeches. The segmentation serves the purpose of hierarchization of information and differentiation of shared argumentations. In their lectures our respondents used thematic formulations with an aim to emphasize the relevance of the issue. These are formulation such as: this needs to be particularly emphasized..., the most important is..., I want to call attention to this fact... etc.

Contact with the addressee is one of the basic stylistic elements. In a lecture a contact between the lecturer and the listeners is a prerequisite of meeting the basic oratorical function of an instructional text – informativeness. The lecturer leads a dialog with a group which is silent and thus needs to be constantly stimulated and activated. “The student’s passivity during lectures that can have a negative impact on his further individual study is a continually discussed issue. This negative impact can, however, be minimized by giving an optimally performed lecture from the point of content and methodology.” (Sirotová, 2014, s. 59) Both the initial and the final parts of the lecture directly address the listener. For inducing a partner dialog relationship our respondents used salutations such as dear colleagues, dear professional community or dear friends. From 22 respondents only 2 started their lecture without direct salutation or greeting. At the beginning of their lecture all our respondents defined the subject and some (17) also presented a brief outline. In the course of the lecture our lecturers praised the listeners for reacting to the lecture and thus turning it into an interactive dialog. 77 % of the lectures were of this character. Quoting and paraphrasing various professional authors and reputable personalities from related areas of study plays an important role in optimization of understanding and strengthening of the feedback in instructional speeches. Various allusions to important works, events or circumstances related to the subject of the lecture are efficient tools for establishing contact between the lecturer and the listeners. In our research we observed obvious attempts to address the listeners by applying objective arguments and pertinent examples. Factual and objective argumentation and explicit precision reinforce the perception of complicated scientific texts, on the other hand the presence of any esthetic elements tends to weaken it. Our respondents used expressive-emotional elements minimally, however they reinforced the demonstrativeness of their speeches by using various visual, audio or textual materials. Audience addressing can also be reinforced by non-verbal devices, one of the most obvious tool for inducing contact is the eye contact. In our research we had a chance to observe three types of speakers based on their use of non-verbal devices. The first type (31 % of lectures) avidly watched their written concepts and the eye contact with the audience was minimal. Students were given no room to react to the lecture and they were writing down the precious information presented by the teacher. In general this type of speech is considered less efficient and it gives only marginal room to acquiring the audience’s opinion. The second type of lecturers (9 %) gave lectures with an intense eye contact and a minimal anchoring of their eyes to the written text. This type of lecture is popular with students as the level of their activation and perception is high. Students reported only one problem with this type of lecturer, the notes from this lecture are often ill-sorted and they must be consolidated during self-study with the help of literature. Usually it applies, that to become a “par excellence” lecturer requires a long term speaking praxis and that these are usually teachers with long time lecturing and professional experience. The third type of speakers (60 %) can be referred to as combined lecturers, they follow their text, but at the same time keep an eye contact with the audience to verify that the listeners understand what is being said and to determine their opinion. This style seems to be the most suitable for students and they also confirmed it in our questionnaire. At the end of the lecture the lecturers again addressed the audience directly by thanking them for their attention. Another non-verbal tool we were able to observe during our research was the application of kinetics in the lecture room. This simple device helps to significantly encourage visual perception. Steady movement within the space of the lecture room followed by adopting a static position was utilized by 90 % of the teachers, the rest moved from the teacher’s desk closer to the audience only when writing information on the board. All teachers reinforced the non-verbal communication by facial and hand gestures (100 %). Also 100 % of students confirmed this information in their questionnaire answers.

Addressing the audience was also reinforced by linguistic stylization, which helped to eliminate possible communication barriers caused by scientific saturation of the text. In their lectures respondents tried to get closer to the language of their listeners, who, naturally, possessed a lower terminological range than their teachers. In the analyzed texts we also studied the terminological and abstract level of the submitted texts. We found out that the level corresponded with the type of scientific text and that it was compensated by the use of adequate examples and concretizations of the abstract terms. Students confirmed this fact when answering the question if a teacher in his/her lecture gives examples, uses parallels or comparisons. Most students leaned towards the “sometimes” answer (78 % BC, 70 % MA), the other students unambiguously stated that the rest of the teachers “always”

complemented their lectures by using application examples. This proves, that when presenting the basic, bearing information the teachers expanded the volume of their texts by using insertions, allusions and examples. In our research the rate of applying examples was on average 6 per lecture. Other devices that significantly influenced the hierarchization of the lectures were figures such as synonymic repetitions in a smaller paragraph of a text (occurred 12 times), enumeration (in each lecture it occurred on average 13 times). On rare occasions the teachers used indirect denominations (figurative devices), these, however, did not concern the basic information, but were rather an individual statement of the teacher pertaining to the given fact. Limited use of indirect denominations was confirmed by students as well (57 % BC, 56 % MA), the rest of the students stated that teachers never used indirect denominations during their lectures. The lectures were, however, in more cases (12) reinforced by PowerPoint presentations, visual materials (7), tables (4). The black (white) board was used as a common didactic tool (22) as it helps to support the understanding of the scientific text.

In the lectures we clearly observed the use of efficient dramatizing elements in more than half of the respondents (12). So called fifth wheel statements, whose main function is to stimulate the listener's attention, frequently occurred in the lectures. These were formulations like This statement probably requires some specification (8), You may not fully agree with me (1) or You may be surprised to hear what I'm going to tell you (3).

The final part of the lecture is very important, because in it the teacher sums up all essential information and at the same time gives room to making sure, via adequate feedback, that the students understood the text. All our respondents (100 %) reviewed the essential information directly or synonymously. For our respondents this phase represented the period of approximation to the students, because in a partner-like manner they drew nearer to students' perception and the diversification of their opinions about the issue at hand. This dialogic phase was reinforced by the use of inclusive plural and motivated the listeners to barrier-free communication with the teacher and other students. Formulations such as Let's think together... or Try to think yourselves... or Let's look at it together... etc. were often used. Some of our teachers kept direct contact with the students by using feedback type formulations such as: as you correctly pointed out, I appreciate you calling attention to this fact, I see this is still not very clear to you, This issue is unclear, I understand why you are shaking your heads etc. This way students become the center of attention, they appreciate the teacher's approach by a positive evaluation of his work and by thanking him after the lecture, by satisfied expressions on their faces or by positive assessment of the teacher in the continuous questionnaire.

The acoustic realization of scientific lectures must be in principle based on the acoustic norms of the standard language and on the adherence and respect of these norms. For the listener the speech becomes disturbing or indicative if just one of the following speech elements is out of balance: the acoustic intensity (volume), the pitch of the voice (voice intonation, sentence melody, natural feel), pace of speech (speed and dynamics), accent (sentence accent and stress, accent rhythm), pause (functional breaks, correct breathing, color of voice, word production). This includes complying with the articulation and correct intonation and respecting acoustic rules of speech. In school practice "it is necessary to make sure that the spoken communication also adheres to the norms of Slovak language" (Gregorík, 2014, p. 20). The acoustic form of our respondents' performances had several common attributes, some executions were, however, fairly different in this context. Not all teachers articulated their speeches clearly (67,6 %), some shortcomings were also apparent (76.5 %) in the technical execution of the acoustic aspect of the speech (breathing, sound volume). From syntactic point of view teachers executed their texts in longer sections, which resulted in difficulties not merely in understanding, but also influenced the orthoepical realization of the text itself. 63 % of lecturers used on average 3 - 4 syntagmatic constructions in their speeches. The constructions themselves were quite complex. Although the texts corresponded to the logical content structuring, due to the substantial sentence length the lecturers experienced problems with the adequate placement of pitch modifications, which are useful for better hierarchization of essential information and for their semantic explicitness. Therefore, it is advisable for teachers using longer compound sentences to try to substitute them with several simple sentences which are easier to understand. From various syntactic constructions teachers also liked

gerund and participles. Another articulation problem we noticed in the speeches of our respondents was observed in the pronunciation of longer words, many of them had an international word-formative base. During their speeches many of our respondents slid into spontaneous talks that became interrupted during the thinking phase and thus resulted in so called non-functional pauses. To be able to find an appropriate expression in the stream of speech requires a resourceful lecturer. While trying to put their formulations more exactly the teachers were filling the pauses with redundant words, so called fillers or word crutches (compare Kumorová, 2015, p. 113). Most common are: in fact, naturally, yes, of course, therefore, simply etc. The frequency of their use is so common that these words become indicative of many teachers, in some cases we can even talk about a speech mark. Despite being experienced lecturers, all teachers included in our research used fillers. As this was a research of verbal performances, we studied the violation of orthoepic norms – violation of the soft pronunciation (common in standard Slovak language) even in places where the softness was indicated in writing, an incorrectly chosen rising melody of speech in declarative sentences, in place of the falling melody. Our respondents also used an incorrect form of the formal address while addressing their listeners (use of the second person plural in place of the second person singular for respectfully addressing singular people, this is a common way of showing respect in Slovak language – translator’s note). Speech problems (apparent mainly in pronunciation) can be easily recognized without deeper linguistic analyses, therefore students had no problem to uncover these inadequacies. Affected intonation or singing was indicated by 26 % of BC students and 21 % of MA student and non-functional pauses by 10,5 % of BC students and 21 % of MA students. Incorrect breathing impeding natural intonation and melody was also observed in some cases. Through acoustic realization of the speech, mainly through adjustment of the speech tempo, the teachers can emphasize the basic pieces of knowledge and call attention to the essential information. In our research teachers rarely utilized the acoustic devices such as the articulation emphasis or the slowing of the speech tempo. This fact was confirmed by 100 % of listeners, who marked two questionnaire items “adequate pauses” and “appropriate tempo” as used only rarely in the educational process. We are of the opinion that the acoustic devices alone are not enough to help better understand the text, but through their rigorous use in the lecture they can significantly reinforce the comprehensibility of the text and the overall understanding of the issue. Language is “part of the culture and culture of the society is reflected in the language – in the style of verbalization, in the word selection, in the tone and intonation, gestures – in accordance with language etiquette.” (Smetanová, 2016, p. 224) Our analyses and interpretations of the lecture recordings supported by student’s questionnaires containing information about their satisfaction with the teaching style of their lecturers confirmed the validity of our hypotheses. The results of our research established the presence of basic characteristics of the formal model in the analyzed lectures, which correspond to the oratorical subject-object style of academic environment.

Results, Conclusions and Recommendations

Our research confirmed that our lecturers possess many positive attributes. These characteristics influence further educational process of the listeners and at the same time impact the formation of their own future teaching style. Therefore, it is important for the teachers to place emphasis on self-reflection and self-evaluation of their own lectures. In the recordings we were able to observe the characteristics of the formal model. The performances demonstrated high level of objectivity through means like arguments and informatively saturated facts as well as through prevailing neutral, non-indicative linguistic devices. Thanks to these means all lectures contained factual objective argumentation and achieved scientific character. Some lecturers acquired higher efficiency of their performances by including more subjective expressive means such as expressive and emotional stylistic units or figurative descriptions. These means have a character of contemplation and embellish the one-sided dialog by a certain individuality and the lecturer’s views, thus bringing some humanizing character to a scientific speech. Bringing higher vividness into the lectures through belletristic and essayistic elements was used infrequently by our lecturers, still, they were able to efficiently alleviate informatively saturated passages, which the students always appreciate. When applying subjective linguistic devices lecturers should avoid using sub-standard language as this may depreciate their performance and be perceived as disturbing (Kumorová, 2015, p. 100)

Addressing the audience as an essential characteristic of the formal model was also present in the analyzed lectures. It helped to reinforce partner-like relationship between the listeners and the lecturer. Contact words such as salutations, dialogical grammatical categories in the first and second person, situational categories with alternating tenses and a conversational speech (including conversing with oneself) prevailed. All these characteristics become a potential model and a motivational factor for future teachers studying at our Faculty. We believe that adopting appropriate teaching style will positively influence the overall quality of the educational process. “A teacher needs to be an expert in his field, he must be a skilled educator and be able to modify his topic to the listeners’ age, to their individual peculiarities, he must be able to effectively communicate with students. He must also be willing to constantly educate himself, to become familiar with the newest trends in order to keep in the loop etc.” (Baranovská – Doktorová, 2016, p. 12) For this reason we need to serve as models to future teachers during their pre-gradual preparation, we must apply all possible optimal tools for developing cultivated teaching style, that becomes a standard model for future generations of teachers.

Abstract

In this article we will summarise information about master's papers which include case analysis of various patient groups and the most successful and significant researches. Study programme Music Therapy is available at Liepaja University since 2003. In the time period from 2009 to 2017, 62 professional arts therapists in music therapy have graduated from this study programme. Unfortunately not everybody is working in this profession. Part of graduates combine art/music therapists work with their previous speciality (musician, pedagogue, psychologist, etc). To get arts therapists in music therapy qualification masters students have to take a qualification exam, which includes "role play" of a specific case with a patient or a group of patients and the presentation of master's paper. In this article we will summarise information about master's papers which include case analysis of various patient groups and the most successful and significant researches.

Key words: music therapy, master's papers, research.

Introduction

Study programme „Music Therapy” at Liepaja University (LiepU) was initiated in 2003, as a professional study programme with attainable qualification – music therapy specialist.

In 2006 according to a recommendation made by accreditation commission, programme was transformed to professional master's study programme who's graduates attain master's degree in health care with qualification – arts therapist in music therapy.¹

One of study programme's „Music Therapy” goals is to improve master's students research competence, which is significant also in the future work of professional music therapist. In that way, music therapist performs his professional activities based on scientific evidence.

Music therapy is relatively new health care form in Latvia and master's papers are like outlets for further, more serious scientific research. For this reason, authors considered it very important to share the information about accomplishments in music therapy field in Latvia, and set aim for the research: to summarize and analyze master's papers presented in LiepU Music Therapy study programme during the time period from 2009 to 2016, including information about research themes, working environment, participants, results and conclusions.

While compiling the description, obtained data were summarized in the tables and descriptive statistics were used according to the purpose of the research.

Music therapy in Latvia is defined as one of arts specializations where to solve clients/patients diverse health and social problems and to overcome them individually or in groups, music and its means of expression, music making techniques and activities are used in the context of therapeutic relationships, to express and reflect thoughts, ideas, experiences, feelings, emotions, needs, problems, etc., to achieve changes in emotional state and mind set, more complete physical, emotional and social integration (Paipare, 2011).

¹All arts therapists (visual plastic arts, dance and movement, drama and music) in Latvia have a united profession standard

Research questions:

1. How many and what kind (research topics) researches in music therapy have been completed during the time period from 2009 to 2016?
2. What kind of professional environments, these master's papers have been developed at?
3. Who were the participants of the research (clients, patients, others)?
4. What are the age groups of participants?
5. What are the main results and conclusions of the research?

Research Method

Research is built as an overview of presented master's papers. This work analysis designs and strategies of researches, researched symptoms, working environment, patient groups, summarizes research results and conclusions.

At LiepU master's researches mostly qualitative strategy has been chosen – in 80% of cases, but – quantitative strategy is used in 20% of cases. In researches where quantitative strategy is chosen most frequently used design of research is quasi-experiment – 86% of cases. Mixed research is used in 14 % of cases. In all researches, where qualitative strategy is chosen, the case analysis is used.

Number Of Presented Master's Papers

71 master's paper was elaborated and presented during the time from 2009 to 2013. During the 2009/2010 study year the biggest percentage of master's papers was presented (11.36% of researches or 16 master's papers).

Exception is year 2012 and 2014, when only one master's paper was presented.

Research Themes and Researched Symptoms

Master's papers have tested effectiveness of music therapy in improving mental, physical and social health and in problem solving. Very few, only two researches were studies of professionals: Doctors' and medical personnel's social view on music therapy; Social workers social view on music therapy in Latvia. A study was conducted on the possibilities of using music therapy in the Latvian penitentiary system. Innovative is an attempt to discover and adapt the potential of the use of the Child Psychotherapy Q-SET (CPQ) instrument in music therapy.

Master's papers research the influence of music therapy on:

- music communication skills in children and youth with mild and severe mental disorders;
- spatial orientation abilities in visually impaired and blind children;
- quality of life and cognitive abilities in patients with multiple sclerosis;
- social interaction of children with autism;
- aggression and behavioural disorders in children with hearing impairment and children after cochlear implant (CI) surgery;
- specific speech and language development disorders;
- reducing the anxiety in children with depressive behaviour;
- movement coordination in cases of children cerebral palsy;
- prematurely born children;
- patients after sustained injuries;
- patients after the stroke;
- patients with bronchial asthma;
- work in groups for encouraging communication.

Working Environment

According to the profession standard (Cabinet Regulation No. 461)² (Latvian Medical Law/ Legislation)³, arts/music therapist works in health, education and/or social care, performing their

²Profession standard: www.lm.gov.lv

³Medical practitioner's certification order:

www.akti.lv/naiser/text.cfm?Key=010103201212_1800943&doknos=arstniecibas-personu-sertifikacijas-kartiba

professional activities independently as a part of multi-professional or multidisciplinary team. During the study process, master's students have an opportunity to get to know each of the above-mentioned working environments and choose in which of them to do the research.

Studies in master's papers on the use of music therapy were performed (see image 1):

- in health care facilities – in 30% of cases (The Riga Regional Hospital, National Rehabilitation Centre „Vaivari”);
- in educational institutions - 45% of cases (Liepaja Music Therapy Centre, Special preschool educational institution “Saulespuķe”, Vainode special primary boarding school, Engure high school, Jumprava special primary boarding school, Skrīveru A. Upīša high school, children and youth creative development centre “Namiņš” etc.);
- in social care institutions – 24% of cases (Social day care centres);
- in another field – 1% (in a place of imprisonment).

Image 1. Research performing locations

Participants

Research work was performed in both – individual and group music therapy sessions. In 90% of all cases work is performed individually, but 10% – in a group. Number of participants varies from 1 (in individual cases) to 8 participants.

Taking into account the various uses of music therapy interventions, this type of therapy can be adapted to clients/patients with significantly different physical and psycho-emotional state in all age groups. Age of participants varies from perinatal age to senior age group.

Classification of research participants by client/patient diagnosis:

- children with developmental coordination disorders;
 - children with mental development disorders;
 - children with speech and language disorders;
 - children with autism;
 - children with hearing impairments;
 - children with behavioural and emotional disorders;
 - children with genetic diseases;
 - patients with multiple sclerosis;
 - patients after sustained injuries;
 - patients after stroke;
 - patients with depression.
-
- preschool age children;
 - adolescents;
 - adults in working age (18-65 years old);
 - elderly people (>65 years old).

Conclusions and Results Of Researches

Themes of presented master's papers include various working environments, various patient groups and age groups. In almost every work there are difficulties and limitations indicated that

surfaced during the research. Part of music therapy researches are included in LiepU scientific collection of articles “Music Therapy” (Mūzikas terapija, 2014), and are being presented in international conferences for music therapists.

Summarizing the results of the research, it can be concluded that there is a noticeable positive effect of music therapy on the above-mentioned patient groups. This allows us to conclude that music therapy can be indicated in neuro-paediatrics, neuro-rehabilitation, psychiatry, audiology and neonatology.

Research results confirm that music therapy methods are effectively used to improve or expand motor skills, to improve or facilitate motor coordination, to facilitate agility and to reduce spasticity, to differentiate and integrate perception, to improve one's body awareness, to increase attention, to develop planning abilities, to stimulate short-term and long-term memories, to improve contact and communication, to reduce psychosocial symptoms, to reduce autistic spectrum symptoms, to develop non-verbal expression skills, to activate and improve remaining speech abilities.

Recommendations

All master's papers recommend continuing further researches with previously mentioned age groups to ascertain the effectiveness of music therapy in mental, physical and social health improvement and problem solving. It is recommended doing both, qualitative and quantitative studies in all previously mentioned fields with various patient/client groups and to use music therapy as a long-term intervention to gain more complete view on result stability achieved in music therapy.

Authors of master's papers recommend paying attention to informing society about arts therapy possibilities and emphasize the necessity for information and collaboration with field specialists in various symptom reduction in various patient/client groups.

That is why, to strengthen music therapy profession's formation and development in Latvia based on evidence, research authors should participate in research projects, to do long-term researches to acquire results and draw conclusions about stability of music therapy process.

Conclusion

Commonly art therapy for future arts therapists is the second profession. Arts therapy students come from different professional working environments. Their first profession is psychologist, pedagogue, medic, social worker, with art related professional, etc., and they already have some experience in this profession. During the master's study programme future arts therapists learn the professional working rights and ethical issues of a medical practitioner so that after the graduation arts therapists can choose the professional environment appropriate for their desires and qualifications, thus becoming a support for the development of professional activities and professional growth.

Since music therapy is relatively new profession in Latvia authors of master's papers also emphasize the necessity to continue informing the executives and personnel of medical, social care and educational institutions, as well as patients/clients and their parents/caregivers about application possibilities and effectiveness of music therapy methods in various symptom reduction, physical and emotional improvement of psycho-emotional state.

Healthy Lifestyle and Wellness of The First-Year Students of Liepaja University, Study Programme Teacher

PhD Helēna Vecenāne

Liepaja University, Faculty of Education and Social work, e-mail: helena.vecenane@liepu.lv

Abstract

In Latvia there is a high morbidity and mortality from non-infectious diseases (including cardiovascular diseases, oncological diseases, mental disorders), the development of which is largely influenced by people's lifestyle (eating habits, physical activity and the use of addictive substances). In 2016/2017, there are 1342 students studying in Liepaja University, among them 428 are the first-year students (IZM, 2017, 16). Students form the part of society and their knowledge, skills and attitudes obtained at the University will contribute to Latvia's growth. A healthy and developed society is the basis for the development of each country. The development of Latvian education system is closely related to the changes in all other areas of human activity. An organized life is in a very close interaction with well-organized life experiences – education, and mentally and physically organized people. The Aim of the study: To determine the healthy lifestyle habits and wellness level of the first-year students of study programme Teacher. Research Methodology: survey method, questionnaire consists of 4 blocks - a total of 90 questions, Cronbach's Alpha 0.692. Research sample: N=121 first-year full-time and part-time students of study programme Teacher, age 18-57, average age – 29. Results: Employing the survey, 11 healthy lifestyle components are evaluated, from which the following healthy lifestyle components – physical activity, eating habits and stress management are analysed more closely. Physical activity habits: 71.9 % of students daily perform moderate physical exercises, 34.8% of students exercise very intensively, but 19 % of respondents perform strength-building exercises. Eating habits: 69.3 % of students have three regular meals per day, 19.4% of respondents daily choose appropriate portions from products recommended by food guide pyramid. Stress management habits: 76.1 % of students daily allocate time for resting and recovering from stress, but 9.2 % of students regularly perform exercises designed to reduce the stress-related tension. When assessing the students' emotional, intellectual, physical and mental wellness, the overall score is as follows: for 2.5 % of students the wellness level is low, for 16.9 % – marginal wellness level, for 52.8 % – good wellness level, but for 27.6 % of students the wellness level is high.

Keywords: students, healthy lifestyle, habits, wellness

Introduction

In Latvia most people do not engage sufficiently in physical activities due to the lack of motivation, lack of understanding about the importance of physical activity for maintaining health, lack of skills and resources for the implementation of physical activity, as well as lack of sufficiently developed and accessible physical activity-enhancing environments (for example, bicycle path, sport halls or sport fields) (LNAP, 2012).

In Latvian National Development Plan for 2014 - 2020 (LNDP) a course of action "A healthy and fit for work person" is included, which states that the main health risks in European region, which also cause significant health-care and social costs, are smoking, risky alcohol consumption, lack of physical activities and a poor diet. Thus, for strengthening healthy and active lifestyle habits in the society as a whole, one of the priorities is to support different health promotion networks: (a) promotion of a healthy diet, active lifestyle and mental health, (b) promotion of children, youth and nation's sports activities, (c) inclusion of health education in school programmes, (d) prevention of addictive substances and processes (LNAP, 2012, 46–48). Therefore, nowadays one of the topicalities in the health sphere is healthy lifestyle, with a particular emphasis on sufficient physical activity and healthy eating habits. The global research studies (Green, Smith & Roberts, 2005; Haerens, Kirk, Cardon & Bourdeaudhuij, 2010) show, that physical activity tend to decrease starting from the teenage years, and this tendency continues until the end of life, thus only worsening the health problems. The study of the health-influencing habits of the population (15-64 y/o) of Latvia (2014) confirms that 38 % of 15-24 y/o respondents engage in physical activities 2-3 times a week for at least 30 minutes, but in the group of 25-34 y/o respondents there is a significant drop to 19.2%. The physical activity is decreasing also in the midst of Latvia's students. In the study conducted by Porozovs, Porozova & Valdemiers (2012) the level of physical activity was compared between pupils and students, and they found that the pupils engage in sports more than the students, and that 42% of students lack physical activity.

