There is need in future to make a research on these issues to be sure that blended learning has impact not only on teachers' and learners' social skills, language competencies ect., but also on their digital competency.

The Investigation of the Level of Satisfaction for the Different Categories of the Sports Centre

¹Serap Colak, ¹Umut Dolu

Kocaeli University, Faculty of Sports Science, 41380, Kocaeli, TURKEY

E-mail: srpclk@gmail.com

Abstract

Today, the service sector's development is one of the factors that determine the levels of development of the countries. The increasing competitive environment and urbanization, people helped to people to establish a new service sector to address the requirements of the sport industry. We have aimed to find out the evaluation of quality of service, from customers who go to sports centers that offers this service. 328 randomly selected people, from Istanbul, participated to our study (%43,3 (142) women, %56,7 (186) men). We applied "Quality Perception and a Satisfaction Survey in Sports Center" to participants . The survey questions, contain these following categories; the state of the physical comfort of the gym, the quality of exercise equipment and exercise methods which are used in the gym, qualification and sentience of trainers of sports , the satisfaction levels of the participants to the gym, questions about traffic and car-park issues, which is one of the biggest problems of the city life. The results were statistically compared according to gender of participants. There was a statistically significant difference between males and females about the comparison of the responses to questions about traffic and parking problems($p < 0,05$). We find that, women participants have more trouble about traffic and car-parking. These results of our study shows that the service should take place in a reachable way, not crowded and adequate parking spaces.

Key Words: sports centers, traffic, gender, satisfaction

Introduction

One of the factors determining the level of development of countries is the development related to the service sector. The relevance of service sector within international and national economies has been experiencing an increase for the past 25 years. When we take a look at the development rate of the service sector in countries around the world from 70s until today, it can be seen that the number of employers within this sector increased by 60% in USA and 40% in Japan (Bergman and Klesjö, 1994). Over time, it became necessary for the service sector to adhere to the quality practices that were already in place for the production sector so that it can contribute to the national economy of its country (Devebakan N and Aksaraylı M, 2003). There are various definitions for the word "service". In one definition, it is described as a product that is made so that it can provide for the consumers' needs and does not have the characteristics of a tangible material (Kurilof, 1993). Whereas in another definition, service is defined as economic activities that give rise to psychological, temporal, positional or structural benefits (Gözlü 1995). Another definition describes service as the execution of work for someone else (Goetsch and Davis 1998). An increasingly competitive environment and rapid technological developments force businesses to adapt and change. In order for the businesses to get ahead of their competitors during this time, their goods and services have to differ and stand out from those of other businesses. The importance of the concept of quality that appeared as a result of these differences increased with time and its application became mandatory. The difference in quality between businesses plays a significant role regarding their preference by the customers(Cimen, 2007).

One of the most basic methods that could be used to make a service company stand out from its competitors is to continuously provide a higher quality service compared to the competing businesses. Service businesses nowadays have a customer-oriented view of quality similar to production businesses. Big companies operating within the service sector are aware that a high quality of service would provide them with a high sales and profit potential which would then create a competitive advantage(Cimen, 2007). Higher quality of service also results in an increase in costs. However, high-quality service coupled with high customer satisfaction and fidelity can make up for the costs brought along by the increase in quality (Yıldız, 2013).

Most of the time, it is hard for customers to evaluate the service quality after they have purchased and used the service. While in these kinds of services, it might be hard to do quality control, it is possible to increase and standardize service quality by finding qualified personnel, a good location and providing adequate staff training (Parasurmann 1985, Kuns and Lenmink 1996, Tek 1999, Uyguç 1998).

Being establishments that provide customer-oriented service, sports centers also have to pay close attention to customer satisfaction. Since consumers that are satisfied with the sports center would be more inclined to revisit the establishment, it is important for the services and products to be well-presented to the customers, in a way similar to other service businesses. Establishments not responding to this need will end up losing their customers.

When we take into account the fact that sports centers are currently regarded as being service businesses, increasing service quality for them also is important so that their business can get ahead of other sports centers. This study was based on a conceptual frame concerning the customers' perception of service quality within the sports sector and in this study, feedbacks of the customers that resided in the central areas at the Maltepe District of the Istanbul Province were evaluated.

Among the marketplace of sports centers which is competitive and cost-oriented when it comes to providing services, it is of utmost importance for these businesses to identify, measure and evaluate their service quality so that they can gain the upper hand in the competition and maintain their presence. For this purpose, we asked the customers of these businesses to evaluate the service they are being offered and tried to determine the factors that play a role on the service quality.

Method

Research Group

Participants are made out of 328 individuals who voluntarily agreed on taking the survey and were chosen randomly at the Maltepe District of the Istanbul Province. 43.3% (142) of the participants were women whereas 56.7% of them were men.

Data Collection Tool

"Survey for Quality Perception and Satisfaction in Sports Centers" (Yaşar Y. 2013) was used as a research data collection tool. In order to provide a more up-to-date approach and a broader perspective, new questions were added and some modifications were made by us to the survey. This survey has questions that consist of personal features such as age, sex, sports age and for how long they have been going to their sports center as well as a total of 35 statements regarding the determination of service quality and satisfaction in sports centers prepared according to the 5-point Likert Scale. The study was conducted by evaluating the information about the participants based on the data collected via the aforementioned survey form.

Data Collection

The survey was conducted with face-to-face encounters by the researcher on random individuals who voluntarily agreed on taking it, at the Maltepe District of the Istanbul Province. The surveys took 22 days to conduct. 4 of the questions were demographic, 6 concerned changing rooms, 4 were about the area where sports-related activity takes place, 6 about tools and equipment, 5 about trainers, 5 about other staff, 5 related to personal information and 3 about the location of the center, with a total of 40 questions.

Data Analysis

The collected data was analyzed under the IBM SPSS Statistical Package for Social Sciences) for Windows 22.0 software, frequency (f) and percentage (%) values were calculated and tabularized.

All the average values concerning the participants and the answers they provided were statistically calculated. Survey questions were investigated one by one and sex-related differences were sought after.

Findings

Table-1: Frequency and percentage distribution of the participants based on sex

		18-24	25-29	30-34	35-39	40+
	SEX	N(%)	N(%)	N(%)	N(%)	N(%)
Age	FEMALE	57(40,1)	39(27,5)	17(12)	13(9,2)	16(11,3)
	MALE	20(10,8)	66(35,5)	47(25,3)	24(12,9)	29(15,6)

A two-parameter distribution of ages of the men and women who participated in the survey was established (Table-1).

Table-2: Frequency and percentage distributions of the participants according to their duration of sporting activity

		0-6 months	7-12 months	13-24 months	25-36 months	36+ months	P
	SEX	N(%)	N(%)	N(%)	N(%)	N(%)	
For how long have you been doing sports?	FEMALE	39(27,5)	56(39,4)	29(19,7)	9(6,3)	10(7)	0,562
	MALE	58(31,2)	68(36,6)	34(18,3)	19(10,2)	7(3,8)	

There is no statistically significant difference between men and women when it comes to their duration of sporting activity ($p > 0,05$) (Table-2).

Table-3: Frequency and percentage distributions of the participants according to their membership duration

		0-6 months	7-12 months	13-24 months	25-36 months	36+ months	P
	SEX	N(%)	N(%)	N(%)	N(%)	N(%)	
For how long have you been a member of this gym?	FEMALE	59(41,8)	43(30,5)	25(17,7)	8(5,7)	6(4,3)	0,448
	MALE	84(45,2)	59(31,7)	24(12,9)	14(7,5)	5(2,7)	

There is no statistically significant difference between men and women when it comes to their membership duration ($p > 0,05$) (Table-3).

Table-4: Frequency and percentage distributions and p-values of the participants according to the answers they provided on the categories of traffic and parking-related issues.

		Highly Disagree	Disagree	Indecisive	Agree	Highly Agree	P
	SEX	N(%)	N(%)	N(%)	N(%)	N(%)	
I think that accessing this center is easy and suitable	FEMALE	19(13,5)	24(17)	37(26,2)	40(28,4)	21(14,9)	0,049
	MALE	12(6,6)	26(14,2)	55(30,1)	56(30,6)	34(18,6)	
I think that it is easy to park your car when you come to this center	FEMALE	23(16,3)	16(11,3)	43(30,5)	41(29,1)	18(12,8)	0,038
	MALE	14(7,7)	26(14,2)	52(28,4)	57(31,1)	34(18,6)	

The questions of Quality Perception in Fitness Centers Survey that we used in our study were divided under 5 categories. These are: questions describing the physical comfort state of the fitness center, questions that demonstrate the quality of the used equipment and practice methods, questions that demonstrate the level of competence and awareness of the gym trainers, questions that show the level of satisfaction of the participants going to the sports center and questions that delve upon traffic and park-related issues which are in fact the biggest problems of today's city life.

In our results, a statistically significant difference was found between men and women concerning the answers given to the question "I think that accessing this center is easy and suitable." which belongs to the category of questions that delve upon traffic and park-related issues ($p < 0.05$) (Table-4). It was deduced that women had more accessibility-related issues than men.

A statistically significant difference was found between men and women concerning the question " I think that it is easy to park your car when you come to this center." which belongs to the same category as the one above ($p < 0.05$)(Table-4). In light of the answers provided to this question, it was concluded that women faced more parking-related issues than men.

There was no statistically significant difference between men and women in other categories that Quality Perception in Fitness Centers Survey that we used in our study. These categories were: questions describing the physical comfort state of the fitness center, questions that demonstrate the quality of the used equipment and practice methods, questions that demonstrate the level of competence and awareness of the gym trainers, questions that show the level of satisfaction of the participants going to the sports center ($p > 0.05$).

CONCLUSION AND RECOMMENDATIONS

Service is defined as the work-related interaction between the institution serving to provide customer satisfaction and the customer themselves (Ramaswamy, 1996, Çeto, 2016).

Service quality is the best way to understand how satisfied customers are with the business' services (Çeto, 2016). Moreover, [high] service quality means that the customer would be more willing to come back for the service and continue their membership (Rosender, 1989).

In establishments that work on a membership based system and require continuity, there are various factors that affect the service quality. Among these factors are: the physical condition and location of the business; staff performance; specifications of tools that are being used and the business' attitude. In our study, we conducted the survey for the customers' perception of quality in sports centers, which focused on these factors and examined customer satisfaction based on these categories. In our survey, we also asked the customers to provide an answer and commentary on questions related to the environmental condition of the business, accessibility of its location, sufficiency and organization of its parking space. The customers were also asked to provide answers and commentaries about the sufficiency and cleanliness of resting and changing rooms, sufficiency of showers and hot water and sufficiency of ventilation and lighting. Among other factors, information was gathered from customers on the sufficiency, diversity and adequacy of the used tools and equipment. Furthermore, they were asked to provide answers on the efficacy of the practiced exercise programs and their satisfaction from them. They were also asked to answer questions on their opinions about the competence of the working staff and the relationships of the latter with the customers. There was no statistically significant difference between males and females ($p > 0.05$) on their satisfaction about the physical condition of the business, sufficiency and diversity of the used equipment, efficacy of the applied exercise program and competence and customer relationships of the working staff. There were numerous studies conducted on satisfactions related to these categories in sports centers (Çeto, 2016, Çoban, 2002, Yerlisu, 2012). However, in our study, besides the abovementioned categories, customers were asked to respond to the questions "I think that accessing this center is easy and suitable." and "I think that it is easy to park your car when you come to this center." that we defined as the environmental factors of sports centers. We investigated the presence of a statistically significant difference between men and women related to the answers provided on this context.

When it comes to the sex-related statistics of the abovementioned questions of the survey used in our study, a statistically significant difference ($p < 0.05$) was found between men and women regarding the ease of access to the center and organization of parking spaces, both of which are environmental factors of the business. No statistically difference between sexes was found in other categories ($p > 0.05$). There are numerous studies conducted on sex-related differences in customer satisfaction (Yerlisu, 2012, Savaş, 2012, Greenwell, 2004, Theodorakis, 2004). Most of these studies also found that the percentage of men going to sports centers was higher than that of women. This means that men are more interested in sports-related activities and can access these centers more easily. In our study, it was found that even in developed and metropolitan cities, women are experiencing problems related to access, traffic and parking when they are going to sports centers. According to the results of our study, more women would be encouraged to go to sports centers if we ease their access to these locations at all times. Sports centers should be located at places that are safe, easy to access and don't have any parking-related issues.

Abstract

The problems which are connected to academic failure, early school leaving, and learning difficulties make us seek other alternatives and opportunities.

The main goal is to identify what type of academic and pro-social learning are being carried out by the school staff and how is the teacher profile which leads this group of disengaged and discouraged students

The methodology used is descriptive, following a multimodal view. We present our research through the qualitative method, extensive interview with teacher and we use the quantitative method to make the observation record inside the classroom.

The results show with regard to the promotion of academic skills its special relevance, evaluation criteria used by the teacher staff.

As for pro-social promotion skills, it is specially highlighted the intervention strategies in extreme situations of teachers.

Regarding as the teacher profile, what most draws powerfully our attention is that is a teacher who combines a balance between discipline and proximity.

Keywords: Academic failure, Social Exclusion, Alternative learning, Teaching Profile.

Introduction

At present, the increase in academic failure, according to Escudero & Bolívar (2008) reflected in the non-overcoming of students of certain subjects and therefore, the failure to achieve the objectives that are raised, in addition to the lack of motivation reflected in the classroom and the lack of knowledge of the teaching staff and Specific procedures teaching (Vilchez & Bravo, 2015), makes the education system must address an effective response so that the student can integrate in an inclusive way (Escudero, González & Martínez, 2009) . This failure is accompanied by a premature abandonment of compulsory schooling, linked to different personal, social, family factors and those derived from the educational system itself (González, 2006). Even aspects related to the teaching capacity of teachers and the formation of this. Noting recent studies of the difference between teachers who teach secondary education with higher qualifications and vocational training technicians who teach in professional modules, the latter achieve a higher level of motivation and permanence in the educational system of Students who tend to abandon their studies prematurely (Alegre & Benito, 2010). This abandonment leads students not to obtain the qualification in compulsory degrees, led not only by the factors mentioned above but also by the problems of adolescents, and if we focus on children at risk of social exclusion, we add others Such as substance abuse, gender and gender violence, the dependence of new technologies, among others (Melendro, De-Juanas & Rodríguez, 2017, Requena, 2010, Sternberg, 2010, Sternberg et al., 2006).

One of the causes of this premature abandonment previously mentioned is due, in part to, the teaching-learning styles taught in classrooms. Learning styles that follow Keefe's definition (1988) are those cognitive, affective and physiological traits that serve as relatively stable indicators of how students perceive interactions and respond to their learning environments.

Therefore, if the individual can perceive and respond it, depending on how he processes and transforms the information, becoming more relevant how one learns what one learns. This consideration makes us think that all learning will depend on how the information is presented, in what terms, modalities, skills and organizational form.

Authors such as Rezulli (2010) distinguish between learning by deductive or traditional method, which is carried out in a formal school, and the inductive method, which occurs in situations where there is no formal learning. To conclude, among other premises that obtains better results that learning oriented to the students that still based on the traditional methodology looks for extrapolated examples to real situations of the daily life.

It is convenient, therefore, to introduce alternative strategies of learning, to establish an effective connection between theory and practice causing obvious changes in the beliefs and future actions of teachers (Solís et al., 2012), in which the work of inquiry is one of The fronts open when it comes to getting students to work in the classroom (Vilchez & Bravo, 2015).

A task in the classroom in which the role of teachers is a determining factor. Aramendi, Arburua & Bujan (2017) claim that it is intriguing that teachers from vocational training, without specific training in education, lead more satisfactions in the students than in compulsory secondary education (ESO), and for this an assessment was made on teachers in The Basque Country (Spain), where the students expressed their opinions about their relationship with the teaching processes developed by the teacher of the Initial Professional Qualification Programs (PCPI), highlighting their more than satisfaction in comparison with ESO teachers.

Therefore, the role of this teacher has as a central element, the power to influence on the training of its students, where the aim is that any teacher to be able to change their traditional teacher role and to become a mediator, guide, facilitator and coach, among others (Harden & Crosby, 2000), depending on the mentioned aspects of their training and the availability of resources available to them (classrooms, media resources, etc.) (Huber, 2008).

A teacher who needs a series of specific skills, and according to Renzulli (2010) include the following:

Finding and facing a problem that has a personal pre-eminence for the individual or group.

To distinguish between specific problems, relevant and irrelevant information, identify obstacles, and transform information into usable knowledge in order to solve the problem.

To plan activities that address the problem, order them by dates, considering alternative courses of action and their possible consequences.

To evaluate the need to collect more information of higher level (content), methodological skills (process), and material or human resources.

To observe models, relationships and differences in the information collected and use it to improve tasks and establish comparisons to other problems.

To generate reasonable arguments and explanations for each decision and course of action.

To predict the results, grant time and resources; appreciate the contributions of others to the collective effort, and work cooperatively for the common good of the group.

These skills are necessary so that the rise of social exclusion and school failure do not thrive and become a scourge and has repercussions on a group of students. For this, among other factors, it will highlight special emphasis on action patterns, which in dynamic interaction with students and creating an adequate classroom climate may be able to awaken the interest and motivation of the latter. Becoming a necessity to motivate and to present a type of learning where the evaluation to be used, preserves the student's self-esteem, encourages him to perform the tasks, facilitates autonomy and also lets us see the acceptance by the teacher of the student and as it is (Tapia, 1998).

Method

The research aims to identify what kind of academic and pro-social learning is being carried out by the faculty of this school and how is the profile of the teacher who leads this group of students which have a lack of motivation and disenchanted.

It intends to analyze different curricular and teaching aspects. The research has set itself the following specific objectives:

Identifying the skills that are promoted and highlighted at the academic level necessary to be developed in the school environment.

Recognising pro-social skills that help the student to develop himself socially.

Clarifying characteristic and defining features of teaching staff.

Sample

The participating students add up to 77 out of a total of 322 students enrolled. The reason for being 77 is due to that those students in particular, have been taught by the teaching staff to who had participated in the study during the process. The students have participated in an optional and voluntary way. Due to this study was optional, we are allowed to draw conclusions from the sample and infer what might happen from it in other populations with a high degree of relevance (Devore, 2008, Montgomery, 1999, Siegel, 1970).

The participating teaching staff has been chosen for its wide experience of more than ten years and for its results during their career path, given as a result that 95% of its students have been graduated.

They are teachers of recognized prestige who seek to provide educational responses that result in the integral benefit of students, using strategies and design procedures based on the deep knowledge of what is potentially the students.

The total number of teachers selected was 20 out of a total of 30, their participation was estimated, considering that they represent sufficiently the sample and in a good way.

Instrument

In the teacher interview, a category system based on the social competence model has been used for students at risk of school failure (Dumas et al., 1999), empirical corroboration of such theory adjusted to a case of educational compensation center or second chance school.

A number of issues were taken into account in order to develop the interviews. Firstly, a profound review of the literature was carried out in order to identify relevant concepts and theories.

Subsequently, we selected the model that based it, the type of interview, the validation through experts, the subsequent change of the questions, the implementation, the analysis of the data, elaboration of results and conclusions.

They conduct an in-depth interview, trying to discover the top reasons for the interviewer's attitudes and behaviors, in order to reconstruct the cultural system that gives rise to the discursive production and non-cognitive aspects of people as their commitments, affections and emotions (Quintana y Montgomery, 2006).

As for the observation register, a total of 77 students were carried out. An observation scale based on the principles of authentic instruction is developed (Newman & Wehlage, 1993; Knapp, 1992).

With respect to reliability, it claims that the scale indices have been obtained after wiping out those elements that have corrected element-total correlation indexes below 0.150, which in turn negatively affected the values of Alfa, and increased the value of the Variance of the scale.

As for reliability, the Cronbach's Alpha, and composite reliability ranging from 0 (absence of homogeneity) to 1 (maximum homogeneity) are calculated. The alpha value is 0.457 for 6 elements and 77 observations, being composite reliability 0.796.

As for convergent validity, it is used: a) the average of the extracted variance, the minimum recommended value being 0.5.; and b) the factor load, that is, the indicators that build up the factor, being advisable that the load of each indicator in the factor exceeds 0.5. In this sense, the average of the variance extracted is 67.4%. Also, the load of the indicators in each factor, in all cases exceeds 0.65.

The data of the qualitative part were processed with a type of programs called Computer Assisted Qualitative Data Analysis Software or what is the same CAQDAS and specifically with Atlas.ti. The result of working with Atlas.ti has allowed us to have a file, which contains all the information that is produced after the analysis, which is called hermeneutic unit or Hermeneuticunit. This unit is composed in turn of a series of elements among which are: Primary Documents, Quotations, Codes Memos, Families or Networks.

With regard to the Statistical Package for the Social Sciences or SPSS, we have considered it as essential to use this research, as it allowed us to create a data file in a structured and organized way to be statistically analyzed. Also, SPSS optimizes variables by establishing different relationships between its elements or variables, as they interact with the modules or subsystems and between the commands or sub-subsystems within the modules, that is; perform a strengthening function with each other to achieve common objectives.

Results

Next, we make a description of the families of codes and specify the frequency of appearance of these in the interviews and the relationship between them. Code families refer to the nomenclature that brings together a group of categories that have been given as a result of the analysis of the interviews performed on the twenty subjects belonging to this research.

Regarding as the promotion of academic skills, it refers to the promotion, empowerment and strengthening of school-based skills based on aspects such as: connection with the experiences of others in the group, substantial conversations and thinking skills. The family that follows is made of the codes that appear in the following table.

Table 1. Family codes «academic skills promotion».

(source: self made)

Codes	Frecuency	Nº of relationships
Curricular adaptation	37	1
Centre of interest	5	4
Evaluation criteria	53	0
Classroom distribution	51	0
Development of materials	9	3
Individual / personalized teaching	48	2
Classroom cleaning	11	0
Planning/organising class	34	0
Flexible schedules	23	2
Tutoring Full Stage	3	0

Within the family of promotion of academic abilities they obtain a higher score those codes which are referring to the evaluation criteria, the distribution of the classroom and the individualized / personalized teaching.

Alternative evaluation criteria are established based on a series of judgments regarding which value judgments are made, in order to estimate students' knowledge, skills and performance. These criteria are mainly based on the progress of the daily students, giving importance to small achievements and highlighting qualitative versus quantitative aspects.

In the manner it is recorded in the interviews that for the realization of the corresponding evaluations the motivation is worked out, concretized in an individualized/personalized teaching taking into account curricular adaptations, elaboration of materials, and teaching support/reinforcement, respecting all the time ,the pace of student learning.

One of the main pillars is the distribution of the room into the classroom made upon as a strategy of placement and organization of students according to their personal and academic characteristics, which partners are more in line with their needs and who or who can contribute more to their learning and progress.

Regarding as the promotion of pro-social skills, it refers to the learning and development of behaviours that help to develop socially empowered social competences, internalizing values and creating habits. The family of codes that configure the pro-social skills are presented in table 2.

Table 2. Family codes «promotion of pro-social skills».

(source: self made)

Codes	Frecuency	Nº of relationships
Strategic grouping	22	1
Competitions	8	8
Creating habits	7	6
Educating in values	54	6
Motivational Teaching	4	1
Strategies for action	61	0
Support/reinforcement groups	11	0
House Rules	11	0

Conflict prevention	10	1
---------------------	----	---

The highest scores are found in the action strategy being the educational responses carried out by the teaching staff in a situation of medium or high complexity, accompanied sometimes by disruptive and even aggressive behavior of the student.

It is a conflicted student that shows having many shortcomings, they suffer an important academic delay due to different circumstances that have determined their life. This makes them get bored at class, not to be motivated and whose consequence is usually disruption. Among other things, it is evident the importance of respect towards the rules of coexistence, making it clear that all violent and aggressive acts are discarded and that these rules are recorded in the murals on the walls of classes and in the centre.

To ensure the compliance with the rules, the teacher performs strategies of action, ranging from taking the student out of his class and placing it in a different one, to be coordinated with the teacher who receives the student. It expresses in a forceful way the rejection to the act carried out by the student, besides showing their agreement to the measure adopted by the teacher.

When they arrive at this new centre, they usually repeat the same actions, now the teachers have to help them to unlearn what they have learned and learn new attitudes, behaviors, behaviors and change their negative thoughts into positive ones. They act by committing them to carry out good actions, to experience and verify the transcendence of these and the benefits that can bring them. In this way, we also work out on educational values. They develop and teach them qualities, behavior and ethically correct actions.

Referring to the role of the teacher would be the characteristic and defining features of the centre's teaching staff, highlighting both their personality and training, as well as other singularities that make them different. This family is configured by the codes given below in Table 3.

Table 3. Codes of the family «role of the teacher»
 (source: self made)

Codes	Frecuency	Nº of relationships
Teaching opening	4	1
Teacher self-control	2	3
Exemplary Teaching Behavior	4	3
Knowing the population	15	2
Availability	7	0
Empathic	5	2
Balance between discipline / love	17	2
Teaching style	14	2
Training	3	0
Social skills	4	3
Humility	3	1
Vocation	13	0
Emotional / Emotional Connections	22	3

Knowing the population aims to learn about the characteristics, peculiarities and particularities of the students with whom they will work. As well as their environment, family, friends, etc. In this way he also establishes affective/emotional bonds that allow him to empathize and better understand the students. This link is mutual with what achieves on the one hand, the respect of students and on the other hand, the confidence necessary to be able to develop in those academic and social skills necessary for their socio-labor insertion.

All of the above combines with a manifestation of balance between discipline and affection, between the emotional and the requirement of responsibility.

Relative to the observation record and following the principles of authentic instruction (Newmann & Wehlage, 1993; Knapp et al., 1992). Highlight that Factor analysis identifies the underlying theoretical model defined by three factors: a) proximity, in the relationships teacher-student and between partners; b) meaningful learning, referring to the connection with the experiences of the environment, the coherence of the material and the participation of the students; and c) reinforcement, making references to the attention that the teacher puts in the strengths of the students.

Table 4. Main component analysis.
 extraction method: main component analysis.
 Method of rotation: standardization quartimax with kaiser. a rotation has converged in 4 iterations

Proximity	Component	
	Meaningful learning	Reinforcement
Substantial conversation, noun with peers or teachers	,812	
Teacher / student relationship	,858	
Connection with experiences of students outside the school	,670	
Material consistency	,721	
Participation of students	,289	
Reinforcement of personal aspects	,663	,934

In this case, the categories substantial, substantive conversation with their counterpeers or teachers and teacher-student relationship are strongly related. On the other hand, the variables connection with students' experiences outside of school; Consistency of material and student participation also present a positive relationship but more moderately than the previous case (they are not so close to one).

The category analyzed consistency of the material. In this case, actions included from the material is presented in superficial fragments with very little connection until actions that are concretized in concepts or key ideas are studied in depth. 70.5% of the observations reflect that teachers deal in depth with key concepts or ideas. It follows, with a 23.1%, action some concepts or ideas are treated with moderate depth. On the other hand, the less representative action, only 1.3%, is for some key concepts or ideas are addressed, but are well connected with the overall content of the topic. This means that topics are presented in an integrated, non-fragmented and offline way.

Concerning the connection with students' experiences outside of school. The scale of observation turns from actions, themes and activities that do not connect with anything beyond itself to actions that the students see connections of the treated topic with their lives. The theme allows them to improve the acquisition of values and their aspirations. It can be observed that more than 35% of class subjects and activities do not connect anything beyond themselves. It presents a similar percentage, with 33.3%, the action the students see connections of the developed issue with their lives. The issue allows them to improve the acquisition of values and their aspirations. This leads us to think that the topics studied within the classroom allow us to improve their expectations and values in a moderate way.

Conclusions

In this study about learning to obtain success in students at risk of social exclusion we have tried to know the academic and pro-social learning that is being carried out by the teachers of this school and how the profile of the teacher who leads this group of students disconnected and Of the educational field. Students enrolled in the so-called school failure and with no prospect of progress, or of obtaining a degree. Boys with enormous difficulties of adaptation to the established system, strong behavioral problems and with very negative academic records. All of them have repeated the academic year twice in the primary education stage.

It has been focused as a case study in a centre of an Andalusia capital of Spain, but whose conclusions could be extended to other centres where there are students of similar characteristics.

To achieve this, we have interviewed the teaching staff who teaches and we have made exhaustive observations within the classroom as both the teaching staff and as the students. To corroborate the information and to detect the type of learning, strategies they carry out, how they connect with their students and how the role they manifest in the class group. So we conclude, among other aspects, that in his pedagogical practice:

They deal in depth with key concepts or ideas, basic to teaching, presenting topics in an integral, non-fragmented and offline way.

In the classroom, teachers try to connect, although not always with the experiences of the "real life" of students, establishing meaningful examples and improve expectations, values and aspirations, beyond the school.

Students seem to respond to this work methodology, since when it is properly applied, they focus on the task to be developed, significantly decreasing attention loss and disruptive behaviors.

The preponderant attitude of this centre is to maintain a strong relationship of trust between the teaching staff and the majority of students. There is also often a very positive support. This is reflected in the conversations held between teachers and students, which allow to establish friendly relations and generate mutual trust.

The data on the teacher-student relationship shows that in a significant majority of teachers, they create a relationship of trust/closeness/dialogue/listening while only a small minority does not go beyond a strictly formal relationship.

And finally it is claimed that the teachers of this school use positive reinforcements, working the self-esteem/motivation and the personality characteristics of the students. At the same time, specific leadership characteristics are observed in these schools, since most of the teaching staff maintains a certain balance between authority and democratic consensus as a form of leadership.

PARADIGM, KEY-CONCEPT OF EDUCATIONAL THEORY AND PRACTICE

Ionut VLADESCU*

University Alma Mater of Sibiu, Strada Somesului Nr. 57, Sibiu, Romania

Abstract: *Paradigm is a sign of the maturity of a scientific field. The paradigm dimensions determine the conceptual and framework of the educational process (theoretical and practical ones). The meaning of the educational paradigm has advanced depending on the context of pre-modern, modern and postmodern. Currently there is a tendency to attribute pedagogy a post-paradigmatic state, but most researchers demonstrate exchanging of the defining aspects of educational paradigm focused on: openness, flexibility, diversity of the patterns. This attempt to explain paradigm and model in post-modernism, we reach the conclusion that education science is one of the models due to the determinative role of ruling order and laws. If we treat the diversity of theoretical approaches and educational methods, the model is not deducted anymore and doesn't express the major notes of a dominant theory. It is the situation when reasons for post-paradigm pedagogy appear. As a key concept, it gets a traditional role based on the normative model but with a different connotation.*

Keywords: *postmodern education, curriculum, paradigm, educational methods, concept.*

1. Introduction - Paradigm, major point in education

According to Cezar Birzea, any science is mature and able to solve scientific problems of a subject when it is able to operate with paradigms (Barzea.,1998). Because of the complexity, an approach to educational enquiry emerged, one that treated educational theory as factual, as referring to how things are rather than to how they should be. This interpretation of theory derives in large part from the influence of natural science as a model of education. There is a plurality of interpretations and theory *paradigm* tends to be seen as a example, a model of thinking that explains the occurrence of particular types of event in particular types of circumstance – for example, by identifying the mechanisms involved where ideas, by Platon, should never be separated from the examples that support them In an epistemological meaning, paradigm is an instrument of scientific knowledge, and viewed by T. Kuhn, sciences do not operate with theories but with paradigms (Barzea, 1998).The philosophical meaning is on a second plan and the dominant theories are the paradigms used by science at a certain moment.

- The scientific community adopts referential works for a domain. These works are true theoretical basis for further education.
- Each dominant theory has its own “method” accepted, together with all the applications by the scientific community and these theories are repeated in time.
- The dominant theory becomes a system of exclusion. It collects the coherent concepts of a community but rejects other explanatory cases, paradigm becoming therefore a normative action.
- Paradigm solves in a typical way typical problems.
- Theories changes more frequent but paradigms have stability and conceptual scientific agreement.
- Associating theory and practice in certain projects, paradigms could become an autonomous program of formation.
- Sciences can produce and use their own paradigms if:
 - ✓ define a referential axiomatic;
 - ✓ define in a precise way the object to be studied;
 - ✓ use scientific knowledge to find specific solutions in a domain;
 - ✓ define the criteria for a paradigm change (Barzea.,1998).

The paradigmatic approach is of real help because it works with the relation object-subject and on a problematic field. Thus pedagogy can be named “normal” and “mature” able to find scientific solutions in a vast and complex domain- education. Speaking about education in a functional-

* Corresponding author: ionut772002@yahoo.com

structural context, we can determine the role of the models in this activity. In a poly-semantic way, the determined normative meaning of the word model is:

- attitude to imitate due to its value and significance;
- person, fact, object with special qualities, representative for a whole category;
- perfect state, aspiration for something, accomplished in approximate ways;

A scientific meaning could be used, too:

- assemble of elements and variables compounding a symbolic or social system;
- logic representation of a theory (theoretical model),(Barzea C.,1998).

Pedagogy uses both definitions, but the normative one prevails as this is a normative science. Cristea (2010).thinks that norms in pedagogy have to be related to the norms in socio-humanistic sciences. In a very general philosophical system, norms are associated to laws, referring to a set of values existing between the absolute ideal and an average of personal successes, expressed in various principles and operational rules. The normative relation between the teacher and the student implies standards and social expectations generating and ruling the pedagogic interaction and communication (Cristea,2009).The laws/norms in communication make necessary bridges among the proposed finalities, the extended project, the transmitted message, the common constructive plan and the feedback internally and externally evaluated.

The active laws in educational policy are normative laws, too, and their existence depends on the conscious will or practice of a single or a group of rational agents. The relation paradigm –model in education has to be interpreted in a functional-structural context. According to these statements, it is possible to determine the report between paradigm and the real historic period characterizing the dimensions of a paradigm, different from one period to another, from pre-modern, modern to post-modern years. In pre-modern period, paradigm was defined /determined in the basic works in the domain, which become a dominant theory, a model to follow in education and practical education. The modern period keeps the relation paradigm –model, emphasizing mutual interdependence and inter-determination. “Without having a well-defined, epistemological identity, a studied domain is only a complex of contradictory processes, in search of the best methods to be used in educational theory and practice”(Cristea S.,2003). These searches follow two tendencies: psycho-centrism and socio-centrism. The openness to other sciences makes possible the extending of the limits of traditional pedagogy, work with empiric researches, indefinite connection between a profession and scientific discipline, between education and pedagogy, the incapacity to theoretically (re)construct the domain (Cristea S.,2010).Modern period develops in time and the diversity of theories “uses different paradigmatic circuits”, which will give particular values to the parameters to follow when defining education: marking influences, setting the connection teacher-student-educational context-methods of education, giving strictness to the model. According to the “center” of the education (which establish priorities), Y. Bertrand classifies paradigms designing three basic “centers”: person, society, content, interrelation leading to the forth “center” – interconnection.

Fig.1. Four components of educational theories

Post-modernism differs from most approaches to learning, according to the conceptual/theoretic dichotomy between psycho-centrism and socio-centrism. S. Cristea evolution is done in two fundamental ways. (Cristea.,2010).

- The first is that rationality and logic are not important to attaining knowledge.

- The second is that knowledge can be contradictory. Because of the contextual nature of knowledge, individuals can hold two completely incongruent views of one subject at the same time, intra-, inter- and trans-disciplinary views.

Connotation is different now and we cannot speak about referential work and about a dominant theory. A question appears: is pedagogy, as theory and practice in education, a sector of the models? The model preserves its utility to satisfy the functional-structural and contextual dimensions of education. The teleological character of education imposes the necessity of a model to give dynamism and show the importance of educative activity. “Education at all stages (system, process, real activity) gets the capacity to anticipate long term, medium or short term results in a determined space and time”(Cristea S.,2006). A model is a conceptual need too, in point of its systemic, historic and national character and education is to be found in the determinative aspect. The resulting quality, educability, is the capacity to develop personality, defining education as a human virtue to continually grow in life, to get experienced, to try to have perfect abilities all these features being evaluated according to the model. This attempt to explain paradigm and model in post-modernism, we reach the conclusion that education science is one of the models due to the determinative role of ruling order and laws. If we treat the diversity of theoretical approaches and educational methods, the model is not deducted anymore and doesn't express the major notes of a dominant theory. It is the situation when reasons for post-paradigm pedagogy appear. As a key concept, it gets a traditional role based on the normative model but with a different connotation. The openness of education sciences using trans-disciplinary approach tries to put foundations for a conceptual educational process using a synthetic, adapted model resulting from the structural elements corresponding to various theoretical approaches and designed to give future perspective on education.

1. Paradigm and change

In a period of openness, diversity and changes, theory and practice in education have the same functions but in an increased complexity context. The definition/design of paradigm is based on the relation object-subject, a determinative factor for the other constitutive elements of education, as a system and a process. The teacher is specialized in human behavior and has to make extraordinary complex changes in a material, extraordinary complicated. Child's flexibility always acted pro and against education, a phenomenon more accelerate these days. The present education paradigm focuses on the object of education but doesn't leave the student to learn independently. The tendency to make the object a “subjective” notion must use the fashionable “defensive doctrine”(Cristea S.,2009). The teacher, as manager of changes, must be familiarized to the laws and demands of the transformations, to understand the substance of the present paradigm in education in case of:

- various theoretical approaches;
- many pedagogic trends to be accepted;
- conceptual incoherence among the elements of educational strategy, of initial formation (and continuous, too), accepted practices to be applied in real contexts;
- discrepancy between paradigmatic dimensions and the resources involved to accomplish them (human materials).

This is the moment when the teacher must be considered an agent of change, in a humanistic theory of education, with old empiric ideas, scientific manipulation of attitudes, with numerous limits but permanently working on the methodology. Without neglecting the intentional, guiding, organized character of education, we notice the terms of spontaneous change, as result of the influence models have, that becomes more important, an organized change. Another conceptual principle is to put into value all types of education.

2. Curriculum, paradigm of post-modern pedagogy

As Cristea (2006) thinks, postmodernism, as cultural model, offers a new method to understand the relation between knowledge and experience, between theory and practice in human actions. This implies a permanent reevaluation of the processes in their educative action and their individualized development in very different contexts and psycho-social situations: To be functional, this paradigm imposes two basic conditions:

- ∨ a historic positioning of pedagogic theory in post-modern cultural context;
- ∨ an axiomatic synthesis of a referential system.

The curriculum paradigm, introduced by R.W.Tyler, helps to generally (referring to all educational contents) treat the learner (no matter the age) in an open, proper way (using all methodological resources)(Cristea S.,2003). Globalization and standardization of individual tasks and performances influence the form a paradigm is created. Its substance is focused on finalities to respond both psychological and social demands. Nevertheless, paradigm was approached in many different ways when documents of educational policy, contents and finalities were taken into account. This is not a completed process and E. Soare, citing W. Pinar (Soare E.,2010),says that “paradigm is a very symbolic concept, representing what the mature generations want to transmit to the younger ones. Therefore, curriculum has a historical, politic, racial, gender, phenomenological, autobiographic, aesthetic, theological and international character”.

The conceptual evolution of curriculum is to be noticed in the introduction of some phrases such as: “apparent curriculum”, “hidden curriculum”, “written curriculum”, “school decision curriculum”, “teaching curriculum”, “learned curriculum” etc.

Cristea (2006) notices the following tendencies in the evolution of curriculum:

- extension of the concept from defining the educational objectives, projecting contents, selecting models to teach-learn-evaluate, to life experiences, useful for personal evolution;
- considering the concept as a sum of efficient contents and learning situations, following a progressive sequence determined by pedagogic aims;
- managerial approach of the concept;
- integrated approach of the intra-, inter- and trans-disciplinary activity.

4. Conclusion:

Curriculum paradigm accepts and promotes a multitude of various aspects. It includes, at a global scale, all structural and functional facets of educational reality projected and existing in an open social environment and in continuous transformation. It also covers the structural finalities of the social system which deeply influence the content, teaching methodology and evaluation situations (Soare E.,2010).Curriculum analysis has the importance of a paradigm because of its features defining the post-modern reality:

- openness;
- capacity to offer models for various educational situations;
- flexibility, permitting an “inside” evolution;
- search for the key element(landmark) of conception- the education finality is to use both formative values of the process and the functional performance of the result.

As a conclusion, it is obvious the predetermined and prospective character of the curriculum paradigm which ensure the pedagogical optimism to the process of education.

Abstract

Preparation for the defence any country can be defined as a continuous process. The main purpose of this process is to plan and prepare state armed forces for mobilization and force employment against enemy. In the event of jeopardy of national security there is compulsory military recruitment for military duty. Not only the political roles of government and state administration, but also the economic capabilities of the state and allied commitments play a decisive role in this process. The tasks and requirements in this area are based not only on the laws, but also on the guidelines of the government and the orders of the president, as the supreme commander of the armed forces. The article deals with current issues of education and training in the field of mobilization planning and war preparation of state territory. This field provides a system for transition of the armed forces of the Czech Republic from a peaceful to war military organizational structure. The issue of the deployment of the armed forces concerns cross-section of all members of the armed forces, both professional and civilian soldiers. For the deployment of the armed forces, it is necessary to have enough skilled professionals to handle these processes. The article describes theoretical foundations and approaches to education and training within the Training Headquarters at the Vyškov Military Academy and the University of Defense. In the article, the authors also introduce limited states of the personal security system at individual levels of command, in connection with ensuring the transition of the armed forces of the Czech Republic from the peace to the war organizational structure.

Keywords: Mobilization, Armed Forces, Education, War.

Introduction

The basic duty of every state is to ensure national defence and security and the protection of its own population. This role belongs not only to the most basic but also to the most expensive and most complex economic activities; because it requires the allocation of significant human, material and financial resources for this purpose (Ivančík, Nečas, 2011, 392). Ensuring the defence of each state can be defined as a permanent process. The crucial role in this process is the ability to mobilize and deploy its own armed forces. Within this capacity, political representation, state administration and the economic capabilities of the state play a key role. Tasks and requirements in this area are based on the laws, the government orders and the orders of the resident as the supreme commander of the armed forces, and the obligations of the state in relation to the NATO and the EU. According to Kozůbek (2012, p. 87) each NATO member armed forces are presently under extensive transformation process to meet declared initial and demanded capabilities. With defence being a significant ongoing investment for any nation, and with the typical perdurability of the capabilities involved, there are challenges in developing of robust and modular force which are able to meet its national interests. In an effort to point out these challenges, an analytical concept is necessary to be developed for experimentation that provides an obvious connecting link from government guidance through to the capability implications.

Due to the changing internal and external environment, the classical concept of the war, when individual states fought against each other and the conflict resolution has been in the hands of individual Nations, has become a thing of the past. The future operational environment will be characterized by the rising role of new actors. These new actors will include the irregular enemy using illegal warfare, criminal organizations, NGOs, mass media, international organizations and civilian actors as part of a civilian environment. For current and future crisis management, all parties have used the resources that involve non-military actors. (Kovanda, 2015, p. 63)

On the basis of these security challenges, changes also occur in the system of mobilization and deployment of the armed forces.

In the defence sector, the area of mobilization is represented by specific military expertise "Mobilization planning and operational preparation of state territory". The subject of this article is the reaction of the department to the current and possible future requirements and the needs of the sector in the field of professional training of its members.

Method

Scientific methods of analysis and synthesis of knowledge from the history of deployment of the Czech Armed Forces were used for research. Training approaches within vocational courses have been analysed and best practices and approaches to education have been developed through an inductive approach. The methods of induction and deduction were used to derive and generalize judgments and conclusions.

Findings (Potential ways and their realization)

a. Background

The basic tool for the process of deploying the armed forces of CR is mobilization planning. Planned measures are generally implemented within individual security states. In times of peace, calculation of human and material resources needs is conducted. Its updating is done regularly with regard to the relevancy of the data and the war organizational structure. In the event of a military threat, the levies will be made on the basis of military duty. Increase of material resources will also be carried out for the war organizational structure. Training and preparation of individual elements then follows. With further deterioration of the situation and the transition to a state of war, formation of other units and services may be established for the defence of the state territory.

Planning and securing mobilization is dependent on human potential. For this activity (control and planning activity) professionally prepared management must be at all levels of command and control. With the current deteriorating security situation, there is need not only for the ability and readiness of the management department of the Defence Department. An important aspect is also the ability and readiness of lower levels to carry out their own mobilization. To do this, we need to maintain basic know-how on defence and mobilization preparations at all levels of management. Meeting these requirements is the purpose and task of the training system for professionals in the area of defence and mobilization preparation. The education and training of these specialists is conducted by the defence department separately. This is due to the fact that this issue is absolutely unique and lacks a direct equivalent in the labour market in the civil sector. In order to meet the required capabilities, the Department of Defence creates specific training courses within its sectorial training and education facilities to provide training to the members of the Defence Department, so they acquire both theoretical knowledge and practical skills.

b. History

In 1995-2004, the education of mobilization expertise was under the responsibility of the Department of Military Strategy and Operational Arts, which was within the organizational structure of the then Military Academy. This department was focused on mobilization and deployment of the armed forces. It provided instruction for students, staff and conducted scientific and research activities. The most important activity of the department was a two-month vocational training course. This Department, however, ceased to exist as a result of the reorganization of the Military Academy at the University of Defence in 2004. There is no organizational element in the current organizational structure of the University of Defence, focusing on science and education in the

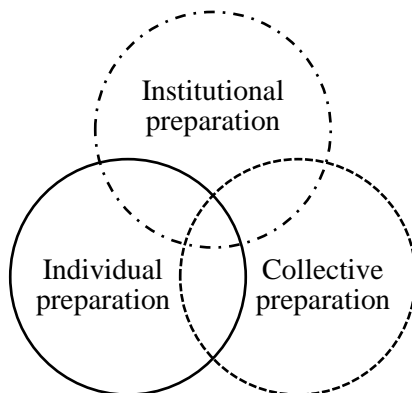

field of mobilization of the Czech Armed Forces. At present, the preparation of persons in the defence sector is implemented by one training facility¹, one military secondary school² and one university³

c. Present time

The current process of acquiring theoretical knowledge and practical skills in the deployment of armed forces consists of three components, namely schooling, education and training, as shown in Fig. 1. Within these three components, a soldier is professionalized during his military career. All educational facilities within the defence sector are included in the institutional preparation or added outside of the Defense Department. Collective preparation includes all the common preparations made in the units. Independent training is then an individual study of the military professional himself. According to Balaban (2015, p. 229), it is possible to utilize Sorensen's model describe the professionalism as: *"Forming an individual towards the best performance of his profession since the moment of his recruitment for military service as workforce suitable for the performance of a certain work in the armed forces, through preparation for such performance, through the performance, or the performance of other positions as a part of his career within the army."*

According to Spišák (2016, p. 180) *"The aim of the education and training of military personnel in the courses is the achievement of the basic qualifications required for the performance of duties in the relevant rank corps. Fulfilling these requirements is a prerequisite for the career development of professional soldiers and the possibility of their appointment to the higher ranks."* The professionalism of the members of the Czech armed forces is therefore an expression of the required ability to handle the given position in the best manner.

Figure 1: Particular elements of education. Source: Own

The above-mentioned institutional training of military professionals can be further divided into several phases. The first phase is a general introduction to the deployment of the armed forces, which is conducted at the training facility. The second phase, for military experts and civilian employees, is a professional course at the University of Defense, in competence of the General Staff of the Army of the Czech Republic (hereinafter referred to as GS). The frequency and the duration of the courses are tailored to the needs of the defence sector in a one-year period and duration of three weeks. Teaching is provided exclusively by GS members. The aim of this course is to enable graduates to be able to plan and implement the mobilization measures set up separately at the various levels of command and control. Nowadays, the need to complete the course is partially triggered by an increase in the number of military professionals and civilian staff dedicated to securing this area. In the previous period, the training of mobilization expertise was underestimated, and there was even a reduction in the

¹ Headquarters of Training - Military Academy Vyškov

² Military High School and Higher Technical School of the Ministry of Defense Moravská Třebová

³ University of Defence Brno

number of experts induced by the reorganization in the defence sector between 2003 and 2013. The third phase, from the point of view of career education, is the Senior Officer's Course (for captain-major) and the General Staff Course (for lieutenant colonel- colonel) in competence of University of Defence. With the changes in the development of the security situation, it is striking that the deployment of the armed forces of CR is currently not part of the teaching plan as it was in the past.

d. Legislative framework

The historical way of implementation is adapted to the current developments within the society itself. A completely new approach, way and concept of the deployment of the armed forces with the emergence of professional armed forces of CR have not yet been designed. If there is a need to modify or change the established system, there should be no over-thinking in terms of the deployment of the armed forces during World War I or World War II or the theories of military art consisting of strategy, operational art and tactics of the 1990s. General mobilization is history. The principle of defence against an ambiguous enemy was a way of seeking the defence of the territory with a maximum of forces and resources. Approaches to legislative adjustments in the field of mobilizing forces and state resources and to the deployment of the armed forces must respond not only to current, but above all, future threats. These future legislative adjustments are a challenge for the training of experts in the area of mobilization the armed forces.

e. Recommendations

For the deployment of armed forces of CR, it is necessary to have enough well-prepared officials in the resort to manage these processes. The solution of this problem can be found between following bordering states:

- In times of peace, develop organizational elements for the deployment of CR armed forces, which will implement the planning.
- Do nothing within the resort.

Arguments can be provided for both options:

- Argument for this option is the fulfilment of one of the key capabilities of armed forces, which is the availability of forces. Argument against this option is the development of organizational elements at particular levels of command and control at the expense of other capabilities. This counterargument is based on the necessity to use every available space for improving the management of combat tasks in the times of peace. It is not possible to weaken the peace structure of CR armed forces by selecting forces to manage measures, which are oriented toward the future.
- To not implement the option, because of necessity to fulfil the fundamental task of armed forces-prepare itself for the defence of CR and to ensure the fulfilment of other tasks associated with common defence against aggression within NATO and EU.

Intersection of these border options may provide for best solutions of the issue. This may take the form of following:

- To prepare and train selected professionals at all sections to provide the building block for the needs of planning in the area of the deployment of armed forces.
- To prepare main officials, who in the process of deployment of armed forces will provide command and control functions.
- To implement practical planning.

Conclusion

The aim of this article is to introduce approaches to education in the field of mobilization and deployment of the CR armed forces, as part of military art. The problems were solved on the basis of theoretical and practical experience of the authors gained at various levels of command and control of CR armed forces.

The issue of the deployment of the CR armed forces concerns the cross-section of all members of the armed forces. The state and the government, through the Defense Department, maintains the established method of deploying armed forces (mobilization), the principle of which was implemented in the history of Czechoslovakia.

In 2005, the proscription was abolished in the Czech Republic, thereby abolishing the general military duty. This also influenced the military readiness of soldiers in reserve. Nowadays, reaction to this state comes in the form of education and training of active reserves, which mostly consist of soldiers in reserve and voluntaries civilians. From the perspective of the institutional level, there is no long-term scientific project in the area of mobilization. Within the professional courses, the students are acquainted with the theory and practice of implementation of the current way of concept of the deployment of the armed forces of CR. In order to develop and maintain the know-how of the area, it will be necessary to identify and accept new challenges for the Armed Forces deployment system from the level of top management of the defence sector.

Abstract

The paper deals with the possibilities of adult career education as one of the decisive tools for expanding and deepening knowledge, developing skills and improving the personal characteristics of students. It describes the possibilities of improving education in decision-making skills by using simulations of crisis situations by state's security forces, for examples the Police and the Armed Forces of the Czech Republic. The article clarifies the possibilities of increasing the quality of training of police and military officers at the middle level of management. In order to determine the status of the selected category of persons, standard scientific methods are used, which, in a wider conception of the given sample, help to recognize the level and individual quality of the examined persons. The final evaluation of the data for examining a given sample of probands becomes a classification, a sum of relevant information that is a basic element for interpretation and other possible uses. The combination chosen and the number of standardized scientific methods used in the research offer the possibility of mutual evaluation, confirmation or rejection of the obtained findings

Keywords: recruitment, training, scientific methods

Introduction

The issue of ensuring the security of the citizens of the Czech Republic in relation with the development of the security environment requires the constant consideration and improvement of the tools for ensuring the safety of the population. In particular, it may take the form of improving the selection of workers, by using different personnel and managerial tools, and their subsequent training. In 2014, the authors of the article developed and tested a tool for the selection and training of security staff. Prior to the development of this tool, an analysis of the current state of the issue under consideration was carried out.

If we want to achieve a higher quality of decision-making skills in responsible officers within the constantly changing security environment, it is necessary to look for the actual activities that can be lead to the accomplishment of this goal.

These activities can take the form of personnel selection, focusing on people with personality prerequisites for quality decision-making, or readiness to learn quality decision-making.

Method

The research used general scientific methods, which were applied in combination. The following methods were used: Method of analysis, synthesis, induction and deduction, method of comparison and statistical evaluation of data and paired-samples sign test.

Following techniques were used during the research:

Critical Incident Techniques - Critical Incident Techniques serve to analyze activity and identify major mistakes. We place this technique in the field of people selection. It is a behavioral, qualitative method by which job positions are analyzed. During the conversation, the worker deals with critical, key events (Flanagan, 1954). The advantage of this method is its focus on practical problems and its flexibility: data collection can be done through interviews, questionnaires or observations (Kempainen, 2000) (Procházka et al., 2015).

Semi-standardized interviews with heads of operational unions of centers- one group of questions focused on the same problems, the other group asked in non-standardized manner.

Test of decision-making situations– Deliberate test for the evaluation of model situations, evaluation at the scale of 1-5.

Personality questionnaire SPIDO offering profiling of values for competencies, which are necessary for decision-making activities and for the solution of various events in the workplaces (Mikšik, 2007). The method of SPIDO was established with the purpose of examining the structure and the dynamics of psychological resistance and integration of personality.

Spearman's Rank Order Correlation – There was conducted the comparison of solving the given tasks, with the success of police in practice, with the utilization of correlational analysis as a statistical method. The core of the method consisted in the table of mutual correlations between evaluation by the seniors and results of the solving of case studies.

Correlation – it describes the impact of change in one variable on the change in other variable.

In order to compare the difficulties of particular situational variable, paired-samples sign test was utilized. The validity of personnel selection describes the relationship between values of employed method (predictor) and some real criteria (number of car accidents in drivers, trade results for businessmen, and evaluation by senior at other occupations). Validity can be measured by coefficient of correlation between predictor and criteria. Simulated situation, in the form of case study, is one of the most reliable tools of personnel selection. Following scheme is suitable for high-quality processing of simulated situations:

1. Collection of data
2. Selection of valid situations for the testing (situations, which differentiate between wrong and right acts, which are adequate in difficulty and which are open to rigid evaluation.
3. Presentation of situations of respondent's sample and aggregation of possible answers to particular questions.
4. Marking of answers by a group of experts.
5. Development of user guidance for the testers.

According to specific conditions, the case study has a written form, where the applicant solves the problem situation or a set of problem situations, or a role playing form, in which the candidates act as participants in a fictitious situation and their reactions are evaluated by their senior (Hroník, 2002, Hroník, 2007).

Plenty of research deals with the use of simulated situations to predict the future performance of police work and monitor their validity.

Another model for decision-making was developed by Gary A. Klein (1993). He developed it on the basis of his own experience in the area of decision-making. In his book he points out model of decision-making based on his experience, in order to avoid limited analytical strategies. The model, general known as RPD, explains how people make decisions without comparing alternative courses of action.

This model integrates two processes- evaluation of situation and mental simulation. The model assumes that people evaluate a situation, in order to generate possible course of action and they use mental simulation, in order to evaluate that course of action.

RPD model points out that experienced decision-makers are able to be first to identify reasonable courses of actions, because they avoid generating courses of actions by semi-random process (Klein, 1993).

Partial conclusion of the above mentioned review was conducted.

According to Hroník, the most suitable tool for personnel selection is simulated situation in the form of case studies. General approach of the author was used in the implementation and development of the tool in operational centers integrated rescue system.

Gary A. Klein (1993), who developed the RPD model, described how decision-makers use their experience to avoid careful consideration. In this work, in the process of developing the tool, author also builds upon real experience with decision-makers at the centers integrated rescue system.

Procedure and instrument development in decision-making situations

In 2015, the author of the article developed a tool to assess the effectiveness of the decision-making processes of operational center staff. Data was gathered in order to determine the frequency of work situation of operational center staff. Data was analyzed in order to determine the frequency of each critical situation and the main factors to which it is caused. A general procedure was developed for the operational centers of security forces, while one of them (the operational centers of the Czech Police) was carrying out its own research project (Mitacek, 2016).

Procedure of the research at operational center of Czech Police:

1. Monitoring of the work-shift will be conducted by the author on pre-determined period at the site of operational center of Czech Police. It will monitor solutions of the announcements and other events, work analysis, methods of critical incidents, time-scale of particular activities and their difficulty.
2. Author created situational questions to describe work-shift at operational center, in which he utilizes knowledge of previously mentioned monitoring.
3. Author set the criteria for evaluation of the case study. Criteria were developed based on experience with the operational center of Czech Police. They include areas such as protection of lives and health, protection of property, speed of the solution, risk of the solution etc.
4. Author conducted exploration of the case study to trial personnel; he then prepared the case study. The case study was given to 25 people. Those filled the case study and the author has written down possible answers to particular task of the case study. The assessment of quality of various types of answers by was conducted by 5 experts (experienced heads of shifts of Armed Forces). The experts evaluate the quality of various answers on the scale from 1 to 5.
5. Subjective evaluation of personal qualities by senior officers and identification of validity concurrency. This will be conducted according to the criteria of practical success in protection of population. Senior officers will evaluate the work of participants on the scale from 1-5 (1 standing for weakest performance).

Evaluation of performance of policeman:

- a. readiness,
- b. work effort,
- c. quality of decision-making in situations,
- d. reliability,
- e. communication with seniors and subordinates

Utilizing the calculation, correlation between the results of case study and evaluation of seniors will be sought. This will result in correlation coefficient describing the validity.

6. In the last part the case studies will be prepared for practical utility- by calculating the percentile norms via statistical calculation. Percentile stands for the position of participant in comparison with the rest of tested population (Mitáček, 2016).

Statistics was used in the following way:

With accordance to ordinal character of data, Spearman's coefficient of correlation will be used (r_s). We assume that we have dual values at N participants $(X_1, Y_1), (X_2, Y_2), \dots, (X_n, Y_n)$, where X_i stands for the quality of solution of individual participants according to the experts and Y_i stands for the results of evaluation of individual policemen by their seniors. Spearman's coefficient is then calculated by the following relationship:

$$r_s = 1 - \frac{6}{n(n^2 - 1)} \sum_{i=1}^n (R_i - Q_i)^2,$$

R_i stands for the order of random variable X_i and Q_i for the order of random variable Y_i . When testing the hypothesis about independence of variables X and Y , statistics test will be utilized.

$$T_0 = r_s \sqrt{n-1} \approx N(0,1),$$

Statistics test is suitable for larger files ($n > 30$) (Budíková et al. 2010).

Findings

Based on the conducted research, the results of solutions to particular simulated situations were acquired. Situations were acquired based on the monitoring of particular shifts in common performance and from structured interview of leading officers of operational center of Czech Police. In the following examples three out of fifteen situations are introduced.

(Situational questions for officers of Armed Forces).

1. How will operational officer approach the examination of death, injury or arrest of foreign citizens?
2. How will operational officer approach the situation of doctor requiring the transportation of drunken patient to anti-alcoholic station by car?
3. Every day, the 158 link is dialed by the same person, who overwhelms the link by useless stories. What measures will you take?

Results, Conclusions and Recommendations

From the results of these situation follows statistically significant correlation between managing the decision-making situations and evaluation by seniors in situation n.10 in readiness $\alpha = 0,05$ in work effort $\alpha = 0,01$, in solving, reliability and communication- statistically insignificant correlation. In situations 11, 12, the items readiness, effort, solutions, reliability and communication are statistically insignificant.

Simulation of work shift was conducted- file of tasks, which are related to mistakes at the workplace in relation to acceptance of announcements and events. Criteria of evaluation were identified, which were then used in evaluation of particular case studies solved by policemen. Also, the exploration of simulated situation to trial personnel was conducted. Based on the evaluation of personal qualities of participants by their superiors, the concurrency validity was established, in relation to practical success in protection of population. A correlation was calculated between the results in solutions of the case studies and evaluation of practical success of policemen. The relationship was identified between the results of success of policeman in solving the test of case study and evaluation of his person by his superior.

There are situations, in which we are able to predict the ability of valid decision-making in policemen. Our method describes possibilities for increasing the quality of education in the area of decision-making skills with utilization of simulations of crisis situations in security forces of the state such as Police and Army of Czech Republic. Implementation of the reliable general procedures in decision-making processes in study programs of „Population protection“ into the education system will be contribution for whole our society. The support of

informal education as part of the process of acquiring the knowledge, skills, changing of positions, experience and contacts may be very effective form of professional preparation of soldiers (Kubínyi, 2014, s. 63). Author has chosen the topic based on his great amount of experience and attempts to look for a way to eliminate mistakes in decision-making processes, which are present in security sphere. The contribution of the results for the theory of population protection comes in the form of tool for increasing the efficiency of decision-making process at the Army and Police of Czech Republic. Practical output is the increase in efficiency in personnel selection. In terms of testing the proposed procedures and personnel selection, it is possible to test the reduction of mistakes-making by employers.

Environmental Awareness of Teacher Candidates

Assist. Prof. Demirali Yaşar ERGİN

Trakya University Faculty of Education, Measurement and Evaluation Department, Edirne Turkey
demiraliergen@hotmail.com

Abstract

Today, environmental problems are gathered at four main points. 1) the destruction of the ecological balance, destruction of the natural order to completely disrupt the balances, 2) the waste of natural resources, 3) not struggling to eliminate natural disaster, 4) the insufficient use of renewable energy sources. Scientists have serious discoveries and worries that the world cannot solve environmental problems, especially global warming, and that the world will become a planet of disasters within this century. The only way to solve the problems that humans have is the most intelligent being on the planet is science. Informing and raising awareness happens through education. If we want to leave a livable world to future generations, we must educate everybody in this matter, especially children. It is in this point that the teachers who realize these trainings have environmental awareness. The study was carried out with a total of 532 students randomly selected from all departments of Trakya University Faculty of Education and Pedagogical Formation program students during the fall semester of 2016-2017. "Environmental Awareness Scale" prepared by the researcher was used as data collection tool. The scale consists of 71 items with a rating of 4. For each sub-scale, the internal consistency was determined by calculating the item-total correlation coefficient and the internal consistency was calculated by calculating the total correlation coefficient excluding item. In the same way, t-test between the upper quartile and the lower quartile was applied to detect the discrimination power of the items. For the scale and sub-scales, the reliability was determined by calculating the Cronbach and Rulon coefficients. It was determined that the scale consisting of 3 factors was valid, reliable and usable after statistical procedures. A questionnaire consisting of 19 questions prepared by the researcher was used to collect data about the independent variables of the research. The questionnaire contains questions about nature love as well as demographic characteristics such as gender and age. The statistical analysis of data featured t test, variance analysis and LSD methods for Post hoc analysis to determine the source of variation.

Keywords: environment, environmentalism, environmental awareness

Introduction

Natural assets are the conditions of our existence, having existed till today, allowing today and the future to be lived. The future will be preserved as long as they are protected. Also defined as the environment, these natural assets can also be defined as the habitat to which all living things maintain a relationship throughout their lifetime. The world is struggling to cope with environmental issues that have long existed, but become increasingly effective on one hand, and the emerging environmental issues on the other. Deforestation, loss of biodiversity, air pollution, nutritional issues, global climate change and similar issues that are directly or indirectly related to the environment are growing exponentially. While global climate change is the leading threat to the planet and life today, it is now evident that we are in the footsteps of irreversible destruction. Civilization is at the threshold of permanent crises which may significantly affect the life on the planet at a point where all living things, including mankind, are threatened. The leading causes of environmental crises, the energy industry is strategic, but also prominent in environmental discussions due to its role in global climate change.

Today, environmental problems are gathered at four main points. 1) the destruction of the ecological balance, destruction of the natural order to completely disrupt the balances, 2) the waste of natural resources, 3) not struggling to eliminate natural disaster, 4) the insufficient use of renewable energy sources. Scientists have serious discoveries and worries that the world cannot solve environmental problems, especially global warming, and that the world will become a planet of disasters within this century. The only way to solve the problems that humans have is the most intelligent being on the planet is science. Informing and raising awareness happens

through education. If we want to leave a livable world to future generations, we must educate everybody in this matter, especially children. It is in this point that the teachers who realize these trainings have environmental awareness.

Solving environmental issues is only possible by raising awareness on such issues and the environment. This is a process of education. It will be possible to succeed if the educational process through formal and informal channels is maintained. Environmental education to raise awareness on environment can be provided informally by the family, by mass communication, internet, social networks and similar methods of influence. But in addition to all of the above, the important thing is to provide formal education on environment. Educational activities with contents to raise the environmental awareness of students of all age should be carried out.

Environmental education is a new field of education that emerged when we realized that the distortion of environment, resulting from mankind's efforts to dominate the nature, can only be remedied by mankind's efforts again (Özdemir, 2016). By realizing that the distortion of the environment caused by mankind's interaction with the nature can be remedied again by mankind, environmental education is considered the primary method of creating the required change in people's cognitive, sensory and behavioral aspects. (Özdemir, 2007).

The foundation of environmental education is intended to protect the nature and natural resources. In addition to informing, environmental education also affects human behavior. Providing positive and permanent changes in behavior and ensuring active participation of individuals in solving problems are the fundamental objectives of environmental education (Şimşekli, 2004).

It is necessary that the candidate teachers, who will be providing environmental education in schools, should themselves gain awareness of the environment in Educational Faculties, then receive education on the methods to provide environmental education depending on their expertise and level. The initial point for raising awareness is teachers at all levels.

Method

The study was carried out with a total of 532 students randomly selected from all departments of Trakya University Faculty of Education and Pedagogical Formation program students during the fall semester of 2016-2017. "Environmental Awareness Scale" prepared by the researcher was used as data collection tool.

"Environmental Awareness Scale" consists of 71 items with a rating of 4. For each sub-scale, the internal consistency was determined by calculating the item-total correlation coefficient and the internal consistency was calculated by calculating the total correlation coefficient excluding item. In the same way, t-test between the upper quartile and the lower quartile was applied to detect the discrimination power of the items. For the scale and sub-scales, the reliability was determined by calculating the Cronbach and Rulon coefficients. It was determined that the scale consisting of 3 factors was valid, reliable and usable after statistical procedures. (Ergin, 2017)

A questionnaire consisting of 19 questions prepared by the researcher was used to collect data about the independent variables of the research. The questionnaire contains questions about nature love as well as demographic characteristics such as gender and age. The statistical analysis of data featured t test, variance analysis and LSD methods for Post hoc analysis to determine the source of variation.

Findings

It is evident, based on the totals and the sub-scales, that the candidate teachers have a very high level of environmental awareness, by 3,6/4 (max). In addition, the results of the skewness and kurtosis analyses demonstrated that the distribution is normal, thus the parametric statistics are eligible. (Table 1)

Table 1. Descriptive statistics

	N	Mean	Std. deviation	Skewness		Kurtosis	
	Statistic	Statistic	Statistic	Statistic	Std. error	Statistic	Std. error
To do	532	3.647	0.301	-2.774	0.106	14.133	0.211
Not to do	532	3.620	0.348	-2.487	0.106	10.390	0.211
Current Threats	532	3.661	0.485	-2.825	0.106	9.649	0.211
Total environmental awareness	532	3.642	0.295	-1.886	0.106	4.734	0.211

The candidate teachers' environmental awareness show no variation by gender in the three sub-scales and the total awareness. Female candidate teachers have more positive environmental awareness in the three sub-scales and the total score compared to men. (Table 2)

Table 2. Environmental awareness t test results by gender

		N	Mean	Std. deviation	t	df	Sig. (2-tailed)

	36 and over	10	3.748	0.147
	Total	532	3.642	0.295

According to the results of the LSD **Post Hoc** related to the candidate teachers' variable environmental awareness in Total and To do sub scales, candidate teachers aged 18-25 display a more negative environmental awareness compared to candidate teachers aged 26-35. (Table 11)

Table 11. ANOVA LSD post hoc results by age

Dependent variable			Mean difference (I-J)	Std. error	Sig.
To do	18-25	26-35	-0.117	0.045	0.009
		36 and over	-0.102	0.096	0.288
Total environmental awareness	18-25	26-35	-0.096	0.044	0.029
		36 and over	-0.116	0.094	0.217

Candidate teachers' environmental awareness in Current Threats ($F=3,108$ $df=3-528$ $p<.05$) sub scale vary by which class they study in. (Table 12)

Table 12. ANOVA results by class

		Sum of squares	df	Mean square	F	Sig.
Current threats	Between groups	2.166	3	0.722	3.108	0.026
	Within groups	122.640	528	0.232		
	Total	124.805	531			

Descriptive statistics on the environmental awareness of candidate teachers varied by which class they study in are as follows. (Table 13)

Table 13. ANOVA descriptive statistics by class

		N	Mean	Std. deviation
Current threats	1. year	85	3.795	0.230
	2.year-3.year	288	3.622	0.491
	4. year	67	3.700	0.404
	Formation	92	3.629	0.648
	Total	532	3.661	0.485

According to the results of the LSD **Post Hoc** related to the candidate teachers' variable environmental awareness in Current Threats sub scale candidate teachers studying the 1. Year have a more positive environmental awareness level compared to candidate teachers in the 2.year-3.year and formation classes. (Table 14)

Table 14. ANOVA LSD post hoc results by class

Dependent variable			Mean difference (I-J)	Std. error	Sig.
Current threats	1. year	2.year-3.year	0.173	0.059	0.004
		4. year	0.095	0.079	0.226
		Formation	0.166	0.073	0.023

Candidate teachers' Total Environmental Awareness ($F=3,182$ $df=4-396$ $p<.05$) vary by the most important reason in choosing where to live. (Table 15)

Table 15. ANOVA results by choosing a living place

		Sum of squares	df	Mean square	F	Sig.
Total environmental awareness	Between groups	1.079	4	0.270	3.182	0.014
	Within groups	33.569	396	0.085		
	Total	34.648	400			

Descriptive statistics on the environmental awareness of candidate teachers varied by the most important reason in choosing where they live are as follows. (Table 16)

Table 16. ANOVA descriptive statistics by choosing a living place

		N	Mean	Std. deviation
Total environmental awareness	Degradation of natural beauties	24	3.484	0.420
	Concrete	68	3.714	0.283
	Air / water pollution concern	18	3.707	0.212
	Relinquishment also demands to leave	8	3.719	0.173
	Other	283	3.636	0.287
	Total	401	3.645	0.294

According to the results of the LSD **Post Hoc** related to the candidate teachers' Total Environmental Awareness varied by the most important reason in choosing where to live, those who prioritize Degradation of natural

beauties as the most important reason have a more positive environmental awareness than those choosing by Concrete, Air / water pollution concern, Relinquishment also demands to leave and Other. (Table 17)

Table 17. ANOVA LSD post hoc results by choosing a living place

Dependent variable			Mean difference (I-J)	Std. error	Sig.
Total environmental awareness	Degradation of natural beauties	Concrete	-0.230	0.069	0.001
		Air / water pollution concern	-0.223	0.091	0.014
		Relinquishment also demands to leave	-0.235	0.119	0.049
		Other	-0.152	0.062	0.015
	Concrete	Degradation of natural beauties	0.230	0.069	0.001
		Other	0.078	0.039	0.049

Below are the variables which lead to no variation in total and sub scales of environmental awareness:

- Do you like nature?
- Do you like animals?
- Do you like sea, land, ponds?
- Do you think to leave the place you live?
- Do you take care of your responsibilities to create a smooth future for your child?
- Have you ever been involved in any social service-social activity?
- Have you ever been involved in any environmentalist social work-social activity?
- Are you reluctant to take responsibility?
- Are you warned against faults?
- Why do you choose where you live?

Discussion and Suggestions

While classes and content to raise environmental awareness are not widespread in all departments and course contents in the education faculties, a high environmental awareness level, maintained by the modern mentalities of academic staff and students, has been found. However, to remove this from personal interest and initiative and render it systematic, candidate students who will address future students of varying age and branches should receive environmental courses coherent with the course contents they'll teach.

Environmental issues should be taken into consideration as part of a systemic integrity. Each geographical region should be assessed in a systemic integrity along with their ecosystem, culture and natural assets, tourism and economy. Certainly, the economic and sociological needs of the region's population should also be on the foreground. Therefore, to serve the economic development of the region without interrupting its natural balance, it is intended to become a touristic region.

Flora and fauna must be preserved. Forests are home to many species. All flora housing endemic species, primarily forests and mountains, must be preserved. New industrial facilities, mining survey, destructive energy generation and transportation systems, which may threaten the natural life and disrupt the natural balance in the region should never be permitted, and in fact existing facilities should not be operated and unnecessary concrete formations should be prevented. Trees should not be cut down for any reason, especially mining surveys.

Pollution must be prevented. All forms of environmental pollution must be prevented. The air, water and earth, as the sources of life, should be preserved in "clean" condition for mankind, animals and plants. Any threat of pollution against such sources of life should be prevented before realization, or immediately remedied if realized. Any threat to the existence of forests should be eliminated Thermal/nuclear plants should never be considered an option, initiatives that may cause deforestation should not be permitted. Any initiative leading to the pollution or

threatening the existence of water sources should be prevented. Mining survey licenses should not be granted in the vicinity of water sources, and industrial facilities should be prevented from discharging/contaminating wastes into such water sources. Industrial facilities must be strictly supervised to ensure they establish treatment plants to avoid environmental pollution.

It has been established that the pollution of soil and water leads to cancer formation in humans through food. Such metallic pollution in the water affect all produce in irrigated farms, thus inevitably causes significant harm to human health. Treatment plants should be established to prevent sewage waste from polluting rivers and creeks.

In recent years, greater amounts of fertilizers, water and chemical pesticides have been used in agricultural land to increase output. In particular, the hybrid seeds are renewed each year, thus pesticides are applied to the soil against harmful organisms which will be forced to develop resistance for the seed, increasing soil toxicity. The soil and water, polluted over a quarter of a century, become unable to renew itself in thousands of years. Nitrogenous fertilizers lead to an increase in nitrate pollution in underground water sources. Soil fatigue and pollution should be prevented. Penal sanctions should be implemented. Thousands of facilities continue to pollute the environment, it will not be possible to prevent pollution without implementation of measures. No penal sanctions are implemented to organizations polluting the environment, no factory is prosecuted or penalized.

Green energy industry should be prioritized. One of the fundamental requirements of development is energy generation. Current energy generation and consumption systems lead to the pollution of air, water and earth at local, regional and global level. The most important instrument in reducing contaminants is energy systems established to contain new and renewable energy that are environment-sensitive and sustainable. Coal and thermal plants lead to serious concern in the scientific world, primarily due to negative health and environmental effects and climate change. Coal-fired thermal plants built within settlement areas increase the health issues for the inhabitants. In the recent years of where renewable energy resources were ignored in a tendency towards nuclear and coal-fired thermal plants, energy industry is one of the leading sources of environmental issues.

The global oil crisis of 1973 led to increased interest in alternative and renewable energy resources. The fossil fuels, which fulfill a significant portion of the global energy requirements, have limited time of use, lead to destruction of the environment during energy generation, which combined with the energy requirements of the future generations, better demonstrates the significance of renewable energy resources. Widespread and large-scale use of such resources is subject to technological developments and the establishment of national and international information networks to determine its potential. The first alternative energy resources to be considered are wind and solar energy.

Abstract

Students' academic success is influenced by four fundamental factors, namely the students themselves, their social environment, physical conditions and education. The factors stemming from the students themselves comprise three sub-factors, namely mental competence, affective/emotional properties and study habits. Students' affective/emotional properties, variations in personality features also reflect on study habits, methods and techniques which interact with mental competences. Consequently, study strategies play a role as one of the defining factors students' success. The study strategies of students should also have a powerful influence on success in mathematics, which is the lowest scoring subject of student success in Turkey. The study has been conducted with randomly selected Elementary school students among Suleymanpasa and Cerkezkooy districts in Tekirdag province during the 2016-2017 spring term. The data collection tool was the "Scale of Study Strategies" prepared by Ergin (2017). The scale comprises 30 items each with 4 grades. To determine sub-dimensions as scale development statistics, the varimax rotated exploratory factor analysis has been used. Internal consistency has been determined by calculating item-total correlation coefficient and item-remainder correlation coefficient individually for each sub-dimension. Similarly, the distinctive effect of items has been determined by applying the t-test in upper quarter and lower quarters. The Cronbach and Rulon coefficients have been calculated for the scale and its sub-dimensions to determine reliability. Through statistical processing, it has been established that the scale is applicable, reliable and usable. Furthermore, the survey prepared by the researchers, involving 13 questions has been used to gather data on certain demographic characteristics of students. According to the findings of this study, the students' success in mathematics is correlated with their study strategies.

Keywords: Study Strategies, mathematics, academic success

Introduction

Students' academic achievement can be categorized into 3 fundamental features: 1) student's personal features (mental capabilities, psychological features, attitudes and habits) 2) features of their social environment (family features, friendship relations, social-economic features) 3) Features related to education system (Course contents, teaching methods, teaching tools). The most important elements in the student's attitudes and habits category are study habits, learning styles, strategies to prepare for examinations and study strategies.

In today's world where information and technology rapidly advance, the needs of individuals and societies are changing. Individuals should receive quality education in order to conform with advanced technology and to accumulate knowledge. Educational institutions should support students to ensure effective studies. Providing education at the desired level of quality can be ensured by enabling students to learn how to learn (Avcı and Nazlı, 2006). At this point, students' study habits for accessing information and strategies used for studies are the most significant elements of permanent learning and therefore, success. (Demirezen & Akhan, 2013)

Information accumulates so rapidly that it is not possible to relay it to students with equal pace. It should be ensured that students are equipped with the ability to attain learning strategies on their own in order to keep track of information in the fastest way. Learning strategies, also defined as learning to learn, should be among the learning outcomes. Each student may develop learning and exam-taking strategies in line with their own type of

intelligence and learning style, in addition to generally applicable strategies. Students should combine these general and unique circumstances to develop strategies providing academic achievements, creating efficient study habits.

One of the most significant factors influencing achievement in the learning process is the study strategies attained. In general, strategy is the path followed in order to reach a preset objective or the implementation of a plan to achieve a goal (Açıkgöz, 1996).

In a world where information is constantly updated, educators should seek to answer the question of "How to teach information to students?" rather than "What information to teach students?". Students are strong, productive and persistent when they believe they can be successful in their academic studies, achieving greater use of study strategies (Bandura, 1986). To ensure greater use of study strategies that increase academic achievement, academic self-efficacy is required. The number and type of study strategies students use to increase success are influenced by the concept of academic identity. (Subaşı , 2000)

For students to learn how to learn, they should first know themselves in terms of learning features. In addition, students should recognize and be able to use various methods beneficial in learning. For instance, what methods are there to ensure learning? Which type of learning requires their use and how? By recognizing their own learning features and by recognizing and learning to use methods of learning, students can learn to learn and achieve effective learning (Özer, 1998: 150).

Study habits has prerequisites such as suitable study environment, self-direction, time and stress management, effective resting, reading adequacy, note-taking and writing skills. Studies show that self-direction, mood management and self-monitoring are successful strategies for study motivation (Thomas, 1993).

It is commonly expressed that the reason of failure is lack of adequate study and students are reminded to study frequently. In fact, effective learning is achieved by consciously utilizing processes and paths ensuring learning (Uluğ, 1995; Özer, 1993). Therefore, achievement in the teaching-learning process requires, in addition to specific study times, students being aware of how they study or recognizing the level of effective study habits students have. Today, attaining the longest-lasting information in the shortest time possible has become an objective of education as a requirement of our age. Considering that success can be achieved through studying effectively, rather than studying hard, the necessity for students to have efficient study strategies is apparent (Küçükahmet, 1987).

Studies show a positive and strong correlation between achievement and study strategies. Self-efficacy and use of study strategies, student's skill level and use of strategy are also positively correlated (Horn, Bruning, Schraw and Curry, 1993: 465).

Küçükahmet (1987), the first study in Turkey on study strategies, examined the study habits and attitudes of university students in various branches using the scale developed by Brown and Holzman (1967), which **demonstrated** that the use of effective study strategies and habits positively influence academic achievement. In general, we seek to teach classes such as Mathematics, Science and Turkish to students using various methods, but little or no information is given on how the student should learn these classes. Students being uninformed on which study habits to use for each class negatively influences the efficient studying of students (Yörük, 2007). Efficient study refers to the use of study time in a planned and efficient manner towards preset objectives and established priorities (Yeşilyaprak, 2003, p.129).

Method

The study has been conducted with randomly selected Elementary school students among Suleymanpasa and Cerkezkoym districts in Tekirdag province during the 2016-2017 spring term. The data collection tool was the “Scale of Study Strategies” prepared by Ergin (2017). The scale comprises 30 items each with 4 grades. To determine sub-dimensions as scale development statistics, the varimax rotated exploratory factor analysis has been used. Internal consistency has been determined by calculating item-total correlation coefficient and item-remainder correlation coefficient individually for each sub-dimension. Similarly, the distinctive effect of items has been determined by applying the t-test in upper quarter and lower quarters. The Cronbach and Rulon coefficients have been calculated for the scale and its sub-dimensions to determine reliability. Through statistical processing, it has been established that the scale is applicable, reliable and usable. Furthermore, the survey prepared by the researchers, involving 13 questions has been used to gather data on certain demographic characteristics of students. According to the findings of this study, the students’ success in mathematics is correlated with their study strategies.

Findings

Study strategies and all subscales as well as other numerical variables used in the study all display normal distribution properties. Statistical results Show that the research data displays normal distribution. (Table 1) Parametric methods have been used in line with these results.

Table 1. Descriptive statistics

	N	Mean	Std. Deviation	Skewness		Kurtosis	
	Statistic	Statistic	Statistic	Statistic	Std. Error	Statistic	Std. Error
Study regularly	89	2,267	0,622	0,453	0,255	-0,157	,506
Learn the course in the classroom	89	2,968	0,600	-0,640	0,255	0,142	,506
Ability to study alone	89	2,640	0,684	-0,180	0,255	-0,685	,506
Not focusing on memorization	89	2,404	0,757	0,172	0,255	-0,198	,506
Not idling with food-beverages	89	2,713	0,907	-0,265	0,255	-0,975	,506
Studying on the desk	89	2,502	0,548	-0,018	0,255	-0,284	,506
Studying in a quiet environment	89	2,815	0,896	-0,198	0,255	-0,971	,506
Studying without heeding distractions	89	3,079	0,783	-1,012	0,255	0,925	,506
Studying on time	88	1,682	0,989	1,046	0,257	0,227	,508
Study strategies	89	2,565	0,293	-0,044	0,255	0,193	,506
Your Age?	88	12,807	0,908	0,490	0,257	-0,516	,508
Your Grade?	87	6,759	0,731	0,411	0,258	-1,024	,511
What is your latest score in the mathematics course?	83	66,976	22,672	-0,322	0,264	-0,555	,523
What is your course score in your latest report card?	78	74,385	19,763	-0,613	0,272	-0,407	,538

There is no correlation between which class the students attend and their study strategies. There is a negative correlation between students’ age and the habit of studying at a desk, children stop studying at a desk as their age rises. There are positive correlations between the latest score in the mathematics examination and the mathematics class score in their latest report card and learning the course in the classroom, studying without heeding distractions subscales and the total study strategies. Students who are successful in mathematics learn the course in the classroom and study without heeding distractions, and generally have more positive study strategies. (Table 2).

Results, Conclusions and Recommendations

Nearly all of the students indicate they want to study at university. However, it is evident in their responses to other questions in the survey that they are not aware of the effort required to achieve this objective.

It is observed that students do not dedicate time to study regularly on a Daily basis. 1/3 of male students indicate they don't study at all, which is concerning. The rate of students indicating that they study on average 1 hour or less daily is less than half.

It is significant that the majority of students consider themselves successful in mathematics class, similar to courses in general. Students are not aware of their failure, or more accurately, they evidently become overconfident with respect to their level of knowledge based on their scores.

1/3 of the students like mathematics class, while 2/3 are afraid of it, implying that a major cause underlying students' failure in this class is the affective field they created with respect to the mathematics class. On the other hand, it is interesting that female students favor mathematics class more than male students, contrary to popular belief.

The majority of students indicate that the mathematics teacher's teaching and their communication with students is successful, thus indirectly accepting that the failure does not stem from the teacher.

Abstract

The academic achievement of the students is influenced by four basic factors, themselves, their social environment, physical conditions and education. The education factor consists of four basic subfactors: teacher, method, environment and material. As one of the basic principles which is valid for all educational factors, when more senses of the student is addressed, learning becomes easier. The training materials that contribute to the inclusion of multiple senses in the course of learning increase the success in learning. One of the reasons for the low student achievement in mathematics is the abstract formation and the lack of connection ability of the student between the abstract and the concrete. In this context, materials in mathematics education gain more importance. Much more attention should be paid in mathematics lesson to the use of educational materials that serve to improve mathematical thinking in the pupils. It is highly likely that teachers' attitudes and behaviors of using materials is effective in mathematics lesson, where student achievement is lowest in Turkey.

The study was conducted with mathematics teachers (n=275) who were working in the spring semester of 2016-2017 in Edirne, Tekirdağ, Kırklareli. The data collection tool was the "Scale of Material Use in Mathematics Teaching" prepared by the researchers. The scale consists of 41 items each with 4 grades. To determine sub-dimensions (8) as scale development statistics, the varimax rotated exploratory factor analysis has been used. Internal consistency has been determined by calculating item-total correlation coefficient and item-remainder correlation coefficient for each sub-dimension. Similarly, Discriminant Coefficients of the items has been determined by applying the t-test in the upper and lower quarters. The Cronbach and Rulon coefficients have been calculated for the scale and its sub-dimensions to determine reliability. It has been established by statistical processing that the scale comprising 8 factors is valid, reliable and usable.

Keywords: mathematics teaching, educational material use, reliability

Introduction

With the mathematics education program first implemented in 2005 in Turkey, the use of materials in the classroom gained significance. This requires teachers and candidate teachers be informed on material selection and usage through in-service and pre-service training. (Özdemir, 2008)

The rapid development of science and technology necessitates the use of technological tools in education. In this context, the reformed Mathematics Teaching Programs (MEB, 2006; MEB, 2013) emphasize that the advanced technology presents new opportunities for learning, requiring teachers to include technological tools and teaching materials in their classes. This aims to ensure meaningful learning in schools and boost the quality of education. (Ünlü, 2017)

Moving from solid information in the learning-teaching process and enabling students to practice is only possible through the use of teaching materials. The teaching materials used to achieve the outcomes specified in the teaching programs are indispensable tools to discover and restructure information (MEB, 2005).

Teaching materials may be clearly identified objects or objects presented in media requiring advanced technology to access the contents. The teaching materials that can be used in the classroom environment include real objects or models, written tools, visual and printed materials, various panels and boards, projectors and its

sheets, slides and movie strips, audio elements, television and video, computers, internet and software (Kaya, 2006).

Materials are objects designed to represent abstract mathematical concepts, engaging various senses of students, which are visual and movable. Materials can be everyday items such as beads, beans, money or measuring tools as well as objects designed and produced for mathematics teaching such as decimal blocks, geometrical board or pattern blocks. (Özdemir, 2008)

Mathematics is inarguably significant in the private and professional lives of everyone. Mathematics is one of the most challenging classes for students. This is primarily because mathematics is composed of abstract concepts and abstract relations between such concepts. Since it is difficult for students to turn abstract concepts and relations into tangible ones, special methods and techniques to facilitate this process are needed.

Piaget indicates that students in elementary level need materials and drawings to gain a lot of experience in order to comprehend mathematical concepts. Mathematical concepts, when simply explained by words or symbols to children without full mental maturity, will be incomprehensible abstract concepts. (Piaget, 1952).

Piaget states that logical-mathematical information is structured in people's minds through associations (similarity, comparison of less or more etc.). This type of information is different from physical information observed in the outside world (the color, weight etc. of an object). (Özdemir, 2008)

In a changing and advancing world, teachers' struggle to render the learning environment effective in mathematics teaching and to raise individuals for the 21st century, the role and significance of developing and implementing teaching technologies and materials is undeniable. Today, individuals aren't expected to access information from a single source or to memorize it, but to raise individual who know the methods of accessing information, are able to use them and solving problems by using such information; the use of teaching materials prepared in line with the principles of teaching technologies have a unique role in providing such qualities to individuals and allowing teachers to prepare effective and interactive learning environments. (İnan, 2006)

Children's mental development moves from tangible towards abstract. People always learn the tangible objects they observe easier than their abstract description. Therefore, students should be allowed to see the item or object in question during the class, if possible, and shown a model, photograph or other icon of the object or event otherwise. In particular, objects seen or held are more meaningful for elementary school students. Therefore, students should first be taught tangible items, to reach abstract concepts thereafter. Tangible topics should be utilized in teaching abstract topics. (Akbayır, 2016)

Use of materials in education facilitates perception and learning. It creates interests and vividness into the classroom. It shortens learning times, reinforces knowledge and helps with long-term retention. It ensures student engagement in the topic, invokes the desire to read and research. Events, concepts and entities that cannot be visited or brought into the classroom can be displayed in the classroom in their actual form. (Aslan and Dođdu, 1993).

In particular, students in elementary level are challenged by perceiving abstract concepts which negatively influences their success in mathematics class. Therefore, mathematics classes should feature multi-media, multiple tools and teaching-learning practices frequently. (Hızal, 1992). Use of teaching materials in learning environments places the students in the center, offers richer learning opportunities, makes mathematics fun, and allows mathematics to be written down and discussed. Use of materials in mathematics classes to associate mathematics with daily life and to render it tangible will positively influence student motivation, engagement and success, and offer positive contributions to the development of estimation, association, information transfer, mathematical conclusion and mathematical generalization skills.

Method

The study was conducted with mathematics teachers (n=275) who were working in the spring semester of 2016-2017 in Edirne, Tekirdağ, Kırklareli. The data collection tool was the "Scale of Material Use in Mathematics Teaching" prepared by the researchers. The scale consists of 41 items each with 4 grades. To determine sub-dimensions (8) as scale development statistics, the varimax rotated exploratory factor analysis has been used. Internal consistency has been determined by calculating item-total correlation coefficient and item-remainder correlation coefficient for each sub-dimension. Similarly, Discriminant Coefficients of the items has been determined by applying the t-test in the upper and lower quarters. The Cronbach and Rulon coefficients have been calculated for the scale and its sub-dimensions to determine reliability. It has been established by statistical processing that the scale comprising 8 factors is valid, reliable and usable.

Findings

The “rotated exploratory factor analysis” has been used to determine the structural validity of the scale. The adequacy of data for factor analysis has been evaluated using KMO and Bartlett tests and found that the statistical requirements are fulfilled. (Table 1)

Table 1. KMO and Bartlett's test

Bartlett's Test of Sphericity	5.934.084	9.251.959
	820.000	528
	0.000	0.000

8 factors have been established for the analysis where components with an Eigen value of 1 or above are selected. Principal component analysis has been used as extraction method. 8 component (factor) explains,533% of total variance. (Table 2)

Table 2. Total variance explained

Component	Initial eigen values			Extraction sums of squared loadings			Rotation sums of squared loadings		
	Total	% of variance	Cumulative %	Total	% of variance	Cumulative %	Total	% of variance	Cumulative %
1	15.219	37.118	37.118	15.219	37.118	37.118	9.045	22.062	22.062
2	2.823	6.885	44.004	2.823	6.885	44.004	3.468	8.459	30.521
3	1.832	4.467	48.471	1.832	4.467	48.471	3.083	7.520	38.040
4	1.724	4.206	52.677	1.724	4.206	52.677	3.072	7.494	45.534
5	1.425	3.476	56.153	1.425	3.476	56.153	2.473	6.031	51.565
6	1.278	3.116	59.270	1.278	3.116	59.270	2.304	5.621	57.185
7	1.106	2.697	61.966	1.106	2.697	61.966	1.641	4.004	61.189
8	1.052	2.567	64.533	1.052	2.567	64.533	1.371	3.344	64.533
9	,957	2.334	66.866						

According to the results of the “Varimax rotated” factor analysis, the factors and the components they include have been determined. Placement of components into the factor where the highest eigen value results in an 8-factor scale (APPENDIX A Table 3).

The factors determined by factor analysis, including positive and negative skills and their meanings are as follows; (Table 4)

Table 4. Factors

Factor	Value	Name	Definition
F1	Positive	Tactile material	Visual material that students may hold and touch in the school and the classroom.
F2	Positive	Online viewing/ examination resources	Materials based on viewing which are accessible online or shared with students.
F3	Positive	Classical, fundamental simple materials.	Compass, ruler and other oldest educational materials used in every age.
F4	Positive	Mind games	Real or online games that indirectly support through developing logic/thinking/strategy usage in problem solving.
F5	Positive	Shape games	Real or online games that indirectly support through using /developing spatial intelligence in problem solving.
F6	Positive	Software	Computer software programs
F7	Positive	Music	Improvised music pieces with mathematical lyrics
F8	Positive	Drawing	Using other items instead of a ruler

Item-total correlation and item remainder coefficients have been calculated to determine internal consistency between dimensions. Calculated to examine the relationship between the factor totals and the scale totals, the Rulon=0.602, and Cronbach α =0.686 have been established. According to these analyses, it has been observed that all factors are positively related to the totals of the scale and demonstrate internal consistency (Table 5).

Table 5. The analysis of internal consistency between dimensions

Factors	Item-total correlation coefficient			Item-remainder correlation coefficient		
	rit	df	p	rir	df	p
F1	0.956	273	p<.01	0.808	273	p<.01
F2	0.692	273	p<.01	0.611	273	p<.01
F3	0.821	273	p<.01	0.740	273	p<.01
F4	0.694	273	p<.01	0.640	273	p<.01
F5	0.707	273	p<.01	0.665	273	p<.01
F6	0.496	273	p<.01	0.388	273	p<.01
F7	0.416	273	p<.01	0.386	273	p<.01
F8	0.372	273	p<.01	0.332	273	p<.01
	rulon			cronbach		
	0.602			0.686		

For each factor internal consistency has been determined by item-total correlation coefficient and item-remainder correlation coefficient, Rulon (0.948, 0.786, 0.888, 0.454, 0.547, 0.720) Cronbach α (0.941, 0.758, 0.854, 0.730, 0.708, 0.696) coefficients. According to these analyses, that all items are related to the totals of the subscale and demonstrate internal consistency (Appendix Table 6-11).

t- Test has been used to analyze the difference between upper and lower quartiles to determine people with high level skills and low level skills. According to the results, it has been observed that all factors are suitable to distinguish low and high skills levels (Table 12).

Table 12. Discriminant coefficients for Subscales

Factor	Upper Quadrille			Lower Quadrille			Comparison			
	n	Mean	Std.dev.	n	Mean	Std.dev.	t	df	p	
F1	74	56.770	6.471	74	24.581	3.634	37.056	146	p<.01	0.000
F2	74	12.919	2.584	74	7.311	2.305	13.837	146	p<.01	0.000
F3	74	17.865	2.972	74	8.095	2.101	22.936	146	p<.01	0.000
F4	74	7.689	2.126	74	3.716	1.188	13.940	146	p<.01	0.000
F5	74	6.419	2.196	74	3.203	0.523	12.173	146	p<.01	0.000
F6	74	11.662	2.771	74	7.878	2.871	8.101	146	p<.01	0.000
F7	74	2.014	1.040	74	1.189	0.459	6.196	146	p<.01	0.000
F8	74	2.730	1.089	74	1.608	0.841	6.964	146	p<.01	0.000

The t test has been used to determine the discrimination power of each factor to discriminate individuals with high and low skill levels. According to the results of the t test calculated to examine the difference between the factor totals and the quadrille created by scale totals, all items within all factors have been determined to function in distinguishing individuals with high and low skill levels. (Appendix Table 13-18).

Results, Conclusions and Recommendations

As a result of the all statistical analyses it has been decided that the scale consisting 8 factors and 41 items is valid, reliable, and useable. All items should be valued straight (Never =1 Always=4). High scores in positive factors indicate positive skills.

SCALE OF MATERIAL USE IN MATHEMATICS TEACHING

Below some expressions are given related to material use in mathematics teaching. Answer the expressions below sincerely by putting **×** only one of the options according to the conformity degree of you. Do not answer if you are indecisive, or do not have any idea.

		Never	Rarely	Mostly	Always
1)	Abacus / counting stick / counting beans etc.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2)	Smart notebook etc. programs	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

3)	Smart board	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
4)	Antropi teach etc writing programs	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
5)	Unit cubes	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
6)	Algebra tiles	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

Abstract

Citizen can be defined as “person living together in a society”, and citizenship can be defined as “a legal and political connection between the state and person.” The concept of citizenship has been defined in all constitutions since the Ottoman basic law. The concept of “citizen” or “patriot” was born in Europe and spread to the world. The concept of citizen in modern sense emerged with American and French revolutions. The concept of citizenship also includes the ideas of “status” and “role”. Citizenship is based on the idea that people are equal and they are treated equally in legal and political sense. For this reason, it forms the basis of the conception of democracy.

The idea of raising “modern citizen” began with the second constitutional monarchy in Turkey. The science of history was utilized in the first years of the republic to raise the consciousness of “nation”, “Turkishness”, and “citizenship”. Atatürk defines the people living within the borders of the republic he founded as “Turkish” or “Turkish nation” even if they come from different ethnic identities. According to Atatürk, the Turkish society founding the Republic of Turkey is called “Turkish nation.” According to Atatürk, Turkishness will exist forever in Anatolia.

Turkish people are intelligent, hardworking, and strong nation founding many civilizations in world and Anatolia at the history books written for the citizenship education in Atatürk period. It was aimed to raise polite, educated, individual, who can reach the Western science, and hardworking citizens conscious of their duties and responsibilities in the Civil information course at this period. It was also aimed to raise republic citizens believing in the revolution. Atatürk was trying to adopt “Turkish identity” and “Turkish culture” by all citizens to compose nation-state and homogeneous nation. Everyone accepting the identity of “Turkish Republic Citizen” was taken under constitutional guarantee and accepted as equal citizens regardless of his ethnic origin and religion.

Key Words: Atatürk, Citizenship-Allegiance, Citizenship Education, Turkishness, Republic.

1. Introduction

While the words “rayah” and “subject” were at Dictionnaire Turc-Francais shortly known as Bianchi & Kiefer, the word of “citizen” wasn't. “Subject” and “homeland” words were seen at A Turkish-English Lexicon which made its first edition in 1890 but the word of “citizen” wasn't. In the meaning at famous “Vatan yahut Silistre” of Namık Kemal, Redhouse defined “homeland” as the place or country where a person is born, and “homeland effort” carried today's meaning of “citizenship”. “Subject” and “subjecthood” were used in the meaning of only “nation” and “nationality” at Kamus-u Türki of Şemsettin Sami in 1901. The word of “citizen” is explained as “citizenship”, “countryman”, “compatriot of the same country”. The fact that only “concitoyen” was mentioned in French reflects that “citoyen” which means “modern citizen understanding “ was not present in Ottomans yet. We can say that “citizenship” concept was not born even though the concept of “country” was existent in the last years of the Ottoman Empire (Ünsal, 1998, p.13).

In the dictionary the word “homeland” is expressed as “country”, and “citizen” is the one whose country and country love is the same (TDK. Dictionary, 1992, p.1553-1554). According to the same source, the concept of “citizenship” means “being citizen, the situation of being born and living in a country”. In legal sense, citizen means real person who lives in a country and dependent on it legally and politically.

2. Method

Qualitative methods have been used in the topic of Atatürk's citizenship understanding in this study.

3. Findings

Many essays and thesis studies have been found about this topic as a result of Web survey. Found studies have been analyzed together with the Works of the researcher.

3.1. The definitions of citizen concept

Citizenship is related to various sciences in terms of definitions and topics. (Duman, 2001; cited by Sağırılı, 2005, cited by Atasoy). The most important study that nearly all of the studies about citizenship refer belongs to a sociologist Chantal Marshall (Gündüz, Gündüz, 2007, p. 18, see Marshall, Bottomore, 2000, p.13-74) Some of the definitions made about citizenship are as follows: **Citizenship;** People who have some political, social, and cultural rights. These rights are ruled and maintained by the practices of the authority. (Marshall, 1992) **Citizenship;** means political and legal bond that connects real persons to the state. (Aybay, 1982, p.3). **Citizenship;** is a legal bond that state determines its provisions and conditions with its one-sided will and realizes a legal status, establishes with the people. (Uluocak, 1984, p.6, Çiftçi, 2006, p.113). **Citizenship;** is a legal and political status given by the state to the individual, and it can be considered as a contract of loyalty that individual feels to the state. (Heater, 2004, p.194; Özdemir-Bingöl, 2009, cited by Er, Ünal, Özmen, 2013) **Citizenship;** has been defined by Active Citizenship European Commission (1998) as the way of developing different cultural views , value of the democracy, feeling partner of the society they live in, and raising their voice. (Kıncal, 2012). **Citizenship;** is the only factor that is shared by everyone in democratic country or nation-state equally regardless of his nation, religion, social class, or gender. (Patrick, 1999, p.2).

The concept of citizenship is generally defined in four different ways; a) citizenship defined with national identity and nationality in modern society, b) citizenship that expresses legal situations of people, c) citizenship that is seen as a status containing civil, political, and social rights, d) citizenship that is seen as duty and responsibility (Kadioğlu, 2008, p. 21-30). The concept of citizenship gained strength, citizenship concept list was created and modern citizenship understanding was adopted in 21th century. As result of this interest; new citizenship understandings such as “political citizenship”, “economic citizenship”, “social citizenship”, “liberal citizenship”, “republican citizenship”, “democratic citizenship” (Osler and Starkey, 2006); “multi-cultural citizenship”, “cosmopolitan citizenship”, “digital citizenship” (cited by Kılınç, 2013).

Were defined by the researchers. New undrstandings such as “Active citizenship”, and “Effective citizenship”, started to appear at the education systems of the European contries (Ersoy, 2013). It has been aimed at raising individuals adopting pluralistic democracy, using their rigths and responsibilities effectively, and being sensitive to their environment and society. In addition; concepts such as: “civil citizenship”, “global citizenship”, “cross-cultural citizenship”, “constitutional citizenship”, “active citizenship”, “universal citizenship”, “Europe citizenship”, Started to be used (Gündüz ve Gündüz, 2007; Turner, 2002, cited by Özden, 2011, p.23). Citizenship is a relatively complex and disputable term according to many authors (see Anderson, J., Askins, K., Cook, I., Desforges, L., Evans, J., Fannin, M., Helen, G. Skelton, T. 2008).

Other definitions about citizenship can be seen in (see Bouineau,1998, p.109, Şenkal, 2007, Lehning, 1999, p. 3, Wiener, 1998, p. 4, Uluocak Akt. Çiftçi, 2006, p.113, Özden, 2011, p.25, Turner, 1993, p.2; Sağlam, 1998, p. 91; Erol, 1995, p. 90; Nomer, 2012; Kastoryano, 2007, p.54; Waltzer and Heilman, 2005, p.159; Yılmaz, 2002, p.92; Duman, Karakaya and Yavuz, 2001, p.7; Sunal and Hass, 2002, p.194-195; Arat, 1998, p. 67; Anderson et al. 2008; Battery, 2003, p.103; Üstel, 1999, p. 80; Schmitter and Karl, 1992, p. 13; Lawson, 2001, p.164-165;

Kepekçi, 2008; İşcan and Demir, 2009; Heater, 2004: 194; Özdemir-Bingöl, 2009, cited by Er, Ünal, Özmen, 2013; Nomer, 2000, p.3; Torney-Purta and Vermeer, 2004).

3.2. The aim and importance of citizenship education

Citizenship education has appeared in parallel with the concept of citizenship, and has shaped with the changes in time (Ersoy, 2007, p.1). Some of the definitions made about the Citizenship education are as follows:

-citizenship education; is fictionalized on basic knowledge, skills, and values that citizens of a country must gain that are evaluated synonymous with being citizen to that country (Karip, 2006, p.321).

-citizenship education; if state guarantees the education right of the children, it has to do it as the nature of the citizenship institution (Marshall and Bottomore 2005, p.6).

-citizenship education; can be defined as the process of activities that are made to prepare young people to their responsibilities and roles as a citizen (Devies, 2000; cited by Özbek, 2006, p.5).

-citizenship and democracy education; students have to know what citizenship is, which rights and responsibilities do this concept bring them, and the connection of the state with its institutions (Patrick, 1999, p.3-4).

-the aim of the citizenship education; is to gain knowledge, skills, and understanding that young people need to play an effective role in regional, national, and international levels (Douglas, 2003, p.8).

-citizenship education; should be related to the life of the children, and should be designed to help children feel themselves in an environment, and a wider world (Menter and Walker, 2000, p.111). Other definitions about the aim of citizenship education can be seen in (Ersoy, 2007, p.25; EU, 1997, p. 84; McCowan, 2009, p.87; Koutselini, 2008, p.167; Davis, 1994, p.2; Heath, Rowe and Breslin, 2008, p. 7; Kymlicka, 2008, p.187; Osler and Starkey, 2003, p.246; Campbell and Craft, 2004, p.75, p.20; Hoge, 2002, p.104; Sadovnik, Cookson and Semel, 2001, p.19-20). Considering these information, the competences to be gained at citizenship education can be stated as “**knowledge, and understanding, skill, and tendency, values, and rules**”.

The aim of the citizenship education based on school is; to gain knowledge, skill, and behaviours necessary to participate actively and responsibly society life in a democracy. **Talented and responsible citizens are;** a) informed and thoughtful of the principles and ruling styles of democracy. b) contribute to their societies via volunteered civil society organizations. c) act politically to realize public purposes. d) have social virtues such as public benefit (Patrick, 1999, p.1). One of the most important necessities of global society is to raise effective citizens. **The features that an effective citizen must have are as follows:** Dealing with the problems with a global view, Working cooperatively, and taking responsibility, Accepting cultural varieties, Thinking critically, and systematically, Solving conflicts without using violence, Changing life style to protect environment (Hicks, 2001, p.230). **21st century citizens must have the following features:**

Working cooperatively with others, Developing social justice principles to guide their behaviours, Thinking critically, Accepting cultural varieties, and learning from them, Evaluating problems in a global context, Solving conflicts without using violence, Changing life style to protect environment, Defending human rights, Making an effort for a more just future, Participating democratic policy (Clough and Holden, 2002, p.10, cited by Kılınc, 2013).

3.3. Historical background of the citizenship education

The concept of Citizenship was born in Athens, and Rome, and it made its development with nation state. Citizenship education in modern sense initially began in 19th century in France related to the development of the nation-state concept (Tezgel, 2008, p.17). Abolishment of Jesuit Cult, confiscating its property, and stopping the studies of its members paved the way for giving a secular education to French children after 1762 (Heater, 2007, p 194). La Chalotais asserted in his work named “Essay on National Education” that the state must take control of the education to increase the feelings of virtue, loyalty to the country, and secularity in 1762. Philosopher-politician Condorcet emphasized that moral and politics be a part of the political education in his report titled “An Education for Democracy” in 1792. Condorcet’s opinion that “state has the mission of raising its citizens”

came into effect at III. Republic Period. French Education Minister Jules Ferry turned the school into a political tool that will serve to form French nation (Schnapper, 1995, p. 142). The essential aim of the courses of history, geography, and citizenship education that took place in curriculums since III. Republic Period has been building “acceptable citizen” and suggestion of patriotism (Üstel, 2005: 20). People were firstly raised to the “citizen” status with “French Human and Citizenship Rights Declaration” and had “equal rights” in French in 1789 (Ercan, 2010, p.11). Like many other enlightened of the countries, Ottoman enlightened have also been influenced by the developments about citizenship education in France. Especially Ottoman enlightened who escaped from II. Abdulhamid regime and moved to certain European cities contributed to the inclusion of the course of “Civil Information” that is directly related to the citizenship education to the curriculum after the declaration of II. Constitutional Monarchy (Üstel, 2005: p. 22). The courses in 1913 Primary Education Temporary Law that are Geography, especially “Ottoman Geography”, history, especially “Ottoman history” emphasis, and “Civil Information” have the mission of forming Ottoman citizenship. It was aimed to unite with a common Ottoman identity with “Ottoman Geography,” “Ottoman history” and “Civil Information” course that was included to the curriculum, and to send children generally aged 7-13, and with some special conditions aged 7-16 with 1913 Primary Education Temporary Law. Especially the aim of the “Civil Information” course was expressed in a 1913 dated history book as “ duties that person has to do for his family, country, and government, and his rights” (Ahmet Ziya and Ali Haydar, 1913, Cited by Hülya Çelik, 2008, p. 359-369).

3.4. Citizenship understanding of ottoman empire

Citizenship understanding of the Ottoman Empire generally is based on the ideology of “Ottomanism”. People living in the Ottoman Empire and accepted as its nationality had different statuses whether they were Muslims or not. The rescript of Gülhane, edict of reform, and declaration of the Constitutional monarchy did not decrease the influences of the European countries on Ottoman political life (Aybay, 2008, p. 70). II. Mahmut told that “subjects with different religions have no differences, they are all equal for me” (Üçok, Mumcu, Bozkurt, 2010, p.350). There are many regulations about citizenship right in 1856 dated edict of reform (Gözler, 2004, p.147). “**Ottoman Citizenship Law**” was published in 1869. This law adopted jus sanguinis to gain Ottoman nationality. “Ottoman citizenship” was protected at constitutional level with “**the Ottoman Basic Law**” in 1876. It is said in the law that “ regardless of their religions, **all Ottoman subjects are equal, and protected by the state.** II. Constitutional monarchy paved the way for a new political-social area understanding, and showing up of “citizen” (Üstel, 2004, p. 27). “**Equality**” came into existence as an important gain. Main duties of the citizens are, “obeying the laws, doing military service, and paying taxes” (Üstel, 2004, p. 59). Ottomans are no more “rayah” and “subject”, but became citizen.

Party of Union and Progress, aiming to create a “nation-state”, believed that its most basic principle is the institution of citizenship, and planned to form a structure whose members are equal and only responsible to the state (Akçam, 1997, p. 145-146). Party of Union and Progress tried to determine the rules of the legal, and political relations between the citizen and the state with the laws and regulations until 1913 (Üstel, 2004, p. 27). Party of Union and Progress started to defend the idea of “Turkism” after the defeat in Balkan Wars, and their official declaration of the failure of “Ottomanism” policy, and they accepted that a progress with all elements of the empire is just a dream. The process of elimination of the elements not Turkish was realized, and Anatolia started to become Turkish rapidly (Akçam, 1997, p. 147-155). The years of 1908-1919 are the years when “new citizenship” understanding was tried to be adopted and loved. Celebrations, and holidays were invented to mobilize “new society”, especially primary schools were given importance (Üstel, 2004, p. 28-29). “Citizenship Information” course was started to be taught as an independent course after the changes made after 1908 curriculum. “Ottoman History” and “Ottoman Geography” courses were also added to the curriculum (Polat, 2011).

3.5. Citizenship understanding in turkish constitutions

The concept of “citizenship” has been defined in all constitutions since 1876 Ottoman Basic Law. (Göztepe, 2003, p.229.) According to the Ottoman Basic Law; “ No matter which religion do they belong to, all subjects living in Ottoman Empire are accepted in Ottoman nationality” (m8).

In 1921 dated Constitution; there was no definition about citizenship. However; a national citizenship understanding on Turkish ethnic identity was dominant in 1924, 1961, and 1982 constitutions. (Firat, Gül, 2014, p.340) .

According to 1924 Constitution; “Everyone is called “Turkish” in Turkey regardless of his race, and religion.” (m.88/1). (Kili, 1982, p.62.). As it is seen, the process of transition from empire to nation-state has affected the definitions of citizenship, as well. **First citizenship law** is 1928 dated 1312 numbered law. It is stated that this law created the desire to become Turkish citizen as many people as possible with the psychological effect of the low number of population. According to this law; “the children whose mothers and fathers are Turkish and who are born in Turkey or abroad are Turkish. The situation does not change whether the child is born in marriage or extramarital”. An interesting feature of this law is that: “a foreign woman marrying to a Turkish man becomes Turkish citizen automatically. In return, a Turkish woman marrying to a foreign man keeps her citizenship” This law was abolished with 1964 dated 403 numbered Turkish Citizenship Law (Aybay, 1998, p. 39-40, cited by Nalbant p.79-94, see, Korkut, 2014, p. 5-41).

In 1961 and 1982 Constitutions it is said that “Everyone who is tied to Turkish state with citizenship bond is called Turkish.” (Aybay, 2008, p.76; Gültaş, 2004, p. 902). With this law an anthropological and sociological definition was not made, in contrary, a pure legal definition was made. “The equality of citizens “ was accepted in the 10th numbered item of the constitution. (Ergin, 2012, p.48, Akt. Doğan). 43 times Turkish, 7 times Turkish nation, 3 times Turkish state, and 2 times Turkish society concepts were used in 1982 constitution where differences were integrated with equal Turkish citizenship. (Firat, Gül, 2014, p. 341). 1982 constitution organized “Turkish citizenship” under the title of Political Rights and Duties. (Şehirli, 2010, p. 135)

3.6. Atatürk’s understanding of citizenship education

Ataturk has placed great importance to raising “national, modern, and democratic” citizens of the society (Akyüz, 2009). Important developments that contributed to the citizenship education at Ataturk’s period are; “Law on Unity of education”, “Changes at the Curriculums”, “the book of Civil Information for Citizen” (Çelik, 2008, p. 359-369).

a) Law on Unity of education (3 March 1924) All education institutions in the country were taken under state supervision and united with this March of third 1924 dated law. The courses of “Turkish, History of Turkey, Geography of Turkey, and Country Information “ became compulsory and were given vital importance. An important step has been taken to raise citizens republic regime needing with this law (Çelik, 2008, p. 359-369).

b) Changes at the Curriculums (1924, 1926, 1936, 1948) Primary education has an important place in citizenship education. Children develop rapidly cognitively, affectively, physically, and socially at this period. (Ersoy, 2007 p.16). Efforts made to increase schooling have increased, some regulations have been made in the content and pedagogical structure of the teaching since the first years of the republic. While the number of primary school was 4.984 in 1923-1924, it rose to 6.713 in 1931-1932; the number of the students rose from 341.941 to 523.611. While the number of secondary school was 64 in 1923-1924, it rose to 80; the number of the students rose from 10.052 to 30.316.

First regulations at curriculums were realized when Mr. Vasıf (Çınar) was Minister of Education. The curriculums of primary, secondary schools, and high schools. The courses of “psychology, manner, philosophy, information of law, information of economics, history of science,” were abolished, and the courses that prepare students to life such as “housekeeping, workshop, laboratory, and nursery for girls” were added to the curriculum (Başgöz ve Wilson, 1968, p.106, Akt. Çelik, p.359-369). It is understood that the aim of “giving national citizenship education” was carried. It is understood that importance was given to develop skills of culture, research, and analysis with geography courses. (İMMP 1926 p.75, cited Çelik, p. 359-369) The first regulation at

Ataturk's period was made in 1924, and primary, secondary schools, and high schools curriculums were changed. "the courses that prepare students to life" were added to the curriculum. The structure of the books based on Ottoman ideology was eliminated, and the content "**dependent on the basic principles of the Republic, and suitable for Kemalist ideology**" was added (Üstel, 2011). The name of the course "Civil Information" was changed as "**Country Information**" and it was aimed to raise citizens suitable for the new regime, and aware of their duties. (Üstel, 2011, Kayaalp, 2015). According to the first curriculum in 1924, there were 2 hours History, 2 hours Geography, and 1 hour country knowledge in Social sciences course at primary schools. (Keskin, 2004). The first big regulation about curriculums was made with first 1926 dated Primary Education curriculum. According to this curriculum, there were 2 hours History, 2 hours Geography, and 1 hour country information in Social sciences course at primary schools. General aim of this course, "is to raise good citizens". (Nalçacı, Özdemir ve Şahin, 2002). The aim of 1926 dated curriculum is to "**nationalize**" and "**modernize**" at the same time in the direction of new principles and reforms of the new state (Kafadar, 1997). The main aim of country knowledge course is **to raise citizen suitable for republic** staffs (Üstel, 2011). The writer of the country knowledge course Ali Kami (Akyüz) (Akyüz, 1930, p. 3). explained the aim of this course is "to children love their country with its widest meaning" (Üstel, 2011). The aim of the courses that were based on raising citizen was to raise every Turkish children grasping psychology, and ideology of the republic thoroughly, and beneficial to Turkish nation and country. 1936 dated curriculum emphasized the importance of school in raising, and new courses were added to realize this aim. The distribution of the social sciences course at primary school is the same. The aim of this project is "**nationalism**". Therefore, the content of 1936 curriculum and social sciences course became "national citizen production center". (Üstel, 2011). The politics project of Kemalist ideology, and national state is to form a "classless, unprivileged, and homogeneous society depending on the principle of "**populism**". This was reflected in at 1936 curriculum and Social Sciences course content. Social Sciences course books contributed a lot to "**Turkish identity**." "Loyal, self-sacrificing, and respectful citizen type" was tried to be raised (Üstel, 2011). 1936 curriculum also aimed at raising "**six-arrow citizen**" or "**regime citizen**" (Gülmez, 1999).

1948 primary school and 1949 secondary school curriculums of the one-party period remained in force during Democrat Party's reign, (1950-1960) (Cicioğlu, 1985 and was abolished with 1968 curriculum, Üstel, 2011). Courses such as Geography, History, and Country Information were united under Social Sciences Course (Kayaalp, 2015).

c) Civil Information Book for Citizen (1931)

"**Civil Information Book for Citizen**" which was written by Afet İnan with the incentive and contribution of Ataturk, and published by Ministry of Education with date 1931, and order number 2197 for schools is pretty important for the citizenship education given at schools. Afet İnan talks about the writing process of this work at her book of "Civil Information, and Mustafa Kemal Ataturk's Handwritings" (Afet İnan, 2010 p. 11-12). The studies of Afet İnan and Ataturk's notes contributed to the publication of various brochures and books. These works are; 1- **Country Information for Turkish Children**" as brochure. (Ankara 1929) 2- Separate book for each topic: "**Election**", 72 pages. "**Military service**", 77 pages, "**Companies and Banks**", 172 pages, "**Tax Information**", 98 pages, (These four books were published in İstanbul in 1930). 3-One book including all of these topics (141 pages) is called "**Civil Information for Citizen**" (İstanbul 1930). 4- Another book was published with this name for secondary schools by Ministry of Education in 1932 with the order number 1908 (191 pages). It is clearly seen at the official message sent dated 18th December of 1931 by Ataturk to Prime Minister İnönü that he is very sensitive to the book "Civil Information for Citizen". The first book of "Civil Information for Citizen" by İnan consists of 17 sections. **The names of the parts are:** "Nation, State, Republic, How did Turkey become Republic?, First Right, First Duty, and the relation between them, State's Duties to Citizens, Freedom, Loyalty, Work-Job, Citizen's Duties to State, Election, Military Service, General Information about Taxes, and Freedom". The second book on Civil Information for Citizen was written by the secretary of republican people's party **Recep Peker**. The names of the parts of the books consisting 29 sections are: "Basic Organization, Turkish Grand National Assembly, the process of the Turkish Grand National Assembly,

Aggregate, Law, budget, economics Council, Council of state, political parties, organization of the government, justice, chancery, tarde courts, lawyer, and law society, municipalities, villages, civil servants, Education, economics, Banks, Health, Family, and National defence (Çelik, 2008, p. 359-369).

3.7. Atatürk's studies about education and citizen education

When Republic was proclaimed in 1923, wars lasting 11 years had been undergone, the country had been burnt, devastated and lost three millions of its population. The destruction of the wars was so terrible that there was nearly no teacher, doctor, nurse, artist, lawyer, etc left. Even there was almost no carpenter, tailor, driver, etc. It was necessary to raise driver, blacksmith the army needed. There was no hospital, school, road, harbour, factory (İnan, 1981 p. 144). The population of Turkey was about 11-12 millions at 1923-1924 education year. Only 10% of this population, and just 3% of the women were literate. There were totally 5.062 teaching institutions including 4.984 primary schools, 72 secondary schools, 23 high schools, 64 vocational schools, 9 faculties, and academies. There were 10.102 primary school teachers in 1923: 1.08 of them were woman, 9.021 of them were men. The ones having vocational education were totally 2.734; 378 of them were woman, and 2.356 of them were men. (Şehirli, 2010, Ankara). Teachers played a great role at War of Independence to arise “national struggle spirit”. (Şehirli, 2012, p. 202-207). The great leader started a successful “**education war**” against all struggles and impossibilities since the first day of War of Independence. He gave Turkish education system a “**new**” and “**modern form**” with his “**macro education plan**”, and laid the foundations of today's Turkey social and economic structure (Özalp-Ataüinal, 1977, p. 30).

The great leader Atatürk predicted big and radical changes for education. This change aimed at turning “**old fashioned, superstitious**” education system into “**modern, scientific, rationalist**” one. “**A cultured society**” and “**educated staffs**” were needed to maintain independence and modernize. Atatürk thought “education system should be settled to meet the needs of the society, and needs of the era, and become widespread”. National education policy targeted at three main aims in the first years of the Republic. These are; 1- Providing national culture unity. 2- Becoming widespread of the citizenship education, and primary education. 3- Raising the educated man power Turkey needed. (Budak, 2003, p.1).

3.8. Atatürk's studies about education philosophy and making education modern

Atatürk in essence was not a man of harsh doctrine, but a man of action. Atatürk who did not limit himself to any doctrine, was pragmatist, as well as idealist. Therefore; the best term expressing his philosophy is “**pluralism**” that is the basis of “**liberal democracy**”. (Giritli, 2001, p.59-72). According to Aytaç. (2001); Atatürk has a “**rationalist**” and “**nationalist**” world view, and he is reformist. He developed a “**National Progress Strategy**” based on his world view. He names this as “**Ideology of Country Problems**”. Big revolutions give education organizations a new aim and meaning. (Karal, 1981, p. 3). Atatürk also followed this way. Important developments and regulations at Atatürk's period laid the foundations of today's education system. “**Reformist**” and “**enterprising**” Atatürk has given a “**new**” and “**modern**” form to Turkish education in 15 years. The most important developments and regulations at Atatürk's period are: (Karagözoğlu, 1985, p. 197)

1-Law on unity of education (1924) 2- Bringing educators from abroad (1924-1926) 3- Reorganization of the National Education 4- Preparing New Curriculums 5- Free Secondary Schools 6- Vocational Guarantee for teachers 7- Coeducation 8- Alphabet Reform (1928) 9- Sending students abroad (1929) 10-University reform of Atatürk (1933) 11- Language Reform and Foundation of Turkish Language Society (1932), and Turkish Historical Society (1931) (Göksel, 1985, p.922, Karagözoğlu, 1985, p.197-199, Binbaşıoğlu, 2005, p. 66-67, Şehirli, 2011, p.173-175).

3.9. The principles Atatürk's new education policy based on

There are two main principles of the education Atatürk desires. These are: “**National Education**” and “**Education Unity**”. The principles of Atatürk about education are as follows: 1- Education should be national.

(MEB, 2001a:291, A.S.D.1959,C.2, p.178). 2- The development of national genius can be made with national culture. (MEB, 2001a:85). 3- Copying others does not bring progress. (Cumhur, 1981,p.73). 4- Unity should be provided at education. 5- Education should be widespread and ignorance should be eliminated. (Akyüz,1993: p. 290) 6- Vocational Skills should be gained as well as general knowledge (MEB 1993, p.11-12) 7- Educated man power our country needind should be raised. (MEB,2001:s.138). 8- Education should be scientific, and secular. 9- Rote-learning should be left. (Cumhur, 1981, p.72). 10- Boys and girls should be educated equally. (A.S.D.1971: c.2, p.84-85) 11- Success at education depends on disciplined study. (A.S.D.1971:c.1, p.328) 12- Education should be modern. 13- Curriculums should meet the needs of th modern social life. 14- Idea, and action should move together at education.15-Education should develop fine arts. 16- Education should be realistic.17- The most important factor affecting education is teacher. Therefore; it s essential to raise talented teachers. The principles to apply at National education are; “Republicanism, Nationalism, Populism, Statism, Secularism, and Reformism”. (Şehirli, 2009, p. 27, Şehirli, 2007, Köknel, 1981, p. 325-327).

3.10. Atatürk’s giving importance to education of the citizens and community centers

Ataturk thought that the continuity of his modern state is possible with a “modern” education. For this reason, he addressed to teachers and people about education many times. He visited schools, and gave importance to teacher training. These positive developments became examples for other nations. When the war of Independence was over, he was asked “what would you like to do now?” He answered “I would like to increase national knowledge as a national education minister.” (MEB, 2001b: 104) He made 39 laws about education during his 15 years of presidency. (Fiden ve Erden, 1993, p.123). “**Nation schools**” were opened to increase literacy level, and teach new letters with his leadership. “**Teacher’s training schools**” were opened to raise new teachers. Vocational skills were also taught at these schools (Baykara, 1999, p. 163).