According to the research of Latvian University Sport Federation (LASS, 2012, 11) students give the following reasons of why physical activities are not implemented: 1) lack of time; 2) lack of suitable sport fields nearby; 3) sports premises are not available at convenient times; 4) lack of company (partners, friends) for doing sports; 5) lack of motivation to do sports; 6) it is too expensive; 7) the health condition does not permit; 8) lack of competent coaches, instructors; 9) insufficient level of knowledge and skills.

In the academic year 2016/2017, there are 82.914 students studying in Latvian higher education establishments (IZM, 2017, 31), from them 21.669 are the first-year students (IZM, 2017, 21), but in Liepaja University, in academic year 2016/2017, there are 1342 students, from them 428 are the first-year students (IZM, 2017, 16).

Students form the part of society, and their knowledge, skills and attitudes obtained at the University will contribute to Latvia's growth, therefore during the study process it is particularly important that all students, not only students from health and sports related fields, obtain the health and physical activity competence. It is important also for future teachers. A healthy and developed society is the basis for each country's development. Broks (2000) suggests that the development of Latvian education system is closely related to the changes in all other areas of human activity, as well-organized life is in a very close interaction with well-organized life experiences – education and mentally and physically organized people. Latvia's socio-economic situation, reforms in education and the transition to a competence-based approach in education actualize the health and physical activity competence, which implies healthy lifestyle and taking responsibility for one's own health.

Health is the basis for a human life. The health concept is complicated; it is related to interaction between the individual and the surrounding environment, which is determined by the individual's conditions of existence, world views and motivation. The health is understood not only as an abstract state, but also as a tool for achieving goals, and as an instrument and a resource that allow the individual to manifest itself in all aspects of human life in various ways. The understanding of health is closely related to person's social, personal and physical capabilities. Holistic understanding of health is expressed in the definition elaborated by WHO in 1947: "Health is a complete physical, mental and social wellness and not just a condition without illness or physical deficiencies". Along with the development of the society and the growth of its welfare, the explanation of the essence of health is clarified: "Health is the degree to which an individual or a group is capable to implement their efforts and meet their needs both by making health-friendly decisions and by changing the environmental impact" (WHO, 1998, p.1).

Traditionally the healthy lifestyle is linked to the concept of health promotion. The WHO Ottawa Charter, in its 1986 resolution, has adapted the following clarification of the health promotion concept: health promotion is a process that enables every person to increase the control over one's own health and improve it. In order to achieve full physical, mental and social wellbeing, a person or group of individuals must be able to identify and implement their desires with the aim of meeting needs as well as changing or overcoming the environmental impact. Therefore health has to be considered as the means for everyday life, but not as a goal of life. Health is a positive concept; it emphasizes the importance of social and personal resources, including human physical capacity. Therefore, health promotion is not only a responsibility of the healthcare sector – healthy lifestyle is a key for achieving well-being (WHO, 2014).

The key prerequisites for health promotion, stated by WHO (2014), are peace, shelter, education, nutrition, income, a stable ecosystem, sustainability of resources, and social justice. Good health is a major resource for social, economic and personal development and an important aspect of quality of life. According to Kuklica, Straume & Klavina (2011), health promotion implies reduction of the use of addictive and health-influencing substances, increase of physical activity, development of the healthy nutrition idea, reduction of traumatism and violence, and other healthy lifestyle-promoting measures. Thus, the goal of health promotion is to prevent the negative impact of environmental, economic and social factors on the human health.

According to the paradigm described by Cockerham (2005), the practice of the healthy lifestyle depends on the individual's disposition to action, which in turn is influenced by person's choice of activity and the possibilities of a socially defined structure; through this interaction a disposition to action is formed, which is followed by a health-promoting or adverse behaviour. Each healthy lifestyle is given an assessment and can be judged from the positive to the negative point of view, creating a common model for healthy lifestyle practices. Such healthy lifestyle principle implies not only the involvement of health professionals but also the daily routine that is not related to health-care activities but still affects the health, such as diet, physical exercise, personal hygiene, alcohol use, smoking, compliance with safety precautions, etc., because it is the daily practice of healthy lifestyle that has a major impact on a person's well-being and longevity.

As health promotion is not only the responsibility of the state policy (mezo-) and the health sector (macro-), but also the choice of each person's lifestyle (micro-), it is essential to comprehend, which areas of life affect health in the most direct way. Corbin et al. (2008) and Robbins et al. (2011) points to the following health-influencing life spheres or healthy lifestyle components, which reduce health risks and improve health: 1) regular physical activity, 2) healthy eating habits, 3) stress management, 4) avoidance of harmful habits, 5) safe sex life, 6) compliance with

safety regulations, 7) first-aid knowledge, 8) observance of personal health (hygiene) habits, 9) finding and accepting appropriate medical advice, 10) consumer awareness, 11) environmental protection. Corbin et al. (2008) and Robbins et al. (2011) consider regular physical activity, healthy eating habits and stress management as priority components of a healthy lifestyle.

Health is closely related to wellness. Miller (2005) characterizes wellness as integration of various components (social, emotional, intellectual, mental and physical); it reflects the person's potential to live, work effectively and make an important contribution to society. Wellness reflects how a person feels (well-being) while living as well as person's ability to act effectively. Wellness is also described as a positive health component, opposite to illness; it is individual to each person and depends on the personality traits; it is determined by a person's self-assessment scale – from positive self-esteem to negative. Robbins et al. (2011) describes wellness as an integrated and dynamic functioning level of an individual, which focuses on the person's responsibility to reach his/her maximum potential and includes not only preventive health behaviour but also the change in thinking and attitudes.

Like health, wellness is a multidimensional concept and a positive component of optimal health. The wellness dimensions overlap with the health dimensions. There are five dimensions of health and wellness that are highlighted: (1) emotional/ mental, (2) intellectual, (3) physical, (4) social and (5) spiritual (Corbin et al., 2008). In the process of development, the wellness concept is expanded adding several other dimensions of human life, reaching eight wellness dimensions: (1) physical, (2) intellectual, (3) emotional, (4) social, (5) spiritual, (6) environmental, (7) work and (8) financial dimension (Swarbric, 2010; Swarbrick and Yudof, 2014).

Method

The questionnaire for this research is adapted and approbated after Corbin et al. (2008) survey on healthy lifestyle. The survey consists of 4 blocks of statements (Reliability Statistics Cronbach's Alpha 0,692). In this study only 2 blocks are analysed. The first block determines the healthy lifestyle habits (The Healthy Lifestyle Questionnaire) and looks at healthy lifestyle components that reduce health risks and improve health: 1) regular physical activity – 4 statements, 2) healthy eating habits – 5 statements, 3) stress management – 4 statements, 4) avoiding harmful habits – 3 statements, 5) safe sex life – 2 statements, 6) compliance with safety regulations – 2 statements, 7) knowledge about first aid – 2 statements, 8) observance of personal health (hygiene) habits – 2 statements, 9) finding and accepting appropriate medical advice – 3 statements, 10) consumer awareness – 2 statements 11) environmental protection – 2 statements. Altogether – 31 statements; and the respondent can choose between two answers – yes and no. The second part of the survey determines students' self-perception on wellness. The survey distinguishes five wellness dimensions: emotional wellness; intellectual wellness; physical wellness; social wellness and spiritual wellness (3 statements for characterizing each dimension, altogether 15 statements, and four Likert-type scale responses (1-4): strongly agree (4), agree (3), disagree (2), strongly disagree (1), summing three questions for each wellness dimension to get student's wellness dimension totals. Strongly agree response characterizes high level wellness; agree – good wellness; disagree – marginal wellness; but strongly disagree – low wellness.

Research participants: n=121 first year full time and part time students of study programme 'Teacher', age 18-57, average age 29; 89,2 % of them female and 10,8 % - male students. The research is conducted during academic year 2016/2017. Due to the fact that WHO (n.d.) includes the age range of 18-64 years when providing recommendations for physical activity and nutrition, as well as general recommendations for maintaining and promoting health, in this study specific age groups are not analysed.

Findings

The first part of the questionnaire describes the healthy lifestyle habits of students. As physical activity, eating habits and stress management habits are the priority components of a healthy lifestyle, they are highlighted in separate tables. The results of the physical activity habits' survey show that 71.9 % of students almost daily engage in moderate physical activity, 34.8% of students exercise vigorously, but 19.0 % of respondents perform strength-building exercises (See Table 1)

Table 1. Physical activity habits of students

Criteria for determining physical activity	Response Yes (%)
I accumulate 30 minutes of moderate physical activity most days of the week (the heart rate rises by 60-75 % of the maximal heart rate)	71.9
I do vigorous activity that elevates my heart rate for 20 minutes at least three days a week (the heart rate rises by 75-85 % of the maximal heart rate)	34.8
I do exercises for flexibility at least three days a week	43.7
I do exercises for muscle fitness at least two days a week (at least a complex of 10-12 strength-building exercises, repeating each exercise for at least 15 times)	19.0

From the survey “Eating habits of students” the following results were obtained: 69.3 % of students have three regular meals per day, 19.4% of respondents daily choose appropriate portions from the products recommended by the food guide pyramid, 69.7% of students restrict the amount of fat in their diet, 49.7% of students limit the consumption of salt, but 62.9% of students limit the consumption of sugar in their diet (see Table 2).

Table 2. Eating Habits of students

Criteria for determining the eating habits	Response Yes (%)
I eat three regular meals each day.	69.3
I select appropriate servings from the food guide pyramid each day.	19.4
I restrict the amount of fat in my diet.	69.7
I limit the consumption of salt in my diet (according to the healthy diet recommendations – no more than 5 g per day).	49.7
I limit the consumption of sugar in my diet (according to the healthy diet recommendations – no more than 50 g per day).	62.9

From the survey on Stress management habits of students, the following results were obtained: 90.7 % of students are able to identify the situations that cause stress, 76.1 % of students daily allocate time for resting and recovering from stress, 94.1 % of students find time for family and friends, but only 9.2 % of students regularly perform exercises designed for reducing the stress-related tension (see Table 3).

Table 3. Stress management habits of students

Criteria for managing stress	Response Yes (%)
I am able to identify situations in daily life that cause stress.	90.7
I take time out during the day to relax and recover from daily stress.	76.1
I find time for family, friends and things I especially enjoy doing.	94.1
I regularly perform exercises designed to relieve stress-related tension.	9.2

Assessing the other health-influencing habits of students, the following results were obtained. Avoiding destructive health-influencing habits: 86.4 % of students do not smoke or use tobacco products, 82.0 % of students do not abuse alcohol, 88.5 % do not use drugs or drug-containing substances. 94.95 % of students practice safe sex life by choosing a long-term, safe partner, but 93.4 % practice safe sex avoiding STD. Safety habits: 91.6 % of students follow the traffic regulation rules, adhere to the speed limit and use a seatbelt, but only 5.9 % of students have smoke detectors at their homes, which can protect them from domestic accidents. 84.5 % of students have knowledge about providing the first aid, but 53.7 % of students are able to help in such domestic accident cases as choking. Personal hygiene habits: 63.8 % of students brush their teeth and use the dental floss at least twice a day, but only 43.3 % of students allocate sufficient time for sleeping. 61.8 % of students have regular medical check-ups, 85.1 % listen to the doctor’s advice during the process of healing, but 71.5 % of students use medication only in the case of need following the instruction. Being an informed customer: 51.0 % of students read the labels and investigate effectiveness before buying the product, but 50.8 % use only products that have been proven by research to be effective. Environmental protection: 35.7 % recycle paper, glass and plastic waste, but 81.4 % of students save natural resources such as electricity, natural gas, etc. (see Table 4).

Table 4. Other healthy lifestyle-determining habits of students

Healthy lifestyle components	Criteria	Response Yes (%)
Avoiding Destructive Habits	I do not smoke or use other tobacco products.	86.4
	I do not abuse alcohol.	82.0
	I do not abuse drugs (prescription or illegal).	88,5
Practicing Safe Sex	I abstain from sex or limit sexual activity to a safe partner.	94.95
	I practice safe procedures for avoiding STDs.	93.4
Adopting Safety Habits	I use seat belt and adhere to the speed limit when I drive.	91.6
	I have a smoke detector in my home and check it regularly to see if it is working.	5.9
Knowing First Aid	I have had training to perform CPR if called on in an emergency.	84.5
	I can perform the Heimlich manoeuvre effectively if called on in an emergency.	53.7
Personal Health Habits	I brush my teeth at least two times a day and floss at least once a day.	63.8
	I get an adequate amount of sleep each night.	43.3
Using Medical Advice	I self-examine myself regularly, have regular medical check-ups, and seek medical advice when symptoms are present.	61.8
	When I receive advice and/or medication from a physician, I follow the advice and take the medication as prescribed.	85.1
	I take over-the-counter drugs sparingly and use them only according to directions.	71.5
Being an Informed Consumer	I read product labels and investigate their effectiveness before I buy them.	51.0
	I avoid using products that have not been shown by research to be effective.	50.8
Protecting the Environment	I recycle paper, glass or aluminium.	35.7
	I practice environmental protection such as carpooling and conserving energy.	81.4

The second part of the questionnaire determines student's self-evaluation on their wellness level. In this survey five wellness dimensions were identified. (1) Emotional wellness: 26% of students say that they feel happy (agree), strongly agree - 60.2% of students, but 13.8% for students disagree with this statement. 50.4% of students have good self-esteem (agree), 6.5% of students strongly agree, 38.2% of students disagree, but 4.9% of students strongly disagree with this statement. I do not generally feel stressed: 2.4% of students strongly agreed, 25.4% agreed, 60.2% disagreed, 12.2% strongly disagreed with the statement. Summarizing the responses to all three statements the following results were obtained: the emotional wellness level is low for 6.2% of students, marginal for 36.9% of students, good for 33.9% of students, but 22.03% of students have a high emotional wellness level (see Table 5).

Table 5. Self-perception of wellness

Wellness dimensions	Criteria	1-Strongly disagree(%)	2-Disagree (%)	3-Agree (%)	4-Strongly agree (%)
Emotional wellness	I am happy most of the time.	1.6	12.2	26	60.2
	I have positive self-esteem.	4.9	38.2	50.4	6.5
	I do not generally feel stressed.	12.2	60.2	25.2	2.4
Total Emotional wellness level		6.2	36.9	33.9	23.03
Intellectual wellness	I am well informed about current events.	0	15.6	74.6	9,8
	I feel comfortable expressing my views and opinions.	1.6	20.3	66.7	11.4
	I am interested in my career development.	0.8	0.8	38.2	60.2
Total Intellectual wellness level		0.8	12.2	59.8	27.1
Physical wellness	I am physically fit.	1.6	13.0	50.4	35.0
	I am able to perform the physical tasks of my work.	0	3.3	51.2	45.5
	I am physically able to perform leisure	0.8	4.9	44.7	49.6

	activities.				
Total Physical wellness level		0.8	7.1	48.8	43.7
Social wellness	I have many friends and am involved socially.	0.8	27.6	56.9	14.6
	I have close ties with my family.	1.6	4.9	37.7	55.7
	I am confident in social situations.	2.4	17.1	69.1	11.4
Total Social wellness level		1.6	15.5	54.6	27.2
Spiritual wellness	I am fulfilled spiritually.	3.3	10.7	73.8	12.3
	I feel connected to the world around me.	2.4	20.3	68.3	8.9
	I have a sense of purpose in my life.	3.3	7.4	59.0	30.3
Total Spiritual wellness level		3.0	12.8	67.03	17.2
Total Wellness level		2.5	16.9	52.8	27.6

Intellectual Wellness (2): I am well informed about current events: 9.8% of students – strongly agree, 74.6% agree, but 15.6% of students disagree with this statement. I feel comfortable expressing my views and opinions: 1.6% of the students strongly disagree, 20.3% disagree, 66.7% agree, but 11.4% of students strongly agree with this statement. 60.2 % of students are very interested in their career development, 38.2% are interested, but 0.8 % are not interested, or completely not interested (0.8%) in their career. Summarizing the data from all three questions the following results were obtained: the intellectual wellness level is low for 0.8 % of students, marginal for 12.2 % of students, good for 59.8 % of students, but 27.1 % of students have a high intellectual wellness level.

Physical wellness (3): 35 % of students feel physically very well, 50.4 % - well, 13.0 % disagree, but 1.6 % students strongly disagree with this statement. 45.5 % of students strongly agree with the statement that they are able to do necessary physical work, 51.2 % agree, but 3.3 % disagree with this statement. 49.6 % of students strongly agree that they are physically able to perform leisure activities, 49.6 % - agree, 4.9 % disagree, but 0.8 % strongly disagree with this statement. In summary, the physical wellness level is low for 0.8 % of students, marginal for 7.1 % of students, good for 48.8 % of students, but 43.7 % of students have a high physical wellness level.

Social wellness (4): 14.6 % of students strongly agree that they have lots of friends and various social connections 56.9 % – agree, 27.6 % – disagree, but 0.8 % of students strongly disagree with this statement. 55.7 % of students strongly agree with the statement “I have close ties with my family”, 37.7 % agree, 4.9 % disagree, 1.6 % strongly disagree with the statement. 11.4 % strongly agree, 69.1 % agree, 17.1 % disagree, 2.4 % strongly disagree with the statement “I am confident in social situations”. Summarizing the responses to all three statements, the social wellness level is low for 1.6 % of students, marginal for 15.5 % of students, good for 54.6 % of students, but 27.2 % of students have a high social wellness level.

Spiritual wellness (5): “I feel spiritually fulfilled” – 3.3 % strongly disagree, 10.7 % disagree, 73.8 % agree, 12.3% strongly agree; “I feel connected to the world around me” – 2.4 % strongly disagree, 20.3 % disagree, 68.3 % agree, 8.9 % strongly agree; “I have a sense of purpose in my life” – 3.3 % strongly disagree, 7.4 % disagree, 59 % agree, 30.3% strongly agree. Summarizing the responses to all three statements, the following results were obtained: the spiritual wellness level is low for 3.0 % of students, marginal for 12.8 % of students, good for 67.03 % of students, but 17.2 % of students have a high spiritual wellness level. Assessing the levels of all 5 wellness dimensions it can be concluded that the total wellness level is low for 2.5 % of students, marginal for 16.9 % of students, good for 52.8 % of students, but 27.6 % of students have a high wellness level (see Table 5).

Results and Discussion

According to the survey results and the WHO Global strategy for diet, physical activity and health recommendations (n.d.), the first-year students of Liepaja University need improvements in almost all spheres that affect healthy lifestyle. When assessing the healthy lifestyle habits, it should be taken into account that all healthy lifestyle activities do not imply similar health risks. For example, the use of tobacco and the abuse of alcohol or drugs affect health immediately, while the consequences of insufficient physical activity and unbalanced diet appear in the long run. We daily face tensions created by stress, but our first aid knowledge gets applied only in particular life situations (Corbin et al., 2008). Thus, the average arithmetic data collected from this research on healthy lifestyle habits show that majority of students avoid tobacco, alcohol and drug-containing substances, and in total 83.6 % of surveyed students avoid harmful habits. However, the habits of physical activity can be considered as satisfactory only for 42.4 % of respondents, 54.6 % of students have good eating habits, but 67.7% of students manage their stress well. 94.3 % of students practice safe sex life, but 48.4% follow the safety regulations, although here is a big dissonance between these two indicators: if 91.6 % of students follow the traffic rules, then safety at home is in danger – only 5.9 % of students have smoke detectors at home, which can protect them from casual domestic fires.

On average 68.7 % of students have sufficient knowledge about first aid, 57.6% of students adhere to adequate personal hygiene, although in personal hygiene practices are also differences: 63.8% of students pay sufficient attention to dental hygiene, but only 43.3% of students spend enough time sleeping. In general, 73.4% of students use appropriate medical services and follow doctor's recommendations. 50.4% of students can be considered as informed customers, 58.4% of students act environmentally friendly, although also here are big differences: 81.4% of students save electricity and other natural resources, while only 35.7% of students recycle.

When assessing the students' wellness level by interpreting the ratings, the level of physical wellness comes first – good and very good physical ability for performing the work duties and participating in leisure time physical activities is shown by 92.5% of students. The level of intellectual wellness is rated as good and very good by 86.9% of students, mental wellness – by 84.23%, social wellness – by 81.8%, but emotional wellness by 56.93% of students (see Figure 1).

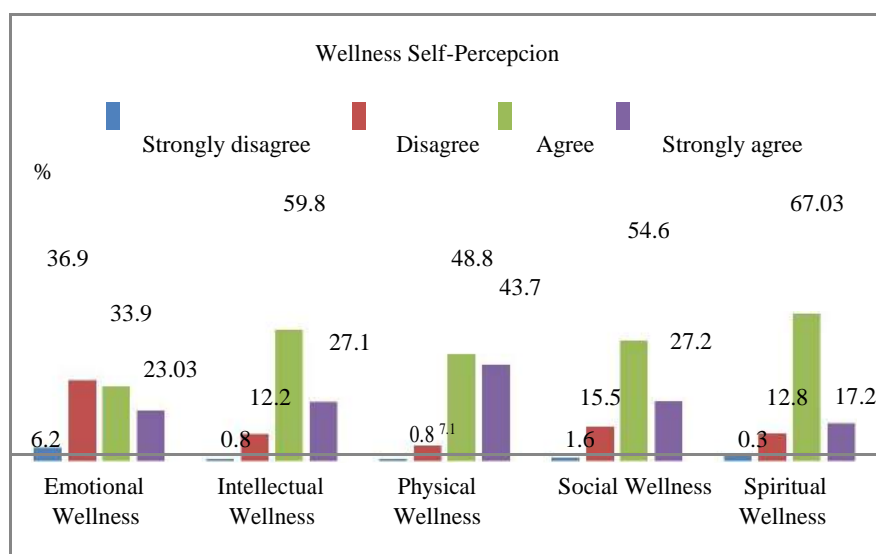

Figure 1. Indicators of overall wellness self-perception of students

Conclusions and Recommendations

Students' healthy lifestyle habits generally require significant improvements, especially in everyday habits: physical activity, eating habits, and adequate sleep. Assessing the overall wellness level of students it can be concluded that 2.5% of students have low wellness, 16.9% – marginal, 52.8% – good, but for 27.6% of students the wellness level is high.

The students' self-perception rates on wellness are relatively high, while students' healthy lifestyle habits need substantial improvements. This may indicate that students feel good at the moment and do not feel discomfort in terms of their lifestyle and lifestyle-related health risks in the near future.

In conclusion, it is recommended to promote the healthy lifestyle habits also in the universities, making health-promoting programs available for all students. It is particularly essential for future teachers – educators of the next generation, promoting the development of a healthy and educated society.

Abstract

Ergonomics is the realization of a work arrangement in the direction of protecting human health. The main aim of this approach is to increase worker productivity by increasing employee compliance with the environment, minimizing possible health problems and increasing optimal harmony with the person's environment. People are in a functional interaction with the environment, work, and the product being discovered throughout their work life and life. In this context, we aimed to evaluate the statistical relationship between the ergonomic approach and musculoskeletal disorders of athletes. A total of 74 athletes participated in our work. Standardized ergonomic muscle and skeletal system disorders questionnaires were applied to participants. Correlational tests were performed and statistically evaluated by comparing the parameters such as gender, age range, height, weight, and sporting time period. When the data obtained from the sportsmen are examined; Age, height, weight, and age of sport showed significant correlations with pain complaints seen in some body regions as topographically ($P < 0.05$). The topographic area in which the pain complaint was highest in 47.3% (n: 35) was lumbar region and negative correlation with sport age was found ($P < 0.05$). As a result, the questionnaires of participating athletes; % 87,8 (n: 65) had complaints of pain related to musculoskeletal system during the last week. Incorrect static posture and ergonomic conditions in the formation of musculoskeletal system diseases can be influential factors. We think that the athletes with complaints of pain can be redesigned ergonomically to reduce the related discomfort by adapting sports methods and working environments.

Keywords: Ergonomics, Sportsman health, Musculoskeletal system.

Introduction

Ergonomics is the realization of a work arrangement in the direction of protecting human health. The main goal of this approach is to increase employee productivity by increasing employee compliance, reducing potential health problems to the minimum, and optimizing adaptation to the environment in which the person is present (Armstrong, T.J., 1979; Dennerlein, J.T., 2011).

Ergonomic approaches that can be applied in the working environment can contribute to the determination and reduction of possible health related risk factors (Tynes T., 2017). People are in a functional interaction with the environment, work, and the product being discovered throughout their work environment and life. Ergonomics is the science of studying the approach that makes the most appropriate arrangement in terms of work and health by increasing harmony of planned environmental factors (Van der Beek, A.J., 1998). Scientific training programs often applied in sports studies are very important in terms of increasing sportive efficiency. It is also a fact that it is important for the athlete to organize the work environment to be the most suitable for himself / herself and the sports branch, in terms of athlete performance and health. In this context, we aimed to evaluate the statistical relationship between the ergonomic approach of athletes and musculoskeletal disorders in this study.

Muscular and skeletal system disorders are frequently encountered in athletes due to excessive use of limbs. Such discomforts may cause a reduction in health and sport productivity by giving the athlete pain and limitation (Fett, D., 2017; Petraglia, F., 2017). Numerous scientific approaches and methodological studies are being conducted to increase athlete productivity (Abade, E., 2017). The goal of the ergonomic approach in sport, which is very important in terms of sport and health sciences, is to ensure that the athlete's working environment, the materials used and the training programs applied are optimized for the purpose and health of the person.

Method

In our study, a total of 74 students from Kocaeli University Sports Sciences Faculty participated. The standardized Ergonomic Musculoskeletal System Disorders Questionnaire (SEKISB) (Ekberg, K., 1994, Colak, S. 2017) was applied to the confirmed athletes who were not in the disability period. In the questionnaire form there are questionnaires indicating body figure and anatomical localization. Basically, pain formation and pain localization and grade are questioned in the last one week out of disability. SEKISB questionnaires obtained from the sportsmen were evaluated using the SPSS20 package program. The data obtained include athlete parameters such as age range, height, weight and sport age, and topographical anatomical pain descriptions on the questionnaire. Statistical comparisons and correlation tests were conducted and evaluated.

Findings

The average age of the athletes participating in the ergonomic evaluation questionnaire was 21.3 years, average height was 178cm, weight average was 72.2 kg and average age was 8.6 years. The numerical distributions of the athletic characteristics mentioned are shown in Table-1.

Table 1. Distribution of the average age, height, weight and sport age of the athletes

	Age (years)	Length (cm)	Weight (kg)	Sports age (years)
Average values	21,3 ±1,97	178 ±0,04	72,2 ±7,23	8,6 ±3,24

When the data obtained from the ergonomic approach questionnaire related to muscular and joint disorders of the athletes were evaluated by statistical comparison and correlation methods, significant differences were observed in terms of anatomical regions where the athletes had pain and discomfort. The assessment of these differences may contribute to the development of new ergonomic approaches to assess anthropometric data of athletes and to more extensive work to be done. In our study, a questionnaire study was conducted and the athletes were informed about the pain zone and the frequency they had prescribed for them in the last week. When the data obtained from the athletes are examined; Age, height, weight, and age of the sport showed significant correlations with pain complaints seen in some body regions ($P < 0.05$) (Table 2). The relationship between the anthropometric measurements of the athletes and the pain regions of the athletes again depends on the correct and effective use of joints and muscles by the athletes in terms of kinesiology. Many types of injuries to sportsmen can vary according to the sport they are doing. Pain and complaints are known to be deformed due to excessive strain and excessive use of anatomical regions.

Table 2. Athlete parameters and statistics values correlated with each other

When the data of SEKISB questionnaires belonging to sportsmen are evaluated statistically, parameters with meaningful relation are seen. Statistical analyzes of the data were performed using SPSS package program and the results are shown in Table-2. There was a negative correlation between left shoulder pain and age, positive correlation between upper back pain and height, negative correlation between back pain and sport age, positive correlation between left forearm pain and sport age, right lower leg pain- There is a positive correlation between left foot pain and sport age. A statistically significant correlation was found for the pain described in the anatomical regions ($p < 0.05$). When the athletes who complained pain in any region of the body in the last week were evaluated among themselves, it was seen that the pain complaint was in the lumbar region with 47,3% (n:35) at the highest level.

The evaluation of these determinations, which may be important in terms of athlete's health, may contribute to the investigation and resolution of pain sources. The topographic area with the most pain complaints in the assessed athletes was identified as the lumbar area. A negative correlation with the age of participants' lumbar region was also found. When participants' lumbar pain complaints were statistically evaluated as sport age, there was a negative correlation ($P < 0.05$).

Discussion

More traumas can be seen in different anatomical regions depending on the branches of the athletes. It is important that the environmental factors are properly regulated in terms of athlete productivity and health as well as protective precautions to be taken by the athletes. As in other professions, we think that such ergonomic regulations can affect the rate of disabling and discomfort. The ergonomic approaches that can be achieved in sports studies will positively affect the athlete's productivity and health. Ergonomic approaches include environmental regulations to increase the efficiency of a person (Junior, S.A., 2015; Tirloni A.S., 2016). For this purpose, we also wanted to investigate the frequency and anatomical regions of the pain that occurred during the last week.

Because these aches are probably caused by the ergonomic uses of the body and are caused by excessive load on the musculoskeletal system. Of course, this will affect the performance as well as the continuity of the pain and disruption of the athlete's psychology. According to our results 87,8% (n:65) of the athletes participating in the study reported that they had musculoskeletal pain in the last week. The high rate of pain reporting lowers both the quality of life of athletes and their performance.

Differences in the frequency of injuries associated with sports branch and athlete's anatomy have important values for sports and kinesiology sciences. Sport, health, and ergonomics have been studied by several branches of science with different disciplines. The causes of pain may constitute the causes of certain disturbances in terms of athlete's health. More comprehensive correlation studies of the sports field and the pain areas may facilitate the athlete to take sports-specific measures (Cheng, K., 2016).

According to the statistical results obtained in our study; Negative correlation between left shoulder pain and age, positive correlation between upper back pain and height, negative correlation between back pain and sport age, positive correlation between left forearm pain and sport age, negative correlation between right lower leg pain and weight, There was a positive correlation between pain and sport age. Statistically significant correlations were found between the anatomical regions of the athletes ($p < 0,05$). When the results from these correlations are evaluated, a positive correlation between upper back pain-height is necessary to show a more careful ergonomic approach to the spine in training and study of tall athletes. The assessment of such athletic differences with more extensive work to be done with anthropometric data may contribute to the development of new ergonomic approaches. Some minor precautions can be taken to make the sport more ergonomic. It is believed that the development of ergonomic approaches in terms of athletes' health and productivity is important.

Pain in the muscular and joint disorders is a common complaint (Pirvu C., 2014; Korpinen, L., 2016). Pain is a very restrictive factor in terms of athletes' health and productivity. In terms of this importance relation, the treatment of the athletes is carried out in the clinics which are equipped according to the medical pain evaluations. From the point of view of sport sciences or other fields of work, pain studies to be performed in employees and pain areas can be determined and their frequency can be evaluated according to sports branch (Ardahan M., Simsek H., 2016). Such approaches and determinations may facilitate the establishment of a solution proposal for pain and discomfort related to sports. For example, we found another correlation in our study correlated negatively between back pain and sport age ($p < 0,05$). As the sport age grows or the athletes are treated, they have learned to protect their waist regions, which are the anatomical regions of the body that are most burdened and injured. When the data of participating athletes are evaluated, they report their waist regions as the topographic area with the most pain.

Statistically significant differences were obtained when evaluating the data obtained from sports pain and discomfort questionnaire ($P < 0,05$). When considering the importance of ergonomic approaches in terms of athlete health and sport productivity, pain complaints are one of the important factors affecting sport productivity. We think that the link between the pain-discomfort statement and the statistical analysis methods between the athletic factors such as age, height, weight, sport age will bring meaningful results.

Ergonomics knowledge aims to increase the harmony and interaction of the person with the environment. The ergonomic approaches to be formed in sports studies will also have an effect on the productivity of persons (Shiromani J., 2017). We think that rearranging the places where athletes perform their training activities, will be important in terms of health and efficiency.

Conclusion

As a result, 87,8% (n:65) of the participating athletes complained of pain related to musculoskeletal system other than disability in the last week. When many different environmental factors are considered, it is important to establish and regulate ergonomic approaches to occupational pain-discomfort situations.

Factors such as improper static posture and ergonomic conditions in the formation of muscle and skeletal system diseases can be influential in many professions. We believe that the incidence of such discomforts can be reduced by providing ergonomic environmental conditions in accordance with the athletes' working style, training techniques and characteristics. Apart from the risks arising from the instruments and equipment used during the training, different measures can be taken, such as the arrangement of the athletes' training and body movements. We think that such adjustable approaches will reduce the pain-injury and associated productivity losses.

A competence development model for Complementary and Alternative Medicine professionals: aspects of life-long learning

Ligita LANDZMANE¹, Lāsma LATSONE²

¹*Institute of Conflictology (Riga, Latvia), e-mail: ligita.landzmane@gmail.com*

²*Liepāja University, Faculty of Education and Social Work, e-mail: lasma.latsone@liepu.lv*

Abstract

The problems existing in Latvia's healthcare system have caused a profound crisis: formal medical specialists leave the country; remaining specialists refuse to work overtime; young professionals refuse to go to work to remote regions of the country. Public health education is neglected, and people lack self-care knowledge and skills when faced by medical issues. Institutions report that people burden health professionals with problems, which could be dealt on their own. After facing a poor treatment and negative attitude, more and more people use services provided by non-conventional medical practitioners. Education of such practitioners at national level is not encouraged in accordance with the legally defined content of the professional activities of Complementary and Alternative Medicine (CAM) specialists. The aim of this research is to promote the development of high quality CAM services. This article will provide a theoretical framework of the conceptual competence development model for CAM specialists. From 2010 to 2017, in the Institute of Conflictology, the legal and actual problems of Latvia's health care system were examined, seeking and modelling possible solutions. Employing the scientific findings and good practice ideas accumulated in the Institute, a theoretical and systematic basis was elaborated for a possible alternative: development of a national professional CAM system. The synthesis of CAM educational problem solutions was recognized as of paramount importance. But in order to understand the legal basis of professional activities of CAM specialists, the content analysis of international and national laws and regulations was performed. Also the legal and factual content of life-long education was clarified in the context of Latvia. A comparative analysis of legislation, good practices and expert advices was used to identify problems and search for solutions. The research revealed that Latvian legislation does not directly regulate professional activities of CAM specialists; only indirectly CAM specialists are mentioned in the Latvian Classification of Occupations, explaining the required qualifications, responsibilities and the level of education required. In the formal education of Latvia, including the higher education system, CAM study programmes have not been developed, although it is recommended by the World Health Organization (WHO). The research data analysis characterizes the legal and factual environment in which the CAM specialists' competence building solutions are possible in Latvia. It allows formulating a scientifically and legally sound recommendation: if CAM educational activities are not possible in the space of formal education, they must be organized through non-formal lifelong education processes. But in order to do it in an authoritative, scientifically and legally sound way, it is recommended to use the competence development model for CAM specialists, developed and approved by the authors.

Keywords. Complementary and alternative medicine, specialists, competence, life-long education, conceptual model.

Introduction

Comparably recently, in 2014, Latvian government elaborated Public Health Policy Guidelines for 2014-2020. The overriding goal stated in the guidelines is to increase the number of the healthy-lived years of life and to prevent premature death for people of Latvia. This is to be achieved by promoting equal health care opportunities for all inhabitants and reducing the risk factors of non-communicable diseases, improving the health of pregnant women and children, reducing the impact of traumas and environmental risks on public health, ensuring the prevention of communicable diseases, and developing a quality health care system and equal availability of health care services to all people in the country.

Assessing the quantitative and qualitative health care indicators from 2017, it can be concluded that health care in Latvia is still very problematic. The official data centre of Latvia – the Central Statistical Bureau has compiled the facts

about the circumstances that, in opinion of Latvia's inhabitants, have prevented them from medical examinations or treatment (Central Statistical Bureau, 2017). The facts are presented in Table 1.

Table 1. Circumstances that have prevented people from medical examinations or treatment

Indicators	Breakdown of results by age group										
	16-24	25-34	25-49	35-44	45-54	50-64	55-64	65-74	65+	75+	
Medical examination or treatment at health care provider - Total	100	100	100	100	100	100	100	100	100	100	100
..there was at least one occasion	29,9	30,9	38,1	40,8	47,5	50,5	49,6	49,0	47,2	45,1	
..there was no occasion	23,9	19,5	22,1	19,3	23,9	18,7	18,3	24,2	21,7	18,9	
Reasons for unmet need for medical care - Total	20,3	16,5	11,8	12,4	8,0	8,6	7,9	0,5	0,4	0,3	
..could not afford to (too expensive)	11,5	0,0	2,0	2,4	2,5	2,2	2,5	3,3	7,1	11,4	
..waiting list	1,2	2,8	1,9	1,4	1,0	0,6	0,7	2,4	3,2	4,0	
..could not take time because of work, care of children or for others	13,3	29,0	21,8	20,6	14,6	15,3	16,1	17,1	17,3	17,5	
..too far to travel/ no means of transportation	13,3	29,0	21,8	20,6	14,6	15,3	16,1	17,1	17,3	17,5	
..fear of doctors/ hospitals/ examination/ treatment	1,7	2,5	2,2	3,7	4,4	1,3	1,7	2,1	
..wanted to wait and see if problem got better on its own	...	1,2	0,8	0,6	0,3	0,4	0,5	2,1	1,5	0,8	

The data collected by the Central Statistical Bureau and its interpretation provide an understanding of the subjective-objective aspects of the health care situation in Latvia. Most often it is the financial situation that prevents people from health examination or treatment. For example, the data suggests that the older people get, the less they can afford health examinations or health care institutions. If in the age group of 16-24 almost 30% percent of people say that they cannot afford health care, then in the age group over 75, national healthcare is not accessible for almost half of Latvia's population. As the result, a large part of Latvian people participate neither in preventive nor active health care system.

The prolonged problems in Latvia's healthcare system have caused a profound crisis. Formal medical specialists leave the country. Remaining specialists refuse to work overtime. Young professionals refuse to go to the remote regions of the country. Public health education is neglected; people acutely lack the health self-care knowledge and skills. Institutions report that citizens are burdening healthcare professionals with issues, which they could solve on their own. After facing poor quality care and negative attitude, more and more people are using services of traditional medical practitioners.

The research proves that CAM is not just a rescuing tool for problematic health care systems. Even experienced economic sector researchers consider CAM as a growing healthcare industry. Grand View Research, which employs researchers with more than 20 years of experience and conducts research studies worldwide, using scientifically recognized data analysis and interpretation techniques, has found that in 2015 the global alternative and complementary medicine market was valued at USD 40.32 billion. It predicts increased usage of traditional therapeutic methods in the coming decade as in 2015, more than 60% of the global population use some or the other form of traditional medicine. According to this research, alternative medicine involves the application of traditional medicine methods such as use of herbs and other mind and body healing techniques mostly based on faith and belief. However, most of these techniques have no regulatory approval or clinical evidential backing. Many governments and regulatory bodies are trying to find clinical support for the incorporation of alternative treatments in order to help to improve the market and treatment methods (Grand View Research, 2017).

Figure 1 visually explains CAM popularity in Europe already in 2015. The research reveals that Europe is the source of most revenue generation in the market owing to the extensive use of botanicals in the regions. Botanicals such as dietary supplements witness considerable demand in countries like Germany and France (Grand View Research, 2017).

Figure 1. Complementary & alternative medicine market share, by region, 2015 (%)

Also the World Health Organization (WHO) states that it is possible to solve health related problems both in economically lower and higher developed societies by integrating the possibilities offered by traditional and complementary medicine (TCM) into the systems of conventional medicine. According to WHO traditional medicine strategy: 2014-2023, TCM is an important and often underestimated part of health care. It is found in almost every country in the world and the demand for its services is increasing. Qualitative, safe and efficient TM contributes to the goal of ensuring that all people have access to care. Many countries now recognize the need for developing a cohesive and integrative approach to health care that allows governments, health care practitioners and, most importantly, those who use health care services, to access TCM in a safe, respectful, cost-efficient and effective manner. A global strategy to foster its appropriate integration, regulation and supervision will be useful to countries wishing to develop a proactive policy towards this important - and often vibrant and expanding - part of health care (World Health Organization, 2014).

At the same time, in the WHO Traditional Medicine Strategy 2014-2023 it is stressed that nowadays the levels of education, accreditation and regulation of TCM practices and practitioners vary considerably as individuals move freely from country to country in order to live and work. Given this trend, a better understanding of TCM practitioners is needed to ensure professional consistency and safety. In order to balance the popularity of CAM services with the quality, the following aspects need to be stressed:

- development and enforcement of policy and regulations; integration, in particular identifying and evaluating strategies and criteria for integrating TM into national and primary health care;
- safety and quality, notably assessment of products and services, qualification of practitioners, methodology and criteria for evaluating efficacy;
- ability to control and regulate TM and CM (TCM) advertising and claims; research and development; and education and training of TCM practitioners;
- information and communication, such as sharing information about policies, regulations, service profiles and research data, or obtaining reliable objective information resources for consumers (WHO, 2014).

The analysis of documents reveals, and it is also noted by WHO, that in various societies the terms 'Traditional medicine' (TM) and Complementary medicine (CM) (TCM) are used differently. We find terms 'Complementary and alternative medicine' (CAM), 'Alternative and Complementary medicine' (ACM), also Integrative medicine (IM). In order to equate the understanding of the terminology that is relevant to the research subject of this study, in this article all the aforementioned and similar terms are marked with the abbreviation CAM.

The goal of this research is to promote the development of high quality CAM services. This article presents a theoretical description of the conceptual CAM specialists' competence development model, elaborated through scientific research and modelling processes.

Methods

In 2010-2017, at the Institute of Conflictology the legal and factual problems of Latvian health care system were studied, searching and modelling the possible solutions. Using the scientific and good practice experience accumulated in the Institute, the theoretical and systemic basis for an alternative solution was elaborated: the development of a national professional CAM system. In order to present the CAM system model to the public, the synthesis of CAM educational problem solutions was recognized as of paramount importance. For understanding the legal basis of the professional activities of CAM specialists, the content analysis of international and national laws and regulations was carried out. The analysis was also needed for clarifying the legal and factual content of life-long learning in Latvia. A comparative analysis of laws, good practice and experts' advice was used to identify the problems and search for solutions. In 2017, synthesis and approbation of conclusions and proposals were carried out based on a work of six experts in a focus-group discussion. The experts were selected according to the following criteria: doctoral degree in social sciences, education, management, law or health care and at least 7 years of work experience.

This study employs not only well-known and recognized quantitative research methods, but also the belief expressed by internationally recognized scholars, that the data analysis in a qualitative research design is usually a repetitive, spiral or cyclic process moving from more general to more specific observations (Cresswell, 1998; Silverman, 2000, Paterson et al, 2001; Palys, Achison, 2007)

Findings

1. Clarification of terminology

In order to understand professional qualification development principles of CAM, the term *qualification* must be clarified. The Law of Education states that a professional qualification is a documented evaluation of education and professional mastery of a certain profession. Thus, professional qualification certifies that a person has:

- obtained appropriate level of education for the profession concerned;
- professional and general skills and abilities appropriate for the profession;
- an educational document that certifies the acquisition of professional qualification (Saeima, 1998).

The other important term is *competence*. The Terminology Commission of Latvian Academy of Sciences, discussing the terms that should be used describing the learning outcomes in the Law of Higher Education, has concluded that in Latvian the term *competence* must be used in a singular form, and its conceptual content is reflected in "Dictionary of pedagogic terms" (2000) giving two meanings: 1) the necessary knowledge, professional experience, understanding of a particular field or issue, and ability to use the knowledge and experience in a particular activity; the person's (employee's) competence is assessed by the surrounding people, the cooperation partners, the society; 2) jurisdiction, lawfulness, the scope of responsibility, taking into account the person's education, abilities, knowledge and experience in the field. When describing the learning outcomes of the education process, the English phrase "knowledge, skills and competences" is reproduced in Latvian as "knowledge, skills and abilities (Latvijas Zinatnuu akadēmija, 2010).

2. The basic tasks and essential qualification requirements for the CAM professionals defined by the Latvian Classification of Occupations (LCO)

In order to understand the content of CAM professional qualification, the basic tasks and essential qualification requirements for the CAM profession groups were clarified, based on International Standard Classification of Occupations (ISCO 08) and the Latvian Classification of Occupations (LCO). LCO is a systematic list of occupations (trades, positions, specialties) that is designed to ensure the accounting and comparison of a labour force in compliance with international practice. It is created by applying the International Standard Classification of Occupations (ISCO-08).

LCO professions, according to the codes given by International Labour Organization, are classified in 10 groups. In LCO, the basic qualification requirements and core tasks for the professionals are defined, as well as the knowledge and skills everyone must have when starting work in the profession. The user of LCO must select the name of profession (trade, position, speciality) according to the basic tasks of professional activity defined by the Classifier.

2.1. CAM Professionals

ISCO 08 and LCO determine that all CAM professionals belong to Unit Group 223 “CAM Professionals”. According to ISCO 08 and LCO, CAM professionals examine patients, prevent and treat illness, disease, injury and other physical and mental impairments and maintain general health in humans by applying knowledge, skills and practices acquired through extensive study of the theories, beliefs and experiences, originating in specific cultures. Their tasks include:

- (a) conducting physical examinations of patients and interviewing them and their families to determine their health status;
- (b) developing and implementing treatment plans for physical, mental and psychosocial ailments using applications such as acupuncture, ayurvedic, homeopathic and herbal medicine;
- (c) evaluating and documenting patients’ progress through treatment plans;
- (d) providing health, nutrition and lifestyle advice to individuals, families and communities;
- (e) prescribing and preparing traditional medicines, such as herbal, plant, mineral and animal extracts, to stimulate the body’s capacity for self-healing;
- (f) exchanging information about patients with other health care workers as needed to ensure continuing and comprehensive health care;
- (g) conducting research into traditional and complementary medicines and treatments and disseminating findings such as through scientific papers and reports (International Labour Organization, 2012).

2.2. CAM Associate Professionals

ISCO 08 determines that Unit Group 323 representatives or CAM Associate Professionals prevent, care for and treat human physical and mental illnesses, disorders and injuries using herbal and other therapies based on theories, beliefs and experiences originating in specific cultures. They administer treatments using traditional techniques and medicaments, either acting independently or according to therapeutic care plans established by a traditional medicine or other health professional. (International Labour Organization, 2012). According to LCO, their tasks include:

- (a) examining patients and interviewing them and their families to determine their health status and the nature of physical or mental disorders or illnesses or other ailments;
- (b) recommending and providing care and treatment for illnesses and other ailments using traditional techniques and medicaments, such as physical manipulation and exercises, blood-letting using natural vessels, and preparations using herbs, plants, insects and animal extracts;
- (c) administering treatments such as acupuncture, ayurvedic, homeopathic and herbal medicine according to therapeutic care plans and procedures usually developed by a traditional medicine or other health professional;
- (d) providing care and treatment for physical injuries such as setting and healing fractured and dislocated bones using traditional methods of physical manipulation and herbal therapies;
- (e) advising individuals, families and the community on health, nutrition, hygiene, lifestyle and other issues to maintain or improve health and well-being;
- (f) referring patients to, and exchanging information with, other health care providers to ensure comprehensive and continuing care (International Labour Organization, 2012).

At the same time LPC and ISCO 08 also explain the differences what distinguishes CAM professionals from associate professionals. Occupations in traditional and complementary medicine for which a competent performance requires an extensive understanding of the benefits and applications of traditional and complementary therapies, developed as the result of extended formal study of these techniques as well as human anatomy and elements of modern medicine, are classified in the Unit Group 2230 – CAM Professionals. Those occupations, whose practice requires a less extensive understanding based on relatively short periods of formal or informal education and training, or informally through the traditions and practices of the communities where they originated, are included in Unit Group 3230 – CAM Associate Professionals. Practitioners working in the singular application of approaches to herbal medicines, spiritual therapies or manual therapeutic techniques are excluded from Unit Group 2230 (International Labour Organization, 2012).

Different from LCO, ISCO 08 gives a further explanation raising awareness about CAM related professions, which are not included in the CAM profession group:

- practitioners working in the singular application of approaches to herbal medicines, spiritual therapies or manual therapeutic techniques are excluded from Unit Group 2230;
- faith healers who treat human ailments through spiritual therapies, without using herbal therapies or other medicaments or physical treatments (Unit Group 3413: Religious Associate Professionals);
- occupations that provide therapy using traditional forms of massage and the application of pressure, such as acupressure and shiatsu therapists (Unit Group 3255: Physiotherapy Technicians and Assistants);
- traditional and lay midwives, who provide basic pregnancy and birthing care and advice based primarily on experience and knowledge acquired informally through the traditions and practices of the communities where they originated (Unit Group 3222: Midwifery Associate Professionals) (International Labour Organization, 2012).