“**Community centers**” were opened to gather people with “**Republic ideals**” on the 19th February of 1932. Turkish Hearths closed and People’s Houses opened instead (Uluskan, 2010, p.34). The concept of Citizenship was born in Athens, and Rome, and it made its development with nation state. Centers where people can socialize have been established. It was aimed to instill into populism understanding to people. There were language, literature, fine arts, sports, history, museum, and publications at community centers. They got approval, and the number of them increased in a short time (Oğuzkan, 1973, p. 89). The number of them rose from 56 in 1933 to 167 in 1937. “**Community rooms**” were opened at small centers. (Kayıran, 1998, p. 814). When they were closed because of political conflicts in 1951, there were 478 community centers, and 4.327 community rooms (Oğuzkan, 1973, p. 89). While the rate of literacy was 10.6 % in 1927, it rose to 19.2 % in 1935 thanks to national education activities.

4. Results, Conclusions and Recommendations

The aim of Ataturk was to found a democratic regime in Turkey. National unity and togetherness understanding carried a great meaning to Ataturk (Bileydi Koç, 2012, p.36). Ataturk talked about this topic as “the most valuable entity of a country is unity between citizens, getting on well with each other , and industriousness.” (Kocatürk, 1999, p. 205). *In his work “Speech” Ataturk expressed that “the decision is to found a new independent state that is based on national sovereignty while starting national struggle (Atatürk, Nutuk, Hz. Korkmaz, 1998, p. 9) Ataturk universalized because he was the first to give independence war against imperialism, and became independence leader for the developing countries of the third world. For these reasons, first universal dimension of “Ataturkist thought” is “anti-imperialism” and the second universal dimension is “carrying enlightenment movement of western civilization to his region, islamic world, Asia, and the third world countries of Africa.” (Odyakmaz, 2003, p. 94-95, see İnan, 1983) Turkish reform Ataturk realized is based on “modernization” . The values such as “nationalism, national sovereignty, secularism, national education, total independence, peace at home, peace in the world, standing against exploitation, human love, respect to woman rights, are at he basis of the state he founded. These values are important topics that modern and western world*

emphasize.

It is compulsory to give a “**national education**” to all citizens in Turkey according to the constitution, and related laws. An education based on “**ethnicity, cultural differences**” or “**multiculturalism**” cannot be presented. “**Integration**” model has been adopted while forming national identity in Turkey. The principles of “socialization, education, law” and “equality before the law” has been adopted as main element. Citizens can express and protect their “cultural differences” at this model. But they cannot politicize their “cultural differences”. The state cannot apply different education models for “every ethnic base”, “different cultures”, “different mother tongues”, “regions”, and “districts”. Our national law, and foundation bases of our state, and nation are not appropriate for this.

“**Ethnicity, race, religion, and language**” are out of question in the definition of national identity in Turkey. As Ataturk said; everyone who can say “**How happy is he who says I am a Turk,**” defines himself as “Turk”. It is the essence of the democracy and tolerance to accept cultural differences in terms of religion, and language, and protect them as cultural heritage. The identity of today’s Turkish nation and state was shaped with Lausanne Peace Treaty. “**Turkishness**” was defined clearly based on “citizenship” without expressing any ethnic meaning in the constitution. **66th item** of the constitution is very obvious. “**Everyone who is tied to Turkish state with citizen bond is Turkish**”. (see Kili ve Gözübüyük, 2000, p. 188, 283). The reason of this definition is that like many other examples in Europe and world, “Turks are the foundation elements of the state (Önder, 2005, p. 52-57).

Ataturk maintained “the education war” he started together with the Independence War until he died. (Karagözoğlu, 1985, p.195-196). Ataturk, the savior of Turkey, and founder of the state, has won victories at the education war, as well. The aims that Ataturk addressed at education are the main principles of a “**national, humanistic, and modern education**”. It is doubtless that if we ignore them, we will suffer a lot. When we apply them properly, the rise of our nation will realize. Ataturk is a great leader who enabled our nation to change era in the area of “citizen education” as well as being a great soldier, statesman and diplomat. We see that most of the opinions of Ataturk are valid today (Tezcan, 1996, C.2 p. 696-697). There are 4433 books at Ataturk’s personal library, most of which are about history, science, language, literature, and he read most of them. (Anameriç, 2005, p.1115-1140). The developments at our education system lived its golden era at Ataturk period. The biggest expectation of Republic regime from educators and education institutions with Ataturk’s expression; “**is to raise generations whose ideas, consciences, and understanding are free.**” The citizen model aimed at to be raised is “**rational, free, local, based on positive science, loving fine arts, and virtuous personality.**” This national citizen model is “**universal citizen model**”, as well. Today, all modern countries aim at this type of citizen. It is possible to make the following evaluations about “**Turkish citizen**” and “**Turkish identity**” understanding desired to be formed at Ataturk period (1923-1938): **Turk**; is wise, generous, brave, freedom lover, hospitable, loyal, and hero. **Turk**; is an unique citizen example who has moral, human, national, universal, earthy, and spiritual components. **Turkish youth**; is an unique human model who adopts national, moral, and universal values. **Idealization of Turkishness**; is a meaningful process. **Country**; is a mutual home. **Citizen**; is the son of the country, and citizens are brothers and sisters. **Patriotism**; is the biggest virtue. **Citizenship**; is being a member of a family. **Working**; is one of the vital points of the ideal Turkish identity of the citizenship books of this period. Furthermore, “working” has also an important place in the economic model understanding of Turkish reform. **In Turkish society**; there is no “class”. Instead of this, there are “occupation groups” needing each other.

Hatred against tyranny and dominance; There is a reserved attitude towards the name “Ottoman” and its environment. “**Captivity**” and “**freedom**”, “**monarchy and democracy**”, “**tyranny and national sovereignty**” are emphasized as uncompromising contradictions. (Karakılıç, Müjdecı, 2014, p.173-198).

When we analyze Social Sciences course books between the years 1923-1950, “citizenship categories” that **“Kemalist/Ataturkist ideology” wants to form are stated as follows:**

1. Obedient, passive, knowing their rights, and duties citizen, 2. Citizen praying Turkishness, 3. Citizen knowing their enemies, 4. Citizen staying distant to Ottoman history, 5. Citizen giving importance to civil life, 6. Citizen adopting mutual benefit, 7. Citizen equipped with army-nation, 8. Healthy and strong citizen, 9. Citizen equipped with holy symbols (contry/flag), 10- Self-sacrificing, and loyal citizen (Kayaalp, 2015).

Republic regime wanted his **“acceptable citizen”** to have features of “national values, and self-sacrificing for the sake of nation, and country.” It has been stressed that new Turkish generations should be “nationalist, populist, reformist, secular, praising of being Turk, self-confident, obedient, and faithful to the Republic.” It has been aimed at raising the citizens with these qualities via Social Sciences courses. The duty of being ready of the acceptable citizens for the inner threats against the aim of “modern civilization level” has been given to them (Tercan, 2014). Citizen model in accordance with global citizenship requires “having a universal identity respectful to his country, nation, laws, and humanity”. For this reason, today’s citizenship values are **“national”** and **“universal”**. The definition and awareness of citizenship of “Citizenship Information” course book requires having some values. These values that “a good citizen” should have are stated as follows;

1. Loyalty; a) Loyalty to nation, b) Loyalty to country, c) Loyalty to state, d) Loyalty to laws, e) Loyalty to spiritual values, and symbols, **2. Duty;** a) the duties of citizens to other people, b) the duties and responsibilities of the citizen to society, c) the duties and responsibilities of the citizen to state, **3. Respect;** a) Self-respect, b) Respect to people, c) Respect to nation, d) Respect to state, e) Respect to laws, **4. Service without thinking himself or his benefits, 5. Honour, 6. Righteousness, 7- Personal courage** (Kan, 2009, p.895-904).

Information, skills , and values necessary for responsible global citizenship are stated by Oxfam as follows: 1-social justice and equality, 2- Differences, 3- Globalization, and dependence, 4- A sustainable future, 5- Peace and struggle. Skills: 1- critical thinking, 2- effective discussion, 3- injustice and struggle for inequality, 4-respect to people and property, 5- cooperation and solving conflicts, Values and attitudes; 1- Identity and self-respect, 2- Empathy, 3- responsibility for social justice, and equality, 4- valuing, and respecting to differences, 5- taking responsibility for a sustainable development 6- believing in people for making differences (cited by Ersoy, 2013, p. 83.)

The qualities that 21st century citizens should have are explained as follows:

1. He should deal with the problems as a member of a global society. 2. He should work cooperatively, and take responsibility of his roles. 3. He should understand cultural differences, accept, admire, and tolerate them. 4. He should have the capacity of thinking critically, and systematically. 5. He should solve the problems without violence. 6. He should be willing to change his life style. 7. He should be sensitive to human rights, and protect them. 8. He should have the capacity of do politics in local, national, and international levels. Education systems should give priority to raise “universal citizen”, and their curriculums should be designed accordingly. (Cogan, J. J. (2000) cited by. Kan, 2009, p. 895-904) Hence, Ministers Council of European Council declared the year 2005 as “the year of European citizen via education. The importance of education at citizenship conscience, and increasing democratic participation was desired to be emphasized with this. (Tezgel, 2008, p. 20) The qualities of “good, global, 21st century citizens that were stated above are “national and universal citizen model that Ataturk desired and struggled to raise”

It is state’s duty to fix the failing parts of “the national education system”, which means “Citizen education system” with “modern principles” without diverging from “wisdom” and “science”. However, non-governmental organizations, educators, and scientists should do their parts in a changing and developing world. In our opinion, “basic principles “ and “Principles to apply” of our education system addressed by Ataturk are right. They should

be developed with “modern principles” and “rational methods”. They should not be stopped with government changes, and populist approaches should be refrained. (Şehirli, 2011).

Abstract

With the development of the social worker's profession in Latvia, the ethical aspects of profession have become more and more topical. Ethical awareness is essential for any social worker in order to provide high-quality social services, and the ethical thinking and consequent behaviour are the cornerstones for a good professional practice. The Code of Ethics helps to regulate the behaviour of social work professionals involved in the problem-solving process as it implies clear guidelines and determines certain behaviours, principles and moral norms that sometimes might not coincide with the expectations of other professionals. The aim of this research is to assess the aspects of social work ethics in the context of interagency collaboration in Latvia. In this article the authors define the basic values of social work and analyse Latvian legislation that defines ethical social work practice. The current trends, which can be observed in the process of interagency collaboration in the context of ethics, are summarized. The social work professionals from different institutions were surveyed in one region of Latvia – Kurzeme with the aim to learn their opinion and experience when dealing with ethical issues in their practice emphasizing the specifics of interagency collaboration. The majority of respondents evaluate the interagency collaboration in ethical context as good, although several problem areas are identified. The research also reveals the main ethical dilemmas in social work practice in terms of ethical decision-making process. The suggestions and recommendations of respondents and other authors are summarized about the changes needed for interagency collaboration to be more ethical and more successful.

Keywords – social work ethics, dilemmas, interagency collaboration.

Introduction

Any profession or organization demands that its members adhere to and practice according to acceptable moral codes or ethics. The Hippocratic Oath, as practiced by the medical professions, is an early example of professional ethics. In all organized professions, also in social work, members have skills, knowledge and competences that are outside the scope of the rest of society. Ethical codes exist to regulate professional behaviour and performance.

Modern society is critically dependent on the ethical practice of its professionals in all its echelons. Within and between different agencies and departments strong professional ethics are critical for establishing effective, efficient inter- and intra-agency co-operation and collaboration. A strong code of ethics is an effective driver of organizational efficiency and integrity. Ethical behaviour dictates respect and adherence to key moral principles. It encompasses honesty, fairness, dignity, confidentiality, competence, trustworthiness, respect for individual rights, respect for group rights, striving for excellence, pride of performance, and a culture of productivity. From a holistic point of view, commonly accepted codes of ethics pave the way for greater efficiency, productivity, resource development and quality service delivery; therefore also social work organizations have an incumbent duty of ethical performance of individuals, teams and their leaders. Shared ethics enhance inter- and intra-agency collaboration and performance.

In Latvia, Code of Ethics for Social Workers is part of their professional activity. It is elaborated on the basis of documents of International Federation of Social Workers (IFSW) “Declaration of ethical principles of social work” and “International ethical standards for social workers”, which are approved in General Meeting at Colombo (Sri Lanka), in 1994. Latvian Social Work Code of Ethics states that social work is a profession that promotes the emergence of social change, solves problems in people-to-people relationships, and contributes to the expansion of people's freedom and opportunities in order to increase wellbeing (Latvijas sociālo darbinieku etikas kodekss, 2001).

In social work the basic ethical principles are grounded in the general basic values of social work. According to NASW Code of Ethics, social workers uphold the following core ethical values and principles: service, social justice, respect for the inherent dignity and worth of persons, importance of human relationships, integrity in professional practice, competence in professional practice (NASW 2008). Thus, basic values of social work are closely linked to the code of ethics – justice, human rights, collective responsibility and respect for diversities (Global definition..., 2014).

G. Shennan quotes American sociologist R. Merton, who has embedded the values in explaining the essence of social work profession:

- 1) Value placed on systematic knowledge and intellect (*knowing*),
- 2) Value placed upon technical skill and trained capacity (*doing*),
- 3) Value placed upon putting this conjoint knowledge and skill to work in the service of others (*helping*) (Shennan, 2016).

This concept suggests that providers of social services must link global values to the daily practice – from global to local and individual values. Over time, values evolve and change, they vary in different cultures. Over the last decades, the society has undergone a rapid change in terms of morality and value system, and social work practices are faced with such controversial ethical issues as abortion, HIV/AIDS transmission, euthanasia, legalization of lesbian, homosexual, bisexual, transgender (LGBT) relationships, biomedicine and genetic technologies etc. Social workers should examine their personal values before identifying the problems, working with ethical dilemmas and making decisions. It is also one of the cornerstones for successful teamwork and collaboration between agencies and institutions.

Collaboration in social work on inter-agency level

In this article the authors explore the issues of partnership and information sharing across professional social work disciplines and organizations. In different countries different terminology is used describing this collaboration process between organizations. In many European countries terms such as interagency or inter-organizational collaboration are employed, but in Post-Soviet countries it is often referred to as inter-institutional collaboration. In our article we will use both ‘inter-agency collaboration’ and ‘inter-institutional collaboration’, depending on the context.

In social work of Latvia, due to the specifics of Latvian language, there is no distinction made between such concepts as joint working, cooperation, partnership and collaboration. Carnwell and Carson (2009), analysing concepts ‘partnership’ and ‘collaboration’ states that partnership is a shared commitment, where all partners have a right and obligation to participate and will be affected equally by the benefits and disadvantages arising from the partnership. Partners work together to achieve common goals and this relationship is based on mutual respect for each other’s skills and competencies, reciprocity, empathy; the professional boundaries are blurring. Collaboration is the more active version of partnership. If the ‘partnership’ is who we are, then ‘collaboration’ is what we do. Henneman, Lee and Cohen (1995) describe the relationship between collaborators as non-hierarchical, when shared power is based on knowledge and expertise, rather than role or title. Carnwell and Carson (2009) analysing the various collaboration definitions conclude, that they repeatedly mention the following words: sharing, partnership, interdependency, sharing of expertise, willingness to work together towards an agreed purpose, trust and respect in collaborators, but recently, the rhetoric around partnership and collaboration is beginning to give a way to alternative terms, such as ‘working together’ with emphasis on social skills required to work together towards a common goal (Carnwell & Carson, 2009). Thus, it can be concluded that both of these concepts are similar, but it is important in what context they are used. Successful partnership is based on collaboration.

Interagency collaboration is often discussed in the same context as inter-professional (inter-disciplinary) collaboration. It is based on the work of inter-professional teams and takes place between different institutions, where team members come from different professional backgrounds and have different levels of expertise. In

such way it is possible to respond to the clients who require the help from more than one type of professionals. The goal of inter-agency collaboration is to provide high-quality services to the client and find the best possible solution to the problem situation. Inter-agency work can also easier attract the necessary resources.

In developed Western countries, particularly in Great Britain, inter-professional and inter-agency collaboration (IPIAC) has been promoted by legislation since 1960's viewing collaboration as a way to improve standards and reduce costs. The term "inter-professional and interagency collaboration" (IPIAC) was introduced by Whittington, Thomas & Quinney (2009) to convey the importance of collaboration at professional and agency level. In Latvia the collaboration approach between different organizations/ institutions for solving social problems has been applied since the end of 1990's. In the Dictionary of Social Work inter-institutional approach has been explained as integration of different professional activities and sciences in the social work practice. On the other hand, the concept "inter-professional team" is defined as a group of different professionals who work towards reaching the common goal. Inter-professional team includes representatives of different professions and organizations (Latvijas sociāla darba vardnica, 2000).

The Guidelines for the development of professional social work in Latvia for 2014-2020 states, that inter-professional and inter-institutional collaboration is an essential component for providing a qualitative social work. It implies that successful collaboration is based on each specialist's understanding about his/her professional tasks, knowledge, abilities and duties, as well as his/her sincere desire to use the knowledge of other professionals in the cases when necessary professional duties cannot be performed within a current position, profession or institution (Labklājības Ministrija, 2013). Thus, each social worker (or representative of another profession), solving a case and knowing the limits of one's own abilities, can search for other specialists (from other professions and institutions), who are able to provide the necessary help in order to solve the client's problems. Particularly for that reason the institutions have different functions and the specialists of different professions engage in different tasks. It also includes a provision that, in solving a client's situation, it is necessary to ensure the application of multidisciplinary and interdisciplinary cooperation principle in order to achieve the results of social services and ensure sustainability (Ministru kabinets, 2017). Although the need for inter-professional and inter-agency collaboration keeps growing as effective collaboration is a key of successful service provision, inter-professional and inter-agency collaboration does have its limitations when we come to the issues of ethics.

Main obstacles to collaboration with other professionals in the context of ethics

Inter-professional and inter-agency collaboration is vital for promotion of the client's welfare. In spite of its benefits, several authors (Paproški, Beth & Haverkamp, 2000; Bruner, 1991; Banks, 2004) in their findings have indicated various obstacles, limits and risks that professionals may face while collaborating:

1. Client protection: There can be a tension between the need to share the information between professionals and agencies and the preservation of confidentiality. All professionals must obtain informed, written consent prior to sharing any information. Although this ensures client's autonomy and confidentiality, it also requires time, effort, and clarity. Both Human Rights and Constitution of Republic of Latvia stress the inviolability of privacy (LR Satversmes sapulce, 1922). Also the Regulations of Cabinet of Ministers, Nr.338, "Requirements for providers of social services" stipulates that the acquisition, use and storage of customer-related information must take place in accordance with the status of access of restricted information and data protection requirements of physical persons, and must be grounded in ethical principles, respecting the privacy of the client (Ministru kabinets, 2017).
2. Differences in training and professionalism: The professionals and paraprofessionals involved in collaboration may have different training and knowledge about practices of informed consent, appropriate use of information, and other procedures that ensure a consistent standard of support; besides each profession and each organization follow their own Code of Ethics.
3. Time constraints: Due to the constraints related to funding and resources, all professionals are often busy and overworked, which creates a practical challenges for coordination of the meetings. Collaboration is not a quick-fix and it cannot take place without the adequate staff and other service-related resources. On the contrary, development of partnerships takes time and effort while building collaborative relationships can be

a gradual process (Townsend, 2004). Also our research proves that more than 20 % of professionals mention the lack of time as obstacle for observing ethical principles in inter-institutional collaboration.

4. Conflicts of values: A commitment among professionals to collaborate can bring along important differences in opinions that need to be voiced for the best interest of the service user or provider. For example, the limits of collaboration get tested when the attitudes of fellow professionals about gender, race, age or status get questioned (this was proven also by results of our survey); or a partner agency is challenged about a judgement that seemingly puts a service user at risk (Whittington, 2003), as it can be in a case of involuntary placement of the client in closed type institutions. Sometimes individuals are reluctant to collaborate because of tensions between the professions, which include territorial attitudes and stereotypes about roles, responsibilities, and abilities and also about personal characteristics (Paproski & Haverkamp, 2000). Banks suggests that when the members of different professional groups work together, the aim should be the improvement of the services, better-informed decision making and removing the overlaps or gaps in services, but this can result in conflicts of values and loyalties between professionals in the team, and/or blurring of boundaries (Banks, 2004). One of the issues raised when working in multi-disciplinary teams is whether or not it is productive to retain its own set of unique values or ethical principles for each profession. This also challenges the professional identity of social workers.

5. The professional and personal competence of professionals and paraprofessionals – lack of knowledge and awareness: Some professionals do not have the training or experience to know with who they could or should collaborate. They may not know how to elicit the information from clients or how to proceed with contacting other professionals (Paproski & Haverkamp, 2000).

6. Lack of coordination and case management: In many settings the case management is insufficient due to lack of a designated case manager or coordinator. In Latvia there are many cases being solved when a particular case manager is not assigned - each institution does its work until the positive result is reached.

In accordance with the normative documents, social workers must sign for non-disclosure of information and they must be familiar with the list of restricted access information, which is developed on the basis of Personal Data Protection Law, where Article 6 stipulates that every physical person has the right to protection of personal data (Latvijas Republikas Saeima, 2000). However, in practice often situations arise which question how secure is the information provided by the client about his or her personal life and to what extent the social worker is able to provide confidentiality if the case is handled within an inter-professional team, because there is no document that would specify the boundaries of inter-professional competence in relation to information of client's case, as this document contains the information of limited access. It is also not defined who is entitled to see it, in what cases and in what way. The Latvian Code of Ethics for Social Workers does not clearly define the duties, rights and activities of the social worker in the sphere of client's data handling and confidentiality, which points to the need for amendments to the Code of Ethics (Latvijas sociālo darbinieku etikas kods, 2001).

Ethical dilemmas in social work practise

The observance of the Code of ethics is closely related to a particular institution and its organizational culture, as well as actions of each individual when carrying out their direct duties. There are lots of components that influence ethical decision-making, which Antle (2005) has summarized in a model outlining the components of ethical decision-making that social workers may find helpful as a reflective framework (see Figure 1).

Figure 1. Components of Ethical Practice (after Antle, 2005)

For social work practice to be ethical, social worker must not only work with the client in accordance with legislation, but must use also a combination of the professional attainment (training, knowledge, techniques) with the personal self of who one is (personality traits, belief systems, and life experience). This is a hallmark of skilled practice, what Dewane (2006) calls – the use of Self. Social workers need such trait of personality as ethical sensitivity – ability to predict the development of situation, and identify ethical dilemmas during solving the social case issues.

The associate professor of Bradley University (USA), doctor of psychology, Nancy Scherman (2017) speaking about ethical dilemmas in social work practice at Social work conference in Riga, explained that what social workers do is based on values, and social work ethics are social work values in action. Therefore an ethical dilemma is a circumstance which occurs only when two or more social work values are in conflict. Scherman lists conditions for solving ethical dilemmas:

- Social worker must make a decision about which course of action is the best;
- There must be different courses of actions to choose from;
- Solving ethical dilemma, no matter what course of action is taken, some ethical principle is compromised (Scherman, 2017).

Keeping in mind Scherman's ideas based on F.G. Reamer's (1987) model, it is possible to conclude that social workers daily face the following ethical dilemmas which can also be attributed to interagency collaboration:

- Client's right to self-determination – from one side a client is responsible for his/her life, problems and decisions, regardless of the opinion of the social workers or other professionals involved in dealing with the issue about the correctness of the client's choice of action, professionals may recommend a solution, but the client's choice must be respected. From the other side, social worker must assess if the client's decision do not do harm the client him/herself or others, for example, as in cases with the suicidal risk.
- Confidentiality – how to draw a line when confidential information must be disclosed, how to determine the boundary behind which confidential information should be disclosed, for example, to which extent and to how many institutions domestic violence can be disclosed or the story of victims of human trafficking, in a way that disclosure does not lead the victim to even greater suffering.
- Differences of values and morals – conflicts between client's and professional's values, for example, a teenager wants an abortion but it clashes the values and moral principles of the social worker;

- Administrative dilemmas, for example, allocation of limited resources;
- Compliance with laws and regulations – in relation to support and caring about the client;
- Disclosure of colleagues' offenses - should a social worker always report on ethical breaches of colleagues in one's own organization or other organizations involved in solving the case; do specialists know where to go if breaching of ethical code is experienced, and how to maintain the reputation of the profession and organization in such situation in order not to lose the loyalty of the clients.

A Latvian practitioner – a Head and supervisor of Latvia Red Cross Crisis Centre “Burtnieks”, Ieva Antonsona, who also responded to the survey questions, adds the following dilemmas:

- Support and help vs client's own initiative and strength;
- Child's right to beneficial life conditions vs parents' rights to use the rights of family;
- Conflict that is created when one person's rights are protected vs interests of other family members;
- Loyalty towards organization vs needs and best interests of the client;
- Need for the services vs financial ability, disproportionate use of time and resources when working with clients with various problems (Antonsona, 2017).

Research methodology

In this research, besides analysis of literature, legislative documents and statistics data, a survey method was employed for exploring the actual situation in Latvia in terms of ethics and interagency collaboration. The survey was conducted in March and April, 2017 in 5 largest municipalities of the Western region of Latvia involving the social services and their subordinate organizations (Family departments and Social Benefits departments of Social Services, Social residential homes, Children homes, Old people's residential homes, Night shelters, Rehabilitation centres for persons addicted to psychoactive substances, a Day care centre for disabled people, Group apartments for people with disabilities), Municipal policy, Orphan Courts, 6 branches of the State Social Care Centre of Kurzeme Region, which provide long-term social care and rehabilitation services for children and adults with mental and physical disorders, and 12 non-governmental organizations, which provide social services or their work is related to social welfare (Crises centres for victims of family violence, day care centres for children from risk families, etc). All organizations, depending on the problems and specifics of clients, are involved in mutual collaboration.

The questionnaire consists of closed and multiple choice questions, leaving space for comments. The closed questions were used for gathering the general data about the respondents: gender, years of service in social welfare, organization in which they work, target group of clients, and with which institutions they interact when solving clients' cases. In order to understand how the respondents value mutual collaboration, what problems they as professionals face in the ethical context, and what are the most common ethical dilemmas in inter-institutional collaboration, eight multiple choice questions were asked. Knowing that the social service providers in Latvia are very busy, the choices of responses were offered, leaving space for the personal comments. At the end of the survey some space was provided for respondents to express and share their reflections, comments, and examples.

In total, 125 questionnaires were returned, which cannot be called a high respondents' activity, however, it is sufficient for the results of the study to be considered as valid. Moreover, the specifics of Latvia must be taken into account – most municipalities are small. For example, in the three of municipalities surveyed, the number of inhabitants ranges from 10,000-11,000, while two were the larger ones, according to official data - 39,000 and 78,000 people) (Iedzīvotāju reģistra statistika). In the reality the numbers are smaller as in the last decade many people have left Latvia due to economic considerations. Also, such social services as night shelters, half-way homes, group apartments, day care centres for people with special needs, addiction prevention centre, crisis centres for victims of violence, day care centres for seniors are only in the largest towns of Latvia.

From all the respondents 94% are women and 6% are men, which did not come as a surprise as in Latvia mostly women work in the social welfare system. In relation to social work, men would usually work in management positions, thus also from these 7 men who participated in our survey, 6 are heads of their organizations (4 –

heads of nongovernmental organizations (NGO), 1 – head of the municipal night shelter, and 1 – a deputy chief of municipal police). From all respondents 66% are social workers, 25 % – heads of organizations or departments, but 9% are representatives of other professions, such as members of the Orphan's Courts, medical assistants in social care institutions, etc.

Findings

To the question: how respondents evaluate the interagency collaboration in the context of ethics, only 12 % of respondents evaluated it as excellent when cooperating with all institutions involved, but 59% of respondents assessed the collaboration as *rather good*. 17% have noticed some ethical dilemmas, and they evaluated it as *average*, but 12% of respondents stated that it depends on the organizations and particular professionals involved in collaboration.

When asked, if during the inter-institutional collaboration respondents have met situations when basic social work values are violated against the client, mostly negative responses of different degrees were received: never, hardly ever, seldom, rather rare. But 20% of all respondents stated that the client's rights to freedom and self-determination have been violated rather often. The respondents who expressed this belief mostly work in different social care institutions or rehabilitation centres for persons with disabilities.

The same 20% percent of respondents consider, that in the process of interagency collaboration the clients' rights to receive professional assistance and principle of social justice are not respected rather often. 16% say that they have seen that clients get discriminated in cooperation with other professionals. These responses mostly came from NGOs and organizations involved in providing services and support to victims of violence and abuse, children and adults with disabilities, low-income people or socially disadvantaged seniors, as well as who work with addicts of psychoactive substances. 19 % of respondents believe that rather often confidentiality is not observed while collaborating, and this is mentioned also as aspect that causes ethical dilemmas.

Further, several multiple choice questions were asked, with the aim to clarify what obstacles or barriers respondents see in the process of inter-institutional collaboration, in order to follow fully the Code of Ethics. Most respondents (68%) have marked the response "lack of human resources", which proves that professionals are too busy to address in depth the multiple problems of the clients. Work with people requires tireless energy, empathy and self-control. A lot of time goes into completion of documents and transferring of them to other institutions. This creates an internal tension, which collaborating with professionals from other organizations with a different organizational culture can only increase. The lack of human resources could also mean that, according to the respondents, other professionals lack adequate professional and personal competence, which is evidenced by the next most popular answer – *ethical principles are not recognized*. I. Antonsone (2017) tells a situation, when several specialists from different institutions had gathered at Crisis centre with the aim to discuss the situation of the client – a woman with children who all had suffered from domestic abuse. A local social worker from the client's village and an Orphan's court specialist from the same district expressed a great disliking towards this woman, indicating that she does not dress properly (during the summer, the client was wearing a shirt with a large neckline), saying that the woman cannot be a good mother, and other insulting statements were expressed as well. When the professional of the Crisis centre noted that the client's clothes have nothing to do with the women's skills to care for children, the other two began to question the professional competence of the specialist of the Crisis centre. Thus, interagency collaboration is not always supportive. 47% of respondents have stated that the collaboration is problematic because of the differences in the level of professionalism of the collaboration partners and differences in the profession/ ethical codes of each organization. Fewer respondents have chosen responses, such as 'inconsistencies in collaboration coordination/ management' and 'legislative imperfections'. But the further questions confirm the opinion about the high overload and the tensions experienced by professionals in their work. A large percentage of respondents mentioned professional burnout and lack of support as the greatest obstacles for following ethical practices.

In our research we wanted to clarify what ethical dilemmas face social work professionals in above mentioned region of Kurzeme, and how these dilemmas influence the decision making process when solving the client's cases. The survey results are revealed in Figure 2.

1. Confidentiality violations
2. Social worker's (SW), support and assistance to the client vs control and compliance to the rules
3. SW care, support and assistance vs client's own initiative and strengths
4. Involuntary placement of the client in closed type institutions
5. The child's rights to favourable living conditions vs the rights of parents to exercise their parental rights
6. Destructive communication with the client's relatives (a person's interests vs interests of family members)
7. SW's respect for the client's right to self-realization vs stigmatization of the client
8. The contradiction between organizational values and personal values
9. Loyalty to organization vs the needs and the best interests of the client
10. Responsibilities of others: colleagues, institution/ management
11. Need for services vs financial abilities
12. Disproportionate use of time and resources when dealing with clients with various issues
13. Interaction with social media when informing the public vs client's right to anonymity.
14. Conflicts between SW and client's values
15. Acceptance of bribes or gifts
16. Disclosing the ethical offenses of colleagues

Figure 2. Ethical dilemmas in interagency collaboration

As it is seen in Figure 2, for Latvian social work professionals the greatest tension is created by the need for services vs financial possibilities. As it was mentioned before, many municipalities lack different alternative services. Presently, our country's high priority is moving away from residential care. According to statistics, in 2015, 1551 children and 5227 children and adults with disabilities still live in large long term institutions (to beginning of 2017, Latvia has 1 950 000 inhabitants) (Labklajibas ministrija, 2015). In Latvia the deinstitutionalisation process is necessary for developing community based approaches and implement alternative systems of care based on the principles of providing family type or small group care. There is lack of such alternative services as foster families, host families, day care centres for street children, rehabilitation centres for children suffering from addictions as also other abovementioned services for children and adults with various problem issues.

The second most frequently chosen response was 'social worker's support and assistance to the client vs control and compliance to the rules'. It points at bureaucracy and many controlling institutions, which from one side are necessary, as they control the quality and lawfulness of services, but from the other side, the large amount of paperwork takes lots of time which otherwise could be spent supporting the client. The frequency of other responses can be seen in Figure 2. One of the respondents said: "I don't have such experience: we make decisions not according to ethical priorities but according to norms and regulations".

A separate section of the survey was devoted to the support system of professionals. Lithuanian authors Dirgėlienė and Veckienė (2016) in their study on Supporting Collaboration in Social Work Organizations admit

that social work professionals, performing complicated crisis intervention, seek to empower the client. In this empowerment process, the client with his/her unique needs is active as well. The fact that social work always takes place in the circumstances of intensively changing environment enhances the risk of “burnout” syndrome. Dirgėlienė and Veckienė sees supervision as the most effective method for avoiding professional “burnout”, therefore they advise that supervision as consulting on professional relations may efficiently contribute to social work as evaluation of new professional activity and construction of qualitative social work practice. Supervision (organisation, group, team, individual) may join together the resources of support providers and support receivers into a solid system while seeking for common goals of professional quality (Dirgeliene & Veckiene, 2016).

Our research results suggest that only 29% of surveyed professionals can attend regular supervisions, although the legislation states that each provider of social services must do so. In reality the supervisions are available only in largest cities. The smaller places lack professional supervisors, but the state financed long term institutions do not have funding for such staff member or for hiring one from outside. 26% of respondents receive support from the management of their organization, 8% confess that the support could be greater, but the largest part of respondents discuss the complicated situations with their colleagues. Antonsone stresses the importance of self-reflection in social work, saying that it is the ability to step back and ask oneself a serious question: why did things happen this way and what could anything be done differently? Reflection means thinking in present about the past for the future (Antonsone, 2017).

Responding to the question: “What do you think should be changed in order to provide more ethical social work services” the largest part of respondents (53%) suggest that regular supervisions should be provided with the possibility to choose the supervisor (See Figure 3).

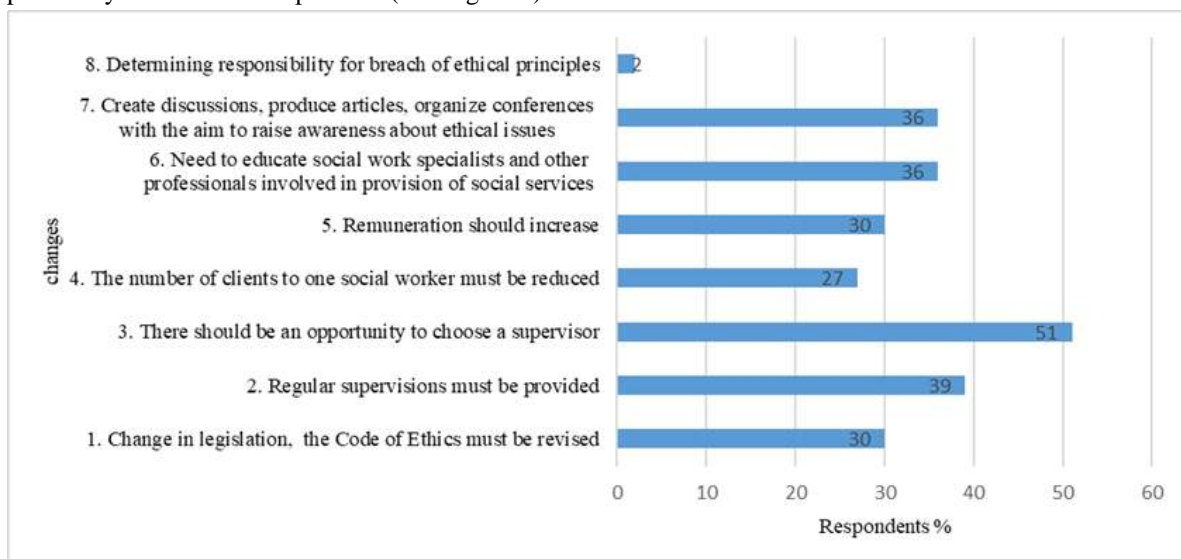

Figure 3. Changes needed for improvement of ethical practices

12% of respondents marked all suggested choices, but 2% added in their comments that there should be responsibility determined for breaching ethical principles. 37% of respondents emphasized the need to educate social work specialists and other professionals involved in provision of social services. The need for education was stressed also in Social Work Conference of Latvia, which was held in Riga, in 2017, suggesting that in social work learning programmes a particular course should be incorporated which not only would give a theoretical knowledge about issues of ethics, but would also provide practical examples that would allow to understand the challenges social workers will face in their practice. Also there is a need to teach self-reflection skills. Our research proved that there is also a need for productive discussions, qualitative articles, and conferences which would raise awareness on issues of ethics. 30% or respondents are convinced that there should be changes in legislation and that the Code of Ethics should be revised. In any case, all surveyed professionals acknowledged the need to actualize the ethics of social work.

Recommendations and conclusion

As shown by results of our research, the majority of respondents link their suggestions for improving interagency collaboration with accessibility of supervision and option to choose a supervisor. Attention must be paid also to the other comments expressed by respondents: *There is a need to reduce the work load in order to avoid professional burnout; Social workers must be careful when sorting out problems of other families, and do not leave one's own family unattended; Ethical principles are often neglected in senior care and social rehabilitation when collaborating with medical staff (family doctors, doctors, etc.), as unfortunately their opinion often is that a low-income or poor senior cannot desire a good state of health.* Another respondent writes that the collaboration is important for solving client's problems and working towards a unified goal. For example, if a child is abused, the Orphan court looks out that the best interests and needs of this child are supported, but the social work specialist works with the child's family that the offenses against the child would stop and that the child could either remain in the family or return back home. But the social work practice proves that the social worker often does not work on the actual issue of abuse, instead tries to eliminate unemployment, controls if the home is clean and well-organized, that that the parents would attend meetings with social worker and would allow the family to be examined at their place of residence. There were respondents who emphasized that social workers should become more active, engage in the work of various organizations, also in policy making and research. From gathered research data it can be concluded that in Latvia there are still several social work target groups, which face discrimination and do not receive equal treatment from different organizations. The social work clients rarely participate in the decision making process.

Conclusion

Ethics is at the basis of social work, as the basic values of social work are based on theories of moral and ethics. Since the beginnings of secular professional social work, social work specialists are facing a challenging task – to provide professional and ethically and morally based assistance and support to other people that are marginalized and excluded from society due to their dysfunctionality. As time goes by and the specifics of the problems change, social service providers also need to change. In order to solve the problems that are becoming more multi-layered and complex, not only high professional competence is needed but also a set of high-quality human qualities. Ability to successfully engage in inter-professional and interagency collaboration is of crucial value. However results of our research show that regardless of the generally positive evaluation of collaboration, there are several negative experiences in the context of ethics. Negative outcomes can be reduced by referring to the guidelines of Code of Ethics and social policy that needs to be updated from time to time. It was emphasized in the most recent Latvia's Social Work conference (2017) that was dedicated particularly to issues of ethics, and also it was proven by data of our research. Different professional groups must be encouraged to break down barriers and to work together collaboratively not only by carrying out statutory activities, but also by trying to maintain a respectful and ethical relationship both with the clients and other professionals.

Abstract

One of the keywords characterizing the vision of modern society is diversity - not only related to ethnic background, culture and gender, but also to the differences of people, similarities and unique characteristics as individuals and groups. There is a need to learn to understand it both as a value and a positive educational resource in overcoming tensions generated by societal change and globalization. In this context, the issue of teachers' diversity competence development and being aware of its transversal character is of utmost importance for opening up possibilities to understand the way we relate to each other and the way we can live together. Although there are ongoing discussions on diverse learners' opportunities, minority schools and inclusive education in Latvia, the research findings indicate that there is an imbalance between existing diversity in society and skills to express tolerance and communicate. As learning to live together is an essential part of school education and equal opportunities and the development of human potential to its fullest is emphasized, the authors chose to focus on particular diversity aspects in the study, especially turning attention to the teachers' competence in the work with gifted children and children with special needs. The goal of the study – to investigate the manifestations of teachers' diversity competence in the context of inclusive education. The research question – how teachers' self-assessment reveal their 1) tolerance to the diversity of learners, and 2) application of professional skills in an educational environment. The quantitative research approach and methodology of the questionnaire as a data collection technique was applied in the study. Respondents were selected by purposeful random sampling strategy and the method of descriptive statistics was used to data analysis. The results of the study will be integrated in the process of teacher education, in order to deepen the awareness of teachers' diversity competence by encouraging the transfer from its visible aspects to the deeper layers - professional attitudes, knowledge, practical know-how and professional actions, thus preparing teachers to work with diverse learners in different educational contexts.

Keywords: Diversity, Inclusive education, Professional competence of teachers

Introduction

The article addresses diversity competence as a key competence for every individual necessary for effective functioning within the context of societal change and globalization. Moreover, recognizing the importance of the issue and being aware of its transversal character it is possible to open up opportunities, understand the way we relate to each other, and how we can live together. Therefore there is a need to learn to understand diversity both as a value and a positive educational resource in inclusive educational contexts.

The authors of the article conceptualize diversity as it refers to the extent a group reflects individuals from different identifiable backgrounds and represents a multitude of individual differences and similarities that exist among people. Our understanding is rooted in the works of, among others, Deardorff (2006), Delors (2013), Gardenswartz and Rowe (1998), Hanovs, Laicane and Mihailovs (2009), Mecheril and Plößer (2011), Sauter and Schroeder (2007), Sheets (2005), and Walgenbach (2014). These sources communicate diversity as oriented towards the characteristics of social groups' values and encompass different aspects such as race, age, national origin, religion, ethnicity, sexual orientation and others. In its turn, inclusive education ensures appropriate conditions for meeting the needs of diverse learners, including different perspectives and unique contributions of each

individuality. It has to be added that these individual differences and diverse perspectives are viewed as enriching and assessed as positive – like a common source of knowledge, growth and changes for all individuals involved in communication and collaboration, rather than being a burden for educational institutions.

Diversity is seen as a hallmark of European school education systems and the development of more inclusive schools as well as the provision of support for teachers are of utmost significance. However, the theoretical context reveals the complexity and mutual interconnectedness of the terminology relating to diversity and inclusive education due to the differences in interpretation and meaning both within and between countries. (Communication from the Commission to the European Parliament..., 2017; Rashid & Tikly, 2010; Thoma & Rehle, 2009) Although inclusive education is defined as a priority for strategic development of the education system and the ultimate goal of education policy in Latvia, there is no a single definition and shared understanding of the concept – in strategic documents it is viewed not as a promotion of every child's optimal development by using his/her individual resources, but as an exclusive form of education for special groups of learners. (Izglītības pamatnostādnes 2014.-2020. gadam, 2014) There are ongoing discussions on diverse learners' opportunities, but in most cases, they focus on children with special education needs and children at risk of social exclusion and leave unnoticed gifted and talented children, who also need individual approach if they are to realize their full potential. It has to be concluded that there is an imbalance between existing socio-cultural diversity in society and skills to express tolerance and communicate in the context of Latvia – society expresses insufficient competence in relation to diversity issues and does not ensure the dissemination and strengthening of diversity phenomenon in the process of education. (Hanovs, Laicane, & Mihailovs, 2009) Therefore it is sufficient for teachers, who educate young generation and serve as the role models for future teachers, to deepen the awareness of diversity competence that is one of the competence areas for the teaching profession, thus enabling them to engage with socio-cultural diversity in the classroom and in the school community. (Schatz, 2014)

There are several models developed by different authors that reflect the components of diversity competence. Aschenbrenner – Wellmann's (2009) diversity competence model is based on cognitive and affective components, characterized by the amount of theoretical knowledge and ability to appreciate mutual tolerance, as well as it includes a behavioural component – ability to use non-evaluative dialog, support heterogenic team and ability to implement diversity as a criterion for efficiency. Also, the aspects of diversity components developed by Rosken (2009) complement the components mentioned before, for example, ability to perceive and respect different and common features, particularly emphasizing the ability to reflect on personal actions and behaviour patterns, as well as the skill to avoid stereotypes. Thus, shared understanding of diversity means self-awareness, awareness of others and interpersonal dynamics – mutual interaction in ways that are efficient and respectful. (Loden, 1996) According to Sheets (2005), the potential of teachers depends on a capacity to perceive diversity as a norm and view it as fundamental to all aspects of the teaching-learning process. She focuses on the interconnectedness between teacher pedagogical behaviours and student cultural displays that are closely interrelated and complement each other, particularly turning attention to (1) diversity recognition; (2) didactic aspect; (3) communication, and (4) open microclimate for diverse social interactions.

In order to reveal the complexity of the diversity concept and the way how all of us process stimuli and information that promotes diversity competence development, the authors of the article focus on the four layers of Diversity model (Gardenswartz & Rowe, 1998). It consists of the personality aspect shaped early in life and is both influenced by, and influences, whereas the internal, external, and organizational dimensions are formed throughout one's lifetime and career choices. The dimensions

mutually interact and impact both the individual and the context itself encouraging and improving professional attitudes, values, knowledge, practical know-how and professional actions, thus preparing teachers to work with diverse learners in different educational contexts.

The Diversity model (Gardenswartz & Rowe, 1998) can also be used as a reflective tool, since interpretation, reflection and decision making form an important part of pedagogical professionalism. In order to further develop the competence, it is important to be particularly aware of how the contextual aspects are interpreted and reflected. Personal self-reflection might serve as a tool for the implementation of the socio-educational pedagogical activity, determined by previous personal and professional experience. (Hanovs, Laicane, & Mihailovs, 2009) This issue confirms the belief that values and attitudes significantly affect the process of diversity competence development – as noted by Deardorff (2006), it is necessary, to begin with attitudes and move from individual level to interaction level, since the degree of the developed and improved competence depends on acquired degree of attitudes, knowledge, comprehension, and skills.

In this context heterogeneity that includes the work with heterogeneous groups and respects differences, becomes of the utmost importance and is seen as a valuable and potential resource. However, it has to be mentioned that heterogeneous grouping might be harmful, particularly for gifted and talented learners, if there is no appropriate instructional and curricular differentiation across the ability levels that reduces excellence gaps (Plucker & Callahan, 2014). Therefore the authors of this publication emphasize pedagogical programmatic dimension of heterogeneity that encourages to find out pedagogical solutions in the context of inclusive education. (Sauter & Schroeder, 2007; Walgenbach, 2014)

As the result, the understanding and awareness of the diversity concept have become a vital requirement in nowadays complex and changing society and education is the only solution in promoting an attitude of tolerance and inclusiveness. (Delors, 2013) Since learning to live together as an essential part of school education, as well as the equality of the opportunity to develop one's own human potential to its fullest has been emphasized, the authors chose to focus the study on particular diversity aspects, especially turning attention to the competence of teachers to educate gifted and talented children and children with special needs.

Method

The aim of the research was to investigate the manifestations of teachers' diversity competence in the context of inclusive education. **The research question** was defined as follows: how teachers' self-assessment reveal their 1) tolerance to the diversity of learners, and 2) application of professional skills in an educational environment.

The quantitative research approach and methodology of the questionnaire as a data collection technique was applied in the study. The scientifically valid questionnaire for evaluating teachers' readiness to educate children with special educational needs, consisting of 78 questions ($\alpha = 0.962$), was elaborated at Siauliai University (Lithuania) with the aim to access the voices of participants as they reflect on their professional competence aspects. For statistical analysis of the research data, the SPSS 22.0 programme was used: a method of descriptive statistics, Kruskal-Wallis test, and Kendall's tau-b correlation test. Five answers were offered to measure the respondents' attitude on a Likert-type five point scale.

The data were obtained during the period of 2012 – 2017 and analysed in accordance with the diversity pedagogical dimensions reflecting teachers' professional competences and pedagogical behaviour

(Sheets, 2005). The respondents were selected by purposeful random sampling strategy and they represent educational institutions that are located in different regions of Latvia. The respondents are teachers (N = 284) of different age, different professional qualifications and seniority levels (see Table 1).

Table 1. The groups of respondents

Pedagogical work experience		Professional qualification	
	Length in years (%)		Professional group (%)
up to 1	2.8	Preschool education teachers	11.3
1-5	12.7	Basic education teachers	12.3
6-10	19.4	Subject teachers	27.8
11-15	10.9	Pedagogical and psychological support team personnel	11.6
16-20	9.9	Other	37.0
21-25	13.4		
26-30	11.6		
31-35	9.5		
36 -40	4.2		
more than 40	5.6		

It must be added that the dominating qualifications in the group of *Pedagogical and psychological support team personnel* are Speech therapists and School psychologists, but the indicator *Other* refers to the respondents with two professional qualifications in the field of education.

Analysing the respondents involved in the research, it can be concluded that different professional groups of teachers with different work experience are represented. In addition, the proportion of novice teachers with little work experience is relatively small. All respondents have higher pedagogical education, and, taking into account the national requirements for regular compulsory involvement in continuous professional development, they also have significant experience in the acquisition of various further education programmes.

Findings

The authors share the belief that teachers` professional competence requires not only specific professional attitudes, knowledge and skills but also concrete professional actions. Therefore, for the research purposes, the questions of the questionnaire were grouped into 4 categories: (1) teachers` self-evaluation related to their ability to provide education for diverse groups of students with: mental, sensory and physical development disorders, behavioural disorders, learning difficulties and giftedness; (2) didactics and assessment – indicators for pedagogical process organization for students and skills to use effective didactic technologies in the process of education; (3) indicators for efficient social interaction with students; (4) teachers` competence indicators in relation to the creation of an open microclimate for diversity in the educational institution.

The findings related to the first category of questions - **teachers` self-evaluation related to their ability to provide education for diverse groups of students** are reflected in Table 2.

Table 2. Self-evaluation of respondents related to their ability to provide education for diverse groups of students

Groups of students	Complete shortage (%)	Little shortage (%)	Do not know how to evaluate (%)	May be sufficient (%)	Completely sufficient (%)	Mean Rank
Students with mental, sensory and physical development disorders	15.5	30.6	15.1	29.6	9.2	2.836
Students with behavioural disorders	7.4	29.2	8.5	44.0	10.9	3.215
Students with learning disorders	4.2	26.1	12.0	45.4	12.3	3.356
Students with giftedness	7.7	21.8	15.1	34.9	20.4	3.384

In this context, the results of Kruskal – Wallis test allow identifying significant differences ($p=0,011$) that are dependent on the qualification of the respondents in relation to the skill *To organize education process for gifted students*. The highest self-evaluation is characteristic for the group of respondents representing subject teachers (Mean Rank 167,91). Equally high this skill has been self-evaluated by the group of basic education teachers and the respondents with two professional qualifications in the field of education (Mean Rank 137,81). In its turn, the lowest self-evaluation of the skill has been observed for the pedagogical and psychological support team personnel (Mean Rank 116,33).

In relation to the second group of questions reflecting **didactical and assessment aspect**, the research findings certify high levels in self-evaluation of several skills in the sample of respondents. Among the skills possessing the highest level of self-evaluation are the following ones: (1) *To organize holidays, excursions, exhibitions* (Mean Rank 4,155; 44,7% of the respondents consider it as completely sufficient); (2) *To select and apply teaching and learning aids* (Mean Rank 4,060; 34,2% of the respondents consider it as completely sufficient); (3) *To assess the students` abilities* (Mean Rank 4,007; 32,0% of the respondents consider it as completely sufficient); (4) *To assess the results of the education process* (Mean Rank 4,000; 32,0% of the respondents consider it as completely sufficient). The results of Kruskal-Wallis test point to the developed skills that might enhance the pedagogical process, including the quality of inclusion, for example, the skill *To assess the students` abilities* correlates with the skill *To promote education process for children with learning difficulties* and the skill *To organize education process for gifted students* (in both cases $r = 0,310$ and $p = 0,000$).

However, there has been identified a problematic issue during the analysis of the results – majority of pedagogues face difficulties to develop programmes, as well as adapt and modify them. The lowest level of self-evaluation is attributed to the skill *To develop special programmes* (Mean Rank 2,757) – 20,1 % of the respondents acknowledge a complete shortage of this skill. Also, the skills *To develop adapted programmes* and *To develop modified (restructured) programmes* have been evaluated as insufficient (Mean Ranks 2,930 and 2,9333). The low rating of the skills mentioned above influence the skill *To provide education process for children with developmental disorders* that is confirmed by the correlation of the indicators for the following skills: *To provide education process for children with mental, sensory (vision and hearing) and physical development disorders* and *To develop special programmes* ($r = 0,472$, $p = 0,000$).

Respectively, the results of Kruskal Wallis test revealed sufficient differences in the rating of only one skill that is dependent on work experience – *To analyse learning difficulties of students*, where the self-evaluation indicates relevant differences ($p = 0,017$): the highest self-evaluation is for the respondents with work experience from 16 to 20 years (Mean Rank 165,89) and with work experience from 31 to 35 years (Mean Rank 154,94), whereas the lowest – for the respondents, whose work experience is from one to 5 years (Mean Rank 100,83) and from 36 to 40 years (Mean Rank 102,71).

Depending on the qualifications of the respondents, Kruskal Wallis test results point to the essential differences ($p = 0,031$) in the self-evaluation levels for the skill *To develop special programmes*: equally low self-evaluation (Mean Rank 129,49) is found in the ratings of subject teachers and preschool teachers, whereas the highest self-evaluation – in the group of basic education teachers (Mean Rank 170,46) and slightly lower – in the group of pedagogical and psychological support team personnel (Mean Rank 167,23). At the same time very sufficient differences ($p = 0,008$) are found in the self-evaluation of the skills *To provide education process for children with special needs*: convincingly the highest self-evaluation is in the group of pedagogical and psychological support team personnel (Mean Rank 176,89), but the lowest – in the group of preschool teachers (Mean Rank 118,58). Similarly, very sufficient differences ($p = 0,007$) are found in the self-evaluation of the skill *To differentiate and individualize the process of teaching*: convincingly the highest self-evaluation is in the group of pedagogical and psychological support team personnel (Mean Rank 179,05). Respectively lower self-evaluation in this context is found in the group of preschool teachers (Mean Rank 163,41) and the lowest self-evaluation - in the group of basic education teachers (Mean Rank 124,50).

The third group of questions reflecting the **indicators for efficient social interaction with students** shows the findings in Table 3.

Table 3. Respondents` self-evaluation of the skill for efficient social interaction with students

Skills	Complete shortage (%)	Little shortage (%)	Do not know how to evaluate (%)	May be sufficient (%)	Completely sufficient (%)	Mean Rank
To apply knowledge of special education in everyday work	2.5	21.8	8.1	46.8	20.8	3.616
To prepare children with special needs for independent life	9.2	22.5	22.5	34.9	10.9	3.155
To organize work for children with special needs in the school of general education/preschool	7.7	27.1	15.1	39.8	10.2	3.176
To ensure individual help in accordance with learning difficulties for the students with special needs	3.2	16.9	8.1	53.5	18.3	3.669
To use individual approach of different kind	2.8	13.4	2.1	54.6	27.1	3.898
To determine the current needs of students	1.1	18.0	5.3	52.8	22.9	3.785
To use different kinds of grouping children in accordance with their level of knowledge and abilities	2.5	18.0	7.4	52.5	19.7	3.690
To promote self-education of students	3.2	15.8	9.9	55.3	15.8	3.648
To control the behaviour of students	1.1	20.8	5.6	48.6	23.6	3.912
To solve conflict situations with the students	2.1	9.5	4.2	49.3	34.9	4.053
To entrust responsibility to the students on different issues	1.8	11.3	6.3	48.2	32.4	3.982
To encourage the students and praise them	2.5	3.2	1.4	38.7	54.2	4.387
To create a contact easily	1.1	5.6	3.2	46.1	44.0	4.257
To express the ideas clearly	1.4	8.5	2.8	50.0	37.3	4.130

The results of Kruskal Wallis test revealed sufficient differences in the rating of the skills that are connected with the self-evaluation of efficient social interaction with students and are dependent on work experience: (1) sufficient differences ($p = 0,036$) are found in the self-evaluation of the skill *To*

apply knowledge of special education in everyday work: the respondents with the work experience from 31 to 35 years (Mean Rank 168,85) and the work experience from 16 to 20 years (Mean Rank 160,88) rate it higher than the respondents with the work experience from 36 to 40 years (Mean Rank 102,54) and the respondents with the work experience from 26 to 30 years (Mean Rank 107,24); (2) essential differences ($p = 0,015$) are also found in the self-evaluation of the skill – *To use individual approach of different kind*: convincingly the highest self-evaluation is for the respondents with work experience from 16 to 20 years (Mean Rank 171,39), whereas the lowest – for the respondents, whose work experience is from 36 to 40 years (Mean Rank 101,71) and over 40 years (Mean Rank 104,44). Depending on the qualifications of the respondents, this context points to the essential differences in the self-evaluation of the following skills: (1) *To apply knowledge of special education in everyday work* ($p = 0,016$) is evaluated higher in the group of pedagogical and psychological support team personnel (Mean Rank 163,65), but lower - in the group of preschool teachers (Mean Rank 103,06); (2) *To determine the current needs of learners* ($p = 0,013$): the highest self-evaluation is in the group of preschool teachers (Mean Rank 165,47) and pedagogical and psychological support team personnel (Mean Rank 163,08), whereas the lowest self-evaluation is found in the group of basic education teachers (Mean Rank 121,66); (3) *To create a contact easily* ($p = 0,027$): preschool teachers more often evaluate their skills to create a contact (Mean Rank 179,81), but the lowest self-evaluation for this skill is observed in the group of subject teachers (Mean Rank 129,34).

There have also been noticed the correlations between diversity groups and the indicators of social interaction with students. The most significant relationships were found between the skills *To promote education process for children with learning difficulties* and *To ensure individual help in accordance with learning difficulties for the students with special needs* ($r = 0,548$, $p = 0,000$) and the skills *To promote education process for children with learning difficulties* and *To use different kinds of grouping children in accordance with their level of knowledge and abilities* ($r = 0,403$, $p = 0,000$).

The results of Kendall's tau-b correlation test certify the lack of correlation between the skill *To provide education process for children with mental, sensory (vision and hearing) and physical development disorders* and the skills *To organize work for children with special needs in the school of general education/preschool*, *To promote self-education of students*, *To control the behaviour of students*, and *To entrust responsibility to the students on different issues*.

Finally, the fourth group of questions reflect **teachers` competence indicators in relation to the creation of an open microclimate for diversity in the educational institution** (see Table 4).

Table 4. Respondents` self-evaluation of the skill to create an open microclimate for diversity in the educational institution

Skills	Complete shortage (%)	Little shortage (%)	Do not know how to evaluate (%)	May be sufficient (%)	Completely sufficient (%)	Mean Rank
To influence the opinion of society on education and integration opportunities for children with special needs	13.4	20.1	19.4	40.1	7.0	3.074
To ensure physical and psychological safety for children with special needs	4.6	18.7	9.8	47.5	19.4	3.585
To create appropriate environment to ensure the education process for children with special needs	3.2	17.3	5.3	49.6	24.6	3.754
To strive for flexibility and diversification in the education process	3.5	14.1	4.9	46.2	31.3	3.877

To analyse pedagogical actions	2.1	14.1	3.9	53.5	26.4	3.877
To reveal inclinations and interests of the students	1.4	13.0	3.9	56.0	25.7	3.915
To strive for democratic relationship with children with special needs	1.8	12.7	7.7	46.1	31.7	3.933
To maintain the balance between the students` proposed education and the teacher`s initiative	3.2	16.5	10.2	51.8	18.3	3.655
To promote the students` initiative and independence	0.4	9.5	4.1	59.2	26.8	4.025
To express a positive attitude towards the children with special needs	1.4	3.9	1.4	37.8	55.5	4.420
To foster creativity of children	1.1	6.7	2.4	50.0	39.8	4.208
To express positive attitude in solving problems	1.1	6.7	1.4	41.5	49.3	4.313
To maintain a positive emotional climate in the classroom/preschool group	4.6	4.9	2.1	48.6	39.8	4.141
To create a positive emotional climate in the classroom/preschool group	2.5	7.0	3.2	44.7	42.6	4.180
To be sensitive towards the child`s inner state	2.8	15.5	6.7	50.0	25.0	3.789
To control personal negative emotions without losing self-control	1.8	11.3	3.8	51.4	31.7	4.000
To promote the child`s self-reliance	2.5	10.2	6.7	53.5	27.1	3.926
To be more sensitive towards the child	1.1	5.3	1.1	40.7	51.8	4.366
To listen to the child and hear him/her	1.1	5.3	1.1	38.6	53.9	4.387
To create emotionally positive and efficient interpersonal relationships	1.1	4.9	1.4	43.0	49.6	4.349
To tolerate different views	1.4	8.1	1.4	39.8	49.3	4.268
To be patient in the work with the children with special needs	0.8	8.1	1.4	43.0	46.7	4.268
To be compassionate	1.8	4.2	0	35.2	58.8	4.444

The results of Kruskal Wallis test revealed existing differences that are dependent on work experience: (1) significant differences ($p = 0,022$) in the self-evaluation of the skill *To be sensitive towards the child's inner state*, where the highest evaluation is in the group of respondents with the work experience from 11 to 15 years (Mean Rank 165,98), but the lowest – in the group of respondents with the work experience from 36 to 40 years (Mean Rank 106,33); (2) very significant differences ($p = 0,010$) in the self-evaluation of the skill *To control personal negative emotions without losing self-control* – also here the highest evaluation is in the group of respondents with the work experience from 11 to 15 years (Mean Rank 160,29), but the lowest – in the group of respondents with the work experience from 36 to 40 years (Mean Rank 99,13).

In relation with the qualifications of the respondents, there were essential differences ($p = 0,035$) in the self-evaluation of the skill *To promote the students` initiative and independence*: preschool teachers rate it the highest (Mean Rank 179,27), but basic education teachers – the lowest (Mean Rank 128,43). The results of Kendall's tau-b correlation test identify in general low correlations ($r < 0,300$) between the groups of respondents and the indicators of open microclimate for diversity in the educational institution. Comparatively the most significant in this context are the correlations between: (1) the skill *To organize work for the students with behavioural disorders* and the skills *To ensure physical and psychological safety for children with special needs* ($r = 0,338$, $p = 0,000$), *To create appropriate environment to ensure the education process for children with special needs* ($r = 0,325$, $p = 0,000$); (2) the skill *To promote education process for children with learning difficulties* and the skills *To strive for democratic relationship with children with special needs* ($r = 0,342$, $p = 0,000$), *To maintain the*

balance between the students` proposed education and the teacher`s initiative ($r = 0,334$, $p = 0,000$), *To express positive attitude in solving problems* ($r = 0,320$, $p = 0,000$), *To ensure physical and psychological safety for children with special needs* ($r = 0,310$, $p = 0,000$), *To analyse pedagogical actions* ($r = 0,304$, $p = 0,000$).

There was indicated no correlation between the skill *To provide education process for children with mental, sensory (vision and hearing) and physical development disorders* and the following skills, like *To influence the opinion of society on education and integration opportunities for children with special needs*, *To strive for flexibility and diversification in the education process*, *To analyse pedagogical actions*, *To control personal negative emotions without losing self-control*, *To promote the child`s self-reliance*, *To be more sensitive towards the child*, *To listen to the child and hear him/her*, *To tolerate different views*, *To be patient in the work with the children with special needs*.

Results, Conclusions and Recommendations

Theoretical frameworks address the diversity competence of teachers as a positive resource for education process organization that can help to identify and meet the needs of every individual involved in the process of education. This also refers to the respect of different learning styles and pedagogical technologies, as well as ensures equity and equal attitude viewed as one of the preconditions for seeking out pedagogical solutions. It is important that teachers are able to recognise a socio-cultural context and aspects of diversity not as learners` deficits, but as fulfilling resources for promoting a rich learning environment.

The intention of the authors was to understand and reflect the manifestations of teachers` diversity competence in the context of inclusive education in Latvia and show the interconnections between the teachers` self-evaluation factors and professional skills to engage with possible challenges and present potential solutions in terms of diversity competence aspects. It is important to emphasize the interaction and interdependence of the diversity competence dimensions – attitudes, values, knowledge and skills, where often the knowledge dimension appears as the main, whereas attitudes, values and skills remain neglected. Based on our theoretical and empirical study, it is possible to reflect on and critically evaluate the findings of the study, consider what might count as successful aspects and identify some of the main challenges facing us as future teacher educators, as well as draw the following **conclusions**:

1. Inclusive education, including the idea of diversity, has been defined as a priority of education policy in the context of education system of Latvia, but still there is no shared understanding of the phenomenon - its meaning is mostly connected with an exclusive form of education for special groups of learners. However, education has to have a pivotal role in solving problem situations concerning the issues of diversity by acknowledging diversity as a value and ensuring availability and accessibility of education for diverse groups of learners, thus promoting equality, equity, and social inclusion and creating a culture where diversity is understood and valued.
2. Although there is a discourse on the equality of opportunities for diverse learners, in most cases, they focus on children with special education needs and children at risk of social exclusion and leave unnoticed gifted children, who also are very diverse in both characteristics and educational needs. Accordingly, the group of gifted learners appear to be neglected both by the society and education system as a whole that has been proved by the findings of our study – the correlations are present only in relation to the first group of questions reflecting teachers` ability to provide education for diverse groups of learners.
3. With regard to the attitude, the respondents have in general assessed it as positive, but there appear contradictions between their skills and searches for pedagogical solutions in the work with diverse groups in different contexts, for example, the skill to organize education for gifted children is evaluated as high among teachers, but there is no sufficient support from pedagogical and psychological support team personnel, since they have rated this skill as very low.

4. At the same time, the groups of respondents lack the skills to transfer the aspects of attitude into the process of education that is supported by the findings of the study, where the lowest levels of self-evaluation is attributed to the skills *To develop special programmes, To develop adapted programmes, To develop modified (restructured) programmes* that, in turn, influence the skill *To provide education process for children with developmental disorders*.
5. Although inclusive education has been politically defined as a priority, the results of the study reveal a very low correlation regarding the skills *To organize work for the students with behavioural disorders and learning difficulties* with the skills of respondents' to create an open microclimate for diversity in the educational institution, whereas there is a lack of correlation in this context regarding the skill *To provide education process for children with mental, sensory (vision and hearing) and physical development disorders*. The findings provoke assumptions that the skills to provide education are insufficient not only regarding the gifted learners but also *the children with mental, sensory (vision and hearing) and physical development disorders*.
6. Reflecting on the criteria in regard to the seniority levels of the respondents, the findings of the study point to the correlations dependent on pedagogical work experience and kind of professional qualification: (1) the respondents with work experience from 36 to 40 years do not have sufficient skills, for example, *To apply knowledge of special education in everyday work, To control personal negative emotions without losing self-control, To be sensitive towards the child's inner state* and others, whereas the highest ratings in this context are for those with work experience from 11 to 20 years; (2) the highest ratings for the skills relating to social interactions with children have preschool teachers, but the lowest - subject teachers; the skill *To determine the current needs of students* with the highest ratings is in the groups of preschool teachers and pedagogical and psychological support personnel, whereas the lowest - in the group of basic education teachers.

The authors hold a strong commitment to the idea that there exists an imbalance between existing socio-cultural diversity in society and skills in terms of applying the dimensions of diversity competence in practice, as well as giving voice to diversity and respecting it in the context of inclusive education. The **recommendations** regarding future prospects are supported by the findings of our study that indicate to the need to (1) emphasize the practical aspects of diversity competence in the education of future teachers; (2) provide special support, for example, continuous professional development courses in the area of teaching practice, particularly during the late stages of teaching careers; (3) consider the topics of continuous professional development in accordance with the needs of different groups of teachers; (4) improve the research tools that would allow deeper insight into the layers of diversity competence and be useful for self-evaluation of teachers in the context of education process implementation, consequently developing the professional agency of teachers.

Abstract

The purpose of this research was to investigate relations between anomia and subjective well-being in Latvian and Lithuanian population. The Latvian sample consisted of 1005 inhabitants of Latvia aged from 18 to 74 ($M = 44.77$, $SD = 14.58$), 47.8% males and 52.2% females. The Lithuanian sample consisted of 1005 inhabitants of Lithuania aged from 18 to 91 ($M = 52.15$, $SD = 17.75$), 42.2% males and 57.8% females. Four questions from Omnibus survey were used - three questions measured dimensions of anomia (normlessness, social isolation, and meaninglessness), and one question measured subjective well-being.

It was found that both in Latvian and Lithuanian samples normlessness, social isolation, and meaninglessness are negatively related to subjective well-being, and all three dimensions of anomia are significant predictors for subjective well-being explaining 9% of variance in total. Psychological help in decreasing of anomia can be important for improvement of subjective well-being.

Keywords: Anomia, Normlessness, Social isolation, Meaninglessness, Subjective well-being

Introduction

Subjective well-being is one of the most important characteristics of human life. Subjective well-being is concerned with how and why people experience their lives in positive ways, including both cognitive judgments and affective reactions (Diener, 1984). The cognitive component of subjective well-being includes overall life satisfaction and satisfaction with separate life domains while the affective component of subjective well-being includes frequent positive affect and infrequent negative affect (Myers & Diener, 1995). The affective component of subjective well-being can be also operationalized as general sense of happiness.

There is empirical evidence that subjective well-being is an important indicator of psychological health and overall quality of life. For example, such global cognitive component of subjective well-being as overall life satisfaction is strongly positively associated with personal longevity (Qian, 2017). Subjective well-being has a negative and significant effect on adolescents' risky behaviors (i.e., smoking, carrying cutters like knives, jackknives, etc., spending more than necessary, risky sexual actions), namely, risky behaviors of adolescents with high levels of subjective well-being decrease significantly (Çakar & Tagay, 2017).

Different factors, such as work, housing, family life, social participation, leisure, health, environment, financial security, learning, can influence subjective well-being. Empirically it was found that low subjective well-being is associated with objective life circumstances such as food insecurity, t.i. individuals' inability to obtain adequate food in quantity and quality because of a lack of money or other resources (Frongillo, et al., 2017). Dimensions of job quality (such as individual task discretion, monetary compensation, job security, low intensity, safe working

conditions) has a significant impact on subjective well-being (Horowitz, 2016). Low subjective well-being is associated also with different aspects of family context such as a reduced leisure time affected by having an ill (in particular, blind) child (Sola-Carmona, et al., 2016). Else one important factor related to subjective well-being, is perception of own health (Sola-Carmona, et al., 2016).

In modern society anomia can be one of possible significant factors affecting subjective well-being. The process of globalization characterizes modern society. Globalization is defined as multidimensional phenomenon and includes economic, political, cultural, social, and technological interactions across countries (Dreher, 2006). Positive effects of globalization are promoting norms, values of democracy, human rights, and learning processes based on information exchanges and interactions among nations, and major features of globalization are free trade, open markets, capital flows and high technology, economic growth, and improvements in people's standard of living (Upadhyay, Singh, Singh, 2016). However, globalization can cause negative consequences – the necessity and inability to re-evaluate and re-organize a system of norms and guidance, difficulties of integration into the greater world society and a sense of mismatch between personal norms and values and norms and values of the greater society, a sense of uncertainty and instability – in the other words, anomie at the level of society and anomia at the individual level.

Anomie is a breakdown of social norms and guidance for the members of a society (Durkheim, [1897] 1951). In its turn, anomia is a breakdown of an individual's sense of attachment to society (MacIver, 1950), a generalized sense of "self-others alienation" (Srole, 1956), subjectively perceived anomie (Lytkina, 2012). While anomie is a state of a society, anomia is an individually psychological state, which can decrease a sense of subjective well-being.

In recent research (Levina, Mārtinsonē, 2017; Levina, Mārtinsonē, Kamerāde, 2015, 2016) different dimensions of anomia were described. An integrative multidimensional model was developed according to which it is possible to distinguish six sub-dimensions of anomia, namely, an individual's deviation from prescribed rules or customs, social distrust, estrangement to others, cultural isolation, lack of goal clarity and generalized sense of meaninglessness. In their turn, these six sub-dimensions of anomia can be grouped into three main dimensions, namely, *normlessness*, *social isolation*, and *meaninglessness*.

Normlessness is a perceived breakdown of the social order in which norms no longer regulate behavior. Main signs of normlessness are a lack of an individual's respect of presumed norms, an individual's readiness to engage in particular acts of deviance and to use non-normative means, a lack of trustworthiness to government and other social institutions as well as a lack of trustworthiness to other people (doubts that others are generally fair, honest and respect presumed norms). Social isolation is loss of a sense of community, which is experienced by an individual as a lack of social support, a sense of loneliness, a sense of alienation, a sense of inferiority, a sense of loss of internalized social norms and values. Finally, meaninglessness is an absence or a lack of clarity of terminal goals (life meanings) as prescriptions for an individual's behavior. Individuals with high level of meaninglessness fill that there are no desirable and sensible goals in their life, there is a lack of control and freedom; they can fill a sense of boredom and pessimism.

Thus, more likely, the main sign of normlessness is a sense that laws no more regulate and guide behaviour of citizens of a certain country. The main sign of social isolation is an individual's sense that in difficult life situations (e.g. accidents, illnesses) he/ she will not receive necessary help and support from government or other institutions. In its turn, the main sign of meaninglessness is a sense of loss of desirable life goals.

Negative consequences of anomia are empirically proven. Individuals with high levels of anomia lose a sense of significance of values of politics and religion (Levina, Mārtinsonē, Klinec, 2016). It is empirically found that anomie at the micro level, namely, at the level of family (in the other words anomia) has an effect on suicidality among adolescents and youth (Thorlindsson, Bjarnason, 1998; Wenz, 1978). Subjectively experienced anomie, t.i. anomia, is positively correlated with depression (Kállay, et al., 2016).

In some recent studies (Kállay, et al., 2016; Levina, Martinsone, Kamerade, 2015) negative links also between anomia and subjective well-being were found. It is found that subjectively perceived anomie is negatively correlated with such aspects of well-being as occurrence of positive mood states in the last two weeks (Kállay, et al., 2016), satisfaction with life (Kállay, et al., 2016; Levina, Martinsone, Kamerade, 2015), general sense of happiness (Levina, Martinsone, Kamerade, 2015). It was also shown that anomia allowed to predict subjective well-being (Levina, Martinsone, Kamerade, 2015).

In spite of the fact that there are some studies, that show negative links between anomia and subjective well-being, there are no nationally representative studies of relations between all three major dimension of anomia, namely, normlessness, social isolation, and meaninglessness, and subjective well-being in Latvia and Lithuania. Therefore, this research contributes to the literature and practices in this field.

Thus, the main purpose of this research is to evaluate which are the relations between anomia and subjective well-being in Latvian and Lithuanian populations. We propose the following hypotheses:

H.1: Major dimensions of anomia (normlessness, social isolation, and meaninglessness) are negatively related to subjective well-being.

H.2. Low normlessness, social isolation, and meaninglessness allow to predict high subjective well-being.

Method

In Latvia and Lithuania Omnibus research was conducted. Fieldwork period was September 2016. Computer-assisted web interviewing was used as a method of the research.

The target population was all residents of the countries mentioned above, aged 18 or older. As a sampling method multistage stratified random sampling was used. Samples are representative to the general population of the countries mentioned above. Stratification criteria were administrative - territorial division. Subsequently, a random sample of households was drawn in each administrative-territorial division. The Latvian sample consisted of 1005 inhabitants of Latvia aged from 18 to 74 ($M = 44.77$, $SD = 14.58$), 47.8% males and 52.2% females. The Lithuanian sample consisted of 1005 inhabitants of Lithuania aged from 18 to 91 ($M = 52.15$, $SD = 17.75$), 42.2% males and 57.8% females.

In this study four questions from Omnibus survey were used. Three questions (statements) measured dimensions of anomia, namely, normlessness, social isolation, and meaninglessness, and one question measured subjective well-being. Questionnaires were in the national language of the country.

Questions that measure dimensions of anomia were: 1) for normlessness - "In my country laws regulate life of individuals" (in Latvian "Manā valstī cilvēku dzīvi regulē likumi" and in Lithuanian "Lietuvoje ūmoniu gyvenima reguliuoja ūstatymai"); 2) for social isolation - "In case of need (unemployment, disease, accident, etc..) I can rely on the help of the state or the local (municipal) authorities" (in Latvian "Nepieciešamības gadījumā (bezdarbs, slimība, nelaime u.c.) varu paļauties uz valsts vai pašvaldību institūciju palīdzību" and in Lithuanian "Atsiradus būtinybei (bedarbystis, ligos, nelaimis atveju) ap galiu pasikliauti valstybės arba savivaldybės parama"); 3) for meaninglessness - "In my life there are significant purposes which I want to reach" (in Latvian "Manā dzīvē ir nozīmīgi mērķi, uz kuriem gribu tiekties" and in Lithuanian "Mano gyvenime yra reikpmingi tikslai, kuriu siekiu"). Responses were made on a 4-point Likert scale (from 1-strongly disagree to 4-strongly agree). Thus, all three statements are negatively formulated, and in the subsequent statistical analysis the answer scale should be reversed - a higher score will indicate a higher level of anomia.

One question measures subjective well-being, namely, "How do you evaluate last year and near future perspective?" (in Latvian "Kā Jūs novērtējat pagājušo gadu un tuvāko perspektīvu?" and in Lithuanian "Kaip vertinate praėjusius metus ir artimiausių penkerių metų perspektyvą?"). Responses were made on a 4-point Likert scale (1 - „the year was happy, in future well-being will grow”, 2 - „the year was happy, in future it is necessary to make efforts to maintain well-being”, 3 - “the year was not happy, in future I hope for positive changes”, 4 - “the year was not happy, I don’t hope for positive changes in future”). Similarly, as in the case of anomia, in the

subsequent statistical analysis the answer scale should be reversed – a higher score will indicate a higher level of subjective well-being.

Considering validity of data it is necessary to emphasize that three statements about anomia do not cover all its signs and allow to measure only its main dimensions. Similarly, the question about subjective well-being also does not cover all its possible aspects and allow to measure only its global component, namely, generalized sense of happiness and global sense of well-being regarding future. On the other hand, it is important to mention that these statements were evaluated by three experts who concluded that questions constructed for this Omnibus research measure the concepts intended, namely, three dimensions of anomia (normlessness, social isolation, and meaninglessness) and subjective well-being. It is also necessary to remind that the limited number of questions is a typical characteristic of all Omnibus surveys what is connected to costs of such studies. However, a significant advantage of Omnibus research is an opportunity to conduct a concrete study in a nationally representative sample, more over in different countries at the same time. Nevertheless, in future criterion validity (e.g. convergent validity) and reliability (e.g. test-retest reliability) of the questions used in this research should be estimated.

In order to investigate relations between anomia and subjective well-being Pearson's correlation analysis and hierarchical regression analysis were used.

Findings

Firstly, it was clarified what are the relations between three main dimensions of anomia, namely, normlessness, social isolation, and meaninglessness, and subjective well-being in Latvian sample. At the first stage Pearson's correlation analysis was used (Table 1). At the second stage in order to evaluate whether dimensions of anomia allow to predict subjective well-being, and if yes than which dimensions of anomia allows to predict it best of all, hierarchical regression analysis was used.

Table 1. Pearson's correlations coefficients for measures of subjective well-being and anomia in Latvian sample

Variable	1.	2.	3.	4.
1. Subjective well-being	-			
2. Normlessness	-.17**	-		
3. Social isolation	-.19**	.14**	-	
4. Meaninglessness	-.17**	.07*	-.08*	-

Note. * $p < .05$; ** $p < .01$

It is found that in Latvian sample there are statistically significant correlations between subjective well-being and normlessness ($r = -.17, p < .01$), social isolation ($r = -.19, p < .01$), and meaninglessness ($r = -.17, p < .01$). Therefore, further using hierarchical regression analysis three models of prediction were evaluated (Table 2). In the first model as a predictor social isolation was used. In the second model two predictors were evaluated, namely, social isolation and normlessness. At last, in the third model three predictors were used – social isolation, normlessness, and meaninglessness.

Table 2. Regression analysis summary for dimensions of anomia, predicting subjective well-being in Latvian sample

Subjective well-being	β	R ²	F
Step 1		.04	39.14***
Social isolation	-.19***		
Step 2		.06	31.26***
Social isolation	-.17***		
Normlessness	-.15***		
Step 3		.09	32.68***
Social isolation	-.19***		
Normlessness	-.13***		

Meaninglessness -0.18***

Note. * $p < .05$; ** $p < .01$; *** $p < .001$

It was found that in Latvian sample low social isolation best of all predicted subjective well-being ($R^2 = .04$, $F(1, 1003) = 39.14$, $p = .00$). Low normlessness in the second model statistically significantly improved the prediction (R^2 change = .02, $F(1, 1002) = 22.54$, $p = .00$). Low meaningfulness in the third model also statistically significantly improved the prediction (R^2 change = .03, $F(1, 1001) = 33.50$, $p = .00$). In Latvian sample social isolation, normlessness, and meaningfulness are significant predictors for subjective well-being explaining 9% of variance in total.

Secondly, it was clarified what are the relations between three main dimensions of anomia, namely, normlessness, social isolation, and meaningfulness, and subjective well-being in Lithuanian sample. At the first stage Pearson's correlation analysis was used (Table 3). At the second stage in order to evaluate whether dimensions of anomia allow to predict subjective well-being, and if yes than which dimensions of anomia allow to predict it best of all, hierarchical regression analysis was used.

Table 3. Pearson's correlations coefficients for measures of subjective well-being and anomia in Lithuanian sample

Variable	1.	2.	3.	4.
1. Subjective well-being	-			
2. Normlessness	-.15**	-		
3. Social isolation	-.23**	.23**	-	
4. Meaninglessness	-.18**	.17**	.09**	-

Note. * $p < .05$; ** $p < .01$

It is found that in Lithuanian sample there are statistically significant correlations between subjective well-being and normlessness ($r = -.15$, $p < .01$), social isolation ($r = -.23$, $p < .01$), and meaningfulness ($r = -.18$, $p < .01$). Therefore, further using hierarchical regression analysis three models of prediction were evaluated (Table 4). In the first model as a predictor social isolation was used. In the second model two predictors were evaluated, namely, social isolation and meaningfulness. At last, in the third model three predictors were used – social isolation, meaningfulness, and normlessness.

Table 4. Regression analysis summary for dimensions of anomia, predicting subjective well-being in Lithuanian sample

Subjective well-being	β	R^2	F
Step 1		.05	56.90***
Social isolation	-.23***		
Step 2		.08	43.87***
Social isolation	-.22***		
Meaninglessness	-.16***		
Step 3		.09	31.33***
Social isolation	-.20***		
Meaninglessness	-.15***		
Normlessness	-.08***		

Note. * $p < .05$; ** $p < .01$; *** $p < .001$

It was found that in Lithuanian sample low social isolation best of all predicted subjective well-being ($R^2 = .05$, $F(1, 1003) = 56.90$, $p = .00$). Low meaningfulness in the second model statistically significantly improved the prediction (R^2 change = .03, $F(1, 1002) = 29.23$, $p = .00$). Low normlessness in the third model also statistically significantly improved the prediction (R^2 change = .01, $F(1, 1001) = 5.83$, $p < .05$). In Lithuanian sample social isolation, meaningfulness, and normlessness are significant predictors for subjective well-being explaining 9% of variance in total.

Results, Conclusions and Recommendations

As it was above mentioned, the main objective of this study was to investigate relations between three main dimensions of anomia, namely, normlessness, social isolation, and meaninglessness, and subjective well-being in nationally representative samples in Latvia and Lithuania. Two hypotheses were proposed. Firstly, it was expected that three main dimensions of anomia (normlessness, social isolation, and meaninglessness) are negatively related to subjective well-being. According to the second hypothesis low normlessness, social isolation, and meaninglessness allow to predict high subjective well-being.

Firstly, the results obtained in this research show that there are negative relations between all three main dimensions of anomia – normlessness, social isolation, and meaninglessness, - and subjective well-being. Also in previous research it was found that in Latvian sample such dimensions of anomia, as social isolation and meaninglessness, were negatively associated with general sense of happiness (*Levina, Martinsone, Kamerade, 2015*). The results of the present study allow to conclude that if a person considers that lows regulate life of citizens in his/ her country, if a person is sure that in difficult life situations such as accidents, illnesses, unemployment the government and the local (municipal) authorities will provide a necessary help and support, if a person feels no confusion regarding life goals and meanings, he/ she will feel general sense of happiness regarding the last year of life and will expect well-being in future.

Secondly, it was established that all three main dimensions of anomia – normlessness, social isolation, and meaninglessness, - allow to predict subjective well-being, and more over all these three dimensions of anomia are significant predictors for subjective well-being. Also in previous research it was found that social isolation and meaninglessness are significant predictors for overall satisfaction with life and general sense of happiness. The results of the present study allows to conclude that perceived existence of social order and of a stable system of norms and guidance, a sense of social integratedness and attachment to society and an individual's hope for social support as well as the existence of desirable and sensible are significant for prediction of an individual's subjective well-being.

A negative relationship between normlessness, social isolation, and meaninglessness, as the main dimensions of anomia, and subjective well-being as well as the role of normlessness, social support, and meaninglessness for prediction of subjective well-being were found both in Latvia and Lithuania. This finding allows to conclude that there exists a stable pattern of relations between anomia and subjective well-being in countries with similar geographically territorial, culturally historical, political, and socially economic characteristics.

The results of the present study are consistent with findings made in previous research which demonstrated a negative relationship between anomia and subjective well-being. However, these previous studies (*Levina, Martinsone, Kamerade, 2015*) have found relations, firstly, between two main dimensions of anomia, namely, social isolation and meaninglessness, and subjective well-being, and secondly, only in Latvian sample. In turn, the current research was focused on links between all three main dimensions of anomia (normlessness, social isolation, and meaninglessness) and subjective well-being, and secondly, was conducted in nationally representative samples in two countries – Latvia and Lithuania. Thus, this research expands our understanding of the relationship between the main dimensions of anomia and subjective well-being in different countries.

The results and conclusions obtained within this research can be widely used in professional psychological work with clients who suffer from insufficient subjective well-being. In order to provide for Latvian and Lithuanian citizens with a low level of subjective well-being circumstances that will allow to improve their subjective well-being specialists of psychological services should be aware of the aspects of anomia with a negative impact.

Summary

Subjective well-being is an indicator of psychological health and quality of life in general. Subjective well-being is concerned with how and why people experience their lives in positive ways, including both cognitive judgments and affective reactions (Diener, 1984). A lot of factors affect subjective well-being, e.g. food insecurity (Frongillo, et al., 2017), dimensions of job quality (Horowitz, 2016), different aspects of family context (Sola-Carmona, et al., 2016), perception of own health (Sola-Carmona, et al., 2016).

In modern society which important characteristic is a process of globalization anomia as a negative consequence of globalization can be one of possible factors affecting subjective well-being. Anomia is an individually psychological state when a person perceives that there are no social norms and guidance for members of society, when he/ she endures a sense of social isolation and meaninglessness (Ļevina, Mārtinsonē, 2017; Ļevina, Mārtinsonē, Kamerāde, 2015, 2016).

In Latvia and Lithuania there are no nationally representative studies of relations between three main dimensions of anomia (normlessness, social isolation, and meaninglessness) and subjective well-being.

The purpose of this research was to investigate relations between the main dimensions of anomia, namely, normlessness, social isolation, and meaninglessness) and subjective well-being in Latvian and Lithuanian population. Two hypotheses were proposed: 1) Major dimensions of anomia (normlessness, social isolation, and meaninglessness) are negatively related to subjective well-being; 2) Low normlessness, social isolation, and meaninglessness allow to predict high subjective well-being.

The Latvian sample consisted of 1005 inhabitants of Latvia aged from 18 to 74 ($M = 44.77$, $SD = 14.58$), 47.8% males and 52.2% females. The Lithuanian sample consisted of 1005 inhabitants of Lithuania aged from 18 to 91 ($M = 52.15$, $SD = 17.75$), 42.2% males and 57.8% females.

Omnibus research was conducted. Three questions from Omnibus survey measured dimensions of anomia, namely, normlessness, social isolation, and meaninglessness, and one question measured subjective well-being.

In order to investigate relations between dimensions of anomia and subjective well-being Pearson's correlation analysis and hierarchical regression analysis were used.

Firstly, it was found that in Latvian sample there are statistically significant correlations between subjective well-being and normlessness ($r = -.17$, $p < .01$), social isolation ($r = -.19$, $p < .01$), and meaninglessness ($r = -.17$, $p < .01$). In Lithuanian sample there are also statistically significant correlations between subjective well-being and normlessness ($r = -.15$, $p < .01$), social isolation ($r = -.23$, $p < .01$), and meaninglessness ($r = -.18$, $p < .01$).

It was found that in Latvian sample low social isolation best of all predicts subjective well-being ($R^2 = .04$, $F(1, 1003) = 39.14$, $p = .00$). Low normlessness statistically significantly improves the prediction (R^2 change = $.02$, $F(1, 1002) = 22.54$, $p = .00$). Low meaninglessness also statistically significantly improves the prediction (R^2 change = $.03$, $F(1, 1001) = 33.50$, $p = .00$). In Latvian sample social isolation, normlessness and meaninglessness are significant predictors for subjective well-being explaining 9% of variance in total.

It was also found that in Lithuanian sample low social isolation best of all predicts subjective well-being ($R^2 = .05$, $F(1, 1003) = 56.90$, $p = .00$). Low meaninglessness statistically significantly improves the prediction (R^2 change = $.03$, $F(1, 1002) = 29.23$, $p = .00$). Low normlessness also statistically significantly improves the prediction (R^2 change = $.01$, $F(1, 1001) = 5.83$, $p < .05$). In Lithuanian sample social isolation, meaninglessness, and normlessness are significant predictors for subjective well-being explaining 9% of variance in total.

The results obtained in the research show that there are negative relations between all three main dimensions of anomia – normlessness, social isolation, and meaninglessness, - and subjective well-being. The results also show that low levels of all three dimensions of anomia statistically significantly predict subjective well-being. The obtained results demonstrate the negative role of perceived absence of social order, a sense of social disintegratedness and detachment to society and a sense of a lack of social support as well as being without desirable and sensible goals for individual's subjective well-being.

These patterns of relations between anomia and subjective well-being were found both in Latvia and Lithuania – countries which have similar geographically territorial, culturally historical, political, and socially economic characteristics.

These results can be used by psychological services in order to provide support for individuals with low subjective well-being. Anomia is a factor of low subjective well-being and decreasing of anomia can be a part of a process of psychological counselling.

The Importance of a Correct Approach in Music (for both Professional Instrumentalists and Amateurs) to Guarantee a Stable Lifelong Benefit

Alberto FIRRINCIELI

*Assumption University of Thailand, Department of Music Performance
Email: info@albertofirrcieli.it*

Abstract

Could a learning method in music guarantee lifelong knowledge and, to some extent, independence from practice? In the author's opinion, the answers within certain realistic limitations should be positive. Since generalization is impossible, and for reasons of concision, this article puts professional musicians to one side and considers two other categories of student: firstly beginners, and secondly those people who previously studied music but for only a while, usually as children. Taken for granted that a lack of practice would damage even the most talented and skilled musician, current music teaching pays disproportionate attention to technical aspects of performance, to the detriment of other essential subjects such as improvisation and composition. The author will focus on the uselessness of a method based merely on reading the notes of the score whilst paying no attention to the music's meaning, and will analyze some of the disadvantages caused from this approach in the student's mind. The author will then explain how a proper teaching process, essentially based from the very beginning on improvisation and as a means to learn directly from the musical instrument, will produce enormous benefit and prevent several problems due to an incorrect method. Directly in consequence of such a method, students approach the musical score with a lively interest in other aspects than mere reproduction of the notes.

Keywords: music pedagogy, learning process, music mistake, music meaning

Introduction:

Lifelong education AND music, lifelong education IN music. Is daily practice essential to be a musician? Is it possible to imagine a different learning process in a discipline where it is generally accepted that daily practice is absolutely irreplaceable? Is there a way to free musicians from this invisible tie to their instrument? In my opinion, the answer to this last question should, within certain realistic limitations, be positive, and in this article I wish to share and discuss some of my points. Specifically, we should investigate further what we mean by "daily practice" and understand which part of it really is indispensable. Undeniably our body requires specific training to achieve otherwise impossible goals. Here, I refer to technical aspects of music, directly related to and dependent on motor skills and coordination. A valid comparison of these aspects of musical training can be made with sports training. Clearly, an athlete must train his body regularly to obtain satisfying results, and also a musician needs to practice finger dexterity, speed and control of his own instrument. Nevertheless, there are many other aspects of music that should not be compared with sport: not all musical genres require huge, endless physical training.

To clarify this point, and considering the limitations of generalization (age, repertoire, instrument played and personal goal of the player must be considered), I will put professional musicians to one side temporarily, since they constitute just one category of musician amongst many (although perhaps the most evident). Instead I will consider two other categories of musician: first beginners, and second those who previously studied music but for only a while, usually during childhood. Why these two categories? All of us started as beginners, whilst only some dedicated, keen music students fulfil their hopes of becoming successful professionals. Since many students yearn to become professional musicians, teachers tend to train them by letting them focus on traditional repertoire (to be performed in competitions and/or exams) and technique, while sadly paying insufficient attention, or no attention at all, to other music elements, such as improvisation, composition and counterpoint, understood as irrelevant for the performer's education, unless some specific test is included in the exam. I will

not include amateur musicians in my analysis. They behave in a rather different way. Normally they don't aim for some ambitious goal, or compete against other musicians, preferring to dedicate themselves to study of the music they really like. I do not discuss them further in this article, although their situation, in fact, is much less stressful and more enjoyable.

Following interviews with and comparisons between several students, I have identified some common characteristics. The first group (beginners) – naively but at the same time ambitiously striving for a high-flying musical career – put all their hopes in their teacher, whilst often admitting to being taught under quite similar and monotonous conditions, based often on mechanical repetitions of the same piece with regular use of the metronome. Moving to the second group we may notice other similarities, although within a different situation: students – or we should say ex-students – candidly declare they have forgotten almost everything about music after they quit practicing, whatever the instrument chosen. This perfectly justifiable reply is mainly due to the conditions in which they have been taught, very similar to the first group. These considerations lead to further questions. What do these two groups really think is musical practice – the music in its totality, or just some aspects of it? Which aspects should be considered more than others at a beginner level? Before answering, I wish to illustrate, by a short overview, past teaching of music in general and the piano in particular, in order to provide historical evidence for the method I will introduce. I have been privileged to acquire experience in teaching music teaching in a variety of both Western and Asian countries. As a piano teacher and also performer, my strongest and longest experience has been forged in front of a keyboard. Also, I often dedicated myself to in-depth analysis of diverse musical subjects and aspects, ranging from the study of early music by the use of period instruments to the composition of contemporary music; thus the considerations I will illustrate may easily be extended to music teaching in general. A brief analysis of musical pedagogy through various musical periods (baroque, classical and romantic) reveals many differences between past and present. In order to explore and better understand the matter, let us briefly compare some aspects of modern pedagogy that differ strongly from the past. It will be immediately clear how such a difference would constitute the heart of the matter, and how past learning and teaching methods could guarantee a real lifelong education. Generalizing for brevity: modern classical music curricula offered by schools and universities are usually arranged in a quite standard path: students have to attend one hour-long class a week for a total of 7 to 10 months per year. During class, students focus mainly on technical aspects of the music they are approaching, as well as on memorization and what is generally referred to as interpretation of the music. Normally other subjects such as aural training, history of music and theory are included in universities' curricula, but in the case of private classes they are usually not considered. As we know, subjects such as counterpoint, improvisation and basso continuo are rarely integrated in curricula, and in many schools they are totally ignored. Focusing more on the students' learning process, we cannot deny that piano students in particular spend most of their practicing time in absolute and almost monastic loneliness. They may have an occasional chance to accompany fellow musicians, but unlike wind and string students, they don't often have occasion to practice and perform chamber music. They usually focus on memorization – often mimicking their teacher without a true awareness or understanding of the musical content – and technical issues, working by means of mechanical repetition of the same musical passage.

Musical subjects that are rarely found in modern-day curricula show how different was the musical education of some of the greatest composers whose music we still perform. From Bach to Mozart, from Beethoven to Schumann and Chopin, not to mention Liszt, Brahms, Rachmaninoff (and of course many others), there was a different idea of music altogether. They were excellent composers AND improvisers, not only performers, as in their time improvisation and composition were considered essential skills for any musician, keyboard players in particular (Burkholder, 2014). Often, they were also conductors and could play a string instrument. They practiced a great deal of chamber music and – at least until the early romantic era – all musicians were able to realize a basso continuo on the keyboard (Ruiter-Feenstra, 2011 and Cooke, 1999). Further minor differences are worth remembering; these may be considered simply as consequences of this more practical approach, and were partly caused by the different organization of society and “lifestyle” of the time. Students generally studied with

their teachers for fewer years than today. Classes were usually held several times per week and – in my opinion extremely relevant – students sometimes served their teachers as assistants, gaining in return an excellent opportunity to learn through experience. Some activities, such as serving as copyist, orchestrator or arranger – jobs more likely thought of as apprenticeship – were considered part of the learning process, and so were regularly included in musical education (cf. Zanetti, 2011). Modern repertoire has not really changed. Musicians still play baroque, classical and romantic music 200-300 years later. Thanks to modern studies in early music and period instruments it has been possible to realize much more accurate musical editions, and awareness of ancient treatises widens our knowledge (cf. ancient treatises: Bach, 1753, Couperin, 1717, Quantz, 1752 e Mozart, 1756). Nevertheless, the approach to music, mainly in terms of the learning and teaching process, has changed drastically. In-depth analysis of this profound change is beyond the scope of this contribution. However, we may clearly notice that “ancient” and “modern” musicians approach the same musical repertoire in different ways. It is not my intention to judge the modern approach as such, simply compare it with the past in order to have an overview of what has changed and define some historical borders. At present, with some exceptions, classical performers, being no longer composers/improvisers, focus their attention on the performance of “written” repertoire. Furthermore, teachers in non-professional contexts are not (or have never been) regular performers. This different perspective has generated a drastic shift in the teaching process, with consequent impact on students’ learning. One of the worst consequences has been the depletion of the original meaning of notation from a set of symbols conveying musical and emotional thought in written form to a set of instructions to be performed mechanically, and perhaps to be embellished or stuffed with personal ideas about the music and the composer. This passive approach usually leads to inability to decode the true meaning of the notation, thus allowing modern teachers to focus on the most superficial and external aspects of the musical score and the music itself. The connection between what the notation aims to convey and what is usually performed is lost. In some way, students faced with, for example, a Mozart sonata, a Schubert lied or a Bach prelude are totally unable to identify the affect and are not in the condition to appreciate what musical choices composers have made in order best to express the musical idea in their mind. The only important and “digitally countable” parameter taken into consideration is the speed (tempo), often without any connection to the affective world that the music aims to evoke. There is a further reason for my choice of the two categories of students mentioned above: in spite of all their ambition, sometimes they do not really pay attention to the qualifications of their teacher they choose; thus, this approach to learning is much more evident in students than in professionals. Such an approach surely has little chance of success, rather causing dependence on rote practice without attention to the core of the music (Bonus, 2010). Why should this approach affect the learning process? Teachers emphasize to their students, directly or indirectly, the need to repeat the same passage for hours and hours, sometimes with the aid of the metronome, thus generating in their minds a mechanical automatism. Furthermore, in many cases, insecurity and bad feeling is induced in the students because of excessive emphasis accuracy of notes, mechanical regularity of performance and a lack of understanding of the real meaning of musical passages within the overall musical structure. To complete the picture, the difference between amateur and professional musicians from the past to the present should be considered, but such discussion would require sociological reflection beyond the scope of the present discussion (cf. Postiglione, 2007).

Method:

The alternative method I am going to illustrate arises in part from the historical considerations explained above, partly come from the Maieutic method applied to music which I have discussed elsewhere (Firrincieli, 2017). I try to provide a method that focuses on an effective teaching process and the strengthening of students’ skills, rather than learning through mechanical repetitions. Such a learning process should be based upon solid historical grounds, should be interesting and stimulating for students, and not based merely on training the memory and on physical technique. It should provide some essential points for development, should be based on mutual dialogue and reasoning and, with the aid of teacher, should empower students’ personality and creativity. This will ensure that students are aware of their skills and potential, and they will be able to acquire

independence and to seek for the correct way to solve musical problems, as explained in my previous article (Firriacieli, 2017),

the strongest point of this Method, and what makes it extremely valuable in a music setting, is in the discovery of induction, as Aristotle stated. Students are not directly led to the true as something that must be tacitly accepted (in our case the understanding of the music piece), rather they take into consideration different hypotheses, and through reasoning they eliminate those that lead to evident contradictions. The real target is an exploration of diverse perspectives on a given issue, a team work – students led by a teacher usually – which collaborate in order to construct a meaning and find out an answer, when possible. According to Socrates, knowledge was possible, but the preliminary condition was the admission of one's ignorance.

This method, as said, offers a concrete methodological approach applied to the study of music, together with a historical and stylistic perspective, indispensable for the true understanding of the music. Clearly, this method is a major modification of traditional teaching and learning, and must be adapted according to the individual needs of each student. Thanks to this new approach, music in all its aspects appears in a new light: as discipline for the mind, not only for the body; as interactive research where the roles of students and teachers may be interchangeable; and is led by reasoning applied to music, with the teacher simply supporting students with his experience.

It is a means to know the tangible world and its laws, to train logic and develop rational skills, to explore diverse emotional moods. The score is intended as a document compiled in a specific time and under specific conventions and notational rules which witnesses what a composer, as more sensitive individual, was able to intercept; represents the inaudible made audible; represents the perfection fixed on the paper through imperfect and limited symbols (Firriacieli, 2016).

It should be easy to understand how innovative this approach is: as a natural consequence,

it is something that must be understood, deciphered, respected, actualized and even contemplated, not something to be reproduced methodically without any awareness about its meaning. It shows an architecture built with notes, and only the respect of its internal rules can guarantee correctness of performance. In one sentence, I would say that Maieutic - through reasoning - helps student to find out the right direction to follow by excluding wrong ones (Firriacieli, 2016).

Whilst the historical approach has been frequently applied in many settings worldwide, its integration with the concept of basing music teaching on reasoning sounds quite new in our modern era (West, 1994 and Landels, 2014). I give some brief examples of the application of this approach in the class.

The starting point is usually the student's performance, his musical idea, and generally speaking his musical skills. The teacher, through questions and reasoning, assesses the strength and depth of the student's knowledge and awareness. The goal is simply to stimulate the student's attention and critical thinking, to check whether or not some musical choices have been made by intuition or by chance, and to probe the analytical skill of the student. Still, I wish to underline the role of teacher: he is supposed to be a mentor, a leader to inspire the student through his experience and love for music, and he should never superimpose on the student his own idea – whether right or wrong – and this for more than one reason. It would limit the student's sensitivity, analytical skills and understanding. Even worse, it would deprive the student of the pleasure of exploration and discovery, a dimension which should be never underestimated. Mere acknowledgement without any real research and study will never be effective or durable. The role and responsibility of the teacher cannot simply be reduced to ordering what should be done: the task is much more difficult, since the responsibility is to create informed, aware and independent musicians. The teacher may also propose different hypotheses, let the student reason,

think and take risks, find possible solutions and test different possibilities. The student, in simple words, should be stimulated to elicit the truth within himself. The process in its entirety is based on close and logical reasoning, and it should be led by teachers' experience; that is why it is strongly discouraged to choose an inexperienced musician as teacher. The most direct consequence is a deep development of the student's sensitivity, sense of observation and intelligence. The entire process should be supported, as already mentioned, by valuable knowledge of other subjects such as improvisation, counterpoint and composition. In my experience, both as student and teacher, such approach provides enduring and lifelong competence in music, can compensate for possible musical deficiencies through the concurrent comparative study of other music subjects, and offers a flexible learning process and real development of mental and musical skills in students.

Findings:

In order to clarify better my point and the efficacy of the method proposed, I will now consider a further classification of students, according to the typology of learning process adopted by them. A very few students have what I refer to as an active learning process: they approach the music by paying attention towards certain aspects generally regarded as of secondary importance. For example, in their practice consider the knowledge of harmonic rules and compositional aspects of the music they play. They also focus on some historical characteristics of the composition and the composer, and they try to contextualize the musical piece. They also consider technical aspects as one of the elements to be studied, not as the only element worthy of attention. In short, their learning process is already quite close to the method I have proposed above.

The second category of student exhibits what I refer to as the passive learning approach. Students with this approach basically consider the score as in a sort of unchanging dimension, with scant attention – or none – to the various elements of the music except for technical aspects, in particular the accuracy of the notes. Students – whether professional or not – with an active learning process develop a durable and sometimes lifelong method of practice, while the success of students with a passive approach is directly tied to the amount of time they spend with the instrument. If, for any reason, these students don't have time to practice for some time – days, weeks or months – their decline is sometimes devastating. They lose confidence and become insecure, and a sense of frustration pervades them when they re-approach the instrument. Consequently, they often need to spend a lot of time in training themselves again.

Usually, when a student enters my class, I ask about his musical past, so as to devise an appropriate teaching plan. Comparison, dialogue and reasoning always play an important role, especially at the beginning. Using this approach, I focus on the problems these students show (but have often ignored) and on observation of the possible causes, in order to fix them.

As we can imagine, a student with a passive learning approach usually lacks awareness of his "musical" condition, so to say. They simply ignore (how they could know?) that the largest part of their technical or musical problems is due to their approach to music and to an incorrect learning process. They have not really considered that a strategy for learning should be one of their first steps, since their previous teachers never or rarely focused on this. Rather, their teachers have provided them with some general advice on practicing their instrument, without really considering the learning process as something that should be studied and analyzed separately, before approaching the musical score. Unfortunately, there are contexts where for different reasons the majority of piano teachers do not practice regularly and constantly and they, in turn, have often been taught with a passive learning approach. In consequence they are not, or have never been, real musicians. In such a situation, it can easily be understood why students ignore their main problem. In summary, I attempt to change their passive learning approach into an active one by means of the above method, making them aware of musical problems and their causes which they previously ignored.

Results, Conclusions and Recommendations:

Let us now discuss some final considerations concerning the two approaches analyzed above. In my experience, the proposed approach which I define as an active learning process, presents many benefits: durability, vitality and efficiency. More than once I have noticed that the greatest obstacle is just at the outset. Starting with a new approach is not so complicated in itself: the main issue is represented by a drastic mental change. The less openminded and flexible is the student's mind, the more arduous will be the change.

One main problem arises from the expectations of individual students: normally students do not expect a teacher to ask questions, but rather to provide answers and solutions. Students do not initially regard the study of western music as an exploration or a route to knowledge; they view the musical score not as an enigma to be solved, but as a set of instructions to follow. However, their achievements are surprising; step by step, they realize that what they previously believed were the most important aspects – the accuracy of notes and other technical challenges of the piece – are just some part of the job, and probably not the most relevant. They become able, after two-way question and answer discussions, to investigate and to search for what they really want to know. Their interest concerning historical context, musical conventions, the composer's style, and characteristics of the time becomes more and more active. One of my greatest professional satisfactions is to notice that students become conscious of the density, complexity, and beauty of music.

For some people, aspects of this approach may sound new and revolutionary: from the outset, the roles of student and teacher are reversed. On the one hand, the student's status gains in dignity and he is considered as a unique person with his own sensitivity and talent, capable of making choices (and also mistakes). On the other hand, the teacher becomes a real educator and mentor, able to support students in their musical growth, rather than a person that controls the student's will, making choices for him based on his authority.

We may say that the weak point of the passive learning approach can most likely be found at its starting point: usually, since the very first class, students are taught to read notation, intended "as-is", without any connection to its emotional meaning. Teachers focus merely on tempo (usually metronomic one) and accuracy of notes; we have already discussed the consequences of this attitude. A brief comparison of this approach with the teaching of language in schools may help (the topic has been widely discussed in Firrincieli, 2015). We may start by saying that we first learned our mother tongue by listening and speaking; later we learned how to read and write, usually at school, after we could already talk. Here is the heart of the matter in music: for most people, the very first step consists of learning to read the notation, following which we are supposed to learn how to play. This is the opposite of what we used to do with spoken language. Spoken language is comparable with improvisation in music: through spoken language we learn how to use grammar and the functions of words in the sentence, so that we can convey emotions, feelings, concepts or simple data. When we improvise, the process is similar: we learn harmony, which is the grammar of the music, and the functions of notes and chords (degrees, passing notes and so on) in order to convey emotions, feelings, concepts. Let us imagine beginning to learn our language through reading, whilst focusing on pronunciation without regard for the meaning of the words we are learning. This would of course be absurd, but in music it is sadly what frequently happens.

Abstract

Although social rights are an important part of human rights, in reality the well-being of the society depends on situation of national economy and its available resources to ensure the social security of the society. Thus, for the past 30 years the concept “social entrepreneurship” is well known across the world, and it is been considered as an innovative and effective solution to the social problems that countries are facing and can’t solve due to their limited resources. When discovering huge potential of social entrepreneurship in increasing social welfare and the development of social services, the research interest of the authors is related to the study of the field. To create a social impact is a main objective of social enterprises as a participant of social economy and market, rather to make a profit for its owners and shareholders. Therefore European and international social enterprises use a wide spectrum of social impact measurement methods and approaches, while in Latvia it is not a widespread practice. Data of social impact provided by Latvian social enterprises are not available and there is no requirement for such data to be provided in the legislation, nor any guidelines or standards for developing a comprehensive picture of social objectives achieved by social enterprise.

Aim of the research: to explore the existing practice of social impact measurement among Latvian social enterprises in order to improve it in the future.

Methods of research: study of literature, semi-structured interview, expert interview, content analysis.

Results of the research: a research about an existing practice of social impact measurement among Latvian social enterprises and based on these findings, recommendations for further improvement of the practice

Key words: social enterprise, social impact, social impact measurement

Introduction

History of social entrepreneurship in Latvia is not long, but recently it has been a significant movement. Consequently, legislators have started working on drafting legal acts that regulate social entrepreneurship - Social Entrepreneurship Law - and an establishment of a support structure to be implemented with the cooperation of the Ministry of Welfare and the ALTUM program.

A social enterprise is an operator in the social economy whose main objective is to have a social impact rather than make a profit for their owners or shareholders. (Communication from the Commission..., 2011). Therefore in Europe and worldwide social enterprises use wide range of social impact measurement methods and approaches, while in Latvia this is not a widespread practice. As the research “A Map of Social Enterprises and Their Eco-systems in Europa: Country Report Latvia” (Feifa, Morica, Lešinska, 2014) shows, no data of social impact provided by Latvian social enterprises are available and there is no legal requirement for such data to be provided, nor any guidelines or standards for developing a comprehensive picture of social objectives achieved by social enterprise. But also social enterprises themselves do not show any interest to report on social impact, although in certain situations they analyse certain aspects of social impact – to provide the necessary information requested by state and local government institutions, as well as other donors. However, this is more considered as formal approach, and there is no information, whether or how these indicators are used for development of organizational performance and increasing of social impact. The situation in Latvia is complicated by the vague criteria of social impact measurement and the lack of a common methodology, therefore organizations measure social impact according to their understanding and capacity. Social impact measurement and evaluation in the context of social entrepreneurship in Latvia is necessary for several reasons:

- 1) To identify the existing situation in social enterprises and in the social business sector as a whole;
- 2) To assess the progress of the financial instruments received and therefore the impact achieved;
- 3) To obtain data and information for further in-depth analysis and research;

- 4) To predict possible scenarios for further development of the social business sector;
- 5) To improve the performance of Latvian social enterprises and increase their social impact. (Methodology of characteristics..., 2016).

The research hypothesis: if common guidelines are developed and practical support is provided during social impact measurement process, the understanding and capacity of social enterprises to measure social impact and to use the data obtained will increase, improving the performance and boosting the social impact, while improving the social business environment in the country as a whole.

Method

Methods to achieve the objective of the study are following.

Theoretical research methods: the analysis of literature sources and normative documentation.

Empirical research methods: a semi-structured interview, expert interview, content analysis.

Research base: members of Social Entrepreneurship Association of Latvia – social entrepreneurs and experts.

The development of social enterprises are associated with the emergence of the new needs of society, that private sector has not paid attention to, but public sector has not been able to respond adequately with an appropriate policy offer. Social entrepreneurship has been discussed since 1980s in Europe and Asia (e.g. Muhamed Yunus social business concept), as well as in North America. (European Commission, 2013). Within this research social entrepreneurship is discussed in the European context, as one of the first studies on social entrepreneurship “Latvia on the way to social entrepreneurship” (Lešinska et al. 2012) in Latvia shows – a Latvian approach to form, research and develop the social entrepreneurship environment is mainly based on a European experience and tradition.

In scientific literature, there is no consensus on the definition and characteristics of a social enterprise, therefore Table 1 summarizes the most commonly used definitions and criteria for social enterprises proposed by the authors.

Table 1. Summary of definitions of social enterprise

Source	Definition of social enterprise
OECD (1999)	Any private activity conducted in the public interest, organised with an entrepreneurial strategy, but whose main purpose is not the maximisation of profit but the attainment of certain economic and social goals, and which has the capacity for bringing innovative solutions to the problems of social exclusion and unemployment.
European Commission (2011)	A social enterprise is an operator in the social economy whose main objective is to have a social impact rather than make a profit for their owners or shareholders. It operates by providing goods and services for the market in an entrepreneurial and innovative fashion and uses its profits primarily to achieve social objectives. It is managed in an open and responsible manner and, in particular, involves employees, consumers and stakeholders affected by its commercial activities.
Yunus (2008)	New kind of business, that like other businesses, employs workers, creates goods or services, and provides these to customers for a price consistent with its objective. But its underlying objective—and the criterion by which it should be evaluated—is to create social benefits for those whose lives it touches. A social business is a company that is cause-driven rather than profit-driven, with the potential to act as a change agent for the world. A social business is not a charity. It is a business in every sense. It has to recover its full costs while achieving its social objective.
EMES (Defourny, 2014)	Non-profit private organizations that produce goods or provide services directly linked to the objective of this company for the benefit of the community.

When looking at the formation of social enterprises in Latvia, then, like in Europe, social enterprises have evolved from different organizational and legal forms of entrepreneurship. It is hard to identify social enterprises due to not existing regulatory framework, certification or register (Feifa, Morica, Lešinska, 2014), however the most common legal forms are:

- Foundation;
- Association;
- Cooperatives;
- Individual merchant;
- Limited liability company (Dobele, 2015).

It is been found out that most of existing social enterprises in Latvia have chosen a legal form of association. Moreover, half of these organizations have the status of public benefit organizations. (Lešinska, 2014) However, an author N. Linde (2014) opposes the classification of non-governmental organizations as social enterprises, referring to the restrictions imposed by law on the pursuit of economic activities by associations and foundations, as a result of which non-governmental organizations cannot be considered as entities of social business, and only entities defined in the Commercial Law are to be considered.

In 2013 a survey carried out by Latvian Chamber of Commerce and Industry highlighted around sixty six active social enterprises in Latvia, but only a half of them consider themselves as social enterprises. Thirty five enterprises have an objective to solve social problems, but thirty three companies reinvest the profit to achieve social goals. (Social Entrepreneurship, 2014). In a research by A. Lesinska (2014), twenty five nongovernmental organizations that identify themselves as social enterprises or their activities comply with the criteria of social enterprise were interviewed, and this compared to Estonian experience may lead to a conclusion – a total amount of social enterprises in Latvia (both commercial and non-profit organizations) doesn't exceed 100. If we analyse companies according to their age and size – in general there are small and young companies (not older than 8 years). (Concept "On social entrepreneurship...", 2014). So far social enterprises have formed and operated without legal regulations and special support from state and other stakeholders, mainly due to the self-motivation of social entrepreneurs and the mission consciousness to make a positive contribution to solving the most pressing problems of society. European Commission is stated that in European context social impact is the main objective for social enterprises, but Commission also notes that social impact and development of social entrepreneurship in general is hampered by restrictions. (Communication from the Commission..., 2011). It is important to emphasize that although any business can have a social impact, non-profit organisations and social enterprises are explicitly designed to create social value while addressing social challenges and are therefore expected to produce social impact. (OECD "Policy Brief on Social...", 2013). Social impact enables the stakeholders to evaluate the contribution of the activities to achieve the identified outcomes, and for how long that effect may last. (GECES Proposed Approaches to Social..., 2014)

As we can see from international experience, the need for measuring social impact is both internal and external (see Table 2).

Table 2. Motivation to measure social impact

Internal motivators	External motivators
For prioritisation decisions (Clifford, 2014)	For philanthropists and grant makers
For effectiveness and its improvement (Clifford, 2014)	In social finance/investment – to balance risks and achievement of funding objectives; to report on the investment, the results of the social enterprise and the results of the joint investment.
For setting up realistic goals (Nicholls et. al., 2007)	Competition in public procurement
To increase competitiveness (Nicholls et. al., 2007)	Results according to consumer expectations
To realize the social mission (Rodert, 2014)	As an evidence to a efficiency of the use of financing in the provision of services; cost control mechanism and resource of information about implementation and development of policy
For cooperation with consumers and partners, responsibility to stakeholders (GECES, 2014)	1) As an evidence to a efficiency of the use of financing in the provision of services; cost control mechanism and resource of information about implementation and development of policy 2) To satisfy needs of private sector (investors, funding) – to initially assess the social enterprise's request for funding in order to monitor the performance of the social enterprise; to balance the risks and achievement of the funding objectives; to report on the investment, the results of the social enterprise and the results of the joint investment.

Therefore it is obvious that social impact data makes a significant contribution to the strategic management of the company and the quality of service provision. But if social enterprise does not measure social impact, it can not satisfies the needs of their stakeholders, thus also showing their best performance and benefit to society. Social impact data can be used also as a tool for creating public image and reputation of organization and communicating with stakeholders, media and society in general in order to serve as a tool to attract potential customers, partners and supporters.

Authors of research “Methodology of characteristics of social enterprises, selection criteria and their application” (2016) make a conclusion that by using the same approach it is possible to achieve several goals, but the best result can be achieved if all stakeholders have a clear picture why social impact needs to be measured and assessed, and how information obtained (data, descriptions, calculations, case studies, conclusions etc.) will be used afterwards. Consequently, measuring social impacts without further analysis and the use of the data obtained to improve the performance of the company is a resource-wasting process. Therefore, further application of the data obtained in the company's operation or management or other words – impact management is important.

Figure 1 shows the process of social impact measurement. Final step in impact measurement process probably is the most important, that involves monitoring – tracking progress against (or deviation from) the objectives defined in the first step and made concrete through the indicators set in the third step; and reporting – transforming data into presentable formats that are relevant for key stakeholders. It is a continuous process of improvement that results with setting up new objectives and starting new processes. According to Hehenberger, Harling & Scholten (2013) the goal of impact measurement is to manage and control the process of creating social impact in order to maximise or optimise it (relative to costs).

Figure 1. Social impact management process (Hehenberger, Harling & Scholten, 2013)

Regular social impact measurement process allows to focus on main objectives of social enterprise and make all necessary change based on these objectives. Measurement also provides a common understanding and an ability to create meaningful dialogue between the company's management and other stakeholders, such as financiers, investors, etc.

A selection of the method of measurement should work in such a way to maximize the efficiency of innovation throughout the process and minimizing the negative impact as far as possible. The promotion and development of innovation can be achieved through the application of guidelines, instead of strict adherence to strict methodological conditions that threaten the development of innovations. When the results of the impact measurement are incorporated into the service delivery process itself, the process of improvement is accelerated and a positive signal for investors is given. Taking into account that Latvian social enterprises are relatively new, the following aim of measuring the social impact of new enterprises (including innovative programs, experimental approaches and / or pilot programs) will be relevant to these companies: to demonstrate that the model of these companies can be a much more successful solution to the social problems than existing alternatives, if it is assumed that the social enterprise receives sufficient support for growth and development.

When interviewing Latvian social enterprises (members of Social Entrepreneurship Association of Latvia), it can be concluded that – how broad is the understanding of social entrepreneurship, also the social impact and its measurement are interpreted differently. Interviews confirmed the fact that social impact is still a relatively unknown concept and entrepreneurs interpret it according to their understanding or they even do not know the concept at all.

For many social enterprises, the social impact is related to improvement of the quality of life of their target group and other similar processes (self-esteem, integration into society, etc.). Organizations also point out that social impact are generated as a result of their activities (we can assume that is planned and targeted), and also indicate the need to measure it (to express monetary, numerically). At the same time, they mention a long-term effect that is not limited to the target group of the organization, but also affect the general well-being of the society, social decision making, etc. Entrepreneurs also emphasize the role of communication in educating and changing society. According to one of the respondents, the social impact can be also services they provide, which may be explained by a fact that if particular service is available, it will contribute to the increase of quality of life.

Data from the study show that only 1/3 of social enterprises measure the social impact (or partly measure), but this can be also a relative indicator, as it was mentioned before, social enterprises' perceptions of measuring social impact vary. However, the motivation of social enterprises to measure social impact does not differ from that mentioned in theory:

social impact is measured both for own needs and for external needs. Social impact measurement for the own needs is related to an opportunity to understand whether the organization's performance has achieved the goals and is meaningful. Social impact measurement is a management tool for assessing the organization's current performance, its results, and planning future interventions more effectively, thereby optimizing and expanding the scope of social impact.

External motivation to measure social impact is related to a current legal form of many social enterprises - an association or foundation. Therefore, the social impact data is summarized and reported as part of the annual report of organizations with the public benefit status or in the form of a report for its partners. One of the respondents, when explaining the social impact of his organization, acknowledges that social impact measurement provides the opportunity to verify the effectiveness of the proposed solution (a social innovation) to solve social problems, and it is also used as a marketing tool. The social impact assessment is also carried out thinking of future plans of the company – there is currently no tangible benefit to measure social impact, but it will be required as a part of business plan when company will apply for grant that is administrated by Ministry of Welfare and ALTUM (a state-owned development finance institution), also other donors. Similarly, the previous social impact is the information that company can use to communicate with potential sponsors.

Essential is also the motivation of social entrepreneurs to gain public support and acceptance of the organization's activities when it comes to the social enterprise's responsibility towards different parties – clients, employees, society as a whole. One of the respondents confirm: *“As we are a public organization, it is important to us that society understands our goals, and we also need to gather data to analyse our progress towards achieving our goals (whether and how public opinion and attitude change, do they receive a service they expect). We also use this information to explain / demonstrate our social impact to co-financiers.”*

Commenting on the benefits of measuring social impact, one of the interviewed social business experts, Jevgenija Kondurova (head of Reach for Change Latvia, an international non-profit organization that support social enterprises) emphasizes: *“Social enterprises need measure the social impact to use it as a tool of communication, as well as for attracting new partners, grants, etc. It is important to prove that their activity has directly affected the target group, and not it has been done by external circumstances. But yes, mostly for marketing and communication, for positioning your brand, for sale, which is some of the key factors to business development.”*

It is necessary to strengthen the entrepreneurial skills and knowledge of social entrepreneurs in order to enable companies to operate in a sustainable and independent manner, thus they are able to cover their operating costs and to earn money for further development. Therefore, measuring social impact could be one of the tools to promote the business-minded approach to the development of one's own business and selling products, at the same time attracting the investment.

Social enterprises use different methods and tools, both quantitative and qualitative, to measure their social impact, however, none of the organizations use one of the most popular methods of measuring social impact. The most commonly used tools by Latvian social enterprises are:

- Evaluation questionnaires;
- Experience stories (references);
- Individual discussion about needs;
- A summary of statistical data (annual report, internal statistics);
- Metric method;
- Numerically (number of products issued, amount of donations, number of beneficiaries etc.);
- Comparison (changes of official statistics).

This shows that the use of methods and tools meets the needs of social enterprises, but at the same time points to the need for more in-depth information, common methodology and guidelines, as well as a more comprehensive understanding of the use of social impact data in improving the organization's performance. Social enterprises are trying to prove their

social impact through performance indicators that result from the normal flow of activities → outcome, and choose methods that are useful and understandable to all stakeholders, satisfying their needs (both internal and external).

Responses also indicate that social impact is evidence-based and social enterprises seek to explain their validity in order to ensure transparency and compliance with services and results. However, an expert Jevgenija Kondurova, when assessing the practice of social entrepreneurs in measuring social impact, concludes that it is relatively weak and points to causes: *"Because there is no real understanding that it needs to be done. Mostly everyone talks about activities, but not so much about the impact. For example, look, how much we have accomplished during the year, but actually how it has affected their target audience and the state, not so much."*

Social enterprises partially carry out the social impact measurement and assessment from the very beginning of their activity as far as it is required by the annual report, management reports, etc., and when the organization uses external communication channels to promote its publicity and inform about their activities. But social enterprises start a conscious and more complex social impact measurement practice and methodology later, when there is a need for such data and they are aware that such data need to be collected and analysed and where this analysis should then be applied (for example, to improve service quality, negotiate with potential sponsors, as a proof of the effectiveness of social innovation, etc.) However, another interviewed expert, Diana Lapkis, director of the "New Do(o)r Riga" program, commenting on the capacity of social enterprises to measure social impact, states: *"The social impact, of course, must be measured in order to show what they have done good, but this should be done when they have been operating for at least 2-3 years. First you need to settle down, do something and only then start measuring the impact. The main thing is to create an action plan, to understand the basic business – liquidity, budget, etc. You do not need to waste time, capacity, therefore at first it's necessary to carry out some activities, then measure."*

The social enterprises also point to the difficulties encountered in measuring the social impact, as well as the barriers that prevent the gathering and analysis of social impact data. The main difficulty is the lack of awareness of both the social enterprise itself and society as a whole (including stakeholders). Organizations have limited capacity and insufficient competences that is a result of a lack of suitable human resources to carry out social impact assessment.