3. Opportunities for acquiring required education for the qualification of CAM professionals in the lifelong education system

3.1. CAM in the context of lifelong learning

Lifelong learning is a process that lasts through a person's life-span, and it is based on changing needs for acquisition of knowledge, skills and experience in order to increase or change one's qualification in accordance with the current interests and needs and the demands of the labour market. Our research clarified that for persons interested in obtaining a CAM qualification, without violating the requirements set by LCO, it is possible to acquire it in three systems of lifelong learning: formal, non-formal and informal. In Latvian legislation it is explained that:

- formal education is a system that includes the levels of primary, secondary and higher education stages, and the acquisition of which is certified by a state-recognized educational or professional qualification document;
- non-formal education is an educational activity that is organized outside of formal education in accordance with the interests and demands;
- informal education or self-education is education obtained outside the educational establishment (International Labour Organization, 2012).

ISCO 08 and LCO do not give a clear picture about the education level required for CAM professionals and associate professionals. ISCO 08 and LCO also do not specify the type of educational document that should certify the qualification of CAM professionals and associate professionals.

3.2. Theoretical opportunities for acquiring the appropriate education for CAM professionals in the formal education system of Latvia

In the education system of Latvia there are five levels of vocational qualifications (VQF), as it is specified in the Vocational Education Law (Section 5). Qualification issues necessary for professional activity are also regulated by the Law on Education. According to the Law of Education, Article 8, the Latvian education system is formally divided into eight levels, thus forming a system known as the Latvian Qualification Framework (LQF). This system covers all educational stages (primary, secondary and higher education) and all types of education (general education, vocational education, academic education), as well as professional qualifications obtained outside the formal education system if it is formally recognized. LQF is linked to European Qualification Framework (EQF) (Saeima, 2015.2; The European Parliament and the Council of the European Union, 2008).

The Latvian legislation has defined the following relations between VQF and LQF/EQF levels

- VQF level 1 corresponds to LQF/EQF level 2;
- VQF level 2 corresponds to LQF/EQF level 3;
- VQF level 3 corresponds to LQF/EQF level 4;
- VQF level 4 corresponds to LQF/EQF level 5;
- VQF level 5 corresponds to LQF/EQF levels 6 and 7 (Saeima, 2015.1).

The LQF/EQF levels 1 and 8 are not connected with the professional education sphere and formation of professional qualification (Saeima, 2015.1, Saeima, 2015.2). Table 2, elaborated by the authors of this article, reflects the principles that are stated in legislative documents revealing the content of VQF and LQF/EQF, corresponding educational stages,

programmes and related types of documents (only the levels of secondary and higher vocational education levels are reflected).

Table 2. VQF and LQF/EQF comparative characteristics

VQF level	Description of abilities according to the level	LQF/EQF level	Description of abilities according to the level	Corresponding level of education	Corresponding Vocational education programme	Document certifying the acquisition of education
1	Theoretical and practical training, which gives an opportunity to perform simple tasks in a specific sphere of practical operation	2	Ability to demonstrate basic knowledge and use it for simple practical tasks in a specific field, partly independently under the supervision of a specialist	Basic education	Vocational basic education	Certificate of vocational initial education
2	Theoretical and practical training, which gives an opportunity to perform independently qualified artisan work	3	Ability to demonstrate general knowledge and use it for performing different tasks in an unchanging a stable environment, taking responsibility about the outcome of the work	Basic education	Vocational education	Certificate of vocational basic education
2.1.					Vocational education after basic education and after age of 18	Vocational qualification certificate
3	Advanced theoretical and professional preparedness that gives an opportunity to perform specific artisan duties, which also include planning and organising of the work to be implemented	4	Ability to show comprehensive knowledge and independently plan and organize work in the field, taking responsibility, working individually or in a team or managing the work of others	Secondary education	Vocational secondary education	Diploma of vocational secondary education
3.1.					Vocational education after general secondary education	Vocational qualification certificate
1,2,3					Vocational further-education	Vocational qualification certificate
4	Theoretical and professional preparedness that gives an opportunity to perform complicated artisan work, as well as to organise and manage the work of other specialists	5	Ability to show comprehensive and specialized knowledge relevant to the field; ability to use analytical approach to solving practical problems within profession in the changing environment; ability to understand one's field of activity in the wider social context, participate in the development of the relevant industry, evaluate one's own activities and activities of other people	First level higher education	College programme (2-3 years)	Diploma of first level higher vocational education
5.1	Higher qualification that gives an opportunity to plan	6	Ability to present basic and specialized knowledge in the industry and use it for	Higher education	Basic studies/ 2 nd level vocational higher	Diploma of higher vocational

	and also perform scientific research work in the relevant sector.	professional, artistic, innovative or research activity; ability to use a scientific approach to problem solving, to take responsibility and initiative; ability to make decisions and find creative solutions in changing circumstances		education Basic studies/ Professional Bachelor's study programme (3-4 years)	education and Diploma of higher vocational qualification Professional Bachelor's Diploma and Diploma of higher vocational qualification
5.2.	7	Ability to demonstrate in-depth and extensive knowledge in the relevant field of science or professionally; ability to independently apply the theory, methods and problem-solving skills to research, artistic or highly qualified professional activities in changing circumstances; ability to independently formulate and critically analyse complex scientific and professional problems, integrate knowledge of different fields, contribute to the creation of new knowledge	Higher education	Higher level studies/ Professional Master's study programme (4-5 years)	Professional Master's Diploma and Diploma of higher vocational qualification
5.2.1.				Short professional Master's programmes (1 -2 years)	Diploma of higher vocational qualification

For formation of professional qualifications it is important to follow the Regulations of the Cabinet of Ministers of the Republic of Latvia on higher professional qualifications issued in accordance with Section 59 of the Law on Higher Education. These regulations stipulate that only the documents that certify the completion of higher education can certify the following professional qualifications of healthcare: a doctor; ergo-therapist; pharmacist; physiotherapist; veterinarian; dentist. The aforementioned professions the legislator has included in separate profession groups that are not related to CAM specialists. The regulations state that the representatives of the above-mentioned professions belong to the group of persons who must obtain higher professional education and higher professional qualification by completing a state-accredited study program of at least four years in higher education institution. Upon graduation from a state-recognized higher education institution, a higher professional qualification document – a diploma certifying the relevant higher professional qualification – is issued, indicating the professional qualification. In addition to the relevant qualification, a specialization may be indicated in accordance with the state-accredited higher education study programme and the LCO (Ministru Kabinets, 1997).

4. Description of a competence development model for CAM professionals

4.1. The theoretical possibilities for obtaining appropriate education for CAM Associated Professionals in the formal education system of Latvia

According to LCO, CAM Associated Professionals, who represent the third group of professions, should develop their qualification by obtaining secondary or higher education. Summarizing the qualification requirements of ISCO 08 and LCO, it can be concluded that for CAM Associated Professionals the VQF Level 3 and LQF/EQF Level 4 education programmes are suitable in the formal education system. Of course, the higher is the qualification, the more skilled is the specialist. However, examining the requirements and recommendations of international and Latvian legislators, it becomes clear that there is no need for CAM associated professionals to obtain education from VQF Level 4 and LQF/EQF Level 5 education programmes, even if they manage the work of others.

LCO and ISCO 08 undoubtedly show that CAM Associated Professionals occupations require a less extensive understanding based on relatively short periods of formal or informal education and training, or informally through the traditions and practices of the communities where they originated. Thus, in the situations, when formal education does not offer programmes for CAM professionals, keeping in mind LCO professional education requirements, it is possible to legally apply the following qualification development approach for CAM specialists:

- educational programmes for acquiring CAM competence are developed in the non-formal education sector;
- the ability to obtain CAM associated professional's qualification while learning in non-formal education programme is awarded to persons who have obtained VQF Level 3 and/or Level 4 qualifications in other areas of formal education.

4.2. The theoretical possibilities for obtaining appropriate education for CAM Professionals in the formal education system of Latvia

LCO states that CAM Professionals, who represent the second group or professions, have formed their qualifications at the level of higher education. At the same time, for a competent performance of CAM Professionals, LCO and ISCO 08 requires an extensive understanding of the benefits and applications of traditional and complementary therapies, developed as the result of extended formal study of these techniques as well as human anatomy and elements of modern medicine (International Labour Organization, 2012).

Table 2 shows the levels of higher education, defined by legislation. Taking into account the fact that LCO and ISCO 08 has set the task for CAM Professionals to conduct research into traditional and complementary medicine and treatments and disseminate the findings such as through scientific papers and reports, the education programmes of VQF Level 5 and LQF/EQF Level 7 can be seen as the most appropriate. However, this hypothesis is contradictory because of the above mentioned fact that in Latvia the legislator requires a 4-year higher education only from doctors, ergo-therapists, pharmacists, physiotherapists, veterinarians and dentists, and these professions are included in separate profession groups that are not related to CAM specialists. CAM specialists are not included in the groups of professions which are in need for the higher qualification. CAM specialists also do not belong to the group for which the education and vocational qualification requirements are specified as for professions in the field of healthcare (Saeima, 2001). At the same time, according to ISCO 08 and LCO, the CAM specialists are health care specialists.

Summarizing the qualification requirements of ISCO 08 and LCO, it can be concluded that in the formal education system, VQF Level 4 and LQF/EQF Level 5 education programs can be effectively and lawfully applied to CAM Professionals. Although these programs do not imply elaboration of a scientific paper, at the end of the courses students prepare a qualification paper employing the principles and methods of the scientific work.

In situations when formal education does not offer CAM programmes, in order to comply with the formal requirements of LCO, it is possible to use the following qualification development approach for CAM professionals:

- Educational programmes for acquiring CAM competence are developed in the non-formal education sector;
- The opportunity to acquire CAM Professional's qualification while studying in a non-formal education programme is granted to persons who have at least VQF Level 4 and/or Level 5 qualification from any other formal education programme.

5. Focus group results

The experts involved in the study unanimously (100%) acknowledge that it is not possible to develop CAM qualifications, i.e. obtain education in any formal higher and secondary vocational education systems in Latvia. There are no higher education programmes available in Latvia for obtaining CAM Professional qualification. CAM Associate Professional qualification development programmes are also not implemented on secondary vocational education level. The Latvia University Centre of Complementary Medicine offers a non-formal education programme for Ayurveda practitioners (Latvijas universitāte, 2017). However, according to the experts, this course is intended only for qualified conventional medicine specialists, and the course has taken place only twice since the foundation of this Institute in 2015. Experts also conclude that the programmes and courses offered by non-governmental and private organizations do not meet the legitimate qualification content of either CAM Professionals or CAM Associate Professionals. The programs and courses offered by non-governmental and private organizations, considered to be CAM-related, are most

often associated with already in the article mentioned ISCO 08 statement about qualifications that are not part of the CAM sector.

Experts also point out that not only among the general public, but also among highly educated scholars, educators and practitioners, the understanding of CAM is inaccurate. CAM is considered to be a pseudoscience, denied, and its representatives despised. Even persons who legally have obtained the expert status in science often do not understand the terminological differences between conventional medicine and CAM medicine, in presentations and publications calling it as traditional medicine, etc.

Experts have acknowledge the model, developed as the result of this study, as scientifically sound (systemic and logical), which, on the one hand, allows integration of CAM programmes into the formal education system, on the other hand provides the possibility for integrating the qualification content in non-formal education programs in accordance with EQF and VQF's basic requirements. Experts note that the well-known principle of private law, recognized in Latvian jurisprudence, is present: all that is not forbidden is allowed. Only in the public legal relationship the principle of public law is applicable: allowed is only that what is permitted by law. The professional and business activities of CAM Professionals and CAM Associated Professionals are based in private relationships. In the sphere of CAM, patients' rights are protected by the Consumer Rights Protection Act, except when CAM professionals act as medical professionals by combining CAM services with conventional medical services.

Given the fact that CAM is a scientifically, academically and practically recognized healthcare provider in the world, and that CAM Professionals and CAM Associate Professionals are not only legally recognized professions but even represent the profession groups, which are included in LCO, at the same time recognizing that in the formal education sector these professionals do not have the opportunity to develop their qualifications, experts recommend to use the world's examples of good practice, and to organize educational programs for CAM Professionals and CAM Associate Professionals in the non-formal education sector as it is in some other countries, such as the United States, the United Kingdom, Australia, Canada, etc.

Taking into account the fact that healthcare and medicine in Latvia is a highly sensitive field of professional activity, experts recommend that before developing programs, it is necessary to explore the content and formalities of the formal education sector by revealing the general content of knowledge, skills and competences that would be needed for CAM Professionals and CAM Associate Professionals if they obtained education in the formal education sector. By clarifying the content of the knowledge, skills and competences formally established by the national legislator, it can be integrated into programmes and courses organized and offered to CAM Professionals and CAM Associate Professionals by non-formal education sector.

Conclusions and Suggestions

In the world, including in the European Union, CAM is a well-developed and potentially perspective sector of national economy. Thus, many higher education institutions worldwide, also in EU, have devoted different research and educational programmes to CAM. In Latvia CAM is not developed as a sector of national economy. Research and education programs dedicated to CAM are not being developed and implemented in Latvian higher education establishments. Good practice of the world demonstrates the potential of developing a CAM qualification as part of lifelong learning, including non-formal education programs and courses.

The CAM analysis and the model developed and presented by the authors of this article can help not only Latvia, but also other countries to create a scientifically-based qualification system for the competence development of CAM professionals.

The authors recommend:

1. To establish an association called "Latvian Professional CAM Association" for the purpose of promoting the development of CAM in Latvia;
2. As part of Association, involving experts who are highly competent in formation of CAM qualification and CAM content issues, to develop educational programs for CAM Professionals and CAM Associated Professionals for their qualification and competence development.

Digital competence and blended learning

Lasma ULMANE-OZOLINA¹
Madara PRIEDOLINA²

1 Institute of Educational Sciences, Liepaja University, E-mail: luo@liepu.lv

2 Institute of Educational Sciences, Liepaja University, E-mail: madara.priedolina@liepu.lv

Abstract

Development of competences nowadays is very important issue. There are discussions about development of competencies using different methods, competencies-based curriculum and so on. Digital competence is one of the 8 key competencies for lifelong learning. It is described by using five areas – information and data literacy, communication and collaboration, digital content creation, safety and problem solving (Vuorikari, Punie, Carretero Gomez, Van den Brande, 2016). The article shows literature based research of possibility to develop digital competence by using blended learning per se, because blended learning is described as learning process where integration of face-to-face learning and e-learning happens. The article's main focus is on development of digital competence.

Many authors talk about “net-generation” who spends their days with technology but does it mean that they are digitally competent people.

Keywords: Digital competence, Blended-learning, Higher education, E-learning

Introduction

Development of competencies becomes more and more popular topic in nowadays. This topic is interesting in all range of educational levels – from primary school to higher education. Development of different competencies is significant issue for life-long learning.

European Commission has defined eight key competencies – communicating in a mother tongue, communicating in a foreign language, mathematical, scientific and technological competence, digital competence, learning to learn, social and civic competences, sense of initiative and entrepreneurship, cultural awareness and expression. Main issue of this article is digital competence, what defined as confident and critical usage of information and communications technology for work, leisure and communication.

Another significant issue is how to manage development of digital competence. One of the possibilities is blended learning. Blended learning is defined as planned, pedagogically meaningful integration of face-to-face and e-learning (Picciano, 2009). Blended learning not only enriches learning process but it gives possibilities for students for more active participation in learning process (Garrison and Vaughan, 2007). Blended learning gives new learning experience for students as well as new teaching experience for teachers (Powell, Watson, Staley, et al 2015). Meaningful integration of e-learning tools gives opportunity for students for personal development, as well as to develop such cognitive skills as critical thinking and conversation leading (Garrison and Vaughan, 2008; Somekh, 2007). Blended learning experience enriches learners' learning as well as teachers' teaching praxis.

One of the reasons to research only digital competence is because of the technological side of blended learning. The poor digital competence can lead to unsuccessful blended learning experience as well as impact outcomes of the learning. To use technological tools effectively learners have to know them and have to know how they work (Hubackova & Semradova, 2016; Dohn, 2009). It depends on users' skills and historical body (Scollon, 2004) - it means that users use technological tools as they used to use. So, as more advanced user learner is as easier it is to use it for learning (in this case, for blended learning), because learners can pay they attention more on the content not on the technology itself (Ozsariyildiz, & Beheshti, 2007).

Eurostat data (Eurostat, 2017) shows that average percent of EU (28 countries) individuals aged 16 to 74, who thinks that they have high level of computer skills, are 29 % in 2014 (compare to 23% in 2007). That can mean that one third of individuals in EU can fully participate in blended learning's e-learning part, if we talk about digital competence. However, only 15 % thinks that they have very low computer skills (1 to 2 out of 6 computer related activities). Computer related activities offered to respondent were the following - copied/moved a file/folder, copy/cut/paste to move information on the screen, used basic arithmetic formulae, compressed/zipped a file, connecting and installing new devices or written a computer program. There is also statistics on individuals internet related skills - use a search engine to find information; send an e-mail with attached files; post messages to chatrooms, newsgroups or any online discussion forum; use the internet to make telephone calls; use peer-to-peer file sharing for exchanging movies, music etc.; create a web page. Eurostat data (Eurostat, 2017) shows that in the year 2013 30% of individuals aged from 16 – 74 evaluate themselves as low skilled (1 to 2 out of 6 internet related activities) and only 12% evaluate themselves as high skilled.

Diagram 1. Eurostat data on computer and internet related skills.

So there is possibility for 71 % to develop their computer skills and 88% of individuals can have possibility to increase their internet related skills.

The European Digital Competence Framework for Citizens (Vuorikari, Punie, Carretero Gomez, Van den Brande, 2016) sets five digital competence areas – information and data literacy, communication and collaboration, digital content creation, safety and problem solving. All these areas can be used and developed in blended learning.

The aim of the article is to find out do the scientific literature speaks about development of digital competence by using blended learning and does blended learning can help develop it.

Method

This is literature based research. Articles are read by using The European Digital Competence Framework set by Vuorikari, R., Punie, Y., Carretero Gomez S., Van den Brande, G. (2016). Articles are not categorized based on educational level or subject. Main issue is blended learning and development of skills.

Findings

The European Digital Competence Framework gives five digital competence areas with several dimensions for each of it. Literature on blended learning speaks about support of digital competence (Toia, 2016; Hubackova, & Semradova,

2016; Bates, Bates, Sangra, 2011; Díez, 2008), development of computer skills (Pratt, 2014), increase of information searching competence and identification of main ideas (Ozdamli & Tavukcu, 2016).

Information and data literacy has three dimensions – (1) browsing, searching and filtering data, information and digital content; (2) evaluating data, information and digital content and (3) managing data, information and digital content. All these dimensions are very important in the blended learning because students have to search for information and digital content to be successful. Blended learning can support development of this kind of skills (Soler, Soler, & Araya, 2017; Ozdamli & Tavukcu, 2016; Buran & Evseeva, 2015; Pratt, 2014). From one side – learners do not have to browse, search and filter data, information and digital content because learning material in blended learning's e-learning part is made to be ready to explore. From other side – there can be assignments that force learners to find information by themselves and there is clear need for previously mention skills. There are not much scientific researches on this issue in blended learning context.

Eurostat data shows that in year 2013 94% of youth aged from 16 – 29 (EU 28) have used search engine to find information. Of course there is different situation in some countries, for example, Turkey had 72 % but Iceland 100%. But average youth in European Union is very skilled in searching. From other side, there is situation that students make searching not effectively – it is hard for them to use keywords or think in bigger picture.

The second area is communication and collaboration with six dimensions – (1) interacting through digital technologies; (2) sharing through digital technologies; (3) engaging in citizenship through digital technologies; (4) collaborating through digital technologies; (5) netiquette; (6) managing digital identity. Interaction, collaboration and sharing are very important skills for successful blended learning experience. These skills also can be developed by blended learning (Soler, Soler, & Araya, 2017; Nazarenko, 2015; Okaz, 2015). Interaction and collaboration through digital technology are very important skills for blended learning. Many students have these skills (Soler, Soler, & Araya, 2017; Okaz, 2015) because of wide usage of web 2.0 tools in their everyday life (discussion forums, wikis, blogs, social networking). But there can be problems to use these skills in learning situations. Some researchers talk about development of online communication but as social competence (Prohorets & Plekhanova, 2015). Eurostat data shows that youth aged from 16 – 29 in European Union (28 countries) have posted messages to chat rooms, newsgroups or an online discussion forum in 72 %. Also there situation differs between countries from 37% in Turkey to 94% in Lithuania. It means that collaboration and interaction through digital technologies in blended learning can differ because of different digital technology usage cultures. 32% of youth (aged 16 – 29) used peer-to-peer file sharing for exchanging movies, music ect. (Eurostat, 2013) So sharing through digital technologies need to be developed. In the same time percentage differs for countries from 13% in Ireland to 74% in Lithuania.

The third area is digital content creation – (1) developing digital content; (2) integrating and re-elaborating digital content; (3) copyright and licenses; (4) programming. Digital content development and integration are very important issue in blended learning. Some researchers admit that there is problem of content creation in blended learning (Powell, et al, 2015; Clement, Vandeput, & Osaer, 2016). Teachers often use the same learning content as they used to for face-to-face learning. Content is not prepared specifically for blended learning. This may cause the issue that learners are not satisfied. Eurostat data shows that in 2013 only 18% of EU 28 youth have created a Web page (from 1% in Cyprus to 48% in Iceland). There is much work to develop digital content creation skills.

There are always discussion from teachers on copyright and licenses. Teachers want to be sure that their work is secured with copyrights; however, teachers and students take into consideration other author's rights (Soler, Soler, & Araya, 2017).

19% of youth aged from 16 – 29 in 2014 (EU 28 countries), according to Eurostat data, have written a computer program using a specialized programming language. This is very little number. From other side blended learning as per se probably cannot develop this kind of dimension (except blended learning course on programming) because learners do not need programming skills to participate in learning situations.

The fourth area is safety with dimensions like (1) protecting devices; (2) protecting personal data and privacy; (3) protecting health and well-being; (4) protecting the environment. All these dimensions can be developed in blended learning settings. Institutions, who offer blended learning, give advice to students about safety issues. Eurostat data in 2011 shows that 68% of youth judge their skills as sufficient to protect their private computer from virus or other computer infection. Safety issue is very important not only for blended learning but for student management systems as well so institutions put big effort on this issue. Sometimes students with lower digital skills need some safety advice when using public computers. Time by time students not log out of learning management system but just close tab. This can lead for problem that next user can get some information or even log in in other account. Eurostat data in 2011 shows that 69% of youth aged 16 – 29 in EU 28 countries judge their ability to be sufficient to protect their personal data. Unfortunately, Eurostat does not have data for later years. But this information on 2011 shows that young learners are able to protect their personal data and privacy.

About health protection in blended learning settings there is very little information in literature. A. Buran and A. Evseeva (2015) in their article mention problems of eyesight as a barrier for online learning as well as time spent on learning (Soler, Soler, & Araya, 2017; Buran & Evseeva, 2015) what impacts learners' and teachers' well being.

The last one area is problem solving. It has such dimensions as (1) solving technical problems; (2) identifying needs and technological responses; (3) creatively using digital technologies; (4) identifying digital competence gaps. Institution who offers blended learning most of the time has support system for students' and teachers' technical problems. Creative use of digital technologies is very important for teachers but as mention previously, teachers need training on technologies. There is no possibility to use technology creatively if you do not know how it works, it functions. Also students and teachers identify their digital gaps because some research mentioned in this article before shows that students and teachers admit that they need training.

Conclusion

There are two kinds of articles – one who pay attention on teachers/ staff and one who pay attention on learners. There is very little research made related to digital competency.

Some research shows that teachers, who work in blended learning, need training on use of technological tools (Kofar, 2016; Clement, Vandeput, L & Osaer, 2016; Georgsen & Løvstad, 2014). There are researches that illustrate teachers' or learners' technological skills before blended learning experience (Özel, Arıkan, 2015). But there are not articles what exactly speaks about development of digital competences. It is often just mentioned only in one sentence.

Many researches evaluate students' and teachers' technology proficiency but it seems that there is no research on do blended learning as per se develop digital competency, if learners and teachers uses it time after time. We can think that it is so because, for example, if learner uses discussion forum for learning purposes, then he/she learns netiquette, collaboration, data managing and so on. As well as teachers do so. Their skills develop as more as they use technology.

Research speaks about teachers' and learners' skills on collaboration, communication through digital technologies but there is hard to find research made on health issues because of blended learning or e-learning. As well as there is no research on do blended learning impacts learners' or teachers' skills on technical problem solving or protecting devices and environment.

There is need in future to make a research on these issues to be sure that blended learning has impact not only on teachers' and learners' social skills, language competencies ect., but also on their digital competency.

Abstract

Technology is all around us. The use of modern technology is increasing in the process of acquiring knowledge as it provides greater opportunities and e-study is becoming as important as traditional education or even more significant.

During literature research, it has been found that there is no unambiguity about all formatting parameters. A survey was made to research users' habits and preferences concerning different text formatting parameters for e-study materials. Application and browser research about developers' imposed default formatting settings of font type, size and colours in the most popular applications and browsers was done.

There are recommendations presented for a user-oriented e-study material design - style, size, spacing, position, colour - to reach the user information must be presented in a comprehensible and easy to remember way. These recommendations have been developed for e-studying materials for one target group - young adults (16-38 y.o.) - without reading difficulties and any significant vision problems.

Keywords: e-study, e-study materials, formatting parameters, technologies, visual perception

Introduction

Nobody is surprised at the use of technologies and their rapid development and growth nowadays. There are a variety of purposes – work, education, entertainment, personal use, etc. – of different technology screen use for all - even young and elderly people. And such usability is only rising. It is not surprising that many of them serve us in delivering visual and textual information. Increasingly, screens are used for learning - in extra-curricular education and self-education and in the integration of technology in everyday standardized full-time education and there is a widespread use of e-learning and e-study.

Research of screen reading has been going for a long time. [1] Differences in reading from the screen and paper have been identified. Reading digital texts and materials from a computer screen is much more difficult than reading a printed text. [2] On the computer screen the text is read 25% slower than from paper. [3] Therefore text formatting parameters which improve reading on the screen are essential. Studies indicate that the text presentation of the parameters to be used are those that are easy and comfortable to be received and natural for people's eyes and human mental development level. [2] But still there are lots of incomprehensible things.

There have been viewed and analysed more than 100 different literature sources: the recommendations of web development and statistics on the most important parameters which are used in the e-environment, and recommendations and guidelines for e-study courses and e-learning materials, as well as various studies in which researchers have tried to find out the best solution. [4]

Analysis of suggested formatting parameters: font, font size for body text and heading, line spacing, and colour were made. During literature research, it has been revealed that many recommendations of the screen texts

continue to rely on the printed material developed parameters. It was found that there is no unambiguity about all formatting parameters.

Sans-serif fonts are mostly mentioned in references as recommended for use. Most mentioned sans-serif fonts are Arial, Verdana, Helvetica, Trebuchet MS, and Calibri. The most commonly referred serif fonts are Georgia and Times New Roman. For body text in different sources it is advised to use a font size of 8 pt and 28pt. However, the most common - from 12pt to 19pt. For Headlines, of course, it is recommended to use larger font size, but about this there is much less information. [5] In the literature, letter size from 12pt to 32pt can be found. In the literature line spacing is displayed in units and px, and mm, and the percentage of the font size. In units, it varies from 1.15 to 2, and most commonly it is recommended to use from 1.5 to 1.6. As the percentage varies from 90 to 160%, the most commonly recommended to use is at least 120% line spacing. [4]

Colour choice is more complicated as there are in need to consider more aspects: not only best solution for easy perception and visual processes, but also for helping the learning process and facilitating memorization as well as psychological colour perception aspects and situations of use.

Most often it is recommended to use a dark text on a light background. [6] A black text on a white background is always a good solution, [7] it is visible and legible, [8] A green text on a white background is being considered for use because the human eye has a natural tendency to green colour, as well as the rays are converged on the retina of the eye without the lens adjustment and adaptation that might induce eye fatigue. [9] A grey background increases the saturation of any colour in its foreground. [10] A black text on a grey background is also advisable. [11] Also, it is recommended to use other colours for text and background: there is found a wide range of suggestions, but not all is good to use.

To choose a good colour combination for tables and different chart types is even harder. There are in need to consider different aspects of colour perception [12] but also colour characteristics and possibility to combine from artistic basic principles of colour [13] and both psychological [12] and artistic point of view. On-screen colour perception also is affect by screen technical parameters.

Mostly, there are found suggestions from only one aspect or point of view. For good e-materials there are need to find best solutions based on all aspects that can affect formatting parameters and colour perception.

Method

Survey. Research on users' habits and choices preferences was done by a survey. For this purpose, two e-surveys were made. They are closed-ended questions surveys. For this research, there was selected an e-questionnaire because it was appropriate not only because it can be quickly carried out, but also because the third part of the questionnaire could be viewed and accurate choices could be made. It had to be done directly on the computer screen. E-survey in this case had a positive effect on the results, as the respondents could act whenever they wanted and in familiar surroundings – at their own screen without additional conditions.

Survey No.1 consisted of several parts. During the first part, there was obtained general information about the respondents - gender, age, education level and occupation. The second part consisted of questions about respondents' technology usage habits and knowledge of e-materials. Third, the main part consisted of questions about formatting options of e-materials where respondents had to provide answers of their own choice. The fourth and the final part was to obtain additional information about respondents' eye health and reading

difficulties, if they had any, to be accurately interpreted the responses received. It was a closed-ended questions survey.

Survey No.2 consisted of two parts. During the first part, there was obtained general information about the respondents - gender, age, education level and occupation. The second part consisted of questions about tablets and graphs colour formatting options of e-materials where respondents had to provide answers of their own choice.

Respondents. Survey No.1 involved 50 respondents aged 16 to 38 (Mean = 24.8, SD = 4.6) years old. From those 6 were men and 44 - women. 24 participants had vision correction. Survey No.2 involved 50 respondents aged 16 to 38 (Mean =25.4, SD = 1.5) years old. From those 4 were men and 16 - women. 12 participants had vision correction.

In both surveys respondents were young people with different levels of education and different current occupation. Respondents were without significant visual defects and without reading difficulties. They joined the survey on a voluntary basis.

Findings

Samples for survey questions were made based on information from previous literature research. Text samples can be seen on web-page <http://www.phd-km.lv/fonti.php> and colour combination samples - <http://phd-km.lv/aptauja2/>.

Survey No.1. Font. There was presented a text sample by 14pt size. Respondents were shown a text in 5 different fonts - Times New Roman (TNR), Arial, Verdana, Georgie, Calibri. They had to take a look at all 5 examples from which respondents had to choose 3 fonts that seemed the most acceptable to use for on-screen text.

In general, Top3 fonts are Verdana (n = 35) Arial (n = 34), Georgia (n = 33). There is near also the TNR (n = 28) that had the greatest number of choices as the first choice, and it coincided with the Arial (n = 15). (Fig. 1)

Font size. Each participant had to see the text where each of the previously used 5 fonts were displayed in 4 sizes - 10pt, 12pt, 14pt un 16pt. Respondents had to choose one size for each font that seemed the most acceptable to use for on-screen text.

In general, most respondents chose 14pt size (n = 87) and 12pt size (n = 81), but it was different for each of the fonts. TNR - 14pt (n = 20) and Arial - 12pt (n = 19), Georgia - 14pt (n = 18), Verdana - 12pt (n = 20) and Calibri - 14pt (n = 20) (Fig. 2)

Line spacing. Each participant had to see the text where each of the previously used 5 fonts were displayed in 14pt size, but line spacing was changed - 1.0, 1.15, 1.5 and 2.0. Respondents had to choose one line spacing size for each font that seemed the most acceptable to use for on-screen text.

In general, most preferred were 1.15 (n = 126) and 1.5 (n = 103) The size of the space between the lines, but the choice was different for each of the fonts. TNR - 1.15 (n = 31) Arial - 1.15 (n = 26), Georgia - 1.5 (n = 28), Verdana - 1.5 (n = 20) and Calibri - 1.15 (n = 29). (Fig. 3)

Colour. Each participant had to see the text written with TNR 14pt font size, each of the options changed text font colour and background colour combination. It was created in 7 different versions: black text on a white background, white - on black, grey - on white, blue on white, green - on white, green – on blue and yellow - on a red background. Respondents had to choose 3 colour combination that seemed the most acceptable to use for on-screen text.

In general, Top3 colour combination is black and white (n = 40) grey to white and green (n = 32) and white (n = 21). 9 respondents decided that there are only two options, which should be applied when displaying text on the screen. (Fig. 4)

There were too few male respondents to compare data and to draw statistically significant conclusions by sex impact on parameter choice but it is possible to raise some hypotheses:

1. The least popular font for males were Times New Roman, whereas for females it was the 3rd preferred font.
2. The second preferred font size after 14pt for males is 12pt but for females – 16pt.
3. As the third-choice males prefer blue letters on white background, whereas females prefer green letters on white background.

Fig.1 Respondents' font choice

Fig. 2 Respondents' font size choice

Fig. 3 Respondents' line spacing choice

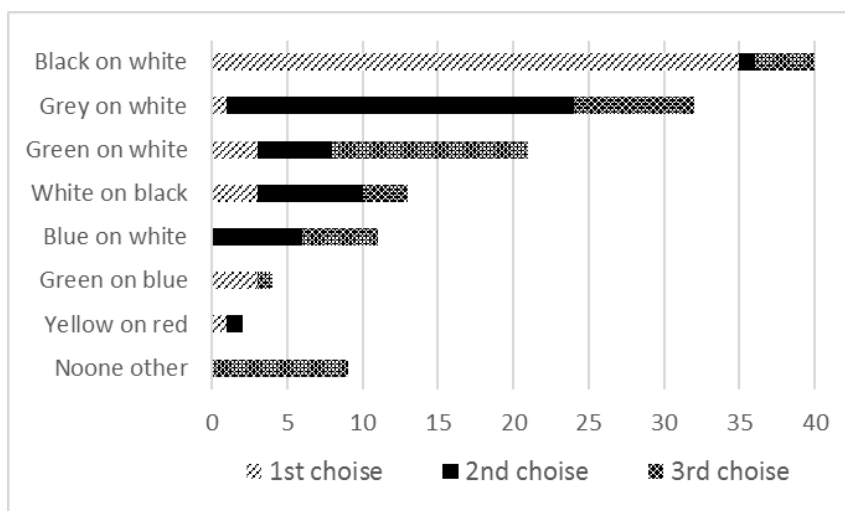

Fig. 4 Respondents' colour choice

Applications' and browsers' research. The research was made about developers' imposed default formatting settings of font type and size in the most popular applications and browsers. The most popular applications were found: Microsoft Office, OpenOffice.org and LibreOffice products, and open access web editors available online: Google, Zoho, Quip products. The most interesting products were word processors, spreadsheets, and presentation programs. After that analysis based on the elaborated recommendations was made. A similar analysis was performed in the most popular browsers - Google Chrome, Mozilla, Microsoft Edge, Opera, and also Safari.

There is no single standard to be applied by developers. There can be observed a use of different fonts and sizes for both body text and headings in applications and browsers. It is shown in table 1 un table 2.

Table 1 Applications default formatting settings

WORD PROCESSOR				PRESENTATIONS					
APPLICATIONS	Body Text		Heading		APPLICATIONS	Body Text		Heading	
Microsoft Office	Calibri 11pt		TNR 24pt		Microsoft Office	Calibri 28pt		Calibri Light 60pt	
LibreOffice	Liberation 12pt	Serif	Liberation 18,2pt	Sans	LibreOffice	Liberation 32pt	Sans	Liberation 44pt	Sans
OpenOffice.org	Calibri 12pt		Arial 16,1pt		OpenOffice.org	Arial 32		Arial 44pt	
Web editors					Web editors				
Google	Arial 11pt		Arial 20pt		Google	Arial 18pt		Arial 52pt	
Zoho	Arial 11pt		Arial Black 18pt		Zoho	Roboto 18pt	Normal	Roboto 51pt	Thin
Quip	Calibri 12pt		Calibri 24pt						
SPREADSHEETS									
Applications	Body Text								
Microsoft Office	Calibri 11pt								
LibreOffice	Liberation 10pt	Sans							
OpenOffice.org	Arial 10pt								
Web editors									
Google	Arial 10pt								
Zoho	Arial 10								

Table 2 Browsers default formatting settings

DEFAULT FORMATTING SETTINGS			
BROWSERS	Standard font	Serif font	Sans-serif font
Google Chrome	TNR 12pt	TNR 12pt	Arial 12pt
Mozilla	TNR 16pt	TNR 16pt	Arial 16pt
Microsoft Edge	Segoe UI 12pt		
Opera	TNR 12pt	TNR 12pt	Arial 12pt
Safari	TNR 16pt		

Survey No.2. Colour combinations. There were presented 10 different samples of colour combinations that are in PowerPoint default formatting suggestions: 1) Office, 2) Organic, 3) Gallery, 4) Integral, 5) ION, 6) ION Boardroom, 7) Retrospect, 8) Slice, 9) Wisp un 10) Facet – original, without colour changes. Respondents need to look on them and ranked they preference choice from 1 to 10 (1 – colour combination like the most and 10 – colour combination likes the least).

Tables. There were presented 10 different samples of table colour combinations. Respondents rank highest 1st, 2nd and 4th sample. (Fig.5.1)

Column charts. There were presented 10 different samples of column charts colour combinations. Respondents rank highest 1st, 2nd and 7th sample. (Fig.5.2)

Circle diagrams. There were presented 10 different samples of circle diagrams colour combinations. Respondents rank highest 1st, 2nd and 9th sample. (Fig.5.3)

Fig.5 (5.1., 5.2., 5.3.) Respondents choice rank of tables colour combination

Fig. 5.1 tables

Fig. 5.2 column chart

Fig. 5.3 circle diagrams

It is found what more preferred combinations are 1) Office and 2) Organic. Respondents found them good for use in all three tested positions: tables and two diagram types. The least preferred are 3) Gallery and 8) Slice.

These are not the only possible combinations but they are suggested for use in one of the most popular application which are in use for e-materials. It is important to know which of them are more preferred and good for use. Also, based on this finding, we can start work on possible changes of colour combinations to find the best solution on screen.

Results, Conclusions, and Recommendations

The most popular choices for different formatting parameters have been found: font, font size, line spacing, text and background colour, and table, charts colour combinations for screen use.

It has been found that respondents' choice does not match with the most popular recommendations from literature. Also, most respondents chose a larger font size, even young people, by survey No.1. This shows that for e-materials there cannot be used standard printed material recommendations directly.

There were recommendations for guidelines prototype developed based on literature study of the recommended parameters of different sources and on survey data collected, and on results of previous studies and vision

science-based research. These recommendations have been developed for e-learning materials and studying for one target group - young people - without reading difficulties and without any significant vision problems. Recommendations are shown in table 3.

Table 3. Formatting recommendations

FORMATTING PARAMETERS	RECOMMENDATIONS	FORMATTING PARAMETERS	RECOMMENDATIONS
Font	Body text: Arial, Verdana, Georgia un TNR Heading: Can use also other fonts	Line spacing	1,15 or 1,5
Size	Body text – min. 14pt Headings – min. 18pt	Colour	Black text on white background Grey text on white background Green text on white background

There are found users preferred existing combinations in Powerpoint by survey No.2. Recommendation for three best solutions in each situation – for tables, column chart and circle diagrams - are found. Recommendations are shown in table 4.

Table 4. Colour combination recommendations

USE FOR	RECOMMENDATIONS TO USE IN POWERPOINT		
	1 ST	2 ND	3 RD
Tables	1) Office	2) Organic	4) Integral
Column chart	1) Office	2) Organic	7) Retrospect
Circle diagrams	1) Office	2) Organic	9) Wisp

The study will be continued as there are lots to do. The data will be updated with a larger number of respondents in different target groups. The results will be tested and supplemented.

These recommendations must be checked experimentally in the target group by combined complexes in the context of e-material to confirm their effectiveness. Recommendations are supplemented by additional parameters. Also, there is a need to develop complementary recommendations, depending on the individual in addition to human factors, which may significantly affect reading and text perception - depending on their age, visual status, reading difficulties, and so on - because each person has different needs and opportunities.

Abstract

The article deals with one aspect of a larger scale and long-term phenomenological research to explore the teachers' perception of their professional identity. This article answers the research question – how the perception of professional identity is connected with novice teachers' educational background. The research sample was novice teachers – master students of the professional master study programme „Teacher” and stratified purposive sampling was used to choose nine extreme cases – the most representative three novice teachers having obtained teacher's qualification via concurrent model, consecutive model and alternative pathway “Mission Possible” each year. Reflection-on-action was used to collect in-depth data. The data of 45 reflection samples applying the reflection tool MAX (Motivation – Acquisition – Extension) and narrative essays were analysed in the context of professional identity and educational background in the period of three years. Novice teachers with diverse educational backgrounds demonstrated different features of how professional identity was perceived and reflected upon. Three most characteristic features for each group were identified and one feature was common for all groups – self-analysis.

Key words: Reflection tools, Professional identity, Educational background, Novice teacher.

Introduction

Global scale changes, increasing demand to advance education level, the need to acquire new teacher roles, the need to keep the track of the diversity of society, and the increasing amount of knowledge make it more difficult for novice teachers to understand their professional identity. Nowadays, schools fulfil socialization functions that were once the responsibility of families, religious organizations or workplaces (Thomas & Beauchamp, 2011). The new social situation is forcing teachers to experiment with their roles, constantly reviewing their professional identity in relation to the changing social context. This raises the question: “Can I be what I am in the classroom?” (Timoštčuk, Ugaste, 2010). To answer this question, it is important for teachers to know what they are, where they are and where they stand. Therefore, teacher education should focus on both novice teachers themselves and their expectations, what they want or do not want to achieve in teacher education and how teacher education influences what novice teachers will be, who they will be able to teach and how they will respond to the changing context of learning (Bullough, Gitlin, 2001). “From the Vygotskian perspective, the overall aim of a teacher-education programme is best conceived as the development of a professional identity” (Van Huizen, Van Oers, Wubbels, 2005: 275).

Professional identity in the context of teacher education

The concept of identity has been discussed from different points of view (philosophy, psychology, sociology, etc.), and the explanation of the concept of professional identity in the context of teacher education is diverse. Beijaard, Meijer and Verloop (2004) have divided all published research on the teacher's professional identity into three categories:

- 1) studies focusing on the development of teachers' professional identities;
- 2) studies focusing on the characteristics of teachers' professional identities as perceived by the teachers themselves or what researchers have identified from the data collected;
- 3) studies in which the professional identity was reflected in the teachers' stories that were told and written.

In general, the meaning of identity is explained differently, but all definitions support the idea that "identity is not a fixed attribute of a person, but a relational phenomenon" (Beijaard, Meijer and Verloop 2004: 108). The development of identity is the accumulation process of practical knowledge, characterized by independent integration, which manifests itself as a continuous learning process for each person, when based on mutual interaction of emotions and knowledge, professional experience is reflected upon. As the experience can be deeply individual or acquired in a group or pair, then the teacher's professional identity can be understood as a continuous learning process, focusing not only on behaviour, but also searching for meaning (Rodgers & Scott, 2008; Ropo, 2009) as well as for a wide perspective of social contexts (Bullough & Gitlin, 2001). Taking into account the close link of the teacher's profession with socio-cultural processes and current changing circumstances, teacher education is seen as a complex process with the deepest impact on the professional identity of novice teachers. According to Gee (2001), the development of identity occurs in an intersubjective field and can best be characterized as an ongoing process, a process of interpreting oneself as a certain kind of person and being recognized as such in a given context. In this context, the identity can be seen as an answer to the periodically asked question: "What am I now?"

Teachers may have different perceptions of themselves – what they are and what they might be in the future, how they perceive themselves as a part of society, how they reflect on what they are expected to do, what roles they are to perform in accordance with the common social views.

Not only is the concept "what am I?" important for teacher, but also "what am I as a teacher?" The perception of oneself must be understood in close connection with the personal and professional "I" (Lipka & Brinthaup, 1999). However, these different concepts of "self" for novice teachers may conflict and affect their teaching and learning environment (Flores & Day, 2006).

Research on professional identity reveals several aspects of identity:

- 1) the **relationship** of identity with the context of **career and role change** (Hall, 1971; Nicholson, 1984; Ibarra, 1999). Identity can change under organizational conditions promoted by career development, its advancement and the acquisition of new roles;
- 2) the **variability** of identity in the process of socialization **affected by (involved) groups and organizations** (Van Maanen & Schein, 1979; Greil & Rudy, 1984; Snow & Machalek, 1984; Pratt, Rockmann & Kaufmann, 2006) shaping the content of the identity in accordance with both the values of the organization and the individual's understanding of the professional culture;
- 3) the **development** of an individual's identity **in a social context** understanding it as an interactive process more than simply adopting roles (Ibarra, 1999; Pratt, Rockmann & Kaufmann, 2006). The **"testing" of role models** takes place to make sure they fit and meet expectations (Ibarra, 1999);

- 4) **the connection** of the development of professional identity **with the professional “I-concept”** and self-image (Schein, 1993; Garleja, 2006; Пряжников, 1996; Пряжников, Пряжникова, 2001; Callanan, 2003; Sveningsson & Alvesson, 2003; Зеер, 2006). The professional “I concept” determines the search for and discovery of personal meaning (Толочек, 2005; Могилёвкин, 2007) allowing one to answer the questions of professional identity: “what I am”, “what I am not”, and “what I would like to be”. „Self-image” determines the way in which teachers teach and the way they are developing as teachers, and how their attitude forms towards changes in education. It also reveals the existence of a link between learning about identity and learning about the job they want to do;
- 5) the development of teacher’s professional identity in the study process (Timoštšuk & Ugaste, 2010; Mikelsone & Odina, 2016^a, 2016^b). The link between learning reflection and the formation of a teacher’s identity is recognized as a goal for better educating students to perform a teacher’s job. The key objective is how teacher educators can educate teachers who can support students’ academic progress and reflect on their own professional activities. Britzman (2003: 31) states “Learning to teach is not a mere matter of applying decontextualized skills or of mirroring predetermined images; it is a time when one’s past, present, and future are set in dynamic tension. Learning to teach – like teaching itself – is always the process of becoming: a time of formation and transformation, of scrutiny into what one is doing, and who one can become”.

Timoštšuk & Ugaste (2010) have defined the teacher’s professional identity as a self-esteem of a person revealed in learning situations and relationships, manifested in practical professional activities, affiliation and learning experience. Studying student teachers’ professional development, Korthagen and Vasalos (2005) indicate that they most often reflect on 6 levels: (1) the level of environment; (2) behaviour; (3) changes in competences, (4) beliefs; (5) professional identity, and (6) mission. These levels are mutually influential, but exactly the changes happening on higher levels – professional identity and mission – characterize the core of the novice teacher’s personality (Korthagen and Vasalos, 2005).

Flores & Day (2006) define professional identity as a continuous and dynamic process, which means visualizing and reinterpreting one’s values and experiences that can be influenced by personal, social and cognitive factors.

Rodgers and Scott (2008: 733) have summed up four basic concepts for understanding the concept of *identity* today:

- 1) identity depends on and is shaped by the perception of social, cultural, political and historical contexts;
- 2) identity is formed in relation to others and includes emotions;
- 3) identity is variable, unstable and multiple;
- 4) identity is created and reconstructed over time through stories.

Reflection as a tool for understanding professional identity

The understanding of one’s professional identity can be ensured by the reflection that makes a person more aware and informed of what has been mastered and creates understanding in the sense that a person is able to change one’s attitude, behaviour and performance in individual and professional contexts during one’s life time (Mikelsone & Odina, 2016^b; Cottrell, 2013). Dewey (2012: 35) has indicated „We do not learn from experience ... we learn from the reflection on experience”. Reflection and its manifestations have been studied in the works of many authors (Schon, 1983; Van Peet & Kroese, 2013; Callanan, 2003; de Bono, 2012; Cottrell, 2013; McMillan & Weyers, 2006; Mikelsone & Odina, 2016^a) and they all point to the specific activities of reflection:

- 1) description of the event / activity and its evaluation from different points of view;

- 2) description and evaluation of specific skills and activities, identifying what is good and what needs to be improved;
- 3) evaluation of the results obtained, ascertaining how / in what way the result has been achieved;
- 4) analysis and identification of what steps should be taken to repeat this result;
- 5) putting in words lived experience and informing others about one's understanding and vision.

Thus, it can be said that reflection is an essential strategic tool for progress and development. The studies of Dewey (2012) and Schon (1983) provide evidence that reflective actions can take place in two ways:

- 1) within the process – at a specific time / moment when the action itself occurs, referring to reflection-in-action. This reflection happens spontaneously, turns out unintentionally as a quick response to what is happening and provides an opportunity to respond flexibly to the particular situation and prevent one from falling out or falling back. Beard and Wilson (2006: 246) refer to it as “concurrent learning”;
- 2) after action has happened and it has triggered senses and caused feelings that can be called reflection-on-action. This is systemic reflection that creates the meaning of learning and understanding and allows one to change behaviour and attitude. It is planned, supported, involves contemplation. Beard and Wilson (2006: 246-247) term it as “retrospective learning and coached reflection”.