Considering that the majority of respondents represented organizations are NGOs, which means that human resources operates on a voluntary basis, this organization focuses more on the main activity of the company, there investing all their resources. Social enterprises also highlights the difficulties associated with the expressing performance indicators of solution of social problems - that means organizations have difficulty to identify the social impact, especially in cases where the effect on the target group is long-term and not so observable. There is also a need for specific criteria and guidelines to explain what is considered to be the social impact data and how to collected such data, because at present companies do not have clear understanding what is considered as the social impact and how to transfer their activities into appropriate social impact data so it would be possible to increase social impact created by social enterprises.

Table 3. Summary of respondent challenges

Challenges	Comment
IF SOCIAL IMPACT IS MEASURED	
Social impact is measured partly	<i>"We can't assess what social impact is – methods, results, how to create it in long-term, social impact is not fully summarized."</i>
Unreliable data	<i>"Data that is located in public databases usually have another purpose of use, therefore they are unreliable, because governmental and municipal institutions change them as needed."</i>
Difficulty to measure specific impact	<i>"It is difficult to measure integration in society."</i>
Lack of awareness within organization and society as a whole	<i>"In Latvia awareness about concepts, approaches, strategies and experience among stakeholders involved in the field of social and solidarity economy is still building. This is a main challenge we face, when measuring and assessing social impact, because it takes time to expand your horizon."</i>
Lack of resources	<i>"At the moment we don't have capacity to collect and analyse larger"</i>

Lack of methodology *amount of data and information.”*
“The best way of measuring social impact should be understood, because we are not sure that our method is relevant to legal requirements.”

IF SOCIAL IMPACT IS NOT MEASURED

There has been no need to analyse in detail the social impact *“While the state has not arranged the social entrepreneurship field, I don’t waste my time.”*
 Not existing formal criteria defining social enterprise *“We are alike social entrepreneurs according to our activities, but we are not the most typical example. Our direct and indirect activity results from our team and especially from the way of thinking and values of our team leaders.”*
 Organizations have not defined themselves as social enterprises *“There is no time and interest. We are doing what we are interested in.”*

Lack of interest *“There is no time and interest. We are doing what we are interested in.”*

There is no opportunity to study international experience *“We are a new organization, therefore, there are few cases of re-socialization*

Existing social impact is insignificant *“We are a new organization, therefore, there are few cases of re-socialization*

There is no understandable methodology / tools for calculating the economic effect *“We need a person that deals with publicity and other tasks what we don’t have a spare time for. However, we do not have the resources to hire additional people.*

Lack of resources *“Basically I understand it, but there is no need and it is hard to measure. It is OK, that a person has found a job, his or her communication improves, bet for health improvement it is long-term process that takes a lifetime.”*

Hard to measure *“There are no specific measurable units, we use the method of sensory stories.”*

Results, Conclusion and Recommendations

Summarizing the needs and challenges of social enterprises, it brings to a conclusion that social enterprises require both a material and moral support, thereby various stakeholders including social enterprises themselves must contribute to an increase of social impact. It is necessary to raise an awareness about an added value of social impact measurement to achievement of social objectives and increase of quality of life of their target groups, and it should be done initially among social entrepreneurs. At the same time it is necessary to educate representatives from governmental and municipal institutions, as well as private sector about the opportunities of social entrepreneurship to contribute to the national and regional by addressing those social problems that state has not been able to solve. Social impact measurement serves as an evidence that social enterprises have a positive impact on the well-being of society, as well as social impact data allows to assess the effectiveness of social innovations, therefore contributes to a developing and providing of qualitative social service. Tab 3 provides a comprehensive picture describing recommendations to various stakeholders and proposing a wide spectrum of activities.

Table 3. Recommended activities for improvement of social impact measurement practice

Recommendation	Responsible organization	Activities	Expected results
To continue the development of social entrepreneurship ecosystem	-social enterprises; - support organizations; - Social Entrepreneurship Association of Latvia;	- Annual Social Entrepreneurship forum - round table discussions in Riga and regions with different stakeholders	- strong advocacy organization - social business ecosystem (state, municipalities, educational sector, research institutions, social enterprises, companies with corporate social

	- Ministry of Welfare	- business matchmaking with investors and potential partners - establishment of a common legal framework; - international visits for exchanging experience.	responsibility, NGOs, investors etc.); - strong social entrepreneurship environment in Latvia that can attract investment and provide solutions to urgent social problems.
To educate society and different stakeholders	-social enterprises; - support organizations; - Social Entrepreneurship Association of Latvia; - Ministry of Welfare	- Annual Social Entrepreneurship forum - informative seminars in Latvia - informative publications and articles in media; - good practice stories from social entrepreneurs; - meetings with municipalities and state institutions; - creating an educational programs, e.g. Social Entrepreneurship summer school, lectures in colleges and universities etc.	- the awareness of a wide range of social groups about social entrepreneurship, its specifics, contribution to solving social problems and the necessary support has been raised; - promotion of public and private sector cooperation; - establishment of an educational institution / program for acquisition of social entrepreneurship themes; - promotion of the recognition of social enterprises and its positive public image in society.
To build capacity and business skills for social enterprises	- support organizations; - Social Entrepreneurship Association of Latvia; - Ministry of Welfare	- establishment of a business incubator program targeted specifically to social enterprises - establishment of a network of mentors - training course on business topics	- a business incubator, where social entrepreneurs and social business idea authors can receive extensive business development support (including training, consulting, facilities, grants etc.); - a network of mentors where experienced entrepreneurs share their know-how and expertise with young and potential social entrepreneurs; - a training course that helps social entrepreneurs to study different business related topics (financial planning, marketing, business management, sales, etc.).
To develop a common methodology and common guidelines for measuring the social impact	- support organizations; - Social Entrepreneurship Association of Latvia; - Ministry of Welfare	- research on social enterprise's needs; - the foundation of a working group composed of the various stakeholders; - engagement of international experts to exchange an experience especially in areas that are relatively new and unknown in Latvia; - training of social entrepreneurs and practical support during social impact measurement process; - training of other stakeholders (e.g. common	- developed framework to measure social impact (including both qualitative and quantitative data), examples; - developed guidelines explaining how to use a methodological framework and adjust it to specific needs of a social enterprises (based on Theory of Change and its principle action→result); - raise of awareness of social enterprises and their capacity to measure social impact; - the integration of the social impact in social enterprise and its extension.

principles to provide comparable statistics from governmental or municipal institutions).

To build the capacity of social enterprises in social impact measurement and assessment	- support organizations; -Social Entrepreneurship Association of Latvia; - Ministry of Welfare	- consultative support during social impact measurement process; - the establishment of a team of specialists in measuring social impact that social enterprises can outsource (equivalent to existing practice of outsourcing marketing, accounting specialists)	- a capacity of social enterprises to measure and assess social impact and to integrate it into its activities has been built.

Abstract

This study aims to contribute to the growing literature on teachers' mobility by exploring perceptions and motivations to join these activities, in particular through the collection of evidence on the impact a first and only exchange experience has had on the participants. The research adopts a qualitative methodology in the form of phenomenological interviews with 6 teachers that engaged on only one mobility initiative. The interviewees shared their personal impressions on mobility, including reasons, facilitators, and outcomes of the experience. Bureaucratic, financial and residual professional impact, are among the most cited inhibitors for repeating the initiative. However, most of the participants expect to be become involved again on mobility assignments someday, especially teachers that identified greater impact from this first experience. The analysis provides interesting clues for international offices, Erasmus coordinators and university top managers, who devote considerable effort to the promotion and support of mobility practices.

Keywords: Erasmus mobility programme, Teacher mobility, Internationalization, Higher Education Institutions.

Introduction

Internationalization is an unavoidable hot topic in the agenda of Higher Education Institutions (HEIs) around the world, with a lot being discussed about the importance, frequency and impact of mobility within programmes such as Erasmus. The implementation of internationalized practices within HEIs is emerging in diversified ways, levels, strategies and engagements. One of the central purposes of the Erasmus programme (European Commission, 2017) has been to promote cross-boundary exchange of knowledge, methodologies and practices among HEI's faculty, encouraging and supporting initiatives that reflect a lifelong learning positioning in a global, digitally connected society. Staff mobility has become an important aspect of internationalization, namely through teaching assignments at a partner institution abroad, with the aim of establishing relevant connections with peers and transfer new teaching approaches and values to their pupils at home. Indeed, the programme foresees that 800,000 HEIs' staff members will be somehow involved in mobility initiatives between 2014 and 2020, ranging from a few hours to several months, in an attempt to offer "a greater understanding of the opportunities available beyond their borders" (European Union, 2012, p.6). Nevertheless, according to

Sanderson (2011) and Jones (2013), it is no longer sufficient to rely on the number of students and academics that embark on mobility experiences, nor is it enough to measure the success of internationalization practices by the design of attractive curricula or courses delivered in foreign languages. The global reach of HEIs within internationalization should be analysed according to a widespread qualitative evaluation of the impact those practices actually have on the mission and intercultural contexts of the HEI.

Smith introduced the term 'flying faculty teachers' to define academics that "*find themselves living and working (albeit temporarily) within environments that are culturally different to their own*" (Smith, 2014, p.118), being commonly subject to a first perfect time period, followed by a cultural shock and a final process of acculturation. Similarly, Santoro and Major discussed the comfort zone model and pedagogies of discomfort derived from those regular or prolonged mobility experiences, which may facilitate a "*rethinking of ideas and, therefore, learning*" (Santoro & Major, 2012, p.311). Yet, Tran and Nguyen (2015) state that the goal of intercultural preparation should contemplate and promote the adaptation between flying academics and the host institution, claiming that this aspect is frequently disregarded. In fact, according to the authors, what flying academics can bring to the host HEI can be transformed into an example of pedagogical practices in international education.

It is also commonly stated that risk taking and some level of discomfort are necessary conditions to construct knowledge. Labriola and Mangione (2013) highlight that besides the on-the-spot outcomes of a mobility experience - CV improvement, be familiar with diverse ways of teaching and learning or new instructional tools, improve language skills or having an enjoyable experience abroad – some other benefits can be addressed in a first-hand mobility experience. In fact, being exposed to a different educational system can also refresh thinking, promote the sharing of ideas or widen horizons. And probably more noteworthy than this, is the inspiration, passion and revitalization that different perspectives can provide.

Notwithstanding, as acutely pointed out by Welzer, Družovec, Nemeč, and Hölbl (2013), as a general rule academics are not willing to have an active participation in those new environments. Issues such as academic development, recognition and reward are important to assess the reasons for this alleged low level of involvement. Considering this evidence, Jones indicates that intercultural competences should be catered for and advocates that "*universities engaging in trans-national delivery of programmes may recognize and provide for the intercultural and/or linguistic needs of staff involved in teaching or supporting those programmes*" (Jones, 2013, p.174). Welzer and colleagues (2013) go further on this scrutiny and enquire whether or not teachers do not need or do not want to experience mobility, the major issue around teachers' mobility being rather the preparation for mobility, namely at the intercultural point of view.

Thus, several studies show that while some academics are staunch supporters of mobility assignments and apply regularly to teaching opportunities abroad, the majority has never participated in an exchange period (e.g., Barbosa *et al.*, 2017; Pinheiro *et al.*, 2016). In the middle, and apparently in a rather modest way, we have what we call one-timers, academics who applied to the programme, overcame all stages of mobility application, participated in a teaching assignment in a foreign country, but, for some reason, did not repeat the initiative. Despite the importance one-timers' perspectives and opinions may possess, they have been disregarded so far. Therefore, it is considered quite relevant to understand the decision process these teachers went through, together with their insights on the institutional and personal side of the experience.

Method

This research attempts to explore a gap in the literature concerning one-time mobility experiences of HEI's teachers by conducting an exploratory qualitative methodology in the form of phenomenological interviews. With the aim of determining what a particular experience meant for the interviewees, an empirical phenomenological research obtains the participant's story through open-ended questions, providing the basis for a reflective analysis of the researcher, in order to obtain comprehensive descriptions (Giorgi, 1997). Thus, this method enables to explore how participants make sense of their own experience of teaching mobility. In order to obtain spontaneous narratives, we provided only one guiding question: "Can you share with us your mobility

experience with the Erasmus programme?” and used active listening techniques in order to clarify topics mentioned by the interviewees.

Our study population comprises 42 teachers from one Portuguese university that in a 7-year period (2009-2016) engaged in one single mobility experience under the Erasmus programme. 6 randomly chosen teachers were invited to participate in the study, mostly supported by Giorgi's (1997) arguments on reflective analysis techniques. The sample includes both male and female teachers, with junior and intermediate levels of seniority by the time of the mobility experience, and had their mobility experience 1.5 to 3 years before the interview (Table 1).

Table 1. Participants' Characterization

Pseudonym	Gender	Seniority at the time of mobility	School year of mobility	Host country
Ana	Female	Intermediate	2013/2014	Poland
Berto	Male	Intermediate	2014/2015	Turkey
Catarina	Female	Junior	2014/2015	Turkey
Diogo	Male	Junior	2014/2015	Italy
Elsa	Female	Junior	2013/2014	Finland
Fernando	Male	Intermediate	2014/2015	Greece

Interviews were conducted in February and March 2017, had an average duration of 29 minutes, and were recorded, transcribed, and subject to content analysis.

Findings

Due to the open question that triggered the phenomenological interview, the narratives flew naturally into the description of the participants' experience, sharing their personal views on the mobility assignment, including reasons, facilitators, obstacles, and outcomes. Overall, mobility was expressed as a must-do event in a teachers' career - *"What is it to be a teacher today and not to have a mobility experience?"* (Catarina) -, a mandatory academic activity - *"Mobility for me is fundamental. And as a teacher it should also be almost compulsory"* (Berto) - that should be encouraged in order to *"see things outside your own space, your own microcosmos"* (Elsa).

Reasons for first mobility

There was not one single or main reason for the first mobility of these teachers. In fact, all mentioned a combination of reasons from professional, institutional, and personal domains.

One important goal was developing networks with peers from other countries that share their main research interests: *"when I look for a mobility, an Erasmus mobility, I try to establish contact with people that have a similar academic background"* (Catarina). In fact, to consolidate academic bonds with colleagues was a priority for the interviewees, as well as the possibility of creating joint post-graduations: *"joint research work, for instance, cooperation, to receive students with partnerships, master, for example"* (Ana). The reinforcement of cooperation between institutions stood out as one of the main reason for mobility: *"I would say that the main motivation was to galvanize people for international cooperation"* (Fernando). Also because, as Ana stated, teachers *"don't represent only themselves, but also (...) an institution"* (Ana).

There was also clear evidence that the participants established research as a goal when considering the mobility application: *"the strongest connection would be at research level"* (Ana). Elsa considered it *"a priority"*.

Similarly, one relevant aspect of the experience was the chance to observe how other institutions and colleagues work: *"We should understand how other schools teach, under which physical resources, with which human resources, how the culture of that scientific field is"* (Berto).

Another set of reasons was positively connected with the comfort zone model discussed by Santoro and Major (2012), namely the opportunity to break out from professional routines. This aspect of the mobility experience was highly valued by the participants: *"you let go of routines, you have that desire to eventually create something new out of an experience, of a didactic experience or even training, we will ultimately learn"*

something new" (Diogo). Moreover, in some of the narratives it appeared to be strongly connected with personal and professional career paths: *"It is something very strong, not only for professional reasons, but for others, but I feel that it is an inseparable part of me, I would say it is almost a philosophy of life"* (Fernando).

Facilitators

Among the facilitators are personal and professional characteristics, such as the desire to travel and being part of international research networks. As one of our interviewees exemplified, doing a first mobility is easier to a teacher who is used to work in international teams, has his/her own network, and recurrently has opportunities to interact with international partners: *"there are people like me and other colleagues that travel a lot (...) because it has more to do with personal traits and idiosyncrasies"* (Catarina). In fact, and in line with Enders and Teichler (2005), it was recognized by almost all participants that a prior personal contact at the host university was essential to this first mobility: *"My department already had a contact provided by a teacher that came to give some lectures. (...) It is an important condition"* (Elsa); *"It is extremely essential to have a prior connection, it seems to me it's not easy to decide to go to a university... it was a result of previous contacts"* (Fernando); *"it was established through the contact of a former student"* (Catarina); *"[there is] always a previous contact"* (Diogo).

Personality traits were evidenced as facilitators in the decision process: *"You have to possess certain personality traits to be ready for this. There are people that don't like to get out of their corner, are afraid of the unknown, don't feel comfortable"* (Ana). Among them, the participants mentioned the interest in travelling and in other cultures, supporting Tran & Nguyen (2015) and Jones (2013) position when referring to the importance of intercultural aspects in the internationalization of HEIs: *"it was a very important experience, firstly because it really is a very different culture"* (Berto). An interesting place had to be, as Fernando mentioned, a *"cultural destination"*, namely because *"I didn't know anything about the country of the partner university, I don't know what they eat, I don't know at what time they work, I don't know what they read, I don't know what they speak about, I don't know how they teach, I don't know how students are... for me it has an enormous amount of curiosity... and so we went, happy..."* (Catarina). The impact cross-cultural aspects may have in the participants' professional lives was mentioned also by Elsa: *"I was really curious to get to know that group of people and was also impressed. The colleagues invited me to exchange some ideas. I really enjoyed it!"*

Outcomes

The interviewed teachers highlighted both professional and personal outcomes of the mobility experience, emphasizing that cultivating mobility should be a recurrent activity: *"This recurrence gives an idea of continuity, of partnership that, this way, grants an open door all the time for any output that we might suddenly want to establish. It does you good, even psychologically. It is really the fundamental condition for being creative, if you're always moving in circles in your own little shell, you lose sight of what's around you, you stop feeling that desire, and that's how it goes"* (Diogo).

However, the feelings the interviewees described during their mobility experience were both negative (e.g., anxiety, frustration) and positive (enthusiasm, motivation). The activity was described by Ana as *"a very big challenge, which is overcoming barriers, overcoming different cultures"*, so whenever the strength of a relationship was missing, such as the absence of opportunity to build a network, it was associated with disappointment and frustration: *"What I felt was that people were very cold, lacking warmth, lacking receptiveness (...) My idea was, ok, participate in mobility, but also try to create work bonds, network with the institution itself, or at least with this particular person from my field..."* (Ana). But even in circumstances where most professional goals failed (e.g., Ana), there were clear personal outcomes associated with the cultural and personal experience, as evidenced before.

Most teachers recognized a residual impact of the experience on their teaching methods. When directly enquired about the effect it had on their lectures and pupils at home, some answers were: *"No, it did not influence"* (Diogo); *"Not directly"* (Berto); *"Not as much as I would have wanted (...) I don't think my students felt that (...) it didn't influence my lectures"* (Ana). One interviewee mentioned that the experience resulted in specific outcomes, especially in the sense that it alerted students to *"intercultural aspects"* in education (Elsa). Effects on

pupils at host institution were referred as well: *"[it had] an immediate impact, yes"* (Ana). As referred by Engel (2010), mobility normally takes place only for a few days, still with positive results on participants. However, these time constraints were decisively one important factor for a scarce impact: *"it was not a regular class in the sense that you accompany students (...) time was very short"* (Berto).

Amongst the most cited outcomes of their one-time-only mobility were coauthored papers, the edition of scientific books, and exchanging Erasmus students in the continuation of the cooperation agreement between the two institutions: *"I promoted this agreement and exchange among teachers and students and within this initiative we are writing a book (...) and working on a master"* (Diogo). Still, teachers recognized the limited outcomes that are possible to accomplish in the first mobility, as more occurrences are needed in order to further develop relationships: *"maybe after a second, third opportunity to meet, because you perhaps start to consolidate something, isn't it? Define things better, clarify the potential of that relationship better"* (Diogo). Nonetheless, most participants mentioned the opportunity to present their work and their institution to peers: *"to show how this scientific area works (...) how [my institution] positions itself"* (Berto) and to compare: *"there is no such thing as perfect schools"* (Catarina).

Overall, although one-timers were able to identify direct outcomes of their mobility, they referred that these outcomes depended on the development of the relationship with peers at the host university, as a one-time experience provides limited opportunity to produce results that should have a long-term nature. As Fernando explained: *"As for direct effects, I have some doubts. It is also a very short period, although the experience is intense. In my case, curiously, if the focus of the work was other kind of mobility schemes, I wouldn't hesitate in saying yes"*.

Intention to repeat the initiative

The participants showed different profiles in terms of goals for their first exchange experience, affecting both their overall assessment and future intentions. However, most expect to repeat the exchange activity someday, and some have already applied for a second opportunity. The teachers that identified greater impact from a first mobility are amongst the most enthusiastic ones when considering repeating it: *"Mobility is to be repeated. Of course I have to fill in more forms and I have to find funding and perhaps I don't make enough effort towards it"* (Catarina); *"In fact, it is expected to do one more mobility experience now, in 2017"* (Diogo).

Still, a second mobility initiative is analyzed in a more rational way, weighting carefully the known costs associated with the mobility, being emotional, financial, or other. As Berto described, *"I'm always looking into the scholarships, wondering... There have to be very special circumstances (...) in this situation it is really necessary to get all the facts and right circumstances together"*. Or, as stated by Fernando: *"I wanted to see if I could get time to repeat the mobility, it hasn't been easy... there was one open recently in that area, but I have no chances whatsoever to think about it"*.

In the case of the least successful experiences, there were both manifestations of unwillingness to repeat the experience (*"while I still remember, I won't do it again"* - Ana), as well as a learning process that changed their preferences and goals for an eventual repetition of the initiative. For instance, in the case of lack of success associated with interpersonal relationships, participants said that in a future experience they would *"go to countries with a culture more similar to our own"* (Ana). In addition, a low level of a so-called mobility culture at home institution was sometimes felt by the participants: *"we were the only ones so far [to do mobility] (...) you have to be willing to go (...) either you like it, or you don't like it"* (Ana), accounting, probably, for some degree of inertia when considering future application procedures, as mentioned by Elsa: *"I would really like to go, but I don't even know if I can repeat the experience at the same institution. I don't know, I have no idea"*.

Mobility obstacles

Bureaucracy, financial costs associated to mobility and residual professional impact, are among the most cited reasons enumerated by the interviewees as mobility obstacles: *"It is not attractive from the bureaucratic point of view, not attractive at all. Quite the contrary, it is even a strong obstacle"* (Berto). Again, another interviewee indicated: *"I have a lot of tasks piled up... one of them is Erasmus...I don't know, I always put other things on top of it. And then I sort of leave it behind. That's why I many times end up doing many things on mobility that don't"*

exactly go through Erasmus, that go through other funding channels, because I have to fill this in, and I'm going to do it, and then I don't" (Catarina).

Berto was one of the participants that most clearly associated his difficulty to repeat the mobility experience with the insufficient financial support, stressing that he had to cover for part of the expenses associated with his first mobility: *"In point of fact, I don't try more often because it is much more expensive for us than people think. Because it is really expensive. Actually the rules themselves seem to me a little discouraging"*. Berto said that having to pay from his pocket part of the travel expenses was a major negative aspect of the mobility, making him question if the outcomes are worth the effort, even when most of the goals set for the mobility experience were accomplished, because *"it is a financial investment that is hard to accomplish (...) the financial, personal and professional cost is not balanced in terms of what we're going to do professionally"*. That aspect was referred by some interviewees as a clear negative factor of the mobility experience, preventing teachers from applying on a regular basis.

Language skills can also be a clear limitation, which conditions the choice of the host university. For instance, participants included Anglo-Saxon countries in their wish list, but manifested their discomfort in teaching in English for natives, thus were more willing to choose non-native English countries: *"Sometimes, language is a barrier as well, it doesn't mean that I speak English very well, which I don't, but I made an effort and that was it. There are people who don't have this sort of personality traits for this kind of experiences"* (Ana).

Another noticed obstacle by almost all participants is the articulation between a period abroad and the current at-home activities. Most teachers choose to do mobility during school breaks, in order to avoid missing classes and having to negotiate substitution sessions with their home students. As Fernando puts it, *"at that time I would have around 12 lecturing hours per week. Therefore, it was extremely difficult to compensate all the classes"*, commenting on the hindrances caused by *"a high work load, the endless tasks to accomplish, all non-professional situations that also do not contribute to this"*, and adding that *"I have colleagues that despite not having participated yet, show some interest, but there's always something in the way, family, an appointment, a task to perform, or classes"*.

Other personal aspects that account for the limitations to repeat the mobility include family responsibilities, such as having children; *"In the meantime I had one daughter, the last two years were devoted to that"* (Elsa).

Still, some interviewees observed that overcoming obstacles also have to do with the way people approach their profession and, ultimately, life itself. As Berto mentioned, this type of decision *"normally implies a certain degree of disorder at personal, family and professional levels"*.

Results, Conclusions and Recommendations

This study aimed at exploring the perspectives of academics that embarked in a mobility program only once and never repeated the experience.

Our findings seem to be aligned with Labriola and Mangione (2013) and with Barbosa *et al.* (2017), namely that teachers recognize the stimulus and the opportunity for widen horizons that an exchange program can bring. Within this context, the results of this exploratory research seem to indicate different levels of outcomes: a residual impact on learning and teaching activities, and a relatively high impact on research (even if it appears to be difficult to maintain for a long term) and on the continuation of bilateral activities between both HEIs. Nevertheless, the impact of cultural aspects in the dynamics of knowledge creation is crucial. In fact, this study empirically supports the different phases of the pedagogies of discomfort postulated by Santoro and Major (2012), with academics experiencing both negative and positive feelings. As noted by Smith (2014), the challenges posed to those teachers that consider mobility, as we surfaced in the interviews, draw attention to the cultural differences and to the distinct phases of an acculturation process. The cultural impact of communities and the motivational aspects in the dynamics of adaptation are pivotal, yet difficult to be managed.

What this study also suggests is that academics' professional and personal characteristics are two central issues when pondering a mobility experience. Underlying this is the notion that if the professional expectations of collaboration are not accomplished, it will be rather challenging and difficult for an academic to repeat the

experience. In such a case, the experience will be associated to negative feelings of displeasure caused by the non-fulfilment of prospects.

Furthermore, our findings indicate, as already mentioned by Jones (2013), that language skills are an important factor considered by teachers when they begin to think seriously about the option of embarking in mobility. Particularly interesting was the idea that teachers tend to choose countries where English is not the native tongue, in order to diminish their discomfort while communicating.

Ambivalence seems to emerge from this study. In fact, although a first mobility experience has been undertaken with enthusiasm, academics seem to think twice about the costs of embarking on a second mobility. Actually, with this study we could say that, for a second opportunity, teachers spend more time thinking about the pros and cons of the experience, at personal, familiar, financial, professional, or bureaucratic level. In accordance with the findings of Law, Muir and Thompson (2011) on the need to maximize the benefits of teacher exchanges through a structured participation and a post-exchange monitoring, this paper considers that intercultural preparation matters. HEIs should, therefore, foster a more attuned definition of academic quality also in this regard.

Finally, and also as stated by Sanderson (2011) and Welzer (2013), we recommend that the conceptualization of how mobility is perceived and embraced by academics and policy makers should be re-evaluated, mainly concerning the real impact and the real difficulties academics have in the field.

Although this study is based on an exploratory research, it provides interesting clues for international offices, Erasmus coordinators and university top managers, who devote considerable effort to the promotion and support of mobility practices and, for that reason, can greatly benefit from the collected data. Among the limitations of this study we can mention the number of participants and the fact that all belong to the same home institution. Further research would be needed with one-timers to assess data saturation. Notwithstanding, the results obtained actively contribute to inform HEIs' internationalization strategies and confirm the relevance of future research on the topic as well as on the widespread qualitative evaluation of the impact those lifelong learning practices actually have on the mission and intercultural contexts of the HEI.

Abstract

The article presents an approach to the preparation of a selected part of the documentation of the crisis management authorities of both the region and municipalities with extended powers staff exercise in the South Bohemian Region, Czech Republic. The topic of the exercise was a simulated crisis situation - a long-term power outage (Blackout 2017 exercise) which represents an unacceptable risk for the regional area. In accordance with the timetable, exercise preparation was divided into activities that followed one another. Main tasks of the exercise preparation fell within the competence of the managing and working groups and crisis management staff of municipalities with extended powers. Results from the preparatory phase of the crisis management exercise show that a thorough and responsible territory analysis based on the time-consuming collection of input data and their evaluation is required. During the preparatory phase, a low number of operators connected to the back-up power sources as well as high requirements on their provision and fuel supply for their operation have been identified. Problems in connection provision (information exchange), complicated defining of functionality priorities and others have been found out. The total duration of the Blackout 2017 exercise preparatory phase was 11 months. The interconnectedness of individual activities was compiled using a Gantt chart. During this period, it was indispensable for the responsible staff to meet the set deadlines in due time according to the exercise preparation timetable.

Keywords: Blackout, Exercise, Crisis Management, Time Schedule, Preparation

Introduction

Education, teaching and professional training of the staff for crisis management needs were first introduced in the International Decade for Natural Disaster Reduction (IDNDR). Since then, their role and importance have been strengthened at the World Conferences on Disaster Risk Reduction in Yokohama (United Nations, 1994), Hyogo (UNISDR, 2005) and Sendai (United Nations, 2015a), at the United Nations Sustainable Development Summit in 2015 (United Nations, 2015 b) and the Global Assessment Report on Disaster Risk Reduction (United Nations, 2015c). Role of education and professional training of the population in the frameworks (United Nations, 1994), (UNISDR, 2005), (United Nations, 2015a) has been growing, especially with the emphasis on vulnerable groups of population, and has become part of the main instruments of disaster risk reduction.

It is essential to provide equal access to quality education for all identified stakeholders and to promote lifelong learning for all. It is especially education and training that help reduce human error, contribute to faster and more efficient decision making process which leads to building a culture of security and resilience at all levels of crisis management. Number of theoretical and empirical studies (Bahadur, 2010; Castleden, 2011; Manyena, 2006; Combaz, 2014) has identified education, learning, knowledge, communication and information among the driving forces of disasters resilience.

Concept of crisis management is broadly defined, such as the definition of authors. However, it is possible to find common features in the definitions which define crisis management as a process based on risk assessment, subsequent creation and planning of activities related to the preparation, solution and elimination of the consequences of an extraordinary event/crisis situations/crisis. For this reason, crisis management requires fast and efficient decision-making process (Fener and Cevik, 2015) at the appropriate state levels or an affected

entity level. Decision making in response to the emergency/crisis situation is carried out by responsible crisis management staff, so it is important to ensure that the requirements of professional qualifications are met. Education, teaching and professional training of the staff form the basis for acquiring skills and competences.

General educational target groups in the field of population protection and crisis management can be defined as follows:

- State administration and self-government staff,
- Security forces and armed forces members,
- Legal and natural entities' employees whose business activity is affected by the obligations in the field of crisis planning and population protection,
- Elected officials, i.e. mayors, regional governors, ministers, etc.,
- Pupils and students,
- Teaching and academic staff,
- Adult population,
- Disabled people.

Education of all identified groups is carried out in 4 phases (National Security Council, 2017):

- Identification of educational needs,
- Planning of education,
- Implementation of educational process,
- Evaluation of educational outcomes.

Detailed requirements for providing individual phases of education and the way of their implementation are defined in the Czech Republic by The Concept of Education in the Field of Crisis Management (National Security Council, 2017) and evaluated in the Report on the Results of a Detailed Analysis of the Current State of Teaching all Security Issues at Schools with Proposals for Further Progress (Government of the Czech Republic, 2017). Education and training for the needs of crisis management can be divided into formal and informal. Formal education is applied at individual levels of education, from basic schools to universities. The issue of human protection in emergencies has been included in The Framework Education Programme for Basic and Secondary Education since 2003. At tertiary level, security courses have been accredited to prepare professionals in the field of occupational safety. Further enhancement of crisis management staff qualification may be carried out by a legal or natural entity which holds a license for educational activities. Informal education in the crisis management field takes the form of educational activities. As a rule, non-governmental non-profit organizations, school facilities for interest-based education and educational centres participate in it.

Because of the article focus and Sendai framework requirements to increase knowledge of government officials at all levels through sharing experience, awareness, implementing best practices, implementing training and education in disaster risk reduction, including the use of already existing training and education mechanisms and mutual learning (United Nations, 2015a), the text below focuses on the system of education of public administration staff.

The system of education of public administration staff working in the field of crisis management, mayors of cities and municipalities and other experts is regulated by laws and other regulations. At the beginning of the term of office of mayors, the crisis management staff of the municipalities with extended powers or fire rescue service organize training of mayors in the area of population protection and crisis management, as mayor, in accordance with Act No. 240/2000 Coll. (Act, 2000), ensures the preparedness of the municipality to deal with crisis situations and is responsible for crisis management at the municipal level.

One position of a crisis management worker is usually established in municipalities with extended powers. The regional offices have a unit or crisis management departments. A low number of experienced experts in the area of crisis management represents a key problem in the Czech Republic (Ministry of the Interior, 2013).

Acquisition of knowledge and skills of crisis management staff is based on two approaches. The first approach is the above mentioned education course at the university or college. The second option consists of further professional training in 10 specialized modules. Part of the systematic approach to staff training is also the obligation to carry out crisis management authorities exercises at the staff level to test preparedness for crisis situations. Training in crisis management aims at (Rosenthal and Pijenburg, 2013):

- Giving decision makers knowledge of the stages of crisis development and resolution of the variety of types of crisis that may affect them,
- Giving decision makers skills in the cognition of crises through the use of certain key indicators and performance review,
- Providing them with techniques for developing plans to avoid crises,
- Providing decision makers with the skills required to manage the crisis as best as possible.

Part of the preparation and implementation of the tactical exercise is creation of the exercise documentation which consists of (Ministry of the Interior, 2009):

- Purpose of the exercise – it is the initial document that sets the basic framework of the exercise (objective, topic, list of participants and their tasks) and serves as the basis for processing the subsequent exercise documentation,
- Organizational instruction – it sets the rules for the exercise preparation and the organization support of the actual course of the exercise and includes: a list of people responsible for performing the exercise, setting up working groups to ensure the preparation of the exercise, organizing material, technical and financial provision of the exercise, organizing the preparation of the exercise management, issuing the instructions for providing participants' preparation, timetable of the exercise preparation, organizing of work meetings and the way of exercise evaluation,
- Exercise implementation plan – it is a comprehensive implementation document creating conditions for organized implementation of the exercise, meeting set objectives, practicing all assigned tasks and ensuring efficient exercise management,
- Exercise evaluation – it is a document for evaluating the set objectives of the exercise.

The paper presents a chosen approach to the creation and elaboration of organizational instructions, especially the survey of the involved people, forming working groups and their tasks and timetable for the Blackout 2017 exercise preparation for the crisis situation in the South Bohemian Region.

Method

Choosing the topic of the crisis management authorities' exercise was based on two requirements. The first requirement was related to the threat to selected elements of critical infrastructure and the second to the crisis situation which carried an estimated. Chosen crisis situation was a long-term power outage - blackout which has not been practiced by the crisis management authorities in the South Bohemian Region until now.

Managing and working groups used brainstorming method which is based on creative forming and solving ideas (Osborn, 1953; Paulus and Nijstad, 2003). Especially in the case of blackout, it is necessary to develop scenarios of impacts and solutions to the problems that arise. Brainstorming method was also used by the working groups dealing with stakeholders.

A questionnaire containing open and closed (yes or no) questions was created for both legal entities and business individual entities, public authority bodies and other entities. The purpose of a specially compiled questionnaire was to collect data on the entity crisis preparedness for blackout. Questions were directed to the area concerning the ownership of a motor generator, needs of operating fuels, requirements for human, financial and material resources, provision of assistance to crisis management bodies and components of the integrated rescue system as well as processing the emergency documentation.

Gantt chart was used for clarity and checking the fulfilment of the individual tasks of the exercise preparatory phase (Laster, 2014). Gantt chart depicts sequences of activities over time. The horizontal axis indicates the time period of exercise preparation and the vertical axis marks individual activities or tasks. Individual activities/tasks are marked by coloured bars with marked duration. Length of the bar determines expected time for task solution.

Findings

Preparation of the Blackout 2017 staff exercise in the South Bohemian Region was divided into four phases. In the first phase of exercise, corresponding stakeholders were identified. Key stakeholders involved in the exercise preparation are:

- The Regional Authority of the South Bohemian Region,
- 17 municipalities with extended powers in the South Bohemian Region territory,
- Energy Companies – ČEZ Group, ČEPS Inc., E.ON Inc.,
- Basic components of the Integrated Rescue System - Fire Rescue Service of the South Bohemian Region, the Emergency Rescue Service of the South Bohemian Region, the Police of the Czech Republic,
- Regional Veterinary Administration, Regional Hygiene Station.

In the second phase of the exercise, an exercise managing group was created which was responsible for creating the scenario of the exercise, the intention of preparation and exercise implementation, organization, exercise timetable for preparation and determining the leaders of the working groups. Managing group was responsible for preparing, implementing and evaluating the exercise, elaborating documentation for Blackout 2017 exercise which is going to be held in November 2017. At the position of the managing group leader was appointed an employee responsible for crisis management at the regional level. Other members were representatives of the Integrated Rescue System components and regional office staff. In order to fulfil the tasks of the managing group, negotiation with energy companies was initiated to discuss causes and extent of the blackout in the South Bohemian Region. The main objective of the meeting was to specify the purpose of the exercise. Two meetings between the managing group and representatives of energy companies took place. Based on them the initial exercise scenario was set and the areas affected by blackout in the region were identified.

In the third part of the exercise, working groups started their work. The managing group decided to create 13 working groups. Working groups devoted themselves to areas such as food, drinking water, fuel, education, transport, gas supply, healthcare, veterinary measurements, social issues, communication, funeral ceremonies, imprisonment and public administration. Created working groups dealt with areas affected by blackout with regards to ensuring security and protection to the population. The task of each working group was to:

- Identify elements belonging to the topic area,
- Determine the impacts of power failure,
- Identify the preserved activities,
- Decide what is necessary for emergency provision in the set area,
- Determine how to address impacts in the affected area,
- Select the entities for providing priority electricity supply basic functions in the affected area.

Subsequently, the appointed leaders of working groups appointed the individual working group members. Other stakeholders were approached by working groups depending on the topic issues. The aim was to get information, negotiate the possibility of using their machinery, materials and services to deal with the blackout crisis situation. For example, working group for food addressed all producers, distribution storerooms, wholesalers and chain stores in the region to collect required information, to assess the situation and to design a crisis management proposal. Meetings of individual working groups with addressed stakeholders took form of brainstorming. Subsequently, the stakeholders were asked in written form to fill in the created questionnaire. Working groups were allocated a two-month period for the complete analysis of the territory. It turned out that it was very time consuming to arrange meetings and get all the required input information, so the deadline for completing the task was extended by 2.5 months.

The fourth phase took place simultaneously with the third phase. It concentrated on analysing the areas affected by blackout from the level of individual municipalities with extended powers. The crisis management staff of the municipalities with extended powers was responsible for fulfilling the fourth phase. Because of the fact that usually just one person works in this position, analysis was limited to the relevant municipality and did not apply to all municipalities belonging to the administrative district of the municipality. The person responsible interviewed relevant stakeholders about ensuring their activities, impact of the blackout and possibilities of providing their functionality during the blackout. Subsequently, the same questionnaires as for the working group were sent to the subjects. As it was time consuming, the two-month processing time was also extended by another 2.5 months. The objective of involving crisis management staff of municipalities with extended powers in the area analysis was to make them sufficiently and thoroughly aware of the situation in their administrative district and to be able to respond to it and solve it. Another reason was the requirement to prepare preventive and mitigation measures for the selected territory based on the identified situation and ability to present requirements for the financial, material and technical provision of the given crisis situation to the superior authorities. Based on the meetings of the managing group and the energy company representatives as well as the proposed exercise scenario, likely influenced areas within the region were identified. Although four municipalities with extended powers were identified as influenced by the proposed power failure scenario during the meetings of the managing group and the energy company representatives, this information was not passed on to the municipal crisis management staff, so that everyone would have the same responsibility for preparing for the exercise. Involvement of specific areas was announced only after the analysis of the municipality territory was carried out.

Results of individual territory analyses of municipality with extended powers were presented at the meetings of the managing group with the staff of the municipality with extended powers. Crisis management staff complained about the duplication of some activities during conducting the analysis. In particular, it concerned interviewing some entities e.g. a working group that addressed the situation in healthcare provision from the point of view of the whole region contacted the hospital representatives as well as the corresponding municipality with extended powers on which territory the healthcare facility was located, did the same. Representatives of the managing group assessed the preparatory phase as highly beneficial from the point of view of municipalities as they learned useful information also for dealing with other crisis situations than just blackout, mapped out available resources and requirements for new resources. Based on the results, the municipal councils will apply for increasing the funds or material equipment for the eventual even addressing. In some municipalities the real functionality of alternative power sources was checked to ensure functioning of the municipal office in the case of blackout occurrence and the identified problems were removed.

Municipal staff and working groups have failed in sufficiently defining the basic priorities in the electricity supply even within the extended deadline. Increased requirements for the provision of motor generators and fuel have resulted from the territory analysis processed by the working groups and the crisis management staff. As a fundamental problem which has not been solved so far, appears to be especially provision of communication between the intervening components, the crisis management bodies and the affected population during the

In the following period, it is necessary to elaborate a notification scheme for a long-term blackout, to create an exercise timetable, to define the area priorities to be addressed by municipalities with extended powers and region within the exercise. Food, drinking water, and fuel supply, healthcare, social care and security seem to be the key areas.

Results, Conclusions and Recommendations

It is very difficult to compare the preparation process carried out with other staff exercises implemented in response to the crisis situation of a large-scale power outage, i.e. blackout in the Czech Republic area (Prague 2014, the South Moravian region 2015, Olomouc 2015, Hradec Králové region 2015 and Vysočina region 2016) as the subjects keep the exercises preparation secret as their know-how. Despite the above mentioned facts, the research succeeded in collecting information that shows that all exercises were managed and organized from the regional level. The South Bohemian Region is the first region to involve municipalities with extended powers in the exercise. This increased the involvement of crisis management staff of municipalities and strengthened their theoretical knowledge and practical skills in dealing with crisis situation. This resulted also in their higher concern and interest in the issue. The people in charge will then implement gained experience in the municipalities with extended powers crisis plans modifications. Preparing the exercise, namely the territory analysis has proved to be the best suitable form of staff training and checking their competencies.

When analysing the territory, personal communication with stakeholders from the corresponding area, proved to be more appropriate form of obtaining information than just a written questioning through a questionnaire. The disadvantage is that a personal meeting is more time demanding than written questioning. On the other hand, the advantage is that the stakeholders provide broader responses and establish personal contacts than by mere questionnaire completion.

Defining priority consumers of electricity in the case of an island system or supply by motor generators is also a complicated issue for the processors of territorial analyses (i.e. working groups and municipality staff).

By comparison with other exercises it was found that the number of working groups created for exercise preparation in the South Bohemian Region was one of the most extensive. After the territory analysis in all the exercises performed, there was a restriction in the exercise solution regarding the selected areas. The reason for the area restriction is the wide range of impacts of blackout on the population. The choice of the exercise area was made depending on the needs of the regions, as it is not possible to check all the affected areas from time, technical and logistical point of view during the exercise.

The most serious issue that needs to be resolved is the connection between the crisis management bodies, the Integrated Rescue Service components and the population, because the functionality of the standard communication means is temporally and technically limited or totally nonfunctional. Significant communication problems have been identified which should be addressed by measures from the state level and not by individual regions. Some regions practice the danger of blackout with functional communication which cannot be considered a suitable approach to the corresponding type of danger.

The preparation phase of the exercise was highly time-consuming. In the case of exercise in the South Bohemian Region, it took 11 months. The other regions devoted a similar time to preparation.

For the regions that have not carried out exercises or will repeatedly perform exercises, it would be advisable to create a methodological process of blackout exercise preparation. Methodological process should include a set of key activities that should not be omitted within the preparation. On the other hand, excessive restriction in the

form of a methodological process may reduce creativity of exercise managing and working groups as well as other exercise participants.

Abstract

The current economic situation in Latvia has highlighted the need to develop social work education in the country and to use innovative methods in social work. The aim of this study is to analyse the basic conditions for the unity of social work education and practice, to find out what additional resources and methods of support social workers can be use in the practical work, and to identify use of the Reittherapy (hippotherapy) method to help to improve the life quality of clients. As a result, the aim of the study is to offer recommendations for promoting cooperation and the development of the profession in the field of education, practice and science. Changes in economic relations, rapid stratification of the society, migration under the influence of global processes have caused a lot of problems also in Latvia. Stress, overload, chronic fatigue, despondency, depression are only a part of today's pressing challenges affecting the quality of life of a society. The theoretical basis of the research is based on research and literature on the topical issues of social work education and practice. In the practical part, an empirical method is used – questionnaires, methods of data processing, analysis. The research respondents were divided into three groups: social work students, social work professionals and clients, in total 600 respondents living in Latvia. The study was conducted in 2016-2017 by survey of 200 students of the Social worker study program at the University of Liepaja. Students of the study year were enrolled with the detection method. The random sampling method was used in the questionnaires of 250 social workers at different professional conferences and through the internet. The same method was used also through the internet for clients who reseave the Reittherapy. The data was processed by the Microsoft Office Excel program. The results of the study are the following: students believe that the Reittherapy method is a resource for social work with clients; social workers believe that Reittherapy is offered to clients as a cure, believe method and it be used to prevent clients' stress, depression, overload, chronic fatigue in recovery in cases were clients do not have access to such services near the place of residence; this method was recommended by social workers and on their own initiative; the comments for this method indicate that there has been a recovery process, the client has obtained psychological satisfaction, improved client's well-being and quality of life and it can be used by a person of any age. The research demonstrates that the use of the Reittherapy method improves the quality of clients life and it needs to be developed in the future. The research reveals new opportunities and challenges in social work, emphasizing the team's united and co-ordinated cooperation. More research is needed to improve the social work, which should be the basis for the development of social work as a science in Latvia.

Keywords: Education, social work, methods, Reittherapy, the life quality.

Introduction

Education is important for everyone, family, society and the state as a whole. It is a path to the quality of the individual's individual life, the formation of building society with society knowledge, the country's economic growth and prosperity. Global processes influence the continuous development of social work education, progress according to the needs of social work practice. The practice of social work requires competent professionals with a broad, comprehensive view, and who are balanced. The people have to be sure, creative, and also critical thinking, be prepared to deal with non-standard situations with everyday challenges. Be able to work in a team, to properly choose and use all possible resources, theories and methods in the professional work. In social works education and practice interacting with the basic values of social work must be respected. The social values are formed in cultural processes. They may be subject to global processes of change in society. Šilņevs (2000) The Social Work terminology dictionary of the most important values emphasized in social work

- human dignity, equal social chances, social solidarity, social well-being for all, fair division of benefits, harmonious social relations, social security (Šilņeva 2000, p.211.).

Changes in economic relations, rapid stratification of the society, migration under the influence of global processes have caused a lot of problems in Latvia as well. Stress, overload, chronic fatigue, dejection, depression are only part of today's topical issues. These and other issues affect the quality of society's life and social well-being. Alternative methods and resources are needed in order to solve the problems, in addition to the methods already used in social work. In order to maintain customer quality of life, it is necessary to seek cooperation with specialists from other fields.

The aim of the research: To analyze the basic conditions for the unity of social work education and practice, to identify the necessary resources and to support methods, to study the possibilities of application of the Rittertherapy method, and to improve the quality of life of the clients.

Tasks of the research:

1. To analyze theoretical literature, normative acts on topical issues of social work education and practice.
2. To study social works education and factors which are influencing social works professional practice.
3. To identify the use of the Rittherapy method which is used to improve customers quality of life.
4. Empirical research project to develop a questionnaire and carry out a survey of respondents.
5. To perform mathematical processing and analysis of the obtained data.
6. Offer suggestions between professionals in the promotion and development of the profession.

Research Hypothesis: If social work clients are provided with the opportunity to receive as a support method for the Reittherapy, then the quality of life of the clients improves.

Method

Research methods:

Theoretical research methods - literature, study of documents on the chosen topic. The basis is based on research and literature on the topical issues of social work education and practice, factors affecting it, methods of support in social work, quality of life, Reittherapy as a support method.

Empirical research method - questionnaire. Respondents of the study were divided into three groups: social work students, working professionals in social work, clients, and in common view living in general 600 in Latvia. In the sample, we were using the method of detection, with the students who, where studying in the "Social Worker" study program at Liepaja's University, and were it is included in the study program. The survey of social work specialists and practitioners used a random selection method at social work conferences and using the internet. The customer survey uses an online selection method for clients who receive Reittherapy service.

The mathematical processing and analysis of data. Data is processed using the Microsoft Office Excel program.

Research respondents: Students of the study program "Social Worker" at Liepaja's University. Social work specialists. Customers receiving Reittherapy service. The survey was attended by respondents from 72 regions and cities in Latvia, the total is 564 out of 600 distributed questionnaires.

Research time: Year 2016-2017

In the time of the research, literature and theoretical knowledge about the chosen topic were analyzed and summarized. The results of empirical research have been summarized and interpreted.

Findings

The Education Systems highlights

Educational system in the 21st century. What should it be? What does it affect? What requirements are imposed? During the research, the authors of the work sought to find the answers by studying documents and literature sources. In the 21st century, education is a sustainable further development. It encourages people to take responsibility in their everyday lives, to realize themselves in accordance with the social, cultural, economic and natural environment around them. It means living with a positive perspective and view on the future, being able to respond creatively to emerging crisis situations in order to be part of a new environment.

The document "Guidelines for the Development of Education for 2014-2020" was approved by the Latvia's Republic's Saeima in year 2014, emphasizes the human-oriented education, education for sustainable development, education-enhancing education for the societies knowledge (Saeima, 2014). Human oriented education focuses on human self-improvement and self-development. This should take place throughout the life of a person at every stage of his life. It is a prerequisite for the entrepreneurial mindset of each citizen, for the development of skills for social inclusion, employment and active civics participation. Education for sustainable development is a life-long process. Its purpose is a person who is able to realize himself fully in the national economy and society as a whole, ensuring the long-term and prudent use of resources. A person needs to understand local problems as well as their global context. It is also necessary to understand and accept other cultures with dignity, to promote a peaceful and sustainable society and its economic growth. The modern society is multicultural. The knowledge and its use in the development process of multicultural contemporary society are changing rapidly.

Social work education was historically formed in Latvia at the beginning of the 90's. Its necessity and development were guided by the ongoing social processes, which led the Saeima (2002) to adopt the "Law on Social Services and Social Assistance". The law regulates the provision of social services and social work in Latvia. The development of social work education and practice in Latvia is in year 2013 approved as the basic document "Guidelines for the development of professional social work for 2014-2020". The document indicates the priority directions and tasks for the relevant period. As the most important tasks and measures related to education are - to promote the competitiveness of social workers, to improve the professionalism of social workers, to create a targeted approach to the support of students who study in social work education programs, to provide support for the development of a science and research base in social work. In order to ensure affordable high quality higher education, to facilitate the supply matching with the requirements of the labor market, to strengthen the link with science and research, and to use the state budget resources efficiently, cooperation and the integration of local governments, employers and sectoral organizations in the management of higher education institutions and study process (The Republic of Latvia, Cabinet of Ministers, 2013). As a result, it is objectively possible to assess the demand of specialist field specialists, to follow changes in professional activity and to adapt the structure of the knowledge acquisition process accordingly, to improve study programs, which are also carried out at higher education institutions. Involving professional practitioners in the implementation of the study process contributes to the development of respective study programs in accordance with employers' demand, development trends in practice, while respecting the development of social welfare, using innovative methods. One of the most important preconditions for providing social work education is the unity of theory and practice as a mutually interactive process. There is some kind of tension between knowledge and application of knowledge, the interaction of theory and practice, although the questionnaires collected by the graduates of Liepaja's University indicate that the level of knowledge and skills acquired corresponds to the demands of the labor market. The proof or the denial of this can be proved by the studies carried out and the reasons therefor.

The question could be asked: what kind of knowledge is needed for the profession and what are the done researches? Is there a comparison of these studies at regional, national and transnational contexts? There is no clear answer, there is an underdeveloped scientific research base. One of the reasons is that social work in Latvia is not a separate branch of science, as in Europe and other countries - Lithuania, Estonia, France, Sweden, Russia and somewhere else. Every University's lecturer, including students, conducts research activities as much as possible, participates in international conferences, and takes part in programs, international projects. It is a valuable contribution to the development of study programs and the provision of scientific research activities, the expansion of cooperation with other European higher education institutions. The addition of social works theory and methodology is the involvement in international projects. The problem that scientists, educators and practitioners have been researching is a social issue that explored how to deal with those who are left behind. They are both children and adolescents, and old people. Scientists conducted questionnaires and comparative studies to discover and identify what these people need, how practitioners work and what can be improved more. In the international project RELAIS PLUS, which took place from 2010 to 2012, there were eight universities from seven countries - France, Germany, Norway, Romania, Slovenia, Greece and Latvia, represented by the University of Liepaja (Project RELAIS PLUS, 2012). The collected extensive scientific research material is integrated into various study courses and demonstrates the similar social problems of the involved countries. Valuable is also Latvia's experience in social development.

Lawrence (2015), Svensson (2016), will be mentioned in the European context of the necessary changes in the system of social work education, in practical work and in promoting social development in the European context.

Social work and support methods

Social work at the development stage has always been a compromise. It developed the methodology of its work, but also used the theoretical and practical concepts of related branches. Today's social work theory and practice recognize the diversity of social work methods and their applications at micro, mezzo, and macro levels. Several authors of social work education and practice Payne (1997), Zemīte (2003), Broks (2000) acknowledge that all people or groups of people are in systems, and undoubtedly have an impact on each other. System effects can be circular and linear. From the revelation of the authors, it can be concluded that the choice of social work methods depends on the professional competence of each social worker. To find, attract and use customer resources is not easy. Successful and quick solution to customer problems is a proof of the professional skills acquired in the Social Work Education programs and the work of the interprofessional team. Resources in social work have been researched and described by many authors in various ways. Camerron, (2014) explains that emotional support is what constitutes collaboration and is acquired through mutual communication, talks based on empathy and understanding, and allowing the client to be open and safe in overcoming disturbances. The informational support options shorten the time to deal with the crisis and provide additional information about unknown things to the client (Camerron 2014). Social work clients in Latvia are not always materially able to pay for their social services themselves. The task of a social worker is to be able to evaluate the client's situation and find the opportunity to captivate additional resources.

According to Rothery (2016), Social workers are practically the people who want to work, are creative, and are ready to attract other industry professionals and related disciplines (Rothery, M., p. 95-104, 2016). Czerw (2017) acknowledges Reittherapy as a method for resocialization programs. In Poland, the method is popularized as an alternative to classic social work methods. It is applied in the fields of social work and social pedagogy, and the study of the application of the method Poland continues (Czerw, 2017, p. 159).

In Latvia, social work has increased interest in Rittherapy as a supportive method for improving the quality of clients' life. According to Zundāne (2014), Knipše (2010), in 1981, the Republic of Latvia implemented the first projects of the Rreitherapy, but in 2000 Reittherapy was acknowledged as the technology of medical rehabilitation.

Topicalities of social work practice

Definitions of social work arose in the 60s-70s of the last century. They emphasize the professional and practical side of social work, which is why it is difficult to defend social work as a branch of science. Social work requires extensive knowledge, borrowed from other sciences, such as - sociology, psychology, pedagogy, economics, medicine, philosophy, law, management science, and others. For comparison, some definitions of social work. National Association of Social Workers (NASW) in 1973 According to Zemīte (2003), social work is accentuated as a professional activity: *Social work is a professional action that helps individuals, groups, families, organizations and communities rebuild or strengthen their social functioning and create social conditions according to their goals. Social work provides humane and effective social services to individuals, families, groups, communities and society in order to improve social functioning and quality of life* (Zemīte, 2003, p. 27). In Latvia, with the formation of the social system, the Law on Social Services and Social Assistance (2002), gave the definition of social work, which is referred to both by practitioners in the field of practical work and educators, as well as by social politics and social development developers. *Social work is a professional activity to help individuals, families, groups of persons and society as a whole to promote or renew their ability to socially function and create conditions conducive to this functioning* (Saeima of the Republic of Latvia, 2002). The purpose of social work is to help a person, family and group of people identify, resolve or mitigate social problems by developing their own resources and involving support systems. The law states that ... the right to perform social work is for persons who have obtained second-level professional higher or academic education in social work or charitable social work (Saeima, 2002). The International Social Work School Association (IASWS) and the International Federation of Social Workers (IFSW) agreed in 2001 on the other definition of international social work. The social work profession promotes social change. Principles of human rights and social justice are fundamental to social work (Šiļņeva 2008, p.14., Global standards for social work education and internships: <http://ifsw.org/policies/global-standards/>). This means that for the first time an international reference point for social work education and practice has been created, taking into account local, cultural and historical perspectives. The global guidelines for social work education and internship practice explain that professional social work is geared towards change and problem solving. Social workers are the change makers. Social work is a system of interdependent values, theory and practice. So in turn, the methodology of social work is based on systematic, knowledge-based knowledge that has developed in the process of evaluating research and practice. The profession in practice is based on theories, social systems, analyzing complex situations and promoting individuals, organizations, social and cultural changes. Social work uses a variety of skills, and activities. The priorities of social work practice are different in each country and at any time (Global Standards for Social Work Education and Practice, 2008, pages 4 to 13). The Global Agenda for Social Work and Social Development should also be taken into account. The Global Agenda - Human-centered sustainable social progress! (*The Global Agenda for Social Work and Social Development, 2010*). The next stage in which this operational program was viewed was in 2012. The International Conference in Stockholm, the Program Implementation and Action Strategies. Priority efforts to achieve the target was indicated. They are concentrated in four important areas. As stated, in the field of education, such development, dissemination and knowledge sharing among all social professionals should be supported. This requires the creation of innovative communication channels. To promote research, regional research and development centers for social work should be supported. This would encourage positive results in the The Global Agenda. As communication channels for social work professionals, educators operate a free discussion website on the Internet, where you can share experiences, exchange of ideas, conferences, and seminars.

Social work is in continuous development, in a direction where global processes have a certain influence. International partners (IASWS, IFSW) have agreed that every 10 years they will update and review the issues of the social system. In July 2014, held Global social workers, educators and social work development makers' conference in Melbourne, the participants agreed on a Global definition of social work. Social work is a practice-based profession and an academic discipline. Underpinned by theories of social work, social work engages

people and structures to address life challenges and enhance wellbeing (Global Definition of the Social Work Profession, 2014.; <http://ifsw.org/policies/definition-of-social-work/>).

It follows from the definition that social work is both interdisciplinary and transdisciplinary, based on extensive scientific research not only in social work but also in other humanities. Most of the research is done with the recipients of social services, clients in an interactive, dialogue process, and therefore the research is based on the practice-specific context. Social work practice has a wide range of activities. The new definition was discussed at the International Conference on Social Work Education in Europe: towards 2025 (2015) in Milan. The participants discussed the necessary changes in professional social work, social work education, theory and practice relations, research and other topics. An insight into the development of the social work profession and the presentation of the conference materials was provided by Lolita Vilka (2015). In contrast, Christensen (2015) from the University of Malmö, Sweden, in a research paper entitled "Acting locally, thinking globally in social work education" (translated by the author), points out that social workers must be prepared for challenges, changes to address social work in the local and global context, solving communities problems. Christensen (2015) in the scientific study reveals that the cases promotes mutual sharing of global social problems. In this way, it is possible to gain knowledge about other countries and their social system. In Sweden, Social Work Education is well established, but International Education in Social Work is required. The required in-depth knowledge of international social work, the driving forces, but also have to be studied as possible to increase the mutual understanding of social work, to develop a global understanding and aware of their own traditions and values. The individual and the environment change over time, it is important to understand how different systems affect the development of an individual. Social workers are faced with new responsibilities, and this is important for the development of education at the national level. The success factor in acquiring knowledge in international social work, it needs endless education continuing, international courses where you can work independently, opportunities for integrating existing programs. According to Christensen (2015), internationalization involves six levels of intervention: intra-personal level (capacity sustainability); Micro-social level (person, client, emphasis on interaction); Mezzos social level (group, institution, coherence); Exo-social level (society, institutions, education system); Macro-social level (culture, nation, traditions, language); Ex-macroeconomic social level (international relations and EU influence). The study is described at the Ex-Macro level - Global Mobility Perspectives - Student and Teacher Exchange Programs, Mezzo-Social Level - The Perspectives of Social Work Local Education - Integration with Visitor, Practicing Opportunities and Work Abroad, Micro-Social Level - Social Work from a Professional Perspective- They have good knowledge of other countries, their culture, norms, the ability to respond quickly, and apply social work skills in different contexts (Christensen, 2015). Members of the European Social Action Network (ENSACT) have been working with the objectives of the Global Social Agenda since 2007 to promote a human rights-based approach to social work, social work education and social policy and to find practical solutions at local and regional level. In line with the objectives of this organization, it is necessary to promote much closer cooperation between service providers, social workers' educators, politic makers, service users and communities. A stakeholder in each activity needs to be supported in order to optimize joint efficiency (European Network for Social Activation (ENSACT)). The Professional Standard of the Latvian Social Worker (Cabinet of Ministers of the Republic of Latvia, 2010) specifies professional tasks that are in line with international guidelines. Social work is based on the needs of social work client groups, problem solving methodology developed and approved. Customer needs, goals, and causes of stress in life determine the choice of the type of social work and the choice of appropriate methods. Germain, C. B., Gitterman, A (1996) explain that some methods and skills are common to all types of social work.

Quality of life.

In each country, the public welfare indicator is the quality of life of its inhabitants. After.Šķesteres (2012) view, the quality of life is a broad and capacious term that includes both objective indicators and subjective satisfaction

and assessment and an individual's capacity to organize their lives in accordance with their intentions. Objective indicators of quality of life are income, work, education and others; Subjective indicators are a combination of self-esteem, satisfaction, ability to act (activities, skills and others) (Šķestere 2012, p. 3). I.Šķestere (2012) believes that the quality of life is ensured by the needs of people. Consequently, the quality of life can be equated with the level of satisfaction of people's needs. The ability of a person to satisfy his needs is directly related to the opportunities available, and they form social, human, environmental and time capital. Of social capital is considered to be of human cooperation and rules that encourage cooperative behavior. Human capital is human knowledge and accumulated information, as well as health and working capacity (Šķestere, 2012, p. 13). An essential aspect of the quality of life is the subjective perceptions of people about what is good life, their subjective life assessment and satisfaction with different areas. Šiļņeva (2000) explained that the quality of life of individuals, families, groups, public well-being index, which includes physical and mental health ... Social workers working on improving quality of life, must take into account the subjective and objective character (Šiļņeva, 2000 , p. 50). Latvian Social Work legislation The Saeima of the Republic of Latvia (2002) defines the following: the quality of life is defined as the following: persons, families, groups of persons, public welfare indicators, which include physical and mental health, work, education, links with society, rights (Saeima, 2002). It can be concluded that there are different views and definitions of quality of life. It is important that an individual of any age, with or without a disability, ensures the quality of life and the needs that society considers to be normal.

Support Method – Reittherapy

Reittherapy also known as therapeutic riding. When translating from German, 'der Reiter' it means 'rider'. According to Agafoničev (2008), the French therapist I. Lalerie is considered to be the founder of modern Reittherapy. He theoretically studied the effects of horses on various diseases in the 60s-70s of the 20th century. Lalerie was convinced that a horse is better able than any other animal to help a person get rid of a wide variety of diseases (Agafoničev 2008). Dreimane (2015) explains in her handbook that Reittherapy is used to solve physical problems, but pedagogical hunting and volunteering is used for people with mental and social problems. Voltiation is a race discipline combining static and dynamic elements executed on a moving horse. There is also rider sport for people with special needs - paralympic entry in case of physical problems and drivings. Driving is a horse racing discipline that does not have riders, but there are drivers on a 1, 2 or 4 horse-drawn vehicle. All exercises on horses are monitored by Reittherapys trainers. Reittherapeits are a medical practitioner performing the patient's functional ability assessment and the physical, psychological and social potential for improvement through riding horses (Dreimane 2015 14 to page 15.). According to Gulbe (2011), the concept of Reittherapy has been emerged in Latvia, and on the global scale it sounds like riding for disabled people. Reittherapy is divided into three broad directions: 1. Reittherapy (hypotherapy) - is intended for human medical rehabilitation and is applicable to people with physical problems (diagnoses). 2. Pedagogical riding and voltiation (persons with a qualification of a teacher, psychologist and social worker diploma and reiteration instructor). 3. Equestrian sport for people with special needs. Gulbe (2011) explains that Reittherapy is a method of treatment in which the main healer is the horse. It includes solving problems in medical, psychological and social rehabilitation. The factors contributing to the beneficial effects of Reittherapy – it includes horse rhythmic and three-dimensional movements, warmth of a horse's body, therapist's, aide's and client's cooperation, as well as the location of unusual therapies. Horses feel the way humans feel today and how people touch it. Horses are amazingly well aware of their therapist's functions, they feel the needs of a person. Horse positively affects the somatic and psychic state of the client. The horse moves in four strokes. The similarity of the horse and human movement have been proven. Reittherapy is a globally recognized treatment method for both children and adults in the treatment of various diseases: central and peripheral nervous system diseases, musculoskeletal system disorders, respiratory diseases, cardiovascular disease. It has a beneficial effect on people suffering from chronic stress, increased anxiety and depression, and can also be used for prophylaxis. Gulbe (2011), Dūdiņa (2015),

Dreimane (2015), explain that horse, horse movements, and the natural environment helps to increase the effectiveness of various therapeutic activities, as well it helps to improve the client's psychological health, cognitive, communication skills and behavior, and positively affects the client's physical and emotional state. The authors indicate on the beneficial effect of the horse on the client's psychic functions. 1. Rises self-confidence. The horse listens to riders given commands, and this is the opportunity to stimulate the patient to continue classes. For a person whose full life is hampered by a physical or psychological problem, it is nice to be aware that there is someone who obeys him. Even for more self-confidence is brought by the fact that many healthy people are afraid to ride a horse. And therefore, there are, cases when the training of healthy people and people with health problems do not go away, and recommend that they start to race as equivalent players. 2. Facilitate communication with the surrounding people. Before and after the class, the client looks at the relationship between the therapist and assistant, the other clients and their family members who come to visit them. During the lesson, the therapist involves the client in a conversation, and arise questions about the various details seen in the stall or in the neighborhood. Negotiations that do not only deal with the client's problem, they facilitate the release, facilitate communication with other people. Improvements are also expected in the use of other means of communication such as gestures, mimicry, and pantomime. The client is introduced to different situation models. Partial communication improvements are related to the development of the speech engine center. This is facilitated by the client's awareness that the horse is listening to his given voice commands. In this way, the customer learns the need for speech. 3. The processes of cognitive and deliberate actions improve. During the lesson, the concepts used to indicate the movement in the room are intensified. It is also easier for the customer to understand and use plain words on a daily basis, widen the vocabulary, and improves memory. The multiplicity of Reittherapy is evidenced by the fact that it is used abroad both for the rehabilitation of child victims and for the cultivation of juvenile offenders. In Latvia, the method of Reittherapy is used as a method of medical rehabilitation but is not widely used in social work practice. There is no known research in the social work about the Reittherapy method, its impact on the quality of clients' life. Based on the research of the theory, an empirical study was carried out to test the hypothesis.

Results

In the course of the research, 182 questionnaires received from social work students, 238 questionnaires received by social work practitioners and 144 customer questionnaires were analyzed, in total 564 questionnaires.

The results of the study are as follows: 1. 76% Students believe that Reittherapy is a support method and resource for social work with clients from different groups. 2. Social workers consider 53% of the patients to be offering Reittherapy as a cure for clients, however, 68% of the respondents believe that Reittherapy could be used for customer stress, depression, overload, chronic fatigue recovery, socialization disorders. 3. Social workers, as an obstacle to the use of the method, mention the following reasons: 1) The service is not available to clients near home to 42%; 2) The 28% of customers do not want to use the Reittherapy method; 3) 30% is a weak interinstitutional cooperation in the use of the Reittherapy method as a reason for identifying different sources of funding like for example - social budget, health budget. 4. 58% of the customers would like to use Reittherapy if it were closer to their place of residence, 14% of clients have used it after illness and as doctors recommendation, 9% of clients used this method, as recommended by social workers, 19% used this method on their own initiative; While observations and feedback on this method indicate that there has been a recovery process, the client obtain psychological satisfaction, improved client's well-being and quality of life, and it can be used by a person of any age. 5. 88% of clients' indicate that after using the Reittherapy method, they have improved their well-being and quality of life. 12% do not observe any change. Negative assessment about the method used, customers indicated in their responses.

Conclusions

The theoretical part of the research reveals the process of formation of the basis for social work education, practice and normative acts in Latvia based on international experience in social work. In social work practice, along with methods of social work, are used methods by other related fields. The use of Reiththerapy as a method of support for improving the quality of client's life is positively evaluated in the environment of social workers, clients and social work students. The research shows that the use of the Reiththerapy method improves the quality of client's life. In the future, the method needs to be developed in order to be able to use for the widest range of customers. Students, educators and practitioners of social work always seek effective and best practices that can be implemented with clients. The research reveals new opportunities and challenges in social work, emphasizing that the teams are united and coordinated cooperation.

Recommendations

More research is needed to get proof of the use of the Reiththerapy method in social work and to complement the diversity of social work support methods.

Social workers need to update multidisciplinary and interinstitutional teams that would allow the wider use of the Reiththerapy method as a support method for improving the quality of client's life.

Email: anita.lidaka@liepu.lv

Abstract

The article carries out a research and analysis of theoretical knowledge and empirical observations by Maria Montessori in the context of contemporary discoveries in neuroscience, as well as a summary of the practical use of the didactic principles and materials by Montessori pedagogy for promoting the speech and language development of preschool children. There is a short summary of the research results and analysis carried out on the operating basis of the Alternative Education Centre by Liepaja University Institute of Educational Sciences. The results of the theoretical and empirical research confirm that the theoretical knowledge and empirical observations by M. Montessori coincide with the conclusions of neuroscience nowadays, playing a significant role in the development process and promotion of language development, in the comprehension of the disorder pathogenesis of language development from a holistic approach in a context of competence-based preschool education acquiring. Whereas the practical use of Montessori pedagogy and Montessori therapeutic pedagogy, promote the development of preschool children's speech and language, considering the multi-structural model of speech and language development.

Keywords: pre-school age, speech and language development, Montessori Pedagogy.

Introduction

Currently there is a project initiated in the Latvian Education system in order to carry out a gradual transition to the education acquisition based on competencies in all education levels, including pre-school education. It means for children not only to acquire knowledge based on the practical experience and skills to use those in new situations, but also to develop abilities and a desire to study. At the same time, it will have to be paid a greater attention to children's personality development and formation of their characteristic habits in the pedagogical process. However, the achievement of such goals is endangered in case of determination an insufficient or disrupted speech and language development for almost every second pre-school child in Latvia at the age group of three to five years. Insufficient speech and language development level encumbers with information grasp, knowledge acquisition and reproduction, as well troubling communication with peers and adults. If it is not timely ascertained, prevented or reduced, then there is a risk to have difficulties at a later age group with written language acquisition and learning, and also there is a possibility of behavioral and socialization problems. For about half of the cases of speech and language development insufficiency have a functional nature and it could be reduced by using pedagogical methods. As one of them it has to be mentioned a method, which is known formore than a hundred years - Montessori Pedagogy. Its theory and practice is rooted not only in previously noted competence based education acquisition approach, but it considers the language either as an important factor ina child's development. By using Montessori Pedagogy in a process of speech and language development there is a holistic approach carried out following the multi-structural model of speech and language development (Tomele, 2015; Lidaka, Tomele, 2016).

Problem statement and sub-problems (hypotheses)

The use of Montessori pedagogy in preschool education process and speech therapy correction promotes the development of children's speech and language:

- on the basis of the multi-structural model of speech and language development;
- considering the principles of the humanitarian pedagogy;
- by providing the child's development in wholeness and the competence-based preschool education acquirement.

Method

The theoretical substantiation of Montessori Pedagogy application in speech and language development promotion is based on the research and analysis of works by Maria Montessori and other authors.

The empirical substantiation of Montessori Pedagogy application in speech and language development promotion is based on the research, observations and case study of Montessori Pedagogy practice.

The theoretical substantiation of Montessori pedagogy application in speech and language development promotion

At the beginning of the last century Italian physician and educator Maria Montessori (1870 - 1952), when studying the theoretical knowledge of medicine, psychology and pedagogy, and by using the method of empirical observation, developed a complex method of medical, psychological and pedagogical approach in education. At the same time Montessori pedagogy besides interdisciplinary solidarity has also a transnational and intercultural one worldwide. By considering the culture and traditions of each nation, the same didactic material is acquired the same way, followed by the same basic didactic principles and philosophical viewpoints, especially emphasizing Montessori pedagogy as a humanitarian pedagogy tendency centered at the child, his interests and needs. In 1988 the significance of M. Montessori's pedagogical work was acknowledged by a resolution of United Nations Educational, Scientific and Cultural Organization (UNESCO) confirming M. Montessori as one of the four educators (J.Dewey, G.Kerschensteiner, A.Makarenko, M.Montessori), who have influenced the pedagogical way of thinking in the 20th century (Lüse, Miltiņa, Tübele, 2012).

During her pedagogical activity M. Montessori has studied various aspects of child's development, including speech and language development, as well as she developed the didactic materials and recommendations for oral and written language development and acquisition. In addition to the empirical observations of children's language development process, there has been performed the research of language origin theory (*Ursprung und Vorgeschichte der Sprache*, 1946) by G. Revesz, the child's language development studies (*Psychologie der frühen Kindheit*, 1914) by W. Stern and the studies on language disorders (*Die Störungen der Sprache*, 1877) by A. Kussmaul, also a practical use of breathing exercises (*Cura della balbuzie e dei difetti di pronunzia: metodo teorico-pratico ad uso degli alunni scuole normali, delle scuole elementari, delle direttrici e maestre dei giardini d'infanzia*, 1906) according to methodology by A. Sala (Montessori, 1994a, Монтеessori, 2005).

The child's speech and language development issues are mentioned and described in many works by M. Montessori, but there are three books, which should be rated as the most important ones from this particular aspect:

- in the book "The Method of Scientific Pedagogy Applied to the Education of Children in the Children's Houses" (*Il metodo della pedagogia scientifica applicator all'educazione infantile nelle case dei bambini*, 1909) there are analyzed the physiological and psychosocial aspects of speech and language development, there is a general overview on types of speech and language disorders, review of formation preconditions for written speech and its mechanism, and it also provides recommendations for the development of children's speech and language for children from 3 to 6 years of age;
- in the book "The Advanced Montessori Method Self-Education in Elementary School" (*L'Autoeducazione nelle scuole elementari*, 1916) there is described a lesson methodology of the language development for elementary school children in grammar, reading and literature, a connection between the other types of lessons and language lessons, and there is highlighted the significance of the early and preschool period children's development in the progressing of speech and language functions;
- the book "The Absorbent Mind" (1949) examines the development of the child's speech and language from birth to 3 years of age, it appraises the importance of the language environment, the pathogenesis of language disorders, also it substantiates the legitimate role played by language in the history of mankind.

M. Montessori interpreted the meaning of the language out of the society's cultural-historical development process position - the language has formed and evolves under the impact of the process of mankind's cultural-historical development, public socialization and implementation of needs. At the same time the importance of the child in this process was also emphasized - solely through the child's ability to acquire the language it is possible to provide

cultural succession for generations, preserve the knowledge acquired by society and transfer it to the future generations (Montessori, 1994a).

In her works M. Montessori brings out the language as a social phenomenon that can only develop in a human society - by interaction between a child and an adult. An essential part of this process is the "prepared environment" that provides the preconditions for language development. The prepared environment is created by a mother, but the child learns the language himself (Montessori, 1994a).

By analyzing a link between the development of child's language and thinking function, M. Montessori pointed out that the language of the child becomes more complicated as more complicated becomes the thinking process. It is not said, which one (thinking or language) could be the primary or the leading factor in the development process, but it is indicated to the connection between the language complication level and the development of thinking (Montessori, 1994a). Modern studies in neuropsychology also confirm that none of those processes is primary or dominant - thinking and language are in a mutual interaction, dependent on child's age group (Voigt, 2013).

M. Montessori believed that the child "absorbs" the native language - by acquiring it continuously, unconsciously and entirely. The period of time from birth to three years of age is the most active developing period in the child's life. The child is like a "sponge", as a "camera" that perceives and stores up all the information unconsciously. During this period the language development occurs only on the basis of the child's social and his own subject matter practical experience. From three to six years of age the child begins to differentiate his impressions, he is able to mark out separate parts from the whole and begins to understand the abstract interconnections as well. M. Montessori believed that the information received up to six years of age deeply penetrates into the child's subconscious and forms the child's character, memory, intelligence and will (Holstiege, 1999; Montessori, 1994a, Oswald, Schultz-Benesch, 1993). From a modern point of view M. Montessori's term "absorbent mind" should be interpreted as specific neurobiological processes at the early stage of child's development - a synaptic formation process that is directly influenced by the child's early experience in the realms of feeling, movement, language and social emotional experience.

However, the phenomenon of child language development cannot be explained only as a result of the "absorbent mind". M. Montessori believed that the child has an unconscious instinct or the "human tendencies" to acquire a language. The term "human tendencies" refers to the need for self-development or self-formation. The language development process is unconscious and it is provided by the child's "self-activity" (*Eigenaktivität*). A healthy child has an unconscious need to learn a language by using self-activity, as well as it has the need to get up, walk and explore the world (Montessori, 1994a). In the scientific researches on mirror neuron activity by J. Bauer (2006) it is stated that there are nerve cells in the human brain affecting language production the same way mirror neuron activity affects the development of movement system. On the operating base of mirror neurons, the children in their early age acquire the first social and communicative approach (Behrens, 2009).

To the terms "prepared environment", "absorbent mind", "human tendencies" and "self-activity" by M. Montessori's child's developmental concept is also added the term "inner development (construction) plan" (*innere Bauplan*) - the child is born with his own definite development plan fulfilled by the support of the child's self-activity and the environment (Montessori, 1994b). Nowadays the concept of the "inner development plan" stands for the peculiarities of genetically conditioned central nervous system (CNS) - an organization of genetically determined and hierarchically arranged morphological, neurobiological and neurological base structures. The scientific researches confirm that, although the CNS structure and its features are genetically appointed, nevertheless it is a plastic and evolving system capable of adapting to the specifics of the current developmental stage as well as to the influence of the external and internal factors. Different development blocks (including development of motility, language and socialization) are exposed to the child's environmental impact (Michaelis, Niemann, 1995) and the learning process results in structural changes of the CNS (Lebeer, Rijke, 2003).

M. Montessori believed that the child's language development has an "explosive" nature (*explosionartige Phänomene*), not a linear one. The child's language development periods without any external display of development dynamics, M. Montessori associated with the process of accumulating information. When a sufficient amount is accumulated, there is a rapid growth of language development featured by qualitative acquiring of new skills. Hence the relatively quiet periods of information accumulation interchange with rapid periods of language development reaching the height of the oral language development at two and two and a half years of age. By the age of two and a half years the basics of child's native language system are already evolved. In the further development period til about five or six years of age there is just an ongoing process of perfection (Montessori, 1994a).

According to M. Montessori the child develops through several "sensitive periods", which have a gradual beginning, culmination and closure. Sensitive periods in the child's development last for a specific time span, when the child learns with joy, interest and endurance; during these periods it is possible to develop and to improve certain qualities and skills without making much effort for the child (Holstiege, 1999; Montessori, 1994a). Since birth til the age of five or six there is the sensitive period of oral and written language learning, that goes into the next age group as a grammar acquisition sensitivity (from 6 to 12 years of age). The sensitive period of language development is relatively divided in the sub-periods:

- oral language acquisition (0-3 years);
- written language acquisition (3 - 6 years):
 - acquisition of writing (3,5 - 4,5 years),
 - acquisition of reading (4,5-5,5 years);
- acquisition of grammar (6 - 9 years).

After the six years of age the development of language evolves by other regularities - there is a transition from an unconscious or absorbent form of language acquisition to a deliberate learning process (Монтессори, 2006).

On the basis of empirical cognitions by M. Montessori and contemporary neuroscientific researches, A. Winkler specifies the sensitive periods of language development mentioned above and notes that it is possible to improve certain skills in a language field all through the lifetime:

- the pre-sensitive stage of oral language starts from birth to 1 year of age, the sensitive stage - 1 to 4 years, the post-sensitive stage - 4 to 12 years, the end of the sensitive stage - at about 12 years of age (Winkler, 2010);
- the pre-sensitive stage of the written language acquisition - from 1 to 4 years, the sensitive stage - from 4 to 9 years, the post-sensitive stage - from 9 years of age, there is no end of the sensitive stage - the deliberate improvement of the written language is possible throughout the lifetime;
- the pre-sensitive stage of grammar acquisition - from 1 to 5 years, the sensitive stage - from 5 to 8 years, the post-sensitive stage - from 8 years of age, there is no end of the sensitive stage - the deliberate improvement of grammar is possible throughout the lifetime (Winkler, 2008).

Also M. Montessori believed that the function development and the acquisition of skills is possible after the end of the sensitive periods, but then the learning process continues at a conscious level and it requires a willpower of a child (Montessori, 1994a) - consequently there is no longer possible an unconscious and easy language acquirement, what was based on the morphological, neurobiological and neuropsychological development of the child's brain in the early and preschool age. Also S. Kannengieser (2009) in the context of speech therapy science notes that the sensitive periods do exist and they are defined by the maturation processes of brain structure, however their initial, final and critical stages still have to be appraised.

M. Montessori indicated that the general interconnections of language development mentioned above (absorbent mind, human tendencies, sensitive periods) are the same for all of the children, but not the preconditions for language development (inner development plan, self-activity, environment).. It also defines both the different levels of language development and the emergence of speech and language development disorders.

The origin of child language disorders M. Montessori associated with insufficient or incorrect speech environment and a child's specific sensitivity towards environmental incentives. Language acquisition is the road to gain greater independence, but at the same time it is also related to the possibility of regression (the occurrence of disorders). M. Montessori indicated that children's speech and language disorders may be functional or based on organic peripheral or central lesions (Montessori, 1994a; Монтессори, 2005). If the development of speech and language functions is delayed and does not correspond to the general regularities of the ontogenetic language development, then the retention of language development can leave negative consequences onto those language system levels, which were supposed to be developed. M. Montessori also indicated that during the following development periods to the oral speech disorders aligns incorrect spelling (Монтессори, 2005) or written language disorders (Tomele, 2013). M. Montessori believed that it is necessary to start a correction of speech and language disorders timely - early at the preschool age (Монтессори, 2005), but when correcting linguistic defects, the laws of physiology and ontogenesis of the child's development should be taken into consideration - the lessons and their content have to be formed based on those laws as well as an adjustment of the level of complexity (Montessori, 1994a).

The critics of Montessori pedagogy, such as W. Bohm (*W.Bohm*) (2012) notes that certain of M. Montessori's statements are defined unclearly and wrapped in mysticism. However, the author of the paper G. Tomele believes that at the time the works of M. Montessori have appeared, there was not yet developed a scientifically reasoned and reliable evidence-based regularity research of the child's brain development and activity, as well resulting in no adequate scientific terminology. Only at the end of the last century and at the beginning of this century, thanks to the introduction of advanced technologies in medicine, there has been a significant turnabout in the development of neurological sciences (Hütner, 2008). On the basis of the child's development empirical observation, M. Montessori, has done the most fundamental discoveries (absorbent mind, sensitive periods, child's self-activity, human tendencies, inner development plan, the role of prepared environment and social communication in child's development, etc.), which are approved nowadays by the latest scientific researches in the fields of psychology and neurology sciences (Hütner, 2008; Milz, 1999; Polk-Lillard, 2008).

In the conclusion of the theory analysis of Montessori pedagogy it can be concluded:

- M. Montessori's empirical observations coincide with the contemporary discoveries in field of neurosciences;
- M. Montessori's language development conception combines the variety of language development theory recognitions (nativism, constructivism, interactionism, behaviourism) and it (the conception) meets the guidelines of a holistic approach in medicine, psychology, pedagogy and speech therapy.

The research of Montessori pedagogical practice in the context of speech and language development promotion

The theoretical knowledge by M. Montessori is essential for understanding the language development process, language development promotion and language development disorders within the meaning of pathogenesis from the point of view of a holistic approach, but also important is the understanding of the practical use of Montessori pedagogy - the didactic principles, the didactic materials and the educator's competence.

M. Montessori believed that the child "learns" not only by working with the didactic materials during a lesson, but "absorbs" the knowledge continuously and in every situation. Thereby the use of the pedagogical didactic principles by Montessori (the principle of individual approach, the principle of free choice, the principle of development, the principle of self-sufficiency, the principle of "an error is not an error", "from a capture to a comprehension" or the principle of subject activity, "from the specific to the abstract" or the principle of visibility, " from the simple to the complex " or the succession principle, the systemic principle) has to be viewed widely - in a teaching and a learning (playing) process, in the correction procedure of development disorders, and in daily situations in a kindergarten or at school, in public places, in the family, etc. (Tomele, 2010). Due to that, the didactic principles, materials and pedagogical competence are not the only essentials in the children's training, educating and development disorder

correction, but also the cooperation with parents, educating them and involving in the pedagogical process play a significant role.

In the context of language acquiring, M. Montessori emphasized several skills to be acquired - listening, speaking and written language (writing and reading). The key to acquiring the listening skills is The Silence Games, which activate the speech and hearing center and promote the sound perception, also essential is the word-economy principle, when working with any didactic material to make it easier for a child to perceive and understand the most important information. To acquire the sound pronunciation and for the speech improvement, M. Montessori suggested daily exercises of the respiratory and articulation apparatus to all children. Whereas, the methodology of acquiring the written language is intended not only for the acquisition of graphic images, writing and reading, but also for a completion of sound pronunciation and perception. The expansion of vocabulary, and the acquiring of morphology (linguistics) and syntax norms happen during any activity, and all groups of Montessori didactic materials (the practical life tasks, the sensory material, the language material, the mathematical material, the cosmic education material) can be used to promote the development of the child's language - by direct and indirect forms of work.

Originally, M. Montessori used her method in a training for children with learning disabilities, but from 1907 - 1967, Montessori pedagogy was used only as a general education method for educating and training of children. In 1967 it was started to be used again for the training of children with developmental disabilities - Montessori pedagogy earned the status of the revitalizing or therapeutic pedagogy, and was included in the concept of social pediatrics by Th. Hellbrügge, intended not only for early diagnostics and correction of disorders, and parental training, but also for the social inclusion for children with various developmental disabilities in the society of healthy children (Hellbrügge, 1981, 1986). Th. Hellbrügge believed that the isolation of children with special needs in the special educational institutions deepens a disorder manifestation in the social sphere, because it is impossible to obtain a social experience by being in a contact with children without developmental disorders. Also children with language disorders are not provided with the environment promoting language and social development, during their stay in the special education institutions. An optimal solution would be to include these children in the general education institutions, providing an effective support system for correcting the language disorders at the same time. Nowadays, the social pediatric centres by the concept of Th. Hellbrügge are located not only in Germany but worldwide - there are 23 centres in Europe, 6 in Asia and 12 in the United States, including that one in Latvia (University of Latvia Centre of Social Pediatrics) (Tomele, 2011).

The idea of revitalizing pedagogy (*лечебная педагогика* - therapeutic pedagogy) also appeared in Russia at the end of the last century. E. Mastjukova (*Е.М.Мастюкова*) (1997) described it as a new pedagogical specialization arisen in the interaction of medical and pedagogical sciences for the training of children with movement, language, intellectual, behavior, communication and socialization disorders and correction of those disorders. V. Prusakov (*В.Ф.Прусаков*), M. Belousova (*М. В. Белоусова*) and M. Utkuzova (*М.А.Уткузова*) (2009) classify the revitalizing pedagogy by Montessori as one of the methods of neurorehabilitation.

Both abroad and in Latvia Montessori pedagogy is used in the educational institutions, the development centers, in the rehabilitation institutions for educating, training, development promoting of children and disorder correction. Two kind of interchangeably independent directions of Montessori pedagogy have evolved - the classical and the revitalizing (special, therapeutic) Montessori pedagogy (Tomele, 2011). Nowadays, when the inclusion process of children with special needs in the general education system is topical, both directions of Montessori pedagogy successfully complement each other.

In the Alternative Education Centre of Liepaja University Institute of Educational Sciences (LiepU IES) the use of Montessori pedagogy in the speech and language development promotion and disorder correction is being studied since 2007, because the didactic principles by Montessori pedagogy coincide with the general principles of

development, systemic and the complex approach, and the didactic principles of language acquiring, as well as with the speech therapy work specific principles (individual approach, visibility, practical activity, succession, scrupulosity, etc.).

In 2008-2009 G. Tomele made the comparative research in a social care institution to carry out a study of development and development dynamics for two groups of children - one group of children was trained and educated by using Montessori pedagogical methods and materials, but the other by the classic approach methods. Munich Functional Development Diagnostics was used to evaluate the development of children. The research lasted for 5 months and there were 24 children taking a part in it. The results confirmed that Montessori pedagogy promotes a development of child's personality and language in whole, and also positively affects the general development - the general and subtle motor skills, the cognitive development processes, the social and self-sufficiency development. It was concluded that the social development and language disorders have to be viewed in a context of the child's development in a specific social environment, and the normalization process has to be focused on a further development of the child's individual activity and communication abilities. The main goal in this process is to improve the communication and the social environment. As a successful model, was acknowledged the "prepared" environment in terms of Montessori pedagogy (Tomele, 2010).

The second comparative research was conducted in 2015-2016 in two preschool education groups to explore the early literacy development, developmental dynamics and opportunities to prevent the reading disorders. There were 29 children of senior preschool age from two preschool educational institutions taking part in the research. In the preschool educational institution (PEI) Y the general education program was acquired by Montessori pedagogical methods, in the PEI X - by the classic approach methods. There was used DIBELS Next method to test the early reading skills. The test took place twice - in winter and spring. Overall the results of the winter test for PEI Y (n = 11) were good - 90.9% of children had reasonable early reading skills, and 9.1% of children needed an intensive support. The PEI X (n = 18) winter test results showed a lower level of early literacy acquiring - only 50% of the children's literacy test results were sufficiently, 22.22% of the children needed a strategic support to improve the early reading skills, whereas 27.78% needed an intensive support. In the second test in spring, it was ascertained that in PEI Y the early literacy level is still reasonable to 90.9% of the children, while 9.1% of the children have improved and they need just some strategic support in the future. Whereas in the PEI X it was ascertained that the percentage of a sufficient early literacy acquiring, and the need for the strategic and intensive support remained unchanged (Tomele, Antoneviča, 2017). The results of the research confirmed that in the Montessori group the children's early literacy has a higher level, the dynamics is more positive, the parents are more involved in a promotion of the early literacy, and the risk of having possible reading disorders at school is lower.

A systematic individual work with children with a linguistic development delay or disorders at the Alternative Education Centre of LiepU IES since 2007 confirmed that the practical life materials, sensorial materials, language and mathematical materials by Montessori successfully provide the development of motor and cognitive sphere, while lessons using Montessori didactic materials have to be adjusted, so their therapeutic effect would be intensified and the expected result in the language development promotion would be achieved. In cases of language disorders, it has to be integrated additionally specific speech therapy technologies in the lessons. Whereas the philosophy by Montessori pedagogy and didactic principles coincide with both - the speech therapy correction implementation and the cognitive development promotion, socialization and behavior normalization for children with language development problems considering the principles of the humanitarian pedagogy. An essential factor is the cooperation with parents and the consolidation of acquired skills, knowledge and mindset in daily situations in the family. The studies carried out confirm the view of T. Hellbrügge that the development of children's language and cognitive abilities in Montessori pedagogy occur on the basis of:

- the training of the general motions and subtle motility;
- the activities with objects and the development of game activities;
- the sense of sensitization and differentiation;

- the improvement of the social relations;
- the creativity and thinking development;
- the promotion of attention, concentration, patience;
- the development and stability foundation of will, personal activity, initiative, self-sufficiency and self-awareness (Hellbrügge, 1977, 1981; Tomele, 2011).

By using Montessori Pedagogy in a process of speech and language development there is a holistic approach carried out following the multi-structural model of speech and language development (Tomele, 2015; Lidaka, Tomele, 2016).

In 2004 within the framework of the program "Education and Training 2010" in the European Union (EU) it was made a set of eight core competencies that should be acquired by children during the educational process:

- Communication in the mother tongue;
- Communication in foreign languages;
- Mathematical competence and basic competences in science and technology;
- Digital competence;
- Learning to learn;
- Social and civic competences;
- Sense of initiative and entrepreneurship;
- Cultural awareness and expression.

It is noted in the EU recommendations that basic language skills, reading and writing skills, the proficiency of calculation, and informatics and communication technology skills (ICT) are an essential basis and support for all kinds of the learning activities (*Recommendation of the European Parliament and of the Council of 18 December 2006 on key competences for lifelong learning*, 2006). It follows that the competence of mother tongue is one of the most significant key competencies in child's personality development and education. Currently Latvia is implementing a project "The competency approach in the learning content" with the support of the European Social Fund. Within the framework of the project until a school year of 2021/ 2022 there will be implemented a gradual transition to the education acquiring based on the competences at all levels of education, which means that:

- the children will have to acquire knowledge on the basis of practical experience, and they will have to be able to use the knowledge in new situations;
- it will have to be developed children's abilities and a willingness to learn;
- will have to pay greater attention to children's personality development and a formation of character habits (*Kompetenču pieeja mācību saturā*, 2016).

Analyzing the theory and practice by Montessori pedagogy in the context of competence-based education, it can be concluded that the concept of pedagogy developed by M. Montessori, right from the beginning is based on the competence-based education acquirement (skills, knowledge, mindset) both theoretically and practically, by developing and improving the child's personality. By promoting the development of children's speech and language by diminishing the risks of speech and language disorders and by implementing an optimal procedure process of correction in cases of disorders, the acquirement of mother tongue competence is provided primarily, but secondarily - the competence-based education acquirement in general. The concept of Montessori pedagogy in practice has proven that there is a possibility of different approach to the children's training and educating (for both children with and without special needs), including the promotion of language development.

Conclusions and Recommendations

Carrying out the theoretical and empirical research on an operating base of LiepU IES (Institute of Educational Sciences) The Alternative Education center from 2007 – 2017, the drawn conclusions are as follows – Montessori Pedagogy (theory, didactic materials, practice) promotes the speech and language development of pre-school age children.

The pedagogical didactic principles by Montessori coincide with the general preconditions of language development promotion, the speech therapy didactic (the individual approach, visibility, practical activity, succession, conscience, etc.) and general basic principles (development, systemic and the complex approach principles), and they are applicable to the promotion of speech and language development.

The environment prepared by Montessori pedagogy, the professional competence of experts and the involvement of parents in the process of training, educating and disorder correcting provide the preconditions for positive speech and language development, whereas the child's biological potential defines the individual nature of this process. The use of Montessori pedagogy philosophy, the didactic principles and materials, based on the multi-structural model of speech and language development, and by considering the principles of humanitarian pedagogy, provide a successful process of speech and language development, as well as the child's development in wholeness and the competence-based preschool education acquirement.

In the promotion process of children's speech and language development at the preschool age, the general and individual preconditions of language development have to be followed in the speech therapy of speech and language disorder correction in the context of the multi-structural model of speech and language development, as well as the principles of the holistic approach and humanitarian pedagogy.

Abstract

This paper is part of a broader international research project, which includes eight case studies carried out in public schools in Portugal and in Chile. It is a comparative study, which aims to understand the way teachers describe formal and informal opportunities for collaboration in their schools and its effect in terms of practical knowledge; to identify the enablers and inhibitors that influence professional collaborative learning at school; to understand the role of teacher evaluation and student academic results on teacher's professional development; to analyse how teachers with different skills, experiences and schools view their own professional development. In this case study, a public school, located in the north of Portugal, with sixty years of history, was selected. The participants in the study are teachers from different disciplinary areas and teaching departments. The school includes elementary and secondary school level, with regular and professional study programmes. Data collection is based on semi-structured interviews to the school director and to eight teachers, mainly coordinators of teaching departments. Results based on findings from teachers point out the importance of collaborative work, but they also recognize that schools need a reorganization that includes time for this purpose, integrated on teacher's schedule. Informal opportunities are also seen as fundamental for professional development and to improve student outcomes. Conclusions and implications for teacher collaboration and professional development will be discussed in the paper.

Keywords: Collaboration, Professional Development, Informal and Formal Learning, Teacher's Perspectives, Portuguese Schools

Introduction

Collaboration is a key challenge and opportunity for schools and teachers to improve their performance and contribute to their own professional learning and development. Collaboration may assume different forms, such as collaborative planning, peer coaching, mentoring, collaborative action research, or even ranging from advice and consultation to shared decision-making (Hargreaves, 1998; Little, 1990). School culture and leadership is also an important variable influencing teacher collaboration and professional development, as collaborative cultures foster and build on qualities of openness, trust and support among teachers (Flores et al. 2007). Basically, culture is related with people when they are with each other in classroom, or at their disciplinary departments. In this relationship, comes out their values, beliefs and behaviors, shared by all organization members (Schein, 1985, in Day, 2004). Day (2004) refers that school is a physical canary, a formal organization, an employer. It's a rich social and psychological context where teachers develop a professional sense of practice, efficacy and community. For the author, this last aspect seems to be the most important value for the teaching and learning process, for teachers and students.

As referred by Day (2004), teachers understand that shared objectives, collegiality, taking risks, support, mutual respect, open mind, humor and celebration, life formation contributes to the collective passion for professional development. This passion helps to reject the tendency for individual cultures (like autonomy, isolation, and insularity rule), artificial collegiality (the relationships at work are imposed by autocracy), balkanization (exists a competition to obtain resources and rewards; loyalty to the discipline or to the department comes before the

loyalty to the school). According to Day (2004), the ideal would be for schools to assume collegial relationships, where people are as important as the professional, where the work by sharing should prevail towards an emotional comprehension. Denzin (1984, p. 137), mentioned by Day (2004), refers that shared emotions are the center of the meaning to understand, in a significant way, the others emotional experiences. According to Forte & Flores (2014), collaborative work brings several benefits such as moral support, which allows teachers to respond in a more successful way to the problems, among other advantages such as new ideas, reflection about practice, more analytical and creative energy to deal better with students and a stronger capacity to learn from others and to improve continuously. However, the construction of learning collaboration networks takes a long time to function, literature suggests that they offer significant effects, on teachers and, also on students (Day, 2004). Those effects are related with: less teacher's isolation, a bigger compromise to the mission, the objectives of the school and to teaching work, a better chance for teachers to be informed, skillfully renovated and inspired to inspire their students, significant development to adapt teaching to students, and a greater chance to look for a systematic and essential change.

This paper aims to analyze teacher's perspectives on collaboration and professional development and understand the way teachers describe formal and informal opportunities for collaboration in their schools and its effect in terms of practical knowledge and professional development. The study is part of a broader international research project, which includes eight case studies carried out in public schools in Portugal and in Chile.

Method

This study is part of a broader international research project and also a Masters Dissertation on Educational Management and Administration, carried out at the Portucalense University, in Portugal.

The objectives of the project include the following:

- To understand the way teachers, describe formal and informal opportunities for collaboration in their schools and its effect in terms of practical knowledge.
- To identify the enablers and inhibitors that influence professional collaborative learning at school.
- To understand the role of teacher evaluation and student academic results on teacher's professional development.
- To analyze how teachers with different skills, experiences and schools view their own professional development.

This study aims to analyze and discuss teacher collaboration and professional development based on findings from a case study carried out in Portugal, in a public school, located in the north of Portugal. The following research questions were defined to guide the study:

- How important are formal and informal experiences of teachers for their practical knowledge?
- What are the facilitating and inhibiting features that contribute to the development of collaborative teacher work?
- What is the role of teacher evaluation and student results for teacher collaboration and professional development?
- What conditions contribute to teacher's professional development and learning?

Data Collection

The research design of the study combines a qualitative and quantitative approach. The methods for data collection include a questionnaire, semi-structured interviews and participant observation. The questionnaire was applied to all teaching staff at the school (N=173), from October to December 2016. For the semi-structured interviews, the school director and teachers with coordination roles in the school were selected (N=8). The semi-structured interviews were carried out from January to March 2017. Table 1 presents a summary of the phases and methods of data collection.

Table 1. Phases and methods of data collection

Phases	Moment	Participants	Data collection	Data Analysis
1st Phase	October to December 2016	Elementary and secondary school teachers. (N=173)	Questionnaire	Statistical analysis using the SPSS program. Content analysis of written comments by the participants.
	January to March 2017	- School Director - Department Coordinators - Coordinator Internal	Semi- structured Interview	Content analysis of interview transcriptions.
2nd Phase		Evaluation (N=8)		Content analysis of field notes and observations.
3rd Phase	March to June 2017	Teachers that authorize the observation	Participant Observation	

For the purpose of this paper, only qualitative data from the 2nd phase of data collection, this is, from the semi-structured interviews to school leaders and teachers with coordination roles in the school, will be analyzed and discussed.

Ethical procedures were considered during the data collection. The research protocol was provided to the School Director, who authorized the development of the study in the school. Informed consent (to the director and teachers) and confidentiality of the data were assured at all research procedures.

The school

The school participating in this case study is a secondary school, with historical reference and over 60 years of existence. It was the first industrial and commercial school in the region and it aims to be a reference in education/training, offering basic level education and a wide range of secondary level education (nighttime inclusive). The school receives students coming from different socio-economic and cultural backgrounds and it is designated as a TEIP school (Educational Territory with Priority Intervention), concerned with disabilities, overcoming absenteeism and social exclusion in early school. The school includes a multidisciplinary team, including a psychologist, a social worker, a coordinator of social and cultural activities, special education specialists, etc. It is the school with the highest number of students and teachers in the region: 1273 students (between the teaching daytime and nighttime); 173 teachers (day and night). In Portugal, schools are organized in mega-groups, according to recent changes in the Portuguese legislation. This organizational change introduced many challenges for teachers work, their pedagogical practices, collaboration with others, and their personal and professional development. Besides this "problem", the different policies or external regulations, produce a permanent conflict toward teachers' identity and a stable culture of the profession. For these reasons, the context chosen for the study seemed relevant and enriching, considering the objectives of the international project and the impact of its results on the school analyzed. Besides this, the report of the external evaluation of the school called attention to the importance of the development of collaborative practices amongst school teachers and departments. Therefore, the participation of this school in the international research project seemed to be an excellent opportunity to develop further steps in this direction.

Participants

The selection of the participants in the study followed the research protocol of the international project, which suggested the selection of six to eight teachers, with roles of coordination and leadership, besides the role of teaching in the school. The teachers of this case study were selected by the researcher, based on the criteria of those who were involved in intermediate leadership processes, such as the ones with the role of Coordinators of Curricular Departments (CCD), from different disciplinary groups, and also other teachers who play a significant role in the school, such as the Responsible for the Library and the Internal Evaluation Coordinator. A brief description of the characterization of the participants in terms of sex, age, academic qualification, years of teaching, years of teaching in this school, school department and coordination roles are presented in Table 2.

Table 2. Characterization of Participants

#	Sex	Age	Academic Qualification	Years of Teaching	Years of Teaching in the School	School Department	Coordination Roles
T1	M	66	Master degree	36	17	Philosophy	Director of the school and top leader
T2	F	50	1 ^o cycle of graduation	28	23	Portuguese	CCD – Intermediate leadership and teacher
T3	F	52	Post-graduation in mathematics	31	31	Mathematics	CCD – Intermediate leadership and teacher
T4	F	54	1 ^o cycle of graduation	30	27	Foreign languages	Coordinator of the national reading plan. Responsible for the school Library. Coordinator of the French disciplinary group and teacher
T5	F	54	1 ^o cycle of graduation	31	28	Mathematics	Internal evaluation coordinator and teacher
T6	F	53	Master degree	26	25	Experimental sciences	CCD – Intermediate leadership and teacher
T7	M	54	Post-graduation in School administration and management	25	25	Social sciences	CCD – Intermediate leadership and teacher
T8	F	51	Master degree	24	24	Foreign languages	CCD – Intermediate leadership and teacher

CCD – Coordinator of Curricular Department

Data Analysis

For data analysis, a content analysis was carried out and data from the semi-structured interviews was organized in different categories (Bardin, 2009). The major categories emerging from the data were the following:

- School leadership and culture;
- Enablers and inhibitors of professional collaborative learning at school;
- Opportunities for professional development: formal and informal experiences;
- Being a teacher today and in the future

In the next section, findings will be presented and discussed, according to the data analysis and the review of literature in this field.

Findings

This section explores the main findings from the interviews to the coordinators of curricular departments and the school director. As referred previously, the data was organized in four main topics, which are presented and discussed in detail in this section. Evidence from the interviews, based on the participants' quotes, is also provided to support the findings.

a) School Leadership and Culture

According to the school director's opinion, the school culture is still under construction, since the school was recently grouped. However, this school has a strong culture related with the professional teaching and also with higher level training. About leadership, the director reinforces the co-responsibility and a democratic leadership. Coordinators, in regard to the school leadership and culture, refer the great environment to work.

"Well the culture of the school group is still under construction, it is still very recent. Secondary school has a very strong culture linked to vocational training and higher level training. It is rooted in the community, having turned 60 years in March. It is definitely a school that has formed many medium-high level individuals in this city. It has a professional training culture, but also a very great concern with the academic training of the students, in addition it also invests a lot on student active citizenship. It is a grouping of schools that wants to build a new identity based on and supporting the identity and culture of the secondary school already rooted in the community, matching it with other schools, in which the reality is clearly very different, even by the geographic location of the Secondary school that is in the center of the city and the others in the periphery."

(Teacher #1_SchoolDirector)

"As a student I attended two different schools in this city, one of them was this one and it was this one that I preferred. There was a better environment between students and teachers here, almost 40 years ago."

(Teacher #5 Internal evaluation coordinator)

"The environment is very good among teachers. Especially in my disciplinary group, there is a lot of sharing, it is almost a family, with the other groups we also relate very well, there is a good environment, I think."

(Teacher #7 CCD)

"I am not the right person to talk about this as I am the school leader, but when I joined the school management team, I have always defended a democratic, participative management, of joint responsibility of all the intermediate leaderships. That is why I have given the intermediate leaderships adequate conditions and they know that they have the necessary autonomy to make decisions, within the framework of the legal normative. The delegation of competences is a fact here, it shows a democratic management and with the basic principle that I have always defended: he who is in the school has the capacity to decide. This means that when the director is not there, there will always be someone who has the ability to decide and to solve problems in the immediate."

(Teacher #1 School Director)

b) Enablers and inhibitors of professional collaborative learning at school

Coordinators on their interviews consider that facilitating features are related, mostly, with emotional issues like empathy, capacity to collaborate and availability. The inhibitors are mostly related with incompatible schedule, different interests, difficulty on following the rules, different academic backgrounds and qualifications, values and age.

I notice that sometimes we go on opposite directions, in terms of class council, the teachers who are more involved with the class ... we should have identical directions. I realize that some colleagues, by their way of being, do not follow the rules ... I like to follow the rules because an organization with rules is essential for the success of students and also for us teachers, to have a good environment, ensuring a better quality of teaching and learning.

(Teacher #7 CCD)

Schedules are the main obstacle, incompatible schedules that do not allow us to sit down and talk about anything, we often exchange ideas by e-mail, regarding the preparation of a test, for example. Factors that facilitate are the spirit of collaboration and availability among colleagues.

(Teacher #6 CCD)

I have more affinity with people of my own age, it is usually with them that I talk and I share the work more. Colleagues from the same year in which I finished my degree, there is greater empathy with them. There is probably not so much affinity in terms of certain people, with more complicated personalities, for example, to develop conversations.

(Teacher #8 CCD)

c) Opportunities for professional development: formal and informal experiences

The coordinators interviews reveal that formal experiences fallow higher and independent initiatives both from the Ministry of Education, by several education legislations.

We are together in the same boat and we help each other, we celebrate our birthday days, sharing little snacks and gifts. Our relationship is great, we know each other well. The colleagues who are placed here feel this and, most of them, like to be here. We also cherish them, we try to help, and so they feel sorry for not being able to continue in school.

(Teacher # 5 Internal evaluation coordinator)

Disciplinary areas meet at least twice per period. It may happen that it is necessary to meet every month, but this regularity is not always needed. But at least twice a period, I think that all disciplinary areas meet. The class directors meet with the equivalent periodicity.

(Teacher #1 CCD)

The informal experiences are associated with teacher's daily work at school. Collaboration in this way of thinking is viewed like a simple sharing process, this means, that there seems to be a difficulty to understand the real mean of the concept of collaboration. When asked about the informal experiences of collaboration, some of the teachers gave answers such as "No, not that I know of." or "No, I do not know what you mean. Our meetings are held in an informal way , maybe...". Another teacher, however, answered the following:

Yes, for example to prepare tests and activities and to share and / or discuss something that may have occurred or is occurring outside of what should be the normal development of the teaching and / or learning process.

(Teacher #3 CCD)

d) Being a teacher today and in the future

When asked to find metaphor that suggested how to be a teacher today and in the future, the teachers interviewed had some difficulties to answer this question. Some preferred to write about the discouragement and negative thoughts they feel, when thinking about the disrespect for the teaching career today.

I want to continue to think that we are the sun that will illuminate the minds of these kids, although we are increasingly more substitutable because they will gather information from sources we do not know ourselves, their rhythm is different from ours, but we (teachers) and the school will still continue to be a privileged space of information and knowledge for some more time.

(Teacher #1 CCD)

In the near future, a change in the process of teaching versus learning must take place in an disruptive way, in the sense that, first of all, it will attract the students and we, the teachers, will do not feel anymore in class as if we were "preaching to the fish."

(Teacher #3 CCD)

At the moment, I am in a phase of great demotivation, so I only think about negative things. Maybe in the port without a shelter, at this moment I feel unmotivated about my profession.

(Teacher #8 CCD)

I am a person that knows very little, I am always trying to improve what I know and my practices, because I feel that I know little very more and more. It is a fast pace in personal and professional life. In the future, I want to be here experiencing what is next, but I have some fear about the future, in practice, this is what we have ... Regarding the students we can have in the future, the citizen that we are going to have is what worries me.

(Teacher #7 CCD)

A gear, which needs to be well oiled so that it can continue to work in the future, because I think that as an education professional, I am not isolated and it is necessary that things interconnect I am thinking of those wheels that spin in the same direction, if there is something that stumbles, they will stop working ...

(Teacher #6 CCD)

As parents are very, very absent, the school seems to be a kindergarten; The students have very little autonomy, they want to learn by playing; They are less and less responsible.

(Teacher #5 Internal evaluation coordinator)

Results, Conclusions and Recommendations

Results based on findings from teachers point out the importance of several aspects related to collaboration and professional development in schools. Some of the results can be summarized according to the following points:

- a) positive perception of the importance of collaborative work, recognizing its importance for teaching work, professional development and organizational performance;
- b) nevertheless, this positive perception is mainly focused on a vision of collaborative work in its informal dimension;
- c) reinforcing the idea that collaborative work, in order to be maximized, presumes the existence of a democratic, participatory and responsible organizational culture, allowing teachers to have high degrees of autonomy in the exercise of their functions;
- d) recognition that the main inhibiting factors of collaborative work refer to the organizational dimension (especially schedules) and to the socio-affective dimension (difference / diversity of interests, values, attitudes, academic culture, etc.);
- e) the importance of certain attitudes to facilitate collaborative work, such as empathy, openness and willingness to collaborate, and teachers are relatively apprehensive about the future, both for the challenges they face and for the autonomy of the students, absence of parents, demotivation, etc.)

These findings are in accordance with previous research and studies in this field, as for example, the study carried out by Forte and Flores (2014), about teacher collaboration and professional development in the workplace, which points out to the problems and limitations situated at the organizational level, such as time and working conditions, the lack of training in collaboration, and issues such as motivation and personal difficulties. Teachers recognize the importance of collaborative work, but they also argue that schools need a reorganization that includes time for this purpose, integrated on teacher's schedule. Informal opportunities are also seen as fundamental for professional development and to improve student outcomes.

Based on these results, recommendations for future improvement should focus on the following strategies:

- a) to foster the positive perception of collaborative work in all its dimensions, whether informal or formal, creating opportunities for teachers to experiment and innovate;
- b) reconfigure teaching work in a more flexible and integrated way, especially with regard to schedules and curricula, so that effective collaborative work is possible outside and within the classroom;
- c) develop opportunities for continuous training that allow the experience and acquisition of skills and attitudes that facilitate collaborative work;
- d) reinforce an organizational culture based on democracy, autonomy and participation, so that collaborative work can take place in an environment of trust and recognition.

Education of Seniors in the Area of Cybersecurity

Petr HRUZA

*University of Defence, Faculty of Military Leadership, Department of Tactics
Email: petr.hruza@unob.czr*

Abstract

Cybersecurity is a current and frequently discussed topic, which affects all members of society, although they may even not realize it. Many economically active people are interested in cybersecurity on their own initiative. It is connected mainly with their active use of technologies in their private lives. Due to information technologies we may encounter an entirely new type of social setting, which is reflected in seniors' lives. As the number of seniors has been growing and they long for being further educated and acquainted with new technologies also after their working age, it is necessary to provide them with adequate IT education. The paper includes the assessment of current situation in education of seniors in the Czech Republic. Education of seniors with the use of modern technologies is described in more detail. The final part of the paper includes proposals for easy and comprehensive education of seniors in the area of cybersecurity.

Keywords: Digital society, Education of seniors, Cybersecurity, University of the Third Age

Introduction

Introduction of first computer technologies raised a number of reactions in society. Some sceptics saw first computers as a futuristic sci-fi, where machines replaced human element and the world fell into darkness. However, positive emotions and desire to try new things prevailed in more numerous groups of optimists. Many projects existing already at the beginning of computer technology came true in order to serve people in their every-day lives. Every user had to cope with the functioning of new technologies and often mechanically learn the functions of new machines, though. Software was the biggest barrier, because at the beginning it was not fully comprehensible for ordinary users.

At present people do not have to deal with similar problems when learning computer technologies. Almost since their toddler age children have been capable of finding intuitively the sense of using computer technology, mainly smart phones and tablets. We get to the issue of personality categories at present age. Marc Prensky, an American author and education advisor, classified such categories in digital age as digital immigrants and digital natives (Ondrušová, 2011; Vágnerová, 2007).

Szymon Marycki was the first in history dealing with education of seniors. He introduced the concept of preparation for old age. Szymon Marycki is the author of "O szkołach czyli akademiích ksiągdwój" ("Two books on schools or academies"), written in Krakow in 1551. Jan Ámos Komenský (Comenius), a bit better known author in the Czech Republic, included seniors into the educational cycle. He distinguished several types of educational cycles from birth to death in his "Pampaedia" – pre-school, primary vernacular school, adult education and old age education. He defended the necessity to educate people in their old age by stating that education had to include all and be managed in several various directions (Gruss, 2009; Příbyl, 2015).

Gerontopedagogy is a pedagogical discipline dealing with education of elderly people. It is not only education in old age, but also education for old age. From the narrower standpoint, gerontopedagogy is defined as a theoretical-empirical discipline providing seniors with complex support in the effort to meet their needs in a non-medical dimension.

The main international documents dealing with lifelong education include "Learning: the Treasure Within" (UNESCO); "Lifelong Learning for All" (OECD); and "White Paper on Education and Training". There is "The

National Program of Preparation for Ageing” in the Czech Republic. All the above mentioned documents have some common thoughts, such as the use of media and educational technologies in educational processes, the analysis of social problems and the issues of financing. The importance of these documents is in the fact that they indicate new prospects in life for elderly citizens (Skoruša, 2014).

Why to be Educated in the Area of Cybersecurity

At the birth of cybersecurity many people might even not anticipate the benefits of such area. However, with the increasing number of cyberattacks and the spread of malware, society started registering new threats, which might affect its life. Therefore, it is necessary to inform all age categories in society about the existence of such threats. Children and teenagers are the age categories to which much attention is paid regarding cybersecurity at present. Special lectures on the above mentioned topic are delivered already at primary schools and children often take part in various projects. Many people take initiative and deal with cybersecurity during their careers. It is related mainly to their active use of technologies in their personal lives. Seniors constitute the last group. They might be on a similar level as children to a certain extent. They are, similarly to children, over-trusting and naive.

Old age is a period of life every person will inevitably reach. Old age is symbolized by autumn in literature. Hectic modern age does not have much understanding for this period of our lives, the period which is perceived as something almost negative, something without joy and active approach to life (Příbyl, 2015). Retirement is a social change, which gives a person the status of a senior. This event is a fundamental change for many people. It often changes their life style and financial needs. Such fundamental changes may cause problems to a person. It is a big advantage for a senior if he/she got in contact with information technologies already in a pre-retirement age (Ondrušová, 2011; Vágnerová, 2007). Such experience becomes invaluable as it is much easier for seniors to remain in contact with other people. It is also invaluable that they keep social contacts and search for various information. The pensioners suffering from various illnesses and immobility may have PC and internet connection as the only option for maintaining contact with their families. Advantages of contact through internet include free calls and e mails. Seniors also surf the internet to look for help in order to maintain their life comfort (Janiš, 2016).

Life Does Not End at Retirement

The slogan “**Life Does Not End at Retirement**” is true more than ever before. One of the main reasons to educate seniors in this area is to eliminate their resistance to new technologies and threats posed by technological media. Seniors could thus overcome many negative perceptions, which they get to know in old age. It is mainly lack of social integration from which many seniors often suffer. Thanks to proper use of technologies they can regularly communicate with family and friends even when they have bad health and lack of financial resources. Last but not least, such abilities may lead seniors to new hobbies, new friendships with peers and new activities (Skoruša, 2014).

Education of seniors is provided through activities organized by centres and clubs for seniors, citizens associations, homes for the elderly, cultural centres, libraries, free time universities, and universities of the third age. These institutions enrich and improve life of senior citizens and support their self-realization. **National Programme of Preparation for Ageing** set up education of seniors as a crucial point in its support delivered to seniors in the Czech Republic.

To be Educated All Life

Life-long education includes every study during our lives. It is considered to be a continuous process of acquiring and developing knowledge, intellectual capabilities and practical skills, even beyond initial education.

It may be carried out in an organized way or through individual leisure activities. Seniors have to be self-motivated to learn how to master information technologies. Motivation is easier among younger seniors, who had computers and mobiles in their jobs. Free time, which they did not have in their jobs, contributes to their willingness to master modern technologies. They are also motivated to remain in contact with their neighbourhood (Přibyl, 2015).

Life-long learning includes **initial education and further education**. Initial education includes primary education (at primary schools), secondary education (at secondary schools) and tertiary education (at universities). Further education follows after certain degree of education is achieved, thus after entering the labour market. One form of further education is focused also on education of seniors. There are many educational courses for seniors, the aim of which is to improve seniors' literacy in the area of information technologies and thus make their lives more pleasant (Janiš, 2016). It is so called University of the Third Age. The term University of the Third Age was introduced by professor Pierre Vellas at the Faculty of Law and Economics in French Toulouse in 1973. Thus, education of seniors began in France. Older students were offered lectures corresponding with their interests and needs (Müllpachr, 2009).

University of the Third Age (U3A) includes activities of universities, which are oriented on the assistance in education of seniors. They provide neither complex university education, nor any other complex education, but they focus on e.g. set of lectures from certain interest area. They might last one or more terms and be of different specializations. The main prerequisite is to pass information on at university level. The aim is the personal development of an individual (in our case a senior), not the acquisition of a university degree. Education is carried out in various forms and educational methods with the use of information technologies. This type of study is finished with a diploma, the award of which is conditioned mainly by attendance, elaboration of certain essays and sometimes also by proof of knowledge.

The Association of Universities of the Third Age was established as citizens' association in the Czech Republic in 1993. There are several U3A in the Czech Republic. They are established at big Czech universities, e.g. Brno University of Technology, Charles University in Prague, Czech University of Life Sciences in Prague, Chemical-Technological University in Prague, University of South Bohemia in České Budějovice, University of West Bohemia in Pilsen, University in Hradec Králové, Palacký University in Olomouc, and Tomáš Baťa University in Zlín.

At present we may also encounter so called virtual university of the third age. It represents new, modern alternative to a typical attendance study at U3A and develops mainly information and computer literacy.

Seniors should get acquainted with the fact that using technologies is very comfortable and beneficial, but it also brings drawbacks which may threaten users. The current offer of courses for seniors is mostly of purely informative character. Seniors get acquainted with the use of technologies, but the topic of cybersecurity is not tackled too much (Hromada, 2015). Seniors are offered courses focused on computer technology at U3A either within certain branches of study or separately. Many universities, mainly technical ones, offer these courses also in several categories according to students' levels of advancement. The courses were analysed in detail from the information system database of The Association of Universities of the Third Age (AU3A), in which all the current courses are included. Not surprisingly, not a single course is dedicated primarily to security. Majority of mentioned courses lacks this element completely. The topic of security is included in the structure of courses for more advanced students. However, security in computer technology, cybersecurity, cannot be covered sufficiently with regard to the number of lessons and topics in a course. After analysing all ongoing courses and study programmes listed in the information technologies section of the AU3A database it may be stated that there are 31 courses with this specialization available at the U3A in the Czech Republic at present. A detailed analysis of their structures revealed that all of them, besides those requiring knowledge from previous courses,

include the following topics: internet, browser, Microsoft Windows office packages, search engines, email and email clients, work with pictures and photos, and communication clients. Advanced courses follow the basic courses and add the following topics: cloud storage, manuals for internet shopping, google services and social networks (Hromada, 2015). Thus, it may be stated that the main topics are internet, communication through communication technology and graphics. Such topics are logical and correctly focused, but the absence of at least basic security elements is alarming. Seniors should not only be aware of at least fundamental risks during their activities in cyberspace, but also respond to them adequately.

Course Content Proposal

If seniors (students) are taught just the theoretical principle of using computer technology without real use of computer technology and internet in practice, they may easily be discouraged. The main thing is to try everything in practice several times. The educational process has to be slow and very clear, with regard to the age of students (seniors). Therefore, the course proposal includes just general rudiments, which are sufficient and easily comprehensible for seniors.

An adequately proposed course with cybersecurity elements should include the following general topics:

- Positive motivation to be interested in cybersecurity on a user level;
- Devices and their operating systems (PC, smartphone, tablet ...);
- Security of devices and their operating systems (firewall, antivirus software ...);
- Internet;
- Security on the Internet (HTTPS, choice of proper password, e-shops ...);
- Social networks (Facebook, Twitter ...);
- Security on social networks (caution when sharing private information ...);
- Cybersecurity (explanation of terms cyberspace, cybersecurity ...);
- Principles of behaviour in cyberspace (do not respond to suspicious emails ...);
- Methods and motivation of attackers in cyberspace (deceptive mails, attacks ...);
- Cyberattacks (simple analysis and examples of possible attacks ...); and
- Principles how to prevent becoming a victim of cyberattack (do not convey sensitive data ...).

The course for active seniors should be scheduled into 3 days. The schedule is in accordance with the course time demand and the content mentioned above. The course has to be thoroughly prepared and all the topics clearly explained.

The first day of the course includes introduction with initial information on the topicality of the course, basic information on informatics and security elements. Seniors can then see the both sides of the topic. They will automatically become aware of not only benefits of technologies and services, but also their duties to be fulfilled if they are willing to maintain security principles. The second day continues with clarifying other aspects of cyberspace. The course participant will thus gradually become more informed about the subject matter. The third day will be devoted to cyberattacks and attackers frequently operating in cyberspace. Finally, they will get acquainted with the types of attacks and the attackers' motivation to conduct them. Defence against such attacks and efficient prevention will be part of the third day of the course as well.

Conclusions and Recommendations

New technologies generated new problems related to education of seniors in the area of information technologies and their employment. As the number of seniors is increasing and they want to be further educated and familiar with new technologies even after their productive age, it is necessary to provide them with adequate education. Care for elderly people is on the increase in modern era. Many producers of information technologies develop

hardware and software for seniors. Seniors have possibilities to attend newly established associations where they can learn how to use information devices and become literate in this area. Computer courses, seminars and similar events are very popular among seniors. Therefore, this age group should be cared for much more. The final part of the paper includes the proposal of a new course for seniors focused on cybersecurity.

Abstract

The literature indicates that beliefs about abilities to cope with difficult situations and to succeed using given competences are crucial to the psychosocial functioning of people with disabilities in higher education. They are also relevant to their academic achievement and predicting professional career possibilities after graduation. The article presents an analysis of the correlations between acceptance of disability and self-efficacy together with hope for success in students with motor disability. The research was conducted with 114 people who were diagnosed with acquired locomotor system limitations, studying at Polish universities on the second level of their studies. Most participants were men with various lesions of the spine, coming from large cities and moving on a wheelchair or with a crutch. The following tools were used to collect data: Multidimensional Acceptance of Loss Scale, Hope for Success Questionnaire and General Self-Efficacy Scale. The level of included variables and dependence structure was determined. The results show a high level of self-efficacy and hope for success in students included in the study. These two beliefs remain in a significant and relatively strong correlation to the dimensions of acceptance of their disability: subordinating physique relative to other values, enlarging the scope of values, transforming comparative-status values into asset values, containing the effects of disability. An applied regression analysis revealed the predictive function of disability acceptance in determining the level of both self-efficacy and hope for success. The two aspects of disability acceptance: enlarging the scope of values and containing the effects of disability, were of the greatest meaning to explain the severity of both variables. It should be noted that disability acceptance allows a greater anticipation of self-efficacy in coping with difficult situations rather than hope for success. The obtained results are significant from both cognitive and practical point of view. They provide valuable information on academic support and career guidance for students with disabilities.