Both Dewey (2012) and Schon (1983) support the idea that the most important value of reflection is to make clear what has been learnt and understood. Beard and Wilson (2006: 35) believe in deep learning – experiential learning: undertaking the “analysis of experience retrospectively, concurrently or prospectively, i.e., with reference to the past, the present or the future”.

But in every case, in order to reflect, it is important to know the purpose and focus of reflection, such as whether reflection is connected with personal development or if it is related to a specific learning activity, or research on understanding one's professional identity. The purpose of this study was to find out how the perception of professional identity was connected with novice teachers' educational background.

In order for novice teachers to reflect on their professional identity, it is essential to contemplate on the following questions:

- 1) “what changes the novice teachers' experience, meaning of life and professional „I concept”?”
- 2) what brings maximum benefit when professional identity is in harmony (merging) with personal identity?
- 3) how to use one's experience for further successful self-determination and creative professional activity (Mikelsone, Odina and Grigule, 2014) and how reflection strategies have been applied?” (Mikelsone and Odina, 2016^a: 240).

Research design, sample and data collection methods

Phenomenological research has been lasting for four years to explore the teachers' perception of their professional identity. Since 2013, 106 master students of the study module “Education for Well-being and Cohesion” of the professional master study programme „Teacher” have completed the course „Educator's Professional Identity and Pedagogic Mastery”. The aim of the course is to improve the understanding of the educator's professional identity and skills to evaluate pedagogic mastery. Among other objectives during the course, students are supposed to enlarge the knowledge and critical understanding of theories and good practice examples of the educator's professional identity in the national, European and global context; examine the contribution of the educator's professional identity to solving problems of well-being and harmonised

development. The learning outcomes of the previously mentioned objectives have been measured by reflection-on-action in the format of four independent assignments in the format of MAX and take-home exam paper: “The evaluation of my professional identity: My professional teacher’s story”. The reflection-on action has been chosen due to its retrospective nature as the intervention has been planned for specific times to involve students in contemplation about their “previous personal experiences, analysing them and then developing personal theories of action” Beard and Wilson (2006: 246).

The reflection tool MAX (Motivation – Acquisition – Extension) has been used to complete unfinished sentences usually after learning activities:

3 things I learnt/ heard/ understood

2 things I want to try/ I will use

1 thing I would like to examine in more detail/ I did not understand (Mikelsone and Odina 2016^a).

Three things show learners’ motivation, two things give the evidence of the acquisition and one thing demonstrates learners’ readiness to extend the acquired, to apply in practice.

Take-home exam papers “The evaluation of my professional identity: My professional teacher’s story” were written as narrative essays.

Pre-service teacher education represents the entry point into the profession, and the way it is organised plays a key role in determining both the quality and the quantity of teachers, as well as hypothetically the novice teachers’ perception of their professional identity. According to the gained experience during the pre-service teacher education process, the group of 106 students of the professional master study programme „Teacher” represented three models of the entry point into the teacher’s profession: novice teachers who have obtained the teacher’s qualification via a concurrent model, consecutive model and alternative model “Mission Possible”.

If pre-service teacher education is organized according to the concurrent model, academic subjects are studied alongside educational and professional studies throughout the duration of the course (Musset 2010). Students get integrated learning experience since education, psychology and content knowledge of one or two subjects take place at the same time. Students are supposed to take the decision whether they want to become teachers at a very early stage in their university studies. Thus, in Latvia they obtain the qualification of two subject teachers in four years, and there is a regular connection with schools.

“In the consecutive model, the specialized courses in pedagogy and in teaching are accessible after having completed another degree in a discipline taught in school (students are educated first in a specific discipline and then they receive pedagogical training)” (Musset 2010: 19). Such teachers have a strong subject expertise, but they can have a weaker knowledge in learning techniques and in pedagogy in general. According to Musset (2010: 19-20) “since they have studies in two different cycles, where they learn two different aspects of the teaching profession, their learning process is fragmented, rather than integrated. In the majority of the OECD countries, initial teacher education for secondary schools is consecutive, which means that their professional identity, as opposed to primary school teacher, is not constructed around teaching but around the subject which they specialize in”. If pre-service teacher education in Latvia is organized according to the consecutive model, students obtain the qualification of one-subject teacher in five years, where the last two years are connected to school teaching.

One of the most recent and important trends in teacher education is the development of alternative pathways into the teaching profession, like Teach for America created in 1990. This programme has inspired similar programmes: “DC teaching Fellows, Phoenix Teaching Fellows, New York Teaching, Teach First (in the UK), Teach First Germany, and Teach for Australia” (Musset 2010: 24) and “Mission Possible” in Latvia. The programme recruits university graduates with other backgrounds and professionals with no particular knowledge in teacher education for a two-year teaching position in a school. The programme offers a six-week summer

course and mainly provides teaching practice at school, “low priority is given to educational theory and research and to scientific knowledge. They rely on the candidates’ previous education to provide adequate grounding in subject matter. The curriculum itself emphasizes learning by doing” (Musset 2010: 22).

Stratified purposive sampling was used to choose extreme cases – the most representative three novice teachers having obtained teacher’s qualification via concurrent model (CC), consecutive model (CS) and alternative pathway “Mission Possible” (MP) each year.

To find out how the perception of professional identity was connected with the novice teachers’ educational background, the data of nine novice teachers’ 45 reflection samples applying the reflection tool MAX (36 samples) and 9 narrative essays were analysed in the context of professional identity and educational background over the period of three years.

Data and Discussion

Reflection-in-action was used during the seminars to get instant feedback on the activities, but the data were not specifically recorded for this research. Reflection-on-action was used to collect in-depth data. Novice teachers with diverse education backgrounds demonstrated different ways of how professional identity was perceived and reflected upon. By exploring the evaluations of novice teachers’ professional identities: “My professional teacher’s story” and independent assignments MAX, a number of specific characteristic features of the perception of identity were outlined in each target group. By analysing and comparing these features, it was concluded that not all were equally distinct and characteristic to each group (Table1.).

Table 1. Features revealing novice teachers’ perception of professional identity

Alternative model “Mission Possible” (MP)	Consecutive model (CS)	Concurrent model (CC)
self-analysis/ introspection	self-analysis/ introspection	self-analysis/ introspection
values of organization culture	intentionality	intentionality
affiliation	finding personal meaning in career	self-image

Common features to all novice teachers: self-analysis

Identifying three most pronounced, dominant features, self-analysis/ introspection was found as a common feature for all groups. Based on the definition of Latvian Dictionary of Educational Concepts where *identity* is explained as self-awareness, self-acceptance, self-reliance, self-esteem in behaviour and ability to make decisions (Skujina et al 2000: 62), self-analysis also reveals different aspects of personality.

“With interest, I caught ideas and studied the ways to learn more about myself” (MP 1), “I have started to explore myself as a person only in the last year. So far, I have not tried to analyse and understand the principles of decision taking” (CS 2); “I have learned so much in the last year, maybe not so much academic knowledge, but I have discovered myself and the nature of teachers. I really liked this approach that we looked at everything through the prism of our personality” (CC 2).

As identity is variable and depends on the situation in which a person is present (Mikelsone and Odina, 2016^b), it also reflects the person’s vision and point of view. *“... I wrote a diary that helped me to identify the situations I succeeded in and was good at if I tackled things with ease and naturalness without artificially darkening*

colours. It's hard to explain this feeling, but I remember it as a very clear revelation after a period of longer depression, when I promised myself that I did not want to end up like this anymore" (MP 2).

"... it is extremely important to give time and space to people's free work, contemplation, reflection on their actions, while giving them the foundation on which to build this freedom – by giving justification, basic rules, formulating expectations and hopes" (MP 2).

It confirms that the essential element of professional identity is the **professional "I-concept"** that is "based on regular self-assessment and exploration of the further goals" (Mikelsone, Odina, Grigule 2014: 241). "I have learned this skill [to analyse myself, my emotions and activities] very well for 2 years while I was a member of the programme – writing weekly career advancement notes, reflecting on my thoughts and benefits at the end of each lesson, analysing my lessons together with the mentor, writing the semester and annual evaluations" (MP 3).

"The most important thing that I have learned from all this is that I am too demanding to myself, too much in orderliness. Everyone is proud of me, but I just put up new and new challenges for myself, why? Because I want to improve, sometimes I am too demanding to myself. I have no idea at the moment what I will do after I finish my master's degree programme" (CC 2).

"From selfishness I passed to self-analysis. In the past, I was accused of saying that I always talked about myself, but then I realized that, in fact when listening to someone, I was reflecting through myself and trying to imagine myself in their place. I was looking for similar situations in my experience" (CC 1).

Another aspect of self-analysis unfolding in identity stories and MAX evaluations involves the ability of future teachers to reflect on their own feelings. This allows one to succeed in everyday life, since the ability of future teachers to reflect honestly and openly on their personal and professional progress also reveals the understanding of their professional identity (Mikelsone and Odina, 2016^a). "Analysing myself at the moment, it seems to me very important that I have learned much better to recognize my emotions and express them aloud, how I feel and why" (MP 3). Developing an emotional competence, novice teachers develop their self-belief and self-confidence, which gives an inner vision for **the value of reflection**. "Two things help me in the analysis – the structures that I use, thinking, reflecting on experiences and talking with people. Structures and forms can be different, but it is important that they are – in the format of questions, schemes or processes" (MP 2).

One more aspect of self-analysis present in the novice teachers' reflections, is **the relationship with other people**, which manifests itself both in the need to know what and how others value and perceive them and the need to understand others. "In the teacher's profession I myself learn to accept the opinions of other people and start taking the advice given by them not so personally" (CC 1).

"... I want to start with the quotations that students write about me as a teacher in the open questions of the annual opinion poll ..." (MP 3).

„ ... I seized all the opportunities to learn more about myself. For example, in the blind spot I learned a lot about myself because I did the Johari window activity with my students, friends and acquaintances" (MP 1).

„It must be said that good relations with people, peace and harmony are what I consider to be extremely important" (CC 3).

„Here’s another ego cookie for me when I recently learned from my friend, who also completed the programme of physics and mathematics teachers that Mencis [professor] has given snippets from my graduate paper to future teachers as an example” (CC 2).

Data also reveal that novice teachers are looking for a lot of similarities in their activities, feelings, and thoughts with **meaningful people** who are close, such as grandma, or publicly known people – writers, professors, mentors, etc.

„ I am pleased to associate myself with people whose strength is logical thinking, including my grandmother who also graduated from the same programme...” (MP 1)

„Thanks to Mencis [professor], if it was not he and we had not had a friendly relationship, then I would not be where I am at the moment. He is one of my inspirational sources ... and there is no such other person with his personality and a view on mathematics, he fascinates and captures people around” (CC 2).

In some cases, it could even be called identification with people who are important to them “... *in the scenes where in childhood Ziedonis [writer and poet] was stubborn, I had the feeling that I was literally looking in the mirror*” (MP 1) or “*I came across similar feelings when I visited the exhibition dedicated to the centenary of Professor Janis Mencis (Senior) and his work. The more I read the memories of the professor’s family members and contemporaries, the more I thought I was constantly comparing and drawing parallels with myself*” (MP 1).

A specific self-analysis feature is revealed for the novice teachers of the alternative model “Mission Possible” background – they are very critical of those people whose vision, beliefs, values are different from theirs – they do not recognize them or are looking for the excuse of their own actions that they are others, not the same as “myself”. “*As I wrote in MAX, I’m intolerant to selfish, self-centred people. Since in my everyday life, thankfully, I do not meet people like that, I have not had a situation in which this aspect of identity could pop up*” (MP 1).

“I have understood that I feel discomfort if the validity of my decisions is questioned” (MP 2). “Also, in this course, I appreciate the significant episodes where we were deliberately encountered with the diversity of people in behaviour and attitudes, such as ... workshop which made it very vivid to reflect on what I would never do as a tutor of the group and how I would never want my students to feel” (MP 2).

“I feel growing anti-reaction – either to the way the teacher treats the students or the idea – money determines the value of the idea” (MP 2).

As identity changes in any new situation, it is possible to notice its new aspects and look at oneself from aside. The data allow us to conclude that understanding the manifestations of one’s identity also happens in comparison with others “*as the knowledge of the unknown part of Johari windows suddenly pops up, and you become aware of such a ‘forgotten’ thing about yourself. This year I remember very clearly two such moments. In both cases, sudden self-knowledge came about when I was watching and hypothetically comparing myself – how I would have acted if I were in a situation like this?*” (MP 1).

Identity always talks about the relationship between the individual/s and the other one/ people. It either connects people or divides them revealing both the personal and professional aspects of self-development – which makes people the way they are “*always first asking questions and finding out situations, rather than assuming that I already know why a person has acted in one way or another. Asking questions to myself is also a tool for self-development ...*” (MP 2).

Thus, it can be concluded that the self-analysis feature of professional identity reveals the awareness and integrity of one's personality and professional "I-concept" that is based on regular self-assessment and exploration of the further goals; a subjective vision / view of the situation and the ability to reflect on one's feelings that allows one to succeed in everyday life; relationships with other meaningful people, meaning to know on what and how others value and perceive them and understand others.

Common features to teachers of consecutive and concurrent models: intentionality

A common essential feature – intentionality in the choice of the profession has been identified in the reflections of novice teachers representing consecutive and concurrent education models. With a mix of support and uncertainty and doubts about the chosen professional path, the representatives of consecutive and concurrent education models express their firm beliefs and certainty about their choice.

"I am proud of my profession in the sense that I like it, and what I do, and I tell this to my friends and colleagues. I have felt badly disdained contempt about my choice of teacher's profession from some of the acquaintances ("What? You will study to be a teacher?!" pronounced in a tone, as if I had done something indecent). I'm proud to say "yes, what is wrong about it?!" I love teaching students, developing their personalities to enable each of my students to be a capable and competitive citizen" (CS 1).

"Some colleagues are asking me why I am so young and bury myself at school. My answer is that I do not consider my life buried, but raised up to a new – higher level because at school it is always necessary to study and perfect myself throughout my life; it does not allow us to sink and stop in development" (CS 1).

„From then on when adults asked me what I was thinking of doing once I graduated from school, I would answer "something to do with English or history." I didn't want to admit it yet since the field of education has a bit of a negative stigma ..., but I was already almost certain that "something" meant "teaching" (CC 2).

By agreeing that identity always tells about the relationship between the individual/s and the other one/ people, the professional identity is also personal because it reveals the "what makes me". It can unite people or divide them (Mikelsone and Odina, 2014).

Thus, it can be concluded that both the consecutive and concurrent model representatives understand their professional identity through relationships and their views, where the main emphasis is to strengthen their self-esteem and self-image. A person's own view of their activities and the development of professional identity become evident through relationships and emotional feelings of an individual.

Individual features of alternative model "Mission Possible" novice teachers: the values of organization culture and affiliation

The participants in the study, whose pedagogical experience is related to the "Possible Mission" organization, specifically accept the culture and values of this organization in developing their own understanding of the identity of the teacher's professional culture of work. *"Of course, the most important role in shaping my teacher's professional identity and mastery has been to the experience that I have received as part of the*

“Mission Possible” programme” (MP 3). As participants recognize the culture and values of the particular organization essential, they expect the same cultural environment and values to be present in the schools they work at. If this does not happen, which is true in most cases, young teachers feel disappointed. *“At the end of the fifth year, I began to get tired of it. Not because I would not be able to adapt to such sudden changes, but because there were still ideas and plans that I wanted to implement with students for all 100%, not just when I was happy to intercept them from music and choir rehearsals”* (MP 1). In this case, this novice teacher changed his working place, but not job.

It is important to note that the culture and values of the MP organization have affected the personal and professional identity of these novice teachers. *“Exactly the experience in the programme helped me to see myself from aside, where I criticized and blamed myself too much, got unproductive, instead of putting energy into productive work”* (MP 2).

“By applying for Mission Possible, in the spring of 2009, I had to pass a four-round selection, one of which was the management competency test. I still look at this test report with interest and find new insights that are relevant to me now, five years later” (MP 1).

This is what makes the difference between that particular organizational culture and other educational environments because MP teachers recognize reflection and its acquisition as one of the competences that teachers need. Once reflection is mastered, it allows one to independently analyse, understand the content of the activity, the context, and be prepared and open to changes, which in other cases is not so clearly expressed due to the lack of teachers’ reflection. This allows the conclusion that the experience gained directly by MP members, entering the educational environment, allows us to associate them with the words “change” and “innovation”. *“Experience in Mission Possible showed me that in order for a person to develop, she/he must be outside her/his comfort zone, the goal must be higher than it seems to be achievable at the moment”* (MP 3). The ability to conduct reflection-on-action regularly generates a sense of learning and understanding of action. Getting out of one’s comfort zone creates new understanding and reveals the interactions between certain activities, which then have generated the result. Such new understanding provides the basis for new changes.

Reflecting on their individual skills and knowledge, MP teachers associate them with the organization’s common goals and disclose their understanding of their professional identity in relation to the “learning organization” (Senge, 1990). Thus, it can be assumed that it is essential to implement student reflection in the study process to make the school “an organization that learns” and MP teachers can greatly contribute to this with their own experience.

Another characteristic feature of the identity directly attributable to the MP group is the affiliation – sense of belonging to different social groups – the family, organization. *“The sense of belonging is essential for me as a professional to feel well – belonging to the community, team, ideas and values in a specific community. Recently I have come to the conclusion that I am working very inefficiently in an environment in which I do not feel affiliated, in which relationships are formal or artificial”* (MP 2).

Reflecting on their professional identity, all members of this group feel strongly affiliated to the organization, even after several years. The next group that forms the feeling of belonging is the family. *“Belonging as a state and as a value is in the centre of my identity – my personality has been very strongly influenced by family and childhood experiences – my parents are teachers, and I’ve been growing up in the environment where education is highly valued and has been put forward as a priority over many other things. I think that my family, home and family affiliation have put essential fundamental values in me as personality and professional – independence in making decisions, responsibility for work, humanity and tolerance”* (MP 2).

“I come from a large family I feel well when everything is in order with them (sisters and brothers), when they are happy and I feel depressed if it is not so” (MP 1).

Agreeing with Ropo (2009) that identity forms in both individual experiences and group/ peer relationships, it can be said that the teacher’s professional identity is an ongoing learning process, where the behaviour, the sense of action and the social context play a role. Professional boundaries are closely related to the boundaries of personality and reveal how an individual interprets oneself as a certain person and recognizes oneself as such in a particular context. *“Symbolically our internal reserves come from our places of origin” (MP 2).*

Thus, it can be concluded that the MP teachers’ perception of professional identity maintains the influence of the organization, since novice teachers recognize culture and values as important for themselves and retain a strong sense of belonging to it. The acquired organizational culture and values are also expected in other institutions/ organizations where they work. If these values do not match, it causes dissatisfaction and professional disappointment. The competence to reflect on their professional activities is a significant benefit acquired in MP, which creates a sense of learning and understanding of activities and provides a basis for new changes.

Individual features of novice teachers of consecutive model: finding personal meaning in a career

By analysing the reflections of the participants of a consecutive model, one distinctly predominant feature in the perception of professional identity for this target group can be identified: finding personal sense in a career.

Career is the subjective judgments of a person about their professional future, the expected possibilities of self-expression, it is individually conscious behaviour and position based on professional and life experience in general (Mikelsone, Odina, Grigule 2014). *“Career development has so far not been smooth, so my professional skills have not yet evolved sufficiently, and I believe that knowledge I have got is still not enough. On the other hand – I belong to those lucky people who have worked all the time in the works that they like very much. Consequently, as the main aspect that characterizes my teacher’s identity, is the subject I teach – I am (or at least certainly was) a historian and only then a teacher” (CS 3).*

“My professional identity has begun to develop in my childhood, but I have to say that I only recently have become aware of myself as a teacher” (CS 1). It can be said that career management is subjective and can be viewed from the person’s perspective on one’s own activities. *“I have started to explore myself as a person only in the last year. Before I did not try to analyse and understand the principles of decision-making” (CS 1).*

“Working at school, from a historian’s point of view, I arrived at the conclusion that this work is degrading – a teacher has to orient well in all the periods of history, so it is difficult to go deep into a particular field professionally” (CS 3).

The individual’s success of subjective career has a much greater impact on his or her career development (Hall, 1996; Mikelsone, Odina, Grigule, 2014) because from a subjective point of view, an individual creates one’s own vision of a successful career and creates one’s own professional identity. According to (Hall, 1996), a teacher, who does not feel personal satisfaction about his/her life in general, who does not feel the impact of professional growth as part of his/her life perfection, also loses optimism and zest in professional activities. Therefore, subjective achievements of one’s career are very significant as they make a person a lot more responsible for one’s career development.

Besides, this also means that the person is responsible for their own career and its development, *“I wanted to spend more time planning myself and realized that computer work was definitely not for me. At one point I gave up and resigned. I had not found or even seriously considered another job, but I could not stay there anymore”* (CS 2). *“Anyway, I was ready for changes, and then came a job offer to work in a private company, to make proposals for chemical equipment and supplies. Well-paid, stable work with promotion opportunities. But every day more and more I felt unhappy about it. I hated going to work every day at a certain time and at a certain time going home and spending the whole day at the computer”* (CS 2).

Thus, based on Schein’s (1993) research on the goals of professional development, it can be said that the development of a professional identity takes place gradually, through the development of one’s own awareness (professional, life, personality), independent planning, adjustment, readiness to analyse oneself and independently finding personally significant meaning in a particular professional activity.

Individual features of novice teachers of concurrent model: self-image

The novice teachers of the concurrent model have explained their understanding of professional identity by such a feature as self-image. Self-image reveals the individual’s subjective vision of themselves and their situation, how they see their world and how it is understood. By integrating the cognitive sphere with self-image and beliefs about oneself, a person makes choices in the favour of one or another profession. *“Since the 1st form, I have been independent, I have never been a book worm – everything was always done without special effort, except for chemistry. However, with my school mate we had our own business or agreement, I helped her with languages, and she helped me in the subjects of natural sciences”* (CC 2).

“I think that the beginning of the profession of a teacher is to be found in my childhood when I unconsciously seated the dolls around desks and enthusiastically taught them something and corrected their assignments. However, during school time, I did not deliberately aim at a teacher’s profession. I was interested in psychology. When in the final form of high school, I was invited to the competition: “I will be a teacher!”, I resisted it for a long time” (CC 1).

Often in early childhood, people “see a vision” of their potential career. For some it is connected with parents’ place of work, where they have often stayed; some want to resemble a pleasant and admirable personality. *“I had an idea that I want to become a teacher early in my childhood, especially when I was in Form 1. This urge manifested itself in the never-ending games with the brothers and sisters playing school”* (CC 3).

“Actually, I had the idea that I could become a teacher only in primary school when everything was still new and unknown. Later there were many other ideas not connected with teaching and then I returned to the thought of a teacher’s profession when I was in high school in Form 12. I also realized that most of all I was interested in pre-school idyll. Perhaps because I had grown up in a large family and got used to children around, but probably because I have always had wonderful contact with nieces and nephews ...” (CC 1).

It can be concluded that the interest of the novice teachers of this model in the profession of teacher has already emerged in childhood, during school time. Developing their self-image, novice teachers have gradually mastered the nature and role of this particular profession as creating a self-image means knowing what I am and what I want. Relatively, it is a lasting image of thought that a person develops in terms of their abilities, skills, knowledge, competence and individuality. Thus, the representatives of this model are clearly aware of when they

have become interested in the teacher's profession, which in their professional identity is reflected as the acceptance of the teacher's role.

Conclusions

1. The tool of the development of the teacher's professional identity is reflection that promotes both personal and professional development and is considered a compulsory teacher's competence. It allows the implementation of changes and ensures that the school is "an organization that learns".
2. The process of the reflection reveals emotions, therefore identity is created and reconstructed over time through stories.
3. The evaluations of the novice teachers of three different education backgrounds reveal that their identities have been formed in relation to others, therefore they are variable, multiple and changing; they have been shaped by their perception of various contexts, especially social and cultural.
4. It is possible to notice and understand others only through self-perception, self-analysis. It is important for teachers to master the skills to analyse themselves and use these skills as an important tool for further planning of their activity, behaviour and performance.
5. In order to enrich their professional identity, it is important for novice teachers to gain new experience in different social groups and communities, strengthening and developing a sense of belonging.
6. Affiliation to the organization is very evident for the alternative model novice teachers and is almost never mentioned in the reflections of the consecutive and concurrent model novice teachers, probably it is easier to belong to a smaller and closed organization than formal higher education institution, but it could also be the issue of the service provided and attention received. Consecutive model teachers tend to associate themselves more with the subject they teach, concurrent model novice teachers are more oriented to the relationships, social groups.
7. Consecutive and concurrent model novice teachers' decisions about the choice of the career are more self-determined and based on their childhood intentions, as well as also influenced by mutual relations. The reflections of the alternative model novice teachers do not reveal they have entered the teacher's profession by taking a purposeful and well-considerate decision a long time ago, but rather as being chosen by the board of experts. They associate themselves more with being leaders, which is also the vision of the programme.
8. Finding personal meaning in the teacher's profession and belief in the teacher's career from one's future perspective are based on the feeling of satisfaction with the choice of the teacher's profession. It is also reinforced by professional self-confidence, which is based on the conviction and determination that the personality is compatible with the teacher's profession.
9. Based on the novice teachers' reflections in the course of the accumulating teaching experience, they have become increasingly aware that to be a good teacher one does not need to be a top scientist in one's field. Being adequately competent in the subject and keeping abreast with world scientific achievements in the

field are sufficient. Indeed, since teachers cannot know everything, they need to acquire alternative methods in order to transmit the existing knowledge more qualitatively.