Key words: acceptance of disability, self-efficacy, hope for success, student with disability

Introduction

The psychosocial functioning of persons with disability at a higher education institution encompasses a variety of phenomena, i.a. academic adaptation, social inclusion, acquisition of social and professional competences, satisfaction with the studies, development of individual dispositions oriented towards overcoming difficulties, effectively fulfilling tasks expected of students, achieving learning goals and being successful. The quality of this functioning is analysed from three perspectives: 1) social including stigma, the image of disability in society, and social support (e.g. S. E. Green, 2007; M. F. Olney, K. F. Brockelman, 2003; S. Holloway, 2001); 2) individual, focusing on personal resources and deficits, and factors related to disability (e.g. K. S. Adams, B. E. Proctor, 2010; H. Livneh, E. Martz, L. M. Wilson, 2001); 3) organizational, such as legal regulations, institutional support, adaptation of academic infrastructure to the needs of people with mobility disabilities (M. Schreuer, D. Sachs, 2014; S. E. Eckes, T. A. Ochoa, 2005). The following study focuses on the individual perspective and two personal resources of students with mobility disabilities: self-efficacy and hope for success. These are two categories of beliefs that relate to effective functioning of a student.

Self-efficacy is a subjective belief about the ability to act and cope with a task in a specific situation (A. Bandura, 2003a). It is a self-regulation mechanism and the main determinant of decisions, choices and actions. As stressed by A. Bandura and E. A. Locke (2003b, s. 87), “among the mechanisms of human agency none is more central or pervasive than beliefs of personal efficacy. Whatever other factors serve as guides and motivators, they are rooted in the core belief that one has the power to produce desired effects by one’s actions, otherwise one has little incentive to act or to persevere in the face of difficulties”. These beliefs can impact human functioning directly and indirectly by influencing aspirations, goal intention, perception of possibilities and obstacles. People with high self-efficacy choose more ambitious goals and expect satisfactory results after taking appropriate action. Perceiving oneself as a person capable of coping with difficulties, working effectively, helps setting ambitious goals, and persevering in maintaining the efforts to achieve them. For people with high self-efficacy a greater range of opportunities seem worth using and obstacles seem less threatening for achieving the goal (A. Bandura, 1997).

Self-efficacy is usually understood as the ability that is specific to a particular task or area, even though the notion of general self-efficacy has been introduced as a sign of general beliefs about the competences that are needed to take on challenges and to deal effectively with difficult situations (R. Schwarzer, Jerusalem, 1995). General self-efficacy is considered a universal construct relating to the basic beliefs held by all people (U. Scholz et al., 2002). Studies have shown positive and close correlation between general self-efficacy, self-regulation, adaptive problem-oriented coping, greater involvement in planning (A. Luszczynska, U. Scholz, R. Schwarzer, 2005), optimism, and self-assessment (A. Luszczynska B. Gutiérrez-Doña, R. Schwarzer, 2005). Research with students revealed a positive correlation of general self-efficacy and subjective well-being (R. Dave et al., 2011), life satisfaction (F. S. Cakar, 2012), having a goal in life (S. J. DeWitz, M. L. Woolsey, W. B. Walsh, 2009), college readiness (L. Ramos-Sánchez, L. Nichols, 2007), academic achievement at college, reported sense of academic competence and confidence in career pathway (B. E. Fenning, L. N. May, 2013), belief in academic success, and academic achievements of university students (J. Lane, A. M. Lane, A. Kyprianou, 2004; J. Lane, A. M. Lane, 2001). High self-efficacy is associated with effective learning, perseverance, effort in achieving academic success (M. Bong, E. M. Skaalvik, 2003), and a sense of being competent in academia and career planning (B. E. Fenning, L. N. May, 2013).

Research into general self-efficacy among students with disabilities provides ambiguous results. Researchers revealed both lower general self-efficacy scores in this group of students compared to their able-bodied peers (T. R. Blake, J. O. Rust, 2002; cf. M. J. Reed, D. J. Kennett, M. Emond, 2015), as well as no significant differences in intensity of this type of beliefs between students with disabilities and without disability (J. Albiero-Walton, 2003). Positive correlations were found between self-efficacy, self-esteem (collective self-esteem, membership self-esteem, private and public self-esteem) (T. R. Blake, J. O. Rust, 2002) and adaptation (C. Murray, A. Lombardi, D. Kosty, 2014) in students with disabilities. It was also found that women with academic disabilities who studied at college and achieved academic success had a stronger sense of self-efficacy. Students with mobility disabilities experience different challenges and difficult situations (including every day situations) while studying at a university (M. Fuller, A. Bradley, M. Healey, 2004a; M. Fuller, A. Bradley, M. Healey, 2004b). However, research shows that disability itself is almost insignificant for academic achievement and competence acquisition (J. T. E. Richardson, 2009). A more prominent role may be played by the belief of having the capacity to effectively deal with any encountered difficulties (E. E. Getzel, C. A. Thoma, 2008; D. R. Jameson, 2007, cf. D. F. Garrison-Wade, 2012). The role of self-efficacy in this group of individuals is also reflected in its impact on career decision-making and the career path taken after graduation (R. W. Lent, A. Morrison, I. Ezeofor, 2014; D. A. Luzzo et al., 1999).

Hope for success is defined, following C. R. Snyder et al. (2002), as interrelated beliefs of strong will and having the competence to find solutions and construct plans in the process of achieving the goal. They are related to an intensified expectation of positive effects of the undertaken actions. Hope for success is a cognitive-motivational phenomenon which refers to the individual's own belief that they are capable of initiating and continuing goal-oriented activities. C. S. Snyder, J. Cheavens, S. C. Simpson (1997) recognizes hope primarily as a cognitive process, but at the same time indicates that it is a component of pursuing the goal which is related to positive emotions. Hope is correlated with self-efficacy, but they are two distinct constructs (F. B. Bryant, J. A. Cvengros, 2004). People with a high level of hope for success perceive goals as challenges, they generate more goals, focus on following their pursuits, they are more flexible in overcoming obstacles, overcome stressors caused by barriers (which block achieving goals) more effectively, and they reach their goals more often compared to those with low levels thereof (C. S. Snyder et al., 2002). Because the goals of high-hope individuals are more specific and realistic, these individuals are more effective, creative and motivated to look for alternative ways to achieve their goals. What is more, they enjoy not only the achieved success but also the process of achieving it (C. S. Snyder et al., 2006a; C. S. Snyder, J. Cheavens, S. C. Simpson, 1997).

It has been shown that hope (understood this way) can directly (K. L. Rand et al., 2011; L. Day et al., 2010; C. S. Snyder et al., 2002) and indirectly influence academic success of university students, i.a. by allowing students to expect good grades (K. L. Rand, 2009) and by affecting learning goals (S. J. Peterson, M. W. Gerhardt, J. C. Rode, 2006). Hope was also an independent variable of career adaptability (A. Buyukgoze-Kavas, 2016). It also significantly differentiated the career decision-making process (A. K. Zaleszczyk, 2015) among university students.

Hope (including hope for success) is more and more often analyzed among people with disabilities, mainly in the context of coping and adapting to limitations. C. S. Snyder and coresearchers (2006b) point out that people with high hope have characteristics that help overcome the challenges of disability. A positive correlation was found between hope, satisfaction in life (J. S. Krause, P. A. Edles, 2014; K. B. Kortte and and., 2012), self-esteem, perception of disability seen as a challenge, and applying task mode to coping with problems (H. Livneh, E. Martz, 2014; P. Dorsett, 2010) in people with spinal cord injury. In contrast, there is little research on hope among students with disabilities. Their results indicate a close and positive correlation between hope for success with psychological empowerment and locus of control (M. Morningstar et al., 2010) and its mediating role in

determining loneliness and academic self-efficacy (D. B. Feldman et al., 2016). Considering the importance of self-determination in pursuing goals and attaining good academic results among students with disabilities (E. E. Getzel, C. A. Thoma, 2008) one can expect a significant role of hope seems as a conviction of being able to accomplish goals and overcome difficulties.

In conclusion, self-efficacy and hope for success are significant beliefs for the educational and psychosocial functioning of students with disabilities. It is also possible to predict their role in the course of professional development after graduation (S. Burgstahler, 2001; W. E. Hitchings et al., 2001). Determinants of these beliefs are interesting in this context. The present paper will analyze the predictive function of accepting disability (C. D. Friedland, 1990).

Acceptance of disability, following B. Wright's theory, reflects the process of change in values requiring the individual to recognize values other than those previously accepted - which were in conflict with the acquired disability (B. Wright, 1983) Disability is not perceived here as devaluing; the individual is able to successfully cope with the consequences of their limitations. In this theory, disability is perceived as a "loss of worth" that is conducive to lowering the importance of one's abilities and even devaluing oneself as a person. It is therefore necessary to make changes in the value system preferred so far to prevent or reduce this devaluation and create conditions for optimal functioning of the individual in particular areas of life. Acceptance of disability refers to such adjustment of the system of values that actual and perceived losses connected to disability do not adversely affect the value of preserved abilities (in: D. S. Dunn, 2015; K. C. Keany, R. L. Glueckauf, 1993). It is seen as a process which encompasses four mutually dependent values: a) enlargement of the scope of values; B) subordination of physique; C) containment of disability effects; D) transformation from comparative to asset values (B. Wright, 1983). A positive correlation was found between acceptance of disability and self-esteem (L. Li, D. Moore, 1998), adaptive problem-solving capabilities, problem-oriented coping disposition (D. A. Groomes, M. J. Leahy, 2002), positive orientation to problem resolution, goal orientation (T. R. Elliott et al., 2000), quality of life (R. K. Chen, N. M. Crewe, 2009), and perceiving disability as a challenge (D. A. Groomes, M. J. Leahy, 2002). Results of research with students indicate a correlation between acceptance of disability with functional impairment and perception of disability as a characteristic defining the individual (B. C. Carl, 2013). If acceptance of disability is seen as a process of change in values, and thus, holding beliefs about oneself and one's opportunities and limitations, it can be assumed that this variable will be significant for the intensity of other beliefs including self-efficacy and hope for success (cf. DS Dunn, 2015).

The following question was asked in the present study: What is the share of acceptance of disability in explaining the intensity of general self-efficacy and the hope for success in students with physical disability. Based on the available theoretical and empirical literature, the following hypotheses were tentatively posited: 1. Acceptance of disability has a significant and positive contribution to explaining the level of general self-efficacy in students with physical disability. 2. Acceptance of disability has a significant and positive contribution to explaining the level of hope for success in students with physical disability.

Method

Quantitative studies were conducted using a set of instruments to measure the discussed variables: general self-efficacy, hope for success and acceptance of disability. The study was conducted among students with acquired mobility impairments at 8 Polish universities, with postgraduate degrees (Master's degree). Data was collected with the help of Representatives of Students with Disability and groups and societies for students with disabilities at the universities participating in the study. The main criterion for participation in the study was a disability certificate, which states that there is a mobility impairment. Encoded data were stored in accordance with valid personal data protection regulations.

114 students with acquired physical restrictions, including spinal cord injury and various spinal disorders participated in the study. All respondents had significant mobility problems - they moved using wheelchairs or crutches. Most of them are male (82 - 71,93%) and people living in big cities (87 - 76,32%). The median age of the subjects was $M = 23.99$ years, $SD = 11.09$. Mean age when permanent motor damage was acquired was $M = 17,13$; $SD=8,87$. The respondents studied primarily humanistic and social studies (71-62.28%), while others studied science (32-28.07%) and natural sciences (11-9.65%). The vast majority of respondents were full-time students (85-74.56%).

The following research instruments were used to collect data: The Generalized Self-Efficacy Scale (GSES) by R. Schwarzer and M. Jerusalem, adapted by Z. Juczyński; The Hope for Success Questionnaire by C. R. Snyder, adapted by M. Łaguna, J. Trzebiński and M. Zięba (2005) and Multidimensional Acceptance of Loss Scale by J. M. Ferrin, F. Chan, J. Chronister, C. Y. Chiu, adapted by S. Byra (2017). GSES consists of 10 items, answers are

given on a 4-point scale. Possible scores range from 10 to 40 points. The scale is used to determine the general belief of the individual about the effectiveness of coping with difficult situations. This tool has satisfactory psychometric properties. The reliability index is 0.85 (*Cronbach alpha*), while stability is 0.78 (*rPearson*) (Z. Juczyński, 2001). The Hope for Success Questionnaire consists of 12 statements (including 8 diagnostic ones), the answers are given on an 8-point scale (1-8). Possible scores range from 8 to 64 points. The questionnaire is used to determine your overall score and, in addition, the scores in its two subscales. Internal reliability of the tool is satisfactory, *Cronbach alpha* is 0.82 (M. Łaguna, J. Trzebiński, M. Zięba, 2005). The Multidimensional Acceptance of Loss Scale consists of 42 items, all are diagnostic, the answers are given on a 4-point scale. It is a tool to diagnose the structure of disability acceptance, as defined by B. Wright. It includes 4 subscales: Subordinating physique relative to other values (SPV), Enlarging the scope of values (ESV), Transforming comparative-status values into asset values (TSV), Containing the effects of disability (CED). The psychometric properties of the scale are satisfactory, the indices of reliability of individual subscales remain within the limits: 0.79-0.89 (*Cronbach alpha*), while the stability indicators fall within the range of: 0,61-0,88 (*r Pearsona*) (S. Byra, 2017).

Data was analyzed using the Statistica 7.0 suite (Statsoft Poland, Cracow, Poland). First, the descriptive statistics for the variables: general self-efficacy, hope for success, and acceptance of disability were calculated. A correlation analysis was then performed to determine the relationship between these variables (Pearson's correlation coefficient). Finally, a standardized stepwise regression analysis was conducted to determine the contribution of disability acceptance (and its dimensions) to the explanation of two independent variables: self-efficacy and hope for success in students with physical disabilities. Scatter plots and collinearity statistics were first verified to meet the linearity and normality assumptions.

Findings

Table 1 presents descriptive statistics for general self-efficacy, hope for success and acceptance of disability. By comparing the average scores of individual dimensions of disability acceptance, the lowest intensity of value changes is found in enlarging the scope of values, and the highest one containing the effects of disability.

Table 1. Descriptive statistics for variables

Variables	M	SD	Score range	
			Scale range (min-max)	Scale range (min-max)
General self-efficacy	26,46	6,58	11-38	10-40
Hope for success	43,89	10,87	19-63	8-64
Acceptance of disability				
Subordinating physique relative to other values (SPV)	27,05	5,48	13-39	10-40
Enlarging the scope of values (ESV)	25,96	3,99	18-37	10-40
Transforming comparative-status values into asset values (TSV)	26,54	4,25	17-37	11-44
Containing the effects of disability (CED)	28,95	4,34	15-38	11-44

Results of general self-efficacy and hope for success indicate relatively different levels of these variables in student respondents (Table 2). Most respondents are characterized by high general self-efficacy, but at the same time more than 1/3 of the respondents have low self-efficacy. In the case of hope for success, the majority of respondents have a moderate or low level of this type of belief. It should be stressed that more respondents have a higher level of general self-efficacy than hope for success.

Table 2. Results level of general self-efficacy and hope for success

Variables	Level of results					
	Low		Moderate		High	
	n	%	n	%	n	%
Self-efficacy	40	35,09	26	22,81	48	42,10
Hope for success	43	37,72	59	51,75	12	10,53%

Correlation coefficients (Table 3) show significant and strong correlations between dimensions of accepting disability and the two types of beliefs: general self-efficacy and hope for success in students with physical disability. It should be emphasized that both general self-efficacy and hope for success correlate positively with all dimensions of disability acceptance. In addition, correlations between the age of disability acquisition and its duration, and the variables explored in the study (general self-efficacy, hope for success and acceptance of disability) were also examined. No significant correlation was found between these variables and the age of disability acquisition in the students participating in the study. In contrast, there was a weak positive correlation between the duration of disability, general self-efficacy ($r = 0.19$) and acceptance of disability ($r = 0.21$).

Table 3. Correlation matrix of acceptance of disability and general self-efficacy and hope for success

	General self-efficacy	Hope	SPV	ESV	TSV	CED
General self-efficacy	1					
Hope for success	0,11	1				
SPV	0,35**	0,21*	1			
ESV	0,51**	0,39**	0,11	1		
TSV	0,43**	0,19*	0,13	0,43**	1	
CED	0,49**	0,43**	0,49**	0,16	0,21*	1

Abbreviations: Acceptance of disability:
 SPV, ESV, TSV, CED *p<0,05; **p<0,01

Next, a standard regression analysis was performed to determine whether disability acceptance (its individual dimensions) has a predictive role for general self-efficacy and hope for success. Table 4 presents the results of this regression analysis.

Table 4. Results of the stepwise regression analysis – general self-efficacy and hope for success

Predictors	B	SEB	β	SE β	t	p
General self-efficacy						
R=0.48; R ² =0.23; Adjusted R ² = 0.21; F(3.11)=11.12; p<0.000						
Enlarging the scope of values	0.04	0.01	0.36	0.08	3.52	0.001
Containing the effects of disability	0.08	0.02	0.46	0.12	3.92	<0.001
Transforming comparative-status values into asset values	0.05	0.02	0.27	0.12	2.30	0.023
Hope for success						
R=0.27; R ² =0.12; Adjusted R ² = 0.10; F(2.87)=9,12; p<0.011						
Enlarging the scope of values	0.04	0.02	0.23	0.09	2.48	0.014
Containing the effects of disability	0.04	0.02	0.24	0.10	2.30	0.023

The regression model created for general self-efficacy includes three dimensions of disability acceptance. They all explain 23% of the variance of the self-efficacy level in this sample. Acceptance of disability: containing the effects of disability made the most important contribution to determining the intensity of the belief in having the ability to effectively deal with difficult situations. The obtained results show that a higher level of general self-efficacy promotes the acceptance of disability manifested by increased transformations of values related to: 1) reducing the impact of disability on the overall perception how the individual functions; 2) the desire to expand the values and focus on abilities and goals that have not been lost due to the acquisition of the impairment; 3) changes in standards and criteria for assessing personal characteristics without making comparisons to external, often unreachable standards, or models.

There are two dimensions of disability acceptance which clarify the level of hope for success: enlarging the scope of values and containing the effects of disability. They explain 12% of the variance of this type of belief in the respondents. Contribution of both these dimensions to acceptance of disability is similar. Higher levels of hope for success can be predicted but with relatively little success, by significantly reducing the impact of disability on the overall self-assessment and broadening of interests and goals, formulated on the basis of the preserved capabilities.

Results, Conclusions and Recommendations

To conclude, the intended research goal has been achieved. Proposed hypotheses have been confirmed. Acceptance of disability plays a significant predictive role both in explaining general self-efficacy and hope for success in students with physical disabilities. A particular contribution to explaining the intensification of this type of belief in the students who participated in the study lies in two dimensions of disability acceptance: the enlarging of the scope of values and containing the effects of disability. It seems that the transformations to reduce the impact of disability on the overall self-assessment, quality of functioning, and capabilities are likely to be significant for the intensification of general self-efficacy and hope of success. In addition, widening the range of values by areas not damaged by disability acquisition, with preserved abilities and opportunities, can also correlate significantly with the strength of beliefs about the ability to successfully handle difficult situations

and the competence to achieve goals in students with mobility impairments. The obtained results are consistent with previous evidence of a positive correlation between disability acceptance, goal orientation (T. R. Elliott et al., 2000), and convictions about oneself (L. Li, D. Moore, 1998).

It should be emphasized that acceptance of disability, as understood by B. Wright, explains intensification of general self-efficacy to a greater extent than hope for success in student respondents. This suggests great significance of the necessary and beneficial transformations in understanding the consequences of having a disability for shaping and strengthening beliefs about the ability to deal with them effectively. These results converge with M. Bishop's assumptions of the disability centrality model of psychosocial adaptation (2005) in which the importance given by the individual to their disability and the specific functional areas are highlighted. According to M. Bishop (2005) perception of the impact of disability and the constraints associated with it are shaped by the person's sense of control expressed in the belief that they have the ability to maintain life balance despite significant changes affecting them. The significance of containing the effects of disability and enlarging the scope of values falls in line with M. Bishop's theory (2005), who points to the need for a long-term process of adaptation to life with disability, a commitment to re-estimate one's goals, priorities and life dimensions, which impact general life satisfaction. An active attitude towards the performance, characteristics, and functioning of areas without disabilities - central to self and life assessment - is the basis for a rapidly changing acceptance of disability; it results in greater efficacy in managing consequences of disability, and greater control over change, and difficult experiences (M. Bishop, L. Shepard, D. M. Stenhoff, 2007). The above interpretation of the positive correlation between acceptance of disability and self-efficacy is especially important for the psychosocial functioning of students with motor disability. Considering the dynamic nature of accepting disability, making the necessary reevaluation is a long-term and extremely important process in dealing with the dual challenges of studying and the multiple consequences of having a disability (K. McNulty, H. Livneh, Ch. L. Livneh, 2015; por. S. M. Smedema et al., 2015; Ch. Murray, A. Lombardi, D. Kosty, 2014).

The difference in the role of acceptance of disability in explaining the intensity of general self-efficacy and hope for success in students with motor disability, found in these studies, shows that disability-related variables can be more predictive in beliefs related to having the abilities for coping with difficulties. These predictions corroborate the results of research into the consequences disability visibility (self-assessment, able-bodied peers' attitudes and assessment, perception of needs and difficulties) in college students (J. Goode, 2007; M. F. Olney, K. F. Brockelman, 2005). On the other hand, hope for success related to persistent pursuit of goals and expecting positive outcomes may be more strongly influenced by personal or social factors (D. F. Garrison-Wade, 2012; M. E. Morningstar et al., 2010). It would be interesting to analyze the role of academic achievements, beliefs about achieving success, and the reasons for studying expressed by students with disabilities against their level of hope for success (M. J. Reed, D. J. Kennett, M. Emond, 2015; D. R. Jameson, 2007; J. R. Nelson et al., 1993). Clarifying the determinants of hope for success among this group of students is all the more significant, as relatively a small percentage of them (only 10,53%) demonstrate high levels of this disposition. The nature of the correlation between hope for success and academic success in students with disabilities (see J. A. Graf, T. Whelley, L. Jones, 2004) also requires further exploration.

The obtained results are important both for research and practice oriented towards providing counseling and support for students with mobility disabilities. They contain initial findings about the determinants of beliefs related to competence in coping with difficulties and achieving goals. They are presented from the perspective of personal resources (H. Livneh, E. Martz, 2014) relevant for coping with experienced challenges, and in the case of students, significant for academic adaptation and the quality of psychosocial functioning as a student. The conclusions are as follows:

1. General self-efficacy and hope for success in students with physical disabilities are explained by acceptance of disability, but to a relatively small degree (explained variance - 23% general self-efficacy, 12% hope for success).
2. Individual dimensions of acceptance of disability, and therefore the specific categories of reevaluation, differ in their impact on self-beliefs, one's coping capacities, and competences that ensure effective achievement of goals for students with disabilities.
3. Personal and social factors may be more important in explaining self-efficacy and hope for success. The intermediary role of acceptance of disability in establishing this relationship is likely, though.

Future research should therefore focus on analyzing a broader set of individual and social determinants of self-efficacy and hope for success in students with disabilities. In addition, it would be important to explore the correlations of this type of beliefs with various aspects of their psychosocial functioning. It would also be interesting to look at the role of general self-efficacy in relation to academic self-efficacy in this group of

students. On the other hand, an important research problem in the case of hope for success would be to determine its impact on the career path of people with disabilities who graduate from university.

The presented study is not free from limitations. Firstly, it focuses on the narrow aspect of explaining self-efficacy and hope for success, involving only acceptance of disability. Although it provides interesting findings for explaining the intensity of such beliefs in students with disabilities, these should nevertheless be regarded as preliminary assumptions and a justification for further extensive research. Secondly, the group of respondents is not uniform, it consists of people with different types of motor damage, who may vary in degree of functionality and the range of experienced challenges (including those related to studying). Thirdly, due to the lack of other explorations into the discussed issue, a relatively simple model of correlation analysis was adopted, limiting explanatory possibilities. Fourthly, all data was collected using self-report measures, whose reliability may be influenced by reactive confounds such as social desirability, defensiveness, agreeableness. However, this issue is not exceptional for the present study, and it penetrates most empirical research in the field of special education and rehabilitation psychology.

With the limitations of the study in mind, one can focus on its usefulness for practice since the present results may be used by institutions and associations supporting students with disabilities at universities. The identified significance of acceptance of disability for general self-efficacy and hope for success can be used in programs of therapeutic-rehabilitation training, or aimed at raising academic competencies and promoting professional success of students with disabilities.

Violin Colourstrings Method in Czech Music Education for Older School-Age Children

Mgr. et Mgr. Marie Kovářičková

¹ University of Hradec Králové, Faculty of Education, Rokitanského 62, Hradec Králové, 500 03, Czech Republic
Email: Marie.Kovarickova@seznam.cz

Abstract

The Colourstrings violin method has become the initial point for creating the model situation which is supposed to contribute to increasing the Czech music teachers' didactic use of the violin in music lessons with older pupils. The aim of the examine was verifying the effectiveness of the model situations in junior and senior pupils in the 8-year grammar school in an experimental way. The results of the study proved that the pupils in the experimental group, where the Colourstrings method was applied, were more interested in music forms learning process and they managed to use more effectively their gained knowledge in integration of vocal, instrumental, motoric and listening activities.

Keywords: Music education, Innovation in playing the violin, Colourstrings method

Introduction

In the history of Czech music education, the teacher's violin playing has always been one of the basic means of effective development of musicality in children of all ages. Due to the growing number of pianos¹ in schools in the mid 1900's and the ongoing frequent use of electrophones, the violin continuously lost its dominant position in music teaching. Although violin and piano are currently the only options in instrument preparation of future teachers at Czech universities, the predominance of the piano as a didactic aid in music education is significant. One of the main reasons for this is the high demand for professional instrument competences² in teacher-violinists. Achieving violin interpretation of good quality is significantly determined by the choice of methodical procedures used in violin teaching, as early as at elementary level. Contemporary Czech violin teachers prefer using methodologies developed by their predecessors - Otakar Ševčík, Jan Mařák and Josef Míčka and the violin school of the late 1900's represented by Jindřich Pazdera, Jaroslav Foltýn, Bohumil Kotmel, Zdeněk Gola and Eva Bublová. Methodical practices of foreign violin schools are currently applied rather selectively³. Only professor Shinichi Suzuki's method, and since 2011 also the Colourstrings method have been systematically applied in teaching violin in the Czech Republic.⁴

The violin Colourstrings method was developed after 1971 by a significant Hungarian educator Géza Szilvay⁵, a teacher at East Helsinki Music Institute in Finland. The method is based on the principles of Zoltan Kodály system of music education, on the Suzuki violin school and on the methodology of violin playing by Paul Rolland. Based on Kodály's idea that "music belongs to all", it is aimed at children and young people

¹The main reason for expansion of pianos in schools was the ministry's decision to distribute confiscated pianos, harmonius and organs among schools in 1948 (Věstník ministerstva školství, věd a umění, 1948, p. 563).

² Instrumental competences can be specified as one's personal attitude to violin play, the ability and skill to play the violin as a basis for didactisation of music theory, as an artistic expression and an expression of violin creativity.

³ HORÁKOVÁ, Marie. *Vývoj vybraných českých houslových metodik druhé poloviny 20. století*. Olomouc: Univerzita Palackého v Olomouci, 2006. ISBN 80-244-1543-7.

⁴ The only certified department teaching violin through the Suzuki method in the Czech Republic is Studio Dobeška in Prague 4, the Colourstrings method is used for teaching violin only at Základní umělecká škola Nový Jičín.

⁵ Csaba Szilvay Géza Szilvay's brother) created this for violoncello and double bass.

from nursery school to university. The main objective of Colourstrings is based on Kodály's principles⁶ for educating "a good musician"⁷. The objective is to educate a violinist with "well-trained hearing, well-trained intellect, well-trained hands and a well-trained heart."⁸ The method thus includes training of intonation using solfeggio and relative solmization, improvement of fingering technique, teaching musical theory and developing emotions through chamber music. For optimal development of a violinist it is essential that all the above mentioned kinds of training are developed simultaneously and that they are always in well-balanced. Reading notes, which Szilvay considers the most problematic intellectual activity in small children, is abandoned at the first stage of instruction. Instead of classical notation the method based on a scientifically proven relationship between colour and tone⁹ works only with colour bars and subsequently with one line and notes of four colours (g string – green, d¹ string – red, a¹ string – blue, e² string – yellow). This simplification of notation allows the children to read "music" easily right from the beginning, and does not put a strain on them.

The complex approach to music teaching and child development which is applied in the Colourstrings method is reflected in very high level of present-day music arts education in Finland. With regard to the fact that this concept of teaching corresponds with the current requirements¹⁰ of present-day Czech music pedagogy for integrative approach to music education and optimal development of pupils' music abilities and skills, the violin Colourstrings method has become the basis for creating model situation called "The Violin In an Encounter with the Music Form".

Modelling didactic situations¹¹ is one of the methods which are relatively often used in music pedagogy and contribute to higher quality of music teaching. Professor Jaroslav Herden defines this method as "creating models of functionally ideal procedures which respect theoretical background and comply with practice. Such a model captures essential features of the didactic practice recommended for solving a given problem, however, it does not close the space for individual applications of the scheme on the specific conditions of a given educational situation".¹² The importance of model situations lies in the possibility to check how

⁶ The Kodály method deals with ten principles, all of the same importance. It is the principle of pure intonation, in-tune singing, the principle of descending tone rows, the principle of rhythm priority, relative solmization, the principle of solmization priority, priority of a two-beat measure, principle of being playful and entertaining, the principle of learning about other nations' music cultures, knowing (experiencing) musical forms, sufficient supply of music literature.

⁷ SLOŽIL, Alois. *Maďarská hudební výchova*. Praha: Supraphon, 1977, p. 22.

⁸ SLOŽIL, Alois. *Maďarská hudební výchova*. Praha: Supraphon, 1977, p. 22.

⁹ First scientific research of the relationship between colour and sound was conducted in the 19th century. Significant artists who took into consideration the relationship between colour and sound included for instance composers A. N. Dvořák and painters V. Kandinskij, P. Klee and T. Wilfred. (PEČMAN, Rudolf. *Barva a tón aneb Zavátá cesta umění i apercepce*. *Universitas - revue Masarykovy univerzity*. Brno: Munipress, 2006, No. 4, 11-15. ISSN 1211-3387.)

¹⁰ Curricular documents defining the content and outputs of education at different levels of schools in the Czech Republic are the Framework Educational Programmes. The Framework Educational Programme for Elementary Education (FEP EE) has been in force since 2004, the Framework Education Programme for Grammar Schools (FEP GS) since 2007.

¹¹ Creation of model situations for example in connection with listening activities was dealt with by Jaroslav Herden, Eva Jenčková creates model examples of music educational situations with focus on music motor activities.

¹² HERDEN Jaroslav. *Modelové situace v přípravě na poslech*. In *Poslech hudby*. Sborník příspěvků z konference konané ve dnech 27. a 28. dubna 1998 na Pedagogické fakultě UK v Praze. Praha: Pedagogická fakulta Univerzity Karlovy, 1998, p. 39.

the suggested teaching methods work in practice while encouraging teachers to use effective practices in music teaching.

The model situation "The Violin In an Encounter with the Music Form" is structured into five sections of varied level of difficulty. Its content complies with the requirements of the Framework Education Programme for Elementary Education (hereinafter FEP EE) and the Framework Education Programme for Grammar Schools (hereinafter FEP GS)¹³. A closer characteristic of individual sections is provided through the keywords in the introductory part. Practices suggested in the model situation are based on the principles of the violin Colourstrings method. At the same time the method of "experiential learning" is applied, i.e. the learning process moves from experiencing music activity to acquisition and consolidation of theoretical knowledge of music forms. To achieve maximum effectiveness of the model situation, the "spiral learning" principle is also used¹⁴, combining progressively organised activities with the element of returning to previously acquired knowledge. Time recommended for the realization of individual sections is one lesson.

Due to the large scale of the model situation, the following part of the article only presents one of its sections titled Period as an illustration.

PERIOD

Internal division of a period, aural analysis of tonal closure of the antecedent and the consequent, playing on the body, vocal and instrumental execution of the period, arms movement in connection to the course of the antecedent and the consequent, metro-rhythmic coordination

Objective: To describe the structure of a period in music with the help of a complex of musical activities. To explain the terms antecedent and consequent, and to identify antecedent and consequent by hearing according to the tonal closure of individual sentences.

Findings: Period is the smallest musical form. It consists of two phrases, usually four measures long. The first phrase is referred to as the antecedent, the second is called the consequent. The antecedent mostly ends on the dominant, the consequence on the tonic. The antecedent-consequent relationship can be compared to a question and an answer.¹⁵

- The division of the period into two symmetrical parts - antecedent and consequent is shown in the figure. From violin playing the antecedent and the consequent and the colour differentiation of bars in the graphic score, pupils are supposed to deduce the usual tonic conclusion of the antecedent phrase on the dominant and of the consequent phrase on the tonic.

¹³ FEP EE and FEP GS are curricular documents defining the content and outputs of education at elementary (basic) schools and grammar schools.

¹⁴ This term is used by Eva Jenčková, who characterises it as a range of progressive model situations which enable optimal structuring of music teaching and differentiating children's assumptions. Adapted from (Jenčková, 2002, p. 22)

¹⁵ SOUŠKOVÁ, Dana. *Hudební druhy a žánry 1. díl*. Hradec Králové: Gaudeamus, 2007. ISBN 978-80-7041-393-7, p. 12.

- In this task, having listened to a violin interpretation of the antecedent, pupils improvise the consequent through an activity of their individual choice - singing, movement, instrumental play. Other pupils decide which parts were used, or whether it was improvisation of the given phrase, at the same time they check the correct tonic conclusion of the antecedent and consequent phrases.
- To enhance the comprehension of the antecedent-consequent relationship, we can use for example comparison to a question and answer relationship or to the movement of a swing. Another illustrative aid is also movement visualisation in the form of a plane manoeuvre, during which arms are deviated from a lateral raise, and with added up measures they return back to the lateral starting position.

- In this task pupils respond to violin improvisation of a rhythmic antecedent played on one tone. They clap a rhythm of their choice in the same number of beats, thus balancing "the music swing".
- A more complicated variation of the previous task is to create a rhythmic-melodic consequent on carillons. Pupils must respect not only the symmetric structure of a period but also the tonic conclusion of the antecedent and consequent.

Verification: Sing the folk songs Koulelo se, koulelo, Ach, synku, synku and Spievanky, spievanky and decide which of them feature the form of a period. With applicable songs subsequently support the internal division of the period with singing in groups. Girls sing the antecedent, boys sing the consequent.

Research survey method

As a method of empirical survey to verify effectiveness of the model situation we chose didactic experiment. Its aim was to verify the effectiveness of the model situation in lower and upper school classes of eight-year grammar school. With regard to the above mentioned objective of the research survey we formulated the following working hypothesis: Pupils in the experimental group, in which Colourstrings method principles are used in teaching understand the structure of music forms better and are able to use acquired knowledge more effectively when integrating vocal, instrumental motor and listening activities. The first stage

of the research survey included 25 first-year pupils¹⁶ of a four-year grammar school. During April 2017 we gradually realised all music activities suggested in the model situation.¹⁷ Following observations and individual interviews with pupils, tasks for some of the activities were re-formulated more precisely and the number of activities was reduced so that individual activities could be realised within one lesson¹⁸. The research survey itself was conducted in May and June 2017 in two parallel first year classes 1B and 1A, two parallel fifth year classes 1G and 5A and two parallel sixth year classes 6A and 6B¹⁹. In the experimental group of sixty pupils the topic of musical forms was presented according to the suggested principles based on the Colourstrings method. Sixty-three pupils of the control group were presented musical forms through exposition without using violin play.

The experiment which was carried out in parallel classes enabled us to compare the outcomes in the classes, to compare motivation practices based on the Colourstrings method with exposition-based teaching of musical forms, and thus assess the effectiveness of the practices based on the model situations.

When processing the survey results, we used a recording sheet for observation of experimental teaching, video recording, both quantitative and qualitative analyses, contingency tables and graphs.

Findings:

Based on observation and analysis of video recordings, the model situation was critically assessed as shown in the following table:

Activity	Author's (verifier's) assessment		Overall assessment of activity
	positive	negative	
No. 1 Development of musicality	+ first -year students' strong interest and motivation ++pupils' interest in a new form of work ++all pupils absorption with the sound of the violin ++ strong interest of all pupils in the violin play itself +expression of positive emotions when playing on the body	- some task assignments inadequate for older students - not all first-year students participating in group declamation - pupils having great difficulty creating a couplet for a given rhythmic figure, failure leading to subsequent passivity in some of the pupils	<i>positive</i> : suitable choice of activity and of most specific tasks within it, high level of pupils' interest, necessary modification of task formulation and modification of rhythmic figure supporting the text

¹⁶ At some grammar schools in the Czech Republic the first year is referred to as kvinta.

¹⁷ In this grade, the subject Music Education is allocated two lessons a week.

¹⁸ In compliance with Section 26 School Act No. 51/2004 Sb. duration of a school lesson in the Czech Republic is 45 minutes.

¹⁹ The above mentioned classes correspond with the following ages: first year (prima): 11-12 years, fifth year (kvinta): 15-16 years and seventh year (septima) 16-17 years of age.

No. 2 Period	+ spontaneous improvisation of the antecedent and consequent ++ great interest of all children in motor visualization of the antecedent and consequent ++ pupils' violin play	- pupils' difficulty closing the consequent on the tonic - carillon playing activity too noisy at times	<i>positive</i> : suitable choice of activity and of most specific tasks within it, relatively high level of pupils' interest, might be useful to incorporate another exercise practicing tonic closing of the antecedent and consequent
No. 3 Song form	+pupils' interest during motivational listening ++ joy from the final realization of Hungarian Dance + pupils' interest in finding differences in the layout of the form	-most boys' difficulty with rhythmic-motor coordination - in the first-year class relatively big noise while using Orff instruments	<i>very positive</i> : suitable choice of activity and of most specific tasks within it, high level of pupils' interest
No. 4 Rondo	+ pupils interest in creating a tonic cluster + support for correct intonation when singing a rondo part ++ pupils pleased with singing in foreign languages + interest in working with cards + pupils' positive emotions over creating the rondo	- pupils not too keen on writing rhythmic figures into the stave - pupils' problems with intonation of rondo part <i>b</i>	<i>very positive</i> : suitable choice of activity and of most specific tasks within it, high level of pupils' interest, optimal outcome of the lesson
No. 5 Variation	++ drawing a picture based on violin play + spontaneous motor improvisation + joy from the final realization of variations	- lack of time for drawing hat designs - motoric étude too noisy at times - pupils' difficulties playing the carillon	<i>satisfactory</i> : suitable choice of activity, some of the activities too difficult for pupils, duration, overall benefit from the lesson still positive

The contingency tables below present the results of a test which was carried out in both the experimental and the control group after the presentation of musical forms. Pupils from both groups were supposed to fulfil the tasks assigned at the end of individual sections in the model situation. Every correct answer scored one mark in evaluation. The results stated in percentage show that the experimental group, which was taught using activities based on Colourstrings principles, achieved higher scores in all tested tasks.

CONTINGENCY TABLE EXPERIMENTAL GROUP Activity 2			
1B age:11	1G age: 15	6A age:16	total
73,5632	78,5714	90,1916	80,78

36,6667	59,3750	67,6471	54,56

Results, Conclusions and Recommendations

The aim of this paper was to present the results of a research survey which was designed to verify the effectiveness of teaching practices based on the Coloustrings method. The didactic experiment which verified the effectiveness of suggested practices, was carried out in parallel groups of pupils in lower and upper classes of grammar school. The above mentioned results of the research survey show that pupils in the experimental group, in which the proposed practices were used, were more active in lessons and were able to use the acquired knowledge better in other musical activities - vocal, instrumental and motor. The results of the research also show that the test assignments at the end of individual sections of the model situation caused greatest difficulty to first year students. With regard to their low success rate in some of the test assignments it is possible to say that it is not appropriate to present musical forms in full in the first year of grammar school.

The research survey proved that teaching practices applied in the model situation "Violin in an Encounter with Musical Form" may contribute to better results in music education for older school-age pupils while increasing the attractiveness of music teaching both for pupils and teachers.

Abstract

The present study seeks to review the current state of research on human resource management –HRM- in order to propose an alternative view from a Corporate Social Responsibility – CSR - and a Law perspective. To do this effect, a bibliometric analysis has been conducted, to identify as challenges for HRM, factors such as the role of stakeholders, climate change, conception of the company, technological changes and management of diversity; this analysis also confirms that the studies of HRM oriented from CSR and Law perspectives are few. In this regard, an alternative view of HRM from the CSR and Law perspectives is proposed. To that end, this article analyze from the ongoing theories, tensions and tendencies, the relations between Law and the CSR. This is justified insofar as the exchanges between the extremes of legal and business, between market and State, which can be seen as conflicting, complementary and concurrent.

Keywords: human resource management HRM, Corporate Social Responsibility CSR, Law, bibliometric analysis, current status of the discussion

1. Introduction

The rise of studies on HRM in recent years has favored its discussion from different disciplinary approaches such as psychology, anthropology, sociology, economics, and, to a lesser extent, (Calderón, Álvarez, & Naranjo, 2006). In this context, this study sets two objectives: 1. to review and synthesize the current state of research in the area of HRM, as well as the main trends and challenges facing this area in the current context, and 2. to establish a connection between law and management from a CSR viewpoint. To achieve the proposed objectives, a chronological analysis is conducted on the four schools—the schools of scientific organization of work, human relations, neohuman relations, and systems—that have made significant contributions to the structuring and consolidation of the HRM area in organizations. This analysis begins with the work of the predecessors to Taylor (1911), that is, Metcalfe (1885), Towne, Halsey, & Taylor (1896) and Gantt (1910).

A bibliometric analysis of the literature indexed by Web of Science (WOS), the KCI Korean Journal Database, the Russian Science Citation Index, and the SciELO Citation Index during the last five years (2012–2017) is conducted using VOSviewer software, version 1.6.4. The study sample corresponds to 9,797

papers studied through a concurrency of terms analysis that creates a knowledge map of terms, with a minimum concurrency of 483. This network identifies the challenges of HRM and related disciplines of study. Finally, an alternative view is proposed for HRM from perspectives of law and CSR. This is justified insofar as the exchanges between the two ends of the legal and business aspects, that is, between the state and the market, can be perceived as a conflictual, complementary, and concurrent relationship. According to the context described above, this paper comprises six sections: Section 1 provided the introduction; Section 2 discusses the historical foundations of studies in HRM; Section 3 presents a literature review; Section 4 summarizes the current challenges and trends in HRM; Section 5 shows an alternative view of HRM from the perspectives of CSR and law as disciplines of knowledge; and finally, Section 6 presents the conclusions, discussion, and recommendations.

2. Method

a. Historical background and concurrence analysis of studies in HRM

As a consequence of the Industrial Revolution, the first practices of HRM in organizations date back to the end of the 19th century, with the development of large companies of the industrial sector in the U.S. environment (Barley & Kunda, 1995). Since then, social, cultural, economic, political, legal, and technological characteristics of the environment have changed, as well as the psychological contract signed between workers and the company. These changes have, in turn, led to three major lines of thought that, in practice, reflect the evolution and study of HR through four differentiated schools (Puchol, 2007): the schools of scientific organization of work, human relations, neohuman relations, and systems. The school of scientific organization of work—of which the main exponent is Taylor (1911), Metcalfe's (1885) successor—highlights the need to maintain a detailed record of operating and administration costs for the sake of the precision and responsibility that must characterize administrative and operative personnel in organizations. This school established the first foundations for the study of management in a scientific way. In this context, scholars such as Towne et al. (1896); Gantt (1910) and Gilbreth and Gilbreth (1917) manage to position management in the field of science with significant contributions to the progression of the production and HRM fields.

Works by the greatest exponent of this managerial school of thought, F. W. Taylor, are oriented to the study of the methods that lead to greater physical performance of the labor force. In this sense, Taylor (1911) focused on studying the time and movements necessary for using tools and machines for the development of work at production plants under the most efficient conditions available. He identified two closely linked variables: productivity and quality of work. The man–machine–production relationship posed by Taylor (1911) has been questioned because of the dehumanization of man in this model and because the organization as a whole was not taken into account in his studies. Notwithstanding the foregoing, it must be recognized that the school of scientific organization makes an indisputable contribution to the direction and management of human resources by regarding man as a central factor of production.

In a chronological order, the school of human relations, which arose as a response to the school of scientific organization of work, is discussed. This school was consolidated through works developed by the social sciences and particularly the psychology of work. In the first stage, works following the school of human relations focused on the selection of workers, professional orientation, and methods of learning and analyzed accidents and fatigue produced by work. In the second stage, the school focused on the individual and on the groups of workers, with efforts devoted to issues such as the study of personality, motivations, incentives,

leadership, communication, and team work, wherein exponents such as Mayo (1945) and Follett (1924, 1941) stand out, among others.

The experimental work developed by Mayo (1945) at Western Electric Company aimed at determining the relationship between job satisfaction and production efficiency. In the first phase of the experiment, Mayo (1945) found that better lighting brings greater productivity and that psychological conditions affect productivity. The second phase aimed at recording the productivity of an experimental group of individuals without them knowing that they are being observed and without variation in schedules or working conditions. Further, the participants' salaries were increased according to the increase in individual production; they also had rest times. The result of this second phase of the experiment is an increase in production from the experimental group. Accordingly, Mayo (1945) concluded that production is based on social norms and expectations of workers. He also reported that individual behavior is supported by the reference group and that the behavior of the group is based on social norms. Further, Mayo (1945) asserted that the greater the social interaction by the worker, the greater his/her production capacity will be, and that any positive or negative social or environmental change will impact workers' reaction. Despite the fact that Mayo's (1945) work has been strongly questioned with regard to the way the experiments were developed, it must be noted that his study has had a pioneering influence in recognizing that the organizational climate affects production. The results of the experiments conducted at Western Electric Company have been the basis of works focused on increasing productivity by improving the organization's environmental conditions. Also, Mayo (1945) influenced organizational studies focused on the study of formal and informal groups in organizations; this would later be the focus of works by Follett (1924, 1941).

M. P. Follett was a follower of Mayo's (1945) original line of thought and is considered to be the mother of industrial psychology. Follett (1924, 1941) suggested that organizations function under the principle of power and that the worker requires belonging to a group to feel satisfied. From this perspective, personal and group growth is achieved by uniting group members with their different skills or abilities. In this way, the synergies that lead to a better group performance are generated in comparison with the individual performances achieved by each one of the different members of the group. Follett's (1924, 1941) contributions are summarized in circular response and constructive conflict. On the one hand, in the circular response, Follett (1924, 1941) affirmed that the relations between people are modified by the contact and interaction between the related individuals, so the contact changes the way each member participating in the relationship conceives the other. On the other hand, constructive conflict is oriented to the importance of the divergence of opinions among the persons involved and the emergence of conflict and the consequent solution thereof through domination, conciliation, or integration.

In this same timeline and after the school of human relations, the school of neohuman relations comes next, with exponents such as Maslow (1943); Herzberg, Mausner, and Snyderman (1959); and McClelland (1961). These scholars complement the theories and postulates from the exponents of the school of human relations. Maslow (1943) proposed the well-known pattern of hierarchical needs by means of a five-step pyramid. The base of this pyramid is formed by physiological needs, followed by the needs of security, feeling of being a member, and self-esteem. The top of the pyramid includes the needs of self-realization, which are achieved through what is known as "peak experience." In this same line of thought, the contributions by Herzberg et al. (1959) have been considered by different scholars to be very significant for the school of relations, especially for the direction and management of human resources in organizations (Griffin, 1972; Kelly, 2001). The bifactorial theory of Herzberg et al. (1959) includes two types of factors: 1. hygienic factors that relate to vital and non-motivational factors for the human, such as the wages earned from work, and 2. motivational factors

The concurrence of studies on HRM is highlighted, wherein concepts such as behavior, perception, information, leadership, challenges, risks, health, job satisfaction, and attitude are reviewed. These concepts are repeated more than 483 times in the 9,797 papers analyzed. These findings coincide with the historical moment of HR, described by authors such as Calderón et al. (2006), who, after synthesizing the evolutionary process of the subject, proposed the conception of the psychological man as a guideline in the current evolution period. In the evolutionary context described, the theoretical confluence in the study on the subject and the conceptualization of the terms “management of personnel” or “HRM” are recognized for the current historical moment. The notions, the distinction of which has not yet been solved, emphasize the management of personnel as an administrative, micro-organizational, static, and transactional matter, whereas the direction of human resource suggests an eminently directive, organizational, dynamic, and constantly evolving function (Puchol, 2007).

3. Findings

a. Challenges of HRM

When verifying the current discussion on the challenges of HRM, various positions are identified, including that of Al Ariss & Sidani (2016), who, when analyzing the future human resources research agenda, identified theoretical and practical gaps related to the HRM, international mobility, and diversity. Calderón et al. (2006) referred to trends in personnel management and identified the following challenges to be taken into account by staff management: (A) intangibles as new competitive advantages, (b) imminent reorganization or globalization, (c) the required organizational redesign, (c) the evolution of employment by employability, (d) the re-conceptualization of organizations, and (e) social responsibility policies. Meanwhile, in analyzing the new perspectives of human resources in the global context, Tung (2016) proposed brain circulation and multicultural teams, specifically geographic and/or cultural separation or distance; differences in type, source, and category; and disparity in economic and technological development. Stone & Deadrick (2015) proposed changes in the economy, globalization, domestic diversity, and technology as the new organizational demands, whereas Alcázar, Romero Fernández, & Sánchez Gardey (2013), in reviewing future lines of research on the subject, highlighted both internal and external factors as well as diversity management practices.

Finally, more specific positions such as that of Puchol (2007) to refer to the challenges of HRM were identified. Puchol (2007) proposed the incidence of what he called environmental forces, including (a) legislation; (b) trade unions; (c) lobbyists; (d) new technologies (Bondarouk & Ruël, 2009); (e) competition; (f) new social values; (g) human resources (globally distributed teams (Agrawal, Khatri, & Srinivasan, 2012), internationalization of departments (O’Sullivan, 2010), and training needs (Wimbush, 2008), among others); (h) the critical conception of the company; and (i) diversity management. Werther & Davis (2014) studied new technologies, nanotechnology, biotechnology, climate change, Asia and new superpowers (Budhwar & Debrah, 2009), English as a global language (Lauring & Selmer, 2012), demographic aging, migration, the female role and labor revolutions, and the 10 mega trends of the environment that impact the challenges of personnel management or human resources. However, these challenges are categorized between external and internal; external issues include governmental and social issues, such as changes in the position of women; labor migration; demographic expansion or contraction; and economic, cultural, technological, ecological, and

political changes. The internal challenges faced by companies include trade unions, information systems, organizational culture, conflict management, and corporate practices.

The evolutionary process undergone by HR has migrated from a purely administrative function to a strategic function wherein human beings are recognized as a source of competitive advantage, as noted by Calderón et al. (2006). This development, in addition to increasing the complexity of this field of knowledge, suggests the need to relate HRM with other disciplines than management (Calderón et al., 2006) such as psychology, sociology, anthropology, law, and economics. In this regard, after the first decade of the 21st century, the most recent studies on HRM have begun to integrate several issues. Each issue has different interests, and this is apparent from the volumes of studies devoted to each. Some topics like management by competences and knowledge management (Donate & Guadamillas, 2015; Hollenbeck & Jamieson, 2015); organizational culture (Tataw, 2012; Wei, Liu, Zhang, & Chiu, 2008); corporate entrepreneurship (Kusa, 2016; Tang, Wei, Snape, & Ng, 2015; Ziyae, 2016); and CSR (Cheema & Javed, 2017; Voegtlin & Greenwood, 2015) are increasing its count. Among the different points of view of recent studies, the psychological, anthropological, sociological, and economic aspects are the most highlighted or popular. However, analysis from the point of view of Law has been less prolific (Ferrary, 2009; Finkin et al., 2013), particularly for examining the relationship between HRM, Law, and CSR (Cadet, 2014; López-Francos de Busturia, 2015). The next section seeks to explain the different elements of this relationship and establish nodal points.

b. An alternative view of HRM from CSR and law

The State and the market are in constant conflict. Such a phenomenon is complex because it involves factors such as politics, economy, and development of technology and telecommunications. This influences the norms that regulate human behavior, with market practices serving as a good example. In this scenario, the relationship between (a) Law and CSR makes sense, and (b) to understand it, it is necessary to make two conceptual approaches and formulate a question with its corresponding answer. Doing so will help (c) identify certain points of interaction between human resources and CSR from the perspective of Law.

(a) The first conceptual approach makes it necessary to affirm that Law is a system of rules that responds to principles and variable dogmas, which according to the branch or specialty (civil, criminal, administrative, constitutional, etc.), provide rules for their enforcement (Hart, 1961). It is necessary to complement the above by stating that there are two different legal orders: one as a national space and the other as an international one (Guastini, 2016). Law is applied in a different way, i.e., according to logic and autonomous principles. Thus, it is known from the outset that Law is a normative system that changes according to the normative, national, or supranational order. However, the second conceptual approach is aimed at establishing that CSR intends for States to favor policies friendly to the right of free enterprise so that this is reflected in the development of a community (López-Francos de Busturia, 2015). Colombian magazine “Semana (2017)” recently explained how large companies are committed to sustainable development and the development of human rights (HR) such as education, work, and healthy environment to further promote the support of individual liberty rights (Quinche Ramírez, 2015). This applies to “a control over their production processes, their products or services, water quality, air, staff (training course), transparency, and integrity” (López-Francos de Busturia, 2015, p. 78).

(b) The two previous approaches show what the scenario is. But a guiding question is still needed: What is the relationship between CSR and the Law? Providing an answer will allow us to establish another relationship—of a second order—that leads to the analysis on human resources. To begin with, it is necessary to state that CSR is not a legal concept beyond a reference to the Law (Cadet, 2014, p. 41). In light of the theories that

validate CSR (García, 2017), the role of the Law is to set the minimum standards of respect for companies in their relations with communities, following the principle of non-regression in the field of HR, but more specifically on social, economic and cultural rights (Sepúlveda, 2006). However, regulatory gaps that put the relationship to test. For companies, the search for economic profit in an environment without legal regulation means that the rules of the market and free competition are the ones that prevail. This does not apply to HR, for example.

The affirmation of Cadet (2014) about the nature of CSR does not escape an analysis on the activity of the company as a new source of Law. Today, rules are not formulated solely by the State; companies themselves agree on certain rules to regulate their relations with society (Cadet, 2014, p. 122). CSR turns out to be a third way, assuming that the first is the Law and the second anarchy. Thus, in the scenario described in the previous paragraph, companies must be competitive and, for this reason, it is not strange that they claim that labor law or social guarantees hamper the production of profits (López-Francos de Busturia, 2015, pp. 208–247). The average entrepreneur's reasoning against the domestic law of states leads one to think that if profits are reduced, the creation of sources of employment and the welfare of the community run the risk of following the same fate (García, 2017). Faced with this legitimized behavior by capitalism and the market economy, the enforcement of social justice as an ideal comes from the efforts of the international community with the creation of supranational norms. In effect, organizations venture to impose an ethics of respect of minimum standards imposed by HR on companies (Truchet, 2002, pp. 89–91); this is the case, for example, with Organization for Economic Co-operation and Development (OECD) recommendations. The phrase venture to impose deserves particular attention. First, the verb “to impose” reveals a paradox of the State–market tension. Some theorists of CSR defend that it departs from the norms of immediate fulfillment and happens to be governed by what the companies simply want because of the simple liberality (García, 2017). For this reason, free decisions made by the companies constitute regulations parallel to the legal or state regulations. Second, it may be said that the first end of the phrase (“venture to ...”) that engages companies allows them to say that they resist—for reasons of economic convenience—to abide by the Law but propose to committing themselves to be responsible to the society, i.e., to abide by the norms that they themselves impose. In this manner, CSR becomes an added value, a distinctive sign that consumers want to support (Observatorio de RSC, 2007). International organizations that represent, in some way, business interests or their vision, venture to propose recommendations to States, aimed at promoting freedom of enterprise; in turn, these [states] receive development or improvement of the quality of life of a community as a consideration. A transnational company, for example, settling in a country where HR are not protected by laws [those of the hosting country] can choose to be socially responsible and prefer to respect international standards linked to human dignity and employee dignity. What is said counts from the strict point of view of the State, the Law, and political theory (Cadet, 2014; López-Francos de Busturia, 2015).

However, from a market point of view, CSR represents a competitive advantage in a society where communities and their members have greater and better access to information. If referring to responsible consumers (Adam-Lachèze, 2012; François-Lecompte, 2009), it is inevitable to think that they can see how synchronized a particular company is with CSR. In the 21st century, this simple fact substantially modifies the consumption habits from a sector of the world population that believes in a responsible use of their access to information (François-Lecompte, 2009). Then, if the perspectives cross, it may be thought that the relationship between Law and CSR shows that the company has a certain capacity to alter the traditional (i.e., state-wise) regulation of its activity. This is what López-Francos de Busturia (2015) and Cadet (2014) perceived as the ability to create a legal order different from the national order.

Three different positions can be analyzed at this juncture. The first position is that of international law. It ventures to propose timid self-regulation guidelines (e.g., Draft Code of Conduct for Transnational Corporations, which was proposed by the UN in 1983) (Berdeja Prieto, 1979; ONU, 1983). The second position is the one proposed by domestic law. Attempts by States are getting increasingly aggressive under the concepts of government regulation and legal CSR. Legalization requires large national and transnational corporations to adopt statutes that take into account anti-labor slavery and human trafficking policies (see the Royal Society of Chemistry's (2017) website), to cite two cases directly related to the area of human resources. The third position is the one that combines both systems, as happened before the Supreme Court of the United States, in the case *Kiobel v. Royal Dutch Petroleum Co.*, 133 S.Ct. 1659 (2013) (United States District Court S.D. New York., 2013), or more recently in the following cases: *Nestlé U.S.A. v. Doe de 2016* and *Jasner et al. v. Arab Bank, PLC of 2017* (United States Court of Appeals for the Second Circuit, 2017).

Kiobel v. Shell served to analyze the possibility that the Alien Tort Statute (ATS) of 1789 (Ruggie, 2012) was used to oppose the violation of HR by a transnational corporation in a place outside the national territory, before the Supreme Court of the United States. In this case, as in *Nestlé U.S.A.*, this form of holding companies responsible for their actions was not given significance. But in 2017, in *Jesner v. Arab Bank, PLC*, the Supreme Court reversed its decision. Certainly, the third case handled CSR from a broader perspective and served to teach the primary importance played by the States in their implementation (Ropes & Gray, 2017). The main debate relies on the doubt—more than reasonable—about the binding force of CSR against the market; therefore, the Law has the advantage of being mandatory. On the other hand, when voluntary CSR closes the possibility for States to set parameters for their use than through their laws, then they only follow the recommendations adopted by organizations such as the OECD.

Two comments must be added to this discussion. The first is that the relationship that is the purpose of this study has been scarcely approached or reviewed (Ferrary, 2009; Finkin et al., 2013), despite the considerable number of sources and issues linked to its problems. The second comment approaches not from intellectual production but from the very foundations of the modern liberal constitutional state. After the Second World War, respect for HR and human dignity became an immediate consequence, transforming them into an ontological condition for all States in the Western culture. In addition, this has a double connotation. The State ensures that its population has a duty to respect HR while providing the legal mechanisms for this to occur. In addition, it adjusts internal rules to create mechanisms with which rights humans can be defended. (c) The discussion to be addressed in this paper is very extensive. Therefore, the areas of interference of the debate (i.e., rights, CSR) and an area of administrative science can be revealed. To this end, the topic of human resources was chosen. How does the indeterminate character, ranging from voluntary to obligatory, of CSR affect the protection provided by the States in the field of human resources? Certain elements for proposing a response are given by the following: the criteria for recruitment; labor and personal development of employees; and the promotion of worker safety, implementation of policies for risk prevention, and assurance of worker access to health service. It was previously stated that there are those who are in favor of CSR for its being outside of the scope of mandatory state law, but the truth is that HR—and the doctrine arising from them—are minimum conditions that no company can avoid complying (Capelli, Guillot-Soulez, & Sabadie, 2015). Thus, not only are labor rights and social security included but also other guarantees are adopted and implemented beyond a minimum with a certain vision of participatory government within the company (Igalens & Tahri, 2012).

4. Results, Conclusions and Recommendations

In the existing literature on HRM, the development and evolution undergone by the discipline since Taylor's (1911) study can be appreciated. Indeed, Taylor lays the groundwork for the study of scientific administration with his works on times and movements within the production plant. But it is also true that the worker is completely absent from any humanity in his studies. In this context and with the emergence of work psychology theories, approaches and schools originated around the psychological and legal contract between human resources and organization begin to take shape. These approaches and schools have been marked by advances in the social sciences (in particular, organizational psychology) and changes in the economic, social, cultural, technological, political, and legal environments. Thus, the need to humanize the worker gave rise to studies from the school of human relations, with exponents such as May (1945) and Follett (1924, 1941), and the works of the neohumanist school, with exponents such as Maslow (1943), Herzberg (1959), or McClelland (1961). Later, this gave way to the emergence of the school of systems, with its greatest exponent Bertalanffy (1968), who conceived the organization as an open system with reference to the biological analogy of the system.

When verifying the current discussion on HRM, both challenges and related disciplines of study are identified. Challenges include issues such as the role of stakeholders, climate change, critical business thinking, rapid technological change, and management of diversity. Meanwhile, when reference is made to related disciplines of study, a marked psychological, anthropological, sociological, and economic tone is recognized in the study on HRM, leaving behind its review through the perspective of Law. Law has a tendency in the Western world to apply CSR effectively. The State regulates the actions of companies, showing how they can be socially responsible, especially through labor guarantees. These must be protected within the framework of CSR.

In the logic of finding new research perspectives on HRM, from the perspective of the Law and CSR, the topics of major importance are listed as follows: criteria for selection of personnel; labor and personal development of employees; promotion of safety, aimed at implementing risk prevention policies; and access to the worker's health service. All these themes show the road map to researchers and academics. Thus, on the basis of the new perspectives, some recommendations for future studies are proposed below. First, governance of the company should be studied. This constitutes the theoretical platform that allows the application of labor policies so that the company becomes compatible with the legal systems of the States. Second, comparative studies on the internal law of the countries in the region must be conducted in the light of international law that proposes recommendations to States on CSR (OECD and ILO). This type of analysis seeks to define and propose tailor-made business policies and management tools in tandem with the growing need for each company to become socially responsible. Third, the relationship of HRM and norms that regulate labor guarantees should be studied in the contexts of mass migration and diversity. These studies would serve to prevent labor slavery or to identify cases and even practices that prevent it. In summary, these types of studies have a general objective: to theorize about the possible modifications of the behavior of companies so that they bridge—through social justice and under the banner of respect for HR—the gaps left by the State. Companies now face a challenge: humanization of HRM aided by the rules of CSR.

Abstract

Human Resources have become essential when speaking about a competitive advantage in the marketplace nowadays. Brand and corporate reputation are crucial when talented and highly-skilled job seekers consider applying for a job as they have often several options. The boom of the internet has opened new opportunities for companies/employers to lead their branding campaigns and advertise job vacancies. This paper reacts to the call of Sivertzen, Nilsen and Olafsen (2003) to test their model with a different group of respondents because the industry the respondents belonged in may have a substantial impact on the responses and relationships of the model. The original research model identifies important factors organizations should focus on when building their employer brand online and it investigates the relationships that connect dimensions of employer attractiveness with variables measuring corporate reputation, the use of social media and intentions to apply for a job. Their study explores whether the perception of employers by potential employees based on the social media promotion influences their intentions to apply for a job in a company. In the research, an electronic questionnaire distributed to computer science students in the Czech Republic was used, where responses are related to well-known Czech computer science companies. The model is replicated not only within a different industry but also in different geographical and cultural terms compared to the original paper. The proposed model was tested by a structural equation modelling in R statistical software. The purpose of this paper is to verify the validity of the original model, to extend the context of its application and to re-evaluate the limits of the model to increase the possibility of generalization. On the one hand, the results indicate positive relationships between variables of the model. On the other hand, we need to take into consideration weak fitting statistics and a low number of observations which limited the validation of the proposed model.

Keywords: Resource-Based View, Employer Attractiveness, Social Media, Corporate Reputation

Introduction

Human resources management has always fought for its position in a company budget. This is precisely why financial difficulties of a company have been in many cases associated primarily with spending cuts on human resources systems (Wright et al., 2001). Nowadays, human resources have become the key to competitive advantage. Successful companies effectively competing in the marketplace have already integrated their talent strategic steps into their daily operations (Bergeron, 2004). A theoretical shift in the concept of human capital and human resources (HR) decisions as a source with strategic nature is grounded in the resource-based view (RBV) and the resultant resource base theory (RBT). This basis also serves as grounds for related areas emerging from human resources that arise from growing acceptance of the importance of people as part of the strategy leading to a firm's success. Therefore, this paper begins with a brief insight into this issue as is the foundation for the original model.

The thought of a resource-based view is referred to Wernerfelt (1984). However, it is important to note that the importance of strengths and weaknesses of a company's internal resources had already been emphasized by Harvard Design School (e.g. Andrews, 1971). This perspective, where companies are viewed from the side of resources and not from the side of the product, allows a new view on strategic options of companies. By resources are meant tangible and intangible assets tied semi-permanently to the firm (Wernerfelt, 1984), although the list of definitions has become much longer during the time. Jay Barney, probably the most influential RBV theorist (Boxall, 1996), later, for the purposes of the discussion, classified possible resources into three categories, physical capital resources, human capital resources and organizational capital resources (Barney, 1991). So then, the core

of RBV consists of analysing and interpreting these resources of the organisations as a source of superior performance and competitive advantage (Wernerfelt, 1984; Barney, 1986). This concept is quite different from the traditional market-based view (MBV), as RBV sees companies as heterogeneous – every firm is different from another one due to the combination of resources it consists of. MBV, on the other hand, sees companies as fairly homogenous, gaining competitive advantage by branding and positioning efforts (Madhani, 2010).

RBV contributed significantly to the development of strategic management and came to be a dominant framework in the 1990s (Boxall, 1996; Wright, 2001). Due to its shift from external to internal factors, RBV provided a logical link between the theories of human resources management (HRM) and strategic development (Boxall, 1996), and, therefore, has been clearly instrumental to the development of strategic human resource management (SHRM) (Hoskisson et al., 2016). Resource-based thinking supported the assertion (if needed) that people are the strategic cornerstone of the corporate success (Wright et al., 2001). It means that theoretical contribution of HRM was not only seen as an useful tool for implementing given strategical scenarios but it was also valued for its potential to generate strategic competitive sources (Barney, 1991). HR may lay down the foundations for a company's competitive advantage by hiring and developing talented staff and by combining talents better than competitors (Boxall, 1996). Gradually, people have come to be a crucial source with an indisputable benefit for companies, precisely because companies compete in information, knowledge and services. Managing human capital as part of strategic planning is now a must and should be an immediate interest of the top management if the company wants to be competitive and successful (Armstrong, 2015). Especially in a period in which there is an excess of demand over supply on the labour market, it is indispensable knowledge for an employer how to be attractive for employers (Kasper, 2005; Mahroum, 2000).

As a consequence of talent shortage, companies, especially those operating in the knowledge-intensive area, need to differentiate themselves on the labour market. In order to offer a unique employment proposition, they need to build an employer's brand that will allow them to keep up in the tug of war for talents (Ewing et al., 2015). The phrase *employer brand* was conceptualized for the first time in 1996 in the very well-known article by Ambler and Barrow (1996), who tested the application of brand management techniques to human resource management. They defined employer brand as „the package of functional, economic and psychological benefits provided by employment, and identified with the employing company “. Naturally, new and narrower definitions appeared later; the authors of this article, however, used the definition from the original paper (Sivertzen et al., 2013) as „the process of building employer identity directed at existing and potential employees, in order to differentiate the firm from its competitors“, which corresponds with the main idea of being different on the market of employers (Ewing et al., 2015). Employer branding, whatever changes its definition has undergone, is one of the attributes that boost competitive advantage. It is also worth mentioning that probably every company has a brand, but only some of them have their brand based on effective branding efforts (Backhaus, 2016a). A number of studies were concerned about brand attributes, finding the most effective or most attractive of them in contributing to employer attractiveness.

This paper contributes to scientific progress related to this phenomenon through replication, as replicability is an important component in research (Brandt et al., 2014). It seeks to determine the most important factors when building an employer branding campaign and therefore contribute to better and deeper understanding of how processes of branding should be managed. The paper uses a model by Sivertzen et al. (2013), which consists of four parts. First, it investigates the relations between five dimensions of employer attractiveness and corporate reputation. Second, the relations between corporate reputation and intentions to apply for a job and the use of social media as a moderator factor between them. Factors are measured by using both the existing scales used as the original and slightly modified scales for the purposes of the model. These relationships are characterized by four hypotheses based on the current knowledge (reviewed theory). The research model is presented in Figure 1 followed by full text hypotheses. The findings of our research are also compared with the results from the original paper, as the intention of this paper is to test the model and verify its validity. To reach this goal, different groups

of respondents, different industries, as well as different geographical and cultural terms were chosen compared to the original paper. These differences could influence the relationships of the model considerably.

As follows from the text above, employer brand is the opportunity to improve and differentiate an organisation's attractiveness as an employer. Therefore, there is a new concept applied in research, *employer attractiveness*. Berthon et al. (2005) defined this as „the envisioned benefits that a potential employee sees in working for a specific organization“, and says that employer's value proposition is perceived and evaluated based on this attractiveness. Based on the research findings, attractiveness is positively related to the needs of target audience. That means that a potential employee or group of employees are attracted to a company if they feel it could fulfil their personal needs (Botha et al., 2011). Employer branding helps building an image of the company so as to achieve this. However, it is often difficult for companies to differentiate if they are from the same industry, demanding the same job positions, and related factors are similar. Nevertheless, Lieven and Highhouse (2003) found that instrumental job and organisational attributes such as salary and similar benefits are overvalued when dealing with employer attractiveness by symbolic trait inferences of particular companies. Similarly, Milkovich and Newman reveal that the attraction is affected by the level of the fit between job offer and its benefits and inherent preferences of a potential employee (Milkovich and Newman, 2008). Many studies have focused on determining the most attractive factors. In the contemporary academic community prevails the consensus about the multidimensionality of this construct (Alnıaçık, 2012). However, it is not a surprise that, due the use of different samples, the hierarchy of preferred traits reveals dissimilarities. The differences are shown to be given for example by the firm's nationality, within particular countries or within certain professions (Backhaus, 2016c) or by gender, age or employment status (Alnıaçık, 2012). Despite the differences in the importance of individual factors, the consensus prevails in the contemporary academic community about the multidimensionality of this construct. A widely used tool for uncovering the preferences was created by Berthon et al. (2005). The employer attractiveness scale (EmpAt) is a result of a mixed research. The scale consists of 25 indicators constituting 5 dimensions. Strong foundations for this scale were provided by Ambler and Barrow's (1996) research. Berthon's scale was used in this paper as part of the model as well.

Company's reputation appeared to represent significant connectivity to employer attractiveness. The reputation of the organisation may serve as a source of information about working in a particular company when a job seeker is considering their choices. Awareness of a company and high corporate reputation ratings are significantly related to organizational attractiveness according to Cable and Turban's (2003). This positive relation is part of the research model. Although corporate reputation has been subject of interest for practitioners as well as academics for decades, there is no generally accepted definition of the term. The existing definitions could be merged into two streams, either the term is analogous to the corporate image or it is differentiated (Gotsi and Wilson, 2001). For the purposes of this article, the identical definition from the original paper is used, which describes corporate reputation as „an organisation's set of socially constructed characteristics, defined by the organisation's previous actions and future prospects“ (Sivertzen et al., 2013). According to the resource-based view, the reputation of a particular company can be considered as a specific strategic asset (Branco and Rodrigues, 2006).

When a company seeks to build its reputation, managers can use demand-based instruments to target at employees who seek out firms with better reputation (Auger et al., 2011), thereby enhancing a potential employee's *intentions to apply for a job*. Several studies have found a positive relation between the level of reputation and intentions to apply. Following the research model, Collin's and Steven's (2002) paper is used. They confirmed the relation between positive perceptions of organisations and intentions to apply for a job in a particular organisation on a student sample. The findings also suggested that firms which understand how to communicate the value have a strategic advantage on the labour market, as it turned out that the possibility that a student will apply for a job in a particular company rises if they have been exposed to early recruitment-related activity (Collins, 2002). Within recruiting, different types of marketing channels are used (Sivertzen et al., 2013). Along with the dramatic

transition of communications technology, recruiters are faced with different needs of workforce and new generation of potential employees, which means different expectations of building relationship with potential employers (Gravili and Fait, 2017). With emphasis on the generation in which our respondents belong, social media should definitely be considered by employers as a recruiting tool to attract and recruit (Wazed, 2015).

Nowadays, as *social media* penetrate society, they have impacted the field of HRM in a number of ways (Kluemper et al., 2016). Social media can increase stakeholder engagement (Hoffmann and Lutz, 2015) and potential job applicants represent an important organizational stakeholder group for human resource management (Kluemper et al., 2016). Organisations are increasingly often turning their attention to using the potential of social media for corporate marketing and branding activities (Gallaugher and Ransbotham, 2010). However, social media should not simply be regarded as another channel for recruitment, but also as a tool to interact with a potential applicant, managing branding and reputation activities simultaneously (Dutta, 2014). Communicating through social media brings many advantages as contact with the target group is personal, realistic, and interactive, and last but not least, it could be more cost-efficient. On the other hand, a possible drawback is that communication through social media cannot be controlled to such an extent as classic media channels (Kissel and Büttgen, 2015). Research should be conducted into how the advantages of this channel can be fully exploited and how social media can support marketing strategies and contribute to the marketing goal of organisations (Tsimonis and Dimitriadis, 2014). All the above-mentioned ideas are emphasized by our sample. Despite the fact that experts disagree about the exact years of birth to define the generation, for our purpose it is the 1981 – 2000 generation called Millennials or GenY. Their main characteristic is their enthusiasm for technology and proficiency. Y's use communication technology differently from any other generation (Smith and Galbraith, 2012). Moreover, the use of social networking sites by millennials far outpaces that by the older generations. On the other hand, there are research findings which suggest unpreparedness of graduates for modern online job market (Manroop and Richardson, 2013). Accentuation on a specific generation is important as generations prioritize employer's attributes in different ways (Reis and Braga, 2016).

In the following part, hypotheses, research model, procedures, participants and measures will be presented.

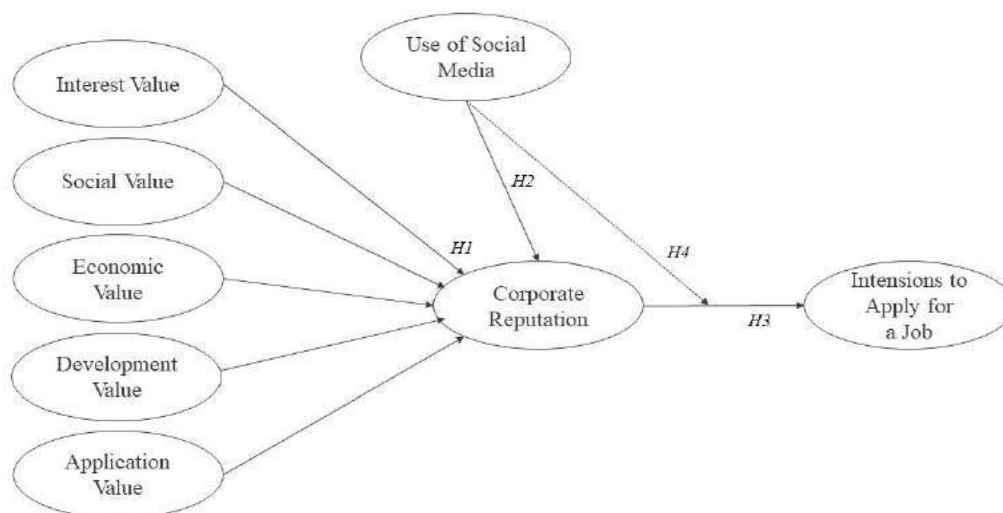

Method

This paper reacts to the call of Sivertzen, Nilsen and Olafsen (2013) to test their model. The research model shown in Figure 1 has been replicated from the original paper. The research was conducted on students of engineering from Norway as respondents, and the questions were related to three well-known Norwegian engineering companies. Our replication is testing this model under slightly different conditions, namely within a different industry and also in different geographical and cultural terms. Our replication was conducted on students of computer science in the Czech Republic as respondents, and the questions are related to three well-known Czech IT companies. This variation could have a substantial impact on the responses and relations of the model.

As Figure 1 shows, the research model consists of 4 parts and contains 4 hypotheses to test. Each part of the model is expressed by a scale consisting of indicators. Individual indicators represent individual questions for respondents. The research was conducted as a survey through a web-based questionnaire.

Figure 1 - Research model

Replicated according to original study Sivertzen et al, 2013

The questionnaire is composed of several parts. The first part contains control variables. These are gender, age, place of residence, nationality, and work experience in the IT sector. Since control variables do not enter the results of the original study, they were changed slightly and will be used for further research. Compared to the original study, our questionnaire did not contain the variable of academic results, as a common assessment element is not used in the Czech Republic and, therefore, the answers would not be comparable. Moreover, a variable nationality was added as the place of residence is not a clearly defined term, because it can be understood in two ways, temporary as well as permanent residence.

The second part measures *employer attractiveness* (EmpAt) in its general sense. In the original model, it was measured by a scale developed by Berthon et al. (2005), based on the question “How important are the following when considering potential employers?”. 25 indicators were measured using a seven-point Likert scale ranging from 1 (totally unimportant) to 7 (very important). The distribution of indicators into 5 dimensions was maintained. These are interest value, development value, social value, economic value and application value, which were applied on factors by exploratory factor analysis (Berthon et al., 2005). This scale was searched and has been fully replicated.

The following part of the questionnaire is related to specific companies. Firstly, the respondent is asked about his/her knowledge of these companies. Based on the answer, only the questions (identical for every company) related to the companies the respondent knows appear. Questions are organized into three blocks, namely corporate reputation related questions, social media related questions and questions related to intentions to apply for a job. Each block represents one part of the model. Questions were designed to respond to the scale. In this case only five-point Likert scale is used, ranging from 1 (I totally disagree) to 5 (I totally agree). The scale measuring *corporate reputation* was developed by Turban et al. (1998) and contains four indicators. The scale measuring *intentions to apply for a job* was created by Highhouse et al. (2003) and contains 5 indicators. The last group of indicators used for measuring *social media* was developed from the scale created by Collins and Stevens (2002). The original scale was intended for general use for employer branding and, for the purpose of this model, it has been modified and redesigned specially for social media. The final modified version consisted of 5 indicators. It is important to note that we have been working with one more indicator than the original model makers Sivertzen, Nilsen and Olafsen (2013). This follows from the fact that the modified scale was not traceable completely. The scales for measuring corporate reputation and intentions to apply for a job were found and fully replicated.

The questionnaire was technically processed by Lime Survey, an on-line survey application. It was through this website that the survey was developed and published, and responses were collected. Data were exported to csv format and processed in R statistical software. The survey was available in English language and was translated into the Czech language and checked by peers for spelling and content.

Hypotheses are derived from the literature review and are replicated from the original Sivertzen, Nilsen and Olafsen's (2013) paper.

H1: Potential employees' perception of the five dimensions of employer attractiveness has a positive relation with their perception of a good corporate reputation.

H2: Potential employees' perception of employers' use of social media has a positive relation with a good corporate reputation.

H3: High corporate reputation has a positive relation with the potential employees' intention to apply for a job.

H4: Potential employees' perception of employers' use of social media positively moderates the relationship between corporate reputation and potential employees' intention to apply for a job.

As this paper reacts to the call of the original study by Sivertzen, Nilsen and Olafsen (2013) to test their model, we asked students of computer science in the Czech Republic about three well-known Czech companies. Therefore, the model is replicated not only within a different industry (the original model works with engineering) but also in different geographical and cultural terms compared to the original paper (Norway).

The three companies the part of the questionnaire was related to were chosen from the list of the Czech Republic's most attractive employers surveyed by Universum (Czech Republic's Most Attractive Employers, 2017). These businesses were established in the Czech Republic and are ranked among the top positions of the list mentioned above. Avast Software is a cybersecurity software company that develops antivirus software and internet security services. Kiwi.com (formerly Skypicker) is one of the biggest European airline tickets sellers. The company uses a unique flight combination algorithm and the website provides a fare aggregator, metasearch engine and booking. These two companies are multinational. The third company used in the survey was Seznam.cz which is mainly a Czech search engine which also runs dozens of different web services and associated brands. The IT sector is a constantly evolving industry with a high added value, therefore, the right employees are necessary to maintain competitiveness.

Respondents in the present study were computer science students from the region of South Moravia, specifically from the city of Brno. The city is characterized by a network of universities and by concentration of developed multinational companies as well as start-ups, thanks to which the city has gained the attribute of the city of innovation. Primarily computer science students from three universities, Masaryk, Mendel and Brno University of technology were approached.

Findings

In total, 65 IT students, 45 males and 20 females, answered the survey questionnaire. There were 8 students under 21 years old, 48 students between 21 and 25, and 9 students were more than 25 years old (the oldest respondent was 29 years old). About one fifth of respondents (14) had no working experience, 19 respondents had less than one-year experience, and 32 respondents had more than one-year experience.

As some responses were not completed, we replaced the missing values with the most frequent answer in the category. Only responses with less than 4 missing values were treated this way, others were withdrawn from the sample.

We have included the results from all three organizations as one sample. This can be done because of closely related means and standard deviations from all three organizations. By using this procedure, we followed the original study by Sivertzen et al. (2013). In total, we have 177 answers with the following structure: 52 respondents

completed the survey for all three organizations, 8 respondents for two organizations, and 5 respondents answered the survey for one organization.

The proposed model and overall analysis were performed in R software, the structural equation modelling was accomplished via *lavaan* package (Rosseel, 2012). Structural equation modeling is a multivariate statistical framework that is used to model complex relationships between directly and indirectly observed (latent) variables. The overall fit of the models was evaluated using the Chi-Square test (χ^2) that measures the deviance between the estimated and baseline model. We want to reject the null hypothesis of Chi-Square test. We also used alternative characteristics of fit: comparative fit index (CFI), Tucker-Lewis index (TLI), root mean square error of approximation (RMSEA) and standardized root mean square residual (SRMR). Hu and Bentler (1999) suggested the following rules of thumb: CFI/TLI > 0.95, RMSEA < 0.05 and SRMR < 0.06.

Firstly, we evaluated the fit of the EmpAt scale using confirmatory factor analysis (CFA). We used the DWLS (diagonally weighted least squares) estimator with polychoric correlations. The CFA model did not converge and no unique solution was found. Although we tried to find another factor using the exploratory factor analysis (EFA), the EFA revealed that the data does not contain any reasonable factor (we rejected the null hypothesis claiming that the number of factors is sufficient for less than 16 factors) and therefore we employed an alternative approach. We summed up all Likert items within each EmpAt category (Spector, 1992), the descriptive statistics are presented in

Table 1. We implied the original *EmpAt* scale published in Berthon et al. (2005). The article already set up which questions belongs to which factors and, based on this, we summed up items within each factor afterwards (verbal answers were coded to numerical values and summed together, e.g. Interest Value = Neutral {4} + Neutral {4} + Important {6} + Very important {7} + Rather important {5} = 26).

Table 1. Descriptive statistics of EmpAt categories

	M	SD	1	2	3	4	5
1. Interest Value	14.14	5.01	1.00				
2. Social Value	14.09	4.40	0.13	1.00			
3. Economic Value	17.36	4.55	0.27	0.26	1.00		
4. Development Value	16.43	5.58	0.11	0.26	0.39	1.00	
5. Application Value	18.11	5.11	0.35	0.50	0.35	0.44	1.00

Note: M is mean, SD is a standard deviation and columns 1 – 5 denote mutual correlations.

The estimated model shows fit for the model slightly off the recommended range: $\chi^2(106) = 181.964$ (p-value < 0.001), CFI = 0.908, TLI = 0.890, RMSEA = 0.064 (90 Percent Confidence Interval = 0.048 – 0.079), SRMR = 0.081. Results of the two regressions from the SEM model are presented in Table No. 2 and the measurement models are in Table.

Table No. 2. Regression

	Estimate	Std. Err.	P-value
<i>DV: Corporate Reputation</i>			
Use of Social Media	0.333	0.129	0.010
Interest Value	0.042	0.020	0.034
Social Value	0.011	0.024	0.663
Economic Value	-0.007	0.023	0.765
Development Value	0.001	0.019	0.975
Application Value	-0.023	0.024	0.324

<i>DV: Intentions to Apply for a Job</i>			
Use of Social Media	0.212	0.101	0.037
Corporate Reputation	0.526	0.075	< 0.001

Note: DV means a dependent variable.

We found a significant positive relation between the Use of Social Media and Corporate Reputation, which supports the second hypothesis H2. On the other hand, only Interest Value category from EmpAt scale has a significant relation with Corporate Reputation. Other categories are insignificant. This finding partly supports the H1 hypothesis.

The second regression model shows a significant positive relation between both, Use of Social Media and Corporate Reputation, and Intentions to Apply for a Job. These findings support the third and fourth hypotheses respectively.

Table3. Measurement model

	Estimate	Std. Err.	P-value
<i>Corporate Reputation</i>			
Company with a good public image	1.000		
Company with a good reputation	0.998	0.051	< 0.001
I have heard a lot of good things about this firm	0.872	0.080	< 0.001
<i>Use of Social Media</i>			
I have seen advertising for jobs at this organization in social media.	1.000		
The organizations' profile in social media gave me detailed information about their job opportunities.	1.165	0.189	< 0.001
This organizations' profile in social media caught my attention.	1.193	0.193	< 0.001
Top officials from this organization (e.g., its CEO) are often quoted in social media.	0.935	0.166	< 0.001
I have seen news stories about this organization in social media (e.g., on Facebook or Twitter)	1.119	0.129	< 0.001
<i>Intentions to Apply for a Job</i>			
I would accept a job offer from this company.	1.000		
I would make this company one of my choices as an employer.	0.731	0.097	< 0.001
If this company invited me for a job interview, I would go.	0.911	0.108	< 0.001
I would recommend this company to a friend looking for a job.	0.931	0.137	< 0.001

Note: First variable in each latent variable were fixed to 1. We removed some questions for better fit.

In addition, we calculated the indirect effects in the final model. Results are available in Table 3. Results show that both Interest Value and Use of Social Media have a positive and significant relation with Intentions to Apply for a Job. Other indirect effects are insignificant.

Table 3. Indirect effects on the Intentions to Apply for a Job

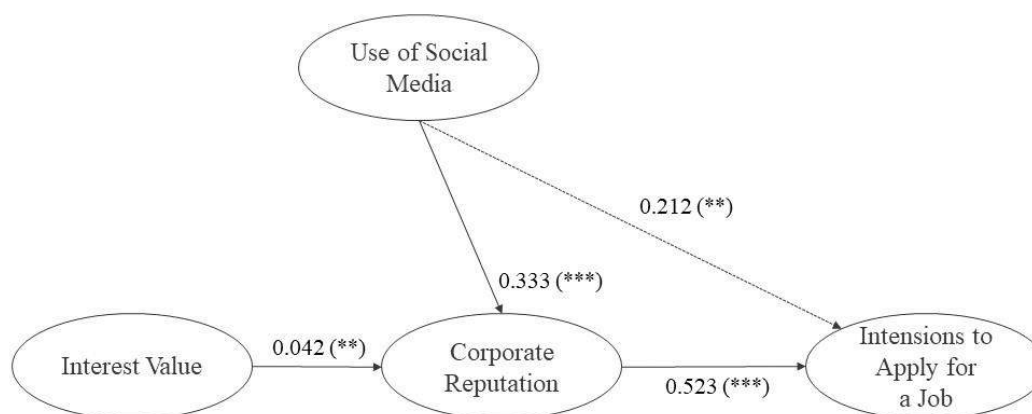

IV	MV	DV	Estimate	Std. Err.	P-value
Interest Value	Corporate Reputation	Application Intentions	0.022	0.011	0.040
Social Value	Corporate Reputation	Application Intentions	0.006	0.013	0.663

Economic Value	Corporate Reputation	Application Intentions	-0.004	0.012	0.765
Development Value	Corporate Reputation	Application Intentions	0.000	0.010	0.975
Application Value	Corporate Reputation	Application Intentions	-0.012	0.013	0.327
Use of Social Media*	Corporate Reputation	Application Intentions	0.508	0.198	0.010

Note: IV is independent variable, MV is mediator variable, DV is dependent variable. * Total effect (direct and indirect combined).

Figure 2 - Results from the analysis

Notes: ***p < 0.01; ** 0,01 < p < 0,05; * 0,05 < p < 0,1

Results, Conclusions and Recommendations

The study was conducted to verify the validity of the original model which investigated the relations between the dimensions in the EmpAt scale, corporate reputation, the use of social media and intentions to apply for a job. The original model had been validated in Norway in the engineering industry, while our research has verified its validity in the Czech Republic and its IT industry. It means that model was replicated within a different industry and also in different geographical and cultural terms compared to the original paper.

Whereas the original study confirmed hypothesis H1 partly (4 dimensions), and hypotheses H2 and H3 fully, our research confirmed all four hypotheses (H1 partly as well, but only 1 dimension). The differences in the resulting model are therefore in validation the EmpAt scale and the role of social media to intention to apply for a job.

It should be noted that firstly, as in Sivertzen et al. (2013), the confirmatory factor analysis (CFA) was conducted to evaluate the fit of the employer attractiveness scale by Berthon et al. (2005). In our case, the model did not converge, so we decided to use the exploratory factor analysis to find another distribution of the given items among factors. However, due to inconsistent data (mainly weak correlation between related items), this attempt was not successful either. This led us to employ an alternative approach of summed up items from within each factor. Therefore, the different result in confirmation of H1 hypotheses compared to the original paper can be influenced by this alternative approach of processing data of the employer attractiveness scale. Different dimensions can be also explained by cultural differences. Berthon's (2005) final scale (Australia) differed from Sivertzen's (2013) final scale (Norway) and they both differ from our final scale (Czech Republic). As Sivertzen et al. noted, there were also differences compared to other studies using the EmpAt scale (Roy, 2008) (Arachchige and Robertson, 2011), even though these studies added several new indicators.

Whereas the original study did not confirm H4 hypothesis, it means the interaction effect of social media on intentions to apply for a job, our data showed a positive relation. This could have been influenced by several factors as well. The original study was conducted in 2013 (4 years ago), so the difference between its and our findings could have been influenced by the fast development of use of internet and social media. In this case, it could also be influenced also by the industry of computing science which is closely connected to the information technologies. However, it is obvious that the use of social media connected to employer branding should be an important part of further research.

The present research suffers from several kinds of limitations. First, there are limitations resulting from the nature of replication research. Although cooperation with the original authors on replication study is encouraged, cooperation was not feasible at the time of working on this paper. Therefore, not all original materials were available. The model consists of four parts, three of which were, according to the original paper, taken from previous studies, and these were fully replicated by us. However, as mentioned above in the text, we were not able to choose 4 exact indicators of the Use of social media, therefore we used 5 indicators altogether. In addition, due to missing collaboration, we needed “to design and conduct the study under the assumption that original study was conducted in the best way possible” (Brandt et al., 2014).

The second factor which can influence our results negatively is limitations related to our own collecting and processing data and calculations. Primarily, we collected answers from a relatively small sample (65 IT students and 177 observations) compared with the study by Sivertzen et al. (2013), who had collected a sample containing 184 engineering students and 366 observations. Therefore, we were not able to perform the factory analysis on the EmpAt scale with satisfactory results and we have had to choose an alternative approach – sum up all Likert items within each EmpAt category (Spector, 1992). Also, the fit measures were influenced by a small sample and we got fit characteristics slightly off the recommended range. Another similar limitation which should be mentioned is that all relations are based on correlation, not on causality. Therefore, the direction of the effects is unknown and it could be the opposite. We present results with directions, following the example of the original paper, only for illustration.

Other limitations may have arisen from conducting the survey online, which was chosen especially for the unique access to the population. Internet as a medium provided us with the opportunity to contact groups and individuals who would be very difficult or almost impossible to reach in another way (Garton et al., 1999), as the targeted audience were computer science students and the survey was launched after the end of the semester. However, conducting an online survey research has brought several disadvantages over traditional surveys. One of the main disadvantages threatening the reliability and validity is nonresponse of those who were asked by us to fill in the survey and self-selection of those who were offered the possibility to take part in our research. These facts limit the possibility to generalize the results.

In conclusion, a valid replication resulted in outputs similar to the outputs of the original paper (Brandt et al., 2014). We need to label our replication as unsuccessful or invalid. However, this does not necessarily mean that the original finding is incorrect (Brandt et al., 2014), as the world is complex. Despite this, our research will go on collecting data and reevaluating current results.

Acknowledgment

I would like to thank my supervisor, doc. Ing. Alena Klapalová, Ph.D., for her guidance. I am extremely lucky to have a supervisor with such knowledge and experience.

Abstract

Between 1999 and 2011 a national program of adult's education and training was developed in Portugal. This program was the subject of around 200 scientific publications, 20 of them centered on the impact of the courses in women and specifically regarding the promotion of information literacy competencies. The present paper intends to analyze those publications, aiming to characterize them and identify the results that were achieved regarding the assessment and impact of the courses in the students' lives. The methods applied coincide with the ones of a literature review, including bibliographic search and retrieval and content and bibliometric analysis. Results show that although little attention is given by the scientific community to this subject, the impact on the lives of the women that attended the courses is significant and worthy of further investment and development.

Keywords: Adult education, Women, EFA courses - Portugal

Introduction

In the beginning of the last decade of the 18th century, the French philosopher Condorcet defended in his *Cinq mémoires sur l'instruction publique* (1994), as well in the *Rapport et Projet de décret sur l'instruction publique* (1989) the idea of lifelong learning, and therefore adult education which, in the context of universal education, he considers fundamental conditions of democracy: a way of ensuring that every citizen can participate in the civil life, perform at his best in his profession, in rural economies as well as in urban, and finally take enlightened part in politics and public decision making. Condorcet gives particular importance to the learning of women, whom he thinks should have the same civil rights as men, and that the inclusion of the equality of rights in the nation's Constitution is a condition for its development and a genuinely inclusive democracy (1847): thus being one of the pioneers of the fight for women's civil rights and one of the founding fathers of democracy as we now understand it.

Nonetheless, it took more than a century since Condorcet's statements to see adult education regarded as a serious question by governments and politicians: right after the 1st, but mainly after the 2nd world war it started to be considered as an essential part of the welfare state and therefore laws, regulations and programs began to be promulgated and developed all over the world, regarding two different points of view: one humanist, which prevailed during the 1960 and 1970 decades, and the other economicist, which appears to have gained strength in our present society (Field, 2001).

Portugal, a country marked by a fascist dictatorship during most of the 20th century, arrived at the last quarter of the century with a substantial rate of illiteracy (around 25%), having the mandatory and free education for eight years been only introduced in 1973, one year before the carnations revolution. Since the revolution, the public policies of adult education were marked by discontinuity, though the first years assisted to cultural and educational campaigns developed mainly in the rural and hinterland areas by the General Direction of Continuing Education, following, not the perspective of literacy in itself, but particularly the one of promoting popular culture and, through the valorization of the population's own knowledge, place culture and education at their service (Melo & Benavente, 1976).

After several years of intermittent policies, in 1998 a government of the Socialist Party formed a task force for the development of adult education and training, through which a national program of adult education was developed aiming to cross certified education with lifelong learning, especially professional training (ANEFA. GMEFA, 2001). As a result of this policy, educational centers were created all over the country to develop courses of adults' education and training, the so called EFA courses; the program endured between 1999 and 2011, when it was suddenly closed by the new government of the coalition between the Social-Democratic Party and the People's Party, which implemented rigorous austerity policies in all domains. In 2016, with the Socialist Party again in the government, the adult education policy was resumed and a new program (*Qualifica*) for adults' qualification was applied with the goals of promoting the productivity, innovation and growth of the country through the development of learning and professional competencies in people who couldn't conclude the mandatory formal education or need to develop new skills (ANQEP, 2016).

The adult education and training policy and the consequential programs applied during the last 18 years were based on theoretical principals, and their results studied and evaluated by professionals and researchers, resulting in scientific publications. In special, the EFA courses developed through the late *New Opportunities* program resulted in around 200 publications, according to the Scientific Open Access Repositories of Portugal portal (RCAAP) and a search in Google Scholar using the descriptor "Cursos EFA" (EFA courses). Namely, information literacy questions and the impact of the courses in women with low incomes who didn't succeed in the mandatory formal education were also subject to several studies. Between 2012, the first year of the closing of the *New Opportunities* program, and 2016, how many documents considering the EFA courses and their impact on women and the promotion of information literacy were published? Who studied them, what were the results?

Departing from a research conducted on the subject and concluded in 2011 by Brito (2012), and with the primary goal of providing useful information for the development of the new *Qualifica* programs, the present paper intends to analyze those publications, aiming to identify the results that were achieved in terms of assessment and impact of the courses in the women' lives; other goals deal with the identification of the academic institutions where those works were developed, the type of publications and the research fields that led to the particular researches, the most influential authors and the network of citations and collaboration between authors and institutions, if they exist.

Method

Literature review was used as a method for this study. A systematic research was conducted in RCAAP, a complete portal to access Portuguese academic publications and, as RCAAP doesn't yet cover all the scientific journals

published in the country, also in Google Scholar. Although the Portuguese scientific literature, mainly in the Social Sciences fields, is not very well represented in the most important international indexing databases, a search was also conducted in Web of Science, looking for papers published in highly recognized journals. The search was chronologically limited between the years of 2012 and 2016 and the following keywords were used: “Educação de adultos” (Adult education), to define the field, and then, adding the boolean expression “AND”, the terms “Cursos EFA” (EFA courses), “Mulheres” (Women) and “Literacia” (Information literacy). The term “Feminino” (Feminine) was also used with the Boolean expression OR to achieve more significant results. Compliance with the terms used for the search and the effective correspondence to the content of the documents retrieved was analyzed. Subsequently the documents were subject to a bibliometric analysis, and finally, a content analysis allowed a comparative review of the selected documents. The focus was a constructivist analysis in the natural context of a qualitative approach. Accordingly, the primary concern of the present study is related to the deepening of the comprehension of the social context and the impacts of adults’ education and training in the individuals, understanding the socializing practices acquired over the courses, more than looking for a representation of practices. It is therefore intended to comprehend, represent and explain this social phenomenon.

The combined results gathered from the diverse sources were subject to a triangulation analysis, though we’re referring to different types of documents, such as grey literature (master and doctoral thesis), journal articles and conference papers. It is important to mention that this research theme has been gaining importance over the years, due to the crescent accessibility of the documents, issued from different theoretical principles and developed in distinct academic institutions and research centers. The referred triangulation consists, therefore, in the combination of different points of view, subject approaches and technics of data gathering and analysis, and it is such diversity that allows the presentation, as a final result, of a more faithful portrait of the educational contexts in the study.

This literature review around the subject of adult education in Portugal takes into consideration two sub-subjects present in several studies: information literacy and the women’s universe, hence being also natural to integrate the analysis in the field of women’s studies, approaching the constructivist vision to the transformativist paradigm, as defined by Mertens (2005) . The publications that were subject to the present analysis result mostly of qualitative researches with similar data gathering technics and, upon that link, connection points with the interpretative study that forms the basis of this comparative analysis were built. The findings are therefore the consequence of the considerations of some of the authors, but also of the discourses in the first person of the actors that were the subjects of the compared studies.

Findings

A first search of the Web of Science (WoS) using the expression “adult education”, limited to the years 2012 to 2016 and refined according to the WoS categories Education - Educational Research, Education - Scientific Disciplines and Information Science - Library Science led to the retrieval of 676 resources that present the term either on the title, the abstract or the keywords, showing that adult education is not a trendy subject in the area of Education and Library Science. The H index of these publications is also small (H7), attending the most cited work only 26 citations. In fact, 482 (71%) of the retrieved resources have 0 quotes within the universe of Web of Science, and merely 151 were cited more than once. In the studied set of four years, 2015 was the most productive one, with 203 publications, followed by 2016 (168); 2012 and 2013 reveal an apparent period of little concern with the subject, presenting in total 167 publications. The document types are mainly journal articles (337) followed closely by

conference papers (294). However, the source that shows a bigger impact of adult education as a content is a series of conference proceedings (Procedia Social and Behavioral Sciences, with 90 resources), followed by two journals specialized in adult education (Adult Education Quarterly and Adult Education in Universities: Local and Regional Perspectives, respectively with 53 and 40 resources).

Regarding the Portuguese language, two Brazilian journals appear on the set of the 25 strongest publications on adult education: Olhares (13) and Laplage em Revista (7). The country where the subject is mostly object of scientific studies, in the context of sources indexed by WoS, is the USA (97), followed by Romania (61) and Canada (60). Portugal appears in 14th place in this ranking, with 18 resources published between 2012 and 2016. The type of documents is shared in almost equal percentage by journal articles (9) and conference papers (8), with only one editorial, this one referring to a monographic number of the Brazilian journal Laplage em Revista, from where most of the retrieved resources were indexed – in fact, 7 of the 9 journal articles on the theme were published by the same number of the same journal; as for the conference proceedings, only two stand slightly out: EDULEARN and ICEEPSY published two papers each in different years. Eight of the resources were published in Portuguese and 10 in the English language: only the English written articles have an impact within Web of Science, which is natural for most Education journals written in Portuguese are not indexed in this bibliographical database, and so only alternative metrics could show their real impact. Attending to the academic institutions that lead the indexed publications on adult education, bibliometric data shows that University of Lisboa (UL) leads with six resources, followed by University of Porto (UP), with four and Univ. of Trás-os-Montes e Alto Douro (UTAD), with three. The most published authors are Barros, from the Institute Piaget of Porto, Ferreira-Loureiro, from UTAD and Cavaco and Guimarães, from the Univ. of Lisbon, these last two working in collaboration – results show that the collaboration between Portuguese academic institutions scarcely exists, being the prevailing collaboration between faculties within the same institution or even endogenous to the same faculty or research center.

As for the particular subjects of this study, three of the results that approach the Portuguese context of adult education address the themes of literacy and only one have women as a subject, with no cross-linking data, and none of them regarding the EFA courses, which are the topics of the primary research the present paper intends to compare with similar studies.

In fact, for the purpose of the present study, Web of Science is of no use, as the above description clearly reveals: the problem of bibliographical databases such as this one is that they are mostly focused on exact sciences and technology or international journals when it comes to the social sciences, which are very much devoted to national realities, where scientific research is meant to have real effect. Thus, if a researcher looks for a mirror of national scientific publications outside the USA and the UK, the best strategy is to recur to national academic repositories or portals or even Google Scholar.

The reflection of Portuguese research regarding the theme of adult education as developed by the EFA courses in the context of women learning and literacy is best given by Google Scholar, where a search with these descriptors linked by the AND Boolean expression and limited by the years 2012 to 2016 retrieved 94 resources. Nevertheless, Google Scholar is not a scientific search engine, and its results report to the full text of the resources, being the information retrieved rather noisy, e.g., not entirely reliable, once it gives back information that doesn't truly study the subjects that we are looking for. A closer look at the abstracts and keywords of each of the resources was then necessary, and 20 resources were finally selected. The search led through RCAAP didn't provide any answers regarding the combination of the three descriptors, which obliged to a more general search using only the expression "Cursos

EFA” (EFA courses), being then retrieved 12 resources. In this case, the need of looking for more results led to a subsequent search using the term "educação de adultos” (adult education), until the final number of 14 results was reached, six less than the ones found in Google Scholar. Finally, 17 documents were selected for the present literature review and bibliometric analysis, which corresponded to the stated criteria: studies centered on the EFA courses from the perspective of women studies and with a particular emphasis on information literacy achievements, published between 2012 and 2016, and based on qualitative methods – mostly case studies with an in-depth analysis.

From those, and as for the document types, most are master (11) or doctoral (3) dissertations; two are articles published in peer-reviewed journals, one is a conference paper and also only one book chapter. The publications correspond to 19 authors, of which 17 are women and only two men, showing that women’s studies still are a matter for women’s researches. As for the author’s affiliations, IPL (Polytechnic Institute of Leiria) and ISCTE-IUL (Lisbon University Institute) are represented by four authors each, followed by the University of Trás-os-Montes) and the University of Minho, both with three authors. The Open University, with two authors and the Universities of Coimbra, Porto and Nova de Lisboa are also represented, the latest with one author each. This lack of visible collaboration is clearly in accordance with the type of publications: mostly academic works that are not divulged through scientific journals or conferences, showing that these are not considered important themes by the academic community. In fact, the citation data provided by Google Scholar reveals that the impact of such texts scarcely exists, for only four of the 19 resources have online registered citations, in a total of five citations, being two of them self-citations, which shows something else: as the works stay mostly as grey literature, there’s no dissemination of the knowledge acquired and researchers seem to search with their backs turned to each other, not acknowledging what their colleagues have studied and discovered before them.

Regarding the years of publication, 2014 was the most productive one (6), followed by 2015 (5), having our findings shown that only one work appeared in 2012. Given that these works are mostly the result of master and doctoral thesis, and attending to the fact that those types of publications take from 2 to 4 or 5 years to develop, it is likely to conclude that the first researches began around 8 or 9 years after the New Opportunities program started, when the project had already reached its maturity.

In the next chapter, a compared review of the literature which has been the subject of the above bibliometric analysis will be presented, through a content analysis and discussion of the selected works. Through the exposure of the results, conclusions will be reached and some final recommendations set.

Results, Conclusions, and Recommendations

In order to better understand the role of different scenarios of Adult Education and Training in the lives of Portugal citizens, we have used a comparative analysis of secondary sources obtained through the RCAAP and Google Scholar, in order to identify the research questions, the main issues addressed and the results achieved in terms of assessing the impact of the same on individuals, not on their individuality, but on the intersection of issues between them. It should be noted, first and foremost, that these contexts of schooling and their entire context are spaces of socialization in which each adult individual is the leading actor of his or her learning process.

As such, we focus on those who place particular emphasis on women's studies or where they have a higher incidence in the groups (Brito, 2012; Costa, 2014; Fonseca, 2014, 2016; Raimundo & Caetano, 2015) and on literacy (Brito, 2012; Oliveira, 2014; Paias, 2013; Raimundo, 2015; Silva, 2015; Vargues, 2013). Our starting point is precisely a

study, within the framework of a doctoral thesis in Sociology, on “Reading literacy in adults - diachronic analysis of (re) socialization processes in a group of Adult Education and Training, built on the feminine” (Brito, 2012).

This study involves a group of women with unique pathways, but that fit together through some regularities. There is, from the outset, an early drop out of the school (by their own decision), with a family economic dimension underlying, devaluing the school capital to the detriment of the economic one – “I did the 6th year and I know that at the age of 14 I started to work (...) because I saw the others had everything and I did not have the things that I’d like to have” (Brito, 2012, p. 315; Silva, 2015). Paias, in her dissertation on Education, also points out both “personal and family reasons” for this early departure (2013, p. 48). However, in Silva’s research we can also see the existence of precarious financial relationships that, coupled with little parental qualifications, create tensions and it’s the parents themselves that promote this early abandonment (2015).

However, once we have taken up our starting point, low qualifications make access to employment more difficult at one point, which leads to unemployment or even lack of professional progression. The arrival of the EFA course is a turning point in their trajectory, leading them to reflect on the need to obtain more qualifications. Having paid training enabled them to lighten economic needs, to get the 9th-grade school certification and even professional certification: “I got to the point where I saw what I needed. Both at the professional level, but also for me” (2012, p. 335). The same statements appear in Raimundo’s thesis, where the subjects state that the primary motivations for attendance are “increasing school attainment and insertion into the labor market” (2015, p. 686). Fonseca also mentions that women studied “wish to have better jobs in the future” (2014, p. 64). Rodrigues emphasizes the fact that they are beneficiaries of a scholarship and Paias stresses that these adults feel “the desire to improve skills and to increase school qualifications”, giving “personal and social importance to the school diploma” (2016; 2013, p.48). Rocha and Silva add that the reasons presented by the women they studied relate to questions of “personal fulfillment and because they felt due to their lack of qualifications. Only one person stated that she wanted to enter the labor market through training” (2015, p.103), and one of Silva’s study respondents states that “many doors closed for only having the 6th grade. (...) So much that I do not have life goals at this moment” (2015, p. 37).

The image they create around the EFA courses is represented by the school in the past, a schooling learning rooted in theoretical knowledge - “a school like ... the C+S (...). I thought that I would give what I learned in the 7th and 8th grades” or “come back ... to be a child” (Brito, 2012, p. 329; Oliveira, 2014, p.295). In Henriques’s research, there are also some fears of a return to learning - “some fear because I had left school many years ago and I was not sure if my head could still learn something, but I tried and had a lot of willpower” (2014, p.85).

At the beginning of the EFA course, there was a “factor that was transversal to all, which was the lack of self-esteem. They had very low self-esteem (...) what was more noticeable was, basically, the attitudes, the know-how in the room, the knowledge to interact with their colleagues, their organization at work level, their autonomy at the degree of study and also to know how to manage” (Brito, 2012, p.352). Nonetheless, different researches mention an increase in confidence, self-esteem, personal valuation and security, but also a greater capacity for interpretation of information, these courses being the primary drivers of the individual and social growth of these adults (Brito, 2012; Graça, 2015; Henriques, 2014; Oliveira, 2014; Raimundo, 2015; Rocha & Silva, 2015). This is an important milestone in the lives of these adults, mainly because of their discoveries and experiences in acquiring skills - “For having played a little longer, ... having done things I never thought to do. (...) I learned to read stories better to my children, which I did not do” or even because “I can give some help to my children in their homework” (Brito, 2012,

p. 319; Henriques, 2014). It is also evident that these courses allow them to gain a different position within the household (Brito, 2012; Raimundo & Caetano, 2015).

During the course, they create other expectations, especially professional ones, taking into account the very development of the training - "to feel that they are important for their lives, placing many expectations on the professional stage after the course is completed" (Fonseca, 2014, pp. 64-65; Sanches, 2015). In reality, "the goal should be to consolidate this kind of skills, but I found that the trainees felt, and I observed myself, that there was no such social or institutional recognition because these opportunities were not given" (Brito, 2012, p. 353). In this sense there are situations of materialization of these expectations and representations with changes in their daily professional lives in institutional families - "I left the course and the next day I started to work" (Idem, p. 341; Henriques, 2014). When in areas other than certification there are elements that go from a situation of the previous inactivity to a situation of work activity (Brito, 2012). Nevertheless, there are also situations where, although there is awareness of a not very favorable scenario, the deception is very evident: "a person already starts to wonder ... it seems that it is not contributing, both financially and ... and then we are at home, ready, but we're not being productive. (...) I already look like an old woman" (Brito, 2012, p.338). The fact that they have more qualifications does not mean that precariousness has been completely eradicated. However, Raimundo speaks of the existence of greater pro-activity in job search after the course (2015).

Within an information society, literacy plays a preponderant role as a key competence for the performance of individuals in different aspects, hence it is essential to understand the importance of the way it works in adult education. As far as literacy is concerned, Brito considers that although these women showed the same level of schooling, they started with unequal levels of literacy, which already happened before the course and this did not allow to establish equity in this sense due to their singularities, based on a close relationship between these difficulties, the feminine gender, their social environment of origin and life stories: "if you read anything you do not understand I already have that ... that perception that I do not understand anything that I'm reading. But at the time I didn't feel that way" (2012, p. 346).

However, with regard to the above-mentioned research, we can see that there are some proficiencies that the EFA course has highlighted, given that these are adults who have long been away from contact with books and, therefore, the notion of reading that still preponderated in their mind was that of a mere mechanical deciphering of the graphic symbols - "I remember reading on a rush ... I was going to catch the train. I could not even breathe" (Brito, 2012, p. 330). Pre-training reading habits in the majority of the group were associated only with daily routines and sporadic readings. Nevertheless, in the adult education scenarios they can break this idea, thus associating themselves with literacy conducts through interactions, sharing, dialogues, senses: "It must have been the only courses, if it was not the only course, where I heard comments about books. I think there was a taste for reading in some of the trainees. (...) I am still to meet the first group that comes to great reading habits because they are people who are adults. At the beginning they do not even have time in their daily life for this or think that they do not" (Idem, p. 350, 354). However, if these skills are not applied day-to-day, especially in the professional context, they become "vulnerable to regression", that is, if individuals do not use them in their daily lives and during their life course, they are blurring and even regressing (Ávila, 2008, p.87).

Regarding these issues, Brito (2012) and Paias (2013) mention the involvement of children in reading activities, which contributes to the consubstantiation of social relations also in the domestic space. The children thus allow them to establish a relationship between the theory acquired and the daily life and that takes them to redeem skills in

the area of family literacy, at the level of new representations and reading practices, allowing a greater rapprochement between parents and children: "I learned to read the stories better to my children, which I did not do before" (Brito, 2012, p.319; Oliveira, 2014). There are also influences that are reflected in the family as it allows them to provide more support to their children also concerning school. The school context is transposed into the domestic space, and the family environment is one of the main drivers: "it is usual for children to help their parents feel proud" (Paías, 2013, p.50). Rocha and Silva consider that, for its uniqueness, EFA courses entail changes in the family, being noticeable in personal growth how these experiences are reflected in the "construction and reconstruction of learners identities" (2015, p. 102).

The building of multiple responses to different audiences is considered as basilar. As such, it is essential to address the teacher's role in these courses and the fact that it cannot be confined to a mere repetition of content regardless the public; teachers must always think about the individuals, not forgetting their sociocultural environment for, after all, they are the basis of all this work, and even because these adults "need to be self-directed; so that the profile of the trainer should be built on the basis of a process of mutual investigation with the trainees and not only with the function of transmission and evaluation of knowledge" (Oliveira, 2014, p.49). It is fundamental to understand non-school contexts as a "laboratory of new practices" (Santos, 2014, pp. 102-103). Nevertheless, it is clear the need for a symbiosis between the trainer and the trainees: "[they] went all away richer, not only in skills that they were bound to acquire to have the B3, but left much richer because there was an entire job done which they also allowed to be done" (Brito, 2012, p.353; Costa, 2014; Santos, 2013). However, we do not always come across these symbiotic relationships (Mesquita, 2012). In fact, the presence of information sharing and cooperative work is central. All this work involves many fractions of availability, "appreciation of multiculturalism", commitment and creativity, primary components to develop in these individuals new durable dispositions that promote literacy levels (Brito, 2012; Fonseca, 2014, p.65).

The studies here analyzed thus reveal that these adult education scenarios play a major role in the lives of these individuals, promoting new opportunities as well as changing values and attitudes and, in general, the acquisition not only of intellectual capital but also of social capital, an indispensable contribution to diminish social inequalities. We cannot overlook that, being mainly composed of a female audience, these non-school contexts give voice to these women and present them challenges that impel them to get involved in a whole range of daily changes and allow an understanding of the world that in many cases they weren't aware of.

In general, these conclusions, all gathered through qualitative studies, are confirmed by a small survey led by Rocha and Cardoso (2016) and presented in a chapter of a book dedicated to adult education in Europe from a gender perspective, edited by Maksimović, Ostrouch-Kamińska, Popović, and Bulajić (2016).

It is also evident through the bibliometric findings that, if adult education is not a popular subject in international scientific research, much less are the women studies applied to the subject or the approach through information literacy. The research in Portugal is incipient and with little impact. It is, therefore, a significant field of study for the development of societies, which the authors recommend should be the object of research projects, preferably with public funding, and also of bigger efforts of communication through publication in journals, conferences or books. Collaboration between academic institutions and research centers, looking for international partnerships could be a way of expanding the study field and obtain more consistent results.

As final recommendations, it would be important to try to follow the trajectories of the women that were subject to the compared studies after the end of training, looking for permanent changes in their lives and assessing the long term effects of the courses they attended. In what refers to the new *Qualifica* programs, these results show beyond any doubt the relevance of adult women's education in what refers not only to learning and the acquisition of professional competencies, but also to the gaining of individual, social and information literacy competencies that lead to the conquest of social capital, empowerment in the private and family life and self-esteem – meaning that the new programs to develop should insist in the particular work with women, according to their needs and to the gender gap that unfortunately still exists in our society.

Abstract

The factor of social affiliation of young people plays an important role in strengthening civil society and national identity. An individual's sense of belonging can promote civic responsibility and serve as a self-regulating component for civic engagement. The aim of the research is: on the bases of theoretical research and the analysis of the results of the carried out survey, to identify sense of belonging of young people (from 9 to 12 grade students) in Liepaja (Latvia) focusing on different categories: (I) self-esteem of young people's loyalty and patriotism; (II) the respect of young people towards their school, city, state, European Union; (III) the sense of belonging of young people to their school, city, state, European Union; (IV) the personal identification of young people with Europe and Europeans; (V) the self-feeling of the needs of young people for their school, city, state; (VI) consciousness of pride; (VII) comprehension of values. As the research methods were used: data mining methods: (surveys, using M. Rozenberg self-esteem scale, unfinished sentence method); data processing and analysis methods (quantitative data processing with data mathematical statistical analysis and predictive analytics methods implemented through processing program); graphical representation of data; qualitative data processing (content analysis, data coding, grouping and processing); quantitative and qualitative data interpretation. The research sample consists of 825 respondents, 9th – 12th grade students that is 38.35% of the total number of students in Liepaja (total number of students in the 9th – 12th grade group: 2151 students), which ensures the reliability and validity of the study.

Keywords: citizenship, sense of belonging, social affiliation, students, values.

Introduction

The promotion of civic society as one of the challenges of the 21st century has been formulated by the World Economic Forum in order to lead the country to the successful development. The importance of the civic society in the process of the improvement of the quality of life of the population has also been highlighted by the World Health Organization (World Health Organization, 2002). Civic engagement of citizens including the youth is one of the conditions for the development of civic society (World Economic Forum, 2013). In the context of globalization, civic engagement and the civic behavior of humans has a profound effect on democracy and the preservation of democratic values (John, 2003), moreover, civic engagement is a way of collectively overcoming the existing global challenges (Koritz, 2009) such as, solving the issue of protecting the environment (Smith, Pangsapa, 2008). Civic engagement is an important component in the development of youth as it promotes the personal growth of an individual, helps in the process of the formation of a social capital and allows adolescents to unwrap their potential and to invest in the development of the local society (UNESCO, 2014). Moreover, it is very crucial to provide the adolescents with a diversity of support: emotional support, respect and advice (Dolan, 2012). Through civic engagement, the needs of the adolescents are satisfied as well (Brennan, 2008) by promoting the social and economic well-being of adolescents (Douglas, Alessi, 2006) and by promoting the well-being of the community (Chaskin et al, 2001). By understanding the topicality of civic engagement and its importance for the development of the state, it is necessary to encourage young people's social affiliation. To understand the potential of youth civic engagement as a long-term contribution of civic society, it must identify young people's sense of belonging and understanding of values. Therefore, this article will be reflected the indicators of youth sense of belonging and understanding of values by student survey data analysis.

The base and methods of research

In order to achieve the aim of the publication, the study was used the following research methods:

1. theoretical research methods – the diverse analysis of scientific and methodological literature of the sense of belonging, youth citizenship and values preconditions;
2. empirical research methods – data mining methods: (surveys, using M. Rozenberg self-esteem scale (Rosenberg, 1965), unfinished sentence method); data processing and analysis methods (quantitative data processing with data mathematical statistical analysis and predictive analytics methods implemented through processing program); graphical representation of data; qualitative data processing (content analysis, data coding, grouping and processing); quantitative and qualitative data interpretation.

The research sample consists of 825 respondents, 9th – 12th grade students that is 38.35% of the total number of students in Liepaja (total number of students in the 9th – 12th grade group: 2151 students), which ensures the reliability and validity of the study. Research data gain confirmation ability (Lincoln, Guba, 1985) and the results of the study are valid because it demonstrates accuracy. The survey was carried out between November 2016 and February 2017 in all comprehensive schools of Liepaja.

The average age of respondents is 16 years, including 18 students (2.18%) at the age of 14; 258 students (31.27%) at the age of 15; 206 students (24.97%) at the age of 16, 179 students (21.70%) at the age of 17; 124 students (15.03%) at the age of 18 years; 13 students (1.58%) at the age of 19 and 27 students (3.27%) at the age of 20. The characteristics of respondents' age and gender are described in Figure No.1.

Figure 1. Respondents' characteristics: gender and age (n=825)

1. Theoretical research regularities of the sense of belonging and youth citizenship through values dimension

1.1. The impact of social affiliation factor of young people in the civic responsibility formation process

Sense of belonging and identity are essential factors for every person to answer to the question: who am I? These factors begin to be shaped in early childhood and developed in the process of socialization, when an individual is in interaction with the norms and values adopted by society (Тощенко, 2003). The concept of identity includes two benchmarking criteria: the similarity (common identity) and the difference, which are the dynamic principles of identification (Jenkins, 2008).

Psychologist J. Piaget divides the process of ethnic identity development into three stages:

- 1) at the age of 6 – 7, the child acquires the first fragmentary knowledge about his or her ethnicity and the family has a key role at this stage;

- 2) at age of 8 – 9, the child can already clearly identify himself /herself with his or her ethnic group; he/she is aware of the basic principles of identification: the parents' nationality, residence and mother tongue, thus forming national feelings;
- 3) in the period of the youngest adolescence (from 10 to 11 years) ethnic identity is formed in full measure, perceiving the peculiarities of different people. The child notes the uniqueness of history and the specifics of the traditional everyday culture (Пижаж, 2008).

National identity and belonging to one particular country or nation develops over time in the context of the cultural and historical environment in which the individual lives. The sense of belonging to country is a matter of national identity, which can manifest itself both as patriotism and as a radical chauvinism. The sense of belonging shapes person's national self-awareness. Ethno-psychologist Dr. I. Apine highlights: "If an individual has lost his/her national self-confidence, he/she already belongs to another ethnic group. If the sense of belonging disappears because of the majority of ethnos, then the ethnic group itself ceases to exist. The seemingly volatile, seemingly inexhaustible national self-confidence, which is an ideal substance, keeps together the people of one nation. The central element of national (ethnic) self-confidence is the core of ethnic identity, awareness of one's belongings" (Apine, 2001, 36).

National identity is an important component in the person formation process and sense of belonging is one of the primary needs of person (Kelman, 1997) and an integral part of the social identity of a person. The sense of belonging manifests itself as an individual's patriotism, loyalty, respect and affiliation with his/her city and state, as a pride of his/her city and country, as well as the necessity to be part of his city and state.

The individual's affiliation with the country contributes to the preservation of the national cultural space, which is one of the goals of the Republic of Latvia. The sustainable development strategy of the Republic of Latvia highlights the importance: "... to preserve and develop the cultural capital of Latvia and to promote the sense of belonging to the cultural space of the country by developing a competitive national identity based on a society's creativity through creating a quality cultural environment in Latvia" (Saeima of the Republic of Latvia, 2010, 12). In the perspective of personality identity, the system of values of individuals is clearly reflected; therefore, through promoting the sense of belonging of young people to their country, a personally responsible and patriotic state of the individual is formed.

A stronger sense of identity and belonging of youth can contribute to higher responsibility not only towards themselves and others, but also towards their community, the state and a common European space – responsibility is a special human attitude that includes attitude towards oneself, their actions, people around and the world. To some extent the responsibility as a social phenomenon can be divided into two aspects: the human legal responsibility before the law, in turn another aspect of the responsibility is a moral responsibility or obligation that manifests in the form of civically responsible behaviour, thinking not only of own interests, but also about the interests and needs of others. (Jurs, Samuseviča, Līdaka, 2017). Responsibility arises from the rational human nature, the individual's understanding and the individual position of societal norms, morals, laws, as well as from communicative nature of social reality, while the condition of responsibility is the understanding of causality of actions.

1.2. The role of youth social affiliation in promoting citizenship

Young people's civically responsible behaviour, which contributes to the future existence of civil society, stems from the social affiliation of young people. This factor serves as a self-regulating act for the individual: if young people feel socially belonging to a group, community or state, this can serve as a stimulus to promote the quality of life of himself/herself and the others. The World Health Organization points out: "The concept of quality of life is very broad, mainly involving the perception of the public of the position of one's life in the context of the

culture and values system in which he lives and bonds himself/herself and his/her life” (World Health Organization, 1997, 1)

Therefore, it can be concluded that the feeling of social belonging of young people as a conditional attitude directly influences the civic position of young people, which is an individual's relations with the society manifesting the fulfilment of the citizen's duties towards the state, a conscious and responsible attitude towards people and country. In the context of the formation of a civic position, it should be noted that firstly, the awareness of young people about the need for active civic action and the development of qualities should be promoted. Subsequently, the individual self-analysis, self-assessment and determination of goals follow. In order to achieve the goals, e.g., to be a civically active member of society and to be able to contribute to the solution of existing problems, a person through various methods and patterns, drives his/her behaviour in a way that is to improve himself/herself. In the result, the element of self-education becomes an essential precondition in the context of the formation of an active civic position, when young people understand their individual needs and desires.

2. Student survey data analysis (summary) – the sense of belonging and youth values preconditions

The analysis of data on the criterion of respect has been summarized in Figure No.2. The data confirm that the majority of young people involved in the study feel respect towards their school, city, state and the European Union:

- 596 respondents (72.24%) feel respect towards their school, including 369 (75.77%) girls and 227 (67.16%) boys. However, 174 respondents (21.09%) cannot formulate a respect towards their school, 94 of them (19.3%) girls and 80 (23.67%) boys;

- 664 respondents (80.48%) feel respect towards their city, including 408 (83.78%) girls and 256 (75.74%) boys, while 115 (13.94%) respondents cannot formulate a respect towards their city, 59 of them (12.11%) girls and 56 (16.57%) boys; 570 respondents (69.09%) feel respect towards Latvia, including 353 (72.48%) girls and 217 (64.2%) boys. Nevertheless, 171 (20.73%) respondents cannot formulate a respect towards their country, 91 of them (18.69%) girls and 80 (23.67%) boys; 393 respondents (47.64%) feel respect towards the European Union, including 243 (49.9%) girls and 150 (44.38%) boys. However, 309 respondents (37.45%) cannot formulate respect towards the European Union, 190 of them (39.01%) girls and 119 (35.21%) boys.

Figure 2. Dignity affirmation to the school, city, state, European Union (n=825)

Figure No.3 highlights self-esteem of the affiliation of Liepaja comprehensive schools students:

- 534 respondents (64.73%) feel belonging to their school, including 324 (66.53%) girls and 210 (62.13%) boys, while 103 respondents (12.48%) do not feel belonging to their school, 55 (11.29%) of them are girls and 48 (14.2%) boys;
- 554 respondents (67.15%) feel belonging to their city, including 342 (70.23%) girls and 212 (62.72%) boys, while 104 respondents (12.61%) do not feel belonging to their city, 55 (11.29%) of them are girls and 49 (14.5%) boys;
- 523 respondents (63.39%) feel their belonging to Latvia, including 325 (66.74%) girls and 198 (58.58%) boys, while 104 respondents (12.61%) do not feel their belonging to Latvia, 69 (14.17%) of them are girls and 35 (10.36 %) boys;

- 351 respondents (42.55%) feel belong to the European Union, including 216 (44.35%) girls and 135 (39.94%) boys, while 173 respondents (20.97%) do not feel belonging to the European Union, 85 (17.45%) of them are girls and 88 (26.04%) boys.

Figure 3. Students' sense of belonging to the school, city, state and European Union (n=825)

According to the research it can be concluded (see figure No.4) that in the comparative perspective, young people more consider themselves as Europeans and less feel themselves as part of the European Union: 682 respondents (76.12%) feel themselves as Europeans, while 569 (68.97%) feel themselves as a part of the European Union.

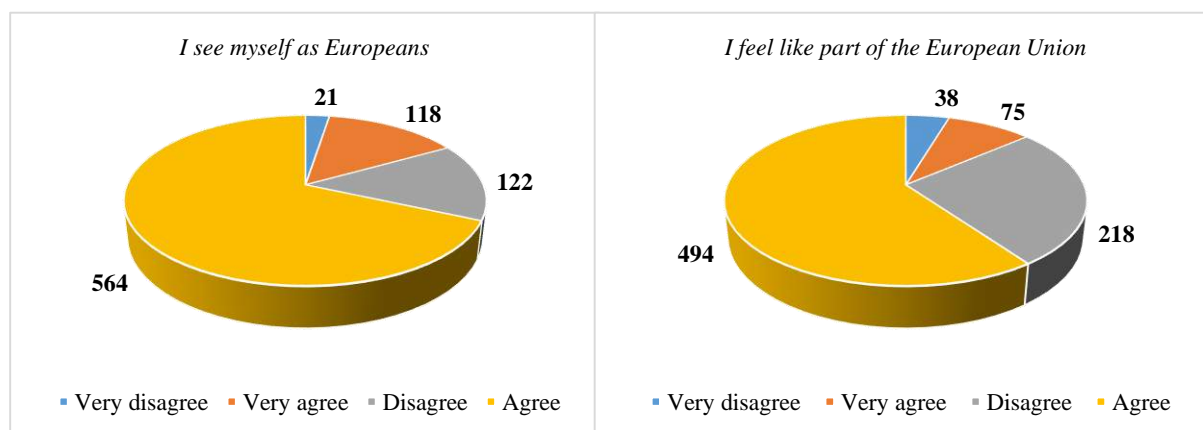

Figure 4. Students' personal identification with Europe and the Europeans (n=825)

The data summarized in Figure No.5 shows that young people feel necessary for their school, city and state:

- 503 respondents (60.97%) feel necessary for their, including 320 (65.71%) girls and 183 (54.14%) boys. However 322 respondents (39.03%) feel unnecessary for their school, 167 of them (34.29%) girls and 155 (45.86%) boys;

- 455 respondents (55.15%) feel necessary for their city, including 289 (59.34%) girls and 166 (49.11%) boys, while 370 respondents (44.85%) feel unnecessary for their city-Liepaja, 198 of them (40.66%) girls and 172 (50.89%) boys;
- 442 respondents (53.58%) feel necessary for their country (Latvia), including 276 (56.67%) girls and 166 (49.11%) boys. Nevertheless, 383 respondents (46.42%) feel unnecessary for Latvia, 211 of them (43.33%) girls and 172 (50.89%) boys.

Figure 5. Students' feeling of necessary for school, city and country (n=825)

Within the survey respondents were able to determine and define their values of life (see Table No.1). They mentioned following values:

1. the largest number of respondents: 506 respondents (61.33%) – 314 (64.48%) girls and 192 (56.8%) boys) have admitted that the family is a significant value for them;
2. the 2nd most popular value amongst respondents is education, which has been highlighted by 210 respondents (25.45%) – 167 (34.29%) of them are girls and 43 (12.72%) boys;
3. the 3rd most significant value for the respondents is friends. This value has been emphasized by 177 respondents (21.45%) – 110 (22.59%) girls and 67 (19.82%) boys). The summary of the mentioned values and the number of choices made is highlighted in Table No.1.

Table 1. Students' mention values

<i>Named values</i>	<i>Number of choices</i>	<i>Percent's</i>
Family	506	61.33%
Education	210	25.45%
Friends	177	21.45%
Health	159	19.27%
Love	111	13.45%
Money	71	8.6%
Respect	42	5.09%
Work	33	4%
Freedom	20	2.42%
Cannot answer to the question	26	3.15%

Conclusions

1. Responsibility as the regulator of behaviour and individual's attitude are the individual's ability and willingness to be responsible for consequences of his/her actions, thinking about own needs and the needs of others to reach the common good. Responsibility arises from the position of individual, individual awareness, dominant individual values, social environment, a sense of duty to his/her family, society and the country as a whole. Responsibility, as a major component of upbringing, is an individual's rational behaviour, when the person has the readiness and the ability to explain the keynotes of his/her behaviour. Civic education within the education shapes and promotes individual's moral and civic responsibility as a model for civic behaviour and youth civic participation, which can contribute to the development of civic society. Youth civic responsibility can be contributed by enriched in content methodically improved civic education at schools as well as teachers' personal model. As a result, creating a responsible civic position within the education process, providing young people with diverse support, through using of available resources, guidance and motivation, sustainable development of civic society is ensured.
2. Involvement in the community has a positive impact on young people's civic awareness, civic pride. It reduces the chances of asocial behaviour (contrary to the public interest) of young people. The engagement in civic participation activities has promoted young people's sense of social responsibility, thus strengthening civic society.
3. The experience that is acquired during the lifetime of an individual that, through self-regulated attitude, the objectification of behavior and the processes of will transforms into a specific model of behavior, which defines the readiness of an individual to express his/her civic position by using the existing opportunities of sense of social belonging.
4. It is possible and most definitely necessary to promote the sense of social belonging by providing them with an opportunity to set and fulfill socially crucial goals, by guaranteeing a variety of support, by providing the necessary resources, by helping to see the motivations of civic behavior, as well as promoting the formation of the civic attitude and values within the adolescence through the process of upbringing and the professionally oriented educational process.
5. The teacher has to be able to provide the confidence in their abilities and their potential for the development of abilities and skills. In fact the whole content of education has to be based on the basic principles of civic education by using the variety of pedagogic approaches and forms in order for the formation of civic responsibility to be as an integrating holistic developmental process of the characteristics, skills and abilities throughout the whole pedagogical process. A teacher can be (or can fail to be) a source of inspiration, motivation and practical support for the civic engagement of the student. Thus, the interest, civic position and pedagogical competence of a teacher are crucial components of the development of civic competence of youth.
6. The dominant civic attitude in the family, the individual and positive experience of cooperation with the peers at school and the professional skill of the teacher all have a crucial importance in the formation of sense of belonging. The formation of sense of social belonging takes place in a direct cooperation with the opportunities of civic engagement carried out by the student due to the fact that it helps the students to see the reason for their actions. In result, the positive experience acquired by the student during the process of self-realization serves as a basis for the promotion of civic attitude and the future improvement of civic position and civic activity.

Recommendations

1. Increasing the involvement of youth, e.g. through direct conversation with peers, in joint actions with youth organizations, youth centres (houses) in order to encourage youngsters by own example to volunteer, participate in a variety of projects, non-formal educational activities, social actions and other practical activities to promote civic engagement. Enhanced cooperation between youth non-governmental organizations, youth centres and schools can raise the organizations capacity to promote youth civic engagement and strengthen local community.
2. For the implementation of the long-term development and promotion the sense of belonging, it is very important and, therefore, it is recommended to update the civic co-responsibility and civic engagement issues in the family. Family is the environment where parents help children to develop their individual civic position with respect and responsibility towards themselves, people around them, neighbourhood, city, country, Europe, cultural heritage, history and traditions. It is parents' responsibility to educate their children not to be indifferent and passive observers, but rather to become responsible citizens of the country.
3. Parents are role models for their children and observed civic attitude in the family can become a leitmotiv for youth civic action in future, therefore the model of parents should contribute to the development of civic attitudes.
4. Opportunities for young people to spend their leisure time in a meaningful and purposeful way are essential in the process of the development of civic attitudes. Thus, it is very important for parents to encourage youngsters to fill their leisure time with worthwhile activities in order to facilitate to the formation of civic attitudes.
5. It is significant to ensure openness and good governance in state and local level, providing all kinds of necessary support for people, including young people in their civic initiatives.
6. It is important to be aware of the specific prospects for the promotion of youth civic attitude in the future in both: the municipal and national levels, which marks the future development directions of youth civic position.

Abstract

The Portuguese education system has undergone great changes in recent decades. Originally, changes are felt within society, either due to migratory movements and, consequently, to new social, linguistic and cultural paradigms; or due to new technological, cultural and world realities. At a later stage, the need to adapt the education system to new realities is felt: in these periods, new legislation is produced and schools and their communities are faced with the obligation to implement some new laws. In Portugal, a few decades ago, there was a social period characterized by the arrival of several migrants from different communities and countries. If, on the one hand, migrants were from background families from Portuguese-speaking countries, it is equally true that some other families of migrants from countries (such as eastern Europe) who do not share the same language arrived in Portugal. The children of these families were welcomed in the schools, but in many cases a long adaptation to a culture and a language which deeply differed from their mother tongue was necessary. However, inclusion was and is indispensable for the school and social success of these students. The English language has been establishing itself as a lingua franca of culture and even of the economy. In Europe, English is considered the language of communication, social networks, and youth culture. Gradually, the need to have good communicative and linguistic competence in English has been felt. In the past, there have been some punctual and local experiences to bring language teaching / learning to primary schools. Legislation was introduced a few years ago to introduce the language in the curricula of primary schools (1st CEB). With this work, we intend to make a historical review of Portuguese as a Non-mother tongue and English as a Foreign Language in primary schools in Portugal and show what has been done in this field.

Keywords: English, Portuguese, Second Language

Introduction

The recent social, economic and political changes that have taken place in recent decades, both nationally and on a broader scale, have led to several movements of a migratory nature. These movements have caused consequent changes in the societies of the different host countries as well as in those countries of origin. From the cultural and social point of view (and necessarily educational and administrative) we have witnessed the emergence of new realities, in the sphere of entertainment but also in the school sphere. Particularly, there are three major changes in the social and, therefore, pedagogical paradigm (since the School reflects the changes of society understood in a broader way). The phenomenon of migration in Portugal and the consequent multiculturalism in schools, the use of the Internet on a large scale, especially using English as a universal language, and the inclusion of the English language in the 1st Cycle of Basic Education constitute the three constraints that we must consider in the paradigm shift of the school in Portugal in recent years.

Method

We have analyzed the Portuguese social reality and studied some legislation that has recently been produced to adapt the school system to new realities. Furthermore, we have compared the latest studies in pedagogy and language acquisition and learning in order to assess the legislation change. We are now presenting some of the conclusions and findings from that analysis.

Findings

In a first line of thought, we refer to the recent emergence of new movements of migrants which, in the last decades, have brought to Portugal many families from various origins and diverse cultural and linguistic practices. According to data collected in 2002 divulged by the Ministry of Education, the cultural origin of

students not born in Portugal was, at that time, mostly Cape Verde (about 5000 students) followed by Angola and Guinea. This migratory flow, originating from ex-colonies, is due to the fact that Portugal, a country with which there had already been some historical relations of affinity, had an increase in the level of quality of life in the 80's, after the integration of our country in the European Community. This was an attractive situation for many migrants who, with their families, settled here. This has resulted in a new reality and - until then - unknown in the country's schools: multiculturalism. Leiria (2005: 2-3) states that the composition of the school population in Portugal went from an almost absolute homogeneity to a great linguistic and cultural heterogeneity. Thus, Portugal, which until the 1970s was a country with few immigrants, began to receive students attending public schools from approximately a hundred nationalities.

From the cultural and social point of view, it is well known that integration was not easy to consolidate. Faced with the need for school integration of these new students, several challenges have arisen. It is true that these communities had relations with Portuguese language, although the linguistic competence was not enough to assure school achievement. Thus, the level of competences in Portuguese of these children inserted in our system of education has not always proved sufficient to achieve the desired goals of school success.

Some years later, the arrival of members of another community - the Brazilian one - has been noticed. This community does not seem to be the one that causes the most linguistic problems at school since the mother tongue is shared (Portuguese). With the Brazilians came some other migrants: the Chinese and the Indians. The problem of school insertion was felt mainly by the communities of Chinese and Indian origin, often engaged in commerce, but who, unlike the former, had no relation to the language or even to Portuguese culture. The challenge of integrating children to whom the very characters of the Portuguese alphabet constitute a set of completely unfamiliar symbols was much greater.

Countless questions arose within the schools and teachers were facing a task that seemed unthinkable before: teaching concepts in Portuguese to children who did not speak the same language. And this is still the case today in heterogeneous classes, where there are children whose mother tongue is Portuguese and children speaking very different mother tongues. New methodologies and practices prevailed, even before they had been legislated.

Portuguese legislation has been adapting somewhat slowly to this new reality.

In 2001 the National Curriculum of Basic Education (*Curriculum Nacional da Educação Básica*) explicitly referred to the existence of children in schools whose mother tongue is not Portuguese. In July 2005, the Ministry of Education issued a document aimed at guiding the integration of children who do not have Portuguese as their mother tongue in our national curriculum: Portuguese Non-Mother Language in the National Curriculum - Guidance Document (*Português Língua Não Materna no Currículo Nacional – Documento Orientador*). This document regulates compulsory inclusion of students whose mother tongue is not Portuguese and clearly demonstrates the importance of cultural diversity and enrichment within the cultural plurality: "The socio-cultural heterogeneity and the linguistic diversity of students represent a wealth that needs pedagogical and didactic conditions that are innovative and adequate for the learning of the Portuguese language ... " The measures include the creation of the Individual Student Process and the application of diagnostic tests of Portuguese language with the objective of adopting methodologies appropriate to the profile of each student. After this first diagnosis, students are placed in groups of similar proficiencies, with three levels based on the Common European Framework of Reference. Students will progress to the next level as they reach higher proficiency levels. More recently, in 2006, the Normative Order of 7/2006 frames the teaching of Portuguese as a non-native language in the legislative landscape. Portuguese, thus envisaged, is defined as integrating students who do not have Portuguese as their mother tongue.

In the National Curriculum of Basic Education, the essential competences of the Portuguese language are described as the official language, language of instruction and mother tongue of the majority of the population

and language of reception of linguistic minorities from other countries. In general, it is essential that the fluency of the Portuguese language gives young people the ability to understand and produce oral discourses and to interact correctly in different situations of life in society. In the domain of writing, young people should be able to produce different types of text with linguistic correction. The Portuguese language is, in Portugal, a factor of national and cultural identity and, at school level, it plays a fundamental role in the construction of competences from the different disciplinary areas. Cameron (2016: 241) states “At the root of learning is the process of making meaning out of participation in the social world.”

In our universe of studies, we recognize that children and school-aged pre-adolescents have access to countless contents of their interest using, for that, the lingua franca of computers: the English language. This language is the first to be used on the Internet since the second half of the 20th century and has been in place since then. People who use the Internet through the English language are not just native speakers from the United States, the United Kingdom or Australia but English non-native speakers from many other countries making up a total of more than 500 million users in English. This is extremely important in the motivation for informal learning of a foreign language.

This is how we came to a major change of language learning paradigm: the recognition of the importance of the English language in the European community and its inclusion in the Portuguese education system since the first cycle of basic education. English has now been officially integrated into the entire teaching / learning process at this level of education. Orlando Strecht-Ribeiro (1998: 43) summarizes this inclusion as follows (our translation):

The teaching of L.E. Should always be guided by principles that foster inter and transdisciplinarity, with a view to curricular integration that consecrates a simultaneously humanistic and holistic view of the child's education, and can therefore serve to contextualize the activities of other curricular areas or, creating context for LE activities.

We agree with this perspective of the foreign language within the general competences to be developed in the 1st Cycle of schooling as well as with the humanizing function that the teaching of the languages entails, in order to meet the purpose of describing the language competences as communication tools as described by the European Community. The political objectives set out by the European Commission in the Common European Framework of Languages direct the action to be taken in the field of living languages to the great objective of preparing the European peoples for mobility at all levels. The same document highlights the richness and cultural diversity of Europe expressed in linguistic differences and the danger of marginalization of those who do not have the skills to communicate in an interactive Europe.

English has been officially and gradually included in the 1st Cycle in recent years. Firstly, it was a non-compulsory study area but, although its frequency was not compulsory, the teaching of English was offered in all public schools, free of charge. The history that follows is brief. There were four years of experimentation and successive changes for a more comprehensive offer. Initially, the law 14 753/2005 approved the Program for the Generalization of English Teaching in the 3rd and 4th Years of the 1st cycle of Basic Education. English language learning was considered an essential process for the construction of a multilingual and multicultural awareness. This philosophy is imparted by the Common European Framework of Reference.

The official school offered children who attended the 3rd and 4th years of school the opportunity to learn English, based on the assumption that this extracurricular educational offer should increase and foster interest in learning this foreign language throughout life. In the long run, this linguistic competence should increase the economic competitiveness of Portuguese workers on a European scale. Thus, in this first period, the teaching of English was affirmed as a free educational complement, whose practical operationalization was defined by the law that created it. However, not all public schools were able to take advantage of this offer at the time.

The year 2005 was pioneer in terms of integration of the Program of Generalization of Teaching of English (Programa de Generalização do Ensino do Inglês) in public establishments. When we talk about a first period, we want to refer to the official instruction itself since, long before this offer by the Ministry of Education, there had been numerous autonomous and private projects in English Language Teaching that had been implemented in several schools in the country. These projects had been led and implemented by English teachers of other years of education other than 1st Cycle, by individuals and supported by parents, associations or even offered. Regrettably, there is no reliable record or survey of the number and scope of these projects, nor of its importance in preparing a more official action and in motivating. We believe that the study of these projects and their implementation would bring useful knowledge.

The following summer, Law 12 591/2006, which revoked the previous dated from 2005, changed the framework of the Program of Generalization of English Teaching in the 3rd and 4th years of the 1st Cycle of Basic Education. In this context, the framework became an activity of curricular enrichment, mandatory as an offer by all public schools for all 3rd and 4th years of schooling. However, it was still a curricular activity whose frequency was free and not compulsory. This situation raised some serious questions concerning the different linguistic competences of the children who reach the fifth year of schooling. Some children had already some competences in English whereas other children had none. Consequently, in the 6th grade around 2006, the English classes were heterogeneous as far as different knowledge and skills students had. At a later stage, the teaching was extended to the four years of the 1st Cycle of primary school, maintaining the nature of optional and being taught classes after the school hours, inserted in the projects of Curricular Enrichment Activities. In the year of 2016/2017 there was a big change in schools. English language Teaching became an official subject in primary schools. Currently, all schools offer English as a compulsory class and all children must attend these classes. Previously, a new group of teachers was legally formed: teachers who were pedagogically and scientifically prepared to teach a language to children. The formation of this new group of teachers and the adaptation of the school routine to include this subject led to the restructuring of all the objectives of English Teaching in all school cycles. Theoretically, it is now supposed that students who finish compulsory school have a good fluency in English.

The National Curriculum of Basic Education describes in its own chapter the main competences of foreign languages. As in the description of the competences of the Portuguese language, these capacities are organized in different competences according to the different cycles of official education. We focus on skills in the 1st Cycle of Basic Education. Competence in languages is defined as the appropriation of organized knowledge, which includes a culture and an identity of a people and the ability to strategically use the linguistic resources in real communication situation. Competence in a language also implies the metacognitive ability and recognition that knowledge in languages is constantly evolving and in constant interaction with the way of being, being and living of individuals. On the other hand, in the document underlies the concern of the articulated management of foreign languages and their integration in the other areas of Basic Education due to the similarities found in the general competences and the specific competences of the foreign languages. Stimulation and trust are key words in the official documents on foreign language learning which aim to "focus the teaching process on the promotion of an affective relationship with the foreign language" and that "learners are given opportunities to become involved in tasks and communicative acts that give them stimulating experiences" (*Curriculo Nacional do Ensino Básico – Competências Essenciais: 41*). The fact that awareness and affective involvement with language is emphasized is, in our point of view, extremely important and meaningful. However, it is important to seek to ascertain the extent to which these tasks are implemented and feasible in schools and to acknowledge the obstacles to their actual put in practice. The competence of lifelong language learning involves the development of communicative projects for the real use of living languages, for a subsequent awareness and reflection of the language (which can only be achieved in most cases by children aged over 10) and the ability to use strategies that allow the use of the language according to their skills in communicational situations.

The introductory paragraph to the guiding principles of the specific competences of foreign languages summarizes the necessary opening of the school to different ways of being, living and living that communicate through the languages of each culture. This introduction, which we could not ignore in this work, shows the recognition of children from different cultures and the need to prepare ourselves for the linguistic and cultural diversity that constitutes the Europe of our century as responses to social and economic turbulence. The new paradigm of the labor market. In the following section of the document, foreign language learning, particularly English, is embedded in the broader competence of the communication of various languages - verbal, visual, auditory and body language - and of individual cognitive, socio-affective and psychomotor skills.

In the early stages of English learning process, it is preferable to use oral language through the reception of stories, tongue twisters, rhymes and songs and simple instructions in English, the visualization of posters and advertisements or small written messages and participation in dialogues or dramatic expression games. The emphasis is placed on the oral and playful activity that mobilizes the interest and motivation of the students always in articulation with the activities developed in the curricular areas. In addition to the essential motivation and awareness of the foreign language, it is intended that children can become familiar with the sounds and intonations of English and memorize and recognize them through the reproduction of small statements of their own day-to-day communication situations.

According to Herschensohn (2013: 233) "...social contexts and discourse in the constitution of learner identity, identity researchers foreground L2 learning as a sociocultural process and not solely cognitive." The framework of the specific competences of foreign languages within the general competences is a framework comparable to a whole for a part: the linguistic resources of the languages are inserted in the understanding and the approach of the problems of daily life; the communicative acts of the English language complement other languages of visual, auditory and even paratextual nature. If a mother tongue serves to communicate properly, the real use that foreign languages must have will be the same: to transmit something in communication situations.

Results, Conclusions and Recommendations

The basic idea is that language is a unique tool of cultural and social values. These values can never be forgotten when we teach a language, whether it is the majority language of a population or a minority language, as well as its social use. On the other hand, we rejoice to realize that language is theoretically treated through a cross-cultural and multicultural relationship within the general context of all school subjects. The school is the foundation of formal (and sometimes informal) language teaching and this function carries other functions and responsibilities of extraordinary value. Whether Portuguese as the lingua franca for all school subjects, whether English as a lingua franca of an economic and social Europe, both approach the human value they possess. In Portuguese official documents produced in the light of the Common European Framework of Reference, languages are a passport of tolerance because they provide access to all knowledge and for transmitting the human, social and economic values of Europe and the world.

Abstract

This research seeks to develop a critical reflection that frames, characterizes and evaluates the homework as a teaching strategy in the curricular area of “Environmental Study” in the Portuguese primary education. For that, we considered three dimensions: the type of methodology used; the number of homework assignments; the duration of the assignment by the student according to the time provided by the teacher. For methodologic purposes, we follow the case study method as we wanted to investigate the homework during a definite period in a narrative and profound way. An original instrument, called *Homework Data Collection*, was created to answer the research questions. The results show that there isn't preferred homework methodology, which is reflected in a lack of proportionality between working time and study hours of “Environmental Study” and in a marked discrepancy between the time determined by the teacher and the effective time that the student took.

Keywords: Homework, Primary school, Environmental Study

Introduction

Education is seen in every age in a very different way, fulfilling the aspirations that shape each generation. As such, Education is an organic process, which, cyclically, is recycled / renewed by the concern to maintain quality standards and by the intellectual goals of education, without ever abandoning the premise on which education serve as a means to prepare balanced citizens for democracy. (Bruner, 1977).

As such, the educational process in exercising a very great influence in society should be the subject of deep reflection. This reflexive spirit must not fail to scrutinize everyone in the process, trying to answer questions such as: What should we teach? With what ends? And what strategies to develop? Where the school constitutes the center of the school and the family and the teachers as conditioning agents / facilitators of the educational process.

The Portuguese educational system LBSE (Law nº 46/86 of October 14, art. 7: 3069), legitimizes the compulsory and free universal character of basic education, in which primary education is integrated.

(...) basic education is the stage of schooling in which the democratic principle that informs the entire educational system is made more widely, and in turn contributes decisively to deepening the democratization of society in a perspective

Development and progress, by promoting the individual realization of all citizens, in harmony with the values of social solidarity, and by preparing them for a useful and responsible intervention in the community
(ME, 2004: 11).

This level of schooling comprises four years of schooling, with an average frequency of 6 to 9 years, providing a globalizing teaching of the responsibility of a single teacher, with competences being developed in the following curricular areas: Portuguese, mathematics, study of the environment and artistic and physical-motor expressions. Primary education is governed by a formal curriculum of its own and each area has a curriculum as well as targets to be met. It should be noted that the curricular plan of this basic cycle also supports the integration of experimental and research activities in the work to be developed by the students, appropriate to the nature of the different areas, namely in science teaching. But, the School is also

an institution for the promotion of social values, never ceasing to be inclusive, and instrument used by the citizen for social ascension.

It is in this context that the School should develop a set of educational strategies inside and outside the classroom. One of those that has divided the school and scientific community is the achievement or not, by the students, of works outside the context of the classroom, commonly known as "homework".

The terminology "homework" (TPC) is widely known by some authors as the most timeless teaching strategy used throughout the world. The literature defines TPC as the academic work prescribed by the teacher in the school, and which must be completed by the students outside the school, overtime, usually at home and, therefore, without the direct guidance of the teacher during their performance (Rosário, P., et al., 2005, Cooper, 2001). This concept is further exaggerated by excluding school-based study, home-based correspondence courses on television, audio or video, or on the internet, and extracurricular activities such as group sports and clubs (Cooper, 2001). Already for Corno (2000), TPC is not limited to classrooms, where the teacher and the student occupy the main role, extending to third parties (parents, explainers and other members involved in the educational process) and whose role may be Essential for the final quality of the work done.

Marzano and Pickering (2007) state that teachers should not abandon TPC. Instead, they argue that their instructional quality should be improved, challenging a reflection on the role of CPT as a strategy for student success. As part of a range of strategies that have been maintained over time, along with the expository method, homework was seen for many years in our educational system as an important pedagogical resource for the consolidation of knowledge, yet in the Recent years a part of the scientific community has looked critically at these tasks, not recognizing pedagogical value. This line of thought has created a sharp divide between researchers who recognize the value of homework and those who view these tasks as a hindrance, resulting in relatively dense scientific output with well-defined positions.

Being a controversial subject in the universe of Education, the TPC are well studied, with a vast literature that gave rise to more traditional models and, more recently, to other models of self-regulatory matrix. In the more traditional TPC models the focus is directed to the analysis of the degree of involvement of students with homework vary according to the support provided by the teacher (s) and the parents or caregivers (Bembenutty, 2005). In this universe of models, one of the first to emerge was Cooper's procedural model (2001), first presented in 1989 (Cooper, 1989a). The Cooper model defines as exogenous factors that can influence the effect of the TPC on the individual characteristics of the students, with emphasis on competence, motivation and study habits, curricular discipline with respect to TPC, student's year of schooling, as well as Individual differences, which include, for example, gender and socio-economic conditions. As for endogenous factors, the model presents them by dividing them between the characteristics of the task and the home-community phase, where potential influences are defined to the effects of CPT. Finally, the model presents the possible consequences of the TPC process in terms of its final results (Cooper et al., 2006).

The originality of the Cooper model from the previous ones is in the introduction of the characteristics of the TPC tasks as potential mediators of this process. It considers that the following should be taken into account: load, objective, area of competence used (eg, reading, writing), degree of individualization, degree of student choice, completion period and social context. It should also be pointed out that in this model the emphasis is placed on parental factors associated with CPT, in detriment of self-regulating factors regarding students. This selection puts aside the specific processes used by the students during the realization of the TPC, where they are inserted, goal setting, planning, self-monitoring, self-assessment, self-instruction or self-reaction, characteristic of a more specificity of the task.

This research that focuses on CPT in primary education, at this stage of the study, is focused on the curriculum area of the Study of the Environment. According to (Roldão, 2004) this area seeks the understanding of the world. It seeks to bring the child closer to the natural-environmental, physical and social reality.

Children of this age level perceive reality as a globalized whole. For this reason, the Study of the Environment is presented as an area for which concepts and methods from various scientific disciplines such as History, Geography, Nature Sciences, Ethnography, and others compete, thus contributing to the progressive understanding of the interrelationships between Nature and Society. (M.E., 2004: 101)

Method

As stated before the followed methodology is the case study method as we wanted to investigate the homework during a definite period in a narrative and profound way. But, before presenting the methodological instrument we must go through the research questions.

According to the existing literature and some exploratory studies developed previously (Corno, 2001; Xu, 2005; Xu & Yuan, 2003), this work seeks to answer the following questions:

Research question 1: Which is the homework's methodology preferred by teachers?

Research question 2: The number of Environmental Study's homework per week is proportional to the number of hours per week of this subject?

Research question 3: Is the time predicted by the teachers in the accomplishment of the homework similar to the time needed by the children in the accomplishment of that homework?

Instrument

In order to answer the research questions, an original instrument was created called Homework Data Collection. This instrument was validated by conducting a pilot test, in which teachers from the Primary School participated. After the corrections, the instrument was delivered to the 8 teachers who began collecting data on Homework in the subject of Environmental Studies.

This instrument seeks to analyze the teacher and children's perspective on Homework. For this purposes, it was collected, at the teacher level, the methodology used and the time provided for the accomplishment of this task. In students' side, it was registered the accomplishment/not accomplishment of this task and the effective time for its accomplishment.

Research sample

Teachers characterization: in this study participated 8 teachers (87.5% are female and 12.5% male) with an average age of 36,6 years old. Also; it is a group of relatively young teachers with an average of 10,5 years of teaching experience, almost all the time (average 9,8 years) in primary school level.

Students characterization: 163 children between 6 and 10 years old (55% are male, and 45% female) of a primary school located in Portugal's inland region. The children are spread over 8 classes, 2 for each one of the 4 levels. So, each class presents an average of 20,3 children.

Findings

With the data collected so far, we have about 25 complete weeks of data available in all the subjects. This gives us an average of 2,64 homework assignments per week, but only 17% of that value corresponds to homework related to Environmental Studies. The associated variance is very small, typically a standard deviation distance away.

We also registered the week days of assignments (see Table 1 for an example).

Table 1: Week day versus number of assignments

Week day	Number of assignments (%)
Monday	34%
Tuesday	0%
Wednesday	38%
Thursday	28%
Friday	0%

Clearly the assignment day has to do with the school structure and thinking about homework. The three days where we can find homework assignment are the three days that the school offers extra after school support from the teacher.

About the distribution of the type of homework within the disciplinary area of Environmental Studies we got 33% for Work Sheet, 42% for Exercice types, 17% for Other type and only 8% for Problem Resolution.

The total time for all classes to carry out the homework was 964,26 minutes, that means 14,61 minutes/week/class. So, considering an average class teaching time of 3,5 hours, homework takes around 7% of class time.

Only in 6% of the times, we found differences between the teacher's perception and the real time that takes to accomplish the task by the children. In these 6%, most of the perception errors are less than 5 minutes per defect, that is, teachers tend to consider that it takes less time to perform the task than what actually happens. We can, then, estimate a global perception mislead of 3%.

Results, Conclusions and Recommendations

During this investigation, we found the following:

- First, and answering the first research question, about the preferred methodology, we can say that neither the Work Sheet neither the Exercises are the preferred homework by the teachers;
- Second, and answering the second research question, about the proportionality between homework time and a number of teaching hours of Environmental Studies, we can say that, in average, there is a proportionality of 7%, but there are so many differences between the classes. Just as an example, one of the classes did not have any homework in this four week period, while other class reached a maximum of nine homework's in the same period.
- And third, and answering the third research question, about the teacher's perception of the time necessary to accomplish the homework on Environmental Study, we can say that most of the times teachers have a good perception of the time needed to perform the homework. So, the existing erroneous perception is very small.

According to the results, we can conclude that, for the curricular area of Environment Study, there isn't preferred homework 's methodology, which is reflected in a lack of proportionality between working time and study hours of Environmental Studies and in a not so marked discrepancy between the time determined by the teacher in the performance of the homework and the effective time that the student took to perform the tasks.

As a recommendation for the next steps, we will follow this study through the two other areas, Mathematics and Maternal Language and try to compare the relative importance teachers attribute to each one. As a second idea we will try to find international studies, at least for the Mathematics case, to gain comparative strength.

Development of Informatics Curriculum in Czech Schools; Possible Implications For Teacher Education

Květoslav BÁRTEK

¹Asst. Prof., Palacký University, Faculty of Education, Department of Mathematics
Email: kvetoslav.bartek@upol.cz

Abstract

The article focuses on the current concept of Computer Science education from the perspective of Czech Computer Science teachers and their opinions on and attitudes to the present situation in ICT education, and deals with the degree to which those teachers are or are not prepared for the upcoming changes. This should form the basis of changes in the training of the existing students of teaching as well as already practising teachers. A fundamental area for our paper is the mutual link between mathematics and Computer Science education, the use of one field in the other, and the possibilities and degree of implementation of these (to us logical) inter-subject links in the present-day education reality. The tool for our survey is a questionnaire distributed among more than a hundred Czech teachers. The outcome is the presentation of selected results of our survey.

Keywords: Lifelong education, Information technology, Curriculum of Computer Science education

Introduction

The present concept of Computer Science education from the perspective of Czech informatics teachers At present, the Czech school system, as the school systems in many other countries (Webb, Davis et al., 2016; Yadav et al., 2016; Bučková & Dostál, 2017), is intensively addressing the reform of Computer Science education & the related definition of informatics didactics as such. The teaching trend, to a considerable degree maintained at most Czech schools, i.e. in most Computer Science subjects, consisted in building pupils' skills in working with ICT devices. Teaching was thus focused primarily on managing the technology and understanding how it works in terms of hardware; it was considerably less oriented at software and the development of computational thinking, algorithmicising, problem solving and programming. The experience in our neighbouring country – Slovakia – is similar, nevertheless as Bučková & Dostál (2017, p. 201) observed, *the Slovak curriculum presents the requirements for this teaching subject significantly more clearly* and according to Blaho (2012) the common main problem remains; *at present it's probably the misunderstanding of the real goals of informatics, neglecting some key areas, the very laic view of what informatics is and how it differs from the work with ICT*. In the light of the above, we will use the term *Computer Science* or *Informatics education* to describe the discipline.

The real objectives at which the reform of Computer Science education is aiming are (Strategy for Education Policy of the Czech Republic until 2020, (2014); Strategy for Digital Education, (2013); Framework Education Programme for Basic Education; Brdička et al., 2015):

- new ways of education using digital technologies,
- creating and using open educational resources,
- development of digital skills and computational thinking of pupils,
- algorithmicising,
- programming,
- emphasising the generally applicable principles and mechanisms “resistant” to changes in hardware or software,
- development of digital skills and computational thinking of teachers,
- etc.

We believe that informatics as a field closely related to mathematics is supposed to develop thinking, just like mathematics. The basic factors of thinking developed by mathematics and informatics are combined, and the effects of such education on the development of thinking in pupils are amplified. Computer science classes may help reinforce some mathematical skills and processes (NCTM, 2016; Cheng, 2016) and conversely, mathematics is a fundamental discipline for computer sciences, because the main benefit we got from the mathematics we *learned in school and at university was the experience of rigorous reasoning with purely abstract objects and structures* (Devlin, 2001). That is why we consider it beneficial to suitably interconnect and integrate knowledge gained in both these fields (i.e. both these school subjects), and address problems using the methods and tools of both the disciplines in parallel. One of the key concepts is becoming computational thinking and its development. As Vaníček & Černochová (2015) explains, *computational thinking is a method generally applicable to solve problems, in particular using the computer*. In available Czech sources is the concept of computational thinking described in detail by Lessner (2014).

The creation of tools to solve mathematical problems at a general level of difficulty defined in education programmes for primary and secondary schools using computers is then possible with minimum software equipment. Such problems can also be solved, subject to a good user knowledge of the program, using table calculators by means of pre-set tools and functions, or it is possible to create comprehensive applications with the necessary prerequisite of programming knowledge (e.g. in Visual Basic for Application).

Method

In order to find out the opinions of teachers on the current state of Computer Science education in the Czech Republic and attitudes to possible changes in the current curriculum of informatics, we have worked out a questionnaire, whose selected problems and results will be dealt with in the following text.

The survey was attended by 123 primary and secondary school teachers in the Olomouc region, who teach informatics disciplines at schools. The examined sample consisted of 57 men and 66 women, teachers with less than 10 years of experience constituting 17% of the sample, and 83% teachers with a practice of more than 10 years. Mathematics as the second discipline was taught by 65 teachers from the sample surveyed. This group includes primary school teachers, as they teach most subjects in the vast majority of cases.

As a research tool, we chose a questionnaire, distributed to teachers in electronic form, using Google Docs. The partial part of the questionnaire contained 32, mostly closed items.

Selected partial findings and results

We have tried to find out the opinion of teachers about the need to change the curriculum of others, teaching Computer Science directly or indirectly unrelated subjects (see tab. 1).

Do you think that, together with the innovation of the content of Computer Science, it is necessary to innovate content and related subjects?

Table 1. Problem: Educational content innovation of related disciplines

	Absolute	Relative frequency	Agree vs Disagree
I agree	15	12%	61%
I rather agree	60	49%	
I rather disagree	36	29%	39%
I disagree	12	10%	
Total	123	100%	100%

From the data obtained, it is clear that changes in the content and other subjects in the context of the change in the curriculum of computer-aided subjects are seen by more than half (in the sum of the frequencies of "I agree" and "I rather agree" categories 61%) of ICT teachers as necessary. In a further logical question, teachers were

asked to specify the subject or objects to which content innovations should relate. "Do you think it would be appropriate to innovate, with regard to the innovation of the content of Informatics, the content of any of these subjects?" Teachers selected from the choices they offered, but also answered in the form of a free answer. Mathematics was the most common answer (60 in total, but 35 of the respondents were maths and 25 were subjects of mathematics). It is a slight surprise that among teachers teaching both Computer Science and mathematics, the numbers of those who feel the need to change the curriculum of mathematics in relation to Computer Science are roughly the same as those who do not feel this need.

Another chosen question tried to find out the specific, useful application for teaching: "In your opinion, which application would be the most appropriate if emphasis was placed on greater use of information topics in mathematics?" Teachers selected from the options available, overwhelming majority 99 respondents (80%) voted the MS Excel spreadsheet or the like, very often they also featured dynamic geometry tools – Cabri Geometrie (62 teachers) and less Geogebra or AutoCAD.

The following question was used to find out the appropriate topics of interconnection between Computer Science and mathematics: "Which topics could you think about using Mathematics in Informatics?"

Teachers once again chose the options offered, but they also responded in the form of a free answer, choosing more than one answer. The most frequently mentioned option, in 109 cases, was the use of graphical capabilities of programs to generate graphs and geometry and drawing (72). Another often mentioned option was solving equations (61). Teachers also often mentioned the option *Calculating Percentage* – 54 respondents. Rarely in the number of frequency units, the topics of *work in numerical systems - binary, hexadecimal etc., databases, basics of statistics*, etc.

Question "Do you think that using the themes solved and taught in your Informatics lesson can help your pupils in mathematics teaching or self-study of mathematics – visualize mathematical concepts?" 71% of teachers answered positively (*I agree* or *I rather agree*), see tab. 2.

Table 2. Problem: Visualization mathematical concepts

	Absolute	Relative frequency	Agree vs Disagree
I agree	48	39%	71%
I rather agree	39	32%	
I rather disagree	30	24%	29%
I disagree	6	5%	
Total	123	100%	100%

Question "Do you think that using the themes dealt with and taught in your Informatics lesson can help your pupils in teaching or self-study of mathematics learn at their own pace?" 68% of teachers responded positively (*I agree* or *I rather agree*).

Table 3. Problem: ICT as a selfstudy support in mathematics

	Absolute	Relative frequency	Agree vs Disagree
I agree	24	19%	68%
I rather agree	60	49%	
I rather disagree	27	22%	32%
I disagree	12	10%	
Total	123	100%	100%

In next question, we have further investigated the views of teachers on the appropriateness of some selected mathematical themes: "Do you think that it is appropriate to use the mathematical themes such as linear

Calculus (eg MS Excel, OpenOffice Calc, etc.) $y = 2x + 3$ – calculating functional values, plotting a function graph, etc.?" In this question the share of positive responses was again lower, a total of 61%.

Table 4. Problem: Appropriateness of ICT support in selected mathematical themes.

	Absolute	Relative frequency	Agree vs Disagree
I agree	30	24%	61%
I rather agree	45	37%	
I rather disagree	36	29%	39%
I disagree	12	10%	
Total	123	100%	100%

Conclusions and Recommendations

The professional support of teachers of informatics and the system of further education of Computer Science teachers is similarly fragmented as did its didactics: there is no elaboration and no system of training or conference of teachers focused on the teaching of ICT, there is no guarantor (the professional association *Jednota školských informatiků* does not have a massive contact with teachers from practice). The possible causes of isolation of Computer Science teachers are also seen in the low endorsement of teachers who often do not feel like ICT and do not tend to be professionally educated, grouped and communicated (Vaniček, & Černochová, 2015, p. 184).

These results indicate one of the direction in which teachers education should be prepared in relation to the changes underway, including in their lifelong learning. But this is only a part of problem – it is problem *what to teach using IT*. The field is much more complex, known as Technological Pedagogical Content Knowledge – TPACK (Niess, 2015).

In order for changes to be feasible to the requirements of the socio-economic and technological level of society, they must primarily be reflected in the education and support of current teachers. It is a positive finding that addressing teachers strongly perceives the need not only for informational education reforms, which are in line with planned innovations, but we have found them in another part of the research. However, they also perceive the need to respond to planned changes in the curriculum of other subjects.

In relation to the curriculum of mathematics we see consistently with the addressed teachers appropriate interconnection in the presentation and solution of complex mathematical problems to pupils in the general level of solutions using technological means and development of generally valid, common skills and procedures for mathematics and Computer Science, such as topics of algorithmicising, problem solving and the basics of logic. As a suitable topic, general solutions of linear and quadratic functions, functional value calculations, plotting of graphs, solutions of linear and quadratic equations and their systems, using different mathematical approaches (algebraic, geometric, etc.), and the development of appropriate solutions, or creating custom programs.

Corpus of Crisis Management: Security versus Safety

M.A. Jiří Dvořák, Ph.D.

University of Defence Language Centre
Email: jiri.dvorak@unob.cz; dvorakji@post.cz

Abstract

Such a complex process like crisis management can only be discussed and understood with success if there is agreement on the meanings of its essential terminology. Enhancing and harmonizing the application of existing crisis management terminology goes hand in hand with the need for establishing and coordinating risk management guidelines and practices. Significant changes have also been taking place in the theory and practice of lexicology, as a result of new technology for data-processing and text-based research. Dictionaries are founded on authentic usages of words, their collocations and semantic domains they are associated with. However, large, complex units of meaning are often absent from dictionaries and terminological glossaries. Therefore study of crisis management terminology would be beneficial for the needs of education and training of authorized personnel on individual levels of management. The paper deals with two key terms of crisis management terminology, security and safety. After a short introduction, the method of analysing the data collected in a crisis management corpus is described. The data on two crisis management terms have been collected in a computerized crisis management corpus and processed with the help of Sketch Engine, a web-based program. Then the concepts of security and safety are introduced together with the areas to which the terms are most frequently related. The summary of security/safety collocations includes the section of common patterns, with similarities as well as differences in their connotations. Finally, several conclusions, which are drawn after analysing the distribution and frequency of terms, reveal the fact that traditional concepts of security and safety have been broadened and reflect changes in society and science.

Keywords: Crisis Management, Security, Safety, Corpus

Introduction

Nowadays, societies face crisis challenges of a different nature. The concept of *crisis management* (CM) has gained new prominence on the political agenda both in domestic as well as international fields. The area of crisis management has gained a large potential for development. Organizations and all societies have begun to address non-traditional threats to *security*, including the challenges brought on by the consequences of political, economic and environmental stress. “*Security*” and “*safety*” are topics of continual change based on new scientific discoveries and analyses of incidents in the field, as well as on new technologies and concepts of social responsibility.

The author has carried out lexicological research in the corpus of crisis management and this paper is focused on presenting the analysis of two terms in particular, *security* and *safety*.

Method

The data on key terms have been collected in a computerized crisis management corpus while considering both qualitative and quantitative criteria. Topics of authentic materials written in English language scientific style cover the areas of waste, food, hazardous materials, accidents, infrastructure, environment, health and *safety*, terrorism, *security*, civil protection, and military. The corpus includes 1.5 million words in whole texts and sentences.

The distributions of lemmas and their combinations have been identified and the frequent collocations being used in a corpus have been compared with the help of Sketch Engine. Sketch Engine is a web-based program having a number of language-analysis functions, for example the Concordancer, the Word Sketch Program, etc.

The Concordancer displays all occurrences for a given query and the Word Sketch Program displays a corpus-based summary of a word's grammatical and collocational behaviour. (Sketch Engine Manual 2014)

Findings

The New Oxford Dictionary of English (Pearsall & Hanks (Eds.) 1998: 1635, 1681) defines the terms *security* and *safety* in the following ways:

“*Safety*: 1) The condition of being protected from or unlikely to cause danger, risk or injury.

Denoting something designed to prevent injury or damage, e.g. *safety* barrier.

Security:

1) The state of being free from danger or threat, e.g. ‘the system is designed to provide maximum *security* against toxic spills;’

The *safety* of a state or organizations against criminal activities such as terrorism, theft or espionage;

Procedures followed or measures taken to ensure such *safety*;

The state of feeling safe, stable and free from fear or anxiety;

From the Latin word ‘securus’; ‘se’-without, ‘cara’ – care, - ‘securus’ – free from care.”

Safety deals mostly with *hazards*, while *security* deals mostly with *threats*. The above mentioned tendency is supported by the collocations *security threats* and *safety hazards* having been recorded 20 times and 14 times respectively in the crisis management corpus. The collocations with the key nouns being interchanged have not been recorded.

Although a detailed analysis of the terms *threat* and *hazard* is beyond the scope of this paper, it is worth mentioning some differences for the sake of clarity. When analysing the various definitions of *threats* and *hazards* the following distinction can be made: “*hazard* is defined as a potential source of harm,” (quoted in Blanchard 2008: 530; cf. ISO Guide 73 2009, definition 3.5.1.4) while “*threat* is either the presence of a *hazard* and an exposure pathway...,” or “the likelihood of a *hazard* occurring.” (quoted *ibid.*, 1181) The term *threat* may be distinguished from the term *hazard* by its intention (Trumble & Stevenson (Eds.) 2002: 3251) and/or imminence (presence or likelihood according to Blanchard) despite the fact that both collocations *imminent hazard* and *imminent threat* have been identified in the CM corpus. *Imminent hazard* may include a severe weather event, already occurring or imminent; or wild fire, an unplanned, unwanted wildland fire including fires caused by people. The following explanation of *imminent health hazard* has also been recorded in the CM corpus: “*imminent health hazard* is a significant *threat* or danger to health considered to exist when there is evidence sufficient to show that a product, practice, circumstance, or event creates a situation that requires immediate correction or cessation of operation to prevent injury.”

(“Definitions. Imminent Health Hazard” 2006: 1)

Shearer and Liotta (2011: 5) state that “threats are readily identifiable, immanent, and prompt an understandable response.” Within a *security-as-defence* framework, the sizing of military force and the acquisition of materiel are examples of typical threat response. The same authors point out that a focus on threats has been the traditional topic of *security* studies (*ibid.*, 5). The aspect of *intention* and/or *imminence* in case of *threat* is supported not only by the CM corpus collocations, e.g. *terrorist threat*, *insider ~*, *adversarial ~*, *malevolent ~*, but also by a few more examples in a wider context (e.g. ... to reduce immediate threats to life, property, and public health;... threat to life and property exists or is likely to exist in the *immediate* future; ...there are serious and *immediate threats* to human life and well-being; ... atmospheric condition that poses an *immediate* or delayed threat to life). The factor of intention has not been detected in “*hazard*” collocations. The collocation e.g. *imminent hazard* can certainly be encountered, but such a *hazard* becomes a *threat*.

The relations of imminence and intention to the terms *threat* and *hazard* is shown in the following graphs:

Safety science is mostly related to the health and well-being of people at work and in other activities. We have *safety* belts in cars, *safety* glass in refrigerators and hockey rinks, *safety* helmets in sport, etc. The longest traditions of *safety* research come from high-risk industries, including transportation, nuclear plants and shipping. (cf. Glendon 2006) The modelling of accidents may cover technological, human and organisational factors with a focus on **unintended** incidents.

The concept of *security* covers everything from personal to national *security*, including financial crime, information protection, burglary and espionage. Financial business, the market sector and national defence all deal with *security* issues. *Security* is defined in the NATO STANDARD AJP-3.14 as follows: “*Security*, in the context of force protection, encompasses those measures, tasks, and activities necessary to achieve protection against terrorism, espionage, subversion, sabotage, and organized crime (TESSOC), cyber intrusion, insider threats, and direct and indirect attacks on personnel, equipment, installations and lines of communication. **Security** covers physical and procedural measures... .” (NATO STANDARD AJP 3-14 (A) (1) 2015: 2-4)

The above mentioned concept of *security* is supported by the following frequent collocations: *national security*, *global* ~, *physical* ~, *economic* ~, *homeland* ~, *information* ~, *human* ~, *transportation* ~, *food* ~; *security strategy*, etc.

The analysis of CM corpus reveals the fact that both terms modify general nouns, such as program(me), policy, requirement, measure, professional, personnel, issue, concern, information, director, function, official, etc. The terms *public safety* (81x) and *human security* (33x) are more frequent than *public security* (5x) and *human safety* (7x) when comparing the *security/safety* common patterns in the CM corpus. The term *human security* reflects the growing recognition that concepts of *security* must include not only states, but also people. *Human security* may be perceived as a sufficient provision of humanism to people with regards to their rights to freedom, self-development, happiness and the employment of their capabilities. The term is the subject of changes reflecting the changing opinions. (cf. Annan 2001: 1; *Outline of the Report of the Commission on Human Security* 2003: 1; Ginkel & Newman 2000: 79; Hammerstad 2000: 395) The term *human security* has to be clearly defined and not confused with other terms, for example *national security*. Carafano and Smith (2006: 6) state that “*human security* focuses on the protection of individuals, rather than defending the physical and political integrity of states from external military threats – the traditional goal of *national security*”. The challenge for governments is that by taking measures in the area of *national security*, they may endanger their citizens and thus pose threats to *human security*. Thus the terms *national security* and *human security* must not be interchanged. The expressions “*national security*” and “national sovereignty” should be used in international statements, documents and treaties. The same authors (ibid., 14) argue that “the use of

the ‘*human security*’ should be discouraged in international deliberations unless it is defined within the boundaries of nation-states and sovereignty.”

Human safety is not a very frequent collocation. There is no definition of the term *human safety*. As stated above, *safety* is related to the health and well-being of people at work and in other activities. *Safety* can always be tracked down to humans (as in case of *security*) despite the fact that the human factor is not emphasized in the collocations, for example *truck and bus safety*; *traffic ~*, *pedestrian ~*, *motorist ~*, *highway ~*, *road ~*; *aviation ~*; *runway ~*; *harbour ~*; *rail ~*; *workplace ~*; *worker ~*; *worker health and ~*; *home ~*; *safety and occupational health (occupational health and ~)*; etc. As it has been mentioned above, *safety* is often related to the health and well-being of people at work. It is interesting though, that while the collocation *health security* has been recorded 10 times, the collocation *health safety* has not been recorded in the CM corpus. The *health/safety* relation has been recorded only as ... *health and safety* ...; ... *safety and health* ...; ... *safety and occupational health* ...; ... *health, safety* ...; etc. The collocation *health security* has occurred 7 x in the structure *public health security* (incl. *Public Health Security and Bioterrorism Preparedness and Response Act 6x*), which is more about the *health security* of nation and defines (protection) against threats of terrorist attacks rather than the health of people at work. As opposed to the term *human security*, the term *human safety* reflects the fact that a) soldiers wear full tactical gear, including Kevlar helmets, body armour, ballistic eye protection and individual weapons; b) construction workers wear helmets and follow other *safety* procedures on a building site; c) patients are informed about *safety* alerts for human medical products, etc. *Physical security* enhancements include alarm systems, bulletproof doors, or walk-through magnetometers. *Physical security* may also encompass actions taken in order to restrict unauthorized access to critical information in computer software and hardware. The *safety of personnel/people/person/employee/worker* structures has been identified in the CM corpus, but the same structures with the term *security* have not.

The same methodology may be followed when analysing the denotations of other similar patterns of *security/safety* collocations recorded in the CM corpus and highlighted in Table 2, namely *nuclear security/safety*, *environmental security/safety*, *food security/safety*, and *public security/safety*. Key terms may also be analysed through multi-head patterns (not only two-word collocations presented in Table 2) and in distant context.

Despite the above mentioned differences, it must be mentioned that there is not a clear-cut borderline between the areas of use of the terms *security* and *safety*. Thus the above mentioned statement, that the *safety* research has the longest tradition in e.g. nuclear plants, does not mean we cannot record the collocations *nuclear safety* as well as *nuclear security*. The same is true for the area of transportation. Despite the tradition of *safety* research in this area, an analysis of the CM corpus has revealed the occurrences of not only *traffic safety*, but also *transportation security* and *aviation security*. The difference in meaning is clear from the following example: *transportation security* can be explained on the categories of *security incidents* in the *security incident report* developed by the Australian Department of Infrastructure and Transport, which include aircraft breach and intrusion (i.e. laser lights, tampering with aircraft, sabotage, etc.), criminal activity, public behaviour, screening events, staff and procedural category, suspicious items and threats (“Aviation Incident Categories” 2014). *Traffic safety* is about *safety belts*, speed limits, airbags, etc. Some examples of *safety hazards* and *security threats* in the area of transportation are presented in Table 1.

Table 1 Examples of *Safety Hazards* and *Security Threats* in the Area of Transportation

Transportation safety hazards	Transportation security threats
Low flying	Sabotage
Reduced visibility	Criminal activity
Quality of fuel and fuel management	Terrorist activity
Transport of hazardous materials	Hijack alert
Errors	False documentation
Construction on rail / road, etc.	Unauthorized access
Inexperienced (unlicensed) drivers, pilots, etc.	Suspicious cargo, items, etc.
Low vehicle standards (poor crash protection)	Corruption of <i>security</i> procedures
Speeding	
Drinking and driving	
Fatigue	
Damaged roadways	
Lack of communication and warning	
Corruption of <i>safety</i> procedures	

The summary of *security/safety* collocations in the CM corpus is presented in Table 2. Similarities are highlighted. The *security/safety* only patterns in $N_{(security/safety)+N}$ collocations are written at the bottom part of Table 2 due to larger data sets in this category. The “only” patterns are recorded even when the collocation with the second key word has frequency below 5, e. g. *security act* 80 vs. *safety act* 4. Although minimum frequency for a collocation to be included in the list has been set to be 5, there is one exception, *environmental safety*, being recorded 4 times. The reasons for such an exception are two a) despite low frequencies the salience scores for *environmental safety/security* are similar and not insignificant; and b) the term *environmental security* is relatively new and deserves certain comparison with the term *environmental safety*. As it is stated in the executive summary report of the *NATO CCMS Pilot Study on Environment and Security in an International Context* (1999: 38), “the new and broader *security concept* – the Strategic Concept of 1991 – complements the emphasis on the defence dimension of *security* and recognizes that *security* and stability have political, economic, social and environmental elements.” (cf. *ibid.*, 35)¹

¹ (*ibid.*, 35) “Since the end of the Cold War, traditional *security* concepts based on national sovereignty and territorial *security* have increasingly been brought under scrutiny. Instead, a broader definition of *security* that would incorporate non-traditional threats to *security* and their underlying causes such as economic decline; social and political instability; ethnic rivalries and territorial disputes; international terrorism; money laundering and drug trafficking; and environmental stress is being advocated.”

Table 2 *Security/Safety* Collocations in the CM Corpus

Results, Conclusions and Recommendations

Corpus is useful for analysing the distributions and frequencies of terms. The corpus of crisis management, in which the terms *security* and *safety* have been analysed, includes 1.5 million words in whole texts and sentences and the topics of authentic materials written in English cover the areas of waste, food, dangerous substances, accidents, infrastructure, environment, health and *safety*, terrorism, *security*, civil protection, and military.

Several conclusions may be drawn about the terms *security* and *safety*. Firstly, the traditional concepts of *security* and *safety* have been broadened and reflect the changes in society and science. Thus *security* covers not only the area of national *security*, but also personal *security*. It is related not only to military, crime and the economy, but also to the whole environment. Similarly, the concept of *safety*, mostly related to the health and well-being of people at work and in other activities, has been broadened. Secondly, there is not a clear-cut borderline between the areas of use of the terms *security* and *safety*. However, there is difference in the frequency of terms, their collocations, as well as connotations generally considered as synonymous. New collocations create new conceptual models and, conversely, new conceptual models create new collocations.

The distribution of terms and specialization of their meanings depend on various contexts that restrict the interchangeability of such terms. The term *threat* is e.g. more typically combined with the term *security* rather than *safety*, while the term *hazard* is more typically combined with *safety* rather than *security*.

It is recommended to rely more on empirical evidence from corpus-based analysis of authentic language when working with terminology. Frequency analysis of terms and their collocations in various contexts as part of linguistic analysis may help CM experts to use the terms consistently and, in the case of no terms, be aware of prevailing tendencies of word combinations from the areas of their interest. It is also recommended to analyse selected terms in distant context, because we can see how terms in seemingly similar patterns are used in different ways and are appropriate in different contexts.

Abstract

This research is aimed to improve the flow management of the government debt in Latvia, its connection to the current Latvian government debt model and to define future improvement directions of the current Latvian government debt model. During the research the structuring of the current model, that is the model with the main function of finance attraction and payment of the coupon and is the bases of government debt coverage, is made. The main weakness of the current model is connected to the main goal that all resources are attracted only for government budget deficit coverage and no other functions are fulfilled. As in the internal issues there is avoidance from too high interest rates, authors summon to avoid by using the external issues system and to create the system for external issues alike for internal issues. Consequently, the current system does not provide opportunities to reduce government expenditures, but the improvements summoned by the authors could reduce government expenditures. In parallel to the reduction of coupon payments authors make analyses on the government expenditures on intermediaries. At the end of the research the possible improvements are suggested from the goal of issues, from the process of issues, form coupon payment and intermediaries expenditure perspective.

Keywords: Debt, Government debt management, Government debt system

Introduction

Global experience that is accumulated in the field of government debt securities flow management gives opportunities to Latvia in accordance to national development of economic and political culture develop the most appropriate management model, that focuses on decrease of the government debt services payments and increase in the effectiveness of government debt flow management. The model is developed by taking into account the most important opportunities and threats of Latvian national economy in parallel by identifying external challenges, that is the level of development of the global economic system. During last years and its influence on the process of global development is under increased attention of politicians, non-government organisations, journalists and scientists. The majority of up till now research papers on issue and turnover of government debt securities and its connection to other ways of debt are mainly made from the perspective of issuer (effectiveness, amount outstanding, technical management, risk acknowledgment and like that) or from the perspective of investor (income, safety, liquidity). In some research papers are made in-depth analyses of risk management of the borrowed finances, mainly from the repayment perspective. As the basement of increase of effectiveness of government debt management from some scientist point of view is the necessity to implement warning system that would give better information on possible opportunities and threats, and how to increase the effectiveness of supervision (Reinhart, Rogoff, 2009). At the same time the increase of government debt flow effectiveness is too little analysed. Politicians and government officers are concerned about issues connected to liquidity and safety of investment, because in the 2008 in the case of Latvia the risk came true and there was no more possibilities to attract financial resources in international financial market with the interest rate that would be acceptable for the national economy. That leads to the fact that many authors have made analyses on the issue how money does effect on economy (Sarvaes, Tufono, 2006; Campello, Glambona, Graham, 2012). More detailed the risk of not covering government debt was analysed (Bijak, Thomas, 2012; Arora, Gandahi, Longstaff, 2012; Breuer, Jandacka, Menicia, Summer, 2012) and by connecting with the proportions of government debt with corporate debt (Maltritz, 2012). The potential investments of households in government financing was analysed (Nofsinger, 2012; Fairlie, 2012) where household income, expenditures and savings were assessed that makes the bases for the financial resources that can be invested in the government debt securities. Doing analyses from the investor structure perspective, too little demand on government debt can appear if the total debt is too big the risk of flow management can be for fill (Richardson, 2012). The problems with the government debt securities definitions were found by some scientists, the majority of definitions are only from one side – issuers or investors side, and do not

cover the economical essence. There are also different approaches in the classification (Brigman, 1992; Panizza, Presbitero, 2012). The relations between issuers and investors were analysed in to understand their correlation (Kerswell, 2012). The previously mentioned publications and other research were used to discover the specific characters of government debt flow management, government debt flow development and trends in the case of Latvia.

The goal of the research is to develop effective government debt flow management model, with the identification of its weaknesses and suggest the best improvements for the current situation in the case of Latvia. **Dynamics and structural changes of the Latvian government debt**

The total amount of money borrowed by the Latvian government exceeded EUR 9.7 billion at the end of 2016. In 2017 the Parliament approved the budget in deficit, thereby adding EUR 0.3 billion to the total national debt. The Latvian government had been financed from budgetary revenue by mid-1993. However, the amount of borrowings has grown substantially since then. During this period, the largest funding was necessary for the financing of effects of the financial crisis suffered in 2010, when the government was forced to make borrowings totalling EUR 3.7 billion from international financial institutions to finance their core functions in the years 2007 to 2011.

An increasing share of funding has been obtained by selling government bonds on external markets. The share of borrowings made on the internal market has been rising over the last years, which should be regarded as a positive trend.

Given developments of the government securities market, the goal of government debt flow management in Latvia is to provide necessary funding at the lowest possible cost, taking account of financial threats. In order to attain this goal and ensure that government debt flow management conforms to the internationally accepted practice, government debt management can be divided into government debt portfolio management and government debt management (The Treasury 2015: 10). According to public documents, the Latvian government has borrowed funds to obtain financing required for infrastructure development and create other pre-conditions for improving the quality of life of people. The growth of the government debt is closely linked with the maintenance and enhancement of the country's competitiveness.

Numerous studies have shown that debt incurred to cover current expenditure could lead to an economic crisis. The borrowing practice cannot be of a lasting nature because one day there will be no one who would be ready to lend if the country is led by people managing finance in a reckless and even populist manner. Many parts of the world have already seen such situations, which were solved in different ways, from national bankruptcy to the successful involvement of an intermediary, which took over the debt and gradually wrote off a certain portion of the debt. From the one of the last crises in Greece where up till 2001 interest rates for government debt securities were 20%, but in 2005 they were only 3% the amount of the debt increased dramatically (Hardouvelis, 2011a: 12), but when in the 2009.interest rate reached 27% the crises appeared (Hardouvelis, 2011b: 32). It is clear that, with rates growing, countries can no longer repay their previous borrowings by means of the issuance of a new borrowing. The provision of aid involving heads of government might not be effective in the short term. The heads of EU government agreement on help to Greece were too late (Kouretas, Vlamis, 2010: 391-398).

If Latvia adhered to the continuous borrowing model, it is doubtful that international organisations and countries with more developed economies would take part in lending transactions. This situation is likely to lead to the emergence of new debt securities at regional or global level, and Latvia would have their own bonds like Brady bonds (Trade Association for the Emerging Markets 2015), or, if there were other countries having similar problems, a new type of bonds would be introduced for a certain group of countries.

Structure of the Latvian government debt

The existing government debt management system of Latvia has been designed to obtain financing from commercial banks on the internal market and from global financial institutions on external markets. On the internal market, government debt is a beneficial option for commercial banks because they may take advantage of

refinancing transactions and receive a certain portion of investments in the form of debt, thereby enhancing the safety of their assets. Government debt can be viewed as high-level security in the event of temporary financial difficulties in situations when funds are insufficient (Bank of Latvia 2013: 3). The dependence of government debt on national tax revenues is mentioned as a substantial threat to government debt in crisis times. As a rule, tax revenues decrease during a crisis, while prices of securities (interest payments) grow, especially if the financial sector is the most significant lender, which may cease financing the government in view of the way the situation is developing (Hassen 2015: 148). To this end, the first steps towards the establishment of a household-oriented savings bonds market have already been made in Latvia.

Table 1. Codes of securities owner's and issuer's sectors (Bank of Latvia 2010: 5)

Name of the owner's and issuer's sector	Code
Non-financial corporations	S.11
Central banks	S.121
Credit institutions	S.1221
Money market funds (MMFs)	S.1222
Monetary financial institutions, except for central banks, credit institutions and MMFs	S.1223
Investment funds, except for MMFs	S.123
Other financial intermediaries and financial auxiliaries	S.124
Insurance companies and pension funds	S.125
Central governments	S.1311
Households	S.14
Public organisations	S.15

The analysis of each individual sector can give a clearer view of the sector's role on the securities market and the degree of sector's involvement. Table 2 below demonstrates the amount of securities acquired by each sector over a longer period and related dynamics on the Latvian securities market.

Table 2. Structure of internal government debt holders (residents) (Bank of Latvia 2017: special request)

Residence and sector	Government debt balances (EUR million)						15/10 %
	2010	2011	2012	2013	2014	2015	
Total residents, including:	777.5	695.3	654.5	926.4	981.7	1,036.3	33.3

S.125	201.9	163.1	166.1	318.3	462.3	388.9	92.6
S.1311	0	0	0	0	0	55.0	-
S.14	3.4	3.2	3.5	4.4	4.0	3.5	2.9
S.15	3.9	4.5	5.5	3.1	4.8	6.7	71.8
Total non-residents	18.3	16.8	20.6	40.1	64.9	79.9	336.6
Total	795.8	712.1	675.1	966.6	1,046.5	1,116.2	40

The structure of government debt presented in Table 2 above corresponds to the names of structural elements (sectors) listed in Table 1. As Table 2 clearly demonstrates, at the end of 2015 households (S.14) and non-financial corporations (S.11) formed 3.1%, which is an insignificant portion of lenders. The ability of credit institutions (S.1221) to respond quickly to money supply is evident: they acquired 44%, which is the biggest share of debt securities issued by the government per sector out of the total debt amount.

In the conditions of sound economic growth, non-financial corporations usually invest most of their funds in government debt instruments because it is one of the safest and most liquid types of investments. Contrary to other

income, income earned from government debt is normally not subject to any profit or income taxes. At present, income tax is imposed on deposits in Latvia. On the one hand, this practice could lead to a decrease in bank deposits made by non-financial corporations, thereby directly encouraging the acquisition of government debt instruments; on the other hand, this could cause a decline of investments made by credit institutions in government debt securities. The authors believe that, lesser intermediation on the securities market and, accordingly, a smaller number of intermediaries will lead to larger benefits with respect to households' investments.

At present, credit institutions are the biggest investors in government debt instruments, which is, to a great extent, associated with the legislation encouraging their interest. Government debt securities are equal across the entire European Union, and it is hard to imagine that investors would compare debt securities issued by the Latvian government and the German government. These essential conclusions must be taken into consideration by parties responsible for government debt servicing, and the debt portfolio must be balanced from the viewpoint of both issuers and investors in order to facilitate more equal distribution of borrowed funds among investors' sectors. It is particularly important with respect to internal debt securities.

Money market funds have a certain position on the securities market as investors, but their response to market fluctuations and changes is relatively weak. Accordingly, the investor sector will always be striving to invest a certain share of funds in debt securities irrespective of the current financing needs of the government. In addition, funds may choose the currency of investments. Based on economic substance and the existing practice, undertakings expecting to incur costs in a certain currency tend to make investments in these funds. As a result, investments are made in a money market fund of the currency of expected costs. Average fund investments are dependent on multiple economic factors, but it is essential that they facilitate the development of a country.

Monetary financial institutions, except for central banks, credit institutions and money market funds, chiefly represent savings and loan agencies. This sector is extremely sensitive even to economic circumstances, and fluctuations may occur at any time. Based on an analysis of this sector's investments over a certain period, quite the opposite effect has been identified, i.e., the total amount of securities acquired by residents has grown, while the amount of securities held by this sector has declined. This is clear evidence that, under certain circumstances, participants of this sector will raise an alarm, which would undermine the stability of the country's economic system.

Insurance corporations and pension funds is the second biggest investor in government debt securities after credit institutions. It is connected to the Solvency II requirements and reserve requests to the insurance corporations, but this is not the only one reason. It is known that pension funds by default must give attracted resources back to the customers in quite a long time period after the resources have been attracted. That leads to understanding that much more effective is to invest in local securities, and if there will be crises or other unpredicted events, for the local customers it will be much more easier to understand the reason for the decrease in savings. If they will invest in a country far away from investor, the investors will much more often complain about the quality of the pension fund and its stuff.

Households and nonfinancial institutions are the basement of each economy. From the thoughts of authors the investments of these two sectors should be more than a half of all investments. The credit institutions are just an intermediaries with some function, but these two sectors are the basement of national economy. Financial sector is much more connected to global processes and due to that fact the geographical dislocation of the investment portfolio can be changed much easier. In case the government of Latvia would start to do the communication with the households and nonfinancial institutions by explaining the need for money and the reasons why these sectors should invest, these could be the main investors. Up till now the only attitude from the government was: "If households have money and do not know where to put it, they can give it to the government".

Table 3. Latvian external government debt (Bank of Latvia 2017: special request)

Year	Quantitative external government debt breakdown (mio.EUR)							Total
	Short term			Long term				
	Debt securities	Borrow	Other liabilities	Special drawing rights	Debt securities	Borrow	Other liabilities	
2010.	2,4	0,0	84,5	141,0	833,0	5 051,9	5,3	6 118,1
2011.	2,1	0,0	84,4	144,2	1 020,8	5 364,0	2,6	6 618,3
2012.	1,4	0,0	84,5	140,6	2 860,7	4 163,6	0,0	7 250,9
2013.	9,9	0,0	80,8	136,2	2 605,9	4 142,6	0,0	6 975,4
2014.	5,7	0,0	0,4	144,4	4 691,4	3 234,6	0,0	8 076,5
2015.	0,0	0,0	0,3	153,9	4 867,4	1 881,2	0,0	6 902,8
15./10.	x	x	-99,6	9,1	484,3	-62,8	x	12,8
%								

With the development of saving bond system, there were some evidence of intermediary support. That means, government have made a new special system for household investments but it is more effective for households to put the money in credit institutions and let credit institutions to bay government debt securities on their own.

Currently in the case of Latvia the one who is having account in the credit institution do not know where his financial resources are invested. It is possible that costumer of credit institution could put in his account more resources if he knew where they will be invested. Whit all the resources that are in the credit institution they are acting as they want. The rest of ways of money holding/investing is connected to commission fees, that makes all the other investments not so attractive.

By making analyses on external debt securities, it has grown dramatically. The firs issue of external debt securities took place in 1999 (see Table 3). If the attraction of external resources is analysed from the ways of attraction, the main resources were received from international and regional financial institutions during the crises, with the main goal to stabilize the global financial system. After the crises the debt is re-financed from international institution to government debt securities.

Table 3 represents that at the end of 2010 the biggest part of debt 82,5% was borrowed financial resources and only 13,1% was government debt securities. If there are special circumstances or special offer from international institutions, such proportion is acceptable. In contrast at the end of 2015 borrowed financial resources makes only 27,2% from the total government debt, and government debt securities reaches 70,1% with the trend to increase government debt by government debt securities. That confirms that there is need to make the analyses of government debt securities system and make improvements, because regular costs to intermediaries could be reduced and that can result also to a smaller government debt in total.

If this is analysed from the amount outstanding perspective, then the total amount from the end 2010 till end 2015 has grown for 484,3%. That is almost five times bigger during five years. There is also a connection between amount outstanding and the cost for its regular systemic expenditures to intermediaries and also percentage expenditures. The smaller is the amount outstanding, the smaller will be all expenditures regarding its maintenance.

Methodic

The methodic of the reserch is based on harmonious and compatible scientific research methods. The main part is connected to analyses and synthesis methods. They are widely used in the analyses of government debt flow management and incoming flow in the government financial accounts. During the reserch the current government debt flow management is analused from strength and weeknes point of view, with the goal to improve the effectiveness. Analyticas calculations and empirical reserch is widely based on the Bank of Latvia publicly availabl data and special requests on securities stock and flow. That leads to identification of improvements in the government debt securities flow management.

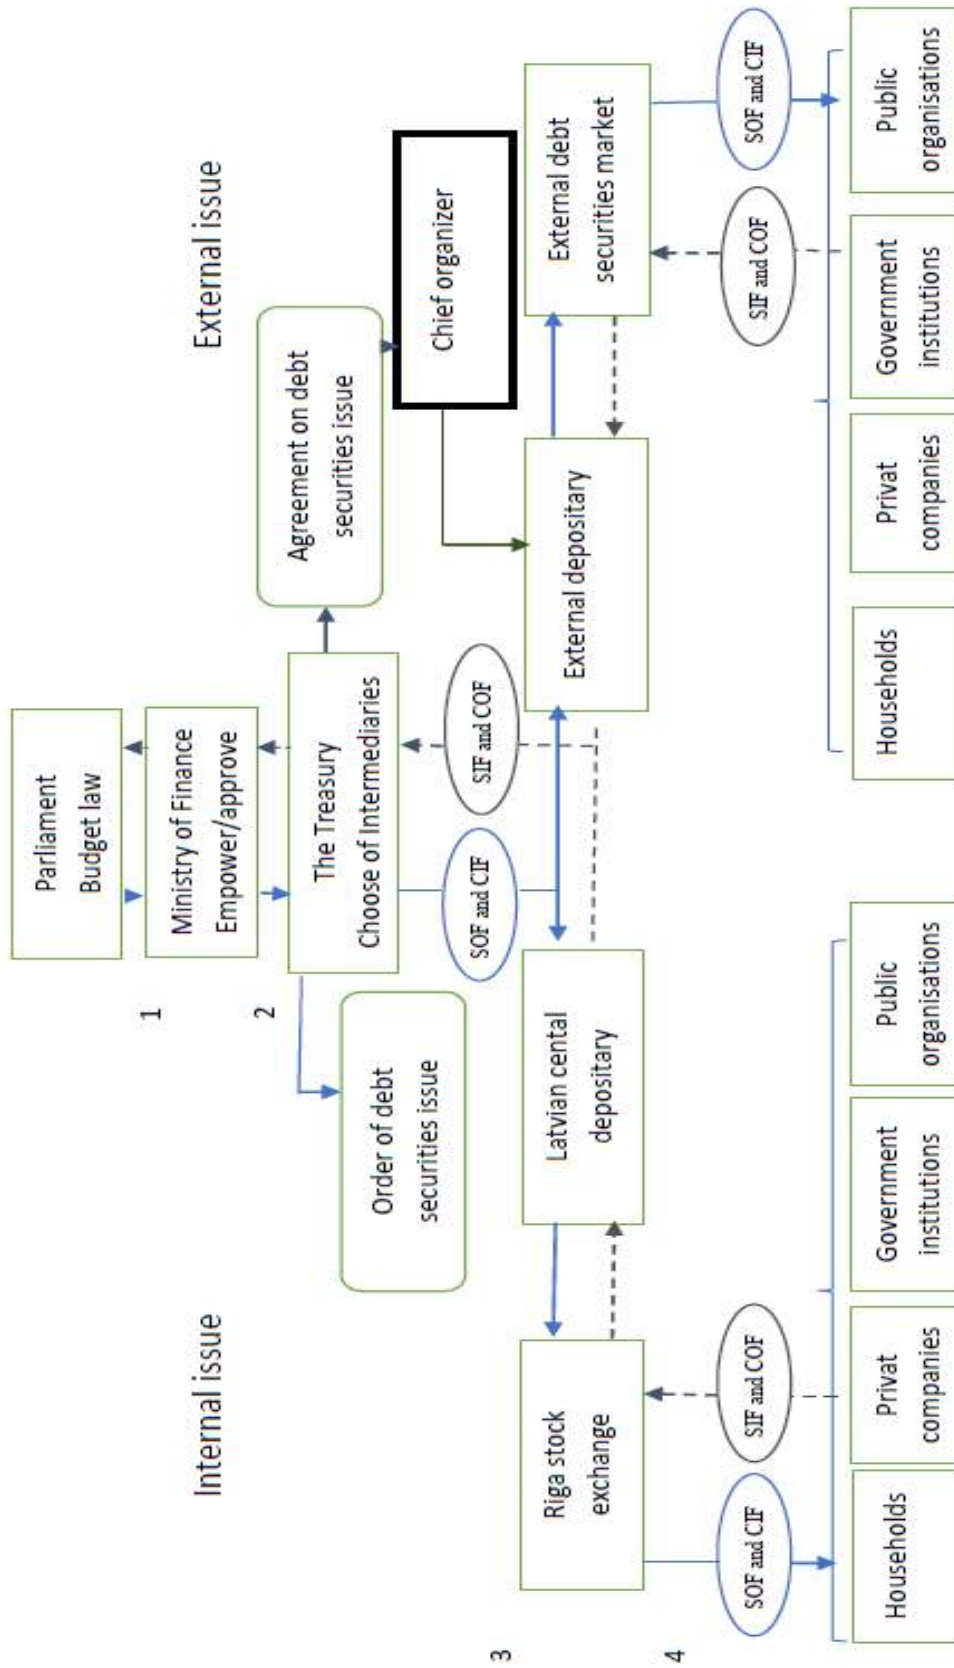

At the beginning the special data requests were sent to government institutions and specific (not published on regular bases) data were received. The data were combined with the publicly available quantitative data. The data were compared and proportions calculated with the main goal to summarise their proportions and what are tendencies. It is important to understand the current trends and as the trends are changing rarely, to suggest the best solution for the government securities flow management model in the future.

In general data analyses is based on quantitative research methods with the main focus on the data flow turnover the flow management model is highlighted with the 4 sub-parts of it. During the analyses of each sub-part of the model, the main attention is focused on its possible improvement and if the sub-part is not needed at all, its substitute. After in-depth analyses author suggests new – more appropriate model for the current situation for Latvia in the field of Latvian government debt flow management.

Findings

In the Chart 1 is represented current government debt flow management model, compiled by the authors to reflect current flow management system. The model is compiled to highlight main weaknesses of the current system and to make in-depth analyses of the possible improvements to decrease expenditures and to substantiate needed expenditures in all government debt flow management, meanwhile the following issues are substantiated not in appropriate way:

- 1) There is need for documental substantiate of the necessity of each issue with the detailed macro economical analyses of the situation in the world and region,
- 2) Documentation must include the country development progress analyses and the growth of European Union assessment, with the prognoses and its evidence.
- 3) Government debt securities possible interest rate analyses, forecast and forecast analyses with the future interest rate changes analyse.

CIF un COF – cash incoming flow and cash outgoing flow;

SIF un SOF – securities incoming flow and securities outgoing flow.

1. chart

The government debt securities flow management model

The model consists of 4 sections:

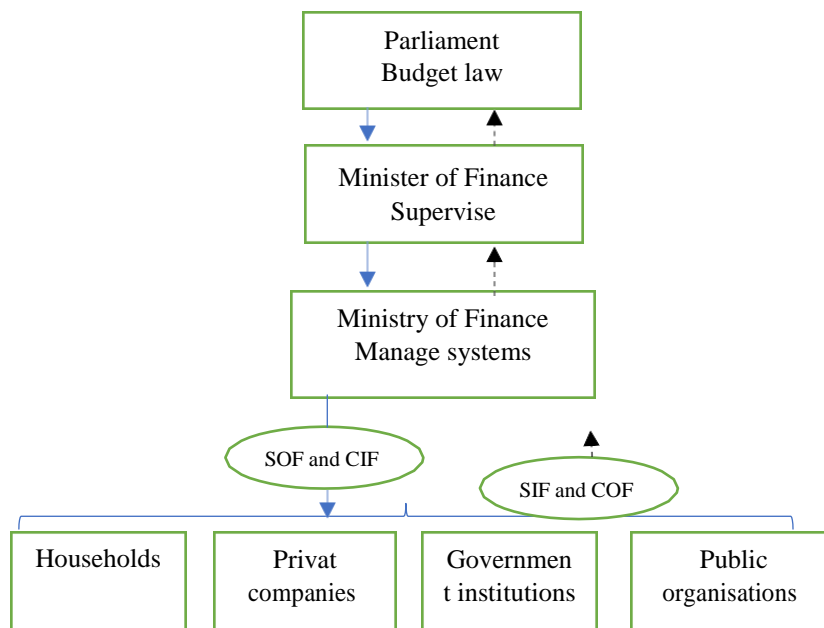

Section I: The parliament has approved annual law on budget that includes the budget deficit for the next year. The Minister of finance is responsible for the fulfilment of this law. The changes in the total deficit amount can be made only with changes in the budget law.

Section II: Minister of finances supervise, control and approve the process of debt, but the technical part of the debt is managed by the Treasury. At the same time, the Ministry of finance is the institution that is directly under subordination of the Minister of finance.

Section III: To start the process of attraction of financial resources, the Treasury must make the analyses of the possible attracted financial resource from geographical (internal or external market), possible amount attracted, the type of debt, the time of issue, interest rate. To do the technical part of issue, the Treasury attracts: i) Latvian Central depository, if the internal market is chosen for the issue and in that case Riga Stock exchange would provide the trade platform, ii) chief organizer of the issue process if the external market is chosen for the issue and external stock exchange would provide its trade platform.

Section IV: The financial resources are received from the holders of securities or intermediaries that provide holding service.

Chart 1 suggested model can be offered and supported only after analyses of external experience. In the Chart 2 are suggested improved model that would decrease expenditures on government debt flow management.

- CIF un COF – cash incoming flow and cash outgoing flow;
- SIF un SOF – securities incoming flow and securities outgoing flow.

1. Chart The improved government debt securities management model

From the analyses of the Chart 1 model it can be concluded that the Treasury is additional institution to the borrowing process. In the case if the Ministry of Finance would make the process of issue, then the Section II of the model would not be needed at all. As the Treasury is fulfilling the Treasury's regulation (The Treasury, 2015) then the reverse connection to the Parliament is not fulfilled.

In the case of Latvia till 2001 the securities settlements and payment services were provided by the Bank of Latvia, but from 2001 it is provided by private (non-residents controlled) company – Latvian Central depository. The Treasury is paying regular commission fees for this service.

As it was previously mentioned, borrowing and increase of government debt is more effective if it is done for the reason of long term investments, but it is not suggested to borrow to cover current day-to-day expenditures. But in the case of Latvia the growth of external debt is directly connected to day-to-day expenditures. That is the reason why it is important to increase internal sector of investors and in the long term to keep external debt as small as needed to continue the system of rating and keep ad hoc opportunities for the resources when there is such ad hoc need in the economy, but internal resources are not enough.

By analytical analyses of the publicly available data sources about government payments as a commission fees no individual data on each service provider is given. As it is seen in the Chart 1, there are 5 groups of service providers – Latvian Central depository, external depositories, Riga Stock exchange, external stock exchanges and chief organizer.

By seeing the model from flow management effectiveness point of view, the chief organizer can be replaced by current Treasury specialists, and the same is with depository and stock exchange providers.

As of 2016 Latvian stat Treasury started to publish information on additional costs to government debt securities that are in parallel to percentage payment. The costs are payment to intermediaries that gives services to the Treasury and as it can be seen from the improved model – such costs would be reduced.

4. Table Government debt service expenditures (The Treasury 2015:12)

Type of expenditures	2015.	2016.	16./15. %
Percentage expenditures	384,9	261,0	-32,2
Regular expenditures	2,4	2,9	20,8

From the data included in the Table 4. there can be made a conclusion that from one point the percentage expenditures, that are connected to international financial markets, are decreasing. From other point the Regular expenditures, that are connected to payment to financial intermediaries that provide infrastructure for issue, maintenance and redemption of securities, are increasing. If the improved government debt securities management model would start to function, the regular expenditures would decrease and that would lead to lower government expenditures in the future.

Results, Conclusions and Recommendations

From the analyses of investors perspective of government debt securities, the main investors are Commercial banks. At the same time Households and non-finance institutions – the main sectors that government should work for- has invested relatively small part of total amount outstanding. That leads to conclusion that government institutions up till now have not made their attention to opportunity to attract financial resources from households and other participants of internal financial market.

After analyses of Latvian external debt structure it is shown that in the end of 2010, government debt securities from total amount outstanding were only 13,1% but in contrast in the end of 2015 government debt securities were 70,1%. That confirms that the government debt in step wise approach (step by step) is kept in government debt securities form. To make the turnover and management of Latvian government debt as cheap as possible, there is need to improve government debt flow management model.

After the analyses of current Government debt flow management rules it shows that in the current process there are intermediaries, to whom are payed intermediaries fee, that are not identified in the Treasury reports. These intermediary services can be taken over by the competent government institution. That would decrease regular expenditures on government debt management and would increase effectiveness of government debt securities flow management.

There is need for changes in the legal acts that structures responsible institution for government debt management from the Treasury to the Ministry of finance, and changes in rules of sale, settlement and maintenance system of government debt securities.

Abstract

Objective: The aim of this research is to investigate the effect of playing soccer for a long time in professional soccer players to sole contact area.

Study Plan: 15 football players (22,65 ± 2,6 years, 174,2 ± 5,6 cm height, 71,2 ± 4,8 kg body weight, 23,21 ± 1,4 kg / m² BMI) who play in the Sports Betting Super League teams, the top league of the Turkish Football Federation, who has no problem on his foot and 15 male volunteers (22,6 ± 1,6 years, 177,3 ± 5,4 cm height, 72,1 ± 3,3 kg body weight, 23,01 ± 1,9 kg / m² BMI) as control group was included in the survey. Professional footballers' age of starting football was determined as 9 years old. It has been determined that there is no anatomic disorder or discomfort in the foot, waist and knee areas which will affect the results of the foot contact area analysis in the study groups. EMED-SF (Germany) plantar pressure analysis system was used in the study. Statistically significant differences between the study groups were examined using the non-parametric Mann-Whitney U test.

Findings: According to the results of the research, there was no statistically difference between the experimental and control groups in terms of physical characteristics. However, Significant results were found at (0.01-0.05) level in the beginning and grand total of heel medial, heel lateral, 1.2.3.4.5 metatars in the maximal force comparisons applied to the right and left foot contact area and the floor. Furthermore, it was determined that the values of the control group were higher than the values of the experimental group.

Conclusion: As a result, it can be said that to make compulsive movements of the sole causes to reduce the foot contact areas and the force applied to the floor by the sole at long training and games from the time the players come from childhood to the professional football player. As a result of the training of the footballers, especially at the beginning of the metatars on sole, it has been observed that it causes changes in terms of contact and applied force to the floor and in consequence of this, they use the different zones in the sole more actively.

Key words: football, foot, sole, training

Introduction

The age of starting to sport is approximately 6 in the World (Coté, Horton, MacDonald, & Wilkes, 2009), while the age of starting to football is between 5-12 for elite and non-elite sportsmen.. (P. R. Ford, Ward, Hodges, & Williams, 2009). With the number of 265 million members, players that play football systematically, football is one of the most popular sport in the World. While 4,1% of the World population are playing football, approximately, only 0,03% of them, nearly 110000 sportsmen, are professional male football player. (Kunz, 2007). In addition to this taking to up level and to protect that level of the players', that reach to Professional level, tactical adaptation, technical truths, physical demands and speed conditions are important for their further Professional career. (Huijgen, 2013). For this, sportsmen have to part much more time to trainings and matches. It is estimated that elite young football players are making practice approximately for 6500 hours until their 18 ages. (Ward, Hodges, Starkes, & Williams, 2007). It is defined that, for the last 10 year, top level Professional football players are making particular practice for football, for 6328 hours, while national Professional football players are making particular practice for football for 5220 hours. (Ward, Hodges, Starkes, & Williams, 2007). It is also examined on the analyse that the average age of the Professional football players in the whole Europe is 25.8. (Besson, Poli, Ravenel, Poli, & Ravenel, 2010) Only 6% of them are under 20 years old, 11% of them are above 32 years old and 83% of them are between 20-31 years old. (P. R. Ford & Williams, 2011) The weight on footwell is a major factor for a sportman's performance, considering how much time this Professional sportsman spares for training, and load intensity in trainings.

The foot is the most exposed part of the body to force, since it carries all the weight. It has been seen that the foot pressure measurements started from the 1980s when the literature was examined, there also has been studies concerning foot biomechanics, diabetic foot, orthopedic surgery and orthosis shoe modifications. External loads has effect on foot pressure. (Özyürek, Demirbüken, Tosun, Okyay, & Angın, 2013) A healthy load distribution

depends on the ability of handling the stabilization and mobilization task together. (Sammarco & Hockenbury, 2001). It is known that the ankle plays a very important role in controlling postural stability and walking. In addition to the task of transporting body weight, the foot, which is the primary effect in ensuring balance, has undergone significant mechanical changes during walking. (Cote, Brunet, II, & Shultz, 2005)

With the developments of the current technology, it has been common that the research on muscle-skeleton system and the diagnosis in clinic practice, planning of the treatment and examine to treatments results and the using of the walking analyses to examine. (Simon, 2004). As a complementary of the walking analysis planter pressure measurement (pedobarography), during walking, ground reaction force can be measured pretty sensitively as pointal. It makes that possible to compare of the pressure and evaluate of t,he feet that touches the ground as dynamicly and in objective criterions With the frequency for the clinic, it is used to evaluate that the feet mechanic is beening corrupt and as a result of this the pathologies' coming up on the footwell. (Hurkmans, Bussmann, Benda, Verhaar, & Stam, 2003).

Besides clinical use of the walking analysis, however, many intraarticular biomechanical studies have been carried out by making kinetic and kinematic measurements and adding pressure measurements to them In particular, studies on walking mechanics of the lower extremity, knee, hip, ankle biomechanics and mechanics of reconstructions applied to these joints are increasingly being studied. Especially today pedobarography is widely used for researchig normal foot mechanics. (Kanatlı, Yetkin, Songür, Öztürk, & Bölükbaşı, 2006)

Pedabarographic measurement is an objective and functional technic which measures the plantar pressure and also can be used in foot analysing. In the static and pedabarographic estimation of foot, maximal pressure measurement of six parts (back feet, middle feet, inside-middle-side of the front feet and fingers), maximal pressure values on the hind paw and back feet(total pressure on the foot, percentages of pressure values on the hind paw and back foot are obtained by total contact area and percentage distribution values of total contact area for hind paw and back foot. The lenght of the part which is in a contact with ground during the movement, pressure chagement in the position of varus and valgus, the factor like fingers functions are extracted in the dynamic measurements.(Tuna, 2005).

It is estimated that the contact to ground of the footwell is always in different loads and different types so that will make some changments on the footwell. Especially the performance of the player depends on even the type of the shoe. So that, it makes more important to makefirm of the effects of the football on the footwell, for comfort and healthy ways. The aim of this study is also to explore the effects of the football on footwell.

Material and Method

This study; the consent that T.C. Gazi University-Faculty of Medicine Local Ethics Commission's gave with the date of 25th February 2008 and with decision of 074 without drug for clinic studies has been done. All of attendants were informed with oral and written about purpose of study and evaluation methods to be applied. Approval forms were taken from all of attendants. Fifteen players ($22,65 \pm 2,6$ yaş, $174,2 \pm 5,6$ cm boy, $71,2 \pm 4,8$ kg body weight, $23,21 \pm 1,4$ kg/m² BMI) who play in Super League teams which is the highest league of Turkish Football Federation and fifteen volunteers($22,6 \pm 1,6$ age , $177,3 \pm 5,4$ cm height, $72,1 \pm 3,3$ kg body weight, $23,01 \pm 1,9$ kg/m² BMI) for control group counted in to the study. It has been specified that soccer players approximately start the football at the age of nine.

The participants who had lower extremity injury during last 6 months, supine hypotensive syndrome, gestational diabetes mellitus, rheumatoid arthritis, hypertension, foot impairment, foot or ankle operation and neurologic dysfunction are not included to research. The participants who had dizziness, nausea on the day of research are not included to research and participants are tested out pain. None of the participants have the symptom above. Right leg is dominant extremity for all participants. Right leg is dominant extremity for all participants. To specify

the dominant extremity all participants are wanted to hit the ball and the extremity they choose to hit to ball specified as their dominant extremity.

The pedobarographic measurements of the foot volunteers were performed using the plantar pressure analysis system EMED-SF (Novel GmbH, Munich, Germany) in the walking laboratory of GÜTF Orthopedics and Traumatology AD. This system is mounted on a 7x1 m wooden platform and includes a platform of 44.4x22.5 cm which is covered with thin skin and has a sampling rate of 71 Hz and two receivers in cm². Participants walked freely before pressing the foot pedobarogram in the 7-meter walking band, and the region where the measurement was made is not specified. Measurements are measured with bare feet collecting the measurements of dynamic and static for each foot.

Separating to 11 zones, it is evaluated in these ways that each zones' contact area (cm²) maximal power (N/cm²). Footwell, called mask, (image-1) Taking each foot apart and evaluated two datas' average.

Picture-1: The view of foot mask in pedobarography (M01: Medial Heel, M02: Lateral Heel, M03: Medial Foot, M04: 1st Metatarsal Head, M05: 2nd Metatarsal Head, M06: 3rd Metatarsal Head, M07: 4th Metatarsal Head, M08: 5th Metatarsal Head, M09: Thumb, M10: 2nd toe, M11: 3rd, 4th, 5th Toes)

Statistical Evaluation

The analysis of the data has been done in SPSS 18 package. Averaging two measurements of subject and control groups; if there is a statistically significant difference among the averages or not, the Mann Whitney U test. In the measurements 95% confidence interval and $P < 0.01 - 0.05$ relevance levels have been accepted. **Findings:**

Totals of the left and right feet that belongs to football players and control groups. And the differences between the averages of the comparisons of the 11 contact area maximal power, totals of the left and right feet, medials and laterals of the left and right heels, right feet 1,2,3 left feet 4. and 5. the results belong to the metatars heads. $0.01 - 0.05 > P$) are meaningful.

Discussion

The human foot has a complex structure containing 26 bones and more than 30 joints There are 3 arches of foot and they show more structural change than any other part of the body(Standing,2008).Contact area and pressure distribution of foot are affected by many factors such as anatomical structure and VKI(Yilmaz,Erdeo,Tat,&Alp,2017). It is not seen as important statistically that the difference between age,height, weight and body mass index of the ones participated in research.This situation indicates that there is no physical property affecting sole of foot of sportsmen except football.

It's commonly known that increased force on foot may cause changes on stance, joint movement gaps and plantar walk patterns.(Henning, Staats, & Rosenbaum, 1994). And this research indicates the differences on walking characteristics between football players and the other people. It's been thought that football changes sportsmen's walk patterns because it's a branch which is chosen in pre-adulthood. Tuna's and his friend's(2004) research on 50 healthy adolescents shows that static measurements indicate high rates on heel, while dynamic measurements indicate high rates on toes.(Tuna, Yildiz, Celtik, & Kokino, 2006) Considering these results we can assume that during different activities, different parts of our foot gain priority. In a research which is done on 25 female football players aged averagely 18,80 +- 2,2, the effect of football to foot's contact points with ground is researched. It's found that it caused significant changes on left foot's 1st and 2nd metatars tops, and right foot's 2nd and 3rd metatars tops. (Uzun, Kaya, Aydos; Kanatli, & Esen, 2012) But for the Professional football players in our research, total of right and left foot, heel medial, heel lateral, 1,2,3,4th metatars tops are all effecting the both feet. We can see that football players's findings on "contact with ground" points, are less than control group's findings.(Table2) This must be understood as football players have this difference because of their special trainings on specific moves and body parts. Especially when female football players's feet are observed, we can see that female players use the back of their heel more actively than male players. And the most important reason for that is male players do their trainings on turf while female players do it on synthetic grass. And again in another research, significant results were found between 17 male football players who were challenged with slalom on turf and synthetic grass, observing the changes of effect on their feet. It's found that playground affects the pressure dispersion on feet and the highest rate of relative load happens on synthetic grass, on medial foot's front parts. And most of the injuries happen at turfs. Stress fractures, Jones fractures which are results of repeating eversion movements usually happen in turfs.(K. R. Ford et al., 2006)

Researches focused on the relationship between shape of movements, kicking the ball, preferred shoes and injuries and disorders, showing there are considerable intersections.(2004) Eric and Eils did some research and found that specific trainings do change pressure dispersion on footwell but no relationship was found between playground and pressure dispersion on foot.(Eils et al., 2004).

In comparisons of players's contact points and their maximal forces, differences were seen on total of feet on both two footwells, heel medial, heel lateral, 1,2,3rd metatars tops's areas.(Table3). Football player Robin M. Queen (2007) and his friends did some research with speed tests observing pressure dispersion on footwell while barrier innerside pass, outer side pass, and accelerating trainings were performed. Research's results were, while barrier inner side pass, inner side of footwell is under more pressure, outer side pass, outer side of footwell is under more pressure, and while accelerating, middle part of footwell is under more pressure. (Queen, Haynes, Hardaker, & Garrett, 2007) In pedobarographic analyses on 23 rugby players and 17 healthy people, M. Rippani and his friends explained that pressure on rugby players's footwells were considerably higher.(Ripani, Ciccarelli, Morini, Riccardi, & Michielon, 2006) In the research which focused on the effect of female football players's contact to

ground points to their maximal forces, right foot 2, 3rd metatars tops and left foot total indicates a great deal of change on 3,4,5th toes, 2,3,4th metatars tops .(Uzun et al., 2012),

These researches demonstrates that changes in sole can be caused by several reasons. It is seen that in the force professional male footballers applied to in 11 areas both their contact area, and also in their maximal force values, while only the 2nd finger had values above the control group's values, in other all parameters they had lower values. This quirky situation can be thought as a reason of force application into the ground to use this area more properly or for greater speed development.

Result

As a result, athletes from childhood to professional footballer currently playing for time until the long-term training and matches the soles on their feet touch the ground moves, compelling, and the soles of the feet by the force is applied to the floor, consequently, it can be said that decreases the amount of time their feet touch the ground. Football players as a result of their training, especially at the beginning of the soles of the feet touch the ground and applied to the available force is caused by changes in terms of the different regions in the base of the feet with more active use. It was observed that this result. However, one of the sports that require explosive force branches is considered to be very repetitive and short distance traveled in football often composed in the soles to force running gathered since the metatarsal heads where the foot area reduces the duration of staying.

How to Choose, Use and Produce Bilingual Textbooks? Impact Strands and Support Strategies to Multilingual Education in the Post-Soviet Countries

Ligita GRIGULE¹

¹Res. University of Latvia, Faculty of Education, Psychology and Art Email: ligita.grigule@lu.lv

Abstract: The paper is concerned with one of the most notable aspects of the educational reform – teaching aids which are relevant during implementation of bilingual education, especially important in the post-Soviet education environment. The article characterizes post-Soviet context of implementing bilingual education and the special role of teaching/learning aids in this context. It also discusses research done on this topic. The article also describes and evaluates teachers' needs and various solutions adapted by the countries to meet teachers' needs. In conclusion, some general recommendations and examples of good practice are offered as practical tools for learning material developers.

Keywords: bilingual education; teaching/learning aids; post-Soviet countries.

Introduction

Research on the quality of teaching aids as an educational medium is traditional and topical, or traditionally topical. The paper aims at highlighting the queries for teaching aids and various immediate solutions applied in the post-Soviet states meeting the multilingual education implementation needs. Comparative education research has widely recognized the close link between changes in politics and education processes (Silova, 2006; Garcia, 2009). Hornberger (2009) points out that socio-historical positioning, geopolitical forces, and language ideologies interact to sustain different kinds of bilingual education policies throughout the world. In the case of the research subject – the common characteristic of introducing bilingual education in the countries of Eastern and Central Asia is the historically long-term presence in a common ideological space and the socio-political situation after the collapse of the Soviet Union (USSR) in 1991. Social science research calls the last decades of the last century the “democracy’s third-wave” (Huntington, 1993) and claims that the global socio-political and economic changes after the demise of state communism and the self-proclaimed victory of capitalism around 1990 are unthinkable without concomitant ideological changes. Dominant political and media discourse and hence also public opinion has undergone sometimes dramatic transformations (Collins 1993; Hollander 1992; Minogue 1993; van Dijk 1995). Sociolinguists state that changes in political discourse in the USSR brought about the transformation of political and linguistic reality in the USSR and its allies (Liepa, 2010). After the restoration of independence, almost all former Soviet states which (historically or as a result of the USSR policy) had practically been multi-ethnic faced the task of designing and implementing state policy of languages. This arose owing to the language policy implemented by the Soviet powers which facilitated domineering position of one language – Russian. As a result, it led to the formation of asymmetrical bilingualism. One of the objectives of education reform was to review the traditional classification of schools – according to ethnicity/ language. Thus, there were minority schools with respective learning/teaching language and schools where studies were conducted in the Russian language. An initial organizational strategy which characterized all the post-Soviet states was abandoning textbooks designed in the Soviet times, also in other states and using books developed in the respective countries to ensure all students learned the same content. As to the language, the necessity to have textbooks in students' mother tongue arose. The first aid observed in all states with complex ethnic composition was the translating of textbooks in minority languages. The added value of translating books was the opportunity to use new, modern teaching aids to direct linguistically diverse pedagogical communities to unified pedagogical approach (Lazdina, 2007). Its pitfall was the often inadequate translation which leads to exaggerated argumentation and ‘threw the baby out with the bathwater’ (Wigglesworth-Baker, 2015). It was particularly relevant when implementing bilingual education – the challenge posed by textbooks was ideally not only to ensure information transfer in the language understandable to all but also to facilitate language acquisition. This led to the concept and methodology of content and language integrated learning as well as selecting and introducing values in a curriculum.

Social sciences give much attention to the very concept of the post-Soviet – whether we are still part of post-Soviet and what the concept of post-Soviet means in the context of education. Another issue refers to educational media – textbooks taking into consideration that their authors – teachers have grown up, received their

qualifications and worked in the Soviet times i.e. in the atmosphere of their ideology and practice and therefore they possess the linguistic knowledge, lack of knowledge, and attitudes. Firstly, it refers to the inherited habits or characteristics and values only typical of people (teachers) who themselves or their parents are connected with the Soviet times. In the wider educational context, the term 'post-Soviet' is linked with shared traditions, customs, and behaviors which are displayed in textbooks and transferred via educational media (textbooks). The context of professional – bilingual education, the term 'post-Soviet' refers to a definite areal and its pedagogical specifics – general teaching approach including an understanding of why and how to teach languages and what it means to 'know a language'. The Soviet approach and system which assumed that textbooks were the exclusive means of knowledge transfer still remain valid in the post-Soviet space. This has the respective consequences also in the context of the necessary scaffolding strategies and needs formulations. Implementing bilingual education in social (policy and professional) discourse forms a vicious circle – implementation of bilingual education is not possible due to the lack of teaching aids which have not been developed as the necessity to design books has not arisen – there is no bilingual education. Professor Irina Maslo (the University of Latvia) states that teachers 'demand for teaching aids' indicates their insecurity to implement changes. For example, starting bilingual education in a school of the Armenian language, a complaint about the lack of textbooks in Georgian was received from a ... sports teacher. Conversely, teachers' involvement in using and developing various materials can be considered as a sign of teachers' adaptability and criteria for evaluating the effectiveness of the implemented changes, i.e. multilingual education. (Tyack, D., & Cuban, L. 1995; Grigule, 2009) Reflecting on two decades of post-socialist transformations, and highlighting the political nature of the transformation processes and the uniqueness of historical, political, social, and cultural contexts of each particular country, scholars portrays post-Soviet education transformations as complex, multidimensional, and uncertain processes and reveal that education systems in Central Asia responded to the rapidly changing political, economic, and social environment in profoundly new and unique ways (Silova, 2006). The author's viewpoint on the post-Soviet consolidates although after the collapse of the USSR, economic and political development of the states has differed, the Soviet ideology which the states were subjected to gives opportunity **both** to track basic common features **and** capture various and creative solutions in a context of massive, intense confrontation with the task of initiating the bilingual education. **Further**, making conclusions and basing on the common features encourages acting within 'the zone of proximal development' by implementing experience transfer and exchange and offering guidelines.

Method

Author's conceptual framework of the study is derived from transformative approaches to pedagogy emphasizing the relevance not only of transmitting the curriculum and constructing knowledge but also of enabling students to gain a broader critical insight into social realities and power relations. (Mezirow, 2009; Lin 2017; Cummins, 1996, 2016, 2017). The empirical material for this study is based on five data sets: teaching aids developed for bilingual education in Latvia in 1998 – 2017, teaching aids developed cooperating with international organizations and local NGOs in Georgia, language textbooks and teaching aids in Ukraine and teaching aids adapted for multilingual education in Kirgizstan. Teaching aids for bilingual education are examined from three aspects: culture aspects, teaching approach and language issue. Book analysis is complemented with an overview of research was done on textbooks in the context of bilingual education and interviews with experts and professionals (publishers, textbook authors, and users). Multilingual education teaching/learning resources in post-Soviet space have been reviewed by questions - what is already available, what is still missing, what should be and what should not be expected? What characterizes teachers' initial understanding of what textbooks are necessary? Taking into consideration teachers' initial understanding, what false friends emerge? What are examples of good practice?

Findings

A sustainable implementation of multilingual education is reached by a coordinated work in different education levels. Van den Akker, Fasoglio and Muldera (2010) offers a curricular perspective both in a conceptual approach to educational problems as well as in how to address concrete development activities for plurilingual and intercultural education and describes this as supra (international, comparative); macro (system, society, nation, state); meso (school, institution, program); micro (classroom, group, lesson); nano (individual, personal). When discussing school books, such issues as ensuring a thorough distribution are a *macro* level task. Focusing attention on schools i.e. *meso* – *micro* level, there are three groups to look at: **content, form** (teaching approach), **and language**.

Cultural aspects in textbooks: The problem with textbooks for minorities is set by Jim Cummins (2017) suggesting to consider not only pedagogical goals relating to the teaching of English within CLIL but also our overall pedagogical goals with respect to developing students' ability to think critically and creatively about broader social issues. Textbooks, particularly language textbooks carries values with the potential to communicate implicit and explicit political messages. A common problem is formulated in the UNESCO Guidebook on Textbook Research and Textbook Revision (1999): recommending to distinguish between 'state-building' and 'nation-building' concepts and to place more emphasis on equal rights and responsibilities of all citizens irrespective of their ethnic identity. Researchers draw attention (Silova, 2006) that, with a simplified understanding of integration mechanisms, post-Soviet textbooks addressed to minorities are intensively teaching about the country's history, geography, cultural values and customs of the titular nation, resulting in the creation of an environment in which the student does not see himself. For years, culture teaching typically looked like a monologue from a representative of one majority culture about particularity their own culture. The old approaches to the culture teaching were no longer adequate to society in which learners should not treat as travelers, visitors but as equal citizens in the society (Grigule, 2011). The findings of the study done in Latvia indicate that social interaction between ethnic Latvians and minorities is poorly reflected in textbooks (Krupnikova, 2004:90), that minorities are underrepresented in Latvian-language textbooks and Latvians in Russian-language textbooks, and that the information space of Latvian-language and Russian-language textbooks is as separated as one of the Latvian and Russian –language media. Similarly, in Georgia researchers find that aspects of the development of intercultural competences are not reflected in national curriculum of Georgian language and literature. Given the spirit of the curriculum, development of intercultural competences is important for non-Georgian students, as it is widely presented in the curriculum of Georgian as a second language; within this very context it is not important for Georgian-language speaking students, as we read nothing about intercultural competences in the national curriculum of Georgian Language and Literature which is designed for Georgian schools (Tabatadze, S., & Gorgadze, N. (2013:7). UNESCO Guidebook on Textbook Research and Textbook Revision also warns that the production of single textbooks for different linguistic communities as well as simple translation can also present difficulties by inaccuracies in the translated versions and cultural bias in some of the illustrations and content matter. Recommendations for Ukrainian educational policy strongly recommended to rethink, to re-evaluate the existing practice that Ukrainian as second-language textbooks is created for each minority language separately. In addition to economic exhaustion, the content does not use the opportunity to represent the multinational society in one training device. New approach to teaching culture became visible in Latvian as second language textbooks at the end of the 90s: by researching and including interesting age appropriate content. For the first time characters were not only called by typical Latvian names. Writing a textbook for Grade 6 the authors together with the Publishing house announced a competition for textbook design. Minority school students were asked to send in interesting photos on different themes. That way minority school children literally "came" into textbooks with their life and interests. (Grigule, 2011).

Language aspects: One of bilingual education base issues is how should the target /two/three languages be allocated in bilingual schooling, becomes specific with regard to textbooks and other teaching and learning materials: In what language or languages should the text-book be? What kinds of books are recommended for successful bilingual education? The research has following fixed solutions:

Two text books with the same content: Following the teacher centered, transitional approach educators conceive the text book as teaching content media and conclude that if the book is in a non-native language, the pupil will not understand the content, hence needs to be given a translation. This type of solution could be observed in Moldova, (Grigule, 2012). When starting the bilingual education pilot project the Ministry of Education gave the pilot class a complete set of text books in two languages. This is quickly done if the national education is organized in multiple languages of instruction i.e. it does not take up much financial resources or time. International recommendations (Grigule, 2012) encourage rethink that effectiveness of such a model when it comes to pupils motivation and cognitive development. Metaphorically speaking, only a hungry cat will go looking for food in a labyrinth. Most pupils who have access to school books in two languages will choose to read in their native language and they will lack the interest to read the same information twice. A meaningful use of parallel texts would be literary texts, especially lyrics, high-quality translations or technical texts with the task to pay special attention to terminology.

Terminology (translating) dictionaries: Teachers who were enthusiastic about bilingual education looked for solutions themselves. Each country gets their own teacher made terminology vocabularies these vocabularies are usually just nouns with translations (1 meaning). Modern day CLIL methodology focuses particularly on functional approach in general and subject-specific language demands, that goes over the terminology lists but also includes: Cognitive Academic Language Proficiency (CALP), Interpersonal Communication Skills (BISC), and language of learning activities and instructions (Cummins, 2016, Bertaux, et al. 2010). These vocabularies are usually developed by practitioners and are often criticised by scholars, particularly linguists. For example, in Crimea linguists strongly insisted that these vocabularies are not called terminology vocabularies. A positive

example is a functional phrase and basic terminology vocabulary for mathematic developed by a Ukrainian publisher ВУК (Гудзик, 2015). This idea was also adapted in Kirgizstan.

Specially designed text book for bilingual education in two languages: Dual language textbooks were initially developed by the team at Riga Classical gymnasium who is one of the beginners of bilingual education in Latvia and today is well known bilingual education center in post-Soviet space. The team of authors from this school has developed text books and work books in mathematics, natural science etc. The schools' proactive and creative action should be acknowledged. However wider use of textbooks turns out problematic due to initial lack of teacher-book and teacher training component. These types of text books should be accompanied by not only a strong teacher training component but also positive, professionally appropriate, enthusiastic attitude as well as pedagogical excitement and an openness to experiment. The method of developing a text book in two languages is being used in Georgia which is an important post-soviet example of authoritarian bilingual education implementation. Faced with a situation of bilingual education implementation being hindered by teachers' low language skills, Georgian education policy leaders decided to implement the requested minimum of 30% Georgian through text books. In the books published first, the translated parts were separate units that according to monitoring were skipped during teaching or were summarized by one pupil (language competent) and re-told to other pupils. In order to further challenge the teachers, there were experiments with implementing the translation within paragraphs or even sentences. Due to international consultant work, further recommendations were implemented. In 2010 those recommendations were more tended to please both sides without causing much trouble. Going into the 21st century of language acquisition, which is characterized by translanguaging or code switching, the proposed recommendations are worth rethinking.

Textbook in one language, and additionally designed workbook: This model includes both a textbook in the main language of instruction (native language) and a textbook in the target (second) language. Using an already existing text book in post-Soviet space is first and foremost dictated by the available financial and human resources. Schools have the ability to choose the base language of text books by factoring in their pupil language skills. Teachers conclude that books that are made for native language speakers are not appropriate for the parallel class bilingual programme pupils because the language is too complex. In the long run, this should signal the authors to re-evaluate in general the text book content that is full of unnecessarily complex texts and rather focus on diverse forms of information perception and processing. Using lower class text books of the same kind is not recommended because language limitations do not reflect academic limitations. Minority school pupils are more than capable to learn and should be taught general education content. Teachers i.e. practitioners, are very involved in text book development but there could be more cooperation with schools when it comes to teaching material development and exchange. Work books and extra materials could be developed for electronic use, thus they can be adapted to individual or class needs. In Latvia. the Latvian Language Agency implemented a special programme (2010) for teaching and professional development of methodology resource authors. Furthermore, there is a wide range of electronic teaching resources available on the agency's website.

Results, Conclusions, and Recommendations

The primary demand for textbooks in post-Soviet countries is influenced by dominant teaching - learning approach, teacher linguistic knowledge i.e. understanding of the language structure and non-professional but personal- civic attitudes towards diversity and the goals of social cohesion. The hypertrophic role of textbooks in post-Soviet countries is ambivalent: lack of textbooks is a significant impediment to the introduction of bilingual education, but the high dependence on the textbook is also a potentially powerful tool for implementing the reform. The textbooks can visualize and shape the new learning approach. A textbook can become a powerful teacher training tool.

Assistance on the Teaching Materials and Supporting Resources development: In the course of the introduction of minority education and bilingual education, post-Soviet countries have received financial and intellectual support from a wide range of international organizations (Lerhis, 2007, Wigglesworth-Baker, 2015) International experts have indicated that there are not many examples in the world of special textbooks created for bilingual education since the needs of students studying different bilingual education models are different. In this regard, the target groups are small and the creation and publication of books are an expensive pleasure. In order to support teaching in the second language, most often there will be no resources (time, financial, human) to create special textbooks. Attention should be paid to the education of authors, the involvement of teachers-practitioners, and school cooperation in order to create additional learning resources, especially focusing on information technologies. According to the bilingual method, one must rely on the development of the student's active teaching, the use of interactive methods, cooperation. This implies the need for entirely new materials, the awareness of which needs to develop in the multilingual education implementation process. It is recommended

to create visual aids with comments in several languages- it is economical, increases the prestige of the target language and will accompany the positive attitude towards multilingualism. International experts have recommended to get acquainted with samples of multilingual teaching/learning resources developed in neighboring countries, it is suggested to organize training sessions for teaching/learning materials developers and encourage joint language and subject teachers teamwork and cooperation between schools in the field of joint development and exchange of training materials. It would be necessary to develop informative materials for parents (questions and answers, opinions of people who are popular in the local community about bilingual education, positive examples of multilingualism. The enclosure of the Second language in a textbook should be:

a) **Motivational:** There is a saying that “only a starving cat will look for food in a labyrinth”. A text which appears in a book in the second language may cause a struggle for the reader. Therefore, it has to be interesting enough to attract the reader’s attention. For example, the text could provide information considering a natural phenomenon, an exciting discovery, modern technology or an important personality for the students in sports or music. The text could be operationally significant. Without understanding the text the reader cannot complete the next task, solve the rebus.

b) **Functional:** The reader will try to read and understand a text that provides him with a positive result. These could be, for instance, instructions on how to create a new gadget or cook a delicious meal.

c) **Developmental:** The reading material should not simply duplicate well-known information neither by its contents nor its structure. It should provide the development of both - student’s academic knowledge and language skills. Considering the differences in the alphabets and the fact that the reading skills for the second language are not that well developed, it is suggested that a slightly larger font size should be used for the text written in a Second language.

d) **Presented in meaningful pieces:** At least one paragraph but preferably whole text or unit; and in a growing amount reaching a total of 20 – 30% of the text-book. The translated texts should come in greater portions that would add up to approximately 30% of the text book, however, this 20 – 30% should not be interpreted literary in the range of a page, paragraph or a sentence, but considering the whole textbook. The amount of these texts might increase throughout the book, for example, the first chapter may enclose only a few sentences in the second language but in the second part of the book a whole chapter might be written in the second language. The fragment in the second language must be long enough to show the functionality of the second language as a system. For instance, it can show the placement of the verb in the sentence, the usage of pronouns, forms of addressing people, style and appropriate vocabulary, etc. Code switching too often will lead to a situation when the student does not develop and understanding of the system of the target language, but will remain the basis of the first language system, that will be accompanied by the vocabulary of a Second language.

e) **Provide perception and comprehension:** Students should visually perceive that code switching takes place in the text. This will not be a problem with languages that have distinct alphabets. However, when dealing with languages that use the same or visually similar alphabets, the student should get a clear signal that there has been a switch to the other language. Text in the second language could be contextualized in order to develop the student’s understanding of it, that is, the text should be accompanied by illustrations and visual keys. If a text is supplemented by a scheme, it is desirable that the notation used in the scheme matches the notation used in the text. In order to make it easier for the student to perceive the information, the text in the second language might be written with a slightly greater font size and it could be coloured with the main terms pointed out.

f) **Provide memorization:** Understanding and memorization of information is provided by context and practising (repetition). It is desirable that words, expressions and terms would be repeated several times and would be used in various contexts. It is easier for the student to understand a longer text, where the meaning of words can be perceived from the context, rather than an abstracted, concentrated, generalized, short title.

g) **Support study skills development (learning to learn):** It is important to support students’ learning autonomy and study skills development. Students should be informed why and according to what principles are there included fragments in the second language in the book. The introduction of the book might include an introductory letter to the students about the teaching approach, the aim of using two languages, pictograms that indicate code switching, the way of using the second language.

h) **Integrated with a second language subject curriculum:** Translated texts might be selected in accordance with the themes of the second language curriculum. For example, a text about the seasons of the year, natural phenomena (nature science) or a description of a landscape (painting) might be accessible, if the students have studied the vocabulary of the subject in language lessons. Summarizing it can be concluded that texts in the second language should be assembled in meaningful pieces that are at least one paragraph long.

Provision of the development of the student’s first and second language.

It is desirable that terminology is taught in both languages. Several methods could be used to promote this:

- Firstly, a text is provided in the first language and is followed by a text in the second language, which includes the same terminology.
- The specific terms could be coloured or stated in the beginning of the text, if possible.
- A translation of the specific terms could be provided after the text.
- A few sentences and phrases are provided before the text in the second language, which are of important contents and enclose the main terms in the first language.
- Students are provided with an exercise to find equivalent terms to the ones from the text in the first language in the text which is in the second language.

Caution on bilingual textbook evaluation: The usefulness and efficiency of developed bilingual text-books should be assessed very carefully including the subject comprehensiveness as well as language development aspects. Pseudo results should be avoided. Pupils are very adroit to compensate the information gaps and creative getting meaning from the small pieces of information. The fact that students are able to answer specific questions concerning the contents of the text will not objectively signify that the knowledge is obtained from the bilingual text. Testing exercises should be intended to handling (analysis, synthesis, and evaluation) and use the obtained information instead of simply reproducing the gathered information (an answer that would require “taking” a word or a phrase directly out of the text).

Abstract

The long-term conceptual document approved by the Saeima "The Growth Model of Latvia: the Human in the First Place" defines a human-centred model of Latvia development. The goal of growth is to raise various quality aspects of every person's life. This can be achieved by actively using the accumulated knowledge and experience of people. At the same time, the importance of the education system for creating a comprehensive world view and value orientation should be emphasized. Family policy guidelines for 2011-2017 indicate that in order to help parents, especially young people, to acquire the necessary knowledge and skills in order to take care of their children fully and to build a stable and happy family, it is necessary to implement educational and informative measures, which are intended to educate parents about their role and how it changes, about the child's rights and responsibilities arising from them, as well as their long-term rights.

Introduction

A strong, socially and economically independent family is one of the most important preconditions for the survival of every society. Families not only affect significantly well-being of the society and state, but also perform a number of important functions: maintain demographic stability, ensure socialization of children and young people and prepare them for life, family care and mutual support for family members. It is important for young people, potential family founders, to explain in a timely manner the necessity and importance of family stability and marriage. The child's waiting and getting into the family is one of the most important stages of family life, bringing with it happiness and joy. At the same time, it relates to the beginning of a completely new life, when the wife becomes a mother, but the husband is a father. However, despite the relatively long period between the creation of a child and his or her birth, where parents have the opportunity to obtain information on the development and upbringing of a child, some parents, especially young parents, lack the necessary knowledge and understanding of the child's development and upbringing, as well as the need to ensure the child a safe and healthy environment. As a result, there is a one-sided conception of the principles of child upbringing, which often does not promote positive emotional and physical development of children, weakens children's psychological relationships with their parents. Many families are confronted with difficulties in children's upbringing due to various social, economic and other factors.

The aim: assess the pedagogical and psychological aspects of the parent education process content in the children's upbringing context.

Method

Analysis of literature and documents, survey.

Findings

Parents' self-feeling and their children's upbringing methods in the family are determined by the society's social structure and culture, and as the family is a kind of the society's "psychological mediator" between the society and child then during the adaptation process the child establishes such emotional attitude with the family which later will become the base for their adaptation in the society. M. Bowen (Bowen,) has paid a special attention to the social emotional process. He believes that the family functioning can be reflected on a conditional differentiation scale, where the "regressive societies" are placed at the bottom, but the "progressive ones" are situated at the top. Some features of the "progressive" society are: social harmony in the attitude towards the surrounding environment, physical comfort and economic security, availability of food, living space and medical care, as well as all public members' long life expectancy. Some features of the "regressive" society are: destruction of the surrounding environment, unreasonable waste of natural resources, increase of such social problems as divorce, antisocial behaviour, violence, crime, alcoholism, drug addiction. All these negative factors in parents that live in the society create the sense of insecurity about their future, about the family's economic situation. This sense of insecurity can cause doubt, distrust, hostility, loss of human self-esteem. Lower adults' self-esteem and lack of self-respect in the society lead parents' behaviour from the self-realization sphere to the self-assurance sphere. Equality with the child as a personality has been banished because parents want to be superior, this allows the adult to feel stronger their significance and self-respect.

Also U. Bronfenbrenner (Bronfenbrenner, 1994) believes that the disorganizing forces do not emerge initially in the very family, but rather in the whole society's lifestyle and objective conditions which are encountered by families. If these conditions and this lifestyle are implemented badly for the sake of trust attitude and emotional security in the relationships among the family members, if these conditions impede the children's care to bring them up and give them pleasure, if the parents' duties do not find support and recognition in the surrounding world, and if the time spent in the family causes losses in the career, personal satisfaction and psychological sense of security, just then the child's psychological development suffers especially. The initial symptoms, which show it, are expressed in the emotional and motivation sphere- reluctance, indifference, irresponsibility. During the first years of life the family for the child is the main model of social relationships. There is reason to believe that the period up to the three year age determines formation of the "basal I." The child's need for love is not only the strongest, but also the most long-lasting one. The child starts feeling themselves first of all as lovable or undesirable, the cognitive self-awareness abilities and means appear in the child only later. Thus the sense "what I am like" is formed before "who I am."