10. When supporting the development of professional identity, it is important to offer a possibility of reflection on ideals of both one's past and present to all in the higher education teaching process.

Abstract

The main purpose of this study is to understand the reasons why teachers undertake in-service teachers training as a factor of professional development (PD). It is an interpretative study belonging to the category of educational case studies and ethnographic studies. The study was made in five schools which are associated to the Marco de Canaveses and Cinfães In-service Teachers Training Centre (ISTTC). The data in this study was collected in two different ways: by applying an enquiry to 450 teachers (N=450) in the five schools selected and by analysing the data previously collected within the process of asking teachers to evaluate teachers training courses organized by the ISTTC (218 enquiries analysed) (n=218). The main conclusion drawn from the study is that professional development is designated by almost all teachers enquired as the main motivating factor for joining teachers training courses.

Keywords: Professional development, teachers' in-service training, teachers working conditions

Introduction

In recent years, the issue teachers' professional development (PD) has been gaining a growing importance both at an international and at a national level for various reasons. These reasons are both social and sociological, economic and professional, pedagogical and didactic, legal and academic.

Rodrigues (2007) lists four reasons for the recent focus on this subject. The first one, arising from the field of psychology, is rooted on the developmental theories of Piaget (1983), who rejected unidirectional influences on the individual and emphasized the importance of the interaction between his internal dynamics, his self-regulating and adaptive processes and the environment that surrounds him. These theories, which were initially applied to the childhood development stages, expanded rapidly to the adult life stages and to his professional life, thus becoming a framework for the concept of "life span development" (Lerner & Hultsch, 1983).

Together with this concept, one can find the globalization, the technological advances, the constant changes in the means of production, in the entertainment industry, in personal relationships (Lerner & Hultsch, quoted by Rodrigues, 2007, p. 25). All these changes, which can be more obvious for some people than others, forces teaching, just as any other professional activity, to a need of permanent self-questioning and updating, in order to be able to correspond to the demands of consumers.

The third reason that Rodrigues points out is the need to break myths which associate bad teaching practices either to very early career stages or to more advanced ones. There are studies which include teachers' professional development models, referring to the vision those teachers have of the whole school system, the kind of relationship they establish with its rules, the priorities they set for their action, among other factors. Some examples are the "Berliner expertise model (1988)", the "Dreyfus skills acquisition model (quoted by Éraut, 1994, p. 124) and the "Huberman model (1992, quoted by Flores, 2012, p. 75).

The fourth and last reason given by Rodrigues for this growing interest on the subject of teachers' PD is the existence of a tendency to believe that it is only through practice that a teacher achieves his or her real training, which would bring the academic component of the training to a second plan. This position is based on principles

such as the teachers' implicit professional knowledge (Doyle, 1979, quoted by Rodrigues, 2007, p. 27), the possibility of describing the teachers' professional knowledge through the explanation of their tacit knowledge (Elbaz, 1983, quoted by Rodrigues, 2007, p. 26) and the use of that knowledge as a guide for the listing of the principles of a good practice (Carter et al, 1998, quoted by Rodrigues, 2007, p. 26).

As far as teachers' professional development is concerned, this is a concept that together with "teachers' identity" is not yet clearly defined in most teachers' conceptual framework and it is frequently mistaken for in-service training. Similarly, "teachers' identity" runs the risk of being mistaken for teachers' rights and duties. Day considers that PD involves all the spontaneous learning experiences and all the consciously planned activities, which are carried out aiming at the direct or indirect benefit of the individual, the group or the school and contribute through them for the quality of the education in the classroom (Day, quoted by Flores et al., 2009, p.75).

This very direct involvement of teachers in their task, this attitude of commitment, a word Day uses very often (2007; 2014), can also be found in Fullan, although in a less emphasized way. The latter defines PD as follows: any activity or process which seeks to improve skills, attitudes, understanding or performance in current or future roles (Fullan, 1995, quoted by Flores et al., 2011).

In fact, the speed at which social changes and the changes in the educational system take place lead to a situation where teachers are constantly assigned new roles and new functions. Many of these roles and functions go far beyond the field of their subject areas and of Education Sciences (Rodrigues, 2011, p.136).

In this context, teachers' training has to be looked at from the point of view of a set of competencies that teachers have to reveal while performing their professional activity. In this case, "competency" should be understood as the effective mobilization in specific situations of previously acquired knowledge, capacities and values (Rodrigues, 2011, p.137).

In the "Communication from the Commission to the European Council and Parliament - Improve the quality of teachers' academic and professional training" from 2006 (quoted by Rodrigues, 2011), the European Union issued a set of general competencies for the European teachers, among which three can be selected:

- To work in multicultural contexts (in order to understand the value of diversity and respect for what is different);
- To work in close collaboration with colleagues, parents and with the community in general;
- And (...) it would also be a big advantage if teachers had the opportunity of acquiring, developing and using leadership competencies.

If this set of skills are aimed at in the in-service teachers training in Portugal they will meet one of the areas that has been more questioned at least since the implementation of the In-Service Teachers Training Centres (ISTTC) in Portugal, which has already conquered an iconic value in the field of change induced by training and can be conveyed through the following question: to what extent can in-service training promote the transformation and improvement of teachers' practice?

In the opinion of Formosinho, Machado e Mesquita (2014) the Portuguese teachers' in-service training model is open to "training focused on school as a social and organizational unit" that ensures "the political-administrative and territorial feedback of training". It has to be remarked, however, that from 2003 onwards, with the arising of some restraints on teachers training financing, the ISTTC became a kind of central management "agencies", putting into practice training plans designed at a central level.

Formosinho *et al.* points out that the effectiveness and efficiency of the ISTTC action continues to legitimize itself within the field of in-service training, focusing currently on the satisfaction of teachers and schools' demands for the constant requirements arising from the educational policies of the various governments (2014, p. 126).

The National Council for Education (NCE) issued a "Recommendation on In-Service Training for kindergarten, primary and secondary level teachers" in 2013. The opinion contained in this document suggests a balance between the training that teachers should get at school and the one that results from national training plans, based on the good results achieved through that experience on previous occasions.

The component of the training plan which is more focused on school should be adequate to the specific circumstances in which it is held and it is not necessarily effective in all contexts. This component should be designed with a broad participation of teachers in order to prevent, among other things, a unilateral conditioning of contents by the school director, who is the main leadership of Portuguese schools currently, or by the middle leaderships.

Vieira believes that the educational practices and training can be frequently labelled either as reproductive or as transformative. It is important at each moment to understand where we are and to learn how to work in the space between what is real and is ideal, building re(ide)alistic practices. It is in the middle space, one with a hybrid nature and undefined borders, that we can find the possibility of exploiting more humanistic and democratic practices, assuming that the lack of humanism and democracy is the main reason for that effort (2015, p. 218).

The issue of participation of teachers in in-service training plans is one of great importance since it allows not only the measurement of the PD process itself but also of the identity issues that have an impact on teachers' work. We believe that the logics of participation of teachers is a crucial sign of teachers' current professionalism, between "reproduction" and "transformation".

Method

This article gives an account of the results obtained in research whose main purpose was to understand the logics of participation of Portuguese teachers in in-service training as a factor of DP.

The research questions were stated following the literature review and the empirical data collected as follows: Hypothesis 1 –

The majority of teachers recognize that in-service training plays a positive role in the transformation of their practice, but they don't associate it with their PD.

Hypothesis 2 – The majority of teachers take part in in-service training, but are rarely available to play an active role in its planning and implementation.

Hypothesis 3 – The majority of teachers take part in in-service training regardless of adverse work conditions.

Hypothesis 4 – The majority of teachers and educators believe that the in-service training courses they take are not valued by the leadership of their schools.

The research which was made may be included in the large category of educational case studies for its empirical nature, for its object, which may be considered important material for the educational system, for its purpose, which is to allow an intervention on that same system and for the data collection methodology, which, by ensuring the reliability of the data, makes that intervention possible.

Simultaneously, it has characteristics of an ethnographic study: the researchers stayed at the research site for a long period of time, thus gaining the status of participant observers, which gave them the possibility of making an in-depth analysis of the problem to be studied and an overview of the factors that constituted influence on the behaviour of all the participants.

As data collection techniques are concerned, two surveys by questionnaire were used: in the first case the questionnaire was applied to a sample of teachers selected among those working in the schools which are associated to the MarcoCinfães IISTTC (Table 1); in the second case, the questionnaire was applied to teachers who attended in-service training courses at MarcoCinfães ISTTC between 2012 and 2015 (Table 2).

Table 1. Characteristics of the schools associated to MarcoCinfães ISTTC in which the questionnaire was applied

Schools and Schools Units	Number of questionnaires distributed	Number of questionnaires returned	Response Rate
Marco de Canaveses Schools Unit	175	123	70.26%
Alpendorada Schools Unit	125	56	44.8%
Cinfães Schools Unit	50	50	100%
Secondary School of Cinfães	50	24	48%
Vocational School of Agriculture and Rural Development of Marco de Canaveses	50	25	50%
TOTAL	450	278	61.78%

Table 2. In-service training courses in MarcoCinfães ISTTC between 2012 and 2015 whose evaluation by teachers was analysed

Typology of action	Number of hours	Year of assessment	Area of Training	Number of trainees who attended the action
A1	25H	2014	Early	29
A2	25H	2014	Intervention Sex Education in Schools	32
A3	25H	2013	Pedagogical	28
A4	25H + 25h)	2013	Practice Specific	10
A5	15H + 15h)	2013	Didactics Interactive White Boards	18
A6	25H + 25h)	2012	Special Needs Education	22
A7	25H + 50h)	2013	School Self-assessment	19
A8	25H + 50h)	2014	Teaching Performance Evaluation	21
A9	25H + 50h)	2013	Pedagogical Supervision	49
			Total	218

In what concerns data analysis, the software programs used were the SPSS (Statistical Package for Social Sciences), version 18, and MS Excel 2016 Preview. The analysis of the answers to the open-form item was made using the content analysis technique.

Findings

Findings from the survey by questionnaire (table 1)

The participants in this research who answered the questionnaire are mostly women, aged between 40 and 50, permanent teachers, with a time in service between 9 and 12 years or above 20. There is also a significant participation of contract teachers, who, if we take into account the characteristics of the schools, may be skilled technicians.

Although there is a participation of teachers of all levels of education, the percentage of primary school respondents stands out.

As regards the attendance of in-service training, it is noted that the vast majority of the participants (91.4%) have attended credited training, particularly long-term one, over the last three years, in spite of the fact that their careers are “frozen”. Most among them choose training courses and attend them at the MarcoCinfães ISTTC (64.6%). A significant number of participants (36.6%) are willing to pay in order to attend in-service training even when that implies travelling to other places.

In what concerns participating in the school training planning it is noted that 45.7% of the participants agree with the statement that they actively do it; 27% neither agree nor disagree; 15% agree completely and 6.5% disagree totally.

Regarding the participation on the needs analysis stage, data show that the percentage of more than a half of the participants (54.3%) agree with the statement presented to them (“I participate actively in the needs analysis stage of the in-service training plan of my school”) and 18.3% agree totally. The teachers who neither agree nor disagree account for 20.9% of the whole of the participants and only 6.5% of the participants disagree completely.

Concerning the role of the ISTTC, the highest percentage of participants disagree partly with the statement that it should be the full responsibility of Centre to organize and implement all the in-service training, while 28.4% disagree totally. The percentage of those who agree partially or totally is 19%.

As regards the importance of in-service training for the quality of professional practice, 88.1% of the participants agree totally with the statement that that importance is very high. Only 6.8% neither agree or disagree and 5.1% disagree partly.

Finally, 81.6% of the respondents agree or agree totally that their main motivation to attend in-service training actions is their professional development.

Findings from the survey by questionnaire applied at the end of the training courses (table 2)

In what concerns the open-term item in the questionnaire which was applied at the end of the last session of all actions that took place at the MarcoCinfães ISTTC in 2012 and 2015, the data obtained lead us to the conclusion that, generally, the teachers that attended the three types of training actions consider that the objectives of those actions had been achieved almost totally. The score of their answers ranged between 4.2 and 4.9. Moreover, the medium score of 4.64 is the highest among the four items which were analysed. It is worth noting, however, that the highest scores (4.8 and 4.9) can be found in training actions of more practical nature.

Regarding the satisfaction of training needs, the average score obtained in this item is also high (4.48) and the training action that stands out this time is A4 – “Mathematics Curricular Targets” (4.8).

The second highest score in this set of items that were selected among all in the opinion survey belongs to the item referring to the impact that the competencies acquired during the training actions will have on the teachers’ professional activity: 4.57. It is noteworthy that the action A8 – The Internal Component of Teachers’ Evaluation, which registers the highest score in this item (4.9) was the one with the lowest score in the item concerning training needs.

The item “After this in-service training action I feel more prepared to work in this specific area” presents the lowest average score among the four items (4.38) and, within it, all the scores are lower than the ones in the items considered previously.

On the other hand, the analysis and interpretation of the data contained in the replies to the open-term items allow us to infer the following conclusions:

- A) Teachers/trainees articulate the training actions they attend with their training needs;
- B) Teachers/trainees prepare structured proposals of new training actions, particularly following others they have just attended;
- C) Teachers/trainees establish a cause effect relationship between the training actions they attend and a better professional performance in the classroom and in school in general;
- D) Teachers/trainees recognize the in-service training as a means of knowledge acquisition and promotion of a reflexive posture;
- E) Teachers/trainees recognize the training as an emancipatory activity;
- F) Teachers/trainees assign a central role to the trainer in the success of the training action, emphasizing relational skills, availability, knowledge, domain of adequate strategies and methodologies and the ability to promote a good atmosphere in the group as essential abilities in the profile of that trainer.
- G) Teachers/trainees do not often use the term “professional development” but recognize practices that promote it, such as self-training, consolidation and acquisition of knowledge and the promotion of a reflexive posture.

Results, Conclusions and Recommendations

The main purpose of this study was to understand the logics of teachers’ participation in in-service training from the point of view of Professional Development.

As emergent purposes there were the one of assessing (1) the impact of current teachers’ working conditions on their adhesion to in-service training and (2) the role that the school leaders play on that same adhesion procession.

The collected data allowed us to obtain valid information to be compared with the working hypothesis stated at the research, which were the following:

Hypothesis 1 – The majority of teachers recognize that in-service training plays a positive role in the transformation of their practice, but they don’t associate it with their PD.

Hypothesis 2 – The majority of teachers take part in in-service training, but are rarely available to play an active role in its planning and implementation.

Hypothesis 3 – The majority of teachers take part in in-service training regardless of adverse work conditions.

Hypothesis 4 – The majority of teachers and educators believe that the in-service training courses they take are not valued by the leadership of their schools.

The in-service training and the professional development

Regarding the first research hypothesis, “The majority of teachers recognize that in-service training plays a positive role in the transformation of their practice, but they don’t associate it with their PD”, we came to the conclusion that the term “professional development” is not frequently used by teachers in occasions when they are asked to express their opinion on in-service training, nor is it much valued when they have to place it on a scale that includes commonly used concepts, such as “teaching practice”.

However, they recognize the value of teachers’ practices which are involved in training and promote PD, such as the consolidation and acquisition of theoretical knowledge, self-training and innovation.

We also came to the conclusion that the majority of teachers establishes a cause-effect relationship between the training courses attended and a better professional performance in the classroom and in school in general, particularly when that training is done in the specific subject areas they teach or in comprehensive areas of the education system, such as “assessment”.

Interestingly, a large majority of teachers considers their PD their main motivation to attend in-service training actions.

The in-service training and the participation of teachers in its structuring and implementation

In what concerns the second research hypothesis, “The majority of teachers take part in in-service training, but are rarely available to play an active role in its planning and implementation”, we draw the conclusion that more than a half of the inquired teachers consider that they participate actively in the process of needs analysis and structuring of the in-service training in their schools.

However, the data obtained show that teachers develop reasonably structured proposals for new training actions, particularly just following the attendance of others.

Moreover, this initiative comes together with another data, which shows that teachers recognize in the training a space of knowledge and promotion of a reflexive posture. These two sets of data together, i.e., the knowledge and the reflexive posture and the initiative to propose new in-service training actions constitute very important conditions to allow teachers to get themselves effectively involved in the structuring of the in-service training plans of their schools since the needs analysis stage.

Another data that should be noted is that teachers sometimes don’t identify certain subject areas as training needs but, after attending courses in those areas, consider them important for their professional performance.

The in-service training and the teachers’ working conditions

Regarding the research hypothesis number three, “The majority of teachers take part in in-service training regardless of adverse work conditions”, the collected data allow us to conclude that a very high percentage of teachers still attends in-service training in spite of adverse working conditions and the current situation of “frozen careers”.

A significant number of teachers is also available to spend money, time and energy to obtain that training. A significant number of teachers attend the training actions at the ISTTC to which their school is associated, which may imply travelling to a different school from their own after classes or from home on Saturdays. A similarly high number of teachers attend training actions at other ISTTC and other institutions, paying for the courses in some of them.

In parallel with this situation, one where the working conditions include work overload, excessive stress, loss of confidence, feelings of incompetence, resistance to change, economic and social crisis, austerity measures, teachers' impoverishment, the majority of teachers who participate in the research characterize a good training action as the one which has a good training atmosphere, a good connection with teaching practice and other activities in the school, which constitutes an opportunity to exchange experiences among teachers and institutions and has an appropriate length of time taking into account the contents to be discussed.

Simultaneously, they consider a good teachers' trainer the one who articulate the contents with the best strategies and methodologies, who can interact well with the teacher, who promotes their autonomy, who is always available and creates a good atmosphere in the training space and group.

Taking into account the data which were collected, the in-service training becomes therefore, not only a space and time for reflexion, for knowledge structuring and a means of support for teachers' work, but also a stronghold of pleasant and proficuous social intercourse among peers, which can potentially generate the necessary energy that may, in some way, help to overcome some of the exhaustion caused by the daily routine.

The in-service training and the school leaderships

In what concerns the research question number four, "The majority of teachers and educators believe that the in-service training courses they take are not valued by the leadership of their schools", the collected data allow us to conclude that the vast majority of teachers are of the opinion that the leaders of their schools recognize the training actions they attend, which contradicts the initially stated hypothesis.

The authors consider that the methodology which was used to test this hypothesis (questionnaire containing only closed items) was not the most appropriate for the clarification of the concept "recognition", which would be important in a perspective of professional development.

Banking Model of Education in EFL Classes

Deniz YALÇINKAYA

Lecturer, Selcuk University, School of Foreign Languages,

Ankara University, Educational Sciences Institute, Lifelong Learning, Adult education (doctorate student)

Email: denizyalcinkaya@yahoo.com

Abstract

This article aims at exploring major conflicts and the inadequacies in EFL classes consistent with 'banking education' which was described by Paulo Freire as one of the remarkable thinkers of education. The article criticizes the traditional method of foreign language teaching that is based on teacher domination as it is described in banking education and reveals the limits of banking model of education for FLL. The pedagogy and the method derived from the pedagogy should be applied for a fruitful FLL is far away from traditional banking education. Learners' attendance and involved in learning English can be increased by means of a different alternative approach – critical pedagogy- in EFL classes. Critical Pedagogy that stresses empowering learners to think and act critically and use their life experiences as tools to foster their learning should be proposed as a suggestion for application of critical thinking in ELT classrooms. Problem posing education was proposed by Freire (1970) as an alternative to the banking model and it leads the development of knowledge by the students themselves. Problem posing education in Critical Pedagogy is more relevant for language learning as because language learning is an active process and cannot be achieved by passivized students of banking education. In the article, basic principles of problem posing education, teacher and student roles, praxis, and dialogue that are major themes of CP in language teaching are analyzed. To clarify the constraints of the present system of teaching of foreign languages, and as a suggestion; CP that should be put into practice in EFL classes is discussed here. For the discussion, available books and articles written on the subject were scrutinized.

Key words: banking education, ELT, CP

1. Introduction

Firstly I 'd like to express the failure in FLL in Turkey and try to find out the reasonable solutions by shedding light to some reasons of unsuccessful students to access the second language. I've been teaching English for a long time in universities in Turkey and I've experienced that the need to speak an FL is irrelevant with the system, method, and techniques used in FLL. The pedagogy should be reconsidered to realize the barriers to be able to speak FL. Although some contemporary teaching methods are involved in ELT materials, both instructors of English and the learners do not avoid applying traditional teaching methods as described in banking model of education by Freire.

2. Method

In this study as the purpose is to extract the implications of the pedagogy for the design of ELT classes it was essential to indicate the general understanding of contemporary language teaching approaches. In addition, it was also needed to have a clear definition of major factors involved in designing ELT curriculum. It was first required to express the current situation in EFL classes as a whole in Turkey. To understand banking model of education versus language learning principals, the key concepts are expressed and discussed here such as; banking education and as an alternative model problem-posing education, critical pedagogy, and communicative language teaching.

Firstly I want to point out the limits and unsatisfactory results in ELT in Turkey in general.

As Prof. Paker states, in Turkey, there are 700 hours English Lesson in primary school and in high school (secondary school) there are 700 hours English lesson. Approximately after 1400 hours English lesson % 90 per cent of students are at elementary level. (Paker, 2012). He also explains that in 2010-2011 academic year % 90,20 of 1450 students and in 2011-2012 academic year % 83,29 of 1634 students who enrolled in School of Foreign Languages in Pamukkale University were at an elementary level even they were at the beginning level.

In the report of TEPAV(Turkish Economic Policy Research Foundation) the findings show that level of the learners are dramatically low.

Table 1: Levels of English taken by students according to school type in Turkey

Source: TEPAV & British Council joint report on ‘At State Schools in Turkey Teaching English Language Needs Analysis’ (2013:40)

I also confirm this situation as one of the instructors of SOFL (School of Foreign Languages) in Selcuk University. The case in universities is the same like in the table above. After a one year of training, it is hard to say that the students can communicate well in English. During two terms the students have to take two or three hour’s English lessons and despite we use some English materials which are designed on the basis of communicative language learning approach that is very popular nowadays, the students can do at the elementary level. English File by Oxford University, Headway by Oxford University or English for Life by Oxford University are some of the books which have been studied in SOFL both in Prep Classes and in Faculties’ compulsory English lessons. The instructors in classes can confess that Grammar lesson are welcomed by all the students and other teaching practices are ignored and understood by the students that they are supplementary exercises to learn grammatical patterns.

Bayraktaroğlu claims that; *From the Preparatory School qualification Exam, 50 students who started the Undergraduate program with an expected score between 60 and 90, when they take the IELTS exam, they have been rated 2,5-4,5 which is much lower than the 6.0 required for studying a foreign language. (Bayraktaroğlu, 2014:4)*

Actually, the case is the same among academics in Turkey. They can read English and comprehend a text adequately but it not easy for them to write and speak in English. They are improved on reciprocal skills but they are lack of capacity of productive skills in English.

What are the reasons involved in this case in Turkey? It can apparently be said that one of the main reasons of

this case is the banking model of language teaching in the education system in language classes.

3. Findings

“Language is not simply communication; rather, it is a practice that constructs the ways language learners understand themselves and their social surroundings.”(Norton & Toohey; 2005).

In the review of Mendez as it is stated, Norton and Toohey suggest language learning with aspects of social change. In their book, they do not only express the need to provide new approaches to better language pedagogy but also indicate the importance of reflection and praxis. This means, they are not very interested in telling the relevant people of language education how to speak, write, read, listen or engage in critical practice but implied the power of praxis in FLL.

Language educators must open new productive possibilities for FLL. Critical pedagogy explores the social visions and promotes the understanding the relationships between teachers and students, material developers and test makers. They are all the elements of a unit and cannot be taken apart from the others in a language learning assumption.