Parents' attitude is a unified system of utterly diverse feelings in the attitude towards the child, actions, behavioural stereotypes which are applied in communication with the child, the child's character, peculiarities of their behaviour and understanding. The child's communication with close adults and peers is not only a factor for a full mental development, but also the base for relationship establishment with other people, themselves and with the subject world. The child, living in the family, gathers a huge experience of mutual relationships in themselves. The child is aware of what is right or wrong, how the parents treat them – avoid the child, are not satisfied with them, acknowledge the child's independence or oppress it, treat their child amicably – with patience, trust, sincerity, love or not. The child develops own attitude- the child loves their parents the way they are, or feels their emotional alienation and tries to decrease it. Awareness of the child and parents' mutual relationships is expressed in the child's expressions, behaviour and mood.

According to the findings of pre-school pedagogy and psychology theories on the significance of individualization of socializing process in childhood A. Samuseviča and B. Vikmane (Samuseviča, Vikmane, 2017) have set in practice the prevailing modern parents' difficulties in children's upbringing,

describing the essence of parents' pedagogical competence and its characteristic features. The data obtained during the research confirm that the child's upbringing and socialization are affected adversely due to the lack of parents' pedagogical competence in all family members' mutual relationships in which the child's permissiveness quite often prevails, but adults feel pedagogically helpless and give in to all child's wishes. The authoritative child tries to carry on with the role acquired in the family in communication with peers and teachers in the pre-school educational establishment in a form of a demonstratively loud behaviour without listening to adults, disregarding the internal order rules, humiliating other children, bullying them, trying to attract their attention and becoming the leader of the situation.

In order to create attraction between parents and children, first of all the adult's ability to feel and respond (empathy) to any child's signals is necessary – whether it would be the look, smile, crying or an aggressive behaviour. The child needs sincerity, tenderness, support. Pre-school teachers mention different child upbringing and socialization difficulties in families, e.g.: parents' differentiated attitude towards their children, physical impact, insufficient care, use of divorced parents in relationships, unarranged daily routine for the child, lack of parents' attention and/or father, child overindulgence, parents' uncoordinated action, etc. Alongside the already mentioned behavioural problems the teachers have noticed the child isolation from others, aggression towards their peers and adults, auto aggression harming themselves, delay of social skill development, etc. Parents need knowledge, abilities and skills to be good parents.

A.Karpova, (Karpova, 2006) carrying out the research of socializing processes in Latvian families, have come to a conclusion that the main psychological mechanism of includes the following:

- support and acknowledgment of a particular behaviour, rejection of another one;
- conscious and unconscious imitation of parents' behaviour, orientation towards the parental sample;
- observation of the child's subjective inner world (awareness, self-awareness and personality in general) in the upbringing process.

During the process of the child's positive self-feeling formation it is very important to feel that the parents love the child, that the child is important to the parents. Every child has got their own emotional needs. The way how – with love, understanding or punishments- these emotional needs are satisfied and whether they are satisfied in general determines:

- the child's self-feeling- the child is happy or depressed, kind or angry;
- the child's behaviour – the child is obedient or disobedient, stubborn, tearful, closed or cheerful and active.

How to establish and later not to lose the contact with the child, what are the positive disciplinary methods like and what does it mean to be good parents in general, are the most often asked questions which have been addressed to the psychologists of the foundation "Centrs Dardedze." The specialists of the centre have noticed that just the small children's parents, i.e. 2-3 year old children's parents, most often seek for help in problem solving. Mostly they are issues related to the child's development and discipline. Parents admit they lack the knowledge on how the child grows and develops, how to discipline the child in a positive way and how to bring up an emotionally healthy and happy child. Child's upbringing is one of the most responsible jobs one can even think of, therefore sometimes the first step towards the success is the arrangement of own adults' live and assessment of priorities.

In order to find out what causes difficulties in children's upbringing, a survey has been carried out. 55 families took part in it. The parents, who participated in the survey, can be divided in the following groups according to their age and number of children:

- 1) young parents (20-27 years old) with one child 1.5 - 7 years old;
- 2) young parents with 2 or 3 pre-school age children;

- 3) parents (30-40 years old) with one child at school and 1 or 2 children in pre-school age;
- 4) parents (30-40 years old) with 1 or 2 teenagers and 1 or 2 children in pre-school age.

Collating the respondents' replies, the following data was obtained:

Table 1. Main Difficulties in Children's Upbringing

Difficulties in upbringing	1 child family (18 families)	2 children family (24 families)	3 – 4 children family (13 families)
No difficulties	7	16	6
Child's answering back	4	1	3
Child's stubbornness, selflessness	12	9	4
Abundance of energy	6	8	3
Disobedience	9	13	6
Jealousy	-	12	2
Lack of time to deal with the child	5	7	4
Lack of finances	2	3	3
Child's overindulgence	3	6	4
School requirements	-	4	2

In the parents' assessments about the educational situation in families various parents' attitudes towards children have been crystalized. 28 families admit there are no difficulties in children's upbringing. Several parents- in 17 families think that their children's excessive mobility causes difficulties for them, in 32 families parents mention their children's disobedience, stubbornness, answering back, children's overindulgence, tantrums, whims.

The demand for consultations, number of complex situations and cases of unconscious violence confirm the fact that in the country the availability of training for the expectant or young parents is insufficient, also at schools proper attention has not been paid to the issues.

One of possible solutions to improve the situation is the set goal of the Family State Policy Guidelines for 2011-2017: promote foundation, stability, welfare of families and increase birth rate, as well as strengthen marriage institution and its value in the society, implementation, developing a training programme for the people who are getting ready for marriage registration, including in it also the points about the protection of children's rights and interests. To implement more successfully in the whole country the training programme for the people who are going to register their marriage in a Registry Office, the Ministry of Welfare of the Republic of Latvia planned to start the development of the programme in 2013 and its approbation would take place in 2014. The main action directions: foundation of family and marriage, planning of family life and child's entrance into the family; support for implementation of parents' responsibility; family's stability, out-of-family care. Within the national programme for the improvement of the child and family's condition a survey was carried out about the young people's attitude towards marriage. In total 3 155 young people aged 18-25 have been surveyed, out of whom 2 066 live in Latvia, but 1 089 are abroad.

In 2017 the Ministry of Justice of the Republic of Latvia in cooperation with several educational establishments have started a pilot project in a pre-marriage training course for the people who are willing to register their marriage in a registry office. The goal of the training programme is to promote the family's stability, as well as to strengthen the marriage institution and its values in the society. The pre-

marriage programme provides the prospective married couples with an opportunity to obtain knowledge and understanding about the essential issues of marriage life. The programme consists of four models- it has been planned that each of them will last for about six academic hours- 24 hours in total during which it is envisaged to acquire financial literacy, improving understanding about wise management of money and budget planning; the knowledge will be acquired and understanding developed about the legal aspects of marriage, psychological and ethical aspects of marriage, formation of spouses' family relationships, parents' responsibility and duties. This year 50 couples were provided with an opportunity to participate in the pilot project.

Results

Nowadays in order the young parents would be able to provide the child's socialization fully and solve the problems of the upbringing process in a constructive way, an appropriate pedagogical competence is necessary. It means that the young parents have to be familiar with the basic issues of the child's development and upbringing, they have to be aware of the constant and significant changes which take place in the child's development during every age stage. The child's activity together with adults, their communication and closeness with family members during the pre-school age are essential preconditions for development.

Assessing the content of the developed programme in the children's upbringing context, several important topics have been discovered which should be included in it. To deal successfully with children's upbringing, it is important to emphasize the great importance of values in the personality formation process. Stability of the value system affects the parents' purposeful upbringing activity. Values do not form by themselves, the person's individual, subjective peculiarities are expressed in them, which originate in upbringing, personality formation conditions, gifts and talents. L. Božoviča (Božoviča, 1975) points out that it is important to discover the values already in childhood, broadening the child's horizon, but A. Brilmeiers (Brilmeiers, 1998) pays attention to the specific impact of the mental authority on the child, which promotes and strengthens their mental life. Also Ā.Adlers is sure that the child needs a peer who is interested and feels them even when do not understand them; a parent is such a person for the child who promotes their positive self-feeling, strengthens confidence in them and their activity. A. Kopeloviča and L. Žukovs mention that the environment affects the child's value orientation in which the child is situated. Mostly the child's development depends on the relationships the child is with the environment, how the child feels, experiences it emotionally. The task of upbringing mastery is to achieve that the values already in the childhood would create an individual, personal world in the pupil, which is revealed in the expression and development of gifts, abilities, inclinations and appeals. Children's upbringing in families is quite often delegated to others: TV, video, computers have taken the most important part in children's personality formation, forgetting that only a spiritually rich personality can make a spiritually rich person. J. Kolominskis pays attention to the personality's internal content, considering that educators definitely have to find answers to the questions:

1) **What** does the person **want**? – It is a question about the person's progress, opinions and tendencies, needs, interests, ideals, values.

2) **What is** the person **able to do**? – It is a question about the person's abilities, giftedness, and talents.

3) **Who is** the person? – It is a question related to the person's character.

A human being is characterized not only by the goal which they are striving to achieve, but also the means which are chosen for its achievement.

Developing the promotion model for children's value formation it is essential to be aware of the terms which are significant in the value formation process:

- 1) parents' values;
- 2) observance of the child's natural development;

- 3) favourable psychological climate in the family;
- 4) formation of human communication;
- 5) social status suitable for the child.

During the upbringing process each its member tries to give some cognitive or moral information, provide a particular orientation. Due to perception some value conceptions are formed in the child's consciousness. They can be either primary or secondary which are based on previous preconceptions. Adults own initiative in the process. During the perception process the adult can include the child's sense spectrum as broad as possible, depending on the child's life experience teach to perceive the most important and promote development of their creative initiative. Perception grows into the understanding of value preconceptions. Conceptions are formed from preconceptions, the nature of things and phenomena and conformity to natural laws are revealed, actualization of the previous experience take place. The developed self-assessment enables us to express the positive or negative significance of the values to the particular child. A certain system of value preconceptions is formed whose elements can be situated in the most varied mutual coherence. Value orientations are formed on the base of value preconceptions which guarantee personality persistence, a certain type of behaviour and activity, set the direction of needs and interests. This is the main factor of personality formation. Parents' task is to create pedagogical situations for value self-expression. The value formation process is constant. Performing a conditional spiral movement in each stage it is based on the previously acquired experience creating permanent values in every human being.

The content of values comprises the main directions in value acquisition already in early childhood:

- 1) "I" as a value,
- 2) preciousness of life,
- 3) values of human life activity,
- 4) understanding and sense of natural value.

The mentioned values are important throughout the life course, therefore their purposeful formation is one of the most responsible tasks already in childhood. It is important to reveal the content of directions. Looking at each of them separately the main emphases for the value formation can be distinguished. The internal content of the human "I", personality emerges and forms during the communication process. A human being in their childhood not only reveals the other person, but also strives for it. The family, group of preschool educational establishment, class – it is wealth of individualities. The human's spiritual wealth, which they bring into a group, enriches others and what can be gained from them, strengthens in the child the desire to become better, develop oneself, but it can only be possible with noble , spiritual work. Mutual exchange of intellectual and spiritual wealth promotes the development of the child's personality. It makes them turn to self-cognition and development already in childhood. To promote "I" as value formation, four important questions are asked: Who am I? What am I like? What do I want? What am I able to do? Looking for answers to them, the child can obtain a broad insight into themselves, their personality, needs, desires, interests, abilities.

Developing themselves, the human being creates the base for awareness of their life preciousness. It is characterized not only by the goal to which they strive to, but also by the means which have been chosen for its achievement. This dynamics directs to an active action, to the search for the conditions of life activity. In it the human biological and social nature is revealed, which determines appropriate values. On the basis of the main types of activity the values can be distinguished which are important for children to pay attention to: knowledge which enables them to act, attitudes, requirements to other people-communication. Introducing a human with the material and spiritual values created by the life activity (art, literature, music, etc.), a harmonic individual's activity is promoted.

Child's discipline is an important aspect of upbringing. Discipline means teaching the child acceptable behaviour which will determine how the child feels and behaves today and how the child will feel and

behave tomorrow. Discipline helps the child to develop self-control and teaches the child to acquire the principles of self-discipline, which the child will need in the life course and will help to avoid problems when the child grows up. Any individual- either a child or adult- needs to understand the daily life rhythm and order of things in this world according to which we have to live, and it would be the parents' task to create for the child in good time an understandable family environment, introduce and explain rules, set strict borders to what can and cannot be done.

This way parents protect a very small child and provides them safety just in a physical way, but an older child is taught the rules which help them form relationships with their peers. One of the parents' most important tasks is to discipline the child in a loving, fair and acceptable way, though sufficiently strictly and persistently. The child's age, sex and family traditions have to be taken into account definitely. Discipline is not a one-day task, but rather a long-lasting process which requires lots of patience and knowledge from the adult, also it is important that the parents and other adults as well, who are involved in the child's care, are consequent in their demands – persistent, consecutive. One more important aspect in the child's upbringing process which has to be emphasized is prophylaxis of the child's speech and language impairment and its significance in the child's speech and language development process. During the development process the child acquires the skill to apply the language as a tool for communication, interaction, self-expression and self-regulation, also for cognition of the surrounding world. When the child is already two and a half or three years old, the feedback of the language development to the child's cognitive and social development can be noticed. The procedure of the child's oral speech and language acquisition process and the achieved development level in pre-school age is an essential factor in the further development context- it is an indicator of the intellectual development and readiness for school. Reading and writing skills are created on the base built developing the child's speech and language during the pre-school age. The quality of written language, especially the reading skill acquisition affects essentially not only the success at school, but it is also an important factor for personally and socially important goal achievement (Geske & Ozola, 2007; Strehlow, 2004; Suchodoletz, 2004, Tomele, 2013; Trinīte, 2015; Tūbele, 2015).

All over the world, also including Latvia, the number of children with speech and language development retention or impairment tends to increase. S.Tūbele (Tūbele, 2006) states that during the time period from 1999 to 2005 20%-25% primary school pupils need the speech therapist's help. In its turn in 2015 B. Trinīte points out that according to the provisional data from Latvia Speech Therapists' Association already 35% of primary school age pupils need speech therapy help. During the preschool age 50% of children aged 3-5 have speech, language and communication disorders, but at the age of 5-6 35%-40% children still have speech disorders (Trinīte, 2015). Also the general conclusion of the speech therapists' reports of Liepaja preschool educational establishments (PEE) in the Pedagogy Department of Liepaja City Municipal Education Department confirms that the average number of children with speech and language impairment during the time period from October 2011 till April 2017 fluctuates from 41.01% to 48.03 and it has got a tendency to increase (see Table 1). In the survey the children under 3 and the ones who do not attend PEE are not included.

Table 2. Survey of the number of children over three with speech and language impairment in Liepaja PEE during the time period from 2011/2012 till 2016/2017a.y.

School year	Month	Total number of children in Liepaja pre-school educational institutions	Total number of children with speech and language disorders	The average number of children with speech and language disorders during the school year
2011/2012	October	2922	1360 (46,54%)	41,58 %
	April	3034	1111 (36,61%)	
2012/2013	October	2744	1178 (42,93%)	41,01 %
	April	2824	1104 (39,09%)	
2013/2014	October	2752	1280 (46,51%)	42,23 %
	April	2704	1026 (37,94%)	
2014/2015	October	2609	1190 (45,61%)	42,23 %
	April	2695	1103 (40,92%)	
2015/2016	October	2660	1363 (51,24%)	48,03%
	April	2617	1173 (44,82%)	
2016/2017	October	2653	1271 (47,90%)	46,38%
	April	2606	1169 (44,85%)	

According to the data collection of Latvia Speech Therapists' Association and Liepaja PEE speech therapists' reports, as well as the international experience in the western Europe and the USA (Ruben, 2000; Strehlow, 2004; Suchodoletz, 2004), it can be concluded that the current situation regarding the children's speech and language development can cause essential consequences in future not only in the context of a particular individual, but also the whole society. Thus prophylaxis of speech and language impairment becomes more and more topical, which is one area of the speech therapist's professional competence. In speech therapy there are three types of prophylaxis:

- primary (informing the public on ontogenesis of speech and language development, pathogenesis of impairments and promotional opportunities of language development in the family and pedagogical process);
- secondary (timely diagnostics and early detection of the impairment);
- tertiary (timely and qualitative correction of speech and language and restriction of secondary impairment), prophylaxis.

Initially a set of systematic methods and activities was understood with the term "prophylaxis," which enables us to notice the possible development risks early and, applying appropriate pedagogical methods, eliminate or reduce them during the educational process. Now the term *prophylaxis of speech and language impairment* includes a much wider activity spectrum and nowadays an important aspect of prophylaxis is not only information, diagnostics and correction, but also cooperation among children's parents, preschool education teachers and speech therapists. Right now in Latvia good outcomes have been achieved in the secondary prophylaxis area and starting from the age of three regular speech and language check-ups are carried out for all children who attend a municipal PEE. The children who do not attend a PEE and are under three are under GPs' supervision. Unfortunately, in the speech therapy practice the cases with insufficient family doctor's awareness of language development in ontogenesis and pathogenesis issues are encountered. In its turn, implementation of the tertiary practice in Latvia is impeded, since the number of speech therapists working at educational establishments is insufficient in order to provide all learners who need it with a timely and efficient speech therapy help (Tomele, 2013; Trinīte, 2015).

Conclusions

Upbringing area is a complex work field in which different opinions will always meet about how the upbringing work should be performed, about the directions and their development, about criteria, how to assess the work outcomes, about the values, which have to be considered as priority. It is art of compromises to balance all these opinions and reach a consensus. Two tendencies have to be taken into account in upbringing which during the personality formation either weave together or collide, interact or oppose each other. On the one hand upbringing is a social necessity, on the other hand it is a phenomenon of an active, creative personality's freedom which is able to manage itself and be responsible for the activity.

In order to strengthen the family and establish a strong base for a positive upbringing system in any new family, it is important to promote the parents' interest in the development of the upbringing process, in consolidation of own and family's values. It is important to awaken everybody's creative energy and promote acquisition of universal values which are essential for human existence according to three cognitions:

- universal values teach to respect and honour anybody, thus welfare of every individual and the whole society is promoted;
- everybody has to take care of values, they are given opportunities to create and acquire different positive values;
- a human flourishes in a gentle and respectful environment, in an atmosphere based on values where they have a chance to learn to carry out a socially important selection.

The modern family's main tasks are:

- create a maximally efficient environment for the child's personality development;
- guarantee the child's psychological protection and safety;
- satisfy the child's material needs;
- find possibilities for the child to acquire various practical skills and develop the necessary self-service skills;
- promote formation of the child's self-awareness and self-respect.

In order to provide young families with opportunities to acquire the necessary knowledge on children's upbringing, in the content of the curriculum specific issues have to be included which would create the base for any parent's self-education in the issues.

Recommendations

- 1 Values are the base for human activities, they are related to mental behaviour. Most of the hopes, possibilities and choices originate from values. They can be important for only one person, but others can join in also in their assessment. Values are the matter of personal choice, they are lots of life ways – different values shape different lives. Values grow from human subjectivity, spontaneity. The moral problem is hidden in the human insignificant attitude towards oneself. A human being has turned themselves into a tool, instrument in order to achieve the goals, they treat themselves as things, losing their self-esteem and uniqueness. Feeling their powerlessness the human being starts despising themselves, stops believing in their own power, loses belief into people, themselves and their abilities. The human attitude towards force and power comes in the foreground, as well as the sense of loneliness and isolation. A human being is not able to be mentally healthy if they do not have the sense of own "I." Just the desire to acquire own "I" promotes strongly the human activity, therefore it is very important to find the opportunities to promote the process of value formation already in childhood.
- 2 Good parents are not born, but anybody can become like that through learning the whole life course. Performance of the parent's role is an interesting and at the same time also challenging

work and sometimes there are different situations when parents feel confused and ignorant and often even angry and impetuous. Most often such feelings take over parents when the child acts somehow in an unusual way, unacceptably for the parents or even in an embarrassing way. It happens, when encountering an untypical own child's behaviour, parents react inadequately and they themselves are not able to manage their emotions and admit that "I can't deal with them," because I feel confused and ignorant. Such situations most often appear when bringing up a three year old child or teenagers. However, certain difficulties can appear in any age of child's development. It has to be admitted that sometimes parents forget about a very essential aspect of upbringing- discipline. Both love, generosity, respect of the child's peculiarities and discipline provide the child with a safe and stable base for their personality's development.

- 3 An important factor in the promotion of the child's language acquisition and prevention of functional language development impairment is the parents' education on the language development preconditions, procedure and norms. In order to reduce the increase of the number of speech and language impairment among the preschool age children's population and their effect phenomena in the later age, the following measures have to be taken, which would guarantee an optimal primary, secondary as well as tertiary language impairment prophylaxis:
 - develop standardized diagnostics criteria for speech and language impairment;
 - carry out researches and inform the government and social institutions;
 - provide the educational establishments with speech therapists and support staff in compliance with the real number of children with development impairment;
 - improve the existing methods and introduce new ones in the preschool education and speech therapy correction work in order to promote the child's development holistically;
 - inform the society and children's parents on various language development issues;
 - encourage parents' involvement in children's language development and language impairment correction, for in the language development context the social environment or family is one of the most important exogenous factors;
 - speech therapists, PEE teachers and parents have to collaborate mutually.

IMPORTANCE OF “CULTURAL HERITAGE AND CONSERVATION” CONCEPT IN THE ARCHITECTURAL EDUCATION

¹*Özlem ATALAN,*

Email:ozlem.atalan@cbu.edu.tr

Abstract

The concept of culture also includes the concept of "conservation" within itself. Conservation culture and education are two basic tools for the transfer of cultural heritage. Education is at the forefront of activities that will contribute to the formation of conservation consciousness. People who have a consciousness of conservation culture and cultural heritage can both protect today and the past. In today's conditions where the impact of globalization is rapidly affecting our cities, it is necessary to approach consciously cultural heritage and conservation culture. From this point of view, it is important to understand the conservation culture for the newly educated "architectural students". In this context, architectural education and curriculum are important. Are architectural course programs sufficient for students to enjoy cultural heritage and to take responsibility for protecting it? In this article, the necessity of teaching conservation culture in architectural education will be discussed. At the same time, the adequacy of the courses about conservation and cultural heritage in the curriculum will be investigated.

Key words: Conservation Culture, Cultural Heritage, Architectural Education, Architectural Courses Programs

Importance of “Cultural Heritage and Conservation” Concept in the Architectural Education

1. Introduction

The impact of globalization quickly changes our cities. It is necessary to approach the cultural heritage and conservation culture consciously. In this respect, it is important to understand conservation cultures for the newly graduated “*Architecture Students*”. Architecture education differs from the education style of other disciplines. The education of the students in Turkey before the university are insufficient for architectural education. Many researchers say that coincidence plays a role in the choice of the profession. For this reason, the process of adaptation to the architectural profession is usually a long time. (Ayıran, 1995; Nalçakan& Polatoğlu).

Cultural Heritage and Conservation

Culture is defined as all of the factors that represent all the material and spiritual values created in the process of historical and social development. It is also all of the factors used to convey to the next generation, indicating the extent of the sovereignty of man's natural and social environment (<http://www.tdk.gov.tr/>). Culture is transmitted from generation to generation. Protecting and maintaining the cultures depends on this transfer. Transfer to generations to generation of culture defines it as heritage and makes it important (Çakır, 2010: 34).

Kuban (1975) states that in the lives of people, the transformation of concepts and goods into symbols for various reasons constitutes a phenomenon called culture. Cultural Heritage is a reflection of people's ever-changing values, beliefs, knowledge and traditions that have reached today. Cultural Heritage are all tangible and non-tangible assets. Cultural heritage includes all the features of the environment, stemming from the intermingling of people and places over time (Turkish Architectural Heritage Protection notification, 2013).

Architectural heritage is a cultural asset that is a common property of mankind and must be conveyed to the future with its unique qualities. It is a group of buildings and structures that must be protected according to conservation principles, with all values. The concept of Cultural Heritage has become today with developing in terms of definition and scope in the historical time. Cultural heritage is limited only to important monumental structures in the early days of the formation process of the conservation notion. In the later processes expanded

the scope of the conservation notion, it encompasses civilian structures as well as urban and rural areas. Scope of cultural heritage has also developed, including intangible work of branch of culture and art (Korumaz, 2015).

In the expansion of the concept of Cultural Heritage, important events that took place in history became decisive. The French Revolution of the 18th century was a time when both cultural heritage was important and there was debate and practices for protection and restoration. In the 19th century, the definition, scope, scale and conservation methods of cultural heritage have developed. For the first time, cultural heritage is being used by international organizations with the 1931 Athens Regulation. "Carta Del Restauro", prepared in 1931 by the Supreme Council of Antiquities and Fine Arts, is an important documentary in this area. The United Nations Educational, Scientific and Cultural Organization (UNESCO) was established in 1945 and the Council of Europe was established in 1954. In the same year, the preparation and acceptance of the "Convention on the Protection of Cultural Values in the Case of Armed Conflict" took place in La Haye, the capital of the Netherlands (Madran & Özgönül, 2005).

After the Second World War, where significant reconstructions were made, the cultural legacy became even more important with the 1964 Venice Regulation. Historical and rural settlements have been included in the definition of cultural heritage in the 1970s. At the meetings of the Council of Europe (1985), ICOMOS (1987) and UNESCO (1989), intangible values were included the notion of cultural heritage. The ICOMOS declaration on the conservation of the architectural heritage of Turkey states that cultural heritage is the symbol of the identity. It is stated that tangible and intangible cultural heritage includes historical, documentary, aesthetic, artistic, social, economic and spiritual values. The architectural heritage is one of the most important components of cultural heritage. It is necessary to reveal aesthetic and cultural values without changing the originality and the qualities that constitute identity (ICOMOS 2013).

Cultural heritage can be dealt with in two main groups as tangible and intangible cultural heritage. In general, monuments, sites, movable artifacts are included in tangible cultural heritage (<http://whc.unesco.org/en/conventiontext/>). Intangible cultural heritage is not visible to the eye, such as language, tradition, custom, music, dance, etc. However, the concepts of tangible and intangible cultural heritage are interrelated. Socio-cultural, cultural heritage values have a connection to society, between present and past (Zancheti et al., 2009)

According to the World Cultural and Natural Heritage Agreement; the concept of conservation is to understand the cultural heritage which is consist of monumental and sites, natural, geological and physiographical formations and to protect its material. And all of the methods used to restore and to present (<http://whc.unesco.org/en/conventiontext/>). Within the history of thousands of years of civilization, the protection of values, which we call cultural and natural heritage, created directly or with nature, is the common problem of mankind in our day. The notion of conservation is all that humanity has created in the historical process and has provided for cultural continuity.

Cultural heritage is divided into sub-groups such as movable, immovable and intangible cultural heritage. However, from the year 2000, the views advocating the handling of cultural heritage as a whole have gained importance. Nevertheless, intangible values are of great importance in terms of constitution of the essence of cultural heritage. Sustainability and conservation concepts are similar in terms of general understanding and purpose. Brutland Report describes "Sustainability" the following. *"Humanity has the ability to make development sustainable to ensure that it meets the needs of the present without compromising the ability of future generations to meet their own needs. The concept of sustainable development does imply limits - not absolute limits but limitations imposed by the present state of technology and social organization on environmental resources and by the ability of the biosphere to absorb the effects of human activities (Bruthland Report 1987).* In this context, it is aimed to protect the natural ecosystem and cultural values. The destruction of

this cultural heritage not only destroys architecture and aesthetics, but also destroys cultural and historical values.

Sustainability and conservation concepts are similar in terms of general understanding and purpose. Sustainable development is defined as meeting present-day needs without compromising the ability of future generations to meet their needs. Within this scope, it is aimed to protect the natural ecosystem and cultural values. The destruction of this cultural heritage not only destroys architecture and aesthetics, but also destroys cultural and historical values.

2. Methods

Cultural heritage and conservation concept should be intensively involved in architectural education and curriculum. In the research, the following questions have been researched.

- Are there sufficient lessons on “*Cultural Heritage, Conservation History of Architecture*” in the Architecture department of curriculum?
- What are the lessons on the history of cultural heritage and conservation concept in 6 major universities architecture department of Turkey?

In this research, the curriculums will be examined which are architectural departments of 6 universities from Turkey. Compulsory and elective courses about the history of cultural heritage, conservation and architecture in the curriculum will be searched. We will try to determine the intensity of these courses in the programs of the architecture departments. With this comparison, it will be investigated where Turkey stands in architectural education for conservation concept understanding and what kind of developments and changes are needed.

3. Findings and Interpretation

3.1. Cultural Heritage and Conservation Courses in Architecture Departments

Turkey continues to work for progress in terms of education system. Studies on the reorganization of the period are underway to advance the education of architecture. Studies on the reorganization of the education process and curriculum are continuing for the development of architectural education. Today, graduates of architecture departments of universities in Turkey, in 4 years.

It is very important for the students graduated from architecture to understand the cultural heritage and conservation concept. The new generations of architects who will build our future, have enough conservation knowledge to protect our cultural heritage. The architectural departments of 6 universities in Turkey have been studied together with compulsory courses, elective courses and curriculum in terms of conservation and restoration topics.

Yıldız Technical University /Istanbul

Yıldız Technical University was founded as “Kondüktör Mekteb-i Âlisi” in 1911 and it were changed name to “Nafia Fen Mektebi” in 1922. University assumed the name “Istanbul Technical School” to provide education in the field of engineering within the premises of Yıldız Palace in 1937. In 1969, the Istanbul State Academy (IDMMA) of Engineering and Architecture was established. IDMMA passed university status and became “Yıldız University” in 1982. It was continued the name ‘Yıldız Technical University’ in 1992 (<http://www.yildiz.edu.tr>).

Picture 1. Yıldız Technical University, Faculty of Architecture (<http://www.yildiz.edu.tr>)

The compulsory courses related to the concept of "Cultural Heritage and Conservation" in Yıldız Technical University Department of Architecture are given below: Introduction to History of Art and Architecture (2 ECTS), History of Architecture 1, Structure Analysis (3 ECTS), History of Architecture 2 (2 ECTS), History of Architecture 3, (2 ECTS), History of Architecture 4 (2 ECTS), Conservation and Restoration (4 ECTS) , Architectural Thought History. Total ECTS credits of these compulsory courses are 19 ECTS credits.

The elective courses related to the concept of "Cultural Heritage and Conservation" in Yıldız Technical University Department of Architecture are given below : Structural Problems in the Transformation of Housing Structures, History of Construction, Turkish Art, Last Age of Architecture, Historical Sites and Analysis, World of Architecture after 1970, Architect Sinan and his period, History of Architecture Profession, Ratio in Design, Modernity Problems in Art and Design, Social Environment Effects in Design, Spatial and Morphological Analysis in Contemporary Islamic Architecture, Relation of Design and Environment Problems, Industrial Archeology, Architecture and Coastal Space, Typological Analysis in Architecture, Conservation and Tourism, Architectural Approaches in the Contemporary Environment, Housing and Cultural Sustainability, Relation of Traditional Architecture and Design, Istanbul in the Period of Westernization, Turkish House and Conservation, 19th Century Architects / Constructions in Istanbul, Architectural Photography, Visual Production of Historical Spaces.

Mimar Sinan Fine Arts University /Istanbul

Mimar Sinan Fine Arts University; was founded by art historian, archaeologist, museum artist, painter Osman Hamdi Bey in 1882 as "Sanayi-i Nefise Mektebi". The institution, which was the first school of art and architecture in Turkey/ İstanbul, was named as the Academy of Fine Arts in 1928. Since 1982, the name of the school has been "Mimar Sinan Fine Arts University".

Picture 2. Mimar Sinan Fine Arts University, Faculty of Architecture (<http://www.msgsu.edu.tr>)

The compulsory courses related to the concept of "Cultural Heritage and Conservation" in Mimar Sinan Fine Arts University, Department of Architecture are given below: Basic Concepts in Art and Architecture (2 ECTS), History of Civilizations (2 ECTS), Traditional Building Materials (2 ECTS), History of Art and Architecture (2 ECTS), 19th Century and Early Period 20th Century Architecture (2 ECTS) Survey and Evaluation 1 (3 ECTS), Architecture from 1920 to the day (2 ECTS), Conservation and Restoration (2 ECTS), Survey and Evaluation 2 (3 ECTS), History of Turkish Architecture (2 ECTS). Total ECTS credits of these compulsory courses are 22 ECTS credits.

The elective courses related to the concept of "Cultural Heritage and Conservation" in Mimar Sinan Fine Arts University Department of Architecture are given below: Environmental Design, Conservation and Tourism, General Characteristics of the Ottoman Complex Building (külliye) and Their Evaluation in Today's, Comparative History of Architecture and Literature in the 20th Century, Reuse of Architectural Heritage, Concept of Intermediate Space in Architecture, Sustainability in New Practices in Built Environment, Architectural Reflection of Socio-Cultural Data and Environment, Variety of Style in Religious Architecture, Traditional and Regional Features of Architecture and Preservation, Environmental Consciousness in Architectural Design, From the Middle Ages to today: An Imaginary space, castle, Undesigned Spaces, Conservation and Re-evaluation of Industrial Heritage, Restoration of Traditional Masonry Architecture, Concept of Place in Architectural Design, Changeability and Transformability in Architecture, Identity Problem in Architecture, Contemporary Design Principles in Historical Urban Texture, Architectural Theories in History, Mass Housing Planning After Modernization, Post-Modernist Examples In The Architectural Context Of Istanbul, Social and Cultural Factors in the Creation of Architectural Environment, Design Criteria of Worship Space, From the Beginning of the Exhibition Space, Contemporary Architectural Theories, Identity Interrogation in Turkish Architecture: Historical, Regional and Traditional Interpretations, Interpretation in Turkish Architecture and Overview of Designs Containing Traditional Turkish Houses, Learning Locally: Sustainable Environmental Principles, Contemporary Design Principles in Historical Urban Texture, Fine Arts-Photography-Architecture Photography, Comparison of Architecture with Painting, Sculpture and Music Arts, Fine Arts, Painting, Fresco and Mosaic, Contemporary Design in the Historical Urban Texture, Interior Design and Color in Local Architecture.

Istanbul Technical University /Istanbul

The history of Istanbul Technical University dates back to the Ottoman Empire period of reign of Sultan 3. Mustafa. "Mühendishane-i Bahr-i Hümayun" (Imperial Naval Engineering), established in 1773 to provide engineering education in the Western style for the first time in the Ottoman Empire, had trained personnel

specialized in ship building and marine mapping. The history of the Faculty of Architecture dates back to 1884, when it was founded as "Hendese-i Mülkiye Mektebi". At the beginning of the 1900s, architecture department was found to depend on "Nafia nezareti", in which education was divided into Roads, Railways, Water Works and Construction-Architecture. In 1944, the school was named Istanbul Technical University (<http://www.itu.edu.tr>).

Picture 3. İstanbul Technical University, Faculty of Architecture (<http://mim.itu.edu.tr/>)

The compulsory courses related to the concept of "Cultural Heritage and Conservation" in at İstanbul Technical University, Department of Architecture are given below: History of Ancient and Byzantine Architecture (3 ECTS), History of Turkish Architecture (3 ECTS), History of European Architecture (3 ECTS), Contemporary Architecture (3 ECTS), Historical Environment Protection and Restoration (3 ECTS), Survey and Restoration Studio (5 ECTS). Total ECTS credits of these compulsory courses are 20 ECTS credits.

The elective courses related to the concept of "Cultural Heritage and Conservation" in Istanbul Technical University, Department of Architecture are given below: Theory of Architecture and Modernism, Architect Sinan, Istanbul Conservation of a World Heritage Site, Istanbul, Infill Problems in Urban Historic Sites, Introduction to Conservation Science, Survey with Equipment, Rehabilitation of Old Buildings, Historical Settlements and Space Cultures, Contemporary Design in Historical Urban Texture, Architecture and Society in Antiquity, 20th Century Art, Restoration of Cultural Property, Modern Concepts of Architectural Conservation (3 ECTS).

Gazi University /Ankara

Gazi University, Department of Architecture was established in 1982. But it is based on historically Zafer Engineering (1966) and Architecture Collage and Yükseliş Collage (1967) these two private collage were united at 1971. It was named as the Ankara State Engineering and Architecture Academy (ADMMA) at 1973. The Faculty, which was taken into Gazi University in 1982, was named "Faculty of Engineering and Architecture"(<http://gazi-universitesi.gazi.edu.tr>).

Picture 4. Gazi University, Faculty of Architecture (<http://www.yapi.com.tr/>)

The compulsory courses related to the concept of "Cultural Heritage and Conservation" Gazi University Department of Architecture are given below: Introduction to History of Art and Architecture, History of Architecture 1, Architecture Culture, History of Architecture 2, History of Architecture 3, History of Architecture 4, Contemporary Architecture Theory 1, Contemporary Architecture Theory 2 and Survey and Restoration. Total ECTS credits of these compulsory courses are 21 ECTS credits.

The elective courses related to the concept of "Cultural Heritage and Conservation" in Gazi University Department of Architecture are given below. Space of Turkish Era Building, Culture and Identity, Development of Architectural Space Thought, Conservation Techniques in Historical Sites, Evaluation in Historical Environment, Pre-Islamic Turkish Architecture, Historical Building, Ottoman Architecture in the Period of Westernization, Construction Techniques in Traditional Houses, Participation of Turkish Buildings Architectural Elements to Contemporary Life, Restitution, Ottoman City Analysis, Restoration Critics, Turkey Architecture during the Republican Period, Housing in Historical Process (3 ECTS).

Middle East Technical University /Ankara

Middle East Technical University is founded under the name of "Middle East High Technology Institute" in 1956. The purpose of the university is to contribute to the development of Turkey, Middle East countries and to educate people. Department of Architecture was found in 1957 (<http://www.metu.edu.tr/>)

Picture 5. Middle East Technical University, Faculty of Architecture (<http://www.mimdap.org/>)

The compulsory courses related to the concept of "Cultural Heritage and Conservation" in Middle East Technical University (METU) Department of Architecture are given below: Architectural History 1, Architectural History 2, Architectural History 3, Principles of Cultural Heritage Conservation (4 ECTS). Total ECTS credits of these compulsory courses are 16 ECTS credits. In addition, in the architecture curriculum, there is a Summer Survey Internship.

The elective courses related to the concept of "Cultural Heritage and Conservation" in Middle East Technical University (METU) Department of Architecture are given below: History Of Art And Architecture 1 And History Of Art And Architecture 2, History Of Art And Architecture 3, The Cultural Context of Art and Architecture, Vernacular Architecture, Theory and History of Landscape Architecture I, Theory and History of Landscape Architecture II, Aesthetics and Criticism 1, Aesthetics and Criticism 2, Theory of Restoration and Conservation 1, Theory of Restoration and Conservation 2, Developments in Modern Art, Architecture in Situ, , City in Late Antiquity and Byzantium: Topography and Architecture, Perspectives in the Conservation and Valorization of Cultural Heritage, A Survey on Architectural Culture: From the Neolithic to the Modern Period, Survey of Early Christian and Byzantine Architecture, Pre-Classical Architecture of Ancient Anatolia, Architecture and Politics in 20th Century Italy, Architects and Architectural Practice in History, Classical Antiquity in Asia Minor, Domestic Architecture in Antiquity, The Cultural Context of Art and Architecture, House and Daily Life in History, Studies in Greek Architecture, Twentieth Century Architecture in Turkey, Seminar in Contemporary Architecture, Studies in Roman Architecture, Masterworks of Medieval Architecture in East and West, Environmental Aesthetics I, Environmental Aesthetics 2, Issues and Problems in 'Modernism, Nineteenth Century Architecture, Conservation of Archaeological Sites, Studying Architectural History, Aesthetics and Criticism I, Aesthetics and Criticism 2, Topics on Urban Form, Patterns and Architecture, Themes on Ancient Domestic Architecture, Special Topics in Byzantine Architecture: The Art and Architecture of Byzantine Cappadocia, History and Theory of Art and Architectural Styles, Ottoman Architecture in the Nineteenth Century, Approaches in Greek Architecture, Approaches in Roman Architecture, Cosmological Thought and Architecture in the Middle East, Assimilation of Western Modes in Eighteenth Century Ottoman Architecture, Anatolian Seljuk Architecture (11-14th Centuries), Architectural History Research Studio: The Modern Capital City, Ankara, Aesthetics and the Psyche, Sources and Methods of Research in Conservation, History of Architecture in the Eastern Mediterranean, History of Modern Structural Engineering, Problems of Traditional Building Materials, Introduction to Deterioration and Conservation, Conservation of Archaeological Sites, Structural Analysis of Historical Structures, Historical Structural Systems (4 ECTS).

Dokuz Eylul University/ Izmir

The education of the Department of Architecture started in 1971 with the establishment of "Ege University, Faculty of Engineering Sciences, Engineering and Architecture Academy" in İzmir . In 1975, it was named as the Faculty of Fine Arts. In addition to undergraduate education in Architecture, City and Regional Planning were started in 1979 at this university. This university was named as "Dokuz Eylul University Faculty of Architecture" in 1992 (<http://debis.deu.edu.tr>).

Picture 6. Dokuz Eylul University, Faculty Of Architecture (<http://mimarlik.deu.edu.tr/tr/>)

The compulsory courses related to the concept of "Cultural Heritage and Conservation" in Dokuz Eylül University Department of Architecture are given below: Introduction to Architecture History, Architectural History from Antiquity to Industrial Revolution, Contemporary Architecture History, Conservation Project of

Historical Building, Turkish Architecture History, Architecture Theory and Criticism. Total ECTS credits of these compulsory courses are 19 ECTS credits. In addition, in the architecture curriculum, there is a Summer Survey Internship.

The elective courses related to the concept of "Cultural Heritage and Conservation" in Dokuz Eylul University Department of Architecture are given below: History of Art, Historical Constructions Conservation, Modernization and Development of Industrial Spaces, Spatial Structure of the Turkish House , Turkish Architecture in Republican Period , Modernization Process of İzmir and the Production of Modern Architecture , Visual Production Techniques in the Modern Age, Contemporary Debates in Architecture, Theoretical Analysis of Modernity, History and Theory of Architectural Drawing, Historical Constructions Conservation Project, Design Approaches of New Buildings in Historical Environment ,History of Civilizations, Historical Environment and Concept of Restoration, Historical Space Reading ,Inter culturality and Mediterranean Houses, Traditional Housing Culture of Anatolia, History of Anatolian Civilizations, Ancient Architecture in Aegean, Renaissance Architecture, Archeological Heritage and Preservation, History of Modern Architecture, History of Turkish Architecture Architectural Theory and Criticism , Architectural Developments in İzmir, Contemporary Approaches in Housing Design, Old Buildings, New Uses, Hostelry Buildings, Principles for Conservation, Traditional – Regional Architecture, Research of Historical Environment Fabric in İzmir, Contemporary Approaches on the Renovation Phenomenon (3 ECTS).

3.2. Interpretation

In the research, compulsory and elective courses of 6 universities which are studying architecture in Turkey were examined. Projects which is relation to Conservation in architectural studio courses are not included in the research.

When compulsory courses are taken into consideration, according to the number of courses, 16.6% of the lessons focus on preserving architectural history and cultural heritage. At least 7.5% of these courses are seen.

Figure 1. Main and elective lessons rates which are focused on “Conservation and Architectural History” in curriculum of Architecture department.

In the Architecture departments, the total ECTS credit in the curriculum is 240. When the course is evaluated according to the credits, in compulsory courses, tuition credit rates for “Conservation and Architectural History” “vary between 10% and 6%. In elective courses, this rate will change depending on the student's choice of those courses.

Figure 2 . ECTS rates of main courses which are focused on “Conservation and Architectural History” in curriculum of Architecture department.

4. Conclusion and Suggestions

It is important to understand the value of cultural heritage and to develop conservation methods. The students who are studying in the architectural departments of the universities will give direction to the future architecture. In order to protect the cultural heritage and to transfer from generation to generation, this education should be comprehensively given to the students.

There are differences between architectural departments, resulting from different models and traditions. However, in all the architectural departments the course is equal to the credits. These curriculums are planned for the education of architectural students to have similar knowledge. But it will be their local culture and cultural heritage knowledge, which makes them different. For this reason, compulsory courses and elective courses which are relation to “cultural heritage and conservation” in the architectural education of universities, are important. In addition, students of architecture should be also taught of cultural heritage via to given more elective courses about "history of civilization and the history of architecture”.

Within the scope of this research, "cultural heritage and conservation" courses in six universities of architecture department are examined as their rates in curriculums. “Cultural heritage, conservation, art, architecture and civilization history” courses are frequently seen in elective courses pools in six universities of architecture departments. However, the proportion of these courses is between 16.6 % and 7.5% in compulsory courses. Number of the courses which are related to cultural heritage, conservation, art and architecture and civilization history will positively affect to students conservation consciousness. Raising this ratio will increase the interest of the students to the protection of cultural heritage.

The selection rate of these courses will vary depending on the number of courses in the elective course pool. For this reason, these lessons related to cultural heritage, conservation and architectural history should be increased in the elective course list. In addition, the placement of summer surveys in the curriculum and the arrangement of cultural and technical trips to Historical Sites and Area will be increased concern to this topic.

Vision about Teaching Methodology
Mina Y. IVANOVA

*Full-Time Piano Lecturer, Assumption University of Thailand,
School of Music, Department of Music Performance
Mina.y.ivanova@gmail.com*

Abstract

This research formulates the convictions about formation of the whole personality of the musician, regarding the key relationship „universe-music”, as R. Schumann’s say: „Is not a good musician who is only a good musician.” (Schumann, 1993). There is competition of quality and quantity. It is not important how long one is practicing, but the handling of it from the point of view of strategy, initiative, concentration and maximal effectiveness for minimal time. For reference we have the Leimer-Giesecking System (Stoyanov, 1954). Practically to inspire that the little time is not an obstacle before the good result, only if we can set an orderliness and method in our lives. Other mark: Intransigence with respect to the quality as a fundament of the teaching vocation regardless whether we teach to professionals or amateurs. In general the difference in the approach here consists in the choice between intensive or routinely extensive practice.

Keywords: Idea, Means, Quality, Efficiency

Introduction

The format of this report is not able to comprise and exhaust the limitless problematic, but to epitomize the guidelines of the teaching-learning process and the relationship Teacher-Student in the subjects Piano, Keyboard Literature and Ear Training..

The Ancient Roman sentence “Non scholae sed vitae discimus” - We learn not for the school, but for the life-emphasizes of the trinity of the intellect, emotion and condition as an emanation of know and can (Ivanova, 2009), by application of the aquired knowledge in our way of live, as the core of the personal building.

The main questions are: What? Is the musical Idea: And How? (Ivanova, 2015). Hence the choice of optimal means corresponded to the performance. Solid cultural and educational background personal building is indispensable for the comprehension of the nature of the Music as an Art of the space-time continuum. (Ivanova, 2013).

The application of Judo principle –The path of clemency leads to love and softness as a universal approach toward everything, with which we interact and which surrounds us (Ivanova, 2015).

W. A. Mozart explained the best way the relevance idea-means: „Playing well piano? There is nothing easier than in the world: need only at a given moment, in a given manner, with a given finger, to push a given key” (Ivanova, 2015).

Method

The objectives of “Vision about the teaching methodology” are how to build Students as musicians and personalities”, based on the holistic approach, enshrined in educational policy of Assumption University of Thailand and its Uniqueness and Identity, and the curriculum of School of Music. Whether train future professionals, as Major Students or Free Elective’s amateurs, the approach should be the same in terms of quality. Here are the headlines, upon which we should work, in view of the presentation of vision and mission, penetrating in profundity and details

of the problematic of the music teaching home and abroad as representatives of the Bulgarian School, built on the best traditions and patterns of the European and Russian experience.

What distinguishes us is the priority of the content, a clear conception; the synoptic and architectural analysis of the musical shape, the deep knowledge and correlations; the aspiration toward the transcendent of category thinking as a transmission toward the universal; the initiation of the creative field as a lifestyle. (Ivanova, 2009, 2015)

Should be formulated the main grounds depicting the formation of the whole personality of the musician, which is „conditio sine qua non” regarding the key relationship „Universe-Music”, by following Monads - question of questions - Founding Idea: What? And the means to its realisation: How?

Findings

There is competition of quality and the quantity. It is not important how long one is practicing, but the handling of it from the point of view of strategy, initiative, concentration and maximal effectiveness for minimal time; clarification of the relativity of the space-time continuum (Cf. Theory of Relativity). For reference we have the Leimer-Giesecking doctrine (Stoyanov, 1954). Practically to inspire the conviction that the short time is not an obstacle before the good result, only if we can set an orderliness and method in our lives.

The Ancient Romans said: „Non scholae sed vitae discimus”. We learn not for the school, but for the life. This sentence stresses of the triad of intellect, emotion and conditions as an emanation of “know” and “can”, applying our knowledge in the way of live. Here is also helpful to consider Judo principle – “The Way of Softness”- Love and Clemency as a universal approach toward everything, with which we interact and which surrounds us.

Our task consists in thorough clarification of the circumstance that the classical music is an European phenomenon of the western and world civilization. We must explain that if the Europeans, study, for example, oriental music, it is necessary to deal with literary and philosophical segments and substrates, which saturate each „fiber” of the cultural space of the context and under line, i.e. we should have the respective knowledge, at least the necessary minimum in order to understand and interpret the musical message, revealing the composer’s individue willpower.

As stated genially by Schuman: „Is not a good musician who is only a good musician.”

Regarding the binding, the materialization of the idea with the means of the craft, Mozart depicted it in a simple but magnificent manner: „Playing well piano? There is nothing easier than that: it is necessary only at a given moment, in a given manner, with a given finger, to push a given key”. Other mark: Intransigence with respect to the quality as a fundament of the teaching vocation: regardless whether we teach to professionals or amateurs, the difference in the approach is not qualitative but quantitative. Analogically, for example, in the building installation business, regardless of its scale, there are needed same fundamentals and requisites as construction project and works, depending on the will and the resources invested by the costumer (Ivanova, 2015).

The reality in other countries made us encounter a new challenges. Our generation has been postulated strongly professionally lead by the noble idea that the only option in the art is „Gradus ad Parnasum”, e.g. Step to Perfection. In this manner, the piano teaching was oriented toward the non-alternative highest professionalism.

In this aspect, it seemed quite different situation that in other countries depending on the proportion population-territory-welfare the piano is learnt by millions and only a very little part of them succeeds the professional realization.

In addition, many of our Students are Free-elective ones.

In reality, the contribution of our teachers in the building of a completely new mentality, relevant in the penetration in the idiomatic of the European musical culture, is incredible (Ilievska, 1984). Anyway, have to delimitate the culture from the civilization, because they are not identical at all. The civilization, much or little, reflects the development of the material being, and the culture functions as an evolution of the spiritual beginning. We strive and for big satisfaction, succeed to develop creative personalities of the Students. Teachers form styles, tastes and criteria as immanent prerequisites for the correct understanding and interpretation of the music. We strive for giving all we have, stimulated by the noble desire to give them education, adapt to their attitudes and tens, as aspiration for aiming paradigm of musical interpretation optimal level .

Such differentiation and sophistication of the perceptions and concepts implicate deepening of the relationship teacher-student, based on the respect of the personality, contributing to mutual understanding and tolerance by clarity and concreteness of the verbal contact. This way of communication appears to be productive, and the positive results in the work process prove it incontestably.

As feedback, the teacher should attempt to penetrate in the behavior and cultural codes, knowing the mores, the trends, the customs and the language of people whom is teaching in terms of traditional pattern. This suggests dynamics, flexibility, consciousness, opening and expansion of the notions arsenal, respect towards the otherness, tolerance and curiosity.

Results, Conclusions and Recommendations

After the above stated, we can give the following classification and determination of our current pedagogical tasks and directions.

1. Problems – Diagnostic and Methodology for their solving.
2. Analysis of the performances.
3. Directions and streams.
4. Purposes and realizations.
5. The importance of repertoire.
6. To expand the correlation of the Ear-Training teaching and basic theoretical disciplines.
7. The adequate own example of the teacher as paradigm and pattern.
8. To develop teaching materials lab, with reference to the specifics of the Department of Music Performance.

I

Teacher's Assignments

The pedagogue is obliged, with lots of attention, tact, and love, to prepare highly educated specialists, capable of sustaining the competitiveness and to realize their abilities adequately in the profession they choose.

The teacher is responsible for the education of versatile personalities, capable of taking the optimum decisions in time and independently, to respond quickly to the challenges of any kind, to adapt flexibly to the different and changing conditions and circumstances.

The teacher must:

Motivate his students to do their best by developing constantly their intellectual and spiritual potential, to organize and intensify to the possible optimum their working process on the principle of „minimum strain, maximum results”, to develop and streamline their will and ability to concentrate their attention and memory, to have patience and endurance, to bring their intentions and acts to the perfect end, to have right general knowledge by searching for the connections, the common between the different fields of knowledge – especially between the disciplines and arts

similar to their profession, such as architecture, music, literature, painting, history, and natural sciences, including Free-Elective Students.

The teacher must focus on the education of a feeling for style, sense of proportion and tact in behavior, for moral and ethics, esthetics and etiquette, for development of the communicative skills.

To possess and educate high criteria for professionalism and entrepreneurial spirit for quality and realization of the musical product, to be exigent and self-critical, to welcome innovations and betterments, to react flexibly to the opportunities and innovations, to strive to the optimum, to ask from students intensively but not extensive labor efforts, to be economic and pragmatic, to use properly the facilities and options.

To apply practically what they learn theoretically, to remember that it is possible to become teachers themselves one day, to remember that „we learn not for the sake of school but for the sake of life”.

II

Specifics of the educational process:

Develop holistic thinking as a system of the professional knowledge and skills.

Encourage a sense for justice and objectivity.

Draw the limit between crafts, mastery, and art, to get aware of high art samples.

The teacher cares for the proper ratio of the information and its compliance to the level and personality of each student, supplies more music in the lesson, gives examples from the living musical heritage. The aim of the teacher is to inspire students love to the musical art in general, to avoid boredom and routine in the academic class.

III

Feedback:

The teacher must be aware whether his/her method is effective and whether the results of the academic process correspond to the desired ones:

Learn from and to listen to the opinion and recommendation of their leaders and colleagues, and of their very students: To develop and consolidate trust and respect, to achieve mutual understanding in all matters:

The teacher should recognize, respect, and approve the individuality of each student and apply the proper relevant approach to each student and to all students in general. Be a person of principles and justice.

To continue working hard on his/her personality, irrespective of the achievements so far and to be able to show and prove practically what he/she is teaching.

Be always available for consultation and assistance for the students, to give them optimism and confidence, to advice how to overcome crises and problems, to encourage them in all constructive initiatives.

Teach pupils how to organize optimally their working time and place, to develop priorities and to form strategic and tactical thinking.

Understand that not only the quantity is important but quality.

Acquire criteria in order to distinguish the good production of real quality from mediocrity and surrogate.

Highlight and stimulate Student's accomplishments.

To try to be always competitive amongst the best because since they want it, they can do it!

IV

Courses Academic process organization: Applied piano, Keyboard Literature, Ear-Training

About mastering of the examination material under the course-outline have to develop the foundations for the healthy professionalism as guarantee of a successful and complete future professional realization.

The knowledge and the organization of the pianistic repertoire is designed to introduce the student into the panorama of all main styles, schools, and epochs in the musical culture, to contribute to their versatile piano artistic development, to educate a feeling towards the style, character, quality, towards sound deriving, touch, dynamics, tempo deviations, and usage of pedal, phrasing and fingering, to obtain knowledge in the form, structure, harmonic, homophone, polyphonic structure, texture, embellishments, music paper writing, editing, use of different published editions, introduction to the specifics of the different national schools in order to obtain a sense for artistic measure and ability to „listen and hear” objectively, to develop the internal hearing and to construct proper musical perceptions and ideas, to help formation of the proper good taste, to overcome the fear from the stage and to develop the musical memory in its main manifestations – on the first place the hearing, visual, motive, tactile, to acquire the proper staging, position and sitting, which is indispensable condition in piano playing, regardless amateurs as Free-Elective students, or majoring/minor future professionals.

Distribution of the time during the lesson of 60 minutes, as follows:

1. Scales – in all varieties: 05 min. (Ivanova, 2015)
2. Technique Exercices – J. L. Hannon – 05 min.
3. Etudes – K. Czerny – op. 299 and op. 740 – 10 min.
4. Polyphonic Piece – J. S. Bach, G. F. Handel, etc. – 15 min.
5. Sonata form – Vienna Classics – J. Haydn, W. A. Mozart, L. van Beethoven – 15 min.
6. Romantic, Impressionistic, or Modern Play – 10 min.

The lesson is conducted as lecture and dialogue, with the active participation of the student and illustration of the problematic by showing at the instrument by the teacher. Each lesson is a stage to the next one, so that the progress can become obvious in a short term. The focus should be student’s assessment as independent work over the material at home by giving proper and clear methodological instructions. The creative activity should be fostered and not passive „copying” of the teacher’s recommendations only. Attention and respect to the auxiliary means in the lesson should be developed, like notes, scores, audio-video-recordings and other references (Iliavska, 1978).

V

Keyboard Literature Lecture Timing:

First, the introduction into the world of the composer: Period, Age trends, styles, personality; second, creativity, genres and specific compositions and third-listening musical records, review scores and teacher’s Live Piano Performances.

Students follow the panorama of human civilization which requires significant knowledge. This approach is critical to transform the education database to become cultural background (Ivanova, 2015).

Note: In the above mentioned teaching-learning method during the lectures other practices are included too, such as musical scores sight-seeing reading, copying of a note text and other additional tasks and tests (Popova, Zlatanova, 1980).

VI

Ear-Training lesson:

With view of the course-outline and the practical needs of the musician, the following content of the academic lesson of 90 minutes should be used:

1. Check of the presence – 05 min.
2. Guessing tones – 05 min.
3. Reproduction of a short phrase – 05 min.
4. Two-parts performance – melodic and harmonic intervals – 10 min.
5. Triads and accords – 10 min.
6. Monophonic dictation – 10 min.

7. Diaphonic dictation – 15 min.
8. Ear training – monophonic – 10 min.
9. Singing in two and three parts – 10 min.
10. Reproduction of rhythmic formulas – 10 min.

The objectives consist of development of an attitude towards the main acoustic parameters of the tone – pitch, strength, duration and timbre, ability for hearing and reproduction, cultivation of the hearing as a main instrument in musical practice (Popdimitrov, 1977).

VII

Evaluation:

The students should clearly understand the objective criteria of the teacher and try to achieve optimal evaluations according to their labor, result, and abilities.

Abstract

Visual art with its ability to comprehensively influence the human development of individuals acquires special relevance in the dynamic development of community development and in an environment full of impersonal messages and negative information flow. Human brain activity is surrounded by visuality which is larger in comparison to hearing. Visual art is one of the means, by including its elements, to develop skills such as self-expression, ability to critically perceive and cognize the world and actively engage in various of human life activities. The object of the research: education process. The subject of the research: application possibilities of visual art's means in education. Goal of the research: to expand the view of the educational possibilities of visual art's application, by raising awareness of prerequisites of the potential for visual art, based on theoretical research and results of the practical research carried out, to draw conclusions, revealing development opportunities in interconnection of visual art's potential and pedagogic guidelines in education. Issues raised by the research: In what way the pedagogical potential of visual art reveals in personal development? In what way can means of visual art be purposefully used in education? Tasks of the research: To study theoretical and practical aspects of teaching visual art in the historical aspect in Latvia; To study application of visual art in education practice in implementation of certain pedagogical approaches; To study human, psychological, philosophical, arts literature on multi-functional possibilities of visual art and its complex influence on personal development; To carry out study of practical activity in application of visual art in education based on research of theoretical literature and experience of practical application of implemented approaches; To develop conclusions on visual art's application possibilities in implementing education based on theoretical and empirical research.

Keywords: Education process, Visual art, Pedagogical potential of visual art

Introduction

The question about the importance of art in human life has been raised among philosophers, artists, psychologists and pedagogues in all ages. Nowadays, when the younger generation grows in a visually fulfilled a world saturated with a negative flow of visual information, multifunctional visual products produced by the gaming industry, persistent visual advertising displays, festivals and shows of various visual quality, the architectonics of pedagogical cooperation between the teacher and the pupil is subjected to a complex and challenge-full situation when implementing the educational process. This raises the need to stress the issue of whether today the education process is being implemented in accordance with the fact that human brain activity is much more subjected to the visual perception in comparison to the hearing perception. Actualizing the purposeful inclusion of visual arts in the implementation of educational content, it's possible that it can become an important tool for solving particular problem aspects characteristic to modern education. Characterizing education of 21st century in general terms, it can be said that it is a life-long process, a component of our everyday lives and a conscious choice that brings gratification – desire to know more, faster, more accurate; it is a need to learn and to learn with understanding and joy, learn from each other regardless of social, economic or health status; it means learning in the environment suitable for individual needs using modern teaching aids (Par Izglītības...,2014). The Sustainable Development Strategy of Latvia until 2030 focuses on the fact that with the development of human ability to enter the labor market and build a professional career, education is also a process of development of human personality (Latvijas ilgtspējīgas...,2010). Consequently, the quality of education, its accessibility and content at all levels and in all age groups become especially topical in the context of Latvia's development. It is generally acknowledged that the quality of education in Latvia is not sufficient. Philosopher, the founder of integral theory, K. Wilber believes that a new society must be developed – one that will integrate consciousness, culture and nature, along with the formation of personal values, collective wisdom and technical skills (Vilbers, 2011). In order to prevent fragmentation of human work and life and mutual alienation, an integrated view of the educational process becomes more and more topical. According to K.

Wilber, such comprehensive view would gradually create a unity in diversity and general common features along with our differences, giving a legitimate work space to art, ethics, science and religion without reducing it only to an individual. At the same time, the supporters of these views raise a reasonable question: can such orientation exist in the context of cultural wars, identity politics, conflicting paradigms and individual policies? (Vilbers 2010). It can be presumed that it is a new beginning for a deeper and broader understanding of human existence which asks for perfection in all levels of education: society, organization/institution and the individual.

Scientists R. Wilkinson and K. Pikita speak about a paradoxical situation in human development, emphasizing the need for significant changes in education. The authors point out that presently humanity is in the age of the high material and technical achievements, but at the same time it experiences stress and tendency towards depression, feels insecure and does not feel a sense of community with people around (Vilkinsons, Pikita, 2011). K. Robinson, an internationally renowned expert in the promotion of creativity, innovations and empowerment, argues that education is not, and has never been, an objective process of developing natural abilities. The author notes that mass education is based on the prevailing economic vision and the phenomenon of academic knowledge inflation (Robinsons, 2013). In turn, people's feelings and opinions, sense of value, motivation and efforts are often ignored, which poses a general threat to the participation in current processes. K. Robinson sees that it is the existing education system that creates problems for the workforce in companies, organizations and public institutions, thus affecting both professionals and those without qualifications.

The above mentioned points out topical issues and existing problems in the field of education as a whole. Researcher I. Belousa highlights the transition from the acquisition of fragmented knowledge and skills, limited in sectors (cognitive approach) to the creation of innovations (social constructivist approach). The author rightly points out that sustainable education is comprehensive, it takes place everywhere, affects the whole society, its content is life, it is subject to evaluation, the teacher is an agent of change, and this process directed towards a positive future (Jaunais atīstības..., 2015). The concerns about educational problems are expressed also in the media environment, raising issues about providing support for the development of creativity and innovative capacities of pupils and youngsters starting from very early childhood, focusing on discovering and developing the child's innate capacities and believing that the society needs personalities rather than industrially beneficial people (Hauka 2015).

Both the Waldorf pedagogy and Emilio Regio's educational philosophy emphasize the integration of visual arts in the educational process. Educational institutions, which ground their work in these approaches, are in demand and work well around the world, ensuring a harmonious and full-fledged personality development. It can be noted that as a member of society every person is entitled to exercise the rights necessary for free development in economic, social and cultural spheres with the help of national policies, international cooperation and in accordance with each country's structure and resources, as well as the rights to participate freely in the cultural life and enjoy the arts (Universal Declaration...,1948). According to the Convention on the Rights of the Child, one of the goals of educating children is to respect and support every child's right to qualitative participation in cultural life and creative activities promoting appropriate and equal opportunities in cultural life and art (Convention on...,1989).

The research studies conducted by W. Earle, R. P. Jolley and J. S. Catterall and the findings stated in the program documents convincingly point to a number of benefits from the inclusion of visual arts in the educational content. Among others, it contributes to individual and moral development (Earle, 2013), contributes significantly to the holistic development of a personality (Jolley,2010), creates support for education and real life (Catterall, 2009), develops life skills (Art and..., 2009), eliminates discipline problems, improves communication, creates a sense of equality among pupils, enhances pupils' general achievement develops purposefulness and perseverance, increases motivation to learn, broadens the horizons, implements the link between science and art (The arts..., 2012).

The Company Harris Poll, after conducting an extensive social survey on the integration of visual arts in the educational process in America, has found that pupils' progress over the course of four years has improved by 2%, but 93% support this approach, while 86% of respondents indicate that there are improvements in relation to pupils'

attitudes towards education, 83% say that communication has become more effective among adults and peers, 79% believe that this is the first step of how to regain what is lost in the education of modern times (Americans believe...,2012). The European Union has recognized the educational aspects of visual arts in shaping the life skills of youth in the 21st century. This is confirmed by the European Commission's plan to carry out the monitoring of the educational effects of art on pupils' competences in the European Union (Art and..., 2009).

Including the visual art elements, it is possible to develop such skills as self-expression, ability to critically perceive and explore the world around and actively engage in diverse spheres of human activities. These questions still remain very significant. Culture and art are the most important components of human comprehensive education that ensure the full development of a personality. Latvia has acquired some historical experience in the evaluation of visual art in education.

The historical aspect of the formation of visual art education in Latvia

The development process of artistic culture in Latvia was essentially influenced by its historical heritage in 20ies - 30ies of last century. It is the time when valuable cognitions concerning education and teaching issues for the balanced development of personality were elaborated. Most of them are important also today. Certain activity was observed among teachers, artists and other interested persons who considered art as an important aspect in youth educating and teaching. The problem of pedagogical character was how to integrate mental potential of art in teaching. In solving concerned problem great importance was devoted to art teaching. R. Kroders in one of his publications pointed that society is not so incapable to feel colour, shape and sound as it sometimes seems. The teaching of such senses in point of fact differs from formal acquiring of knowledge. Along with scientific, religious, moral education, it was necessary to place artistic education. It expresses itself as an important addition to intellectual education in school life and promotes the development of attention, fantasy and creative action. R. Kroders characterizes artistic education as the culture of feeling organs and marked its importance in the development of sight and hearing for getting into the world of colours, shapes and sounds where abstract person wanders with blind soul. The author pointed also the importance of art in economic life, in making different objects and other multicoated spheres of human's activities (Kroders, 1939). Artist, teacher J. Springis moved forward the possibility for the establishment of the society of art lovers and thus to develop wide and versatile understanding of art with attention to more valuable life understanding. Considering art understanding of that time society there was opened wide sphere for action. It was necessary to introduce educational and teaching issues in the profitable direction. According to the opinion of most of the authors, such kind of job is not limited to preparing definite programmes, but it contains also series of others, enough complicated issues (Springis, 1925). How to promote understanding of art, skills for perceiving art, making dialogue between the receiver of artwork and artist's created works. In making dialogue with works of art A. Grikis made important attention to the thing that every intelligent individual and especially a teacher has to follow processes of art and to make the understanding of art role in education (Grikis, 1936). Already in 1920 A. Dauge remarked that art not only stimulates us to understand the beauty but also to create it. Teacher in his cognitions expressed the necessity of high culture education to promote the development of artistic perception. We can get significant impulses in historical experience for solving perception issues of works of art in modern schools. As it pointed A. Dauge art creates deep experiences and in the result, human obtains strong impulse not only for the development of his intellect but for his whole "I" mature what is the sacrifice of art (Dauge, 1920). The most part of authors consider that systematic work which improves the perception of work of arts should be started by inspection of original works what surrounded nature, present and history are reflected searching connection points with impressions of artist and viewer's memories.

Study of individual pedagogical approaches in the implementation of educational content that includes visual art

Waldorf pedagogy provides an important place to visual arts in its educational curriculum. The founder of this alternative approach is a German philosopher, occultist and pedagogue R. Steiner (1861 - 1925), whose activity was based on efforts to unleash human intellectual, social and, above all, spiritual forces (The Hutchinson ..., 1995). The first school, based on R. Steiner's philosophical views, was founded in Stuttgart (Germany, 1919) and its network exists also today in different countries of the world, including Latvia (Riga, Adazi). At the basis of

Waldorf pedagogy approach is the unification of science, art and religion, emphasizing artistic creativity and intuitive thinking. Thus, one of the basic principles of this approach is the inclusion of elements of art in all subjects. In turn, the educational process must be a work of art developed by the teacher and based on the regularities of the language of art. On the other hand, the educational institution that implements the concept of Waldorf pedagogy, has to adhere to several basic principles: to promote the child's ability to open-up for the world; not to expose children to premature intellectualization, which leaves a negative impact on the personality development; to stress the discovery of the human in the content of each subject; artistic must dominate in the learning process; in the process of upbringing the interaction between physical and spiritual elements must take place and it must reveal liveliness and independence; in the learning process all forms of diversity must be promoted, such as diverse teaching methods, learning space, implementation of the initiatives, and everything must be revealed through the motion and change. In Waldorf schools, such subjects are taught as visual arts, crafts, drama, eurythmy or art movements, vocal art, instrumental music, two foreign languages, mathematics, chemistry and physics. These subjects are not covered simultaneously, but periodically by each subject, then integrating them all together (Valdorfpedagoģija, 2015). A practising teacher believes that by drawing shapes in Grade 1 the writing skills are enhanced, the understanding about shapes is stimulated, and it facilitates the development of free-hand geometry up to technical drawing and projective geometry (Griezne, 2013). According to R. Steiner, art is essential also for the preparation of teachers, because it encourages exploring and learning the regularities of child's development. The pedagogue's perception of the child's development that is obtained through experience is the basis for spiritual pedagogical activity which fosters humanness within a human person (Šteiners, 1921). The experience of Waldorf pedagogy gives grounds for applying visual arts in the educational process also in general education institutions for development of a balanced personality.

The educational philosophy of Reggio Emilia stresses the influence of visual art on the personality development. This philosophy is originated in Italy after the World War II in the city called Reggio Emilia. Reggio Emilia currently is practised in more than 50 state funded educational institutions in which organize their activities in accordance with the established philosophical concept and they are ones of the most successful schools in the world. Reggio Emilia's philosophy, oriented towards the development of pre-school and elementary school learners, is based on a set of insights which also reveals the importance of visual art: Children have a strong interest, they are capable and curious; children learn better when working together with other children, family, teachers and the community; Children know "hundreds of languages" through which they make diverse discoveries – through moving, drawing, painting, modelling, creating collages, singing, playing musical instruments (Reggio Emilia...,2017). At the core of the implementation of Reggio Emilia philosophy is the unique, natural development of children in their own environment. The followers of this philosophy have the conviction that children have the right and they must be given an opportunity to develop their potential. Its operational experience is based on child-centred learning; creativity and aesthetics; collaboration; supportive environment; documentation; collaboration with parents. A child is considered to be both – an active knowledge constructor and a researcher. The process of acquiring educational content is predominantly organized in the form of project implementation, since such approach opens possibilities for research, observation, asking questions and discussing the issues in order to finally arrive at understanding. In their work educators incorporate important aspects that are proven in practice. They promote learning through collaboration and offer about hundred languages a variety of art materials (The hundred...,2017); show children's works and photos, present children's work; create portfolio of child's work (Reggio Emilia...,2017). It is important that the educators are specially trained in visual arts for working with teachers and children, in order to promote their expression using various media tools and symbol systems (Edwards, 2002). With the reference to the above mentioned, a research methodology has been identified, highlighting the importance of using visual arts in the educational process in accordance with the educational objective to provide to form an independent and developed personality for being a member of a democratic state of Latvia and society (Izglītības likums, 1999).

Characteristics of the potential possibilities of visual art

The cultural promoter and artist M. Fujimura believes that art is the cornerstone of the development of all civilization, pointing out that it is art that helps to understand oneself, teaches to respect the diversity of societies

and strengthen traditions, because art is everywhere and it is rooted in the very beginnings of human life (Fujimura, 2005). Art is one of the basic platforms of understanding the existence of a human life, which is based on the human ability to perceive and portray it in an imaginative way. It is important to point out that it is one of the forms of social consciousness that reflects people's interests, activities, the beliefs of different social groups, nations, society as a whole. In its broadest sense, art is all the processes and products of human mastery, imagination and inventiveness; opposite to nature (The Hutchinson ..., 1995). Nowadays, the manifestations of visual art are experiencing a peculiar condition in which the philosophical ideas of the era get thematically blended with the aesthetic and artistic ideas. At the same time, it can be noted that they open up new possibilities for creating new art products such as animation, video, manipulation in the digital environment, interactivity, synthesis of arts using sound, movement, light and images, which allows unifying elements of art language in a peculiar synthesis. Art scientist E. Gombrich notes that nowadays visual art is a time for courageous inventions and innovations, at the same time only a few comprehend what is happening and do not even realize how much of it has entered into human lives, influencing the formation of taste and preferences (Gombrihs, 1999). This creates new challenges and the need for revising the educational content in the context of the age. Dialogue with visual art is fostered by its imaginative character. In psychology, the term "image" is considered to be a subjective phenomenon that arises as a result of subjective-practical, sensory-perceptive thinking, which is a reflection of reality, in which the most important categories (space, movement, colour, form, texture, etc.) exist at the same time. In an informative way, the image is an extensive representation form of the surrounding reality (Psiholoģijas vārdnīca, 1999). Consequently, it can become an important stimulus for teacher-pupil cooperation. According to the philosopher V. Ageyev, each visual art type uses only a set of expressions characteristic of it and determines the peculiarities of the dialogue in which the spectator participates as a person who perceives the information offered to him (Agejevs, 2005). The imaginative thinking mechanisms play the key role in the process of artistic communication. For example, Cardinal J. Pujats commenting on the works created by artist V. Buss says that Buss is not satisfied just with the rendition of the outer shell, but he tries to dive into the essence of the phenomena that is being exposed, giving the spiritual interpretation of the narrative. Even more, the Cardinal states that the art created by an artist evolves from the in-depth aesthetic attitude towards reality – native land, countryside and cities, people's work (Valdis Bušs..., 2014). The viewer, building dialogue with the art, builds on his own experience and knowledge. Consequently, the impact of art on a person can be described as a variational and multifaceted. Due to the general depiction of objects and phenomena, visual art has a potential for influencing the whole person, thus it becomes an important tool for education and upbringing purposes.

Characteristics of the multifunctionality of visual arts

Artist V. Buss, describing the essence of visual arts, believes that real, great art in its diversity and versatility is not meant for people's entertainment. It can be a great experience that makes not only one or many people mentally deeper and stronger but gives the strength of even a whole nation to overcome the most difficult moments of its existence (Valdis Bušs..., 2014). Visual art is an emotional communication, the transmission of specific information between people and the exchange between contemporaries and the epochs. It is the language in which the artist expresses his/her feelings and experience in a form of images and opinion about various life situations. It also includes information about time, culture and achievements. Visual art is a system of signals when one generation passes on its experience to the next. The task of the artist is to find the basic concept of his/her time, which does not disappear, and to choose the appropriate form and means of expression. Thus, the visual art work becomes the most objective testimony of the time to which the work of art belongs to (Postašs, 2009). Art, which is a harmony between mind and emotions, turns to human mind, feelings, imagination and to the subconscious, showing the person the meaning and goals of his/her life and helping to understand the world and one's own self. An analysis of works of several authors (Ageyev, Dauge, Buss, Esaak, Fujimura, Kroders, Ostrow, Postašs, Reisman, Springis, Vyzman) who explore art and artistic activity, allows distinguishing a number of art's functions (see Table 1).

Table 1. The functions of visual art in opinion of artists, pedagogues and scientists

Visual art functions	Opinion of scientists, artists and pedagogues
Content function	Determining the content - What does the artwork mean at a given moment? This factor must be considered before trying to identify other functions: V. Buss, E. Esaak, P. Postazs, L. Vayzman;
Physical function	Masterfully designed works with a certain function: architecture, design, applied arts – A. Ageyev, E. Esaak, J. Springis;
Social function	Portraying social conditions: politics, patriotism, satire – E. Esaak, S. Reisman, S. Ostrow, L. Vayzman;
Personal function	Self-expression, communication, leisure, therapy, faith – A. Dauge, M. Fujimura, A. Grikis, R. Kroders, E. Esaak, L. Vayzman.

The teacher, writer and artist S. Esaak distinguishes three basic functions of art: social, personal, physical (Esaak, 2017). S. Reisman, the director of the movement “New York City's Percent for Art Program” and artist, designer and art historian S. Ostrow, have explored more in-depth the social function of visual art (Reisman& Ostrow, 2013) Professor L. Vayzman indicates six functions of art: art for delight, persuasion, commemoration, worship and ritual, commentary, and self-reflection (Vayzman, 2014). In general, visual arts are the processes and products of a human workmanship, imagination and inventory. The art education issues are historically and currently addressed by educators, psychologists, artists, writers, philosophers and other specialists both in Latvia and abroad.

Method

The object of the research: education process. The subject of the research: application possibilities of visual art’s means in education. Goal of the research: to expand the view of the educational possibilities of visual art’s application, by raising awareness of prerequisites of the potential for visual art, based on theoretical research and results of the practical research carried out, to draw conclusions, revealing development opportunities in interconnection of visual art’s potential and pedagogic guidelines in education. Issues raised by the research: In what way the pedagogical potential of visual art reveals in personal development? In what way can means of visual art be purposefully used in education? Tasks of the research: To study theoretical and practical aspects of teaching visual art in the historical aspect in Latvia; To study application of visual art in education practice in implementation of certain pedagogical approaches; To study pedagogical, psychological, philosophical, arts literature on multi-functional possibilities of visual art and its complex influence on personal development; To carry out study of practical activity in application of visual art in education based on research of theoretical literature and experience of practical application of implemented approaches; To develop conclusions on visual art’s application possibilities in implementing education based on theoretical and empirical research.

Findings

The authors conducted the research exploring the views of Year 2 students of study programme "Teacher" about the essence of visual art, understanding of art and its influence on personality development, as well as about the positive and negative aspects of visualization. 48 respondents participated in the survey (20 students in 2015, 28 students in 2016/2017).

Table 2. Essence of visual art in opinion of respondents

Essence of visual art	Opinion of respondents (%)
Expression of personal emotions	23
Expression of beauty	14
Expression of creativity	12
Manifestation of expression	12
Reflection of regular work	8
Expression of personal imagination	8
Expression of personal feelings	8
Expression of personal joy	8
Proof of personal intelligence	7

23% of respondents understand the essence of visual art as an expression of personal emotions, but 14% understand it as the expression of beauty. 12% of the future teachers involved in the survey see art as the expression of creativity and manifestation of expression. Defining visual art, students acknowledge regular work as important aspect (8%), expression of personal imagination and feelings (8%), as well as see art as proof of personal intelligence (7%). The components mentioned by future teachers defining the essence of art give grounds for a meaningful dialogue in the pedagogical process implementing the intended curricula.

The role of visual arts in personality development

In opinion of several scientists and educators (Dauge, Edwards, Esaak, Fujimura, Garrett, Kroders, Postazs, Buss, Vayzman) teaching visual art means not only showing how to mix the paints and make shapes out of clay, but also it needs to stimulate pupils' self-reflection, self-criticism, visualization skills, and ability to learn from mistakes while experimenting. Such skills are important for performing any type of work. With the help of the survey, the views of future teachers were clarified about the role of visual art in personality development. The opinion of respondents is revealed in Table 3.

Table 3. Visual art for the personality development

Personality development aspect	Opinion of respondents (%)
Self-expression of personality	19
Creativity development of personality	15
Discovering the versatility of visual art	13
Development of aesthetic feelings of personality	12
Development of emotional feelings of personality	10
General personality development	9
Intellectual development of personality	9
Development of a value conception of personality	7
Development of personal beliefs	6

The research results reveal that 19% of respondents believe that visual arts and creative activity provide possibilities for self-expression, 15% - for promoting creativity, 13% - for recognizing the versatility of arts, 12% - for formation of ethical views, 10% - for development of emotional feelings, 9% - for general personality development, 9% - for intellectual development, 7% - for developing understanding about values, 6% - for formation of a world-view. The respondents' answers reveal the complex and multifunctional effects of visual art on the development of personality. They encourage teachers to understand more comprehensively the areas of how visual arts affect the personality.

Actualization possibilities of visual art in the educational process

Visual art is a special language and at the same time an important tool for personality development that can have a significant impact on the whole educational process (Dauge, Fujimura, Kroders, Vayzman, Ostrow, Reisman, Springis). The aim of the survey was also to find out the views of the future teachers about the actualization possibilities of visual art in education. The views of respondents are presented in Table 4.

Table 4. Actualization possibilities of visual art in the educational process

Work forms for actualization of visual art	Opinion of respondents (%)
Visual art exhibitions	22
Information and communication technologies	20
Projects	16
Workshops, camps	9
Festivals, holidays	8
Discussions, presentations	6
Excursions	6
Art markets	4
Days of culture	4
Auctions, Leisure time	3

The obtained results show the versatile opinions of how the future teachers see the inclusion of visual art in the process of education:

- **visiting, organizing and arranging visual art exhibitions - 22%**. The art has its own language expressed through visual representations, which everyone needs to learn how to read. Visual images reflect our needs, everyday achievements, our expectations, experiences and ideas;
- **information and communication technologies – 20%**. Nowadays, the potential actualization of visual art is significantly influenced by the continuous development of information technologies, by creating qualitatively and quantitatively new communication level opportunities with non-present visual art works and processes that are taking place in the art space. The use of information and communication technologies becomes a learning method on the one hand and an art-making tool on the other hand;
- involvement in local and international **collaborative projects - 16%**. It is an opportunity not to distance oneself, but to cooperate, to create common experience, values and goals, showing mutual respect, sense of community and trust. When creating a collaborative network, it implies the principle of tolerance, including openness and respect for cultures and lifestyles; the principle of cooperation between cities and educational establishments, enabling new ways for combining the resources that are available to everyone and jointly address common issues; active participation in arts, culture and research;
- 9% of respondents mention **creative workshops and camps**. It is an opportunity to lay the foundation for a new level of cooperation in the future and to create a dialogue in the art space by acting practically, gaining new experience and discovering new dimensions in the cooperation process;
- **festivals** are acknowledged by 8%. Currently, it is recognized that festivals have informative and representative character, which encourages, stimulates and shows the achievements in arts. Participation in festivals is a great way for gaining experience in the international art context and motivates cooperation;
- organization of **excursions** is mentioned by 6% of respondents, the organization of **art markets and cultural days** – by 4%, while the importance of organizing **auctions and leisure time** is stressed by 3% of respondents, as it encourages the exchange of experience and thoughts, widens the horizon and mutual enrichment;

The summarized responses confirm that the teacher can apply the potential possibilities and functions of visual art in many different ways while implementing the curriculum, thus, encouraging, motivating and supporting each student and helping the students to find their place in the social environment and create meaningful life activities and interpersonal relationships.

Investigation of the positive and negative aspects of visualization

The use of visual techniques and materials goes hand in hand with the development of cultural history. As noted by scientist V. Ageyev, today expressions such as "visualization", "visual communication", "visual perception", "visual thinking" are often used in psychology, self-expression, semiotics, and visual art (Agejevs, 2005). The opinion of the future teachers on the advantages and disadvantages of visual art is presented in Table 5.

Table 5. Positive and negative aspects of visualization

Positive aspects	Negative aspects
It is an opportunity to understand the past and the present and sometimes also the future.	Not always can be understood without explanation.
Encourages the emergence of new ideas and creativity of the person	Copying of ideas; Putting ideas in the frames
The ability to visualize, show, and create unconventional things	Gloomy and negative colours and tones.
Visualization can move deeper than what is read, written, heard;	Creation of negative emotions with visual activity; May create unpleasant images that cause emotions of the same nature.
Creates positive emotions	
Ability to get acquainted with world's places without	Discriminatory attitude can be exercised

being	
there (photos, videos)	
Visual art is the most convenient way to get to know things;	Provides an inaccurate idea
Ability to see and touch, better understanding of events;	
Explains explicitly	
There is a chance to create something unusual from unneeded things	Others will not accept it and will criticize it.
Beautiful, eye-catching, gives positive impression – flower beds, various natural landscapes;	Untidy spaces collapsed buildings that cannot be restored.
Influences person's mood	
With the help of visual art, everyone can express their views, and make the public think about things and events.	People with poor eyesight do not remember or perceive so
A new vision, open creative thinking that fosters future development.	well; can be difficult to see.
Creating images that last longer in the memory	Influence from others;
Positively unburden daily life, creates a sense of safety; Creates the opportunity to live in the visual world	It is possible to diminish other people's self-esteem It takes a lot of time.
More information is perceived in comparison with hearing.	Intrusive message sweeps up the senses.
A message is communicated (symbols, mood, emotions, etc.)	Exaggeration of effects can make it difficult to see the essence
	Screaming colours and symbols give unpleasant feelings (e.g. ads for big promotions).

The research shows the interest of future teachers about the use and inclusion of visual art activities in today's educational practice. Respondents point to certain significant positive and negative aspects of self-expression, as well as give its critical evaluation. The opinions expressed by the respondents on multifunctional nature of visual art and its impact on human development are in line with the findings of scientists and artists. The research results show that visual art is an integral part of human life, which combines education, craftsmanship and ability to create. It is necessary to actualize and improve the readiness of the future teachers to assess the potential of visual art.

Conclusions

The 21st century is characterized by dynamism and rapid change, which brings both benefits and challenges into the content of education. Visual art is an integral part of the educational content, and its implementation can be grounded in significant historical experience and lessons learned from alternative pedagogical models. At the same time, it can be noted that the potential possibilities of implementation of visual art in the general education content for comprehensive and harmonious development of a person have not been properly assessed.

Nowadays the application of visual art for the implementation of educational content is significantly influenced by communication technologies. The virtual environment has become an important living space, which can also become an important tool for assessing the multifunctionality of visual art and enhancing human ability and understanding of the world.

The possibilities of using visual art for the implementation of educational content include the application of diverse forms of work in pedagogical practice. When modelling pedagogical practice, it is necessary to actualize person's self-expression, stimulation of creativity, and acquisition of moral ethical norms. Visual arts can become an important tool for preventing the fragmentation of educational content in sectors, as well as a tool for education, upbringing, socialization and for providing pedagogical support.

Abstract

In this study, the levels of fulfillment of the Framework of Turkish Higher Education Competencies of Boğaziçi University Faculty of Education students and Sakarya University Faculty of Education students has been examined at the undergraduate level. Knowledge (theoretical, factual), skills (Cognitive, applied), ability to work independently and take responsibility, learning competence, communication and social competence, area-specific competence were examined within the scope of the research. The study population consists of students that had education at Boğaziçi University and Sakarya University in the 2014-2015 academic year. The sample of the research consists of 307 students, participated in the study, that were randomly selected from Boğaziçi University and Sakarya University Faculty of Education. The study is in the descriptive scanning model and firstly the relevant literature was searched. "Survey" was selected as the scale type. 5-point Likert type scale was used in the Survey of Turkish Higher Education Competencies Framework Level Determination. SPSS 17 statistical program was used in analyzing the data obtained through the measuring instruments used. Descriptive scanning method was used as the study model. According to the results of statistical analyses of the application conducted within the scope of the study, it was found that Levels of Fulfillment of the Framework of Turkish Higher Education Competencies of Boğaziçi University Faculty of Education students at the undergraduate level are higher compared to Sakarya University Faculty of Education students.

Keywords: Higher Education, Quality, Accreditation, Framework of Turkish Higher Education Competencies, The Bologna Process.

Introduction

In the world, since the second half of the 20th century, as for Turkey, mostly with the 2000s, a massification has begun to emerge in higher education and this quantitative growth has brought the problem of qualitative leap nowadays (Çetinsaya, 2014, Akt: Gülpınar, 2014).

Higher Education in Turkey

The institutions of higher education established during the Ottoman era went through great transformations with the Republic. Among these transformations, the main ones were 1933 university reform and the higher education laws of 1946, 1960, 1973 and 1981. The legal framework for higher education was determined according to the constitutions of 1961 and 1982(Kucukcan and Gur, 2009).

Competencies Framework

Competency in the field of higher education tells what an individual, who successfully completes any higher education level, knows, does and is capable of (WEB 1).

Frames help to make it easy to understand and compare competence practice (WEB 3).

Studies of Creating the Framework for Turkey Higher Education Competencies

The first studies to establish the National Competencies Framework (NCF) in higher education in Turkey was initiated by the Council of Higher Education after the Summit of Ministers which was held during Bologna Process in 2005, in Bergen and which finalized the resolution of the framework of national competencies. Later, the Commission and the Working Group continued "Studies on the formation of Turkey Higher Education Competencies Framework in the light of the opinions coming from stakeholders. (WEB 8).

Method

Descriptive scanning method was used as the study model.

Population and Sample

The study population consists of students that had education at Boğaziçi University and Sakarya University in the 2014-2015 academic year.

Data Collection Tools

In the study, the Survey for the Determination of Turkish Higher Education Competency Framework Level at the Undergraduate Level was used.

1. The Survey for the Determination of Turkish Higher Education Competency Framework Level at the Undergraduate Level

The Level Determination Survey of Turkish Higher Education Competency Framework at the Undergraduate Level was used. The survey consists of 43 questions. It is a five-point likert scale test.

Data Analysis

According to the reliability analyzes made, the Cronbach-alpha value of the whole scale was determined as 0.950 and it was observed that a very good level of reliability was achieved. The reliability levels of scale dimensions are given in the table below. According to this, since the reliability levels of all dimensions are higher than 0.8 it is revealed that a good level of reliability has been achieved also in scale dimensions.

Findings

In this part, the findings obtained will be mentioned:

Table 1. Average, Standard Deviation, Skewness and Kurtosis Values of the Study Variables

Variable	Average	Standard Deviation	Skewness Value	Kurtois Value	Normal Distribution Conformity

The arithmetic averages of expressions of scale dimensions were taken and new variables were created to determine how the Turkish Higher Education Proficiency Framework Level Scale dimensions at the undergraduate level were perceived by the participants in the survey with a holistic approach and to determine the average of the opinions shared. The following table contains the average, standard deviation, kurtosis and skewness values of the mentioned variables.

Variable	Average	Standard Deviation	Skewness Value	Kurtois Value	Normal Distribution Conformity
Knowledge Level	3,41	,745	-,694	,550	Conformable
Skill Level	3,68	,671	-,895	1,484	Conformable
Independent	3,61	,765	-,546	,357	Conformable

Competency of ability to work and take responsibility

Learning Competency	3,83	,627	-,844	1,189	Conformable
Field-specific Competency	4,03	,620	-1,288	3,229	Conformable
Communication and Social Competency	3,83	,627	-,844	1,189	Conformable

Table 2. Knowledge Level Variable Evaluation Scores and t-Test Results

Variable	University	n	X	ss	t	p
Knowledge Level	Boğaziçi University	228	3,52	,659	4,239	,000
	Sakarya University	76	3,06	,877		

When looked at the averages of the Knowledge Level variable, it has been found that the level of knowledge of Boğaziçi University students is higher than the level of knowledge of Sakarya University students according to the independent sample t-test results.

Table 3. Skill Level Variable Evaluation Scores and t-Test Results

Variable	University	n	X	ss	t	p
Skill Level	Boğaziçi University	228	3,77	,623	4,386	,000
	Sakarya University	76	3,37	,714		

According to the results of an independent sample t-test, it has been revealed that the skill level of Boğaziçi University students is higher than the skill level of Sakarya University students.

Table 4. Competency of Ability to Work and Take Responsibility Variable Evaluation Scores and t-Test Results

Variable	University	n	X	ss	t	p
Competency of Ability to Work and Take Responsibility	Boğaziçi University	228	3,69	,743	3,501	,001
	Sakarya University	76	3,34	,781		

According to the results of an independent sample t-Test, it has been found that the competency of ability to work independently and take responsibility of Boğaziçi University students is higher than Sakarya University students' competency of ability to work independently and take responsibility.

Table 5. Learning Competency Variable Evaluation Scores and t-Test Results

Variable	University	n	X	ss	t	p
Learning Competency	Boğaziçi University	228	4,12	,575	4,404	,001
	Sakarya University	76	3,72	,731		

According to the results of an independent sample t-Test, it has been revealed that the Learning Competency level of Boğaziçi University students is higher than the Learning Competency level of Sakarya University students.

Table 6. Communication and Social Competence Variable Evaluation Scores and t-Test Results

Variable	University	n	X	ss	t	p
Communication and Social Competency	Boğaziçi University	228	4,01	,505	9,951	,000
	Sakarya University	76	3,24	,607		

According to the results of an independent sample t-Test, it has been revealed that the Communication and Social Competency level of Boğaziçi University students is higher than the Communication and Social Competency level Sakarya University students.

Table 7. Field-specific Competency Variable Evaluation Scores and t-Test Results

Variable	University	n	X	ss	t	p
Field-specific Competency	Boğaziçi University	228	4,11	,518	3,527	,001
	Sakarya University	76	3,76	,806		

According to the results of an independent sample t-Test, it has been revealed that the field-specific competency level of Boğaziçi University students is higher than the field-specific competency level of Sakarya University students.

Results and Discussion

In this study, Boğaziçi and Sakarya University Faculty of Education students' levels of meeting THECF at undergraduate level were studied. The results obtained are as follows:

1. The averages for "Level of Knowledge" show a significant difference in favor of Boğaziçi University students in terms of two university students.
2. The averages for the "Skill Level" show a significant difference in favor of Boğaziçi University students in terms of two university students.
3. The averages for the "Competency of Ability to Work Independently and The Responsibility" show a significant difference in favor of Boğaziçi University students in terms of two university students.
4. The averages for the "Learning Competency" show a significant difference in favor of Boğaziçi University students in terms of two university students.
5. The averages for the "Communication and social competency" show a significant difference in favor of Boğaziçi University students in terms of two university students.
6. The averages for the "Field Specific Competency" show a significant difference in favor of Boğaziçi University students in terms of two university students.

As a result, when Boğaziçi and Sakarya University's level of meeting THECF at undergraduate level is examined, it has been seen that the level of Boğaziçi University Education Faculty students is higher than Sakarya University Education Faculty students.

In this part, some useful information is given as recommendation to researchers who will carry out new studies in this field.

1. The study was carried out only by comparing Boğaziçi and Sakarya University Faculty of Education Students. Students in different fields can be included in the study.

2. The perceived level of Turkish Higher Education Competency Framework of the students participating in the study can be re-evaluated by considering their economic levels and genders.
3. The number of students participating in the research can be increased.
4. In order to determine the students' level of meeting THECF in different places, the study can be conducted in different provinces, different regions or all over the country.
5. The reasons for the fact that Sakarya University Faculty of Education students' knowledge skill level, independent working and taking responsibility, learning, communication and social competencies are lower than Boğaziçi University Faculty of Education students can be studied. Studies can be done to increase these levels, skills of Sakarya University Faculty of Education students.

Abstract

The aim of each teacher's professional activity is a gradual awareness of one's own pedagogical activity, its independent planning, adjusting and implementing, and readiness to analyse and reflect on it. During the times of change, it is crucially important to find a personally significant meaning within a particular professional activity, and to be ready to implement one's own ideas, to communicate the achieved results and to be able to discuss them. This research is focussed on pedagogical challenges of preschool teachers during the process of implementing the child-centred approach. The challenges of pedagogical activity are caused by differences in teachers' perception, experiences and readiness to adopt the child-centred approach and educational content that comes with it, which is based on a holistic vision that promotes children's skills to learn independently, solve problems and make decisions, as well as their ability to think flexibly and to use the acquired knowledge and skills in different life situations (Elschenbroich, 2001, Marcon, 2002, Crain, 2005, Kinos & Pukk, 2010). Despite the fact that in preschool education practice this approach is being employed already since the mid-1990s, the analysis of experience shows that many teachers understand differently the nature of teaching and learning, and tend to preserve both the academic aspect and their dominant (authoritative) role when choosing the learning content and form. The main challenges are: 1) changing the dominant role of teachers when ensuring child's meaningful activity; 2) the ability to balance between the academic and social aspects of teaching and upbringing; 3) the ability to reflect on one's activity and change. The aim of this research is to describe these pedagogical challenges and to develop recommendations for improving the pedagogical activity of preschool teachers while implementing the child-centred approach. The research results presented in this article are analysed as part of the case study. The data are obtained from the video analysis of teachers' pedagogical activity (N = 6), from surveying the preschool teachers (N = 102), from analysis of pedagogical documentation/ materials (integrated lesson plans) (N = 80), and from evaluation (reflection) of teachers' activity (N = 80).

Keywords: preschool education teacher, child-centred approach, reflection on teacher's activity.

Introduction

The changes brought about by the 21st century make a lot of people turn to new and challenging work environments in order to acquire new knowledge, skills, competences, new vision, values, and attitudes. In preschool education this situation is characterized by the transition from teacher-centred teaching to child-centred learning by reducing the academic approach and increasing socially oriented learning and improving the competence of pedagogues to ensure the child's holistic development (Eiropas Komisija, 2011). This requires a change in teachers' awareness about their professional pedagogical activity, its content and methods of implementation.

Despite the fact that in Latvia the child-centred approach in preschool educational practice was introduced already in mid-1990s, the analysis of experience (Grava, 2012; Mikelsone, Grava&Pavitola, 2017) shows that we still cannot talk about a complete transition to it. Therefore, it is important to identify the challenges and conditions that affect preschool teachers when they implement a child-centred approach in their pedagogical practice.

Teacher's pedagogical professional activity during the implementation of change

The aim of each teacher's professional activity is a gradual awareness of his/her pedagogical activity, its independent planning, correction and implementation, and readiness to analyse and reflect on it. In the times of change, it is particularly important to find a personally significant meaning in the particular professional activity (Schein, 1993, *Пряжников*, 1996, Wenger, 1998), as well as readiness to implement ideas, communicate the results of one's activities (I.Lāce, 2014) and the ability to discuss them (Mikelsone & Odina, 2016). Learning to teach is not just a matter of applying decontextualized skills or reflecting on pre-defined patterns (Britzman, 1991: 8). Learning to teach (also to teach oneself) is always a process of formation. As Wenger suggests, learning is not only collection of skills and information, but also a certain personality formation process (Wenger, 1998:215). In such transformation process, the perception of who we are and what we can do is changing. Assuming that the process of self-formation is also the process of learning, four components can be distinguished (Wenger, 1998:5):

- 1) Meaning. Learning through the experience: the ability to perceive one's own life and the surrounding world as meaningful;
- 2) Learning. Learning as doing: joint activity based on common historical and social resources, background systems and views;
- 3) Communities. Learning to be affiliated (to belong): belonging to a social community in which activities are recognized as valuable and competent;
- 4) Identity. Learning as becoming: understanding how learning influences and shapes us in the context of community.

Being active in the educational environment teachers face different experiences related to education, teaching and learning in different contexts, therefore the concept of learning described by Wenger is useful for exploring the complex process of change in which all today's preschool teachers are involved.

Teachers are not always ready to accept and implement the new and changing context of teaching and learning. Especially if during their previous professional "history" they had always relied on the ratings provided by other authorities which they believed were objective, complying with general, predefined criteria, which everyone had to achieve in the same way. The teacher's success or failure was measured by implementation of curriculum and by the published results of national standardized tests (Timoštšuk & Ugaste, 2010). Today it is important for the teachers to be aware of how they learn, how they teach others, and how they respond to the changing learning contexts (Bullough & Gitlin, 2001:45). The responsibility for teacher's professional development is passed on to the teacher him/herself (de Janasz & Forret, 2008). It is solely up to the teacher what he/she will learn and how he/she will respond to the changing context of teaching (Bullough & Gitlin, 2001:45).

Adjustments in the teaching and learning context deeply transform the work of the teachers and bring about changes that make the teachers ask: can I be who I am (Bullough & Gitlin, 2001). For a better understanding of one's own professional self, the teachers need to learn to reflect on their activities. However, if the focus is maintained to standardized norms and if the teacher lacks the support of trusted team members, at the moment many teachers find it easier to accept the feedback rather than to reflect on his/her own actions. Speaking about one's own activity, teachers must be able to be honest and open to themselves and think – what can I do differently? Therefore, teachers must become more open to reflection, because it gives:

- 1) understanding of what has happened or where the teacher stands in his/her activity,
- 2) perception or ability to "see" what happens;
- 3) the ability to admit/ recognize one's feelings.

When teachers implement the change of the pedagogical approach, the process of self-formation becomes important; it is related to finding a personally significant meaning, taking individual responsibility for one's own work and ability to reflect on one's activities.

Theoretical basis of child-centred approach

In the second half of the 20th century and in the 21st century, in Latvia (Karule, 1992; Meikšāne, 1998, Krastiņa & Salīte, 2008, etc.) and in the world (Scheller, 1981; Marcon, 2002; Edwards, 2005), the theoretical ideas about the formation of a child-centred learning environment and the active involvement of children in the learning process are assessed as suitable for preschool education. It implies modelling of subjective experiences, which contributes to the development of children's experience of self and is related to the questions: what do children need; what is offered to them. This vision is based on the constructivism theory and is considered to be the most appropriate theoretical basis for preschool education in the 21st century (Motschnig-Pitrik & Holzinger, 2002; Krastiņa & Salīte, 2008; Sheridan, 2009; Zarina & Belousa, 2011). This means creating such learning environment in which the children want to learn and where they learn out of their personal initiative. Children want to learn and they learn independently from adults because learning is an internally motivated process. From a teacher this requires other professional competence, which is not related to creating a learning environment in which ready-made knowledge is delivered (Gordon, 2009).

The following constructivism aspects form the basis of the child-centred approach:

- 1) Children are active participants in the learning process; they construct knowledge themselves based on their previous experience. The construction of knowledge starts from this experience by overcoming the cognitive conflict between existing knowledge and the external unknown reality (Piažē, 2002). New knowledge is acquired with the help of speech, senses and active activity, adding them to the existing experience (Powell & Kalina, 2009). Teacher does not teach children but provide children with the opportunity to learn by themselves (Tafa, 2008), creating such learning environment, which encourages children to be curious and ask questions;
- 2) The social and cultural context is equally important for the individual and subjective experience of children. Acknowledging that the children are active participants in the learning process and design their own knowledge, the meaning is given to the social context – the role of the other people in the learning process (Вьготский, 2005). All cognitive functions arise from social interaction, and any function in child's cultural development appears twice: at the social level – between people and at the individual level – within the child him/herself. This is evidenced by the nearest development zone theory developed by Vygotsky, which distinguishes between the child's real or actual level of development, which reveals child's ability to solve problems independently, and the potential level of development to which the learning process is oriented and which is determined by the ability to solve problems with the help of adults and in cooperation with the more capable peers. This means that for children's development such situations must be created, which children cannot solve on their own and in which they need support from the teacher and their peers. Also the children's previous experience is recognized in social and cultural context (Брунер, 1977), as well as the fact that children learn by observing, imitating and modelling the behaviour of others (Бандура, 2000);
- 3) Children are a closed informative system; they cannot acquire knowledge from outside – they only can construct it themselves (Glaserfeld, 1989). Without denying the objective reality, it is assumed that a child cannot know what reality is. The mental constructs that are based on past experience help to establish certain order in the flow of experience. When children face external or internal obstacles and the problem arises, they change, adjusting to the new experience (Glaserfeld, 1989). Thus, in the learning process the psychological and physiological peculiarities of children are important (Dougiamas, 1998; Улановский, 2008);

- 4) There is a relationship between the child's activity and thinking in the learning process (Piažē, 2002; Matthews, 2003; Выготский, 2005; Gordon, 2009) and child's daily life and personally relevant problem situations (Dewey, 1956). Learning is an active, creative and problem-oriented process that begins in a customary day-to-day environment when the child faces the unknown (Dewey, 1956; Sutinen, 2008). A teacher with his/her knowledge drives a child into new experiences, maintaining a balance between the learning organized by a teacher and learning that is performed independently by a child (Gordon, 2009). Therefore, learning cannot be viewed solely as an individual or just as a social process – individual cognitive and social processes have to be integrated into the acquisition of knowledge, because children learn in different ways: either trying to solve the problem independently, or co-working with peers or with the help of a teacher (Gordon, 2009). This allows describing the child development as a problem oriented activity in which the following roles are emphasized: children as researchers and teachers as children's supporters.
- 5) The formation of a child's attitude and solving problem situations are essential, particularly emphasizing conversation and self-reflection (Taylor, 1998). Children are directed towards formation of a positive attitude, mutual communication during the activities and the assessment of their achievements. The learning process is determined by three features: (1) active and collaborative participation of children in the learning process; (2) a learning process based on the formation of attitudes; (3) motivation of children for learning (Brostrom, 2006). Thus, the children's development is related to their desire to be curious and to explore, with the emergence of interest that promotes the child's motivation to learn.

All of these constructivism aspects share a key feature – learning as an active knowledge construction process based on past experiences (Murphy, 1997), in which the child participates in the formation of the environment and the learning process. In the educational environment, which gives the child an opportunity to solve his/her own problems and achieve the result, the child is encouraged to explore the world around him/her. Therefore, it is important to specify the contexts, conditions for teachers' pedagogical activity and the features that support the child-centred approach (see Table 1).

Table 1. Child-centred pedagogical activity of teachers for the holistic development of children

Context	Condition of pedagogical activity	Features
Problem-oriented context	Providing children with opportunities to choose (1)	- the choice of materials, resources and type of expression; - the choice of activity and time
	Creation of problem situations for potential development of children (2)	- support, if necessary, at the level of children's current developmental stage, in which the children themselves are able to solve the problem; - creation of situations in which children cannot solve the problem independently, and providing support to them
	Ensuring self-motivated learning of children (3)	- ensuring conditions for children to ask questions; - ensuring conditions for evoking interest in children
Continuous cognitive context	Variety in resolving a cognitive conflict (4)	- organization of active participation - indirect support (indirect teaching, knowledge transfer)
Social context	Development of a meaningful interaction (5)	- listening to children and waiting for children's reply
		- organization of conversations and peer

Subjective context	Ensuring /promoting the child's positive experience (6) Organization of child's self-reflection (7) Attributing a personal meaning (8)	cooperation - a positive and interested attitude - respecting child's thoughts and feelings - Exploring previous subjective experiences of children - Organizing the self-evaluation of child's performance; - Linking the topic to the children's daily experiences (subjective meaning); - exploring children's interests and subjective experiences
--------------------	--	--

Teachers' pedagogical activity always takes place in specific contexts, in which it is possible to determine the criteria and characteristics of pedagogical activity that can also be used for analysis of pedagogical experience.

Research design and data collection methods

For this research the case study (Geske&Grünfelds, 2006) is employed for analysing and interpreting the acquired data relevant to educational practices, preschool education in particular. The case study has a discerning nature and it focuses on a deeper exploration of the problem, concentrating on details and reciprocal links and describing the pedagogical challenges faced by preschool education teachers in Latvia.

Various data collection methods were used for this study ensuring the scientific validity of the case analysis: survey (N = 102), analysis of integrated lesson plans (N = 80), teachers' performance assessment (reflection) (N = 80), video analysis of teachers' pedagogical activity (N = 3) and interviews (N = 3). The choice of respondents was based on the subjective selection criteria, in particular the method of convenience, i.e. the most accessible representatives of the general sample were involved. In Latvia, there are 647 state preschool educational institutions which implement preschool education programs, and the data obtained from representative sample are attributed to the general sample as a whole. The study was conducted in the period from November 2016 to June 2017 in several stages, using the benefits of the case study methodology for collection of complex data.

In the first research phase, the survey was conducted and the integrated lesson plans analysed with the aim to clarify the problems that preschool teachers detect themselves and to discover their theoretical understanding about the implementation of the child-centred approach. It gives a general idea of the current situation in preschool education in Latvia.

In the second phase, the observation of teachers' pedagogical activity was performed, which was recorded on video, with the aim to identify the teachers' pedagogical activity in practice, followed by interviewing the teachers using a semi-structured interview with the goal to understand their subjective perception about a child-centred approach and to see the possible processes of change.

In the third phase, the reflections provided by the teachers were analysed.

Findings

In the first phase of the study, the survey results were analysed using both descriptive and analytical-statistical methods. Each response and all the responses together were analysed, clarifying the activities/ situations which the teachers themselves consider as problematic when implementing the child-centred approach.

A contradiction can be detected in the understanding and opinions expressed by the teachers – initially, teachers point out that children's individual development, age, abilities, etc. are important (37%), which confirms teachers' theoretical understanding of child's individual development as an important condition, but analysing problems which teachers face in their educational practice, 35% of respondents admit that the tasks given to children in day-to-day practice are not relevant to the child's experience, interests and their stage of development. Not always, when implementing the pedagogical process, the actual, individual needs of the children are taken into account. 27% of teachers believe that in preschool establishments the emotional well-being of children is provided, that the child is enjoying the learning process, the child is independent, noticed, listened to, and that the child's interest in various things is supported by the teacher and the parents. At the same time, only 2% of the respondents believe that a free, independent child's activity is an important way of acquiring knowledge in preschool age, and 4% of respondents consider the environment as a significant factor. Thus, it can be assumed that the teachers do not understand completely the content and substance of a child-centred approach.

28% of the respondents point to the problems in *teacher-child* relationships, dominated by the "strategy of influence" (Šteinberga& Tunne, 1999:19) or a teacher-centred pedagogical position when the teacher is a sole decision maker. Despite the fact that teachers theoretically understand/ know how children develop, learn and acquire new knowledge, however, in the teaching practice the dominant teacher's position is preserved. The answers of 12% of respondents allow to conclude that when planning the daily rhythm the preschool establishment does not take into account the time needed for acquiring skills and abilities, as often games, which children have started to play, get interrupted in order to follow the teacher's plan to continue with activities of another content. Survey data revealed that only 5% of respondents base their planning of an integrated learning process on preschool education programs and guidelines. This fact raises the question about the relevance and importance of this document to educators.

14% of respondents indicate that in preschool a child-oriented learning environment, the one that promotes initiative, autonomy, cooperation and interest, has not been created. Thus, describing the background of preschool education and identifying the main problems in the pedagogical work of teachers in implementing the child-centred approach, it can be concluded that the preschool teachers theoretically know what it is, what its content is, but in practice it is not fully implemented. The child's experience is taken into account minimally; they get very little involved in the planning of activities. The "strategy of influence" that is characteristic to teacher-centred approach is still seen in the preschool education practice. The question about the practical use of existing preschool education programs and guidelines is still open for discussion.

Analysing 80 integrated lesson plans, attention was paid to two aspects: defining the anticipated results and the development of the context for the child-centred approach. The anticipated results can be assessed from a teacher's position or a child's position. In the first case, the teacher decides on what content to teach, plans how to implement and evaluate this content. This approach focuses on the teacher's performance and on assessment of how well the children have learned the material they are working on. In the child-centred approach anticipated results tell what children will be able to do and what they will know at the end of a certain learning period. Anticipated results focus on what the child must achieve, not on the teacher's intentions. The context of the child-centred approach is analysed following the conditions and characteristics of teachers' pedagogical activity reflected in Table 1.

As a result it can be concluded that out of the 80 integrated lesson plans analysed, 64% of the planned anticipated results are designed as teacher-centred. For example, in the integrated lesson theme "Wild

Animals" the following anticipated results are defined: *"strengthen the understanding of the concepts - big, small, largest, and smallest"*, *"to develop small finger muscles"*, *"to develop imagination"*. The results to be achieved reveal the teacher's intention, not what the child will be able to do or know. When analysing the inclusion of the child-centred approach context (see Table 1) into the integrated lesson plan, a qualitative content analysis was employed, which emphasizes the integrated view on the data and the specific contexts and allows interpreting the social world in a subjective, but scientifically fashionable way (Pipere, 2011:227). The analysis confirmed that the focus of teachers is more on the content of the integrated lesson plan, for example, in natural science the aim is "to get to know a pet – a cat and get acquainted with the characteristics of a cat (fluffy, cute, angry)", as well as on a description of specific forms of work and methods, such as observation a living object, imitation, manipulation with objects, play using the movements. Contexts of child-centred approach and their conditions are revealed indirectly. They are not specially designed, but the content analysis shows that the integrated lesson plans generally have all the contexts and conditions, but they are not included in each plan separately. The problem-oriented context and social context are identified the most clearly, for example, the theme "Healthy Lifestyle" provides free choice for children, allowing children themselves to work with the characters and role-play situations in which different characters choose healthy products. The emphasis is also placed on the context of continuous reasoning and its condition of "ensuring the child's self-motivated learning" as well as its characteristic: to explore and deduce independently.

It can be concluded that the current preschool education lesson plans do not have provision for inclusion of special contexts of the child-centred approach. However, changing the integrated lesson planning structure, preschool teachers would be encouraged more to reflect on their pedagogical activity already in the planning process and develop integrated lessons plans, including all contexts of child-centred approach: continuous cognitive context, problem-oriented context, social context, subjective context and their conditions (see Table 1).

At the Stage 2 of the study an observation of teachers' performance was carried out and interviews, with the aim to clarify the actual situation of pre-school education practice. The child-teacher relationships were observed during the morning circle and play activities. For collection and analysis of observation data, a grounded cyclical approach described by Ansdell and Pavlicevics was applied: observation – description – interpretation (Martinson, 2011). In total 3 cases were documented in three institutions. Observed cases were captured in video recordings. Total recording time for the video is 107.70 min. 39 episodes were distinguished for the case analysis.

Table.2 Data about the cases

Description of Case A	Description of Case B	Description of Case C
The case is observed on 10.02.2017. Participants: 1 teacher (10 years of teaching experience), 1 teacher's assistant, 16 children (3-4 y/o). Length of the video: 50, 32 min, 13 episodes documented.	The case is observed on 15.04.2017. Participants: 1 teacher (5 years of teaching experience), 1 teacher's assistant, 11 children (2-3 y/o). Length of the video: 29, 34 min, 14 episodes documented.	The case is observed on 21.04.2017. Participants: 1 teacher (5 years of teaching experience), 12 children (3 - 4 y/o). Length of the video: 28, 04 min, 12 episodes documented.

The recorded play activities and a morning circle are organized in routine conditions. Interviews were conducted on the same day following an observation. The purpose of the semi-structured interview was to find out the subjective experience of the preschool teachers in organizing the preschool educational process and to obtain in-depth information on teachers' understanding, attitudes and beliefs about the child-centred approach used for children's development. The interview

consisted of 15 questions based on the analysis of theory, observation of play activities and analysis of the data obtained from the surveys.

Respondents for observations and interviews were selected based on the researchers' personal subjective assessment and selection, which is supported by a non-probability sample (Geske & Grinfelds, 2006). Three pre-school teachers, with teaching experience of more than 5 years, were interviewed – they were the ones that led the play activities, which were video-recorded. The data for this study were collected separately (through observations and interviews), but analysed and interpreted in an integrated way.

Table 3. Summary of the characteristics recorded in interviews and observations according to the conditions mentioned in Table 1

Case A	I	V	I	V	I	V	I	V	I	V	I	V	I	V	I	V
Conditions	1.		2.		3.		4.		5.		6.		7.		8.	
Level	3	1	3	3	3	3	2	3	3	3	3	2	3	2	1	1

Case B	I	V	I	V	I	V	I	V	I	V	I	V	I	V	I	V
Conditions	1.		2.		3.		4.		5.		6.		7.		8.	
Level	2	2	3	3	3	2	3	3	3	2	3	2	3	2	2	1

Case C	I	V	I	V	I	V	I	V	I	V	I	V	I	V	I	V
Conditions	1.		2.		3.		4.		5.		6.		7.		8.	
Level	1	2	2	2	2	2	2	2	3	3	3	2	2	2	1	1

Abbreviations: **I** – found during the Interview; **V**- captured in Video recording
 Characteristics of levels: 3 – corresponds (both features observed); 2 – partly compliant (a single feature observed); 1 - do not match (no features observed).

In all cases, the interviews acknowledge the significance of social context in preschool education practice, emphasizing both the need for meaningful interactions and for promoting the child's positive experience. However, in the video observations, no respect was found for children's thoughts and feelings in any of the cases, which shows that the promotion of a child's positive experience is only partially implemented. In the case A, also the formation of meaningful interactions was manifested only partly – the failure to wait for the child's response was observed, for example, *if the child cannot answer immediately to the teacher's question, the teacher responds in his/her place.*

Although in the interviews, in two cases (cases A, B), the child's self-reflection organization was highlighted, then in the video recordings only a partial manifestation of this characteristic was found in all cases.

Attribution of personal meaning is partly observed only in one of the interviews, for example *"from the very morning – when greeting each child and asking how he/she feels and what is new, the teacher must express interest and admire it all."* However, this feature was not present in any of video observations.

Thus, it becomes evident that although theoretically teachers are aware of the benefits of the child-centred approach for the child's holistic development, its features are not all applied in preschool teaching practice. Analysing the data obtained through video recordings and interviews, the following challenges for teachers are identified: the attribution personal meaning, ensuring the possibilities of choice, as well as providing the self-motivated learning.

During the third stage of this research, the teachers' reflections (N=80) on their work were analysed, with the aim to understand the teachers' ability to reflect and evaluate their activities, keeping in mind the need for professional development and readiness for change. It can be concluded that teachers' reflections are more of emotional character, they do not reveal much about the performed activities but rather the assumptions about children's feelings and their activities, such as "*children were interested*", "*children liked it*". The described situation or activity is not reflected fully, for example, "*I can communicate and cooperate with children*," or does not show that things can happen also differently: "*I can organize and manage active and interesting lessons both indoors and outdoors because I am a sports teacher*". Very few specific skills are described – what I did and what I will do next time. Consequently, there is no basis for awareness about what needs to be done to improve the performance (Callanan, 2003). A positive result, the one that matches the plans, is taken as self-evident and nothing is specifically analysed and evaluated in order to understand how it has been achieved. According to de Bono (2012), this means that there are no further steps assigned which would guarantee that this success can be repeated. Thus, it can be said that teachers provide more the evaluation of their performance, rather than the evaluation of the work process, and that the reflections have more nature of feedback rather than the one of reflection. The analysis of the interviews showed that teachers consider the concepts *self-reflection* and *feedback* as synonymous, for example, to the question "how is child's self-reflection organized?" the teachers responded: "*At the end of each lesson I ask the children what they liked and what they have learned*"; "*Feedback is a very important part of the play-activity*". However, reflection provides an understanding and awareness about what a person has mastered, and raises awareness about the fact that a person is able to change his/her attitude, behaviour, and performance both in individual and professional context (Mikelsone & Odina, 2016; Cottrell, 2013), which is very important when implementing changes in preschool educational practice.

Conclusions

The pedagogical activity of teachers always takes place in a specific environment, operating conditions, with the specific purpose and tasks for which they are responsible. By analysing the teachers' activities according to the nature of the child-centred approach, one can identify several challenges that teachers have to overcome or accept:

1. The research proved that the teachers know and understand the essence of the child-centred approach, but they do not apply it fully in their practice. Teachers ground their work in their pre-designed integrated weekly plan, but elaborating it they do not take into account (or take too little) the interests and needs of children, and also involve the children too little in the process of decision making. Therefore, one of the challenges that teachers should address is involvement of children in the planning of pedagogical process.
2. An essential condition for teachers' activity in a child-centered pedagogical process is the assignment of a personal meaning to the child's activity, linking it with child's daily life and his/her subjective experiences. Thus, a significant challenge in the work of a preschool education teacher is respecting the child's subjectivity and the development of a sense of a personal meaning.
3. When implementing the pedagogical process including integrated lessons, all contexts and conditions of the child-centred approach must be observed. If only one or a few of them are implemented, then it is not possible to talk about a holistic development of a child, as then the dominant role of the teacher and a "passive" role of the children is maintained, which is more characteristic for a teacher-centred approach. Thus, the challenge for preschool teachers is to be able to implement their pedagogical activities and to develop integrated lesson plans in a way that matches all four contexts and eight conditions of the child-centred approach.
4. It is important for preschool teachers to master reflection skills as an essential tool for implementing the change. Being in the process of transition from a teacher-centred position to

a child-centred approach, reflection ensures not only a deeper understanding of what teachers have learned and how they have done it, but it gives an opportunity to change their attitudes and behaviour both in individual and professional context, which is essential for the implementation of change in preschool educational practice. So the next challenge for preschool teachers is the acquisition of reflection skill and its regular application in their pedagogical work.

Abstract

The right to health and, consequently, to a higher quality of life is one of the fundamental rights of a person. Every human's individual responsibility is application of all opportunities provided by the state for the sake of own health protection. Therefore recreation is important - a purposefully organized rehabilitation of individual's physical, mental and emotional abilities, which promote the individual's productivity and also serve as prophylaxis to somatic and mental illnesses, health promotion and promotion of individual's productivity. The main functions of recreation are healing (human health rehabilitation), educational (development of spiritual potential) and sports function (development of physical abilities). In order to ensure the educational function of recreation, alongside the individual's responsibility and awareness of healthy lifestyle urgency and necessity, creation of the society's education on a new quality of education - health literacy – has to be emphasized. Therefore, health literacy has to be perceived as one of the most important components in adult education.

Key words: health literacy, recreation process, educational function of recreation, adult education.

Introduction

According to T.Koçe (Koçe, 2012), the essence of adult learning is to justify theoretically and develop an integrated training content for adults and efficient pedagogical techniques how to convert the theoretical knowledge into the necessary life skills. Education and living standard correlate directly and closely with health. In Latvia health literacy is on a pretty high level compared with lots of southern and eastern regions in the world, although it drops significantly behind the level of Scandinavian countries and several Central European countries. Health literacy shows correlation between the person's education level and their ability to maintain health, improve it or observe a health promoting treatment regimen. Health literacy is the cognitive and social knowledge, competences and skills which determine the individual's motivation and opportunities to obtain, understand and apply the information the way it would promote and guarantee a good health.

Aim of the research: study implementation of health literacy in adult education in the context of the recreation process.

Method

Literature analysis.

Interview.

C. Maslach's methodology for detection of burnout syndrome manifestations (processing of the research outcomes has been carried out with the help of software SPSS 11.5).

Findings Adult Education as Public Opinion Developer

According to the report developed by the International UNESCO Committee: "Learning: the Treasure Within" (1996), adult education is the matter of the whole nation, it is an impressive force for the society's transformation. Adult education changes into a system which initiates the society's renewal, accelerates the scientific, technological and social progress, it becomes the learners, educators and employers' common activity of innovation. In adult education learning to live together, acquisition of knowledge and skills, working on your own, development of your own life and living are set as the main

tasks. The power to stimulate change lies in the hands of conscious consumers and active citizens through the choices they make every day. The modern life gives a person new opportunities and choices, but at the same time also new risks and insecurity. People can choose different lifestyles, but at the same time they themselves are responsible for their own life development.

In the “Memorandum on Lifelong Learning” (2000) lifelong learning has been defined as all purposeful activities related to learning which are carried out independently with an intent to improve knowledge, skills and competence. It is not any longer just one aspect of education and training; it has to become the leading principle, providing and acquiring education in absolutely all educational areas. Such a vision is being introduced in life.

The term “lifelong learning” pays attention to time: it is education for the whole life course which happens either permanently or temporarily, but the term “lifewide learning” enriches the term, paying attention to dissemination of education which can penetrate into all our life areas during any stage of our life. The dimension of “lifewide learning” helps us see better how formal and non-formal learning supplement each other. It reminds us that purposeful and interesting learning can happen in the family, leisure time, social life and daily work life, also it makes us understand that teaching and learning are roles and types of action themselves which can be changed and exchanged in different times and places.

As T. Koçe (Koçe, 2012) emphasizes, the global goal of adult pedagogy is improvement of human quality of life.

Multidimensional Concept of Human Quality of Life

According to I. Brown (Brown, 2003), quality of life is a sensitive concept which provides us with an opportunity to look at human life from different points of view. One can look at both life in general and disability through the prism of quality of life, which enables us to see different aspects and be aware of the existing challenges. B. Bela and T. Tisenhofs (Bela, Tisenhofs, 2006) emphasize that quality of life mostly depends on the person’s creative approach to life, capacity and practical activity. The factors of quality of life include welfare, braveness, sustainability which is provided by education, health participation in social processes, the situation in family. I. Šķestere (Šķestere, 2012) in her research confirms that the assessment of quality of life is always closely related to what definition of quality of life has been chosen for the conceptual base, it is important to obtain a sufficiently broad insight into the definement spectrum of quality of life. On the basis of various authors’ cognitions on quality of life, a summary of definitions of quality of life and their descriptions has been carried out.

Table 1. Quality of life characterizing aspects from different authors’ point of view

Authors	Description
Emerson, (1985)	Satisfaction of the individual’s values, goals and needs through the actualization of the person’s abilities or lifestyle.
Parmenter, T. (1988)	Quality of life reflects the level in which the individual has been able to satisfy their needs and has developed own personal awareness of life, self-esteem and ability to integrate into the social environment.
Goode, D. (1990)	Quality of life has been guaranteed if the individual with or without disability has been provided with an opportunity to satisfy such needs as home, education, work, society, as well as living life which is considered as normal by the rest of the society.

Felce & Perry (1995)	Human satisfaction and feeling of comfort derive from the stage in which the individual's objective situations comply with their desires and needs.
Bach M. un Rioux M. (1996)	Social feeling of comfort, which is felt by the individual, community or society in general.
Cummins R. (1997)	Quality of life is a set of objective and subjective factors, which includes the material feeling of comfort, health, productivity, intimacy, safety, community's and emotional feeling of comfort.
Falce, D., Perry, J. (1997)	Quality of life is a multidimensional concept which includes the human personal feeling of comfort. It is related to intimate relationships, family life, friendship, standards of living, work, neighbourly relations, place of residence, country, home, education, health and safety.
World Health Organization Oort, (2005)	Perception of the individual's personal life position in the context with the system of culture and values, in which the individual lives, and in relation to the individual's goals, hopes, standards and worries. It is affected in a complex way by the person's physical health, psychological condition, person's opinion, social relations and the most significant factors of the environment.

According to the authors, health is a significant quality of life characterizing element. The respondents involved in S. Medne's (Medne, 2011) research "The Influence of Health on the Quality of Life," assessing the quality of life, have most highly appreciated the relationships in family and among friends, health and self-esteem follow only after it.

Despite the increase of medication consumption, respondents' health self-assessment and quality of life have not changed essentially. The research confirms that the respondents with a higher self-esteem assess their quality of life better. The common respondents' opinion and conclusion of the research is that health is very essential in the assessment of the quality of life and quality of life is affected by disease forms and the individual's common emotional prosperity – happiness and satisfaction.

The goal of the European Health Protection Policy "Health 2020" is to support an activity which would improve essentially people's health and welfare. A good health is important for economic and social development and economic recovery support. The main elements of health policy are the values which are included in the Constitution of the World Health Organization – all people with the possibly highest level of health; health development, where health is a resource which enables everyone to implement their potential and promote the society's development; problem solution, accepting new approaches for the health sector organization; involvement of the interested people on the basis of researches and experience; attention to the individual and collective endeavours in order to reduce essential drawbacks in the health sector. A good investment in health can be provided applying the human lifestyle approach and giving people the chance to participate themselves in the process.

Significance of Recreation in Promotion of Human Life Quality

Recreation is a purposefully organized recovery of the individual's physical, mental and emotional abilities, it promotes the individual's productivity, as well as serves for the somatic and mental disease prophylaxis, health improvement and individual's productivity promotion. A person can have the leisure time daily when the daily recreation activities are performed at home; at the weekend when the recreation

activities are performed outside home; on holiday when longer journeys with accommodation outside home are performed – the recreation tourism. According to many authors' opinions (Torkildsen, 1999; Jenkins, Pigram, 2003; Kari, 2008; Torjman, 2004; Korpela et al, 2014), I.

Kundziņa (Kundziņa, 2014) points out that recreation is a value for both the individual and society. It means that recreation can be characterized as an activity, diversity of form, motivation to get enjoyment, acting in leisure time, voluntary participation, universality, purposefulness, flexibility, creation of a by-product and satisfaction of human needs. Recreation has a direct impact on the factors which form the personality; improving, promoting and satisfying human involvement and needs in recreation activities and actions, their feeling of comfort and quality of life will improve. Awareness of the recreation significance and recreation activities improve the human quality of life and feeling of comfort, well-being and even safety. They do not have to have sports activities. The most important thing to consider is that wellbeing/feeling of comfort/well-being is the resource of economics and development both in the life of the society and every individual. Welfare, satisfaction and sense of happiness improve people's mental and emotional health, balance between their work and private life, self-realization and ability to cooperate and get on well with others.

Health Literacy in Recreation Process

The most important functions of recreation are the healing (human health recovery), educating (development of mental potential) and sports function (development of physical abilities). Implementation of the functions is related to the concept of *health literacy*. In the global context the meaning of *health literacy* is the opposite to the so called health illiteracy, i.e. lack of knowledge on own health, its assessment, maintenance, promotion, preservation. The term *health literacy* was used for the first time in 1974 in relation to the "necessity to incorporate pupils' education on various health issues in the school education system." During the following decades the term *health literacy* obtains an escalating popularity in the scientific discourse, which results in its wider and more varied definement, conceptualization and application. Regarding health literacy, one more recently emerged term has to be mentioned – *know-how*. This term includes not only the knowledge on something, but also sufficient skills to apply the knowledge practically in daily life. The term of the word compound *know-how* is in a way a synonym to *health literacy*.

According to I.Stars (Stars, 2015), the term of health literacy understanding can have several levels and at least two of them are – the individual or social context level and the second – in the biomedicine or public health perspective. Conceptually understanding of health literacy is characterized with two different criteria. The individuals functional skills (reading, speaking, listening, counting), the skill to find, understand and apply information for health improvement purposes, being able to function in the health care sector and making adequate decisions about own health are mentioned as the main health literacy elements. Another approach emphasizes that health literacy also includes the person's civic consciousness and skill to balance own individual activity with collective responsibility, as well as the competence of technologies and media, which provides the person with an ability to assess critically the available health information.

Health literacy is the cognitive and social knowledge, competences and skills, which determine the individuals' motivation and possibilities to obtain, comprehend and apply information so that it would promote and guarantee a good health. It characterizes the correlation between the person's level of education and their ability to maintain health, improve it or observe the health promoting treatment regimen. Acquisition of new knowledge increases the capacity of brain, therefore it is important to use any chance for new knowledge acquisition. Physical activities increase the capacity of knowledge acquisition, in its turn good knowledge helps to do sport all life long. Thinking is brain movement.

Further education, cultural activities, discussions, reading, chess and card games move away people from memory deterioration (LAB, 2014). In the work of the International Healthy Cities Conference (2015) one of the main cognitions: healthy aging is provision of continuous lifelong learning possibilities, learning as increase of productivity and a way of spending leisure time.

Results

In order to study implementation of the educating functions of the recreation process in the health literacy context in adult education, 2 groups of respondents were established, in total 90 members (45 for each). The respondents' professions in Group 1 (28 men and 17 women) are related to work in different companies, but the members of Group 2 (14 men and 31 women) are related to work with people. The selection was carried out randomly in compliance with the participants' voluntary choice to take part in the research.

In the recreation process it is important to find out the main health affecting problems. It is hard for people to balance their time- the time spent with the family, at work, for studies and relaxation. Thus the lack of time management skill, overconsumption of own energy and inability to replenish it, as well as the inability to rethink what we are going to do are quite often causes of stress and burnout. Almost everybody in their daily life uses the term "stress." However, hardly anybody is really aware of the true meaning of the word, neither the fact that the common negative meaning of the stress is so plain – it can not only harm, but also help and be even harmless.

As in the modern age of information overload, technologies and competition a human being is more and more often exposed to stress and the burnout syndrome, in the first stage of the research the respondents' burnout level was found out applying C.Maslach's methodology for burnout syndrome detection that consists of 22 statements which the respondents have to evaluate on the scale from 0 to 6 points. The chosen methodology measures 3 burnout components: emotional exhaustion, reduction level of depersonalization and personal achievements. The research data processing was carried out for each respondents' group separately and the outcomes are summarized visually in the pictures.

Figure 1.Reduction level % of personal achievements

According to the percentage data in Figure 1, it can be concluded that 48.9% of the people working in industry have a high reduction level of personal achievement (hereafter Group 1) and 68.9% to the workers whose jobs are related to work with people (hereafter Group 2), 40% respondents of Group 1 and 24.4% respondents of Group 2 have an average reduction level of personal achievements, in its turn a low reduction level of personal achievements is 11.1% and 6.7%, respectively respondents of Group 1 and Group 2.

Figure 2. Depersonalization level

The percentage data collated in Figure 2 reveal that 17.8% of Group 1 and 15.6% respondents of Group 2 have a high depersonalization level, an average – respectively 37.8% and 44% respondents of both groups, in its turn a low depersonalization level is to 44.4% and 40% of respondents.

Figure 3. Emotional exhaustion level %.

The data collated in Figure 3 enable us to see that 40.0% respondents of Group 1 and 31.1% respondents of Group 2 have a high emotional level exhaustion, 35.6% respondents of Group 1 and 44.4% respondents of Group 2 have an average emotional exhaustion level, in its turn 24.4% respondents of Group 1 and 24.4% respondents of Group 2 have a low emotional exhaustion level. The research outcomes reveal that among the respondents with a high reduction, whose professions involve work with people, shares exceed statistically significantly (0.05) the respondents whose professions are connected with work in different companies, shares. Among the respondents with an average reduction, whose professions are connected with work in different companies, shares exceed statistically significantly the respondents who in their profession are connected with work with people, shares (0.01). Among the respondents with a low reduction there are no statistically significant differences. Among the respondents with a high depersonalization the shares do not differ statistically significantly, there are also no statistically significant differences regarding the average or low depersonalization. Among the respondents with a high emotional exhaustion level, whose professions are related to work in different companies, shares differ statistically significantly from the respondents whose professions are related to work with people, shares. There are statistically significant differences among the average level indicators of emotional exhaustion, but no differences among the indicators of the low emotional level.

The research reveals that the respondents, whose jobs are related to work with people, are more exposed to emotional exhaustion and depersonalization, but the respondents, whose jobs are related to the work in different companies, to personal achievement reduction.

During the 2nd stage of the research a task was set to find out the respondents' opinion on the recreation process, its significance in quality of life improvement.

Collating respondents' opinion in both groups it can be concluded that the most important aspects of the impact of recreation process in quality of life assurance are health, its enhancement, individual self-esteem, possibilities of self-realization, relationships in the family and at work.

During the 3rd stage of the research a task was set to find out the respondents awareness of health literacy. The explanation of the term aroused difficulties to the respondents. The "Health Study" acquired during the school times, frequent visits to doctors to control their health condition, involvement in work of different disease societies were mentioned most often. Involvement in various sports, individual sports activities and interests were mentioned less often. A few respondents emphasized the significance of interest groups in development of sporty activities. More active organization of different health promotion groups, which would be available for people of interest, was expressed as a recommendation. As a positive sample was mentioned the beach callisthenics group in Liepaja on the Baltic Sea coast together with a coach. Among the suggestions it was recommended to make an interest group for theoretical and practical classes in the health literacy context.

Implementation of the 4th task in the research encouraged the respondents to get involved in an education and practical activity which gave opportunities to assess promotion of health literacy in actualization of the recreation process. The instructor of the dance Zumba S. Priedola introduced the respondents with the dance, which combines elements of Latino dance, international music and fitness, its origin. The coach highlighted that both dancers and non-dancers can get involved in the classes equally well and fast as no previous knowledge in the dance art is needed. Zumba creates a free atmosphere which encourages people to move both non-dancers and the ones who usually do not like taking part in group classes. On the other hand, the dancers and experienced sports people are attracted by the change of rhythms, healthy and lively entertainment atmosphere during the classes. Anyone can enjoy the music and process. Zumba is based on the principle that the classes have to be simple enough and entertaining, so that the participants could attend them for a longer time and they would achieve noticeable health improvements. Zumba can be described as a cure or even therapy to fight low spirits and weariness.

In the interview the instructor points out that Zumba fitness classes have already been taking place in Liepaja for three years. The observations confirm that it is a huge socialization process. There are lots of women who attend the classes, for on daily basis they encounter monotonous lifestyle, depression.

Everything has changed due to Zumba classes. All Zumba participants have met other women, they have found equal peers of interest, they do not struggle with powerlessness and gloomy mood any longer, but they attend the classes, enjoy them. The number of men involved in the classes increases gradually. Another obvious criterion is that the participants accept challenges, set a goal and try to achieve it purposefully. Lots of people attend Zumba classes in Liepaja, thus these classes are like a mass of movement. People see that living healthily and actively is exciting, that is why they also invite others to join in. The instructor mentions the "hidden" training as the benefit of the classes: the participants can feel like in a party, but at the end of the class they are sweating; they have a high energy consumption level: during one class it is possible to burn 700 calories, depending on the individual physical fitness and movement intensity; it is a cure against stress and tiredness, participants forget about their worries;

their coordination and flexibility are improved; obesity problems are being solved; cardio training: dance movement strengthens body muscles, including the most important muscle - the heart.

In the respondents' assessments the main cognitions about the completed work are that in group classes can be involved not only the people who are already fit and with a good sense of coordination, but anybody, whatever their level of fitness is; help people feel and look well, improve their fitness, forget about the age; be aware of movement significance in health improvement and maintenance; simply become a little bit happier.

Conclusions and Recommendations

Striving towards the improvement of quality of life a necessity emerges to pay more attention to health, its enhancement. Knowledge on health, its positive and negative influencing factors are important. This confirms the need of the health literacy term's explanation to any member of the society. Due to the research it has become clear that adult education is an important base for health literacy promotion in the public recreation process.

In the health literacy context interdisciplinarity is very important, where solutions can be found in different areas of interconnection, providing availability of education in all ages, giving opportunities to acquire skills, an appropriate professional competence. An interdisciplinary point of view helps to choose a complex solution. In order to implement an interdisciplinary approach, needs and efficiency have to be assessed, the possibilities and necessity of integration have to be specified.

The theoretical cognitions of health literacy and recreation and practical skills can be acquired through action learning. Sitting at a desk is not a very suitable and efficient way of learning for adults. In a direct practical action learning both the knowledge is checked and acquired, and various methods and suggestions are tried out.

Experiential learning is assessed positively in adult education. Just such kind of learning is important in health literacy and recreation process, for it covers lots of learning areas, activates the activity, analysis of the events and reflection. In health therapy context the participants, joining together in groups of interest, generate new knowledge, develop abilities and improve skills.

Self-directed learning takes an important place in health literacy. It confirms the personality's ability to control own goals, sets the development and improvement criteria. Developing own action plan, setting the tasks to be completed, the human being promotes development of own self-assessment skills. In order to improve the procedure of the recreation process, it is important to be aware of its components, types of implementation, forms and methods.

The Development of Teachers' Pedagogical Competence in The Process of Self-Education at The University

Alida SAMUSEVIČA¹, Santa STRIGUNA²

¹Dr.paed., professor, senior researcher, Liepaja University, Institute of Educational Sciences

Email: alida.samusevica@liepu.lv

²Mg.sc. educ., assistant, Liepaja University, Institute of Educational Sciences

Email: santa.striguna@liepu.lv

Abstract

The quality problem of teachers' professional work is connected with the students, trainee teachers', self-education options and motivation research during the study process. Students' purposeful self-education and development of self-reflection skills is one of the most significant pedagogic approaches in teachers' education that can guarantee the education transformation process of the 21st century in school practice which will be focused on creativity and innovations. In order to make it possible for the education system to provide a purposeful and productive acquisition of pupils' self-education skills, the issue about the teacher trainees' motivation and self-education skills during the study process has to be promoted, therefore improving formation of students' pedagogic competences during the study process at university. Research question is to encourage a scientific discussion about the significance of university students' independent studies, describing the individualized learning development possibilities in the pedagogic self-education competence formation process during the study time. The subject of the research: self-assessment of students' self-education competence in the study process at a higher educational establishment. Objective of the paper: to describe the competence of students' self-education in professional socialization within the study process. Research methods: analysis of theoretical findings, questionnaires and interviews, student self-assessment and self-reflection analysis. The study of pedagogical competence is based on the self-analysis of the student's practical performance in order to determine the motivation for professional growth. In the publication the significance of university students' independent studies has been described, characterizing the individualized learning development possibilities in the process of pedagogic self-education competence formation during the study time. The results of the research confirm that the dominant of productive studies is "learning" process, which contains the student's purposeful and according to his/her professional development needs carried out independent work. The characterizing criterion of effective, on student's professional growth oriented study process is the determined need and the ability of the future specialist to study independently, as the personal effort and activities of the independent work contribute to acquirement of lasting and qualitative knowledge, the motivation to continue or to enhance the obtained education, the development of purposeful pedagogical skills and competences.

Key words: self-education, competence, students, study process, pedagogical competence

Introduction

Nowadays in all professional activity areas the employees, who are able to think in a creative way, adapt quickly, communicate and work in a team, are required. However, quite often one can hear from employers saying that it is not possible to find such people. Why is it like that? As we live in the time of revolutionary changes and if we want to survive and develop, then the skills and competences, which we acquire at school, are essentially important. There is no doubt the character of very many people's work will change pretty soon. Most probably in future people will have to change not only their place of work but also their occupation several times in their lifetime. Pupils' parents wish education would help their children discover their gifts and abilities and also provide a purposeful and meaningful life. The youth desire the same. The more complicated the world becomes, the more creative and pedagogically professional teachers have to become in order to be able to overcome its challenges. Therefore, the society's demands for the change of the education system work and qualitatively educated teachers is justified.

Education plays a significant role in people's life, children's future and society's long-term global development. Education is not a linear process which prepares for the future. Actually, education develops a person's talents and perception abilities with what we are able to live the best life now and build a possibly better life for the future. Tom Friedman reasonably claims that we need not only a bigger number of secondary school leavers, but also more young people with an appropriate education. Our schools have got a doubly hard task: they have to

promote not only reading, writing and arithmetic skills, but also the knowledge about business management, innovations and creativity. In order to regain the old good life standards, we have to rearrange not only banks, but also schools (Friedman, 2007).

Education is a tool and foundation for further development of knowledge, skills, culture and personality, implementation of own abilities and talents. As education is a life-long process, then due to it, the person's literacy increases. An educated person's skills are a developed ability to generate personal judgments and behavioral strategies, analyze and evaluate their life activity, improve constantly personal experience, develop self-regulation and plan self-development. The self-education competence is the base of all above mentioned skills. The issue about the teacher trainees' independent learning and teaching skills has to be promoted in order the education system would be able to provide pupils with a purposeful and productive acquisition of self-education skills, as well as their professional self-realization challenges during their study time, thus developing the students' pedagogic competence formation process at university.

Goal of the publication

Encourage a scientific discussion about the significance of university students' independent studies, describing the individualized learning development possibilities in the pedagogic self-education competence formation process during the study time.

Research subject

Self-assessment of students' self-education competence in the study process at a higher educational establishment.

Research methods

The qualitative research methods have been used in the studies of the theoretical literature, normative and other documents: analysis and synthesis, analysis of students' self-education competence self-assessments with the help of a written questionnaire and oral interview, the logically constructive method in the development of conclusions and generalizations.

Teacher education: theoretical framework

Teacher learning is a complex problem entwined with beliefs and experiences (Berenson, 2012, 113). A teacher's competence is regarded as a strategic matter in most countries, and the training of teachers and a discussion about what kind of competencies are needed to teach seem to be ongoing issues (Goodwin & Oyler, 2008). The „new” professionalism of the teaching fraternity is anchored, to a large extent, on the ethos of the teaching profession. This ethos helps teachers to articulate the shared understanding of the values, beliefs and attitudes that are essential to guide present and inspire future generations of teachers to a higher level of professional excellence (Gopinathan, et.al 2008). The professional identity determines the paths then teachers choose for their professional development and it impacts their attitudes towards educational changes and reforms (Kozminsky, 2012, 13).

The concept of teachers as lifelong learners is a key component in considering teachers' life cycles, starting with their introduction to the profession via initial teacher education and continuing via professional development throughout their careers (Devitt, Oldham & Kerin, 2012). Changes in educational policy and proposed reforms can confront teachers and teachers-educators with a sense of professional identity crisis, which affects their commitment to teaching and may hinder their motivation, feelings of self- satisfaction and professional pride, and their sense of internal coherence (Day, Elliot & Kington, 2005). Collinson (2012) see career-long professional development as both professional and personal development, both formal and informal learning (Collinson, 2012, 59).

Competence is perceived as ability on knowledge, values and attitudes, an ability, which ensures readiness to act in authentic situations. The notion of competence, understood in this light, reflects didactic and methodical

aspects relying on an overall simple structure: knowledge, abilities, experience, attitudes and values. The structure of competence enables the description of learning as well the theoretical and practical aptness to bring it to be realized. Competence as a stimulating factor of social stability and development bears on individual ability to adapt to incessantly changing world, but also- change future through application of responsible understanding, professionalism and effective self-realization (Дахин, 2009). Competence as the promoting factor of social stability and development is individual's ability to adapt in the changing world and also change the future, by applying responsible understanding, professionalism and effective self-realization (Дахин, 2009). The term *competence* is not necessarily a clear and neutral term to describe the qualities of teaching. According to Biesta (2011) there is a tension in the competence discourse between on the one hand a behavioristic approach that emphasizes doing, performing, achieving, observing, measuring and, ultimately, control, and on the other hand an integrative approach that emphasizes knowledge, skills, understanding, values, purpose and, ultimately, teacher agency.

Evaluating teachers' competencies

Evaluation of new teachers during the induction year raises a number of questions about the evaluation practices that are created. Research shows that certain issues need to be addressed, such as the processes involved, the focus of the evaluation and its validity (Fransson, 2012, 74).

Self – evaluation is used the organization of the study process of institutions of higher education as one of the forms of evaluation on regular basis (Rutka, 2009). Analyzing self-evaluation criteria offered to the students, one can conclude that they are mainly based on the requirements defined by the teachers' professional standard on the knowledge, skills and attitudes necessary for the teacher. Therefore, gradual recognition and independent planning, adjustment and implementation of own development (professional, life, personal), readiness to analyze oneself in time and constantly find personally important significance of the professional activity becomes the objective of professional self – implementation (Schein, 1993).

Research into evaluation in accordance with specified standards highlights the accompanying, challenges, and dilemmas (Delandshere & Arens, 2001; Imig & Imig 2008). For example, the risk that complex competencies and knowledge dimensions, might be simplified is stressed, as well as the fact that evaluation is a complex process that is almost impossible to judge fairly (Berliner, 2005; Samuseviča & Striguna, 2014).

In this context, Biesta (2009) questions whether standards really measure what is regarded as valuable competencies and wonders whether what is measurable becomes what we value. Successful and experienced teachers who have obtained pedagogic authority have to share their experience and cooperate with their new colleagues.

Reflection

As for reflection, the teachers consider it a necessity for becoming exemplary (Korthagen 2004). C. Rodgers (2002) formulates reflection as a multidimensional phenomenon:

- it is a meaning- making process that moves a learner from one experience into the next deeper understanding of its relationships with and connections to other experiences and ideas;
- it is a systematic, rigorous, disciplined way of thinking, with its roots in scientific inquiry;
- it needs to happen in community, in interaction with others;
- it requires attitudes that value the personal and intellectual growth of oneself and of others (Rodgers, 2002, 845).

Characterizing teachers' reflection it could be said that it is a specific way of thinking about pedagogical situations which cause confusion and perplexity, and emotions. Reflective skills, if practiced, can be learnt and improved. Essentially, we are talking of five criteria, which, in their collaborative action and personal

interaction, may lead towards a new profile of teacher education and training: professionalism, life-long learning, responsibility, co-operation, flexibility (Schulz, 2012, 184).

Description of self-education competence

Self-education is a purposeful and independent cognitive process which is directed by a person's needs, interest to obtain or develop knowledge and skills, create attitudes and new experience. Self-education in a particular area characterizes completeness of activity and simultaneously it is also the source of personal development. Self-education is a type of the subject's personal development which greatly affects its abilities in the experience enrichment. The goal of self-education is the subject's self-realization in one of the topical work dimensions: personal, social or professional.

Teachers' pedagogic competence is one of the education quality keys which is forged in the personal professional development process during both the study time and professional activity. In the modern society the phenomenon of the prevailing academic knowledge inflation is one of the strongest indicators which confirms the necessity of changes in education. Changes at school have to start with the teachers' help who are active self-education experts themselves and provide their pupils with a motivating personal example. Not a single teacher will be able to find their way in the complex future environment unless their knowledge, motivation and professionalism are connected with a constant personal, social and professional development. To what extent does a teacher trainee develop the self-education competence during the study process at university?

The description of higher education acquisition process and outcomes quality by the education theory lecturer Ken Robinson arises a justified analytical contemplation: *"most of the big universities have almost none individual training possibilities. The most often used study methods are mass lectures which are read by the teachers alienated from practice, and well-attended seminars which are led by badly-paid postgraduates. Homework is assessed without any feedback. The standardized tests and uniform evaluation system make the study process even more impersonal, for attention is focused on a better success statistics and fundraising, and not on every student's abilities"* (Robinson, 2013, 78). It is hard to admit, but we still do have in teachers' education the system which definitely could be called as the "initial filling model", because it envisages that during the study time a student develops the academic abilities and stores the necessary education resources for practice and supplements them gradually during the following years of work. The term "academic abilities" means here intelligence or development of mental abilities, less attention is paid to the development of skills and particular competences.

The theoretical researches emphasize that a student in a particular sociocultural environment, obtaining an individual education experience, creates own learning and interaction culture (Виготский, 1984; Macke, Hanke, Viehmann, 2008). Just the competence *"becomes the expression of such a skill which gives a person a chance to manage and work in the social and cultural diversity which is obtained through learning"* (Eichorst, 1998, 12-13). When analyzing the essence of the competence, implementation and expression specifics, groups of several skills are highlighted:

- disciplinary competence which characterizes planning, analysis, synthesis, methodology;
- professional competence which includes professional communication, activity in a multicultural environment, development of abilities;
- institutional competence, with which an innovative activity, implementation of innovations into practice, ability to work autonomously and in a group, interdisciplinary transformation is understood (Perrenoud, 2004).

An essential element of competence formation is the connection between the motivation and personal values, progress takes off only in the conditions where a human being is personally interested and motivated in the particular activity (Apsalons, 2013, Равен, 1999). Therefore the individual's ability to use efficiently and develop the obtained experience is understood with competence, for competence is a complex unity of knowledge, skills and attitudes which are manifested in activity, achieving the result. Knowledge includes the

areas of activity, facts, principles and theories. Skills provide capacity with the help of learning in order to perform activity applying knowledge (Key Competences for Adult Learning Professional, 2010). Competence from a potential opportunity turns into real abilities and professional ability only through an independent and active subject's activity. Thus one can confirm that the self-education competence develops and improves through activity.

If in the pedagogic process the acquisition of professional activity is implemented, focusing on the structure elements of activity approach, then such a didactic model gives a possibility to notice the regularities between the lecturers and students' goals, motives, interests and needs in connection and unity, which facilitates the formation of self-education competence (Леонтьев, 1986, Špona, 2006). Being competent in the self-education activity means to be able to update and mobilize knowledge, skills and experience, and also transformation skills in particular situations have got an essential meaning. Self-education competence is one of the leading personalities in the teacher's professional activity (Zaire-Beck, 2000).

In pedagogic practice *self-education competence* is characterized by not only a set of specified capacities and skills, but also by experience reflection of a systemized professional activity which develops creativity and innovations in the education area. The quality of professional activity in the pedagogy area greatly depends on the teacher's self-education competence, which, in its turn, reveals the necessity within the activity of the pedagogic higher education establishment to be aware, plan and implement the study process, which forms the trainee teachers' capacities and skills that are necessary for further development of self-education competence. The analysis of theoretical cognitions confirms that *student's self-education competence is an integrative quality of their study activity*, which is characterized by a purposeful, planned, systematic and independently organized cognitive activity, reflection of the acquired knowledge and experience, as well as a self-constructed and self-managed development in the professional mastery nuances of pedagogic activity.

The study environment, collaboration with lecturers and teachers from schools, as well as the test of own pedagogic skills and abilities into practice influence essentially formation of students' self-education competence, which determines formation of other key competences, for in the study work self-education competence is not only a goal, but also a tool for the development of the trainee teacher's personality.

Independent studies require from students self-discipline and high motivation, independent decision making, ability to find one's way in information and choose the most suitable ability to adapt and transform. Every student themselves has to be responsible for the opportunities in their professional development. The theoretical analysis confirms that the structure of student's self-education includes several important components:

- personalities and motivation which characterize awareness of personal development and attitude towards the necessity and need of self-education;
- individual self-education experience: psychological and practical readiness for self-education implementation; planning and realization of self-education;
- assessment of the self-education process and results.

Research outcomes

In order to find out the development level of the students, trainee teachers' self-education competence, diagnosing the criteria of the individualized independent learning, a questionnaire was worked out which gave the students a possibility to assess on a five-point scale their self-education skills, which are necessary for the acquisition of a purposeful pedagogic activity during the study process at university.

The students were offered in the questionnaire to assess and analyze the characteristic features and skills of the study activities which reveal the students' self-education motivation: purposefulness, independence, self-education and need for personal development; characteristics and skills of the real practical activity that confirm their independent learning habits: the need to extend their knowledge and skills, the skill to self-educate independently, the skill to solve learning problems during the study process, self-initiative in the profession

acquisition, participation and activity in studies; also statements were offered in order to ascertain the development of self-adjusting habits during the study process: the ability to organize their learning process, the skill to carry out the self-control of learning quality, the skill to carry out self-assessment and reflection.

To implement the research, on a basis of a random selection and students' voluntary choice to participate in the research, the 1st, 2nd and 4th year students (N=67) of different qualifications (preschool, primary school, basic school, music, sports, dance and special education) from the study program "Teacher" were involved, who were interested in assessing their self-education skills. To ensure the data reliability, during the research specified, individual studies were carried out about every student, providing every student the necessary time to fill in the questionnaire and some additional time for an individual interview about the procedure of the study process and students' learning skills. The choice of interviews as a research method is based on the cognition that every student constructs enthusiastically their individual reality of special experience, every student's reality is different and it is constructed socially. Therefore every student's evaluative statements are important to be aware of their individualized learning experience. The obtained information during the interview gave a chance to supplement the interpretation and generalization of the obtained data, facilitating understanding of the self-assessment data analysis provided by students.

During the development process of the self-education skills self-assessment and research planning, in the implementation period the publication authors' hypothetic assumptions were linked with the cognition that just the 4th year students' self-education average indicators would be the highest, for in the previous study period a significant amount of work was invested both in the acquisition of the chosen qualification at university and in practice at school and alongside the studies the independent learning skills have been developed in a purposeful way that can be judged by their collaboration with the lecturers in the scientific work. The analysis and summary of the research data did not confirm the previously made assumptions.

Picture 1. Average indicators of students' self-education competence assessment

As it can be seen in Picture 1, the 4th year students' average self-education competence indicators are lower than the 2nd year. It can be explained with the obtained information in the individual interviews that when the individual self-education experience in the 4th year increases, the students' self-assessment becomes more critical and adequate, for their own experience has been identified and updated analytically in the context of social and pedagogic reality, awareness about the real opportunities of their own pedagogic activity has been strengthened, the areas of professional activity have been crystallized in which they have to develop purposefully. From the 4th year students' point of view they are:

- purposefulness of professional activity (3.35);
- need to broaden their knowledge and skills (3.42);
- necessity for self-education (3.5).

As one can see, all of the above mentioned qualities are connected with the trainee teachers' motivation and development of professional dimension.

The 2nd year students' responses in the interviews confirm their high motivation in teacher's profession acquisition and reveal the increased self-assessment level in the assessment of their learning skills. The varying self-assessment of self-education competences is greatly affected by the students' learning experience obtained in the previous school. The 2nd year students are the pupils who have already encountered the initiated reform in transition to the development of pupils' competences in their school practice and it has provided a positive approval for their individual awareness about their abilities and skills. When arranging pedagogic studies, more attention has to be paid to the self-education skills, which have got the lowest indicators by the 2nd year students' assessment:

- skill to solve study problems (3.52);
- skill to carry out a self-assessment (3.57);
- skill to implement the learning self-control (3.6);
- planning of independent studies (3.67).

Conclusions and recommendations

In theoretical researches the approach of competences is characterized in different ways in compliance with the nuances of the professional activity specifics, but practically all scientists come to a common conclusion that in the specialists' educating process the focus on personal development and formation of professional competence is the most important.

In the pedagogic process of competence approach implementation at university the education results are offered not only in the context of the terms' knowledge-skills-knacks development, but also to guarantee the teacher trainee's readiness for professional activity (and the level of the readiness, i.e. competence), implementing the professional activity into its diverse and complex synthesis.

Self-education ability is one of the most topical items of professional competence, because the ability to self-educate independently is included in the requirements of education outcomes. In the modern society self-education is one of the professional activity's preconditions which is set for education and simultaneously it is an influential factor of the teacher's personal professional development.

The personalities, which higher education and teachers' education are associated with, are independent, critical and creative thinking, purposefulness, objectivity and honesty, ability to think in an abstract way and debate in a reasoned way, ensure and inspire. All these features are equally rooted in both the prevailing atmosphere of the educational institution, study process arrangement, and in the students' enthusiasm the particular education is acquired with.

The teachers' training programs have to guarantee the opportunity to promote students' individual reflections about the progress of competences and collaboration with lecturers and teachers from schools, and not only to assess the success of studies in compliance with the academic and professional standards. Despite the time restrictions at university that is given to the lecturers for their individual work with every student, the lecturers have to be ready to adapt to the society's development challenges and help their students develop in themselves such self-education skills which will be able to guarantee in practice the future specialists' successful professional activity, providing their pedagogic mastery.

The fact, how the teacher trainee has been directed to their professional development searches and confidence that the pedagogic mastery depends on personal self-development and self-improvement, greatly determines a successful practicing teacher's self-assertion in the professional activity.

The quality of the teacher trainee's self-education competence is provided with a close connection of the professional development areas such as: purposefulness, necessity to broaden own knowledge and skills, the

need of self-education, the skill to solve learning problems, the skill to carry out a self-assessment, promotion of the skill to implement learning self-control in the acquisition of professional activity during the study process.

The transformation of skills in the professional activity competence is only possible in such a study process, where students themselves are active promoters and members of their development. Therefore in the study process the pedagogic competence formation factors as students' motivation and values orientation, personal responsibility, pedagogical interaction and active participation in their skills development obtain a special topicality.

Students' purposeful self-education and development of reflection skills is one of the most significant pedagogic approaches in the teacher trainees' education process, which can provide in school practice the transformation process of the 21st century education based on creativity and innovations.

Abstract

The aim of the study was to find out and analyze the differences in opinions of pupils of 8th and 9th grades from 28 primary schools in Slovakia (n = 949, 8th graders = 542 and 9th graders = 407) about the content, forms, motives and possibilities to enjoy physical activities (PA) in their free time. The survey was conducted in the school year 2014/15, whereby their opinions were surveyed through inquiry (11 questions) and evaluated through the TAP 3 program of Gamo Banská Bystrica. The survey results indicate that pupils do not perform sufficient PAs in their free time. The PAs undertaken have a dominant recreational character and their main goal is the improvement and consolidation of health and physical fitness. Pupils in both groups are most significantly motivated to perform PA by their parents (more than 57%). Teachers of physical and sports education are the "smallest" motivator. The main factor preventing regular PAs for "ninth graders" are health problems and other leisure activities, and for "eighth graders" high financial costs. We observed statistically significant difference at $p=0.05\%$ in six cases of the 8th and 9th graders.

Keywords: survey, opinions, physical activity, boys, free time

Introduction

The meaning of exercise is contained in Galloway's (2007) thought: "For each hour we spend exercising we can prolong our life by 2 hours. That is what I call a great investment." According to WHO (WHO, 2007) physical inactivity is the fourth biggest killer in the world and the increase in the diseases of civilization points towards a direct link between lifestyle and the lack of physical activity in the majority of European countries. The results of research by STEM/MARK and Všeobecná zdravotná poisťovňa (the biggest health insurance facility in Slovakia) from 2013 (n=2058) in the Czech Republic (<http://www.tlukotsrdce.cz>) show that 55% of men and 60% of women have a high-risk waist circumference. Wagner (2015) claims that 65% of men in Slovakia are currently overweight and that this number will reach 71% by 2030. According to data of the Public Health Authority of the Slovak Republic (ÚVZSR) from 2013 (<http://www.uvzsr.sk>) 13 – 15% of children aged 11 to 15 years are either overweight or obese. 20% of young people aged 18 to 24 are overweight. There is an ever increasing lack of interest in physical education and physical activity. Research by Peráčková (2008), Antala et al. (2012) and others show that for many children, physical education lessons are the sole opportunity to do some form of exercise.

Šimonek (2006) considers physical activity one of the most important parts of a healthy lifestyle especially during adolescence and supports his claim by referring to the words of the famous Greek writer Plutarchos: "Who thinks that they can ensure their good health by doing nothing proceeds as stupidly as someone who thinks that by being quiet they will improve their voice." There are numerous overseas studies (Hennesy et al., 2010; Vander Ploeg et al., 2013 and others) which link the physical activity of adolescents with that of their parents. Pařízková et al. (2007) also state that if a child is used to spending free time with their parents going for walks or doing various physical activities they will naturally create a positive attitude towards exercise.

Studies which are concerned with the quality and quantity of physical activities can be split into 2 groups regarding their methods:

- ✓ those which use objective data gained from pedometers and accelerometers, for example the works of Tudor-Locke-Basset (2004), Harris et al. (2009), Pagels-Boldemann-Raustorp (2011) and others.
- ✓ those which use data accumulated via questionnaires or surveys. These are the studies by Pratt et al. (1999), Nader et al. (2008), Łubkowska-Troszczyński (2011), Straňavská-Görner (2015) and others.

We realize that both approaches have their advantages and disadvantages and the ideal solution is to combine them together. Due to the large number of respondents in our research we have chosen a survey method.

Goal

The goal of this study was to find and analyse the differences in the opinions among boys of 8th and 9th grade of second level education in primary schools in Slovakia, the amount, motives, forms and possibilities of and for physical activities during their free time. This study is a partial segment of the project **KEGA 002UMB-4/ 2014** carried out at the Department of Physical Education and Sports, Faculty of Arts, Matej Bel University in Banská Bystrica.

Methods

949 pupils of eight and ninth grade (542 from 8th grade and 407 from 9th grade) took part in the survey that was conducted in order to establish the amount, motives, forms and possibilities of and for physical activities. The survey was realised in May during the school year 2014/2015. We approached pupils from 28 primary schools (Tab. 1.) 18 schools were from the central region and 10 from the eastern region of Slovakia. The questionnaires were created and analysed with the use of program TAP 3 from Gamo in Banská Bystrica. The answers were analysed according to each respondent's school grade.

Table 1. Characteristics of the research sample of pupils (n=949)

Results and discussion

Initially we wanted to find out how boys mostly spend their free time (Tab. 2). Almost $\frac{3}{4}$ of boys spend their free time “equally” actively and passively. From the table it is clear that the pupils in 8th grade are more active where 11.07% of boys prefer physical activities in their free time. Passive pastimes have a lower frequency among 8th graders (15.87%) compared to 22.6% in the 9th grade. This is also confirmed by the study of Nader et al. (2008) where the authors claim that the older the children the lower their interest in physical activities. At the age of 15 they only spent 49 minutes a day during a weekday and 35 minutes a day during the weekend being active. **The difference in answers among boys with regard to their school grade was statistically significant at the level $p < 0.05$.**

Table 2. Ways of spending free time

We then analysed the amount of physical activity (Tab. 3). The answers were similar in both research samples. 16.61% of 8th graders and 17.69% of 9th graders spend less than an hour a day on physical activities, in other words app. 58% of all respondents claim that they spend a maximum of two hours a day on physical activities. In comparison to the recommendation of Šimonek (2006) who states that 10 to 17 year olds should spend at least three hours a day on physical activity, resp. 20 hours a week we find our results to be very negative. Such low or rather inadequate physical activity rate in children during their free time has also been found by Pratt et al. (1999), Sigmund-Mikláneková et al. (2007), Biddle et al. (2009) and others. **The difference in answers among boys with regard to their school grade was not statistically significant at the level $p < 0.05$.**

In regards to the amount of physical activities during weekends we found (Tab. 4) a pleasing fact that more than 82% of pupils of 8th and 9th grade spend their free time on physical activities for three or more hours a day. Ca.17% spend less than three hours a day on physical activities. As we agree with Kučera-Dylevský (1999) that “exercise affects development and development affects exercise” we recommend a suitable specific intervention in order to encourage an adequate level of physical activity in this group. **The difference in answers among boys with regard to their school grade was not statistically significant at the level $p < 0.05$.**

Table 3. Amount of physical activity of pupils during weekdays in hours per day

Table 4. Amount of physical activity of pupils during weekends in hours per day

The amount of physical activity of pupils during summer holidays (Tab. 5) showed that the time they spend on physical activity increases slightly in comparison with the weekends - 44.46% of 8th graders and 43.98% of 9th graders spend their time actively for more than 5 hours per day. When analysing and comparing this question with the previous one we have found one negative aspect in the slightly increased percentage of pupils who spend less than 3 hours a day on physical activity (23.25% of 8th graders and 22.60% of 9th graders). During the summer holidays pupils have plenty of free time which they need to fill purposefully and actively. The study of

Drobes-Hillman (2012) states that there is plenty of evidence about the correlation between physical activity and drug abuse. It is less likely that physically active children would experiment with drugs. **The difference in answers among boys with regard to their school grade was not statistically significant.**

Table 5. The amount of physical activities of pupils during summer holidays in hours per day

When analysing the character of the physical activity in both groups we found that they are predominantly recreational (Tab. 6). The biggest difference between the number of answers was within the performance aspect - the difference between the 9th and the 8th grade was ca.7%. Moravec-Kampmiller-Vanderka-Laczo, (2007) and Raczek-Mynarski-Ljach (2002) discovered deepening differences in the levels of sports performance among children who practice sport and those who do not. **The difference in answers among boys with regard to their school grade was not statistically significant.**

Table 6. The character of physical activity of pupils

Table 7. The dominant place for pupils to practice sport

When identifying where sport activities take place (Tab. 7) we can positively say that 63% of pupils of 8th and 9th grade prefer outdoors. Watkins-Dalal (1995) claim that exercising outdoors is often a lot more challenging than in a gym or a playground. **The difference in answers among boys with regard to their school grade was statistically significant at the level p<0.01.**

When it comes to the type of sport, pupils of both grades prefer team sports, with the answer frequency close to 50% (Tab. 8). Bašková et al. (2009) claim that team sports are especially suitable physical activities for pupils. They not only evoke a feeling of companionship and mutual commitment but are also important for learning about reciprocity of opinions and formation of personalities during adolescence. **The difference in answers among boys with regard to their school grade was statistically significant at the level p<0.05.**

Table 8. The preference of forms of sport among physical activities

Table 9. The preference of sports and activities based on popularity

When we enquired about the preferences in sports and physical activities (traditional or less popular) we learned (Tab. 9) that pupils of both grades prefer traditional sports, however, 8th graders were inclined towards traditional sports even more. This fact came as no surprise, as traditional sports and games such as football were also dominant among boys in the studies of Nemeč (2002), Kollár (2006), Antala et al. (2012) and others. **The difference in answers among boys with regard to their school grade was statistically significant at the level $p < 0.01$.**

The pupils agreed that they mostly practice sport and physical activities with friends, classmates from school or after-school clubs and sport leisure groups. This answer was chosen by more than 65% of pupils (Tab. 10). **The difference in answers among boys with regard to their school grade was not statistically significant.**

Table 10. Companions of pupils during physical activities

Table 11. Who influenced pupils when choosing a physical activity

Parents had the biggest influence on whether pupils practice sport (Tab. 11). Moore et al. (1991) identified that the influence of active fathers was bigger than that of active mothers, however, the biggest influence was identified in families with both parents physically active. When compared with children whose parents were not physically active the result showed that children with active parents were six times more likely to practice sport. Less than 14% of pupils of both grades chose their PE teacher as a major motivator to practice sport. **The difference in answers among boys with regard to their school grade was statistically significant at the level $p < 0.05$.**

The strongest motivator to practice sport proved to be a desire to improve and strengthen their health and physical fitness (Tab. 12). This answer was chosen by 46.86% of 8th graders and 66.83% of 9th graders. 8th

graders also often answered that they practice sport to improve their figure and lose weight (41.14%). Stackedová (2008) also confirms similar results in her study when she found that the primary motivation for people to join a gym was weight loss. **The difference in answers among boys with regard to their school grade was statistically significant at the level $p < 0.05$.**

Table 12. The main motive of pupils for undertaking physical activities

The last question was aimed at finding out the largest factor preventing pupils from practising sport (Tab. 13). The dominant answer among 8th graders was financial cost (44.10%), among 9th graders it was “health issues or other forms of free time activities” (44.72%). Studies by Reed-Philips (2006) point towards a fact that students who have gym or outdoor sport facilities close to school or directly in their home town are more physically active. **The difference in answers among boys with regard to their school grade was statistically significant at the level $p < 0.01$.**

Table 13. Main factor preventing pupils from physical activities

Conclusion

According to Frömel-Bauman (2006) physical activity has many functions in a person’s life. Therefore it is very important for the promotion and prevention of health to make the lifestyle of our population active again. The results of our study point towards facts which need to be taken into consideration with regards to the individual age of adolescents:

- 8th graders are more active when it comes to free time activities;
- the amount of physical activities in both grades is in many cases low - during weekdays and weekends as well as summer holidays;
- the physical activity of 8th and 9th graders is mostly recreational and they usually practice outdoor sports;

- pupils of both grades prefer traditional team sports (football, basketball, volleyball, etc.);
- when analysing the major motive for physical activities we found significant differences, where for 8th graders it was mostly “improving figure and losing weight” for 9th graders it was “health benefits of sport”;
- we also identified some differences in the major factor which prevents them from practising sport - for 8th graders it was mostly “financial cost” and for 9th graders it was the option of “health issues and other ways of spending free time”.

Abstract

The purpose of this study is to measure the effect of recreational activity-based program on the social skills of mentally retarded students. The research sample is composed of a total of 50 educable mentally retarded students – 31 males and 19 females – aged between 9 and 12 who regularly attend Private Gül Bahçesi Education and Rehabilitation Center situated in Tuzla district of İstanbul province. Preliminary test, final test and uncontrolled group experimental model were used in the research. The program containing different activities in 2017 was applied for 13 weeks. Personal information form and Social Skills Evaluation Scale were used as data collection tool. Data were analyzed with SPSS 21 package program. Frequency and percentage distributions, Cronbach's Alpha, Shapiro Wilk-W and Wilcoxon test were applied. As a result of the research, it has been determined that recreation-based program has a positive effect on social skills of mentally retarded students. Significant differences at the level of 0.05 have been found between preliminary and final test. Considering and applying such activities for the development of retarded individuals as an alternative education can be useful.

Key Words: Recreation, Retarded Child, Social Skill

Introduction

The quality of life and the achievements of a person in life are directly proportional to their social skills (Sazak 2003, Türer 2010). Social skills are the most important and functional skills necessary for an individual to fulfill the expectations required by the rules of society and to live effectively and independently in society (Sucuoğlu ve Çiftçi, 2004, Dağseven 2008, Türer, 2010, Alptekin, 2012). These skills are behaviors that enable an individual to interact positively with others. They bear interpersonal attributes. These are desirable, communicative and reproducible behaviors. These behaviors include such abilities as initiating, maintaining and terminating relations appropriately, working with groups, helping, sharing, dealing with adverse situations, using social resources and making choices (Bacanlı 1999, Akfırat 2006, Dağseven 2008, Türer 2010, Alptekin 2012).

Teaching the social skills is highly important in that it helps individuals initiate and improve positive relations with others, it allows individuals meet the expectations of the environment, it allows them deliver their necessities, desires, wishes and preferences appropriately and helps this communication be maintained (Alptekin, 2012). This training is carried out in an environment that is under normal conditions without noticing. However, there is a need for systematic training for mentally retarded children who are the disadvantaged individuals. It is stated that social skills education can be performed on the basis of direct teaching, collaborative teaching, conscious process approach, peer-mediated teaching approaches with the purpose of making it easier for these children to have a social environment (Çiftçi 2001, Pınar and Tekinaslan, 2003). Trainings given to children with mental retardation will enable them to acquire social skills as well as it will easier to hold on to life in the future. At the same time, it makes it easy for the individual to get a job while going from being a student to an adult, to become a member of the community, and to overcome the challenges of later life (Alptekin, 2012)

Children whose physical, mental, emotional or social characteristics and are separated from normal children by terms of life skills are called mentally retarded children. They are classified as educable, teachable, severe and very severe mentally retarded individuals. Mentally retarded people can have difficulty in coping with the needs of everyday life, interpreting the behavior of others correctly and showing the expected social reactions (Pehlevan, 2010). There are

many factors affecting the socialization process of disabled individuals. Some of these are family, social groups (peer groups), various activities such as sports and games, school and socialization tools that are considered as mass media. These tools help the retarded people to adapt to a wider world within rules and values (socialization) (Usul, 2012).

When we look at the studies in literature on the social skill acquisition of mentally-retarded children, cooperative learning and creative drama method (Akfirat, 2006, Avcıoğlu, 2012), folk dances (Pehlevan, 2010), sports and orienting (Usul, 2012), peer-mediated social skills program Pınar and Tekinaslan 2003, Özyayın ve ark., 2008), and direct teaching method were used to gain skills (Türer 2010, Alptekin 2012). Teaching was systematically carried out via researchers / teachers.

While social skills are the behaviors that ensure positive interaction with others in society, social competence denotes the demonstration of these behaviors and their positive evaluation by others (Akfirat, 2006). Social skills are very important in acceptance of mentally retarded individuals in society. Social skills include such skills as communicating, expressing emotions, working with groups and coping with adverse situations. When these skills are gained, mentally disabled individuals will be made available to the same services from which their peers benefit (Özyürek 2004, Türer 2010). It is possible to give these skills to mentally retarded children with education, a single activity or via a program composed of different activities.

Achieving the points that cannot be reached with courses in disabled students, providing the knowledge, skills and abilities that will help the students improve their personality and providing a self-expressive and self-confident personality development can only be realized with social activities (Tetik, 2008). Recreational activities are one of the social activities that will reduce the negative impact of people's situations, relax them psychologically, diversify their lives, reduce their stress and have a good time. It is possible to help the retarded people acquire social skills through recreational activities that can be used as an alternative education or the therapeutic recreation which has a therapeutic feature in order to increase their quality of life with sports, cultural and artistic activities (Başaran, 2015).

For this reason, the purpose of this study is to analyze the effect of recreation-based activities on the social skills of mentally retarded and educable children.

Research Problem: Recreational activities have an effect on social skills of educable and mentally retarded students.

Sub-problems of the Research:

- Recreation-based activities are effective on mentally retarded children's basic social skills.
- Recreation-based activities are effective on mentally retarded children's basic speaking skills.
- Recreation-based activities are effective on mentally retarded children's advanced speaking skills.
- Recreation-based activities are effective on mentally retarded children's skills of initiating relationship.
- Recreation-based activities are effective on mentally retarded children's skills of maintaining relationship.
- Recreation-based activities are effective on mentally retarded children's skills for group work.
- Recreation-based activities are effective on mentally retarded children's emotional skills.
- Recreation-based activities are effective on mentally retarded children's autocontrol skills.
- Recreation-based activities are effective on mentally retarded children's skills of coping with aggressive behaviors.
- Recreation-based activities are effective on mentally retarded children's skills of accepting the results.
- Recreation-based activities are effective on mentally retarded children's skills of giving directions.
- Recreation-based activities are effective on mentally retarded children's cognitive skills.

Method

Research method

Preliminary test, final test and uncontrolled group experimental model were used in this research.

Groups	Preliminary test	Procedure	Final Test
Experiment	T1	Activity training determined as recreational activity	T2

This research was applied between 24.01.17 and 26.04.17 for 3 days and 2 hours a week for a total of 13 weeks. Activities related to sports, culture and skills were included in the practice.

The program applied;

Activities Done	Period	Time	Content
Cinema	24 January Tuesday 2017	10:00 - 12:00	Children's movie was watched.
Chess	25 January Wednesday 2017	14:00 - 16:00	How the game is played was taught.
Cinema	27 January Friday 2017	10:00 - 12:00	Animation-Children's movie was watched.
Reading	31 January Tuesday 2017	10:00 - 12:00	Reading-Writing-Spelling activity was performed.
Intelligence games	1 February Wednesday 2017	14:00 - 16:00	It was emphasized on counting, measuring, money exchange and simple operations.
Zumba	3 February Friday 2017	10:00 - 12:00	Basic steps were taught.
Theatre	7 February Tuesday 2017	10:00 - 12:00	Children's theatre was watched.
Daily life skills	8 February Wednesday 2017	14:00 - 16:00	Play field in the class was arranged.
Drama	10 February Friday 2017	10:00 - 12:00	Improvisation/empathy work was performed regarding cooperation, sharing and respecting.
Dance	14 February Tuesday 2017	10:00 - 12:00	Hand-feet harmonized figures were taught.
Music	15 February Wednesday 2017	14:00 - 16:00	The ability to practice receptive language and expressive language was worked.
Chess	17 February Friday 2017	10:00 - 12:00	The movements of pawn, knight and king were shown.
Painting	21 February Tuesday 2017	10:00 - 12:00	The simple story told was portrayed as a painting.
Cooking	22 February Wednesday 2017	14:00 - 16:00	How to make a sandwich was taught.
Developing the senses	24 February Friday 2017	10:00 - 12:00	The story about "Sharing" was told. An activity was conducted regarding this matter.
Artistic activity	28 February Tuesday 2107	10:00 - 12:00	Small objects were made with clay.
Music	1 March Wednesday 2017	14:00 - 16:00	Nursery rhyme was taught.
Daily life skills	3 March Friday 2017	10:00 - 12:00	The activity of making up the bed was performed.
Drama	7 March Tuesday 2107	10:00 - 12:00	Pantomime, song, painting and creativity was used about the subject.

Football		8 March	Wednesday	14:00 - 16:00	The activity of dribbling between slaloms was conducted.
Scientific activities	skills	10 March	Friday	10:00 - 12:00	With the help of big cards, the activity of separating what you see and improving the memory skills was performed.
Chess		14 March	Tuesday	10:00 - 12:00	Chess was played in groups.
Reading		15 March	Wednesday	14:00 - 16:00	Turkish language activities were held by trying to improve their vocabulary with nursery rhymes and poems.
Music		17 March	Friday	10:00 - 12:00	A nursery rhyme was taught.
Painting		21 March	Tuesday	10:00 - 12:00	A painting was made with crayons.
Cooking		22 March	Wednesday	14:00 - 16:00	It was taught how to make a pastry.
Dance		24 March	Friday	10:00 - 12:00	Hand-feet harmonized figures were taught.
Intelligence games		28 March	Tuesday	10:00 - 12:00	Songs and rhymed poems were told to help the development of auditory memory.
Developing senses		29 March	Wednesday	14:00 - 16:00	The story about "Tolerance to our environment" was told. An activity was held about the subject.
Volleyball		31 March	Friday	10:00 - 12:00	Overarm pass and bump pass was worked.
Drama		4 April	Tuesday	10:00 - 12:00	Dramas concerning playing a role, thinking, taking as a model and the ability to express the feelings were performed.
Cooking		5 April	Wednesday	14:00 - 16:00	It was taught how to make a cookie.
Dance		7 April	Friday	10:00 - 12:00	The activity of matched dance was performed.
Garden activity		11 April	Tuesday	10:00 - 12:00	Flower planting was taught.
Scientific activity	skills	12 April	Wednesday	14:00 - 16:00	The activity of understanding the concepts of numbers and qualifying in counting was performed.
Daily life skills		14 April	Friday	10:00 - 12:00	The activity of folding clothes was performed.
Reading		18 April	Tuesday	10:00 - 12:00	Children's books were read.
Cinema		19 April	Wednesday	14:00 - 16:00	Charade was played with illustrated cards showing different emotions.
23rd April Children's Day project		21 April	Friday	10:00-12:00	Celebration activity for Children's Day was performed.
Football		25 April	Tuesday	10:00-12:00	Shooting activity was performed with miniature goals.
Music		26 April	Wednesday	14:00 - 16:00	The activity of imitating the sounds of the nature was performed (Birds-Snakes-Wind-Waterfall etc.)

Population and sample selection:

Research population is composed of a total of 50 educable mildly mentally retarded students – 31 males and 19 females – aged between 9 and 12 with 75 – 60 IQ scores who regularly attend Private Gül Bahçesi Education and Rehabilitation Center situated in Tuzla district of İstanbul province.

Data collection tools

Personal information form and social skills evaluation scale were applied as the data collection tool.

Personal information questionnaire:

With the purpose of determining the demographic information of research group, questions regarding age, sex, retardation and education status and family were included.

Social skills evaluation scale

This scale was prepared by Avcioğlu (2007) in order to measure the social skill levels of children. Reliability and validity of the scale was performed and it was found that Cronbach' Alpha reliability coefficient as .98, split half reliability coefficient as .89 and test-retest reliability coefficient as .83.

The scale is composed of 12 parts and 69 questions. These are as follows; Basic Social Skills (13), Basic Speaking Skills (4), Advanced Speaking Skills (5), Skills of Initiating Relationship (5), Skills of Maintaining Relationship (6), Skills for Group work (7), Emotional Skills (6), Autocontrol Skills (6), Coping with Aggressive Behaviors (4), Skills of Accepting Results (3), Skills of Giving Directions (4) and Cognitive Skills (6).

Data Collection:

First, sample group was determined for the purpose of data collection. In this regard, it was discussed with the head of Rehabilitation center and the families of retarded students attending this center who voluntarily wanted to participate in the research were determined and permission was obtained from families. Parents were applied preliminary tests at the beginning of the program and final tests at the end of the program after 13 weeks.

Reliability-validity information:

In this study, the value of .980 was found to be the Cronbach' Alpha reliability value of the scale.

Data Analysis:

Data obtained from the research were analyzed with SPSS 21 package program on computer. Frequency and percentage distributions were obtained for demographic information and Cronbach' Alpha was used to measure the reliability of data related to the scale, Shapiro Wilk-W Test was used to determine whether they exhibit normal distribution and Wilcoxon-Signed Rank Test was used to test whether there is a change in social skills of the retarded students following preliminary and final test.

Findings

Table 1. Demographic Information of Children

	Gruplar	<i>f</i>	%
Sex	Male	31	62,0
	Female	19	38,0
Age	9	9	18,0
	10	9	18,0
	11	16	32,0
	12	16	32,0
Attending a Nursery	Yes	26	52,0
	No	24	48,0
How long did s/he go to a nursery	Didn't	24	48,0
	1 Year	21	42,0
	2 Years	5	10,0
Retardation Status	Special Learning Disability	22	44,0
	Mental Retardation	28	56,0
When Was the Retardation Determined	1 Age	11	22,0
	2 Age	9	18,0

3 Age	12	24,0
4 Age	8	16,0
5 Age	5	10,0
6 Age	5	10,0
Total	50	100,0

Of 50 students constituting the sample group in Table 1, 31 of them (62.0%) are male and 19 of them (38.0%) are female. 9 of them are 9 years old (18.0%), 9 of them are 10 years old (18.0%), 16 of them are 11 years old (32.0%) and 16 of them are 12 years old (32.0%). 26 of them attend the nursery school (52.0%) and 24 of them don't attend (48.0%). 22 children have special learning disability (44.0%) and 28 children have mental retardation (56.0%). 11 of them were found to be retarded at the age of 1 (22.0%), 9 of them at the age of 2 (18.0%), 12 of them at the age of 3 (24.0%), 8 of them at the age of 4 (16.0%), 5 of them at the age of 5 (10.0%) and 5 of them were found to be retarded at the age of 6 (10.0%).

Table 2. Demographic Information of Families

	Groups	<i>f</i>	%
Mother's Life	Alive	50	100,0
Mother's Occupation	Housewife	44	88,0
	Personnel (Worker)	5	10,0
	Teacher (Civil servant)	1	2,0
	Total	50	100,0
Mother's Education	Primary School	42	84,0
	High School	6	12,0
	Associate Degree	2	4,0
	Total	50	100,0
Father's Life	Alive	49	98,0
	Death	1	2,0
	Total	50	100,0
Father's Occupation	Self-employment	25	50,0
	Worker	21	42,0
	Teacher and civil servant	4	8,0
Father's Education	Primary School	43	86,0
	High School	6	12,0
	Associate Degree		
	Total	1	2,0
Parents Are Together	Yes	48	96,0
	No	2	4,0
Economic Condition of Family	Good (5001 +)	26	52,0
	Weak (5000 -)	24	48,0
	Total	50	100,0

Mothers of all students constituting the sample group in Table 2 are alive 50 (100.0%). 44 mothers are housewife (88.0%), 5 mothers are worker/employee (10.0%) and 1 mother (2.0%) is teacher. 42 mothers are primary school graduate (84.0%), 6 mothers are high school graduate (12.0%) and 2 mothers (4.0%) have two-year degree. Fathers of 49 people are alive (98.0%) and the father of 1 person (2.0%) passed away. Regarding the occupations of fathers, 21 fathers are worker (42.0%), 4 fathers are teacher-civil servant (8.0%). 43 fathers are primary school graduate (86.0%), 6 fathers are high school graduate (12.0%) and 1 father has a bachelor's degree (2.0%). Parents of 48 people

live together (96.0%) and the parents of 2 individuals divorced (4.0%). Economic condition of the families of 26 people is good (52.0%) and the economic condition of 24 families is weak (48.0%).

Table 3. Social Skills Wilcoxon-Signed-Rank Test Results of Children

	N	Pretest		Posttest		Z	p
		Mean	SD	Mean	SD		
Basic Social Skills	50	43,8800	7,85491	57,4400	5,10366	-6,176 ^b	,000
Basic Speaking Skills	50	14,4800	3,32118	18,6600	1,83626	-5,692 ^b	,000
Advanced Speaking Skills	50	14,9600	3,25112	20,9800	2,63795	-6,277 ^b	,000
Skills of Initiating Relationship	50	13,9800	2,77371	20,9000	2,27901	-6,197 ^b	,000
Skills of Maintaining Relationship	50	18,3800	4,25652	26,1200	2,98732	-6,118 ^b	,000
Skills of Coping with Aggressive Behavior	50	23,2400	4,43805	31,3600	2,87679	-6,214 ^b	,000
Skills of Accepting Results	50	17,2800	4,19932	24,6800	3,12619	-6,184 ^b	,000
Skills of Giving Directions	50	18,4200	3,87609	25,8400	3,01939	-6,231 ^b	,000
Cognitive Skills	50	12,3000	2,35822	17,1200	1,81423	-6,216 ^b	,000
Skills for Group work	50	9,1600	2,14152	13,0200	1,53184	-6,131 ^b	,000
Emotional Skills	50	13,0000	3,17516	17,7000	1,99233	-5,849 ^b	,000
Autocontrol Skills	50	17,0400	4,15004	24,6200	3,10950	-6,173 ^b	,000

As a result of the Wilcoxon-Signed-Rank Test performed with the purpose of measuring the effect of social skills education on retarded students in Table 3, statistically significant differences (.000) at a level of $p < 0.05$ were found between preliminary and final tests in all skills (Basic Social Skills, Basic Speaking Skills, Advanced Speaking Skills, Skills of Initiating Relationship, Skills of Maintaining Relationship, Skills for Group work, Emotional Skills, Autocontrol Skills, Coping with Aggressive Behaviors, Skills of Accepting Results, Skills of Giving Directions, Cognitive Skills).

Discussion, Conclusion and Suggestions

Of the 50 students in the sample group of the study, 31 of them are male and 19 of them are female. 18 people are aged between 9-10 and 32 of them are aged between 11-12. 26 individuals go to nursery school and 24 of them don't. 24 of them don't go to nursery school, 21 of them go for 1 year and 5 of them go for 2 years. 22 children have special learning disability and 28 children are mentally retarded children. Their intelligence level is 60-75%. 11 children were found to be retarded at the age of 1, 9 children were found to be retarded at the age of 2, 12 children were found to be retarded at the age of 3, 8 children at the age of 4, 5 children at the age of 5 and 5 children were found to be retarded at the age of 6.

Mothers of all the students who constitute the sample group are alive. 44 mothers are housewife, 5 mothers are worker/employee and 1 mother is teacher. 42 mothers are primary school graduate, 6 mothers are high school graduate and 2 mothers have two-year degree. Fathers of 49 people are alive and the father of 1 person passed away. Regarding the occupations of fathers, 21 fathers are worker, 4 fathers are teacher-civil servant. 43 fathers are primary school graduate, 6 fathers are high school graduate and 1 father has a bachelor's degree. Parents of 48 people live together and the parents of 2 individuals divorced. Economic condition of the families of 26 people is good and the economic condition of 24 families is weak.

In the study, the effect of recreation-based social skills training program on educable mentally-retarded students was determined. Statistically significant differences were found between preliminary and final tests of Basic Social Skills, Basic Speaking Skills, Advanced Speaking Skills, Skills of Initiating Relationship, Skills of Maintaining Relationship, Skills for Group work, Emotional Skills, Autocontrol Skills, Coping with Aggressive Behaviors, Skills of Accepting Results, Skills of Giving Directions, Cognitive Skills. This condition shows that the activities applied have a positive effect on all social skills of students and improve them. These results support the skills both in problem sentence and sub-problem sentences.

In literature, there are similar studies conducted on folk dances, drama and sports. In a study titled "The Effect of Turkish Folk Dances on Socialization of Mentally-Retarded Children", while there are positive development in such skills as basic social skills, skills of initiating relationship, skills of maintaining relationship, skills for group work, emotional skills, autocontrol skills, skills of coping with aggressive behaviors and skills of giving directions; no change has been observed in basic speaking skills, advanced speaking skills, skills of accepting results and cognitive skills (Pehlevan, 2010). The reason for the parts without any relation may be the study conducted with a single activity. While some skills stand out depending on the characteristics of the activity, some of them keep in the background. The result of Pehlevan complies with our skills of initiating and maintaining relationship and skills of giving directions. While the desired development in communication skills in folk dances has been found to be low, communication has come to the forefront in drama. In the study of Avcıoğlu (2012) titled as "Effectiveness of Collaborative Learning and Drama Methods in Providing Social Skills to the Mentally-Retarded Children", it has been observed that children become skillful at self-introduction and they can generalize in free game activities with their peers as of the first week. Following the "Drama-based Social Skills Education" practice related to the social relations and cooperative behaviors, Aslan (2008) has found a significant difference between the final test score averages of experiment and control group children on behalf of the experiment group for "Cooperation, Social Relations 1 (Maintaining Positive Relations) and Social Relations 2 (Maintaining Relations with Group) Behaviors Sub-Scales".

In the study of Demirdağ (2010) titled "The Effect of Sports on Socialization of Educable Mentally-Retarded Children", it is stated that sports is effective on socialization of children and there is a relation between sports and socialization. There is a statistically significant difference between child's skills of self-introduction, apologizing, thanking and the skills of leadership concerning sports' share in increasing the ability of expression and harmonizing characteristic of sports. In the study of Sukan (2013) named "the effect of sports on socialization of mentally-retarded people", the mothers complaining that their children are hyperactive or inactive have stated that they observe a serious change in their children after doing sports, define this as a quietness, success and ability of their children have developed, their communication has become stronger with sports and they are accepted in the society. Sports is included in programs in many fields by utilizing its characteristics that increase self-confidence and provide psychological relaxing in addition to physical development. Athletic activities being quite useful for the development of handicapped contribute their socialization, communication skills and improvement in the sense of achievement. In the study of Özyaydın et. Al. (2008) titled as "The Effect of the Program of Developing Friendship Skills on Social Interaction of Pre-school Children with Special Needs" performed with the purpose improving the communication skills of children at younger age, positive and visible increase has been established in social interaction behaviors of target children with their peer tutors. Moreover, target children have preserved their social interaction behaviors they learned after 3 and 4 weeks following the application process and they have been able to generalize to the other two peers in class.

Each activity included in our application program has been specified in a way to address one or more social skill levels of children and to help their development. The purpose of "Cinema" activity is to develop cognitive skills and emotional skills. "Chess" activity aims for cognitive skills, skills of accepting results and autocontrol skills. "Reading" activity aims for cognitive skills and skills of developing emotions. "Intelligence games" aim for cognitive skills and skills of accepting results. "Zumba" aims for the skills of giving directions. "Theatre" activity aims for cognitive skills and skills of developing emotions. "Daily life skills" are expected to develop basic social skills. "Drama" activity aims for the skills of basic speaking, maintaining relationship and developing emotions. "Dance" activity aims for the skills of giving directions and developing emotions. "Music and painting" activity aims for emotional skills. "Cooking" activity

aims for giving directions and basic social skills. It is expected that emotional skills and basic social skills will develop with "Developing emotions". "Art activity" aims for maintaining relationship and emotional skills. "Football and volleyball" aims for skills for group work, skills of coping with aggressive behaviors and autocontrol skills. "Scientific skills activity" is expected to develop cognitive skills. "Garden activity" aims for cognitive and emotional skills and skills of maintaining relationship. "23rd April Children's Day " activity aims for cognitive and emotional skills and skills of group work and maintaining relationship. The skills determined for each program aren't limited and address more skills and they may even complete each other. Such a program designed for multi-dimensional development of children has allowed them to learn by having fun and supported their multi-dimensional development of skills.

According to the answers of parents, it has been observed that the targeted development has been ensured in all skills following the comparison of the results of preliminary and final tests. When we analyze its reason by comparing with the studies we have reached, it can be said that our age group is appropriate for development and learning, they are mild/educable in terms of intelligence level and we have conducted the application with various activities that may address all social skills.

In conclusion, in this research conducted with the purpose of measuring the effect of recreation-based activities on social skill levels of educable mentally-retarded children, various activities directed to athletic, artistic, cultural areas and skills have been applied and it has been determined that these activities have positive constructive effect on social skills of students

Suggestions;

- Education programs given in schools and rehabilitation centers should be arranged in a way to be based on recreational activities.
- The program based on recreational activities should be diverse and develop all of their skills.
- Recreational Activity Based Socialization training program can be applied together with alternative active learning methods.
- Educational environments necessary for teachers to be able to successfully implement their educational practices should be organized and training equipment and personnel support should be provided.

Abstract

The present study focuses on anxiety manifestations in students in selected Czech elementary schools. The gained emotional experiences associated with the school could negatively affect both students' performance and their attitude to school in general. Assessment of the learning outcomes through tests could become a significant trigger for anxiety that can influence the students' learning outcomes. The present study analyses the degree of anxiety in relation to a typical stress situation in the school environment, such as the level of actual anxiety prior to and after testing. An anxiety measuring questionnaire and a scale to measure actual anxiety were used. It was confirmed that the level of actual anxiety among students is considerably higher prior to testing than after testing. With regard to the results and the primarily negative impact of testing in the school environment, the paper also introduces several useful recommendations for reducing anxiety among students.

Keywords: Anxiety, elementary school, stressful situations.

Introduction

It is generally known that long-term exposure to both positive and negative stressful events may cause the development of anxiety. According to Atkinson (Atkinson et al., 2003) anxiety is an unpleasant emotion characterized by terms such as 'concern', 'worry', 'stress', 'fear', which is to some extent experienced by all of us. However, Praško also points out that anxiety is a natural emotion experienced by everybody. This emotion is not always negative because it is often helpful and has an adaptive effect. It should also be noted that anxiety is part of everybody's life; the problem is if the frequency and intensity of anxiety experiencing have an increasing tendency that starts to cause problems in everyday life. According to Praško, an excessive emotion in the form of anxiety prevents natural life and adaptation to changing life conditions (Praško, 2003). In order to define its principles, anxiety must be distinguished from fear. Fear and anxiety are natural responses to a threat but in the case of fear such danger is clear and objective, while in the case of anxiety it is hidden and subjective (Pugnerová, Kvintová, 2016).

According to Erikson (Erikson, 2002), anxiety is a diffuse state of tension (caused by a loss of mutual regulation and subsequent failure of libidinous and aggressive control mechanisms) that magnifies and creates an illusion of external endangerment without suggesting appropriate defense mechanisms. Erikson also focuses on experiencing anxiety in children and claims that in childhood fear and anxiety are very close and indistinguishable, primarily because a child's immature organism is incapable of distinguishing between an internal and external, real and imaginary danger. Every child needs to learn this and for this purpose needs help from an understanding adult (Erikson, 2002).

Various literary resources agree that anxiety is to some extent innate and has a biological basis. Anxiety may develop as a result of complex effects, which include genetic predispositions, the personality of the individual and life events. This is also confirmed by Praško (Praško, Vyskočilová, Prašková, 2008), according to whom the cognitive behavioral model assumes innate vulnerability, which is in childhood joined by maladaptive learning. According to this model, anxious experiencing is learned either by imitating parents in childhood or is a result of maladaptive attitudes, which occur during maturing. Anxiousness is maintained by how individuals assess themselves, their environment and their future. Excessive and long-term anxiety has a negative effect on an individual's self-esteem, social experience, psyche and real potential.

In addition to innate predispositions that cause anxiety, the current Euro-American culture has a considerable effect on increased anxiety and neuroticism. Accelerated pace of life, rush, high expectations and performance orientation, all of this has a negative effect on the formation of the personality of an individual and an ability to adapt to new conditions.

Anxiety and stress in children in the first stage of elementary schools

The period around six years of age is significant especially in terms of the child's adaptation to a new school environment. The school becomes an important social milestone. Once preschool children are exposed to examination for school maturity, they find themselves in stressful situations. They need to address various tasks that have an influence on their future. Although they need not be aware of the seriousness of these tasks, they may sense it according to direct or consequential responses of parents, teachers, psychologists and physicians (Cap & Mareš, 2007). Children are vulnerable when they enroll in school and accept the role of a student, especially if they are sensitive, unprepared for school or immature.

According to Malá (2016) the following factors need to be considered in the assessment of children's anxiety: Developmental factor: assessment of the degree to which the child's brain is capable of distinguishing between a reasonable and logical threat based on real observation, and an unreal threat based on bad assessment, which does not correspond with what is observed. Maturation factor: identification of whether the child is able to distinguish between what is known and what is not (fear of strangers, this aspect is important for the survival of the child). Communicative factor: most of the child's emotions are expressed in a physical way, which means that anxiety is used by children to complain about physical problems. Children are also marked by increased visceral and emotional irritation, which is easily spread around the whole body, and greater mood instability decreased self-control and an ability of immediate relief.

Elkind (2009) calls today's children 'hurried children'. Similarly to other authors, he is concerned that the pressure of today's life forces children to mature more quickly and shortens their trouble-free childhood. According to Vágnerová (2005), an anxious student responds to usual situations as if they presented a threat, is in constant tension, is unable to concentrate, use own abilities and enjoy entertainment. Such children are incapable of adequate self-assessment and are unable to exploit their talents because they are burdened and exhausted by mental stress and negative anticipation. Today's children are forced to succeed not only in school but also in other spheres of life. According to Stuchlíková (2005), parents are often unconcerned about the fact that their child is anxious and that anxiety decreases their child's performance in school.

All of this causes much greater exposure of children to stressful situations that may lead to the development of anxiety disorders. Martinez (2015) claims that the current prevalence of anxiety disorders in children aged 7-11 years is 15.7%. The school is an additional stressor that may have a negative effect on children's mental health. This fact is confirmed by studies concluding that school stress is usual and that every student experiences at least one stressful situation in school per week. A higher prevalence of school stress occurs in children who have learning difficulties, which is also associated with negative experiencing (Kyriacou, 2003; p. 84). School situations are experienced in different ways. Emotional experiences affect students' performance and their attitudes to school, school results, social positions and acceptance by teachers or classmates. Especially in younger schoolchildren, emotional control is so important that it may become the source of failure (Vágnerová, 2001).

One of the major triggers for stress and anxiety in students in the first grade of elementary school is testing their acquired knowledge by means of tests. During written examination students experience excessive anxiety; in the Czech educational environment, this fact may present a significant barrier to optimum academic achievement. Cassidy and Johnson (in Jackson, 2015) claim that students exhibiting a high degree of anxiety associated with written testing achieve on average by 12 percentile points worse results independent of how much effort and

time they spend. Andrews & Wilding (2004), who primarily focus on anxiety associated with test situations, describe them as a physiological state, in which students experience excessive stress, fear, and discomfort during and prior to testing.

Although the Czech system of education is undergoing a period of renaissance in terms of educational approaches, supports joint education for all students and emphasizes a personalized approach to students, assessment of students' knowledge by means of tests is still the most frequent method. Although Czech education is regularly confronted with criticism, no radical measures have been taken to adjust the school environment to become a more comfortable place for learning and spending a substantial part of the day.

Anxiety reduction

Anxiety responses and anxiety coping can partially be influenced by the way of teaching (Vágnerová, 2005). Appropriate guidance has a calming, strengthening and healing effect; inappropriate guidance has an opposite influence (Matějček, 2011). To help the child alleviate anxiety means to help the child realize what is happening, localize the sources of anxiety and teach the child how to cope with these situations in an efficient way (Cohen, 2002, Verecka, 2002).

Effective methods of direct psychotherapeutic work with anxious children, which fall within the competence of clinical or school psychologists, include for example the following: imitation method – a student observes and has a tendency to repeat another student's behaviour, relaxation method or breathing exercises – a child is taught by suitable techniques to relieve anxiety in imaginary or real situations, abreaction method – reliving suppressed emotions in a safe and supporting environment, assertive training method – training of practical behaviour in certain situations and providing a child with safety in experiencing success and confidence in the child's conduct, the last example is rational-emotional therapy focusing on identification of irrational thoughts and efforts to process them in a rational way (Ellis, 2001, Matějček, 2011, Krowatschek & Domsch, 2007).

A more accessible method is reported by Křivohlavý (2001) and Kvintova, Kudlacek & Sigmundova, (2016) i.e. controlled physical activity, which has a positive effect not only on reducing anxiety but also on increasing positive self-assessment. Similarly, creative activities resulting in new and original creations, as stated by Holeček (2014), may help reduce anxiety.

General educational measures designed for anxious students are classified by Matějček (2011) into three tiers: 1. Encourage children's faith in themselves (self-esteem) and provide them with a sense of security in their actual environment. 2. Teach children to effectively control their strengths and weaknesses. 3. Help children build a system of safety measures that in the good time signal a danger of failure. Specific practical suggestions and documents serving as inspiration or applicable directly in lessons for the purposes of active learning about, preventing, mitigating and understanding anxiety can be found for example in publications by Pfeffer (2003), Buchwald (2013), Plummer (2013), Krowatschek and Domsch (2007), Černý & Grofová (2013).

Research objectives

The objective of this study is to identify the current degree of anxiety among students in the first stage of elementary schools. The testing was performed at two levels; prior to lessons and after lessons; then the level of actual anxiety was identified in a specifically demanding situation – prior to and after a written test. A partial objective was to compare the data by age, gender, and situation.

Methods

Anxiety was measured by means of the State-Trait Anxiety Inventory for Children – STAIC (Spielberger et al., 1973), adapted by Ruisel, Senka & Šebej (1983).

The advantage of this research tool is the duality in understanding anxiety as a state and a more stable personality trait. Due to this fact it is possible to comprehensively map anxious experiencing of an individual including specific manifestations of anxiety. This inventory also allows a qualitative assessment of situations, in which anxious feelings take place. The questionnaire is divided into two parts. These are self-report scales, one of which measures anxiety as the current state, while the other one measures the degree of anxiousness as a more stable state of personality. The scales can be used independently of each other. Each of the scales includes 20 items. In each of the items in the scale measuring current anxiety, the respondents choose one of three statements that best describes their current experiencing. In the scale measuring anxiety as a more permanent state of the personality, a single statement is selected that best describes how the respondent usually feels.

Regarding the fact that the present research study aims to examine whether the degree of anxiety changes by age, gender, and school environment, the scale measuring current anxiety was used.

Sample

The research sample consisted of 152 children, of whom 92 were boys and 60 were girls aged 6-11 years; average age was 8.41, MIN 6, MAX 11, SD 1.63. As far as ethical aspects are concerned, the legal guardians of all monitored students were informed about the content, course, and purpose of the testing at an informative meeting. At the same time, their written informed consent was given concerning the participation of their children in data collection, anonymity and processing and publication of the results of the study. The process of data collection respected the developmental level of the respondents, for example in the first and second grades the testing was carried out in small groups of up to 10 children.

Statistical data processing

The data were processed using the STATISTICA program, StatSoft, Inc. (2013). STATISTICA (Data Analysis Software System), version 12. For each variable, basic statistical quantities were calculated and distribution of normality verified. Normality was assessed using the Shapiro-Wilk normality test. Moreover, the paired t-test and Pearson correlation were applied. The level of statistical significance was tested at $\alpha \leq 0.05$; $\alpha \leq 0.01$; $\alpha \leq 0.001$.

Findings

Table 1 presents the levels of anxiety in the entire sample measured during the first measurement prior to lessons and second measurement after lessons. A statistically significant difference was measured between the higher anxiety level reported before lessons and the lower anxiety level reported after lessons.

Table 1. Degree of anxiety prior to lessons and after lessons in the entire sample

Variable	Mean	SD	N	Diff.	SD of diff.	t	Sv	p
Prior to lessons	32.697	7.336						
After lessons	28.997	7.993	152	3.710	8.311	5.508	151	0.000

Legend: SD-standard deviation, N-frequency, df= degree of freedom

Moreover, additional data were identified relating to above-average levels of anxiety in the entire sample. It was observed that prior to lessons, above-average levels of anxiety were reported by 25% (38) of students of the total sample of 152 students (sten scores 8-10); after lessons, above-average levels of anxiety were observed in 19% of students (29).

Table 2. Correlation of the degree of anxiety prior to lessons and after lessons in the entire sample

Variable	Average	Standard deviation	Age	Prior to lessons	After lessons
Age	8.408	1.629	1.000	0.253*	-0.193*
Prior to lessons	32.697	7.326	0.253*	1.000	0.415*

After lessons	28.987	7.993	-0.193*	0.415*	1.000
---------------	--------	-------	----------------	---------------	-------

Legend: *p < .05000

Table 2 shows the associations between currently experienced anxiety and age established by means of the Pearson correlation coefficient. The degree of experienced anxiety is positively correlated with age (slight intensity), which means that increasing age increases the degree of experienced anxiety. On the contrary, after lessons a significant negative association was observed; increasing age decreases the degree of experienced anxiety.

An analysis of the anxiety scores in terms of intensity suggests that students in grades 1 and 2 show above-average anxiety levels: 15.2% of students prior to lessons, and 21.2% of students after lessons. Students in grades 3, 4 and 5 show a high anxiety score: 33% of students prior to lessons, and 16.2% of students after lessons.

The following tables (Table 3, 4, 5, 6) present gender-based differences in the degree of anxiety prior to lessons and after lessons, and experienced anxiety depending on age.

Table 3. Degree of anxiety prior to lessons and after lessons in boys

Variable	Average	SD	N	Difference	SD of difference	t	sv	p
Prior to lessons	33.630	7.446						
After lessons	29.043	7.530	92	4.587	9.111	4.829	91	0.000

Legend: *p < .05000

Table 4. Correlation between the degree of anxiety and age in boys

Variable	Average	SD	Age	Prior to lessons	After lessons
Age	8.50	1.64	1.00	0.05	-0.43*
Prior to lessons	33.63	7.48	0.05	1.00	0.26
After lessons	1.00	1.00	1.00	1.00	1.00

Table 5. Degree of anxiety prior to lessons and after lessons in girls

Variable	Average	SD	N	Difference	SD of difference	t	sv	p
Prior to lessons	31.267	6.957						
After lessons	28.900	8.719	60	2.367	6.742	2.719	59	0.008

Legend: *p < .05000

Table 6. Correlation between the degree of anxiety and age in girls

Variable	Average	Standard deviation	Age	Prior to lessons	After lessons
Age	8.27	1.64	1.00	0.57*	0.13
Prior to lessons	31.27	7.02	0.57*	1.00	0.65*
After lessons	28.90	8.80	0.13	0.65*	1.00

Legend: *p < .05000

As far as gender differences are concerned, it was demonstrated that in both genders the degree of experienced anxiety is statistically significantly higher prior to lessons than after lessons. Boys show a higher level of experienced anxiety prior to lessons than girls. After lessons, there are no significant differences in the degree of experienced anxiety.

At the same time, a correlation was demonstrated between age and experienced anxiety prior to lessons in girls. Increasing age in girls increases the degree of experienced anxiety prior to usual lessons ($r=0.57$). There is a moderately strong positive association between the degree of anxiety prior to lessons and after lessons ($r=0.65$). Girls with an increased degree of anxiety prior to lessons will report the same after lessons.

As far as boys are concerned, a significant negative association between age and the degree of anxiety was observed; increasing age in boys decreases the degree of experienced anxiety after lessons. It can be concluded that older boys are more relaxed after lessons than younger boys.

Table 7. Degree of anxiety prior to written test and after written test in grades 3 to 5

Variable	Average	SD	N	Difference	SD of difference	T	sv	p
Prior to test	38.187	8.855						
After test	27.465	6.997	86	10.721	10.236	9.713	85	0.000

Legend: SD-standard deviation, N-frequency, df= degree of freedom

The measurement of the currently experienced degree of anxiety prior to and after written testing included 86 students of the research sample from grades 3 to 5. Students from grades 1 and 2 were excluded because they only take a small number of written tests. The average age of the research sample was 9.7 years, MIN 8 and MAX 11, SD 0.81. An analysis of the degree of experienced anxiety prior to and after a specifically demanding school-based situation (written test) confirmed a significantly higher degree prior to testing rather than after testing. The t test criterion was carried out by the value of 9.71 at 85 degrees of freedom, the corresponding p value was 0.000.

In comparison with a usual school day without testing, the degree of experienced anxiety was significantly higher before testing than before a usual school day. The degree of anxiety after testing was comparable with the degree of anxiety after a usual school day.

A detailed analysis of anxiety levels revealed that of the group of 86 students, 51% showed an above-average degree of anxiety prior to testing (sten scores 8-10), after testing, above-average anxiety values were observed only in 9% of the students.

Limitations of the study

In all cases, the results could have been affected by intervening variables, such as changes concerning the respondents during the research period. However, it is very difficult to affect or eliminate these variables. The results could have also been influenced by an insufficient capability of introspection in especially anxious children, whose perception tends to be very limited.

Another potential source of inaccuracy of the results of the research study could be multiple testing within a short time period. Although the questionnaires were administered meticulously, some students might have remembered previous answers and might have used them or deliberately or without thinking changed them during the retest.

Regarding the fact that the data collection by means of testing was performed individually, in small groups, in various places, and in various classes, it was impossible to ensure identical conditions for all participants. The procedures and methods of data collection were always selected to be appropriate to the age of the participants; care was taken not to expose the participants to an increased risk of anxiety caused by completing the questionnaire or being in a new environment or situation.

Results, conclusions, and recommendations

The research study suggests that the average degree of anxiety in all students in the first stage of elementary school is significantly higher prior to lessons than after lessons. It can be assumed that classes and associated activities present a burden that increases anxiety, which is consistent with the conclusions formulated for example by Kopřiva et al. (1998) or Mlčák (1999). It should be noted however that of the entire sample, a high degree of anxiety is achieved by 25% of children prior to lessons, and 18.4% of children after lessons.

As far as gender-based differences are concerned, in their study Headley and Campbell (2011) state that girls show a twofold degree of anxiety symptoms as opposed to boys. Similarly, higher anxiety in girls is also mentioned for example by Vymětal (2004) and other authors. As suggested in their hypotheses, regarding their gender roles, boys might tend to admit feelings of anxiety less frequently. However, according to the present research study, boys seem to experience anxiety prior to lessons more than girls. While the degrees of anxiety after lessons are almost identical, with increasing age boys' anxiety after lessons decreases, in girls it increases in line with their degree of anxiety prior to lessons.

Anxiety related to testing represents a much more serious problem than many parents and teachers realize. As many as 16-20% of students report high anxiety scores, which makes it the most frequent negative aspect of academic achievement. A total of 18% of students reports a moderate degree of test-related anxiety (Cassady & Johnson, 2001; Jackson, 2015). An increased degree of anxiety might have a negative effect not only on the results of the test itself (Andrews & Wilding, 2004; Cassady & Johnson, 2001; Havlínová et al., 2006; Jackson, 2015).

To a large extent, the results of the present research on the degree currently experienced anxiety prior to testing are consistent with the mentioned studies and even exceed those results. In this research, an above-average degree of anxiety prior to testing was reported by 51% of students. The results corresponding to a very high degree of anxiety prior to testing (sten score 10) was achieved in the present study by 30% of students. This result could be related to age. Younger school-aged children are only building up their defense mechanisms, while older students already have some experience with testing.

The students' average anxiety score after testing showed to be lower than the average score of their anxiety after classes. This can be explained by Nakonečný's conclusion (2000), according to which anxiety reduction acts as a reward. Students who have undergone a difficult situation associated with anxiety then experience a state of relief and joy. The higher average score after lessons than after written testing can be explained by the findings formulated by Urbanovská and Škobrtal (2012). These authors explain that the period after lessons is marked not only by relief but also by concerns about the parents' negative reaction to academic failure, concerns about homework or things and phenomena not related to school.

What often happens is that teachers have a tendency to trivialize emotional problems and rather react to academic achievement and behavior, but it is emotional experiencing that might be the primary cause (Stuchlíková et al., 2005). Headley and Campbell (2011) focused on the ability of elementary school teachers to identify children with anxiety symptoms. According to the results, teachers are generally able to recognize a child who suffers from serious anxiety states and respond to them. However, they have problems identifying children with mild forms of anxiety from those who show serious disorders. It would surely be beneficial to enrich the present research study with teachers' responses aimed at identification of anxious children and compare them with the data collected.

Abstract

Edmodo is basically a web application that is similar to Facebook but provides educational tools instead of a social media platform. Edmodo also reinforces classroom activities. Another benefit of Edmodo is that it allows teachers to create online classes. Teachers post assignments, lecture notes, exams, competitions, and also evaluate students and communicate with them via Edmodo. E-Learning makes it possible to learn about information and communication technologies. Applications such as Edmodo Classroom 2.0 makes it possible to learn even outside the classroom. These applications are viewed as solutions to insufficient class hours and issues that are experienced within the class. In the digital age, new generations tend to maintain different opinions and also different learning capabilities. It's important that we care about how this generation can learn and respond to diverse teaching methods for the sake of their future. Online activities that support a learning outside classroom is similar to other learning practices. Life-long learning is important for building the future of our education. It is a process that's alternative to formal education. It has no place and no time. Life-long learning aims to ensure the community is aware of all learning opportunities, it establishes a culture of learning so that people are excited by learning and they can enhance independent learning through technology. Students who use technology as a part of their life makes life-long learning necessary. E-learning environments and mass media are needed in lifelong learning activities to provide learning outside the school. In this study, a course work is explained with using Edmodo for life-long learning. It also explains how the learning continues in online environments and the benefits of life-long learning of Edmodo. In this way, it is thought that the researchers who study same subjects can benefit in an effective way.

Keywords: Life-long learning, Edmodo,

Introduction

Life-long learning, which allows people to accomplish self-realization, has become a social necessity by the development of technology. Information technology is a necessity to provide continuous education and to train individuals to have life-long learning skills. Cross (1981) said that one of the building blocks of life-long learning was the development that had happened in technology. Digital competence, namely having sufficient knowledge in information technology, has been counted among the eight qualifications required for life-long learning (Akbaş

& Özdemir, 2002). The most widely used technologies for life-long learning are distance learning tools, social media and open education systems. The realization of life-long learning through distance education and open education in the countries where the young population dominates will increase the human capital and turn those countries into information societies (Berberoğlu, 2010).

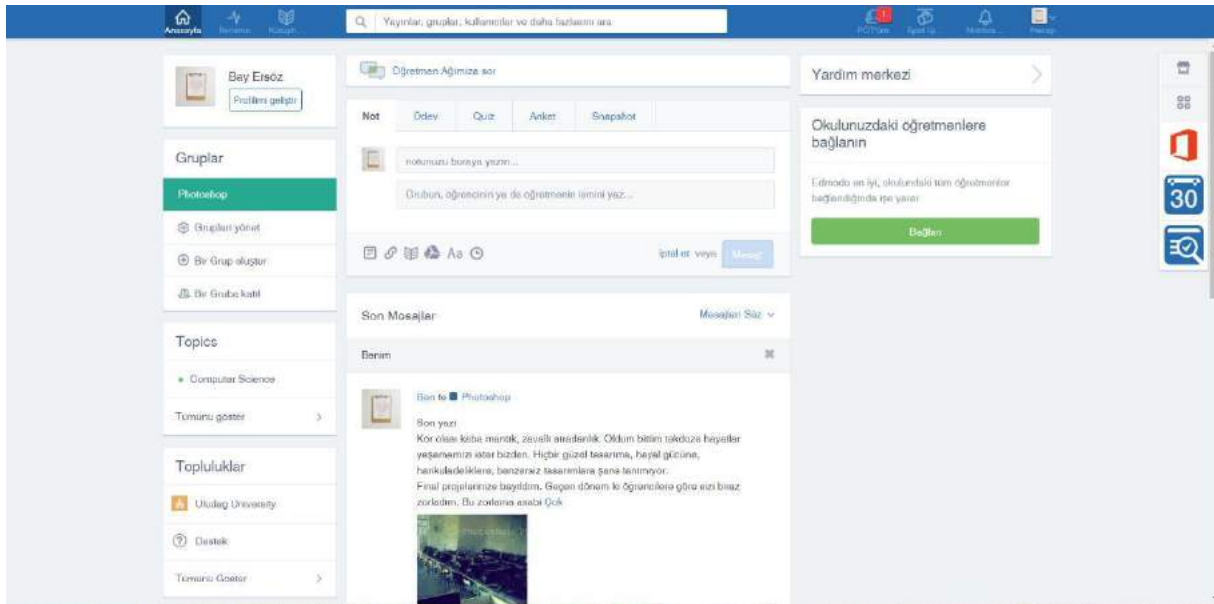

According to the Turkish Internet Metering Survey 2017 data, the new generation of users spend most of their time on social networks, especially on Facebook, Youtube, Instagram and Twitter. Social networks are websites that allow people to communicate with each other, create a circle of friends, and allow sharing of posts. Social networks have become a part of our lives as a realm utilized in every sector.

Today, the use of social networks for educational purposes has become quite popular. Various forms of social media allow for collaborative learning, communication over social networks, creation of learning groups, learning games, simulations, virtual worlds, immersive language learning, receiving guidance, messaging and collaborative projects – even when mobile – with people from all over the world. Online applications, educational social networks and similar applications provide education outside the classroom environment. Edmodo, Classroom 2.0 and Thinkbinder are the most known social networks used for educational purposes.

Edmodo

Edmodo is an educational social network with a structure similar to Facebook. It was founded by Borgi Hara and Hutter in 2008 and reached approximately 80 million users as of August 2017. With the help of Edmodo, students, teachers and parents join together in the same learning environment, creating a great learning community. Each user has his or her account, and to be a teacher one must have his or her account certified.

Figure 1 Edmodo homepage

Through Edmodo, teachers can create virtual classes and invite whoever they want to participate in these classes. According to Mathupayas's (2013) study, the most common applications on Edmodo are assignments, notes, comments, and file shares, in order. By creating a virtual classroom environment, Edmodo easily enables applications that are difficult to accomplish in the classroom. The basic practices and benefits provided by Edmodo are as follows:

Sharing: Teachers and students can share whatever they want on the main page of the course offered through Edmodo. Comments can be made under these posts shared. Moreover, interest areas can be followed, and all users on the globe can be reached through the posts shared. The posts provide interaction.

Assignments: Homework can be assigned to students in groups created by the teacher. In an assignment post, a delivery date can be determined, students' delivery dates of the assignment can be seen, and materials related to

the assignment can be added. Assignments also can be assessed easily via Edmodo and at the same time students can see the corrections made and the grades they get. Additionally, successful students can be rewarded with virtual badges. Badges provide gamification in education and increase the course motivation.

Library: Files, pictures and materials are kept in the library. Thus, materials used in lessons are stored orderly.

Users can use, download and send these materials to each other whenever they want.

Examinations and assessments: Examinations, quizzes and questionnaires can be easily administered via Edmodo, with the help of online forms. Assessments of these exams are also made online, and grades are assigned to students in the assignment grading section. Assigned grades, badges, and missed assignments are easily seen on the progress screen. Moreover, with the help of the export button, all the grades assigned to students can be downloaded by the teacher in the csv format.

The purpose of this research is to examine student views in terms of the usefulness of applications in Edmodo for life-long learning. The question “Can Edmodo applications be used for life-long learning?” was determined to be the problem statement, and accordingly, the research question was as follows.

1. What are the opinions of students about fulfilling life-long learning through Edmodo?

Method

In this study, Grounded Theory, one of the qualitative research methods, was used. Grounded Theory was developed in 1967 by Glaser and Strauss. In Grounded Theory, the researcher collects information through observations and materials as well as interviews. He creates categories by blending the data that he collects and clustering expressions that have similar meanings. Then, main categories are formed from these created categories.

Action research was adopted in the implementation of the method. Action research is a research approach that involves identifying problems related to the implementation process or collecting and analyzing data to understand and solve a problem that is already occurring. In this study, the practitioners were also the researchers and collected the data related to the problem that they determined while carrying on the application.

The participants of the study consisted of 22 randomly selected students who studied in the Department of Computer Education, Faculty of Education, Uludag University. An interview form was used as the data collection tool. The interview form was developed by the researchers. During the preparation of the interview questions, opinions of 2 subject matter experts were consulted, and the form was finalized by making necessary arrangements in the structured interview form. 22 students who were selected from the participants by simple randomization were directed open-ended questions.

The rest of the research data consisted of the interactions on Edmodo created by the students in the sample and the observation notes taken by the teacher. The data were collected through the answers given to the interview questions by the students participating in the research and then were analyzed. The interpretations that were obtained from the examined posts were coded in the context of the questions posed within the scope of the research. The resulting codes were grouped under categories. Then, frequency and percentage values of the categories were found.

Application Process

Students were given Photoshop education for 4 weeks. The lessons on campus were carried out together with Edmodo. The actions performed before, during and after the lessons are explained with pictures below.

The teacher shared subject-related materials with the students through Edmodo before coming to class (Figure 2). These materials included the pictures to be used in class, what topics were to be described, what students needed to read before coming to class and objectives. Related materials could be easily downloaded and used during class.

Figure 2 Related materials

After the lecture, the students prepared their designs using the technique they learned and shared them through Edmodo. The teacher followed these shared items from his computer and informed the student of the errors in the design. At the end of the lesson, the teacher shared the subject of the weekly homework, delivery date and other things to do. When students left the classroom, they did their homework until the subsequent week and uploaded it on Edmodo.

Figure 3 Assignments

The teacher assessed all the assignments on the system, rewarded successful students with virtual badges, and shared the profile of the best weekly student on the main page.

Figure 4 Best of week

Students shared their decent designs willingly on the home page. The teachers gave feedback for the assignments turned in in the first week of the course, and the students were asked to complete the missing items. In the weeks that followed, the teachers left complementary comments only under outstanding works shared by the students who improved themselves.

The lessons continued like that throughout the whole semester. At the end of the semester, the final project was shared over Edmodo again. The students uploaded the projects they prepared to the system between the relevant dates. The teachers assessed the projects. The students' end-of-the-semester grades, weekly assignments, midterm and final projects, and all of the badges they received were easily calculated by the assessment application provided by Edmodo.

Figure 5 Assesment via Edmodo

Öğrenci	Not	Klasuz (Vize %50)	Tezlim (Kalemi (Vize %50))	Yokdizi çizm ile kendi portreini yapıp, çizmiş olması	Menpu (sıyım)	Karipostal	AFAD Logo Yangınları	Karipostere konulu Çiçeği Yangınları	Album kapağı tasarımı
Sarıp Keleş	100%	Tezlim edildi	Tezlim edildi	5/5	5/5	5/5	Tezlim edildi	Tezlim edildi	5/5
Müzyen Koçman	98%	Tezlim edildi	Tezlim edildi	4/5	5/5	5/5	Tezlim edildi	Tezlim edildi	5/5
Zeynep Merne Moğul	98%	Tezlim edildi	Tezlim edildi	4/5	5/5	5/5		Tezlim edildi	5/5

Ahmet TETİK	97%	Tezlim edildi	Tezlim edildi	5/5	4/5	5/5	Tezlim edildi	Tezlim edildi	5/5
Merve TIFTİKCI	100%	Tezlim edildi	Tezlim edildi	5/5					

Findings

In the coding of the data, the answers given by the students relating to their views on Edmodo were used. Responses close to each other were combined under the same codes and then categorized. Their opinions about learning with Edmodo were gathered under the categories of Sharing, Interaction, Assignment, Reward and Assessment.

Table 1. Opinions of students

Categories	Code	Examination
Sharing	Before lesson	Sharing materials to help us prepare for the next lesson
	Students' post	Likes to shares, comments written by friends
Interaction	Student-student	Students' correspondence between themselves
	Teacher- student	Interactions between teachers and students, comments.
	Other	People working in the same area communicate via Edmodo
Assignment	Assignment posts	How the assignments will be and the contents
	Submit assignment	Expressions that define when to deliver the assignments
Reward	Badges	Opinions of students about badges they have won
	Teacher's comments	Teacher's comments on student sharing
Assesment	Feedback	Teacher feedback during the course and during the preparation and sharing of assignments
	Exam	Making exams, assignments and other projects on Edmodo

The posts that the teacher shared about the subsequent lesson allowed the students to come prepared for the lesson. Sharing a lesson's objectives before coming to class intensified the belief that the lesson would be productive. A student answered the question "Were the materials helpful that the teacher shared about what he would teach before coming to class?" as follows:

"Of course, at least you have a chance to make a preliminary preparation about the subject. By doing research, you benefit your friends and teachers as well as yourself during the lesson. It is very successful in this respect."

The teacher showed to the students that he was knowledgeable and had a full grasp of the subject by the posts he

shared. This allowed the teacher to become a model to be followed in the eyes of the students.

Students had positive opinions about the assignment application. It gave the teacher a great deal of convenience to assign, collect and assess assignments. The response of a student to the question "Have you got an assignment through Edmodo, how did you submit it, and how was the assessment?" was

"Yes, I got assignment. I submitted it as if I was sending a file through the social networks. In this respect, it provided convenience. The assessment results were reported via Edmodo."

This shows the ease with which students receive and deliver assignments. For the teacher to share the successful posts and well-prepared assignments on the homepage, to give badges and to make encouraging comments to the posts increased the student motivation. To the question "Did you share anything through Edmodo? How were the attitudes of your teacher and friends to those posts? How did they feel to you?" a student gave the following answer:

"Yes, I did. When my teacher and my friends liked and commented on some of my posts, my enthusiasm for the lesson was growing, and their liking of my work positively affected me towards the lesson."

The fact that teachers rewarded outstanding and successful assignments with their comments increased the students' interests towards the lesson.

Discussion, Conclusion, and Implications

The data from the interview and observation forms were combined under 5 main categories as a result of the analyses based on the Grounded Theory framework. The claim that it would be possible to accomplish life-long learning using Edmodo was presented by comparing the interview data and the relevant literature to the life-long learning dynamics. The main themes created in this context were "Self-Realization, Flexibility, Motivation and Learning by Having Fun, Teachers as a Role Model, and Information and Communication Technologies". These themes, which were determined by the Grounded Theory method, were the building blocks that enabled the life-long learning with Edmodo.

Self-realization

Students agreed that Edmodo facilitated education, encouraged learning, and supported independent learning. Students could improve themselves from any location with access to the Internet by receiving any education they wanted.

The student-teacher and student-student communication increased greatly with the help of the nature of the interaction provided by Edmodo. A student who had never spoken in class since the beginning of the year shared 17 posts on Edmodo and even sent a greeting card to his friends.

Life-long learning helps the individual complete his personal development and fulfill his self-realization by ensuring that he is able to advance in the field in which he is interested. Thus, the quality of life of the individual increases.

Flexibility

Life-long learning can be adapted to changing needs. New technologies move with the technologies that will make learning easier. Students can learn without any time constraints also outside the classroom through e-learning environments and technology-based education, and can continue learning lifetime. They do not have to worry when they miss a lesson because with the help of Edmodo, they can listen again and review their notes. Throughout the examination period, by looking at all the posts shared on the homepage, they can understand what is taught in the course, how the course is carried out and by which assignments the course is reinforced. Lecture notes are always at their disposal.

Motivation and Learning by Having Fun

Learning environments need to have instruments that increase the life-long learners' motivations. With the help of Edmodo, motivation can be achieved in a number of ways. The virtual badges given to the successful actions of students have a great effect on the participation of the students in the classes. In the light of the answers given by the students, it is seen that the assignments given to the students were done more effectively as the students got badges, that the badges were encouraging, and that the students' interest in the courses increased. The answer a student gave to the question "Did you share anything through Edmodo, and how did it feel to you?" was

"Yeah. Attitudes were very good. Criticisms are very important for me to improve myself. Likes, humorous comments, memes, civilized negative views all added up many things to me and will continue to add up. Of course, it is pleasing for your posts to be appreciated. Moreover, comments are very important in terms of seeing the reflection of your ideas on the other side."

Another student expressed his feelings about the badge he received as follows:

"I got a badge as the champion of the week :) Thanks to this badge, I was listening to the lessons willingly every week and I was making more efforts to do the assignments in accordance with the topic of that week."

For students, Edmodo is a gamification tool. It encourages students to learn by having fun and increases their motivation to lessons.

Teachers as a role model

In the life-long learning approach, the teacher should be a role model, should guide and assist the students.

The teacher must deal with every student in the class in the same way and find solutions to their problems. In a classroom setting, it is not possible for a teacher to deal with everyone in a crowded classroom. Many students lose interest in the course and school due to the fact that the decent works they prepare are not seen and evaluated by the teachers (Karakelle & Canpolat, 2010).

The students complained that the teacher did not equally attend to everyone in the classroom. It was found in their comments that Edmodo amplified this interaction.

With the help of Edmodo, the teacher can share what he will teach in the lesson before he comes to class and the preparations to be made by the students before coming to class. Additionally, the fact that the teachers provided instant feedback to the comments shared by the students and easily assessed all the assignments on the same screen made them role models in the eyes of the students.

Information and communication technologies

The individual needs the use of technology in life-long learning. Information and communication technologies form the basis among the most important factors affecting life-long learning (Gönüç, Odabaşı & Kuzu, 2012). Learning with Edmodo is one of the best examples to be given about how learners can benefit from technology. In extracurricular settings, the individual meets the need for learning to the greatest extent through the Internet.

The students found Edmodo very useful because they were able access to the resources of the classroom and were able to communicate with the teacher personally any time they wanted outside the classroom with the help of Edmodo.

The students participating in the study spent an average of 6-7 hours per day on the Internet. The use of technology in education requires also the teacher to get in the virtual world. This allows the teacher to see the expectations and needs of the new generation and to understand how they learn better. It can be said that the use of Edmodo in life-long learning has many positive effects. Edmodo is an effective educational social network that enhances motivation in life-long learning, enhances the teacher-student interaction, and helps people fulfill self-realization. Effective use of technology and the popularization of e-applications and e-learning environments directly influence the increase in life-long learning.

Abstract

The aim of the research was to establish the possibility of predicting the dominant hand in preschool children with the motor test *Speed of performing sideways steps to the left and to the right side*. Research sample consisted of 232 children, both genders, aged 66 to 84 months. Sideways steps speed laterally to the left and to the right side was measured, and then its possible interconnection with the dominant hand were tested. The result have shown no statistically significant difference in the speed of sideways steps test. However, it was established that the left-handed respondents were faster performing *sideways steps to the left* ($M = 3.81$ sec). On average, somewhat lower results were obtained for the right-handed respondents in *sideways steps to the right* ($M = 3.89$ sec). Even though there was no statistically significant difference between the two groups of respondents, the obtained data indicate a symmetric bilateral transfer. Results of this research still indicate possible connections, so it would be necessary to conduct additional testing which would include genetic predisposition of the children, as well as previously acquired motor experience, and it would also be necessary to construct a new test with a longer distance for the sideways steps test up to 15 or even 20 meters. Authors believe that longer distance would result in more statistically significant differences and thus could help in the possible prediction of the dominant hand in preschool children.

Keywords: left handedness, motor sideways step test, right handedness

Introduction

Human brain as the centre of nerve activity alignment represents the main part of the central nervous system. It differs from that of most vertebrates and primates due to the rapid development of functional hemisphere, previously called hemispheric dominance. The term lateralization indicates the existence of differences in the functioning of the left and right hemispheres of the brain. Lateralization is a consequence of the brain hemisphere specialization, the dominance of one side of the body manifested as greater skill, strength and preferred use of the eye, hand or leg on that side of the body. The question is whether lateralization is an inborn or acquired characteristic of humans. Previous research has not provided an unambiguous answer to that question. Some researchers believe that lateralization is the consequence of brain hemisphere specialization (Sperry, 1967). Other researchers argue that lateralization is not just a physiological phenomenon which can be explained by the structural and functional differences between left and right brain hemispheres (Clark, 1957). In most people, left brain hemisphere is dominant and as one hemisphere always controls the opposite side of the body (due to nerve fibres crossing), for most humans the right side of the body is the dominant one. The left side of the brain localizes the functions of speech, writing, computing, abstract thinking, symbolic functions and relationships, as well as logical analysis. Complete lateralization, i.e., the consistent preference of the eye, hand and leg on one, mostly right side of the body, is observed only in humans. Lateralization represents the highest nerve specialization and in phylogenetic development emerges at the same time as the development of the use of hands in work and speech in communication. Forming lateralization is an aspect of the development that takes place during the first four years and ends between ages six and seven (Andrilović & Čudina, 1987). Besides physiological, lateralization is affected by psychological and social factors, too. The fact that most people

perform perceptive-motor tasks with their right hand has led to the conclusion that this phenomenon is normal and correct. However, in our ancestors the dominance of the left hand as well as the ambidexterity existed to a greater extent than today. This fact is confirmed by the findings of historic artefacts from the early Neolith, shaped for the left-handed to a greater proportion than in the contemporary times. This very fact poses a dilemma of whether this reduction came about due to changes in the demands of modern society (Clark, 1957). Today we live in a world where everything we use is primarily intended for the right-handed population. In exceptional cases, objects intended for the left-handed can be found.

Therefore, the left-handed children are in an inappropriate environment and are forced to adapt to the objects intended for the right-handed population. Left-handedness has long been the cause of conflicting opinions. Some saw it as a deviation from normality, as something abnormal and even pathological. Others explained left-handedness as a habit or a bad habit (Kosinac, 2007, p. 138), which resulted in many parents and teachers forcing children to write with their right hand. It should be emphasized that play as the basis for children's learning has an important role in the lateralization. Children express themselves spontaneously through play, which facilitates the development of lateralization in favour of children, i.e. children should not be encouraged to use the nondominant hand but should be allowed to develop according to their affinities.

Consequences of redirecting left-handedness to right-handedness can manifest in multiple areas of development: speech, motor development, character and intellectual development. Recent studies on brain development suggest the dominance of the left hand should not be abolished or redirected. Nevertheless, left-handed children need help in acquiring motor skills during learning, for example, learning how to set up and use writing supplies (Brković, 2000). These facts have pointed to the need for timely determination of the dominant hand in preschool age.

Methodology

Research Sample

Research sample in this study included 232 children of both genders aged 66 to 84 months, who attended several kindergartens in the city of Zagreb. The sample consisted of 122 boys and 110 girls. The research was conducted in accordance with the *Ethical code of practice for research with children* (Dulčić, 2003), i.e. parental consent for participation in the research was obtained for each participant, and each child could withdraw from participating in the research at any moment.

Variable Sample

For evaluating the speed of performing sideways steps to the left and to the right, MKKS motor test (sideways steps) was used.

Test description: Along a distance of 8 m, the respondent should move as fast as possible sideways and cross the target line, taking care not to cross their legs at any time. The test was repeated three times to the left and then three times to the right side.

For the assessment of the dominant hand, the children were observed when choosing a pencil for drawing on paper.

Data Analyses

The collected data were processed by basic descriptive statistics, and Kolmogorov-Smirnov test was made to test the normality. Central and dispersion parameters (arithmetic mean, standard deviation, coefficient of skewness, coefficient of curvature, minimum and maximum value) are shown in Table 1.

When processing the data obtained from three different measurements, the best results were taken for statistical processing, i.e., each child's best results since they best describe child's ability. As children at this age are prone to rapid loss of concentration, the best result of three measurements gives the most realistic picture of their potential. Reliability of internal consistency of the tests was expressed through Cronbach's alpha and the

homogeneity of tests was calculated with the correlation between the items. Differences between children who dominantly use their left or right hand were estimated by ANOVA statistical method for independent samples.

Results and Discussion

In this study, the total number of respondents was 232, and out of that number 16 respondents had left dominant hand while for the remaining children (N = 216) the right was the dominant hand. Table 1 shows the basic, central and dispersion parameters and Cronbach's alpha for the speed of performing sideways steps to the left and to the right vs. the dominant hand.

Table 1. Basic descriptive parameters and Cronbach's alpha

Dominant hand		MKKS _R	MKKS _L
right hand	M	3.89	3.95
	SD	0.51	0.53
	Min	2.78	2.97
	Max	5.54	6.11
	a ₃	0.65	0.83
	a ₄	0.46	1.08
	N	216	216
left hand	M	3.91	3.81
	SD	0.41	0.38
	Min	3.24	3.10
	Max	4.57	4.48
	a ₃	-0.04	-0.20
	a ₄	-1.20	-0.37
	N	16	16
Cronbach's α		0.90	0.90

Legend: M - arithmetic mean; SD - standard deviation, Min - minimal value of the results; Max - maximum value of the results; a₃ - coefficient of skewness; a₄ - coefficient of curvature; N – number of respondents; Cronbach's α - Cronbach's alpha; MKKS_R - sideways steps to the right side; MKKS_L - sideways steps to the left side.

The Kolmogorov-Smirnov test showed normal distribution of the obtained data. Both tests showed good reliability since Cronbach's alpha for both tests was high ($C\alpha = 0.90$) in addition to good homogeneity as a property of the composite tests (Dizdar, 2006) where all the correlations are significant at $p < 0.05$ (MKKS_R: 0.70 – 0.79; MKKS_L: 0.71 – 0.82). The best results for arithmetic mean are observed in the group of left-handed respondents, who performed sideways steps to the left side test ($M = 3.81$), that is, they performed this test the fastest. The second best result was achieved by the right-handed respondents, who did sideways steps to the right on average in 3.89 seconds. The left-handed respondents did the sideways steps test to the right side on average in 3.91 seconds, while the lowest average score was obtained by the right-handed respondents on the sideways steps test to the left side with average arithmetic mean of 3.95.

However, examining the results by groups of respondents, it is clear that the best results were obtained by the right-handed respondents when performing both tests: sideways steps to the right side and sideways steps to the left side, as their minimum result were 2.78 seconds and 2.97 seconds, with the right-handed children being faster on the test to the right than to the left side. Moreover, left-handed children had a lower minimum score, i.e., the fastest left-handed child (Min = 3.10 seconds) was slower than the fastest right-handed child (Min = 2.78 seconds). Similarly, the left-handed child achieved a better result in the speed of sideways steps to the side of the dominant hand than to the side of the nondominant hand (Min = 3.24). In addition, the slowest children achieved the lowest results for the nondominant hand.

Differences between the groups were determined by univariate variance analysis (ANOVA), i.e., the differences between the arithmetic means for each group of respondents (left-handed and right-handed) were determined for the tested variables (Table 2). Groups were homogeneous, based on the F value of the Levene's test coefficient and its level of significance (p), which was not statistically significant for either of the tested variables (MKKS_R

- 0.46; MKKSL - 0.16). ANOVA analysis indicates there is no statistically significant difference between the left-handed and right-handed children in the tested variables. Since the level of significance for both tests - the sideways steps to the right side ($p = 0.89$) and the sideways steps to the left side ($p = 0.30$) was not below the 0.05 threshold, it can be concluded that there are no statistically significant differences between these groups of children.

Table 2. Significance of difference between groups, right-handed and left-handed vs. sideways steps to the right side and sideways steps to the left side

Variable	Levene's test		ANOVA	
	F	P	F	p
MKKSR	0.53	0.46	0.01	0.89
MKKSL	1.97	0.16	1.08	0.30

Legend: Levene's test -homogeneity test of variance of the analysed groups, F – Levene's coefficient, p - Levene's coefficient level of significance; ANOVA - univariate variance analysis; F - F ratio, p - Significance of F ratio, MKKSR - sideways steps to the right side; MKKSL - sideways steps to the left side.

Intrinsic motivation is one of the most important factors in children of this early age. Although in various situations a person can perform complex motor skills very successfully, even if he/she has never been in a similar situation before (Magill, 1998), experience of long-time preschool teachers indicates that when children are asked to perform given tasks for the first time or if they feel they would not be good enough and skilled they tend to avoid it and it can be difficult to motivate them to try the task at all. Additionally, asking such children to perform a motor activity as fast as possible, in most cases is unsuccessful. These factors, genetics, pre-motor experience and motivation are just some of the causes that may have affected the results of this research.

Conclusion

The conducted research did not confirm the connection between the dominant hand and better performance of the sideways steps to the one or the other side, thus the possibility to apply the constructed test for assessing dominant hands in preschool children has not been confirmed. However, even though the results show no statistically significant difference, it was noticed that the left-handed respondents had better results when performing sideways steps to the left, as well as the right-handed children when performing sideways steps to the right. The results point to the trend of faster execution of the given test, to the side that is the same as the dominant hand, i.e. symmetrical bilateral transfer occurred although the results showed no statistically significant difference.

The symmetry and asymmetry of bilateral transfer is still an open question to which researchers have not yet found an answer. It is generally accepted that the bilateral transfer is asymmetrical, which would indicate that more transfer occurs from the dominant hand/leg to the nondominant hand/leg (Magill, 1998).

The authors suggest that a possible reason for the absence of a statistically significant difference between the left- and right-handed children and the motor test *Speed of performing sideways steps to the left and to the right side* is the length of targeting line set at 8 meters, that is, the set distance which children had to overcome was too short to obtain statistically significant differences. As the results of this study indirectly point to possible differences, additional research should be carried out in which the dominant hand at this age would be determined by the modified tests.

In addition, the research data indicate that the children achieved the best results in the second and third measurements. As the research was conducted with preschool children, it is very likely that children would need to take a certain form of sideways-steps training. Experience working with children reveals that many of them do not understand what the term maximum speed means or what it means to run at a maximum speed. This reflects the complexity of research with children of preschool age.

This research has shown that such tests have a future in working with preschool children in predicting the dominant hand, but before these tests, it is necessary to conduct additional research to construct a measuring instrument that would enable the prediction in an appropriate manner.

Abstract

The aim of this research was to determine the trend of changes in some morphological characteristics of preschool boys aged 6,5 years, who attended kindergartens in Zagreb, Croatia. The study included 374 boys. Four measurements were carried out every five years in the time span between 1998 and 2013 (in the year 1998, 2003, 2008, and 2013). The boys were measured by eleven anthropometric measurements and the body mass index (BMI) was calculated. ANOVA with Bonferonni post-hoc test was used to establish the differences. The results indicate that most of the measured variables showed statistically significant differences, while significant differences were not observed only in the BMI and upper arm circumference. The cause can be found in increased body height, which could diminish the importance of increased body mass. The obtained results confirm the negative impacts of inadequate diet and sedentary lifestyle on the increase of subcutaneous adipose tissue in preschool aged boys.

Keywords: anthropometric measurements, 6 year-old boys, inharmonious trend

Introduction

Determining the trends in the development of anthropometric dimensions is one of the most important tasks in studying the consequences of man`s contemporary sedentary lifestyle. Such a lifestyle is characterized by a reduced need for movement. Consequences are increasingly present in the health status of people (Pulgarón, 2013). It has been established that there is a continuous increase in body weight throughout the world. Thus, on the worldwide level the percentage of obese children increased from 4,2% to 6,7% between 1990 and 2010. The same authors consider that by continuing this trend this percentage will increase to 9,1% by 2020, which would mark the year with almost 60 million obese children worldwide. The highest percentage would be found in Africa with around 12% (de Onis, Bloosner, & Borghi, 2010). With higher body weight and obesity, some morphological characteristics of children would certainly change, such as increased levels of subcutaneous adipose tissue (Olds, Tomkinson, Ferrar, & Maher, 2010). Such a trend was also established in Croatia, which is among the countries that are significantly affected by this negative trend, according to some indicators of the World Health Organization (WHO, 2014).

Such trends affect entire families. It is a known fact that in families in which parents have increased body weight these values usually will reflect on the morphological characteristics of their children, who will also be heavier or even obese. Increased body weight and obesity are established across Europe, only with differences with regard to the geographic regions. Countries that belong to the Mediterranean region and the British Isles are particularly vulnerable. Thus, the proportion of children with an inappropriate body weight in these countries is about 30%, while on the other hand, eastern and northern European countries has a smaller percentage of such children in the population (Cattaneo et al., 2009). Similar indicators have been recorded almost all over the world (Al Alawi, Abdulatif, Al Dhubaib, Mohammed, & Al Ansari, 2013).

As Croatia belongs to the Mediterranean countries, it could be assumed that negative trends are present, which has been confirmed by some research (Horvat, Mišigoj-Duraković, & Prskalo, 2009). It has been determined that the values of some morphological characteristics of preschool children have significantly increased during five years, primarily body weight and subcutaneous fat tissue. Other anthropometric measures did not change significantly.

Beside the assessing trends of increased body weight and obesity, it is certainly necessary to work on programs that would increase the level of participation of children in various forms of kinesiological activities. In this way,

with an adequate diet, the possibility of utilizing caloric intake would be increased (Armstrong, Lambert, & Lambert, 2011).

The aim of this research was to determine possible changes in some morphological characteristics during the fifteen year period of preschool boys who attended kindergartens and were in their final year before attending elementary school. Particular attention was directed on measures that characterize a possible increase of the subcutaneous adipose tissue and which can indicate negative consequences of contemporary lifestyle. The boys were measured between the years 1998 and 2013 on five-year intervals.

Methods

The study sample consisted of 374 preschool boys aged 6.5 years (\pm 6 months). The measurements were carried out four times over a period of 15 years. In 1998 the sample included 59 boys, in 2003 90 boys, in 2008 there were 108 preschool boys, and in 2013 the sample comprised 108 boys.

The sample of variables consisted of eleven anthropometric measures: body weight, body height, sitting height, arm length, upper arm circumference, forearm circumference, thigh circumference, calf circumference, upper arm skinfold, abdominal skinfold, subscapular skinfold, and body mass indeks (BMI) was calculated. Parents' consents were collected for all of the participants. Trained measurers carried out measuring following the standard protocol during morning hours in three kindergartens in the city of Zagreb, Croatia.

Collected data were processed using the statistical program SPSS 23. The central and dispersive parameters were calculated for all the variables. The ANOVA was used, with Bonferonni post-hoc tests (variances for all variables were homogenous) for the purpose of determining secular changes in anthropometric measures of preschool boys over the period of fifteen years, i.e. in order to establish the differences in morphological characteristics between boys with the measurements conducted four times over the period of fifteen years. All other presumptions for applying the ANOVA were satisfied: all variables were ratio-type, revealing normal distributions, with all subsamples of participants higher than 30. The results were commented on the level of significance of $p < 0.05$.

Results and Discussion

Results of the ANOVA which reflect secular trends between the generations of boys at the age of 6.5 (\pm 6 months), for all the measured anthropometric variables of preschool boys, collected during the period between 1998 and 2013 are shown in Table 1.

Table 1. Results of the ANOVA between boys at the age of six for all anthropometric variables

Legend: Bold – the highest and the lowest values of means and statistically significant differences; * significant differences at $p < 0.05$; ** significant differences at $p < 0.01$

The research was conducted in order to determine possible differences that would occur among boys aged 74 ± 6 months. Measurements began in 1998 and then periodically, every five years, 6,5 year-old boys were checked with eleven anthropometric measurements belonging to latent dimensions: longitudinal, circular, body mass, and subcutaneous adipose tissue. In addition, from the obtained results the body mass index (BMI) was calculated with the formula suggested by the Centers for Disease Control and Prevention (CDC, 2000).

From the obtained results it is evident that there is statistically significant difference at the level of significance of .01 in almost all measured variables. The results confirm that during the measurement period there were significant changes in morphological characteristics of boys in this age group.

The greatest changes were observed in the measures of the level of subcutaneous adipose tissue, subscapular, upper arm and abdominal skinfold. Especially, this refers to the differences in the amount of subcutaneous adipose tissue at the beginning of measurements and in the year 2008. During the entire measurement, that year showed the worst indicators regarding the number of overweight and obese children. Thus, in the sample of boys, the percentage of overweight children increased from 14% in 1998 to almost 19%, while the number of obese children increased to almost 11%. Research results show that in that year in the population of 6.5 year-old boys, the percentage of overweight and obese children increased to almost 30%. At that time, the problem of increasing body weight was being noticed around the world, including Croatia (Poljičanin & Benjak, 2013). Due to the perceived problem, changes in diet were implemented. Around the year 2008, under the influence of scientific and professional community in the kindergartens of Zagreb, significant changes were introduced in children's nutrition (Ministry of Health and Social Care, 2007). More fresh vegetables and fruits were introduced into their diet. The results of this study show that the trend of weight gain in the following period has stopped, thus, the latest anthropometric

measurement of preschool boys, related to body weight and subcutaneous adipose tissue, shows more appropriate results. In all the measures of subcutaneous adipose tissue there was a significant reduction, which is particularly evident in the last five-year period between 2008 and 2013. Body weight decreased, but still relatively. Also, the circumference measures had the highest values mostly during the third measurement. These results were expected, since they are affected by the subcutaneous adipose tissue values. In addition to the measures that estimate body fat, an increase in body height during the fifteen-year period is also noticeable. This finding again confirms that the increase in body height is still present (Tanner & Phyllis, 1990).