I think we must define some terms and expressions about FLL before criticizing the limits of the current system. In analysing banking model of education in class we must refer to Freire as he stated this *banking education* as;

“Education thus becomes an act of depositing, in which the students are depositories and the teacher is the depositor. Instead of communicating, the teacher issues communicate and make deposits which the students patiently receive, memorize, and repeat. This is the “banking concept of education, in which the scope of action allowed to the students extends only as far as receiving, filling and storing deposits. (Freire, 1970).

As an alternative to the *banking model*, Freire (1970) proposed *problem posing education* which is identified in the context of Critical Pedagogy. Freire expressed the problem posing education as:

“They must abandon the educational goal of deposit making and replace it with the posing of the problems of human beings in their relations with the world. “Problem-posing” education, responding to the essence of consciousness – intentionally – rejects communicate and embodies communication.” (Freire, 1970).

Problem posing education is an opposition to banking education in many ways. The roles of teacher and student is changed and through dialogue here no one teaches another, nor is anyone self-taught. As Freire describes people teach each other. Problem posing education leads a way to liberation of person to society whereas banking education mirror oppressive society as a whole.

The following attitudes and practices maintain teacher student contradiction in banking education:

- (a) the teacher teaches and the students are taught;
 - (b) the teacher knows everything and the students know nothing;
 - (c) the teacher thinks and the students are thought about;
 - (d) the teacher talks and the students listen – meekly;
 - (e) the teacher disciplines and the students are disciplined;
 - (f) the teacher chooses and enforces his choice, and the students comply;
 - (g) the teacher acts and the students have the illusion of acting through the action of the teacher;
 - (h) the teacher chooses the program content, and the students (who were not consulted) adapt to it
 - (i) the teacher confuses the authority of knowledge with his/her own professional authority, which she and he sets in opposition to the freedom of the students;
 - (j) the teacher is the Subject of the learning process, while the pupils are mere objects.
- (Freire, 1970)

The basic principles of traditional class education and cannot be abandoned by teachers today. As a result of this system, the students cannot be adopted to modern learner-centered education in class despite its many advantages that are proposed by modern authorities of education.

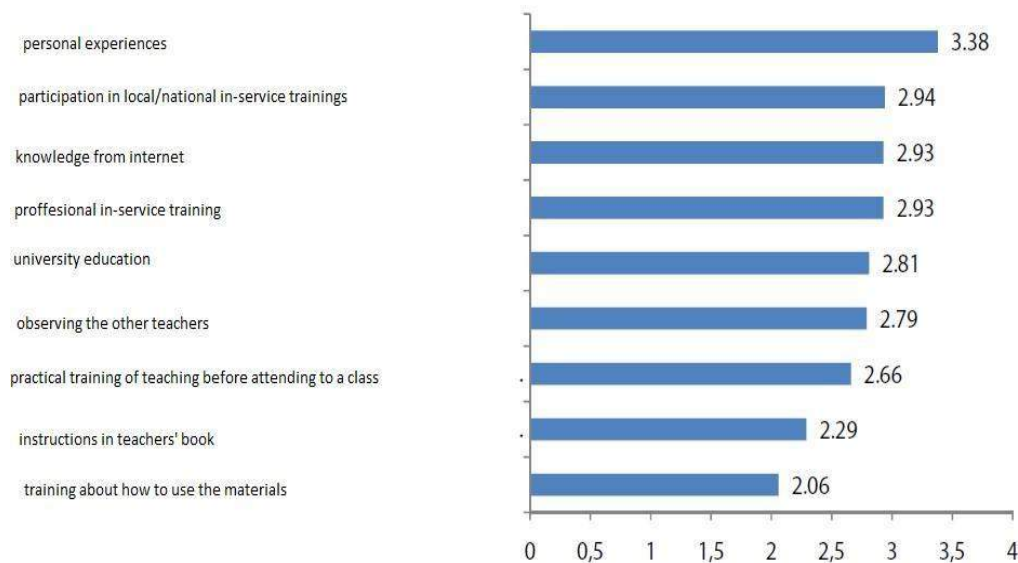

Problem posing education should be taken place transforming the traditional teaching systems.

In general, when we compare two models it is seen that each of them reject the other.

As Schugurensky says: “I learned that teachers can proclaim—and sometimes believe—to be implementing an emancipatory pedagogical model, yet in practice impose a traditional banking education.” (Schugurensky *Twenty lessons I learned from Freire p: 4*).

We can also see the case when we look into the Needs Analysis Report of ELT at state schools in Turkey.

Graph 1: How effective were the following factors on your teaching method? "(1 = zero effect, 4= most significant effect)

Source: TEPAV & British Council joint report on ‘At State Schools in Turkey Teaching English Language Needs Analysis’ (2013:46)

This data above show us that experiences are useful and necessary as it is proposed in problem – posing the model of education.

Critical Pedagogy /CP

Critical pedagogy has been developed with the work of Freire in the 1970s. Critical Pedagogy is an approach to language teaching and learning and it is associated with Brazilian educator Paulo Freire. Freire expressed it in these words; *The special contribution of the educator to the birth of the new society would have to be a critical education which could help to form critical education.. (Freire, 1974:29.*

In fact, in Turkey, the trend of learner-centred approach in English Language Teaching is followed as a contemporary English language teaching pedagogy and so the lesson plan is designed focusing on developing learners’ communicative competence and promoting learner’s self-autonomy in language classrooms. Learner-centeredness came forward during 1970s-1980s and communicative language teaching was developed. Therefore language learning-teaching processes changed from language form to language function and the need of the learners is considered important. However it is not the case in English classrooms, the learner and teacher are in the habit of teachers’ domination and autonomy. This rigid habit cannot be transformed to learner-centeredness. Actually, as an experienced instructor of English, I can claim that both sides are pleased with the traditional training system. Teacher talks and wise listener learners listen. Activate the students in class is a big issue.

All these set of tenets about nature of language and of language learning and teaching describe CLT. As Brown

states; “ From earlier seminal works in CLT (Widdowson 1978, Breen & Candlin 1980), Savignon 1983) up to

more recent teacher education textbooks (Brown 2000, Richard-Amato 1996, Lee & VanPatten 1995, Nuna 1991a) we have definitions enough to send us reeling.”

As CLT is involved in CP is related to some principles like cooperative learning, interactive teaching, learner-centered classes, and content centered education etc. When we compare the banking model and communicative language teaching it is seen that traditional model of education and as an alternative model communicative language teaching is opposite in many details:

In Communicative Language Teaching

- ✓ Meaning is paramount
 - ✓ Dialogues center around communicative functions and aren't memorized
 - ✓ Contextualization is a basic premise
 - ✓ Language Learning is learning to communicate
 - ✓ Communicative competence is the desired goal
 - ✓ Teachers help learners in any way that motivates them to work with the language
 - ✓ Students are expected to interact with other people
 - ✓ The teacher cannot know exactly what language the students will use
- (Brown, 2001: 45).

All these tenets cannot be practiced in a banking model of language education. In the banking model of education as mentioned above, the teacher is the subject of the learning process, while the pupils are mere objects. So it is not possible to teach a language in this traditional way of teaching as it is understood that when the learner is involved in learning he/she can learn effectively, as a reason of the nature of language learning requires involving.

However, the limit of the situation is that the instructors of English are not confident. The Tütüniş state this case;

A teacher who is unsure of his/her own communicative knowledge is not adapted to communicative method. For this reason, the theoretical flux is warmer for her/him and gives priority to rule teaching as a method. The end result of this method is that the student goes into the conversation effort and often gives up using the target language. (Tütüniş, 2014).

Another aspect of the issue is that ELT is a very distinctive subject matter that cannot be practiced and achieved under the conditions of banking model of education. Language Learning may be affected by some factors and these are named as effective filter and state of relaxation. It is known today that when a person has lower stress he/she can learn better a language. It supports the idea of freedom in class in ELT. When the learners' confidence is low they are in fear of making mistakes and it causes them not to produce a language and not to communicate in the target language. This is the effective filter and in this situation, it is not very possible to get enough input in the target language. (Krashen & Terrell, 1983).

Rogers' learning principles also support the claims about language learning atmosphere;

-When productive learning is concerned with the goals and desires that it wishes to achieve, and when the person considers the material presented to him as a means of achieving these goals, he/she progresses at a rapid pace

-When the threat to self is low, experience is perceived in a different design and learning progress

-Learning becomes easier when students take part in taking responsibility for the learning activity. (Rogers, 1969: p.164).

Carl Roger's views about education are that learners have their own interests and desires and the teacher's job is to free the student's sense of self-helping his students to live their interests and desires. (Rogers, 1969).

“I learned that education is communion: “I cannot think authentically unless others think. I cannot think for others, or without others.” (Schugurensky Twenty lessons I learned from Freire p: 5).

When language is used simply for the repetition of lessons, it is not surprising that one of the chief difficulties of school work has come to be instruction in the mother-tongue. Since the language taught is unnatural, not growing out of the real desire to communicate vital impressions and convictions, the freedom of children in its use gradually disappears” (pp 289) (Dewey, 1900: pp 55-56 – The School and Society).

The students must express their own feelings and emotions on a topic they are very interested in or have some boundaries with it. They must have some desire to express themselves and motivation to do something on a topic such as students’ financial problems when they are university students or shortcomings of education in universities. They may wish to talk about their legal rights in university education system or their role or place, whether they are subjects or objects. For example; an old woman named ‘Carol Baines from Australia lived in the Australian outback and had an unusual life’ is not in point of interest. (English for Life- Elementary, 2007, Tom Hutchinson, Oxford University, page: 96) No student cares the story. Instead of doing this you can choose a student that he/she wants to be a model and make the students talk about her/his life and every detail in it. Lifestyle, culture, money, sadness, happiness, problems etc. can become in view. Such a situation will empower all the students to be involved in the life of this student as because all the students will be talking about their lives unawares. Semantic point of view is essential in FLL as Littlewood states:

“One of the most characteristic features of communicative language teaching is that it pays systematic attention to functional as well as structural aspects of language.” (Richards & Rodgers, 1986:66).

According to the Communicative approach, contextualization is a basic premise. Richards and Rodgers explain the paramount of CLT.

“Firth also stressed that language needed to be studied in the broader sociocultural context of its use, which included participants, their behavior and beliefs, the objects of linguistic discussion, and word choice.” (Richards & Rodgers, 1986:69).

The learners in ELT classes as they are ruled under in banking model of education cannot ask questions and do not comment or discuss and analyze. As wise listener, they are waiting to be told and memorize. The dramatic fact is that second language acquisition cannot be acquired if the learner isn’t involved in the target language. Speaking a language is ability such as to be able to write or swim. You learn how to write with a pencil practically, you see and you are told how to write but eventually, you achieve it by practicing. Swimming is not described you can swim when you swim.

Krashen (2003) states that cognitive development, including the acquisition of concepts and facts, is more likely to occur through problem-solving than through deliberate study.

4. Results, Conclusions, and Recommendations

Thus, this study raises concerns that all stakeholders need to take into account when education policy is being implemented in the dissemination stage. Policy cannot be successfully implemented without listening to the teachers’ voices as they are the key agents of the change. If the policy of learning reform is to be successful, intensive and consistent teacher development must be organized and sufficient resources must be allocated so that all schools, especially those in rural areas, can meet policy objectives.

As it is understood, learning a foreign language is a big process and only the method is not the key element to be designed. There are many components of language learning and the aim of learning plays an important role. You can name it as motivation and motivation are linked to some approaches and techniques can be used in ELT. Teacher and learner roles should be adjusted and the learner must be taken as a subject that can determine his/her own needs to learn a language. Language learning is an active process and it cannot be limited to class education.

I personally think that the functionality of a language increases the motivation and it must be paid more attention rather than structural aspects of a language.

Hymes (1972) defined communicative competence not only as an inherent grammatical competence but also as the ability to use grammatical competence a variety of communicative situations. As Richards and Rodgers explains; “*Wilkins’s contribution was an analysis of the communicative meanings that a language learner needs to understand and express. Rather than describe the core of language through traditional concepts of grammar and vocabulary, Wilkins attempted to demonstrate the systems of meanings that lay behind the communicative uses of language.* (Richards & Rodgers, 1990:65).

Unfortunately, it is seen that regular instructors of English are tempted to use traditional techniques and methods in teaching English. It is easier and faster but useless. We must put habit formation aside and try to communicate in English. As Tutüniş states; the teachers that are not confident in English interaction repudiate the communicative method and lean towards theoretical approaches and give priority to teaching grammar rules as a method. As a result of this, learners try to speak accurately and give up speaking. (Tutüniş, 2012).

So, as a result, the followings should be put into practice to help learners learn English:

Language teachers must realize the communicative language teaching and leave the structural traditional methods. Widdowson states; The structural approach is based on the belief that language learning comes about by teaching learners to know the forms of the language as a medium and the meaning they incorporate; that they will learn how to do things with this knowledge on their own. The communicative approach is based on the contrary belief that language learning comes about when the teachers get learners to use the language pragmatically to mediate meaning for a purpose... (Widdowson,1990).

Banking education cannot provide what the need is in ELT classroom. Language learning nature is versus traditional banking education.

Consequently,

-innovation and social change in teacher education must be on the agenda of effective language education, especially in such countries where failure in teaching English is recorded.

- A comprehensive curriculum of CP must be realized and regarding this curriculum, ELT material must be designed. These materials must give chance to the learners to choose their own topic and field of interest.

-Vocationally oriented Language teaching can help to solve some motivation problems and give chance to learners to use his/her life and job experiences as a resource in learning which is proposed in problem-solving education.

Abstract

Development of competences nowadays is very important issue. There are discussions about development of competencies using different methods, competencies-based curriculum and so on. Digital competence is one of the 8 key competencies for lifelong learning. It is described by using five areas – information and data literacy, communication and collaboration, digital content creation, safety and problem solving (Vuorikari, Punie, Carretero Gomez, Van den Brande, 2016). The article shows literature based research of possibility to develop digital competence by using blended learning per se, because blended learning is described as learning process where integration of face-to-face learning and e-learning happens. The article's main focus is on development of digital competence.

Many authors talk about “net-generation” who spends their days with technology but does it mean that they are digitally competent people.

Keywords: Digital competence, Blended-learning, Higher education, E-learning

Introduction

Development of competencies becomes more and more popular topic in nowadays. This topic is interesting in all range of educational levels – from primary school to higher education. Development of different competencies is significant issue for life-long learning.

European Commission has defined eight key competencies – communicating in a mother tongue, communicating in a foreign language, mathematical, scientific and technological competence, digital competence, learning to learn, social and civic competences, sense of initiative and entrepreneurship, cultural awareness and expression. Main issue of this article is digital competence, what defined as confident and critical usage of information and communications technology for work, leisure and communication.

Another significant issue is how to manage development of digital competence. One of the possibilities is blended learning. Blended learning is defined as planned, pedagogically meaningful integration of face-to-face and e-learning (Picciano, 2009). Blended learning not only enriches learning process but it gives possibilities for students for more active participation in learning process (Garrison and Vaughan, 2007). Blended learning gives new learning experience for students as well as new teaching experience for teachers (Powell, Watson, Staley, et al 2015). Meaningful integration of e-learning tools gives opportunity for students for personal development, as well as to develop such cognitive skills as critical thinking and conversation leading (Garrison and Vaughan, 2008; Somekh, 2007). Blended learning experience enriches learners' learning as well as teachers' teaching praxis.

One of the reasons to research only digital competence is because of the technological side of blended learning. The poor digital competence can lead to unsuccessful blended learning experience as well as impact outcomes of the learning. To use technological tools effectively learners have to know them and have to know how they work (Hubackova & Semradova, 2016; Dohn, 2009). It depends on users' skills and historical body (Scollon, 2004) - it means that users use technological tools as they used to use. So, as more advanced user learner is as easier it is to use it for learning (in this case, for blended learning), because learners can pay their attention more on the content not on the technology itself (Ozsariyildiz, & Beheshti, 2007).

Eurostat data (Eurostat, 2017) shows that average percent of EU (28 countries) individuals aged 16 to 74, who thinks that they have high level of computer skills, are 29 % in 2014 (compare to 23% in 2007). That can mean that one third of individuals in EU can fully participate in blended learning's e-learning part, if we talk about digital competence. However, only 15 % thinks that they have very low computer skills (1 to 2 out of 6 computer related activities). Computer related activities offered to respondent were the following - copied/moved a file/folder, copy/cut/paste to move information on the screen, used basic arithmetic formulae, compressed/zipped a file, connecting and installing new devices or written a computer program. There is also statistics on individuals internet related skills - use a search engine to find information; send an e-mail with attached files; post messages to chatrooms, newsgroups or any online discussion forum; use the internet to make telephone calls; use peer-to-peer file sharing for exchanging movies, music etc.; create a web page. Eurostat data (Eurpstat, 2017) shows that in the year 2013 30% of individuals aged from 16 – 74 evaluate themselves as low skilled (1 to 2 out of 6 internet related activities) and only 12% evaluate themselves as high skilled.

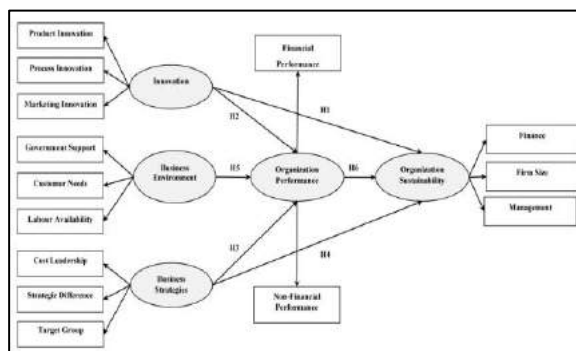

Diagram 1. Eurostat data on computer and internet related skills.

So there is possibility for 71 % to develop their computer skills and 88% of individuals can have possibility to increase their internet related skills.

The European Digital Competence Framework for Citizens (Vuorikari, Punie, Carretero Gomez, Van den Brande, 2016) sets five digital competence areas – information and data literacy, communication and collaboration, digital content creation, safety and problem solving. All these areas can be used and developed in blended learning.

The aim of the article is to find out do the scientific literature speaks about development of digital competence by using blended learning and does blended learning can help develop it.

Method

This is literature based research. Articles are read by using The European Digital Competence Framework set by Vuorikari, R., Punie, Y., Carretero Gomez S., Van den Brande, G. (2016). Articles are not categorized based on educational level or subject. Main issue is blended learning and development of skills.

Findings

The European Digital Competence Framework gives five digital competence areas with several dimensions for each of it. Literature on blended learning speaks about support of digital competence (Toia, 2016; Hubackova, & Semradova, 2016; Bates, Bates, Sangra, 2011; Díez, 2008), development of computer skills (Pratt, 2014), increase of information searching competence and identification of main ideas (Ozdamli & Tavukcu, 2016).

Information and data literacy has three dimensions – (1) browsing, searching and filtering data, information and digital content; (2) evaluating data, information and digital content and (3) managing data, information and digital content. All these dimensions are very important in the blended learning because students have to search for information and digital content to be successful. Blended learning can support development of this kind of skills (Soler, Soler, & Araya, 2017; Ozdamli & Tavukcu, 2016; Buran & Evseeva, 2015; Pratt, 2014). From one side – learners do not have to browse, search and filter data, information and digital content because learning material in blended learning's e-learning part is made to be ready to explore. From other side – there can be assignments that force learners to find information by themselves and there is clear need for previously mention skills. There are not much scientific researches on this issue in blended learning context.

Eurostat data shows that in year 2013 94% of youth aged from 16 – 29 (EU 28) have used search engine to find information. Of course there is different situation in some countries, for example, Turkey had 72 % but Iceland 100%. But average youth in European Union is very skilled in searching. From other side, there is situation that students make searching not effectively – it is hard for them to use keywords or think in bigger picture.

The second area is communication and collaboration with six dimensions – (1) interacting through digital technologies; (2) sharing through digital technologies; (3) engaging in citizenship through digital technologies; (4) collaborating through digital technologies; (5) netiquette; (6) managing digital identity. Interaction, collaboration and sharing are very important skills for successful blended learning experience. These skills also can be developed by blended learning (Soler, Soler, & Araya, 2017; Nazarenko, 2015; Okaz, 2015). Interaction and collaboration through digital technology are very important skills for blended learning. Many students have these skills (Soler, Soler, & Araya, 2017; Okaz, 2015) because of wide usage of web 2.0 tools in their everyday life (discussion forums, wikis, blogs, social networking). But there can be problems to use these skills in learning situations. Some researchers talk about development of online communication but as social competence (Prohorets & Plekhanova, 2015). Eurostat data shows that youth aged from 16 – 29 in European Union (28 countries) have posted messages to chat rooms, newsgroups or an online discussion forum in 72 %. Also there situation differs between countries from 37% in Turkey to 94% in Lithuania. It means that collaboration and interaction through digital technologies in blended learning can differ because of different digital technology usage cultures. 32% of youth (aged 16 – 29) used peer-to-peer file sharing for exchanging movies, music ect. (Eurostat, 2013) So sharing through digital technologies need to be developed. In the same time percentage differs for countries from 13% in Ireland to 74% in Lithuania.

The third area is digital content creation – (1) developing digital content; (2) integrating and re-elaborating digital content; (3) copyright and licenses; (4) programming. Digital content development and integration are very important issue in blended learning. Some researchers admit that there is problem of content creation in blended learning (Powell, et al, 2015; Clement, Vandeput, & Osaer, 2016). Teachers often use the same learning content as they used to for face-to-face learning. Content is not prepared specifically for blended learning. This may cause the issue that learners are not satisfied. Eurostat data shows that in 2013 only 18% of EU 28 youth have created a Web page (from 1% in Cyprus to 48% in Iceland). There is much work to develop digital content creation skills.

There are always discussion from teachers on copyright and licenses. Teachers want to be sure that their work is secured with copyrights; however, teachers and students take into consideration other author's rights (Soler, Soler, & Araya, 2017).

19% of youth aged from 16 – 29 in 2014 (EU 28 countries), according to Eurostat data, have written a computer program using a specialized programming language. This is very little number. From other side blended learning as per se probably cannot develop this kind of dimension (except blended learning course on programming) because learners do not need programming skills to participate in learning situations.

The fourth area is safety with dimensions like (1) protecting devices; (2) protecting personal data and privacy; (3) protecting health and well-being; (4) protecting the environment. All these dimensions can be developed in blended learning settings. Institutions, who offer blended learning, give advice to students about safety issues. Eurostat data in 2011 shows that 68% of youth judge their skills as sufficient to protect their private computer from virus or other computer infection. Safety issue is very important not only for blended learning but for student management systems as well so institutions put big effort on this issue. Sometimes students with lower digital skills need some safety advice when using public computers. Time by time students not log out of learning management system but just close tab. This can lead for problem that next user can get some information or even log in in other account. Eurostat data in 2011 shows that 69% of youth aged 16 – 29 in EU 28 countries judge their ability to be sufficient to protect their personal data. Unfortunately, Eurostat does not have data for later years. But this information on 2011 shows that young learners are able to protect their personal data and privacy.

About health protection in blended learning settings there is very little information in literature. A. Buran and A. Evseeva (2015) in their article mention problems of eyesight as a barrier for online learning as well as time spent on learning (Soler, Soler, & Araya, 2017; Buran & Evseeva, 2015) what impacts learners' and teachers' well being.

The last one area is problem solving. It has such dimensions as (1) solving technical problems; (2) identifying needs and technological responses; (3) creatively using digital technologies; (4) identifying digital competence gaps. Institution who offers blended learning most of the time has support system for students' and teachers' technical problems. Creative use of digital technologies is very important for teachers but as mention previously, teachers need training on technologies. There is no possibility to use technology creatively if you do not know how it works, it functions. Also students and teachers identify their digital gaps because some research mentioned in this article before shows that students and teachers admit that they need training.

Conclusion

There are two kinds of articles – one who pay attention on teachers/ staff and one who pay attention on learners. There is very little research made related to digital competency.

Some research shows that teachers, who work in blended learning, need training on use of technological tools (Kofar, 2016; Clement, Vandeput, L & Osaer, 2016; Georgsen & Løvstad, 2014). There are researches that illustrate teachers' or learners' technological skills before blended learning experience (Özel, Arikan, 2015). But there are not articles what exactly speaks about development of digital competences. It is often just mentioned only in one sentence.

Many researches evaluate students' and teachers' technology proficiency but it seems that there is no research on do blended learning as per se develop digital competency, if learners and teachers uses it time after time. We can think that it is so because, for example, if learner uses discussion forum for learning purposes, then he/she learns netiquette, collaboration, data managing and so on. As well as teachers do so. Their skills develop as more as they use technology.

Research speaks about teachers' and learners' skills on collaboration, communication through digital technologies but there is hard to find research made on health issues because of blended learning or e-learning. As well as there is no research on do blended learning impacts learners' or teachers' skills on technical problem solving or protecting devices and environment.