In addition to the changes in children`s nutrition in kindergartens, there is a need to expand the number of programs in which the time that children spend in kinesiological activities would increase (Sindik & Horvat, 2015; Mišigoj-Duraković, S. Heimer, Gredelj, Z. Heimer, & Sorić, 2007).), as well as their efficiency (Horvat & Bokor, 2005).

Conclusion

The results of this fifteen-year research of preschool boys aged 72 ± 6 months, prior to their elementary school enrolment, showed that after the year 2008, when all values of body mass and subcutaneous adipose tissue were the highest, there was a moderate decrease and stopping of that trend. That year the values indicated that a significant number of boys that age is overweight and obese. The percentage was about 30% of all the boys who participated in the measurements. After the year 2008 there was a change in the children`s diet in kindergartens. The amount of fresh fruit and vegetables were increased and carbohydrates were decreased. These changes after a five-year period (2013) showed their effect. Unlike body mass and adipose tissue measures, differences in BMI during the fifteen-year period were not statistically significant. It can be assumed that it was affected by an increase in height that, in some way, amortizes increase in body weight. In addition, it is necessary to carry out the WHO (2012) recommendations regarding the minimum time per day that children should spend in physical activity, which is 60 minutes.

Perceived Life Satisfaction and Burnout Syndrome Among Teachers

Jana KVINTOVA, Simona DOBESOVA CAKIRPALOGLU, Marie CHRASKOVA

*Faculty of Education, Palacky University in Olomouc

Abstract

The teaching profession is one of the professions considered vulnerable to a phenomenon called the burnout syndrome. Life satisfaction, which is a part of well-being, is supposed to be associated with a degree of burnout. The aim of the present study is to investigate the current susceptibility to the burnout syndrome among elementary school teachers and secondary school teachers in relation to subjectively perceived overall life satisfaction and work satisfaction. The data were obtained by means of the Maslach Burnout Inventory and the Life Satisfaction Questionnaire. The results showed that one-third of teachers were significantly emotionally distressed and showed a low level of personal satisfaction. One-fifth of teachers reported a high level of depersonalization. Teachers in elementary schools are significantly more emotionally exhausted than teachers in secondary schools. The level of work satisfaction is significantly negatively associated with the level of emotional exhaustion, and positively associated with overall life satisfaction and the level of personal satisfaction.

Keywords: Burnout, emotional exhaustion, life satisfaction, teachers.

Introduction

The teaching profession is classified in the group of helping professions. Helping professions refer to occupations that involve a regular and personal contact with people in a helping relationship. Teaching is another human service profession including regular interpersonal interactions with students and colleagues (Spittle et al., 2015, Křivohlavý, 2012). Furthermore, the society has placed an increased pressure on teachers, who are expected to actively engage in their work, to expand their activities beyond teaching, to be emotionally involved in the results of education, and to consider their profession rather a mission (Urbanek, 2005).

The term stressor indicates any circumstances, conditions or stimuli that produce stress and trigger a stress response in an individual, and are considered by the individual as situations threatening his/her mental or physical well-being (Pugnerová, Kvintová, 2016). Professional stressors are all stress situation and stimuli related to a profession. Professional stressors in the teaching profession are to some extent specific and differ from stressors in other professions (Urbanovská, 2001). Stress in the teaching profession is not only the result of a stress situation that arises in the course of teaching, but is also associated with other types of stress that teachers are exposed to, including their relationship with other teachers, superiors, parents and various educational institutions (Průcha, 2002).

The top five work-related stressors among teachers in Europe (ETUCE, 2007) were identified as working intensity, role overload, increased number of students in class, pupil misbehaviour and lack of support from management (Cefai, Cavioni, 2014). Similarly, in the UK, USA, Canada, Australia and New Zealand the most common teachers' stressors were identified as heavy workload, excessive reforms, and unacceptable pupil behaviour, and moreover emotional demands, performance appraisal and lack of time for personal and professional development (Williamson and Myhill 2008; Bricheno et al. 2009; Cefai, Cavioni, 2014). In many studies, the conflict of roles (informant, friend, supervisor) is considered one of the predictors of burnout. This is confirmed by the results of research studies revealing positive correlations between the conflict of roles and the level of burnout among teachers. The burnout syndrome specifically includes the dimensions of emotional exhaustion and depersonalization (Lee & Ashforth, 1996). Czech research studies add further stressors: time stress, permanent link with work-related issues, and low social and financial appreciation (Novotná, Miňhová, 2000; Holeček, Jirincová a Miňhová, 2001; Paulík, 2012).

Burnout

Burnout can be defined as a multidimensional chronic syndrome marked by exhaustion and withdrawal from one's work as the result of prolonged interpersonal stress (Maslach & Jackson, 1986, Schwarzer, Schmitz &

Tang, 2000). Burnout has been associated with decreased job performance, health consequences, and an increased probability to leave the profession in a variety of fields, including teaching (Maslach, Schaufeli, & Leiter, 2001; Richards et al., 2014). Lavian (2012) considers burnout a precursor to teachers' intention to leave their teaching professions. Rumschlag (2017) believes that burnout is the main reason for teachers leaving their professions in the 21st century. Hong (2010) specifies the reason for teachers leaving their professions as emotional burnout. The author adds that pre-service teachers tend to have naive and idealistic ideas about the teaching profession, which might result in burnout already in the first years after starting the teaching profession. This is also confirmed by a research study by Urbanovská (2011). According to Riggs (2013), approximately 9.5% of young teachers leave the teaching position during or after completion of the first school year.

It is generally agreed that the symptoms of burnout tend to be work-related and situation-specific. Burnout can be considered as prolonged job stress, in which work-related demands exceed an individual's resources, including a clear disparity between the initial effort and final effect. It could be characterized as a progressive loss of idealism, energy, and purpose in people working in helping professions (Cherniss, 2016). Work enthusiasm as a factor associated with burnout is also reported by Hagemann (2012, p. 10), who adds other factors such as length of experience, personal changes in management, change in orientation (from mission to performance), or lack of support of the teaching staff or bullying in the workplace. Hagemann (2012) adds that significant factors supporting burnout include a feeling of loneliness in the profession without sufficient supervision, lack of free time for relaxation, or breaks missing the purpose of relaxation.

Teachers who show symptoms indicating a high degree of burnout, but stay in the teaching profession, might experience a lower degree of motivation for transferring knowledge, which might have a negative effect on the quality of teaching (Cherniss, 2016), students' achievement, quality of attitudes towards colleagues and students, and general school development (Brunsting, Sreckovic, & Lane, 2014). Jinfeng et al. (2016) deal with the negative influence of the burnout process on an individual's motivation for knowledge sharing. Some research studies suggest that teachers tend to underrate their health and be less satisfied with their health than individuals in different professions (Paulík, 2013). For example in a research study by Sigmund, Kvintová, Pugnerová & Hřebíčková, (2014) teachers reported worse assessment than nurses, doctors, public servants, and sales representatives. At the same time, the intensity of health problems and the feeling of overall deterioration of teachers' health increases with age and length of teaching experience, and is also associated with decreased in job satisfaction (Paulík, 2012).

Life satisfaction

The concept of *life satisfaction* is an interdisciplinary construct without a clear terminological definition (Křeménková et al. 2017). Life satisfaction tends to be understood as one of the dimensions of the well-being construct (Kvintová et al., 2016). Keyes, Shmotkin, Ryff (2002) distinguish two concepts associated with well-being. The first is called subjective well-being (SWB), which according to Diener (1994) includes both the cognitive component representing conscious assessment of one's own life, and the emotional component consisting of the positive and negative emotion (Diener, Oishi, & Lucas, 2003). In other words, SWB can be defined in terms of life satisfaction and a balance of positive and negative emotional states (Hřebíčková, Blatný, Jelinek, 2010). Individuals with high SWB typically have a higher level of life satisfaction, positive mood, optimism and joy, and have less negative emotions such as sadness, anxiety or anger (Diener et al., 1997). The second concept represents psychological well-being (PWB), which is associated with addressing existential challenges and issues such as the meaning of life and personal growth (Hřebíčková, Blatný, Jelinek, 2010). Wood et al. (2009) refers to other components, including positive relations with others, autonomy, environmental mastery, and self-acceptance.

Regarding the stability of the construct of life satisfaction, scientific literature describes two perspectives. The first represents the traditional trait-like perspective, which is based on a dispositional/tendency approach. This approach is associated with stable personality characteristics and assumes considerable temporal stability and

cross-situational consistency (Diener, Lucas, 1999). The other represents a constructionist approach, which considers contextual intervening variables that affect the level of life satisfaction and therefore supports the measurements of the consequences of these interventions, i.e. fluctuations in life satisfaction judgements (Heller et al., 2006). It should be noted that a problematic aspect of the latter perspective is the low probability of repeating the measurement under identical conditions.

Research studies suggest a positive correlation between life satisfaction in teachers and high-quality education, professional achievement and other aspects of effective teaching (Baker & Martin, 2009; Spittle et al., 2011). A satisfied teacher has a positive effect on the class climate (Baker & Martin, 2009), is more creative and open to introducing new teaching approaches (Veen et al. 2005; Spittle et al., 2011). A satisfied teacher is more involved in the development of authentic human relationships with students and between students (Reynolds & Muijs, 2005), but also has a more positive attitude towards educational reforms and various intervention programmes (Spittle et al., 2011).

Research objectives

The main aim of the present study is to investigate the current susceptibility to the burnout syndrome among elementary school teachers and secondary school teachers in relation to subjectively perceived overall life satisfaction and work satisfaction. The following research questions were formulated: What is the prevalence of the burnout syndrome among elementary and secondary school teachers? What is the overall life and work satisfaction in elementary and secondary school teachers? What is the relationship between the level of the burnout syndrome and overall life and work satisfaction?

Methods

The data on the level of the burnout syndrome were collected by means of a self-report inventory called the Maslach Burnout Inventory (hereinafter referred to as MBI) designed by C. Maslach et al.(1986). According to Kebza and Šolcová (2003) this is the most frequently used method for measuring the burnout syndrome. The MBI is designed to assess three components of the burnout syndrome: emotional exhaustion (EE), depersonalization (DP), and personal accomplishment (PA). It consists of 22 questions, of which 9 relate to the area of emotional exhaustion, 5 to depersonalization and 8 to the level of personal accomplishment. Emotional exhaustion and depersonalization are negative, on the other hand the third area of personal accomplishment is positive. In each item, the respondent considers two answers, i.e. the frequency and intensity of emotions. The answers are indicated on a 7-8-point rating scale. The frequency category is indicated on a 0-6 scale (0 = never, 1 = a few times a year or less, 2 = once a month or less, 3 = a few times a month, 4 = once a week, 5 = a few times a week, 6 = every day). The intensity category is indicated on a 0 to 7 scale (0 = never, 1 = slightly, 4 = moderately, 7 = significantly, very strongly). The critical value for the burnout syndrome is 17 points and higher in emotional exhaustion, 5 points and higher in depersonalization and 33 and lower in personal accomplishment. The validated Cronbach's alpha is 0.83 for frequency and 0.89 for intensity (Maslach & Jackson, 1981).

Individual dimensions of the burnout syndrome may be characterized as follows:

The dimension of emotional exhaustion is characterized by a state of emotional exhaustion, loss of zest for life, wearing out, loss of interest and strength for any activity, depletion, debilitation, and fatigue (Singh, & Arora, 2014). It is considered the most relevant indicator of the burnout syndrome.

Depersonalization is related to behaviour of an individual towards other people. This condition occurs when an individual does not receive the necessary positive feedback from those who the individual takes care of. This condition results in bitterness towards these persons, loss of respect and deference, or detached behaviour. The level of personal accomplishment represents a risk especially to those individuals who lack healthy self-confidence. Regarding the fact that these persons are not self-confident, they lack enthusiasm for dealing with these situations (Křivohlavý, 2012, p. 55). The last dimension is personal accomplishment, which expresses a tendency to negative assessment of oneself in relation to work and other people, and feelings of competence.

Life satisfaction was investigated by means of the Life Satisfaction Questionnaire (LSQ) developed by J. Fahrenberg, M. Myrtek, J. Schumacher and A. Brähler (2001). This questionnaire is used to capture the level of overall life satisfaction but also life satisfaction in ten significant life areas. These areas are as follows: Health (HEA), Work and employment (WOR), Financial situation (FIN), Leisure (LEI), Marriage and partnership (MAR), Relationship with own children (CHI), Own person (OWP), Sexuality (SEX), Friends, acquaintances and relatives (FAR), Housing (HOU). For each area, seven statements are provided; each respondent makes an assessment on a seven-point scale (from ‘very satisfied’ to ‘very dissatisfied’). For the calculation of the level of overall life satisfaction, the following areas are not included: Marriage and partnership (MAR), Relationship with own children (CHI) and Work and employment (WOR). In the present study the authors used only the following partial outcomes of the questionnaire: overall life satisfaction and work-related satisfaction.

Sample

The survey included a total of 122 teachers from the Olomouc region. 58 were elementary school teachers; 64 were secondary school teachers. The average age of the entire research sample was 45.56 years, SD 11.87, MAX 69 and MIN 24. The overall variability of the research sample was between 24 and 69 years of age. The most numerous age category was 46-55 years, followed by 25-35 years. The length of teaching experience ranged from 1 to 47 years.

In terms of respecting the code of ethics, all participants in the survey were fully informed of its purpose and of a possibility to terminate their participation at any time without giving a reason. All participants were informed of further data processing and ensuring anonymity. Each participant was involved on a voluntary basis and consented to data processing and publication.

Statistical processing

The data were processed using the STATISTICA programme, StatSoft, Inc. (2013). STATISTICA (Data Analysis Software System), version 12. For each variable, basic statistical quantities were calculated and distribution of normality verified. Normality was assessed using the Shapiro-Wilk normality test. Moreover, the paired t-test and Pearson correlation were applied. The level of statistical significance was tested at $\alpha \leq 0.05$; $\alpha \leq 0.01$; $\alpha \leq 0.001$.

Findings

During an analysis of various dimensions of the burnout syndrome it was observed that in the total sample of 122 teachers, almost one-third (28%) reported a high level of emotional exhaustion, which is considered a significant indicator of the burnout syndrome (see. Table 1). The average value of emotional exhaustion of the entire sample was 20.6; this value is in the category of medium to high risk of the burnout syndrome (range 17-26), MIN 0 (2 respondents) and MAX 49 (1 respondent).

Table 1. Individual dimensions of the burnout syndrome - entire sample

Dimensions of MBI	N	Mean	Low degree	Medium degree	High degree
			%	%	%
Emotional exhaustion (EE)	122	20.6	45.9	26.2	27.9
Depersonalization (DP)	122	8.10	49.2	27.9	22.9
Personal accomplishment (PA)	122	35.8	31.2	21.3	47.5

Table 1 also presents the percentage of respondents reporting a medium degree of emotional exhaustion. This is reported by 32 teachers (26.2%). A low risk of the burnout syndrome was reported by almost a half of the respondents (45.9%).

As far as depersonalization is concerned, the average value of the entire sample of teachers was 8.1, which means a medium risk of the burnout syndrome (range 7-12), MIN value was 0 (9 respondents) and MAX 24 (2 respondents). A high degree of depersonalization was reported by 23% of teachers, a medium degree of depersonalization was reported by 34 teachers (28%). As in the case of emotional exhaustion, in the category of depersonalization almost 50% of respondents reported a low level of depersonalization.

The last dimension of the burnout syndrome is personal accomplishment. It was observed that lower values of personal accomplishment led to a decreased risk of the burnout syndrome. The average value of personal accomplishment of the entire sample was 35.79; this value is in the category of a medium risk of the burnout syndrome (range 32-38), MIN 10 (1 respondent) and MAX 51 (1 respondent). As far as the percentages in various categories of personal accomplishment are concerned, a high degree of personal accomplishment was reported by 48% of respondents, a low level by 31% of teachers.

The authors also compared the values of individual dimensions of the burnout syndrome among respondents from various types of schools – elementary schools (N=58) and secondary schools (N=64) (see Table 2). Using the Student's two-sample t-test at a level of significance $\alpha = 0.05$ and $\alpha = 0.01$, a significant difference was observed in the item of emotional exhaustion and personal accomplishment. A higher level of emotional exhaustion was reported by elementary school teachers. Secondary school teachers are less emotionally exhausted and show significantly higher level of personal accomplishment. The differences in the values of depersonalization were not statistically significant.

Table 2. Correlation between the burnout syndrome and type of school

Variable	ES Mean	SS Mean	ES SD	SS SD	t	p	df	F-ratio variances	p- variances
EE	23.88	17.00	12.18	14.29	2.87	0.04	122	1.38	0.22
DP	7.97	8.24	6.51	7.19	-0.21	0.82	122	1.21	0.44
PA	33.69	38.10	10.12	7.28	-2.74	0.00	122	1.93	0.01

Legend: ES- elementary school sample, SS- secondary school sample, SD- standard deviation, EE- emotional exhaustion, PA-personal accomplishment, DP-depersonalization, OLS-overall life satisfaction

The authors also examined the correlation between the independent variable of length of teaching experience (TE) and the dimensions of the burnout syndrome. As suggested in Table 3, using the Pearson correlation coefficient at a level of significance $\alpha=0.05$ a significant correlation was identified between length of teaching experience and emotional exhaustion and depersonalization. In contrast, in the case of personal accomplishment, no significant correlation was observed.

Table 3. Pearson correlation coefficient: correlation between teaching experience and the burnout syndrome - entire sample

Variable	N	Average	SD	EE	PA	DP
Teaching experience	122	19.28	13.33	0.48*	-0.24	0.39*

Legend: SD- standard deviation, EE- emotional exhaustion, PA-personal accomplishment, DP-depersonalization, * $p < .05000$

Graph 1 below presents the changes in the level of emotional exhaustion (EE) and depersonalization (DP) depending on the length of teaching experience. The values indicate the averages in the monitored dimensions of the burnout syndrome in respondents with the corresponding length of teaching experience. The results of the present study suggest that increasing length of teaching experience leads to a linear increase in emotional exhaustion. Similarly, the level of depersonalization increases with increasing length of teaching experience. Respondents with at least 26 years of experience report average values that indicate a high risk of the burnout syndrome.

Graph 1. Development of EE and DP depending on teaching experience

Another area of the research was life satisfaction (see Table 4). A test using the Pearson correlation coefficient suggested an indirect correlation between overall life satisfaction (OLS) and emotional exhaustion (EE). It may therefore be concluded that increasing overall life satisfaction leads to decreased emotional exhaustion (EE) and vice versa, increasing emotional exhaustion (EE) leads to decreased overall life satisfaction (OLS). A negative correlation was also demonstrated between overall life satisfaction and length of teaching experience. It can be concluded that increasing teaching experience leads to decreased overall life satisfaction. Direct correlation was revealed between the overall life satisfaction and personal accomplishment (PA). In the last categories (DP), the Spearman correlation did not reveal any significant associations with overall life satisfaction.

Table 4. Pearson correlation coefficient: correlation between OLS, burnout syndrome and teaching experience

Variable	N	Average	SD	EE	PA	DP	TE
OLS	122	253.34	33.48	-0.44*	0.21*	0.01	-0.27*

Legend: TE-teaching experience, SD- standard deviation, EE- emotional exhaustion, PA-personal accomplishment, DP-depersonalization, OLS-overall life satisfaction, * $p < .05000$

Table 5 shows the correlation between work-related satisfaction and the dimensions of the burnout syndrome, and overall life satisfaction. The average level of work-related satisfaction in the monitored sample was 35.93; minimum value 26, maximum value 46. The average value of life satisfaction was 253.44; minimum value 155 (1 respondent), maximum value 306 (1 respondent). Most values were in the range of 230- 297.

The following Table 5 shows the correlation between work-related satisfaction and the burnout syndrome, and overall life satisfaction. The testing was performed by means of the Pearson correlation coefficient at a level of significance $\alpha=0.05$. The results suggest that those respondents who are more satisfied at work show lower values of emotional exhaustion (indirect correlation). A significant positive correlation was demonstrated between work-related satisfaction and the level of personal accomplishment, as well as overall life satisfaction (direct correlation). It may therefore be concluded that increasing work-related satisfaction leads to decreased emotional exhaustion, increased performance and personal accomplishment, and increased overall life satisfaction.

Table 5. Pearson correlation coefficient: correlation between WOR, burnout syndrome and overall life satisfaction

Variable	N	Average	SD	EE	PA	DP	OLS
WOR	122	35.93	4.72	-0.57*	0.30*	-0.09	0.51*

Legend: WOR-work satisfaction, SD- standard deviation, EE- emotional exhaustion, PA-personal accomplishment, DP-depersonalization, OLS-overall life satisfaction, * $p < .05000$

Results, Conclusions and Recommendations

The results of the present study, similarly to other studies, suggest that the area of the burnout syndrome in teachers is a topical issue. Over the past two or three decades, burnout has been researched extensively in association with helping professions, such as nursing and social work. Numerous studies have been conducted to analyse the syndrome from different perspectives. The teaching profession belongs to one of the most hotly-debated domains that is prone to the burnout syndrome (Ghanizadeh & Jahedizadeh, 2015).

In the present research study, the Maslach Burnout Inventory was used to provide information about the prevalence and intensity of the three burnout dimensions. The study revealed that almost one-third of teachers showed a high degree of risk of burnout in the area of emotional exhaustion. The same percentage was observed in teachers reporting low personal accomplishment, i.e. another aspect contributing to burnout. More than one-fifth of respondents showed a high degree of risk of burnout in the area of depersonalization. The total number of respondents who achieved a medium or high value in the burnout dimensions (except personal accomplishment, where low and medium values are added) suggests that almost a half of teachers are at risk of the burnout syndrome and about a half successfully resist the burnout syndrome. Therefore, the authors of the present study agree with the conclusions formulated by Arvidsson et al. (2016).

The importance of emotional exhaustion as a significant predictor of the burnout syndrome is emphasised by many studies. For example, a study aimed at British teachers examined the effect of teachers' work on various burnout areas and a highly demanding nature of the teaching profession was confirmed (Kinman, Wray, Strange, 2011). This dimension is closely associated with the other two mentioned areas - depersonalization and personal accomplishment. This is also confirmed by Křivohlavý (2012). The author explains that in the process of burnout, the first symptom is emotional exhaustion. The reaction to emotional exhaustion is depersonalization, and finally these two factors cause a decrease in the level of personal accomplishment, which is associated with a decrease in work efficiency and loss of its sense.

Teacher burnout is associated with a multiple of causes and consequences (Ghanizadeh & Jahedizadeh, 2015). Examples of factors contributing to burnout are as follows: role overload, work pressure, classroom environment and self-esteem (Pishghadam & Sahebjam, 2012), other factors include: personality types (neuroticism and extraversion) and emotional intelligence (Dorman, 2003). However, the most commonly reported and most significant factor leading especially to emotional exhaustion is students' disruptive behaviour (Doménech & Gómez, 2010; Fernet, Guay, Senécal & Austin, 2012). Many studies on this issue suggest that the most

important intrinsic factor affecting teacher burnout is low self-efficacy (Klassen, Wilson, Siu et al., 2013; Skaalvik & Skaalvik, 2014; Yu, Wang, Zhai, Dai & Yang, 2015; Wang, Hall & Rahimi, 2015; Arvidsson, Håkansson, Karlson, Björk & Persson, 2016; Zee & Koomen, 2016). Ghanizadeh & Jahedizadeh (2015) consider self-efficacy one of the most predictable and reciprocal factors in both affecting and being effected by teachers' burnout. The level of self-efficacy influences not only well-being but as well as teacher competences and effectiveness of teaching that is supported by other research, for example Dofková, Kvintová (2016); Singh, Babita, (2014).

Teachers who feel under great work pressure are inclined to reduced self-assessment and distrust of their own abilities. This negative understanding of oneself and one's own work makes teachers believe that the school no longer meets their expectations and a considerable feeling of helplessness begins to develop. Teachers in this condition are more prone to burnout. If personal discomfort and a high degree of distrust of oneself last for a long time, teachers start to feel anxiety, are very sensitive to students' disobedience and their poor achievement, all of which leads to a high degree of emotional exhaustion and depersonalization (Yu, Wang, Zang et al, 2014). A study carried out among Finnish teachers confirmed a correlation between work demands and the burnout syndrome. Work demands also greatly affect teachers' health (Hakanen, Bakker & Schaufeli, 2005).

The present research confirmed that the degree of emotional exhaustion increased with the length of teaching experience, which can be explained by a loss of teachers' original ideals and increasing pressure on emotional experiencing as a result of various factors (lack of appreciation, inappropriate students' behaviour, and large amount of work duties) throughout the course of teachers' career. The effect of the length of teaching experience on the degree of emotional exhaustion was also confirmed by a study carried out among Chinese teachers (Wang, Ramos, Wu et al., 2014). Teachers with experience of over 10 years reported a substantially higher degree of emotional exhaustion than teachers with shorter teaching experience. A higher degree of emotional exhaustion was also confirmed in teachers with over 40 working hours per week compared with those with smaller workload.

A comparison of the results between elementary and secondary school teachers revealed a statistically significant difference in the dimension of emotional exhaustion. A significant difference was also observed in the area of personal accomplishment. It can therefore be concluded that in comparison with secondary school teachers, elementary school teachers are significantly more emotionally exhausted and report lower personal accomplishment.

The present research also confirmed a correlation between work satisfaction and the burnout syndrome. The occupational area is particularly influenced by emotional exhaustion and the degree of personal accomplishment. The causes of reduced personal accomplishment might be for example unfulfilled ideals and expectations, high demands of the teaching profession, insufficient appreciation of the teaching profession, and decreased teachers' social status (Hagemann, 2012). According to Křivohlavý (2012), a decrease in personal accomplishment results from lack of work-related fulfilment.

A positive relationship was also confirmed between work satisfaction and overall life satisfaction. This confirms the findings formulated by Hagemann (2012), who adds that the burnout syndrome is a result of failure not only in a single area (work-related area in our case) but also in other significant areas of life. Therefore, the onset of the burnout syndrome is affected not only by work, but also by the family, oneself, and social background. A study among British teachers examined whether the effect of social support in work improved mental well-being and prevented burnout. The results suggested that social support had a positive effect, even when a person was affected by a number of stressors (Kinman, Wray, Strange, 2011). As far as social support in the teaching profession is concerned, it can be concluded that this area is very weak. Mental well-being of teachers is not taken care of very well. Unlike other helping professions, the teaching profession lacks supervision, which acts as a prevention of burnout. As a result, the only sources of support include the family, friends and acquaintances.

Despite the global emphasis on quality in education, many countries face a lack of qualified teachers (Skaalvik & Skaalvik, 2016; Hong, 2012). One of the causes of the outflow of teachers is teacher stress, which is one of the factors contributing to burnout, and may have devastating consequences both for teachers and as well as the quality of education (Liu & Onwuegbuzie, 2012; Montgomery & Rupp, 2005; Stoeber & Rennert, 2008). According to Skaalvik & Skaalvik (2016) there are two causes of teachers leaving their profession. One of them is time pressure, emotional stress, and eventually leaving the teaching profession. The other one is associated with a lack of supervisory support and trust, low student motivation and value conflicts via lower self-efficacy and lower engagement to motivation to quit.

The results of the present study as well as relevant international studies suggest a serious need for preventive measures. For example Ghanizadeh & Jahedizadeh (2015) emphasise prevention through emotion regulation strategies in the workplace in order to decrease the manifestation of the burnout syndrome. The authors of the present study believe that measures should be taken in the preparation of pre-service teachers and in the context of teachers' lifelong learning.

Acknowledgements

Abstract

This study aims to identify emotional intelligence levels of teachers as a predictor of their work engagement and the relationship between teachers' work engagement and emotional intelligence levels. The research was designed as a relational survey model. The research sample was composed of 353 teachers working at public high schools in Küçükçekmece district of İstanbul in the academic year of 2015-2016. The Work Engagement Scale (UWES-TR) and Trait Emotional Intelligence Questionnaire-Short Form (TEIQue-SF) were used as data collection instruments. Correlation and linear regression analysis were utilized in the data analysis. A statistically significant and positive relationship was found between teachers' work engagement and emotional intelligence levels in the research. It was also concluded that emotional intelligence is a significant predictor of work engagement.

Keywords: Work engagement, Emotional intelligence, Teacher opinions.

Introduction

Working life play a both materially and spiritually crucial role in the lives of humans who are social beings. Management is also important in working life. Concept of management which started to develop in 1880s has been addressed with different theories. Continuing its development as classical (traditional) approach, neo-classical (behavioral) approach, modern approach, and postmodern approach, management theories would regard human as a machine by ignoring their social and psychological requirements to increase productivity in the organizations in the first place. Then, human was regarded as a part of organization, and the importance of meeting human's social and psychological requirements started to be apprehended. Thus, psychologists and management theoreticians have started to examine and enhance humans' impacts on working life (Titrek, 2013).

Having developed in the beginning of 21st century and aiming to improve humans' positive traits, increase and strengthen their resilience and prevent them from orientating towards negative behaviors, positive psychology reflected on the organizational field as the positive organizational behavior (POB) (Keser and Yılmaz, 2009). According to Luthans (2002), "positive organizational behavior is the body of studies and applications regarding the strengths and psychological capacity of measurable, improvable and effectively manageable positive human resources for the development of today's working life" (Luthans, 2002: p.59 in Çalışkan, 2014). While negative situations in working life are examined and investigated in traditional psychology, positive organizational behavior studies examine the contrasts of these negative situations (Keser and Yılmaz, 2009). Improving and strengthening the positive traits, preventing the negative behaviors and revealing and enhancing individuals' potentials in educational organization that raise the future of the society are inevitably of importance and necessity. In this sense, teachers have crucial responsibilities in educational organizations. Teachers' performance of these responsibilities depends on several factors (Özdemir, 2016). As work engagement and emotional intelligence are considered among these factors, this study investigated whether emotional intelligence is a predictor of work engagement.

According to the definition by Lodahl and Kejner (1965), work engagement is the level of individuals' association with working or the fact that working has a significant place in individual's life (*in* Karacaoğlu, 2005). Work engagement is basically a concept regarding individuals' positive attitude toward their job or the act of working. Individuals with such an attitude feel energetic, are proud of what they do and feel happy when working (Gül, 2015).

* This study is adapted from the Miray Kabar's master thesis.

Work engagement means that individuals feel vigorous, commit themselves to their jobs or become satisfied with their jobs and concentrate on their jobs when they are working. There is continuity in work engagement. It is not dependent on a single object, event or person. It refers to an emotional and cognitive state. It comprises of three important dimensions: vigor, dedication and absorption. Vigor refers to being highly energetic, ambitious about work and mentally resilient when working. Dedication means regarding work as serving a meaning and purpose, perceiving it as being enthusing and inspiring, being proud of the work and evaluating the work specifically when working. Absorption is about fully concentrating on the work, being unaware of the time, only thinking about the work and being very happy when working (Hakanen, Bakker and Schaufeli, 2006; Eryılmaz and Doğan, 2012).

It is possible to say that concept of work engagement is related to similar concepts such as organizational engagement and occupational engagement and influenced by several factors either directly or indirectly. Work engagement may vary by certain individual differences. Situational attributes such as individual's working conditions and manager-employee relationship may affect individual's career. Hence, it can be assumed that individual's work-related behaviors are affected by both individual and situational variables. There are other factors, too. Term of employment in the organization, field of occupation, characteristics of the job and the organization itself may have an impact on work engagement. As is seen, there are several factors that are effective in the attitude of work engagement (Kurt, 2013). Engagement refers to an emotional state. Therefore, it can be implied that emotions have a prominent place in work engagement.

Concept of emotional intelligence of which foundations were laid by the concept of social intelligence introduced by the Psychologists Edward L. Thorndike in the literature has been addressed in several academic research studies due to countries' search for increasing the quality in various fields since 1980s. Today, there are three schools which have had individual contributions to the concept of emotional intelligence:

School of Emotional and Social Intelligence represented by Daniel Goleman et al., school pioneered by John D. Mayer and Peter Salovey, and the School of Reuven Bar-On. Goleman is the researcher who introduced the concept of emotional intelligence to world; Bar-On is the first person to produce the scientific emotional intelligence test and use it in the academic field; and

Mayer and Salovey are known as the specialists who brought emotional intelligence into the literature and ensured its study on the scientific platform (*in*: Delice, Günbeyi, 2013).

Defined for the first time by Peter Salovey of the Department of Psychology at University of Yale and John D. Mayer of University of New Hampshire in 1990, concept of emotional intelligence, according to them, is "a sub-form of social intelligence which is related to individuals' ability to monitor their own and others' feelings and emotions, distinguish between them and use and utilize this information in their own thoughts and actions (*in*: Kızıl, 2014).

Having become popular with Goleman's book "Emotional Intelligence" published in 1995, emotional intelligence allows for recognizing, evaluating and learning our and others' emotions and reflecting the information about emotions and energy of emotions to the daily life and work efficiently and giving appropriate reactions to them (*in* Titrek, 2013).

Emotional intelligence is important for individuals to achieve success and happiness either in their social lives or working life. Research studies show that individuals with high emotional intelligence can establish positive relations in their family and social lives, gain success more easily; are productive and respected and loved by their superiors and inferiors in their working lives and ascend in their careers rapidly. Employees with high emotional and social capacity who are aware of their emotions, can control their feelings and understand others' feelings are required in today's working life. Organizations who employ individuals with high emotional intelligence will host more positive and efficient communications and relations. Hence, team spirit can be

created to enhance performance, and success can be achieved through a happy and peaceful work environment, which will in return affect employee engagement positively (Doğan, Demiral, 2007).

In accordance with these facts, it is possible to say that it is important for teachers to have work engagement and emotional intelligence at educational institutions. Due to the importance that teachers who will shape the future have work engagement and emotional intelligence in educational organizations, requirement of studying their levels of work engagement and emotional intelligence guided this research.

Methodology

Descriptive relational survey model, which is a general survey model, was used in this study aiming to identify the relationship between teachers' levels of work engagement and emotional intelligence. The research population was 1912 teachers working at public high schools in Küçükçekmece district of İstanbul in the academic year of 2015-2016. Sample size calculation table prepared by Yazıcıoğlu and Erdoğan (2004) was utilized when choosing the sample. Accordingly, with a sampling error of 0.05 ($p=0.05$ and $q=0.5$), 333 teachers were deemed to be sufficient for the sample. Simple random convenience sampling method was used in the study. The sample of the research was composed of 353 teachers working at public high schools in Küçükçekmece district of İstanbul in the academic year of 2015-2016. Majority (56.4%) of the teachers who participated in the study are female. 34.3% of them were at the age of 20-30, 44.5% were at the age of 31-40, and % were at the age of 41 and older. 67.7% were married, and 24.4% were working at an Anatolian High School whereas 75.6% were working at a vocational high school. 69.7% of the teachers have an associate or bachelor's degree while 30.3% have a master's degree.

In the research, the Work Engagement Scale (UWES-TR) and Trait Emotional Intelligence Questionnaire-Short Form (TEIQue-SF) were used as data collection instruments. Information on the scales are given below.

The Work Engagement Scale

To measure teachers' work engagement levels, the Utrecht Work Engagement Scale (UWES) developed by Schaufeli et al. (2002) to measure employees' work engagement was used in the study. The Turkish adaptation and reliability-validity study of the scale was performed by Eryılmaz and Doğan (2012). The 17-item scale is composed of three aspects: vigor, dedication, and absorption. Developed in 5-point Likert type, the scale is graded with "Never fits (1)", "Not fit (2)", "Somewhat fits (3)", "Fits (4)", and "Completely fits (5)". The reliability of UWES-TR was investigated with internal consistency and test-retest methods. Cronbach's alpha reliability coefficient calculated for the whole scale is .94. The coefficients calculated for the subdimensions are .87 for vigor, .87 for dedication, and .84 for absorption. Test-retest reliability coefficients were found to be .85 for the whole scale, .89 for vigor, .80 for dedication, and .69 for absorption (Eryılmaz and Doğan, 2012). In this study, the Cronbach's alpha reliability coefficients were calculated to be .87 for vigor, .86 for dedication, .86 for absorption, and .95 for the whole scale.

Trait Emotional Intelligence Questionnaire - Short Form (TEIQue-SF)

To measure teachers' emotional intelligence levels, the Trait Emotional Intelligence Questionnaire - Short Form (TEIQue-SF) developed by Petrides and Furnham (2000, 2001) for identifying individual's level of self-perception regarding his/her emotional efficacies was also used in the study. The Turkish adaptation and reliability-validity study of the scale was performed by Deniz, Özer and Işık (2013). The 20-item questionnaire is composed of four factors: well-being, self-control, emotionality, and sociability. It is a 7-point Likert-type (1: strongly disagree, 7: strongly agree) measurement tool. Internal consistency reliability of TEIQue-SF was calculated with Cronbach's alpha coefficient. The coefficients are .72 for well-being, .70 for self-control, .66 for emotionality, .70 for sociability, and .81 for the whole questionnaire. Its test-retest reliability coefficient was found to be .86 (Deniz, Özer and Işık, 2013). In this study, the Cronbach's alpha reliability coefficients were

found to be .72 for well-being, .69 for self-control, .64 for emotionality, .68 for sociability, and .85 for the whole questionnaire.

Data Analysis

The data were analyzed in a software package for social sciences. Skewness and kurtosis values within the range of ± 3.29 according to Tabachnick and Fidell (2007) and ± 2 according to George and Mallery (2010) are acceptable for normality (Şentürk, Zahal, Yurga, Gürpınar and Altun, 2016). Based on this, it was accepted that the data exhibited normal distribution. Correlation and regression analyses were performed to identify the relationship between teachers' work engagement and emotional intelligence.

The scores obtained in the scales that were prepared in the 5-point Likert type were graded as “none” (1.00-1.80), “low” (1.81-2.60), “moderate” (2.61-3.40), “high” (3.41-4.20), and “very high” (4.21-5.00). For the correlation coefficients, as the absolute value, the relationships were interpreted as “low” 0.00- 0.29, “moderate” 0.30-0.69, and “high” 1.00-0.70 (Büyükoztürk, 2009). The teachers' work engagement levels were interpreted in accordance with their answers to the work engagement scale on the basis of this information. It was assumed that the ranges were equal in the 7-point Likert-type trait emotional intelligence questionnaire, and the score range was calculated to be 0.86 for the arithmetic means (Score range= (Highest Vale – Lowest Value)/7= (7 – 6)/7= 6/7 = 0,86) (Kaplanoğlu, 2014). According to this calculation, the evaluation range of the arithmetic means were accepted as “not available” (1.00- 1.86), “none” (1.87-2.71), “very little” (2.72-3.57), “moderate” (3.58-4.43), “somewhat high” (4.44-5.29), “high” (5.30-6.14), and “very high” (6.15-7.00).

Findings

The relationship between teachers' levels of work engagement and emotional intelligence was identified in a comparison through the correlation analysis. The analysis results are given in Table 1 and 2.

Table 1. Analysis Results Regarding the Relationship between Teachers' Levels of Work Engagement and Emotional Intelligence

		Work Engagement	Emotional Intelligence
Work Engagement	r	1	.475**
	p		.000
Emotional Intelligence	r	.475**	1
	p	.000	

Table 1 shows a statistically significant and positive relationship was found between the work engagement and emotional intelligence levels of the teachers working at high schools ($r=0.475^{**}$, $p<0.01$). Accordingly, it can be assumed that the emotional intelligence scores increased as the work engagement scores increased and the teachers with higher work engagement levels have higher levels of emotional intelligence.

Table 2. Analysis Results Regarding the Relationship between Teachers' Scores of Work Engagement Factors and Emotional Intelligence Factors

		Vigor	Dedication	Absorption	Well-being	Self-control	Emotionality	Sociability
Vigor	r	1	,794**	,853**	,407**	,181**	,133*	,300**
	p		,000	,000	,000	,001	,012	,000
Dedication	r	,794**	1	,767**	,458**	,168**	,162**	,275**
	p	,000		,000	,000	,002	,002	,000
Absorption	r	,853**	,767**	1	,396**	,145**	,103	,275**
	p	,000	,000		,000	,006	,053	,000
Well-being	r	,407**	,458**	,396**	1	,375**	,351**	,451**
	p	,000	,000	,000		,000	,000	,000
Self-control	r	,181**	,168**	,145**	,375**	1	,554**	,490**
	p	,001	,002	,006	,000		,000	,000
Emotionality	r	,133*	,162**	,103	,351**	,554**	1	,427**
	p	,012	,002	,053	,000	,000		,000
Sociability	r	,300**	,275**	,275**	,451**	,490**	,427**	1
	p	,000	,000	,000	,000	,000	,000	

Table 2 presents the relationship between teachers' scores of emotional intelligence factors and work engagement factors. Accordingly, vigor factor of the work engagement is positively and statistically significantly correlated to the emotional intelligence factors of well-being ($r=0.407^{**}$, $p<0.01$), self-control ($r=0.181^{**}$, $p<0.01$), emotionality ($r=0.133^{*}$, $p<0.05$), and sociability ($r=0.300^{**}$, $p<0.01$). Dedication factor of the work engagement is positively and statistically significantly correlated to the emotional intelligence factors of well-being ($r=0.458^{**}$, $p<0.01$), self-control ($r=0.168^{**}$, $p<0.01$), emotionality ($r=0.162^{*}$, $p<0.01$), and sociability ($r=0.275^{**}$, $p<0.01$). Absorption factor of the work engagement is positively and statistically significantly correlated to the emotional intelligence factors of well-being ($r=0.396^{**}$, $p<0.01$), self-control ($r=0.145^{**}$, $p<0.01$), and sociability ($r=0.275^{**}$, $p<0.01$). Absorption factor of the work engagement was not found statistically significantly correlated to the emotionality factor of the emotional intelligence ($r=0.103$, $p>0.05$).

There is a positive significant relationship between teachers' scores of emotional intelligence and work engagement ($r=0.397^{**}$, $p<0.01$).

Table 3. Regression Analysis Showing Emotional Intelligence's Effect on Work Engagement

	B	Std. Hata	β	t	p	R ²	F
Emotional Intelligence	36,640	2,916		12,565	,000		
	1,366	,135	,475	10,120	,000	,226	102,412

In the regression analysis performed to identify the effect of emotional intelligence scores on work engagement (Table 3), it was found that teachers' emotional intelligence levels predicted their work engagement levels at 22% ($R^2=.226$). Accordingly, the linear relationship between teachers' work engagement and emotional intelligence levels is statistically significant ($p<0.05$).

Conclusion, Discussion and Recommendation

A statistically significant and positive relationship was found between the work engagement and emotional intelligence levels of the teachers working at public high schools. It was concluded that emotional intelligence scores get higher as work engagement score increases. A positive and statistically significant relationship was determined between teachers' scores of "absorption" and "dedication" factors of work engagement and "well-being", "self-control", and "sociability" factors of the emotional intelligence. "Absorption" factor of the work engagement was found positively and statistically significantly correlated to the emotional intelligence factors of "well-being", "self-control", and "sociability".

It was determined in the regression analysis performed to identify the effect of emotional intelligence scores on work engagement that teachers' emotional intelligence levels predicted their work engagement levels at 22%. Accordingly, the linear relationship between teachers' work engagement and emotional intelligence levels is statistically significant. In other research studies conducted with different wage earners, similarly, emotional intelligence was found to be a significant predictor of work engagement. For instance, Toyama and Mauno (2017) and Zhu, Liu, Guo, Zhao and Lou (2015) achieved similar research findings in health organizations; Bartlett (2015), Clercq, Bouckenoghe, Raja and Matsyborska (2014), Thor (2012) and Ravichandran, Arasu and Kumar (2011) in different organizations. Lestari and Sawitri (2017) and Garrido and Pacheco (2012) also concluded in their research in educational organizations that emotional intelligence significantly predicts work engagement.

The following recommendations can be made to increase teachers' levels of work engagement and emotional intelligence in accordance with the data obtained in the research: Improving teachers' emotional intelligence levels will enhance their work engagement levels. Teachers play a key role in raising individuals with high emotional intelligence for the society. Thus, faculties of education which train teachers should attach importance to emotional intelligence. Curricula of these faculties can be rearranged to raise teachers with high emotional intelligence. It can be ensured that teachers take part in projects that will contribute to their professional developments and domestic or foreign in-service trainings (courses, seminars, etc.) In-service trainings on emotional intelligence (management of emotions, activation of emotions, empathy, social skills...) can be organized.

Abstract

This paper presents specific reference tools (Barrios, López-Gutiérrez & Lechuga, 2016) where we found that neither institutional language integrated support nor a specific language plan was being provided by the bilingual programme. This runs counter to experts' opinion who claim the need of such a plan. While studies show the importance of language support in bilingual instruction, they rarely address specific content professors' needs tending to remain distant from real teaching contexts. The educational Innovation Project provides professional development for subjects taught through the medium of English. The title "Support for students and professors" means moving into the reality of the classrooms to address specific needs of this specific academic scenario. We examine how language support has a dual focus that includes both students and instructors (Griffith, 2012). The paper concludes with a reflection on interdisciplinary innovation projects that provide professors with the tools to ensure the quality of bilingual programmes.

Keywords: English Medium Instruction, Higher Education, Social Sciences Education, Gender art

Introduction

This paper presents specific reference tools which continues the line started on the article published last year in 2nd International Conference on Higher Education Advances (HEAD '16) (Barrios, López-Gutiérrez & Lechuga, 2016), where we found that neither institutional language integrated support nor a specific language plan was being provided by the bilingual programme. This runs counter to experts' opinion calling for the need of such a plan: "The English-taught degree programme requires a language plan of its own, which will be complementary to the larger university policy and plan... it is a necessity for ensuring a smooth and collaborative transition into English medium" (Marsh et al., 2013, p. 15). While studies show the importance of language support in bilingual instruction, they rarely address specific content professors' needs, tending to remain distant from real teaching contexts. The educational Innovation Project (PIE 15-100) provides professional development for subjects like Gender Art (as Clotilde Lechuga is a member of international I+D project HAR2016-75662-P *Subjectivity Practices in the Contemporary Arts. Critic Reception and Identity Fiction from Gender Perspective* at Malaga University) which are included in Social Sciences Education taught through the medium of English in the Primary Education degree at the University of Málaga.

The title "Support for students and professors" means moving into the reality of the classrooms to address specific needs of this unique academic scenario. Firstly, the paper acknowledges a trend towards English Medium Instruction (EMI) in Higher Education while at the same time distinguishes EMI from adjunct CLIL (Brinton, Snow & Wesche, 2011) suggesting that more explicit language integration is needed. With this in mind, we present a professional development project for instructors which we will call the CLIL eye (Griffith, 2015). Secondly, we examine how language support has a dual focus that includes both students and instructors. Outlining these actions, the innovation project focuses on collaborative work, language support, and collective training in aspects related to a systematic monitoring of the experience. Finally, we will use a case study in which a glossary is integrated into a lecture and an external observer will provide assessment for the instructor on ways to improve discourse. The results indicate how, with this task design, language is

supported as not only the language of learning, and as language through learning (Coyle, et al., 2010), but more specifically as the language for teaching. The paper concludes with a reflection on interdisciplinary innovation projects that provide professors with the tools they need to ensure the quality of bilingual programmes.

The background of any discussion on plurilingualism in higher education in Europe begins with convergence. In Paris in 1998, European universities highlighted the need to create greater plurilingualism in Europe (Sorbonne Joint Declaration, Paris, 25/5/1998). After about a decade, Smit and Dafouz (2012) have reported “English medium university {EMI} courses all over continental Europe have tripled” (p.2). In Spain, Dafouz and Nuñez (2009) have cited more than thirty higher educational institutions offering bilingual degrees. Our study takes place at the University of Málaga in southern Spain and explores how a language specialist can assist content professors teaching through a second language.

In our search for usefulness, and in order to be as concrete as possible, we will share our initial prediction and research purpose. “Most teachers have not yet acquired the teaching competencies and abilities that are peculiar to CLIL {Content and Language Integrated Learning}. They have been unable to do so because broadly speaking suitable Teacher Education (TED) in CLIL is not offered in a systematic fashion” (Horrillo, 2012, p. 4). We predict university professors outside language areas could benefit from a CLIL/EMI practicum; and we will explore how to do this from multiple perspectives. Exploratory does not mean without purpose or without direction, rather what it means is that the project tends to work inductively from the bottom up rather than deductively.

Linguists find it easy to believe in bilingualism, but content professors find themselves uncomfortable in this new found role of language expert (Hynninen, 2012). We insist that, through a facilitative collaboration, professional development can impact teaching practice in higher education. Collaboration gives all involved a unique opportunity to learn from the other. Thus, our inquiry began by establishing a dialogue between a language specialist and a content specialist. In the next section we will point to the context, clarify terminology and in turn, reveal the research focus that surged out of the study.

This paper discusses relevant challenges facing bilingual instruction in our specific context. This collaborative initiative allows the content instructor to discover ways to improve teaching first by directing student discourse what Coyle et al, (2010) identify as the ‘language of learning’ and next by directing instructional discourse with what we describe as the ‘language for teaching’.

Context

English Medium Instruction (EMI) has been a growing trend across universities in Europe in the last 15 years. This movement was first introduced in Master’s degree programmes although it has progressively extended to bachelor’s programmes (Wächter & Maiworm, 2008). Not only is EMI a direct result of globalisation in Europe and elsewhere, but it also currently lies at the center of internationalisation strategies of many tertiary institutions around the globe (Doiz *et al.*, 2013; Gustafsson & Jacobs, 2013; Wilkinson, 2013). Many factors contribute to this need such as the promotion of job mobility, employability, staff and student exchanges and joint- and double-degrees substantiate the case for English-taught degree courses (Fortanet, 2008).

However, the first challenge is in the definition of EMI. EMI in its strictest definition, implies that language learning is implicit and not explicit. John Airey (2012) goes so far as to insist that he is “not an English teacher” while lecturing on Physics through the medium of English. So perhaps a clarification in terminology is in order. Brinton, Snow and Wesche (2011) have identified three types of CLIL in higher education. First, *theme based CLIL* where language instructors explicitly focus language by using contents. In the past this has been identified as English for Specific purposes (ESP) or a topic based approach. Second, these authors point to *sheltered CLIL*, where a focused content approach allows for only implicit language learning. This is

indeed EMI across Europe particularly in higher education. And finally *adjunct CLIL*, which allows for a content focus as well as integrating language. Given this clarification, our approach clearly takes the adjunct approach in that language support is explicitly provided to both students as well as to instructors.

After clarifying EMI and the adjunct CLIL approach and in line with authors such as Wilkinson (e.g., 2008) and Gustafsson and Jacobs (2013), many authors chose to use the term Integrated Content and Language in Higher Education (ICLHE) over the umbrella term Content and Language Integrated Learning (CLIL) since, as Gustafsson and Jacobs (2013) argue, this latter term is originally linked to school –rather than to university- contexts and “there are issues peculiar to higher education, such as disciplinarity, which make this CLIL approach distinctly different in the higher education context” (p. iii). For the purposes of this paper, we will use them interchangeably, but clearly point to the higher educational context as being specific to our research.

In the case of the Faculty of Education, at the University of Málaga a group in the Bachelor’s Degree in Primary Education has been partly taught through the medium of English since the academic year 2014-2015. On the whole, the evaluation of the experience by students and teachers has uncovered new challenges that have been addressed by an interdisciplinary innovation project with the goal of constantly improving the teaching/learning experience. After the first year, the assessment revealed that both students and instructors needed to improve language performance. How to tackle this dilemma will be the focus of this article.

During 2016-2017 course an innovative approach is taking place. Language support is being addressed in two directions and we will call this multi-perspective approach “developing the CLIL eye”. For students, an integrated glossary is offered as a tool to explicitly focus technical art terms during a lecture given by a guest professor who belongs to the bilingual team, in the subject Artistic and Visual Education, while for the instructor, an external observer evaluates instructor discourse and effectively offers vital feedback to improve teaching discourse which we will deem the language for teaching.

Literature review

Gajo (2007) has argued that teacher training must prepare instructors in bilingual didactics, which are different from traditional second language classes and different from traditional content classes. The eternal dilemma is finding specialists with both content and foreign language skills. Collaboration seems to tacitly be the answer.

In similar Spanish university contexts, both Rubio and Hermosín (2010) and Fortanet-Gomez (2012) have examined professors’ attitudes toward CLIL instruction. Rubio and Hermosín (2010) explored the “willingness of teachers and students to a hypothetical implementation of multilingualism in a Spanish university.” Their results at the University of Huelva demonstrate that over 50% of their sample would be willing to participate in such a program (Rubio & Hermosín, 2010, p. 107).

Fortanet-Gomez’s (2012) study in Castellon provides a more varied sample of professor participants. Her main conclusions about higher education show that 72.9% of professors feel that if they teach in English that this should include language objectives. Her study showed that 95.5% feel they should receive specific teacher training and 83.8 % think content teachers should coordinate with language teachers (Fortanet-Gomez, 2012, p. 58). She is not alone in this proposal.

Instructors’ willingness to grow professionally through this project cannot be underestimated. Clearly, quality instruction begins and ends with quality instructors and the success of every educational programme can be improved with specific teacher support networks. In the case of this project, the language specialist moved into areas of education and art to explore real content specialist’s needs. By bringing language learning theories directly into the context of these content classrooms, it was easier to put theories into practice.

Coyle et al (2010) discuss reconceptualising language learning where language needs are divided into three groups: The language of learning (vocabulary), the language for learning (discourse strategies) and the language

through learning (the ultimate success). (See Fig 1.) We present this project in such a way that the instructor is both instructor and learner. Language can be supported in many ways and we will focus on just two. One for the students to support the language of learning and one for the instructors to support the language for teaching.

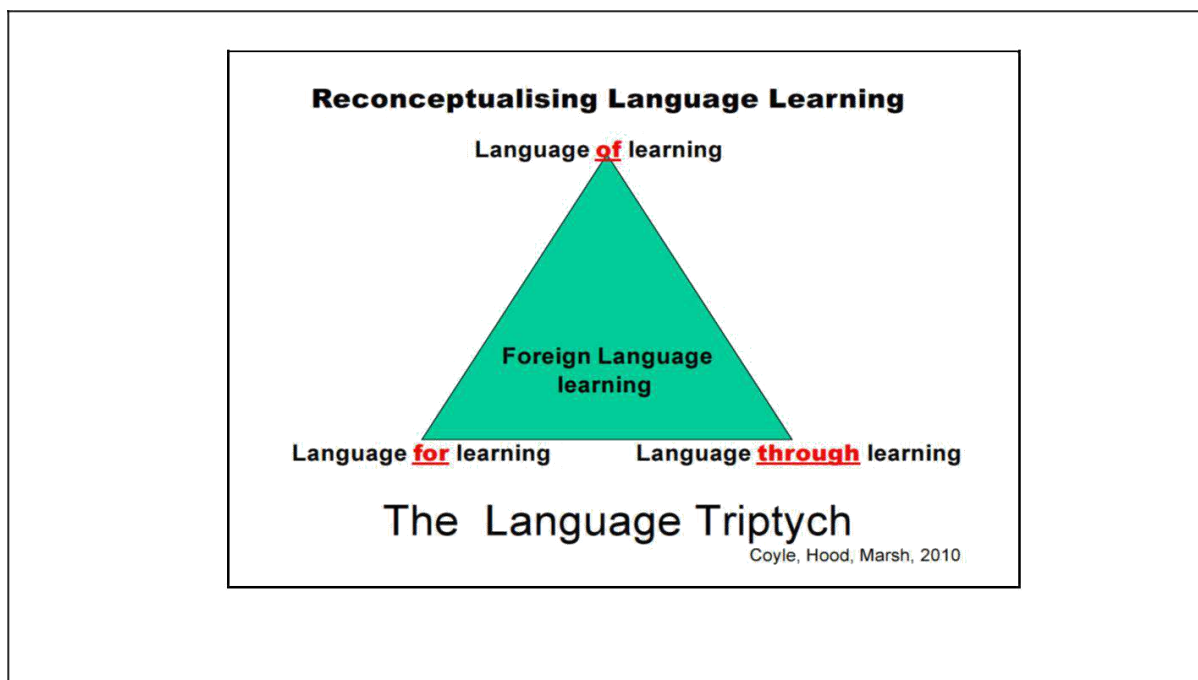

Figure 1. The language triptych as presented by Coyle, Hood and Marsh, 2010

In the case of this project we will highlight the language of learning with the integrated glossary. In this way we will illustrate specific language support for students. The explicit lexical focus will be incorporated in the lecture within the instructional design. At the same time, the external observer will provide both didactic and discursive feedback for the instructor. In this way, quality of the instruction through a second language is reinforced. The feedback uses error analysis and discourse features to aid professors in the communicative process. By highlighting the language for teaching, the feedback is particularly relevant to the context at hand.

Consequently, this collaborative case study will address language support using a highly contextualised classroom experience to illustrate how language can be successfully integrated into content classrooms. Stake (1995) would call this the “bounded context” of our case study. We have chosen one instructor, one classroom experience to highlight how language can be supported in two directions: First, for students through instructional design and second, for instructors through in-service assessment.

Method

Action research is about capacitating people to act because they choose to do so. The implication being, of course, that the participants are capacitated to define their world through experience developing a sense of empowerment and competence through action and interaction. Developing the CLIL eye is a support network that encompasses believing and doing: believing in CLIL and actively doing something to improve it. This is a commitment that involves action from all participants. The methodological choice of participatory action research will allow us to better address the specific qualitative needs of this particular bilingual programme.

In the Education department and as a response to challenges and difficulties faced during the early stages of the implementation of this partially-taught programme perceived by students and staff, a collaborative interdisciplinary innovation project was designed. Teaching through English in higher education involves constant assessment because CLIL cannot just be simply imposed by government policy-makers. Both top-

down and bottom-up perspectives are essential for the success and sustainability of any bilingual programme. Participatory action research purposefully takes a bottom-up approach.

The main project objectives and associated actions may be summed up along the following three lines: first, professional development for effective instruction through English, next, language provision, support and resources, and finally, monitoring and evaluation of the experience. As a follow-up, we present a specific case study to illustrate how language support and monitoring works in practice.

We seek not to quantify, but rather to qualify. Cohen and Manion (1989) have stated that case studies recognize the complexity and ‘embeddedness’ of social truths. However, we duly note that there are limits to this more open structure. “Case study data, paradoxically, is strong in reality but difficult to organize. In contrast, other research data is often weak in reality but susceptible to ready organization.... Case studies are a step to action.” (Cohen and Manion, 1989, p. 50)

Case study will allow us to create a professional development project for effective language integration. This innovative project engages professor participants in collaborative interdisciplinary training and practice to illustrate the multiple perspectives involved in any bilingual programme. Both language and non-language specialists are fully aware that there is a need for teamwork and cooperation and this need has been corroborated in previous tertiary education experiences: “Developing an English-taught degree programme requires coordination and, especially at the outset, more staff collaboration than may be considered essential in a domestic language programme” (Marsh *et al.*, 2013, p. 26). The actions have been discussed in detail in Barrios, López-Gutiérrez and Lechuga, (2016) to achieve the goal of professional development. In the case of this article, we will describe the following two specific actions:

- Assisted structured materials development; a consensus has been reached to develop language and content integrated tasks with the assistance of a framework designed to include subtasks, one of which is the integrated glossary.
- Formative classroom observation; language specialists observe content teachers teach in English and provide formative feedback within the specific classroom context.

How can we provide language support for both students and instructors? Whenever you have non native instructors, teaching non native students, explicit language support must be provided. Both students and teaching staff perceived the need language support in order to improve explicitly language proficiency for this bilingual programme. For students this language support is illustrated with instructional design; while for the instructor, language support is illustrated with the observer’s feedback of classroom performance.

Instructional design for students

Examining Coyle, et al. (2010), we see a differentiation between the language *of* learning (vocabulary) and the language through learning. In fact, language *through* learning is evidenced by effective language teaching. So in turn, we observe the more contextualized the language, the better the language learning; the more interesting the topic, the better the attention levels. The more language is supported, the easier it is for assessment to separate language and content issues. And we observe that the integrated approach addresses the balance of language and contents that provide for true quality in bilingual programmes.

With regard to materials development, a structured glossary has been integrated into a lecture on contemporary art. The specific language focus was supported throughout the lecture and students were provided a handout that re enforced this new terminology. The conference can be seen at the Faculty of Education Science youtube web page (Lechuga, 2016).

This class session was originally conceived for the first course in the Bachelor's Degree in Primary Education and aims to introduce contemporary art practices and a glossary in English language related to Social Science Education. Both the professor of the course as well as the visiting professor agreed that better language performance from the both students and professors could contribute to better instruction. So for students and in order to highlight the lexical items necessary for the lecture, selected words were chosen to create a glossary to support a lecture on the differences between traditional paintings and contemporary artwork.

The main topic of the lecture refers to a study made by Arthur Danto (2003) concerning History or Art evolution. In this study, the author elaborates on the differences between mimesis and reflection, both being essential concepts to be considered. Following Danto's theory, mimesis appears as a possible imitation of reality and reflection is able to be understood as meditation/opinion/criticism, all of which advance contemporary understanding (Lechuga, 2015). This terminology provides the specific terms to create a deeper understanding of art. The complexity of the ideas expressed called for specific lexical items to be defined and understood by students before and during the lecture. In consequence, these items were referred to and expanded upon during the class session.

Instructional feedback for Instructors

In the focalized classroom context, during the same lecture referred to in the previous paragraph, an external language specialist generated feedback for the instructor. Using a rubric developed in a similar project in the Computer Science Department at this same university (Griffith, 2012), the instructor's language performance was assessed. The main variables include pronunciation, usage and discourse together with interactional features for classroom instruction. With this specific language support for the instructor, we address the issue of the language for learning.

Linguistic and instructional data was collected from spoken performance during classroom instruction. One of the objectives of the innovation project is the monitoring and evaluation of the programme with the aim of detecting areas of improvement. This involves classroom observation including coaching. All non native instructors feel like learners at the same time they feel the responsibility to effectively transmit their contents. What this means is that professionals are encouraged to continually improve within the inherently imperfect context. Many studies (Rubio & Hermosín, 2010; Morgado & Coelho, 2012), show that university professors are reluctant, even anxious, as they face instruction through a language that is not their own. The innovative project aims to monitor instructors to improve the quality of their bilingual programme.

Findings

Implementation deals with instructional actions and seeks a more qualitative assessment of the bilingual programme. Undoubtedly, one factor is student proficiency, but the other is, the oftentimes overlooked, instructor proficiency. Fortanet-Gomez (2012) has noted: "While there is general agreement on the importance of this {second} language, its implementation as a language of instruction does not seem to be so evident. {O}ne of the main factors for the success of {multilingual policies} is the lecturers' proficiency..." (p. 52-) Instructors are well aware of this issue and we note that to discuss their role as language learners within their role as language instructors empowers them to improve. In this section we will describe the findings for our two participatory action research inquiries:

- 1) How can language be explicitly supported for students?
- 2) What are the common errors for instructors?

How can language be supported?

The classroom seminar is entitled *Reflective learning: contemporary art in gender studies* and aims to create a better understanding of evolution in artworks including social and gender issues. First, the language support plan consists in creating a glossary to introduce the subject, so both students and instructors focus on significant descriptions by collaborative learning and scaffolding which are reviewed at the end of the session. At the same time, teaching through images or Visual Thinking Strategies (VTS) uses scaffolding methodology based on the image of a painting, drawing, sculpture, video, etc. (González-Sanz, Feliu-Torruella & Cardona Gomez 2017).

In relation to specific vocabulary, seventeen slides are shown which combine either vocabulary highlighted in sentences or artwork pictures and links to art video recordings. The idea is to focus attention on keywords having selected nine concepts related to the history of art. These are Cultural Heritage, Mimesis, Reflection/Reflexion, White Cube, Contemporary art/Postmodern art, Cultural Intangible Heritage, Gender studies.

Some of glossary words are directly related to UNESCO Convention's normative as Cultural Heritage to Cultural Intangible Heritage as well as to the Diversity of Cultural Expressions (UNESCO, 1972, 2003, 2005) covering gender perspectives, Flamenco music, ecology, education or cultural diversity. Accurately this approach helps when explaining global interests in preserving Heritage. Moreover, Gender artworks are briefly introduced by a video performance made by a woman artist in which the precise representation of the young female in Eugène Delacroix's (1830), *Liberty Leading the People* painting is strongly criticized. Finally, last slide presents the same keywords separately so students can explain in English what they understood of concepts given and they are asked to connect them to concrete examples in a more specifically language focused conclusion. Adjunct CLIL allows for language to be supported within the content classroom in a highly integrated way.

What are the common errors in instructional discourse?

Fortanet-Gomez (2012) has speculated that "what might be the case is that the lack of experience in teaching in English might have led to relatively low self-confidence in using the language for teaching" p. 55. In order to further develop the CLIL eye, the instructor agreed that classroom observation proved highly relevant to specific teaching needs.

The main variables include pronunciation, usage and discourse together with interactional features for classroom instruction. Pronunciation was an issue, but never to the point of preventing communication. Vowel quality was challenging as was intonation. One of the main causes of foreign accents is that once learners have established the L1 sounds, they tend to perceive all new sounds in terms of those categories. Consequently, these perceptions leak into their L2 production. We remind readers that we are differentiating accent from mispronunciation. The most common errors occurred with vowel quality in that English vocalic patterns contain more sounds (14) than Spanish (5) or with the consonant sounds that exist in English, but not in Spanish. Spanish does not have the vowel digraphs: *ou, ow, eigh, au, aw, oo* and, in particular, the diphthong /əʊ/ was oftentimes mispronounced. For example: Moses (in Spanish *Moises*). What the instructor received was this comment: '*in English this sounds like noses, hoses, poses, closes.. es llana. And the o is /əʊ/.*' This type of feedback allowed her the ability to accommodate her accent into a target pattern. Another example is with the semi vocalic phoneme /ju:/. For example in Cubism. Here is the feedback provided: '*The u is semi vocalic.... Like the sound you, news, /kjubizm/*' None of these mispronunciations prove any different than what could be expected from Spanish speakers using English given the phonological contrasts between the two systems. We do make note here, however, that communication was never impaired due to these errors.

UTTERANCE	CORRECTION	LINGUISTIC COMMENT
<i>Are you agree</i>	Do you think this is art?	Excessive use of <i>it</i>
<i>that is it a piece of art?</i>	Is this art? Is this a piece of art? Do you agree that this is art?	Improper use of <i>agree</i>
<i>Do you follow?</i>	Are you following me?	Wrong tense in EN
<i>Russian by that moment</i>	At that moment, at that time Usu. refers to a specific moment By that time (usually refers to simultaneous actions) by the time we got there it had started to rain	Prepositions and Time reference
<i>Culture heritage</i>	Cultural heritage	Word formation
DISCOURSE: OPENING AND CLOSING WERE AWKWARD	SAYING HELLO. It is my pleasure to be here today. Today we are going to discuss. I'd like to thank Sandra for the opportunity to speak with you today about..... SAYING GOODBYE Well that's all I have today. I hope you enjoyed the presentation. I hope you find this glossary helpful. Thanks for listening and I hope that you have gained something from the presentation today .	These are patterns that you take for granted in your first language. Practice modeling target structures within the context.

Usage and discourse errors will be described in this next section and can be referred to in Table 2. Perhaps more than the form focus, the underlying ideas in language learning serve to put content professors' foreign language performance into perspective in their new role as language experts. Some authors refer to this highly functional L2 usage as "multicompetence" (Cook, 2006). This author has argued L2 learners, including those who have reached the ultimate attainment stage in the L2, are not equivalent of two monolinguals in one brain. Instead, Cook maintained that L2 learners possess an integrated cognitive system, called multicompetence. L2 learners process information in both languages differently from that of monolingual native speakers. The resulting linguistic competence of a bilingual L2 learner is therefore qualitatively different from the one possessed by monolingual minds. Language learners must necessarily be measured in functional terms and not as a deviation from some unattainable ideal. Somehow, content professors are reassured by this idea of functional bilingualism. Developing the CLIL eye for instructors has meant understanding how proper CLIL instruction is not only within the realm of multicompetence, it is also within their reach.

The instructor who received this feedback has noted the relevance to her own professional development, not only as an English learner, but also with regard to proper communication strategies. Not only does the feedback uncover challenges such as pronunciation or specific sentences, but also more discursive strategies like how to introduce yourself or to finish your delivery. Certainly using this cooperative feedback has been insightful.

Conclusions and Recommendations

EMI initiatives in higher education are on the increase across Europe. Conditions, however, are not optimal and programmes that are completely or partially taught in English are launched with no specific attention to quality assurance. Higher Education institutions should establish requirements and provide resources so that teaching quality is not compromised and students can benefit from language development possibilities (see Marsh *et al.*, 2013). The university context requires a closer follow up, which indeed, has been the focus of this paper.

This study has dealt with the professional development of CLIL professors at the university level. Some universities find themselves in what Donald Schön calls a “squeeze-play”: An educational institution in which educational policy plays a small role. “In the normative curriculum, a practicum comes last, almost as an afterthought. (Schön, 1987, pp. 310-311)” Very little has been written about professional development at this tertiary level, but many of the issues related to action research developed in other academic settings apply. Nevertheless, there are some specific considerations related to professionals in higher education, their needs and their expectations. No one seems to address the challenges of the multi level classroom and we strongly recommend future research to pursue this area. Without the practical element, professional development in education is detached from the setting and the real challenges professors face every day. This study explored the question of whether participatory action research can provide meaningful experiences that add to good teaching practice through an in-service training. We have called this developing the CLIL eye.

Some final reflections pertain to the evaluative information provided by both students and staff. Students perceive the need for some kind of language support and provision which the institution, however, fails to provide systematically. In addition, students tend to demand a high level of English competence from the teachers and they admit that learning through English also requires a high command of English from them. Both teachers and learners agree on the need to improve their proficiency in English. In order to teach and learn cognitively complex and demanding disciplinary content, a high level of proficiency is indispensable. The support needed necessarily must be created within each context as the needs vary, across student groups, within the staff as well as in regard to specific contents. In service training seems to readily adapt to each context and address needs as they occur.

Not surprisingly, research evidence suggests that limitations in language ability may hinder students from expressing and exploring complex concepts (Met & Lorenz, 1997; Airey, 2009), and this conclusion is equally applicable to staff, who has also been found to face difficulties with non-subject related interactions and classroom management language (Dafouz & Núñez, 2009; Strotmann *et al.*, 2014). This coincides with our findings in that every bilingual programme discovers new ways to support language in its own unique search for quality.

Nevertheless, the question remains as to what is the appropriate benchmark for students and instructors. Although TOEFL 550 seems to be a common benchmark in some institutions (Marsh *et al.*, 2013, p. 18), the target for staff to reach a CEF C1 seems entirely reasonable. At the UMA, top down planners suggest that a B1 for students and a B2 for instructors is sufficient. However, when the research moves directly into the classroom, all needs assessment suggest that B2 for students and a proficient C1 for instructors seems to be more advisable if quality instruction is to be considered. Language must consistently be supported through instructional design as well as is qualitative assessment for instructors. Top-down planners in their desire to encourage more instructors to teach through a second language, underestimate the challenges that this context inspires.

The first year experience of a partially English-taught bachelor’s degree programme revealed major challenges regarding lack of integrated language provision and support, language competence level in students and staff, and mixed-level groups. In order to face these challenges, a collaborative interdisciplinary innovation project was initiated. In closing, we are fully convinced that no attempt to introduce a change in the medium of instruction will ever be successful if the teachers involved do not share, work together and collaborate in group discussions, needs identification and collective solutions. As we continue to seek quality instruction in our bilingual programme, we humbly feel we have taken a step in the right direction through this in-service training.

Social Change and the Education of Urban Sciences*

Azize Serap TUNÇER¹

¹Doç. Dr., Ahi Evran Üniversitesi, İktisadi ve İdari Bilimler Fakültesi, Siyaset Bilimi ve Kamu Yönetimi Bölümü
Email: serap@seraptuncer.com

Abstract

The field of urban science, as the newest sub branches in the field of Social Sciences, is also one of the most dynamic fields in its category. Especially the relationship between social change and urbanization has updated the urban sciences literature in an increasing rate. The most important indication of this process is seen in the variance and uniqueness of local services and projects such as urban transformation, restoration and renovation and has had a tangible and practical effect on the daily lives of city-dwellers. On the other hand it can be said that local politics as a means of participating in politics have become preferred over central politics when considering the global urban networks especially as the power of metropolitan cities increase. The principal argument of this study is that most post-secondary education faculties in Turkey, which are expanded all throughout, can be in closer communication and contact with local administration, and such a circumstance gives credence and applicability to the field of urban sciences as a means of practical and effective social change. The increasingly urban world dynamics have distances the administrative systems from centralization; and favors smaller local governance that is closer to citizens at large. This in turn causes “Public Administration” field to gravitate towards “local” elements with respect to its “Public” side and to become defined as such. Increases in the quality, diversity and efficiency of public offerings also serve to improve the technologies and models that come about from this field, feeding back and strengthening this relationship. The theoretical foundations of this study is made by literature scanning, and the aim is to demonstrate that there is a clear increase both in quantitative aspects, like attendance, number of students and related courses, as well as in quality with respect to the diversification of topics and the increase in available literature.

Key Words: Urban Sciences, Social Change, Inter-disciplinary, Information Technologies.

Introduction

Cultural products creates its sources from the customs, moral values and practical life of the society. Social education is the element of culture, brings up children within social manners and education and gets a social responsibility and the best manners of society. From this point of view social education gets a sense with in the conscience of human.

As Bookchin’s noted, “education, is the top priority for a radicalization of our time.” (1986: 41) Because “education took many forms in the past and proved itself able to adjust to changing circumstances... but the present change is not like past changes... We have never been in such a situation before. The art of living in a world oversaturated with information has still to be learned. And so has the yet more mind-bogglingly difficult art of grooming human beings for such a life.” (Bauman, 2010: 100-130) For example “education has certainly not reduced the phenomenn civil war; it may indeed have enhanced it; it may even be its principal source of nourishment.” (Wallerstein, 2003: 128)

Besides “we once shaped our personalities by thinking about the social roles we assumed, or about the way others saw the individuals playing their social roles. We could do so because all roles related to common forms

* This work was supported in part by the Ahi Evran University Scientific Research Project Coordination Unit for IIB.E2.17.018 project.

of authority, norms and values... I use the term ‘desocialization’ to describe the disappearance of the social roles, norms and values that were once used to construct the life-world. Desocialization is a direct result of the de-institutionalization of the economy, politics and religion. Whereas a system of production was of necessity seen as a system of social relations of production, a market economy governed by international competitiveness, the proliferation of new technologies and the speculative movement of capital has become increasingly divorced from the social relations of production. Similarly education can no longer transmit the behavioral norms (discipline, work, deferred gratification) imposed by a mode of production.” (Touraine, 2000: 39)

The tight relationship that exist between economic development, educational levels, and democracy is illustrated quite clearly in all over the world. (Huntington, 1993: 65; Fukuyama, 2006: 110-111) According to Fukuyama: “Middle-class societies arise as a result of universal education. The link between education and liberal democracy has been frequently noted, and would seem to be an all-important one... Inequality creeps into the system as a result of unequal Access to education; lack of education is the surest condemnation to second-class citizenship. The effect of education on political attitudes is complicated, but there are reasons for thinking it at least creates the conditions for democratic society.” (2006: 116)

Importance of University Education

Serious organizational transformations have been observed at the high education system of most countries recently. For example contemporary educational authorities reached a consensus on the importance of the approach to interdisciplinary education and its necessity. All in all, it can be concluded that in the period from the past until today, ‘interdisciplinarity’ in light of its development is gaining importance and its place in today’s generation’s understanding of knowledge.

On the other hand the searches for new alternatives have gained momentum especially after the urban and environmental problems, it has recently been applied to the real life. Especially environmental education has play a dominant role of social responsibilities. Because this type of criticism perspective improves the students’ ability to order information, to realize the difference between fact and opinion and to find the relevant data among irrelevant data and to comprehend and appreciate the past and next generations and to comprehend change and continuity.

Environmental education is a process that allows individuals to explore and deeper understanding of environmental and urban management issues, engage in problem solving, responsible decisions and take action to improve the environment. As a result, individuals develop a deeper understanding of environmental issues and have the skills to make informed and. “The central aims of green democratic theory include community environmental education, democratization and integrated policy-making. As Bookchin suggests, “citizenship within the context of collective ecological management becomes a way of transforming urban dwellers into ‘ecological stewards’, giving those who may have no direct experience of nature some responsibility for, and democratic input into, managing the metabolism between society and the environment. Hence the vital importance of environmental education to foster this responsibility.” (Barry, 1999: 259)

Consequently, universities, that a great responsibility falls upon them, must add new responsibilities and objectives to their three traditional functions of undertaking research activities, offering vocational training and providing public services. Especially in the concept of environmental perspective, technology development centers, university-industry joint research centers and state universities on account of public research undertaken in and their role in the mentioned centers seem to be key elements in regional innovation systems.

While the most significant duties of the universities to educate students are the teaching-education and research, it is to produce knowledge for the existing sources of the governmental institutes. By linking the knowledge of the the universities and these institutes especially local management authorities, while increasing the quality of

education the demanded and qualified man power are reached for the necessities of the country. Also university-local administrations cooperation is very important in order to provide efficiency and use local sources effectively.

On the other hand global competition forms an important element of oppression on the universities to become competitive with other universities not only at national level but also at the international level. The universities that aim to increase their competitiveness power in this market hasten their quality work.

Local Administration and Urban Sciences in the Current University Model*

The first consideration of urban science in our country has been in the form of courses in “city planning”, taking place in the curriculum’s in faculties of architecture. Afterwards, under the school of “Public Administration” it has branched out and has seen an appreciable increase in scope and detail.

In his work “The Education of Urban Sciences in Turkey” (1987), Prof. Dr. Ruşen Keleş, by compiling and analyzing the works of academicians in the field of urban sciences on the issue of their perceptions and experiences in schools, have presented an important contribution to the field.

30 years after Keleş’s study, urban sciences have grown beyond the bounds of city planning and architecture and has become a stronger and more well-defined field on it’s own right in the form of “Public Administration”, going so far as to become a separate faculty especially in higher education. As a result of this, there has been an increase in the number of students attending or taking courses on this field. In addition, “Public Administration, Urbanization and Environment” has become a category on it’s own for an Associate Professor degree. The number of students across the country in the “Public Administration and Political Sciences” field has surpassed well over 20,000 when considering other related fields like forest sciences, environmental engineering and similar.

When considering this from a quality perspective rather than quantity, it can be said that the urbanization literature stemming from the “establishment of cities” back until the ancient age, and that the “History of Civilizations” and “History of Political Thought” courses can be started with the concept and attributes of the “city”. The overlap between Urbanization and Public Administration courses have resulted in the “Urban Politics” courses and have transformed into courses that borrow from the foundation of sociology such as “Political Science” and “Sociology of the City”. Considering that nowadays the most current, modern and innovative service and production models are realized by arms of public administration, there is an inescapable gravitation towards “Modern Approaches to Administration”. The fundamental concepts of the field of “Administrative Sciences” such as administration, participation in public administration, privatization, efficiency and performance, have all been codified in local laws. In short it is easily claimed that the literature of urbanization and local administration have grown its share of the “Public Administration” field.

With the increased numbers of courses and faculties, along with the expansion of the field itself, local administrations, as the implementers of such programs have continued to strengthen, which came out of the need to fill the void after the narrowing of scope and focus of units within the central administrations. This education which has spread all across the network of universities in the country provides students with general conceptions of the fundamentals while at the same time observing these effects in their own local cities. As urbanization

* Daha geniş açıklama için bkz. Tunçer, A.S. (2015). Kamu yönetimi öğretimindeki kavramsal değişim sürecinde yerel yönetim ve kentbilim unsurlarının rolü. 13. *KAYFOR (Kamu Yönetiminde Değişimin Yönü ve Etikeleri)*, Selçuk Üniversitesi, Konya, 1982-1991.

increases all throughout the world, it is clear that the models and differences along with unique facets of the fields come about naturally as a result.

For example Keleş, in the study mentioned above, thinks that “the education of urban sciences, whether it be university or higher-level education, benefits immensely from being studied within the country as opposed to abroad” and ties this with the unique socio-cultural circumstances. He continues: “because leaving aside the fundamental academic topics, the social, economical, political and administrative structure of the country is best handled by, and closest to urban sciences.” (1987: 227)

This statement is even more applicable to metropolitan establishments that have long surpassed the scale of cities. On one hand the growing scale of cities, complimented by advancements in technology and increase in quality of life, service offerings have grown and diversified. Understanding all this authentic frame of reference increasingly requires understanding the unique circumstances in lower local units to analyze effectively.

Conclusions

Nowadays urbanization - public administration - environment field have both become fundamental issues to be considered in unison, as well as containing countless sub-branches that have grown wider and deeper in their respective fields. Quality of the urbanization and environmental problems lessons is as important as education techniques, facilities and physical opportunities. So there is no doubt that the urban education programs and credits affect the quality of education positively. The adequacy of that education is relative.

In summary, this rich literature has found its practical applications in the implementation of local administrations with cooperation with universities and their partnerships. Despite being a controversial issue, “at least one university per city” can be considered the intersection of local administrations and the education of this field, which can be considered an interesting opportunity.

More modern administrative techniques and varied models of public service through liberal local policies can bring this relationship to more synergistic results.

Abstract

Literature reviews assume that during physical activity occurs positive emotional changes. However, statistics on population physical activity habits indicate that only a small proportion of society engage in physical activity. As the reason is mentioned a lack of motivation. The research question of the present study is whether the motivation to engage in physical activity is related with emotional changes during physical activity? 50 voluntary participants, aged 20 to 59 years, took part in the study. The data were collected by both subjective and objective research methods. Motivation was measured by Motives for Physical Activity Measure- Revised scale (MPAM-R, 1997). Vitality or subjective wellbeing was measured by the Subjective Vitality Scale (Subjective Vitality Scale, 1997). Emotional changes during physical activity were recorded using Face Reader 3.0. The results show that some aspects of motivation - competence, enjoyment and health is associated with positive emotional changes during physical activity. Vitality also is related to positive emotional changes and are able to predict a positive emotional change during physical activity. It is concluded that the motivation to engage in physical activity is related to emotional changes during physical activity. We also conclude that, in order to encourage people, engage in physical activity more regularly, it is important to develop methods for developing people's intrinsic motivation to engage in physical activity in order to gain more fun, and to develop competence. In contrast the focus on appearance will be less effective for building models of physically active behavior and developing the habits of regular physical activity.

Keywords: motivation, self determination theory, emotions, physical activity.

Introduction

Physical activity, if it is performed regular, is very useful for the physical and psychological well-being of the population (World Health Organization (WHO), 2010). Studies have approved that leisure time physical activity positively affects the emotional state and positively correlates with happiness (Lyubomirsky & Layous 2013). However, only a small part of modern society performs the amount of physical activity recommended in general health guidelines (Sisson & Katzmarzik, 2008).

Many people say they are simply too busy to exercise, 45% people in Latvia mention that they do not have time (Eurobarometer: Sport and Physical Activity (2010)). Despite of all the health benefits provided by physical activity according to the population survey in 2013 39% of the population of Latvia say that they never practice physical exercise, 30 % practice seldom and just 6% of population of Latvia confirm, that they regularly practice physical exercise or sport activities (Eurobarometer: Sport and Physical Activity (2014)). Studies show that lack of motivation is a reason to perform a regular physical activity with a moderate intensity 150 minutes per week, which corresponds to recommendations (Wilson, Mack & Grattan, 2008).

Considering the positive effects of physical activity and the low level of motivation of a society to engage in physical activity it is essential to find out what motivates people to engage in physical activity in their free time.

A study on physical activity and motivation in Latvia was carried out in a student sample using self-assessment questionnaires. The results of this study indicate that there is a positive correlation between leisure time physical activity and motivation (Kaupuzs, 2013).

The aim of current study is to find out how the motivation to engage in physical activities is associated with emotional changes (valence) during physical activity using both self-assessment questionnaires and objective research methods (Face Reader, veloergometer, pulse meter).

By “motivation” we understand the inner interests of a person, the drives, the desires that urge the person to take on a particular activity or change ones behavior (Whitehead, 1993). It is possible not only to determine the relation between motivation and the habits of physical activity by using self-determination theory, but also to assess whether there is a positive correlation with the positive valence of emotions, vitality (subjective well-being) (Ryan, Deci, 2001). The authors of Self-Determination Theory explain subjective well – being with term “vitality”, that mean subjective energy level that is not opposed to fatigue or energy-based calories. This vitality, according to the authors of the theory, is related to psychological factors, where the basic need (competence, autonomy, psychological relatedness) increases satisfaction, but the dissatisfaction of these needs reduces energy / vitality. Both experimental and field studies have confirmed this assumption (Moller, Deci & Ryan, 2006; Nix, Manly & Deci, 1999).

Self-determination theory is used to study motivation in various areas of activity, including physical activity. White (1959) postulates that people driven by the need for competence or effectiveness. The theory is based on the assumption that an individual has three natural basic psychological needs - needs which are universal, innate and psychological. These needs are need for competence, autonomy, and psychological relatedness. An individual chooses to take or avoid performing a specific activity to meet the respective basic needs. Self-determination theory can be applied to many areas of activity, including physical activity (Deci & Ryan, 1985).

Emotions are formed on the basis of life experience, as well as on the basis of inherited affects, the function of emotions are the preservation of the body's homeostasis. Emotions are an informative signal and they are always situationally triggered. Most definitions of emotions include the following components: motivation, behavioral readiness (progression), behavioral tendencies, perceptual selectivity, cognition, associated with the state of activity, and sensation (Izard, 1992). The most complete and brightest emotions manifest the human face. Face expressions are universal (Ekman, Friesen & Tomkins, 1971).

The term physical activity is the main concept describing body movements, performed by muscles and consuming energy (Biddle, Fox & Boutcher, 2000). Physical activity is considered to be among basic human needs (Biddle & Mutrie 2005)

At a time when mental health care costs have risen, physical activity is a potentially alternative to maintaining health and well-being. Physical activity can also serve as an addition to traditional forms of therapy (pharmacology and psychotherapy), where physical activity has the advantage of low costs, has no side effects and can be applied more preventively than habitual health promotion (Biddle & Ekkekakis 2005).

Problem statement and sub-problems (hypotheses)

The current study aims at finding how to motivate to engage in physical activities leading to emotional changes (valence) during physical activity, using both self-assessment questionnaires and objective research methods (Face Reader, veloergometer, pulse meter). The research question: is the motivation to engage in physical activity associated with changes in emotions (emotional valence) during physical activity?

Method

Method of the research

Correlational study design was used. The variables of research issues were motivation, habits of physical activity and vitality. Criterion variable - emotional changes (positive or negative emotional valence). Information was also gathered on additional variables that could affect emotional changes - physical activity habits. The study was conducted in a laboratory, the data were collected individually. The study participants were informed about the purpose of the study (mentioning that physiological responses would be measured, without mentioning a specific measurement of emotions), respondents were informed about confidentiality of data.

Sample

The age range of participants was from 20 to 59 years, average age of 35.2 years (N = 50, Mean 35.2, SD 8.75). Respondents were selected on the basis of one criterion - the ability to pedal veloergometer for at least 15 minutes in mild to moderate intensity. There were no criteria for daily physical activity. As a result, 50 from 54 data were used for further research. Those excluded faced an unexpected situation during the study, for example, sudden pain. From these 50 data women are 84%, men are 16%. 84% of these respondents have higher education, 10% with incomplete higher education and 6% with secondary education.

Data collection tools.

The study used a self-assessment methodology for assessing the motivation of physical activity. The motivation for physical activity was measured by Motives for Physical Activity Measure-Revised scale (MPAM-R), (Cronbach alpha - pleasure 0,89; competence 0,86; appearance 0,89; health 0,82; social aspect 0,87;) (Ryan, et al., 1997). The methodology includes 30 assertions that respondents have to agree upon by using Likert type scale, where 1 means "does not match me, but 7 "fully fits me." The physical activity scale has five sub-scales that measure various motivational components of physical activity: pleasure/joy, competence, appearance, health and social aspects. Self-assessment questionnaires were also used to appreciate how the type of motivation for physical activity is related to emotional state (emotions) using Subjective Vitality Scales (Ryan & Frederick 1997). Subjective Vitality scales has two sub-scales that measure vitality state and vitality trait. Each scale includes seven allegations in which respondents are asked to evaluate by using Likert type scale where 1 means "I do not", and 7 "fully in line with me" (Cronbach's alpha for trait scale 0,84; for state scale 0,89) The methodology of both questionnaires was back translated from English to Latvian. Additionally, demographic data were collected and the physical activity habits (how long, how often and with which activities they are engaged) were identified.

During physical activity objective measurement of emotions was performed by using Face Reader. The software "Face Reader" is a program for analyzing automatic facial expression. It identifies six basic emotions: happiness, anger, grief, astonishment, fear, disgust, and a neutral emotional state. Emotions are recorded more than two times per second. Face Reader is usually combined with other methods to convey context and content to the resulting data (Zaman& Shrimpton-Smith,2006). Objective measurements of physical activity were used - pedaling veloergometer at moderate to moderate intensity by recording a pulse. The intensity of physical activity corresponded to a health promoting aerobic cyclic physical activity lasting for 15 minutes.

During physical activity pulse, face expressions were measured. In addition, data on respondents' gender, age, weight, education, occupation and physical activity habits will be obtained.

Data collection took place at the Laboratory of Physical Ability of the Latvian Academy of Sports Education.

Findings

The data set was analyzed computing Pearson correlation coefficients to determine the relationship or relationship between the study variables. The variables between which correlated statistically significantly were further entered into regression analysis.

Table 1. Descriptive statistics of variables (N=50)

Variables	Average	Standart deviation
Age	35.26	8.75
PA frequency	2.90	1.07
PA length	2.68	1.25
Motiv-Pleasure	5.33	1.15
Motiv-Competence	4.79	1.16
Motiv-Appearance	5.33	1.16
Motiv-Health	6.03	.94
Motiv-Social	4.00	1.60
Vitality-Trait	4.87	1.06
Vitality-State	4.84	1.4
Pulss	129,8	12.62
EmValence-Positive	6.09	10.84
EmValence-Negative	-5.41	14,4
EmValence-Neutral	-2.40	15.38

There were positive correlation between positive emotional changes and the motivation sub-scale competence $r(50) = .03, p < .05$ and the motivation sub-scale health $r(50) = .30, p < .05$. As well as statistically significant correlation between positive emotional changes and motivations sub-scale pleasure/joy $r(50) = .36, p < .01$. There was no statistically significant relationship with other motivation sub-scales (appearance, social factor). Also, the habits of physical activity (frequency of exercises and period of time, how long did they engage in physical activity) did not show statistically significant correlation with positive emotional changes.

Statistically significant positive correlations were also observed between positive emotional changes during physical activity and vitality. Both vitality as a trait $r(50) = .29, p < .05$, and vitality as a state $r(50) = .38, p < .01$. Neutral and negative emotional changes during physical activity did not show statistically significant correlations. See Table 2 for all the correlational coefficients.

Table 2. Pearson correlation analysis between emotion valence, motivation and vitality (N=50)

Variables	1	2	3	4	5	6	7	8	9	10
1 M-Pleasure/joy	-									
2 M-Competence	.76**	-								
3 M-Appearance	.30*	.48**	-							
4 M-Health	.59*	.48**	.59**	-						
5 M-Social	.56**	.54**	.27*	.44**	-					
6 EmVal-Positive	.36**	.32*	.25	.30*	.15	-				
7 EmVal-Negative	-.18	-.23	-.04	.09	-.12	-.36**	-			
8 EmVal-Neutral	-0.6	.11	-.00	-.25	.11	-.26	-.69**	-		
9 Vitality-Trait	.50**	.63**	.29*	.29*	.30*	.29*	-.13	-.10	-	
10 Vitality-State	.53**	.55**	.34*	.38**	.30*	.38**	-.23	.20	.74**	-

* $p < .05$, ** $p < .01$

The variables which showed statistically significant correlation to positive emotion changes (emotional valence), were entered into regression analysis. The model was statistically significant, $R^2 = 0.15, F(8,270) = p < .01$. The only statistical significant predictor of motivation to engage in physical activities was vitality state, $B = 3.63, p < .01$.

Results showed that motivational aspects are not predicting emotional change during physical activity. All in all, the relations between motivational components and positive emotional changes is statistically significant. A statistically significant correlation was observed between positive emotional changes and vitality - both as a state and a trait.

Also, this study indicates a statistically significant relation between vitality and positive emotional changes. Similarly, vitality is statistically significant correlated with all sub-scales of motivation - pleasure, competence, appearance, health and social aspect.

Results, Conclusions and Recommendations

According to the theory of Self-determination, competence is an internal motivation component, which means not only current skills but also aspects of the social environment, for example, when surrounding people - coaches, team / teammates, partners provide meaningful positive feedback, increase in individual competence. It also increases the person's motivation to work further in this area (Ryan, et al., 2009). Regarding the component of motivation Whitehead (1993) notes that children are already born internally motivated to be physically active. Whitehead's statement points to a number of aspects. First of all, the pleasure of moving - it is an internally motivated natural desire that we have from our childhood. Secondly, by surveying the respondents about what motivates them to do physical activity, 32% of respondents said that it was a family. This confirms Whitehead's statement about the essential role of behavioral models, the values we pass on from generation to generation. If this motivation can be saved - through physical luck, freedom and joy - then we can manage to achieve far more than promoting fitness behavior. Already in childhood behavioral pattern are established, helping people maintain lifelong physical activity. Thus, in a natural way, this behavioral model would be passed on from generation to generation (Whitehead, 1993).

External motivation defined as engagement in activities with aim to gain some benefits independent of the activity (Ryan, et al., 1997; Ryan, et al., 2009). This means that people engage in physical activity, not because physical activity seems to them to be interesting or give fun, but because they get something from physical activity (Frederick & Ryan, 1995; Ryan & Deci, 2008).

Competence, pleasure or joy are interpreted as internal motivation, but appearance, health and social aspect as an external factor. In this study, health as a component of external motivation was statistically significant correlated with positive emotional changes, in contrast to the external appearance and the social aspect.

With respect to the research question the results showed that a statistically significant correlation between individual components of motivation and positive emotional changes. There was no statistically significant correlation between the components of motivation and negative or neutral emotional changes. Among the components of motivation - competence, health and pleasure in this study - showed a statistically significant relationship with positive emotional changes.

A statistically significant correlation was observed between positive emotional changes and vitality - both as a state and trait. According studies (Moller, Deci & Ryan, 2006; Nix, Manly & Deci, 1999) the present study confirms assumptions and indicates a statistically significant relationship between vitality and positive emotional changes. Similarly, vitality is statistically significantly correlated to all sub-scales of motivation - pleasure, competence, appearance, health and social aspect. The obtained results indicate that the motivation does not predict changes in emotions during physical activity. Yet, the relationship between motivational components and positive emotional changes is statistically significant.

The study's limitation is a small sample that, perhaps might not be able to shed light on relationship between the other components of motivation described in the theory of self-determination - appearance and social aspect. Hypothetically it might be that the social aspect is more important for older respondents, but the design of a current study did not allow it to clarify this assumption. During the study, it was observed that vitality varied according to the day time when study was spent. In the morning, people generally showed higher levels of vitality than evening. Therefore, it is advisable in future to choose one time (morning or afternoon) as much as possible when planning the next study. This research took place in the laboratory, which means that laboratory offered to all the respondents the same conditions. In future, it would be useful to conduct a study, for example, in field conditions.

The theory of self-determination states that the possible reasons for the lack of motivation to engage in physical activity may be the feeling of incompetence experienced by a person during a physical activity. Since this competence statistically significantly correlated with positive emotional changes in the study, this study also confirms the theory (Izard, 1993) We can state that emotions including motivation to do or to avoid action also include behavior tendencies and behavioral readiness (progression). If positive emotions are experienced during physical activity, there is a reason to believe that people will be willing to do it repeatedly / regularly and vice versa. Another assumption of the theory of self-determination is that a person does not see the connection between the behavior and desired benefits - as a result there might be a decision not to do anything. For example, if a person has a motivation to lose weight we cannot expect results instantly. Also, activities for health promotion often do not give a quick and obvious result. Asking the respondents whether they had noticed any changes in their feelings of emotion after 15 minutes of physical activity, almost no respondent of the study changed their emotional state. Respondents were surprised to see the data that was captured by Face Reader hardware - the data obtained indirectly helped to create a clear link to it as emotionally affected by physical activity. In general, this means that in everyday life, rarely do you feel the connection with how physical activity increases the positive emotions.

The most important principle that must be followed in order to be optimally motivated and experienced by a person is the need for a person to experience specific psychological needs during the activity being performed. People by their nature are considered to be active, purpose-oriented, looking for a possibility to satisfy the three basic needs of the basic psychological needs.

We observed statistically significant correlations between positive changes in emotions during physical activity and vitality (both the character and the state). Also, the vitality state were able to predict positive emotional changes. Vitality (feature, state) statistically significantly correlated with all motivational sub-scales - pleasure, competence, external appearance, health and social aspect. Recent study (Ryan, Weinstein, 2008) highlights a vital aspect of vitality - contact with nature. It is pointed out that people who engage in physical activity in the open-air experience a higher level of vitality.

We conclude that it would be important to develop methods and to emphasize how to develop people's internal motivation in order to get pleasure from the activities performed and to develop their competence in order to encourage more and regular engagement of physical activity. In contrast, the emphasis on health benefits, external appearance will be less effective in developing behavioral patterns and developing the habit of regularly engaging in physical activity.

In general, we can conclude that motivation to engage in physical activity is associated with changes in emotions during physical activity. It is very important to develop behavioral patterns already in childhood, which means that organizers of sports activities should be advised to focus on sports activities for the whole family. It is also important for a trainer or sports expert to work so that physical active people can see the link between their activities and the immediate benefits they bring.

Abstract

The aim of this study was to investigate the management process of the risk management in the park and recreational activities and evaluating them in terms of the application processes. In this study, documentary screening and archival examination method were applied. Recreational activities have many risk factors. Especially, safety and health problems are frequent in recreational activities. Planning of sports and recreational areas should include, usage of materials, ergogenic aids, medical supports, and safety management strategies. The evaluation process was done particularly in protection and usage processes, health management, location and construction of the facilities, security dimensions. As a result, in the management processes of the park and recreation activities, construction processes, business processes and educational dimensions, service management process and risk management dimensions should be analyzed by managers and educators. Also, municipalities, universities and local sport administrations must be planning recreation risk management documents to public partners and athletes.

Keywords: Risk management, Park recreation, Recreational activities

Introduction

The use of open public spaces by children and urban residents varies depending on cultural and environmental factors (Albert et al., 2011). The participation of sports and recreation areas in contemporary city planning is important for creating healthy living environments (Ustundag et al., 2011). Sports and recreational activities are constantly vulnerable to multiple safety matters before, during and after activities. Positive applications could prevent the existence of accidents that provoke injuries to the participants (Zakaria et al., 2016).

Most of the accidents in parks occur from unsafe playground equipment, inattentiveness of the children, and neglect of the families (Gul, 2012). Miles and Priest (1999) remarked that management process is one of the essential components of the recreational activities. Additionally; program evaluation, program development and administration, risk management and research are the key elements of the management.

Definitions of Leisure and Recreation

Leisure: Discretionary time is the time remaining after sleeping, commuting, working, personal tasks and doing necessary household and which can be used in a chosen way (Tribe, 2015).

Recreation: Activities conducted in leisure time. Recreational activities comprise home-based activities such as watching television and reading, and those outside the home comprise theatre, cinema, sports, and tourism (Tribe, 2015).

Recreational activities categorized by Baud-Bovy and Lawson (2002) into six categories.

Table 1. Categories of recreational activities

Category of activities	Examples
Taking place about the home	Watching television, reading, listening to music, gardening, do-it-yourself hobbies,
Having a high social content	exercise, leisure use of computers Entertaining, eating out, drinking in bars, party going, visiting friends and relatives
Cultural, educational and artistic interests	Visiting theatres, concerts, exhibitions, museums, attending non-vocational classes
Pursuit of sport, either as participants or spectators	Golf, football, swimming, tennis, bowls, darts, gymnastics
Informal outdoor recreation	Driving for pleasure, day excursions to seaside and countryside, walking, picnicking
Leisure tourism involving overnight stay	Longer distance travel, tours, weekend breaks, holidays and vacations

Categories of recreational activities (Baud-Bovy and Lawson, 2002).

Attendance in recreational activities seemed to be undulating recently, with an increase in team, winter, water, and fitness sports participation. Individual sports decreased moderately in 2015 while racquet and outdoor sports continued to stay unchanged (Physical Activity Council, 2016).

Ambitiousness Youth, Young Adult & Adult Participation in Recreational Activities

Ambitiousness participation calculates non-participants' attentiveness in particular outdoor recreation, sports, fitness and leisure time activities. A lot of ambitiousness participants selected being attended to outdoor activities. In fact, youth and young adults in every age community described camping as their top interest. Bicycling follows as second among ambitiousness young adult participants, ages between 18 - 24, and the activity came in third among nonparticipants, ages between 6 - 12 and 13 - 27. Hiking and running/jogging were also activities that each age group wanted to try (The Outdoor Foundation, 2016).

For ambitiousness adult participants of all ages — and ambitiousness participants of all ages — camping and bicycling were in the top 3 most interesting activities out of a range of outdoor, sports, fitness and leisure time activities. Hiking and running/jogging also rated in the top 10 most attractive activities among adult participants (The Outdoor Foundation, 2016).

Risk Management

Risk management has a variety of roots and is applicated by a wide range of professionals. Risks that affect corporations can have issues with regard to financial performance and professional esteem, along with milieu, safety, and societal results. Consequently, managing risk efficiently helps the corporation to perform well in an environment full of ambivalence (www.iso.org).

The consideration of risk management emerged after World War II. Risk management has long been linked with the utilize of merchandise assurance to preserve individuals and corporations from diverse losses linked with casualties. Different shape of risk management, options to merchandise assurance, emerged throughout the 1950s when merchandise assurance was comprehended as very expensive and uncompleted for protection against risk (Dionne, 2013). One of the early developments in risk management was in the United States out of the assurance management purpose. The application of risk management became more common and more advantageous organized because the price of assurance in the 1950s had become prohibitive and the extent of coverage restricted. Corporations noticed that acquiring assurance was inadequate if there was also insufficient awareness to the preservation of property and people. Assurance customers, therefore, became worried with the standard of property protection, the standards of health and safety, product liability consequences and other risk control worries. This combined method to risk financing and risk

control advanced in Europe throughout the 1970s and the concept of total price of risk became crucial. As this method became established, it also became clear that there were many risks facing corporations that were not insurable. The instruments and methods of risk management were then spread to various disciplines. The maturity of the risk management discipline is now such that the associated with assurance is much weak. Insurance is now seen as one of the risk control methods, but it is only relevant to a certain section of dangerous risks. Risks related to economics, commercial, marketplace and fame issues are accepted as being particularly crucial, but outside the historical extent of insurance (Hopkin, 2017).

International Organization for Standardization (ISO) & Parks

ISO is an independent, non-governmental international organization with an affiliation of 163 national standards bodies. Through its members, it brings together specialists to share knowledge and develop voluntary, consensus-based, market relevant International Standards that support innovation and provide solutions to global challenges (www.iso.org).

Technical Committee of ISO (ISO/TC 83) about sports and other recreational facilities and equipment ISO has developed 76 standards. 32 standards are still in the development phase. 22 countries are the participating members of these standards and 24 countries are the observing member that includes Turkey (<https://www.iso.org/committee/50190.html>). There are 4 standards for playgrounds (ISO TC/254) and these standards also include amusement park standards (<https://www.iso.org/ics/97.200.40/x/>). These 4 standards contain standards of design and manufacture; operation and use; requirements for inspection during design, manufacture, operation, and use; biomechanical effects on amusement ride passengers.

As a participating membership of UK to ISO about standards for facilities and equipment that related to sports and other recreational activities, according to British Standards Institution (2008), there are eight main components that create the standardization.

Table 2. BS EN 1176 Standardization of children's playground equipment & surfacing

-
1. General safety requirements and test methods
 2. Additional specific safety requirements and test methods for swings
 3. Additional specific safety requirements and test methods for slides
 4. Additional specific safety requirements and test methods for runways
 5. Additional specific safety requirements and test methods for carousels
 6. Additional specific safety requirements and test methods for rocking equipment
 7. Guidance for installation, inspection, maintenance and operation
 8. Additional specific safety requirements and test methods for spatial networks
-

In Turkey, the standardization of playgrounds has been determined by the Turkish Standards Institute. TS EN 1177 standardization specifies the standardization of the impact-reducing playground floor layouts and the determination of the critical fall height. TS EN 1177-1 standardization introduces standards for general safety rules and test methods with playground components and ground rules.

International Organization for Standardization (ISO) & Risk Management

Risks affecting corporations can have resulted in terms of financial performance and professional fame, as well as environmental, safety and social consequences. Therefore, managing risk efficiently helps corporations to perform well in an environment full of unpredictability. ISO 31000:2009, Risk management – Principles and guidelines, provides principles, framework and a process for managing risk. It can be used by any corporation regardless of its size, activity or sector. Using ISO 31000 can help corporations increase the probability of obtaining objectives, increase the determination of opportunities and threats and effectively distribute and use resources for risk treatment. However, ISO 31000 cannot be used for authentication intentions but does provide guidance for inner or outer inspection schedules. Corporations take advantage of it can compare their risk management applications with an internationally recognized benchmark, providing sound principles for effective management and corporate governance (<https://www.iso.org/iso-31000-risk-management.html>).

Table 3. ISO Standardizations of sports and other recreational facilities and equipment and risk management

	Published ISO standards	ISO standards under development	Participating members	Observing members
ISO/TC 83 - Sports and other recreational facilities and equipment	76	32	22	24*
ISO/TC 262 – Risk management	3	3	53*	17

*Membership of Turkey (Table 3 is created from the datas that retrieved from www.iso.org).

Table 4. Ten steps to risk assessment and developing a risk management plan

1. Make a commitment as an organisation to risk management
2. Identify possible threats and risks
3. Assess the level of each risk
4. Decide to accept or treat each risk
5. Determine treatment options for all unacceptable risks
6. Formalise your risk management plan
7. Implement your treatment options
8. Communicate information to everyone affected
9. Review your risk management plan
10. Identify any new risks and update your action plan

Government of South Australia Office for Recreation and Sport (2016).

Application of the Risk Management in Park and Recreational Activities

The aim of risk management in recreation is to protect the recreation corporation's proprietorship (field, building, facility, etc.), the income of the recreational corporation and the recreational corporation's reputation (coach, athlete, spectator etc.) (Cobanoglu, 2008). The procedure of risk management can be applied as part of a best practice management system within the sport and leisure sector (Fuller & Drawer, 2004). Classification of the risk management in sports and recreational activities as followed;

- | |
|--|
| <ol style="list-style-type: none"> 1. Risk management in activities 2. Risk management in injuries 3. Risk management in facilities and equipment 4. Risk management in insurance and finance 5. Risk management in sports branches |
|--|

(Yilmaz, 2013).

Results, Conclusions and Recommendations

Nearly 25% of adolescents reported at least one recreational injury. Injuries were mostly minor, reflecting soft tissue trauma and skin abrasions (Grimmer et al., 2000). Local governments need to produce effective policies to ensure that sports services are organized to promote sports and for the adoption by the public (Ucar, 2014). Designs that allow parents and children to socialize and at the same time take into account climatic characteristics should be prioritized (Uysal, 2015).

Risk management in park and recreational activities

Basically, there are four main sources of the risk in the park and recreational activities and these risk factors are facilities, equipment, program, and human. In terms of risk management approach, park and recreational activity corporations should analyze four key management areas: finance management, insurance management, facility management, injury management (Yilmaz, 2013).

Risk management in the park and recreational activities should consist of four basic processes: planning, identification, evaluation, prevention, and control. The aim of the risk management in the park and recreational activities should be; identifying the risks associated with the goals of the corporation, controlling the most critical risks first, and ensuring that the risks and the detailed understanding of the impact on the success of the corporation and prioritizing the risks.

Heat cramps, heat tiredness and heat strikes due to increased body temperature that can occur in hot and humid environments due to the physical activity are health problems that have frequently occurred in recent years. Because of this fact, injuries may occur which may lead to death rarely (Armstrong et al., 2007). Additionally, cardiac problems are the most common causes of death during recreational activities (Fornes & Lecomte, 2003). The risk plan for possible first aid interventions should include education programs covering personal health information, use of personal protective equipment, cleaning of pathogenic soils and materials, safe removal of pathogenic materials from the environment, proper hand washing and drying techniques and vaccination. Risk management plan should also include medical examination, proper activity program, emergency intervention team. Main components of the plan should be; symptoms of the illness, emergency health team, liquid intake, temperature limits, clothing, acclimatization, preventive approaches. Weather conditions can sometimes be life-threatening during sport and outdoor activities such as camping, hiking, cycling, fishing, and climbing, especially in open areas. Most of the natural disasters like storm, landslide, snow slide, flood, hail may result in loss of life (Twiggy, 2004). The main components of the risk management plan for this situation are education (about weather conditions), intervention team, timing, location, nature, and equipment.

The necessity of wearing appropriate clothing and appropriate equipment for the activities should be constantly emphasized (Luke & Micheli, 1999). The tools and equipment that used in parks and recreational events must be of good quality and robust. The walls around the area where the activity is held should be covered with protective and soft material (Frosdick & Walley, 2010). The grounds of sporting areas should have the most efficient structure and should be well planned. There should be no tools or obstacle objects in the area of activity that could jeopardize the safety of the individuals. Additionally, slippery floor increases the risk factor of lower extremity injuries (Piekarz et al., 2015).

The most common, contemporary and least expensive method of transferring the risk is to take out insurance services. There are various types of insurance that should be considered recreational corporations. First one is liability insurance. The various classes covered by the liability insurance are; public liability insurance, occupational liability insurance, manager and responsible liability and association liability insurance. The second one is income protection insurances; workers' compensation insurance, personal accident insurance, participant insurance and travel insurance. The third one is insurance for the protection of assets. Other insurance types that might be considered by recreational corporations are cancellation and abandonment insurance, natural disaster insurance, private emergency insurance, tax audit and legal expense insurance (Yılmaz, 2013).

Participation of Turkey in ISO/TC 262 – Risk management indicates that Turkey recognized the importance of risk management, actively participates in the technical committee & applies the standardizations of risk management. However, the application of ISO/TC 83 - Sports and other recreational facilities and equipment standardizations are still being observed by ISO is Turkey. Application of ISO/TC 83 standardizations would make further investments with reduced risk factors.

Regarding the diversity of activity contents of park and recreation management, priority should be given to the risk factors that may be encountered in the planning process of the facilities should be; location selection, climatic conditions, landscape and architecture, transportation and users' expectations. Therefore, expectations should be taken into account, especially attendance of the participants in the physical activity, and specific and general risk factors should be considered that different age groups may encounter in the same field of activity.

Abstract

Successful training in swimming is impossible without precise and correct control of a swimmers' training process. The coach must have as much information as possible about the athlete's fitness to obtain a comprehensive picture of the course of training and to optimally plan future activities. The results of performing a specific exercise depend on the state of function which is most vital for ensuring performance under certain conditions. The key precondition logically underpinning the informative nature of the tests is that the results of the test. Thus exercises which provoke immediate maximum deviations from training effects can provide the most objective pedagogical evaluation of various endurance components. The use of specially designed swimming test sets allows swimmers to learn the necessary control of their training process, helps determine strengths and weaknesses of their preparation and prepares them to accept operative corrections. The aim of the work is to optimize the management of swimmers' training processes on the basis of special testing results. In order to determine their areas of need, two of Latvia's best swimmers were tested with 6 specific endurance test sets. Once determined, the swimmers were given different swimming sets to develop their areas of weakness. For all swimmers we have developed 6 areas of sets to either sustain or improve a swimmer's endurance (endurance of anaerobic and aerobic ability). Intensity for each set differs depending on whether the athlete is improving or sustaining these areas. Intensity within the sets for improvement of the areas ranges between 83-98% of maximum speed and to sustain the areas 80-96% of maximum speed depending on individual swimmer results from the test sets.

Key words: sport swimming, endurance, testing, training planning

Introduction

Effective control of an athlete's training is only possible if the coach knows what is happening to the athlete's organism at each stage of training (Counsilman 1977, Shirkovec 2002, Maglischo 2003, Vasilie, 2014, Talanian 2015, Dalamitros 2016,).

Successful swimming training is impossible without accurate and appropriate monitoring of the swimmer. The process of planning and organizing training is largely driven by analyzing changes in the swimmer's capabilities during various

periods and stages of training and ascertaining her strengths and weaknesses. The coach must have as much information as possible about the athlete's fitness to obtain a comprehensive picture of the course of training and to optimally plan future activities. The results of performing a specific exercise depend on the state of function which is most vital for ensuring performance under certain conditions (Sokolovas 2002, Maglischo, 2003, Anderson et al, 2008, Ford et al, 2011., Williams 2011).

The key precondition logically underpinning the informative nature of the tests is that the results of the test (Petrovich, 1989, Petrovich et al, 1990 Oliveira et al, 2012). Thus exercises which provoke immediate maximum deviations from training effects can provide the most objective pedagogical evaluation of various endurance components.

The results of the exercises are mutually comparable, therefore testing under the auspices of this program provides objective information about the proportional development of specific characteristics during various stages of training.

The aim of the work is to optimize the management of swimmers' training processes on the basis of special testing results.

Methods and organization

The study involved two Latvian athletes, both breaststroke swimmers. One of them, P., was National champion 50 and 100 m swimmer, 18 years old; while the other, V., was National champion in 200m breaststroke, 19 years old. In order to compare the overall endurance fitness and just the training of these athletes and encourage improved results, a set of tests was employed over three (3) sessions to determine and evaluate the swimmers' special endurance development level. Interval exercises with maximum swimming speed (Petrovich, 1998, Shirkovec, 2002) can be used for the pedagogical control of the various special endurance criteria.

A-2×25 m, rest interval 80 s – anaerobic alactic power;

B-16×25 m, rest interval 80 s – anaerobic alactic capacity;

C-4×50 m, rest interval 45 s – anaerobic lactate power;

D-4×50 m, rest interval 10 s – anaerobic lactate capacity;

E-8×50 m, rest interval 10 s – aerobic power;

F-16×50 m, rest interval 10 s – aerobic capacity.

In order to evaluate the developmental balance of special endurance components, the following special coefficients were used:

$K_1=A/B$ – describes anaerobic alactic capacity compared with alactic power;

$K_2=B/C$ – describes lactic capacity compared with alactic capacity;

$K_3=C/D$ – describes lactic capacity compared with lactic power;

$K_4=D/E$ – describes aerobic power compared with lactic capacity;

$K_5=E/F$ – describes aerobic capacity compared with aerobic capacity;

K_6, K_7, K_8, K_9 ($K_6=A/C$; $K_7=A/D$; $K_8=A/E$; $K_9=A/F$) – describes all components compared with alactic power (maximum speed);

$K_{10}=D/F$ – describes aerobic capacity compared with lactic capacity.

In order to comprehensively assess their special endurance development level, the athletes' individual coefficients were compared with model indicators. If an individual coefficient describing a particular characteristic is significantly lower than the relevant model coefficient, the given characteristic has a development reserve and close attention must be paid to this characteristic in the immediate future. If the coefficient is greater than the model coefficient, it can be considered that the given characteristic is overly developed, possibly at the expense of some other characteristic.

Indicators were measured after each test. Time was measured in seconds after each test using a SEIKO hand chronometer.

Pulse rates were taken by the swimmers themselves. The pulse rate was measured on the carotid artery, 3 times after workout at interval: 0-10 s (P₁), 30-40 s (P₂) and 60-70 s (P₃). Together with sporting results, these indicators are often the most objective criteria used by trainers working with swimmers. The size of the P₁ indicator reveals the reaction to load of the cardiovascular system. P₂ and P₃ indicators describe recovery of heartrate frequency.

Lactate indicators were determined using a lactate express diagnosis device in the third minute after completion of the C, D, E, F tests and the first minute after test A.

Results

In order to determine and evaluate the swimmers' special endurance development level, we used the aforementioned set of tests. The test results are shown in table 1.

Table 1. Athlete's results of the special endurance test (time, heart rate and lactate) at the beginning of swimming season.

Swimmer		Alactic power Test A	Alactic capacity Test B	Anaerobic power Test C	Anaerobic capacity Test D	Aerobic power Test E	Aerobic capacity Test F
V.	Time, s*	30.1	29.75	33.8	36.29	36.65	37.4
	Heart rate, 10 s**	25-24-18	26-24-18	29-26-21	29-26-21	30-24-22	30-25-20
	Heart rate's per 10s sum	67	68	76	76	76	75
	La, mmol/l	4,7	6.6	12,5	8.5	8.6	9.5
	<hr/>						
P.	Time, s*	31.28	31.75	37.65	39.48	41.35	43.22
	Heart rate's per 10s sum	29-26-20	30-26-25	33-28-25	32-27-24	33-27-24	32-28-25
	P-sum	74	81	86	83	84	85
	La, mmol/l	7.2	7.5	11.4	9.1	8.5	10.6
	<hr/>						

* - average test time on 50 m;

** - number of heart rate in 10 seconds immediately after the swim, after 30 seconds, after 60 seconds.

After summarizing the test results we obtained the following individual coefficients (see table 2).

Table 2. Athletes 'special endurance individual coefficients in comparison with model indicators

Coefficients		Normality range	Swimmer V.		Swimmer P.	
K ₁	A/B	0.97-0.99	1.01	Higher	0.99	Normal
K ₂	B/C	0.89-0.92	0.88	Lower	0.83	Lower
K ₃	C/D	0.95-0.97	0.93	Lower	0.95	Normal
K ₄	D/E	0.97-0.99	0.99	Normal	0.95	Lower
K ₅	E/F	0.97-0.99	0.97	Normal	0.95	Lower
K ₆	A/C	0.87-0.90	0.89	Normal	0.83	Lower
K ₇	A/D	0.84-0.87	0.84	Normal	0.79	Lower
K ₈	A/E	0.81-0.83	0.82	Normal	0.75	Lower

K ₉	A/F	0.79-0.82	0.8	Normal	0.72	Lower
K ₁₀	D/F	0.93-0.96	0.97	Higher	0.91	Lower

Swimmer V., whose specialty is 200m breaststroke, scored within the normal range for six coefficients covering aerobic power, capacity development and anaerobic capacity levels. Anaerobic alactic and lactic power are in development reserve. Pulse and lactic indicators recorded after the tests align with accepted bodily reactions and loads.

Swimmer P. had only two coefficients within normal range. These are alactic power and lactic capacity. All other endurance components– anaerobic power and capacity, aerobic power and capacity – are poorly developed. Furthermore, pulse reaction to test loads is inadequate, pulse indicators are higher than the accepted norm, and recovery takes longer. This may be regarded as an inadequate endurance level or due to individual cardiovascular system peculiarities. Furthermore, lactic indicators after tests align with accepted bodily reactions and loads. The test result explain why swimmer P. is only successful in sprint distances.

Comparing the test results for both swimmers, we conclude that the overall endurance component development level is satisfactory for swimmer V. and unsatisfactory for swimmer P.

Based on both swimmers' test results, individual training programs were created to achieve improvement in the proportional development of special endurance components. The tasks were performed over a single season from 6 September 2012 to 2 July 2012. Sports training theory and the criteria of athletic swimming were used to select and systematize efficient interval training series in order to realize the reserve of the weaker components of special endurance (see table 3). The column “intensity” presents the results for the respective distances as a percentage in accordance with the length to be swum for the given exercise. Intensity can be calculated using this formula:

$A=R/I \times 100$, where:

A – Training session time, 50m;

R – Exiting result (average time 50m) in concrete test

I – required training set's intensity, in percentage from every specifics test.

Table 3. Basic swimming sets for general development of special endurance

Energy supply mechanisms/ Load capacity	Exercises	Intensity, %
Anaerobic alactic power	2×25 m, i*-15 s	90-92
	2×25 m, i-80 s and more	95-97
Anaerobic alactic capacity	8-16×25 m, i-15 s	88-90
	8-16×25 m, i-80 s and more	93-95
	16×100 m, i-30s	81-84
	8-16×100 m, i-80 s and more	87-89
Anaerobic lactic power	2×50 m, i-20 s	88-90
	2×50 m, i-40 s	90-92
	4×50 m, i-45 s	88-90
Anaerobic lactic capacity	4×100 m, i-20 s	86-87
Aerobic power	2×50 m, i-80 s and more	89-92
	2×200 m, i-60 s	88-90
	4×200 m, i-60 s	85-87
	2×200 m, i-80 s and more	93-95

	4x200 m, i-90 s and more	90-93
Aerobic capacity	10 and more times 50m,100m or 200 m	AnTh** mode, 2000 m and longer distances

*i – rest interval;

** - anaerobic threshold.

For example, analysis revealed that swimmer P. had weak aerobic capacity and power. We proposed the following exercises to realize the aerobic capacity reserve:

- 1) swimming (2000 m and more) with average result 1min.50 sec in100 m, once per week in September and October;
- 2) 20*50 m, breaststroke, rest interval-15 s with result 45-47 s three times per week, throughout the training cycle;
- 3) 8x200 m in anaerobic threshold mode with result 3.05-3.10 once per fortnight from December to March; with result 3.00-2.59 from March to July; Rest interval 30-40sek.
- 4) 8-10*100, rest interval-30 s with result 1.24-1.25 from March to July.

An analogous method was used to calculate the training swimming sets results for both swimmers by performing exercises to develop the individual components of endurance. Taking account of the rather high pulse indicators for swimmer P., we increased the rest intervals when swimming 100 and 200 m. For example, when swimming 16x100 m, during rest interval-30s swimmer's heart rate was 25 per 10 s, or 150 per one min. So rest interval was prolonged till heart rate became 20 per 10 s, or 120 per minute.

Comparing repeated test results for both athletes after six months, we concluded that the special exercises helped to improve the lactic capacity and power (K_2 , K_3) indicators for both athletes. Swimmer V. was also able to record an increase in anaerobic capacity (K_1 , K_2). Over six months swimmer P. also achieved improved aerobic capacity indicators. Overall swimmer V. had 9 out of 10 coefficients in the normal range, while swimmer P. only had three. Continuing training by individual training parameters, after the start of the repeated testing season (ten months later), two swimmers' results are presented (see tables 4 and 5).

Table 4. Swimmer's V. tests of the special endurance results (time, heart rate and lactate) at the beginning and at the end of the swimming season.

Load capacity	Alactic power Test A		Alactic capacity Test B		Anaerobic power Test C		Anaerobic capacity Test D		Aerobic power Test E		Aerobic capacity Test F	
Time, s*	30.1	29.0	29.75	29.1	33.8	32.7	36.29	35.5	36.65	35.8	37.4	36.9
Heart rate per 10 s, sum	67	69	68	70	76	75	76	75	76	74	75	74
La, mmol/l	4.7	4.5	6.6	7.0	12,5	13.4	8.5	8.6	8.6	7.8	9.5	8.8

*results at start of season – standard font, end of season - bold.

Results in all tests improved, with no change in pulse indicators. Lactate indicators fell in tests E and F (aerobic power and capacity indicators). The improvement of results with lower pulse indicators indicate increased work economy.

Table 5. Swimmer's P. tests of the special endurance results (time, heart rate and lactate) at the beginning and at the end of the swimming season.

	Alactic power		Alactic capacity		Anaerobic power		Anaerobic capacity		Aerobic power		Aerobic capacity	
Load capacity	Test A	Test B	Test C	Test D	Test E	Test F	Test G	Test H	Test I	Test J	Test K	Test L

* Results at the beginning of swimming season – standard font, end of season - bold.

Swimmer P. saw an improvement for all test results, as well as a reduction in lactic quantity. Pulse indicators remained high, indicating individual reaction to training loads. Throughout the season the athlete's rest intervals were increased in order to ensure recovery in accordance with the load. Regarding improvement of overall results, we could not achieve proportional development improvement for all special endurance components (see table 6). While the athletes saw improvement in the aerobic endurance components, in comparison with alactic power (maximum speed) two of them remained in development reserve. During the season the four lagging endurance components were raised within normal bounds. There were no changes in the aerobic capacity coefficient or the relationship between maximum speed and anaerobic lactic power and capacity.

Table 6. Comparison of athletes' individual P. coefficients with model indicators

Coefficients		Normal range	First test		Repeated test	
K ₁	A/B	0.97-0.99	0.99	Normal	0.99	Normal
K ₂	B/C	0.89-0.92	0.83	Lower	0.89	Normal
K ₃	C/D	0.95-0.97	0.95	Normal	0.91	Lower
K ₄	D/E	0.97-0.99	0.95	Lower	0.97	Normal
K ₅	E/F	0.97-0.99	0.95	Lower	0.95	Lower
K ₆	A/C	0.87-0.90	0.83	Lower	0.88	Normal
K ₇	A/D	0.84-0.87	0.79	Lower	0.81	Lower
K ₈	A/E	0.81-0.83	0.75	Lower	0.79	Lower
K ₉	A/F	0.79-0.82	0.72	Lower	0.79	Normal
K ₁₀	D/F	0.93-0.96	0.91	Lower	0.94	Normal

Conclusions

In reading the above results, equally increasing proportionate (7%) results across the test sets (percentage of time) assists in determining strengths and weaknesses in the associated tests. The following are conclusions based upon the above results.

1. Using the proposed test system makes it possible to determine and evaluate swimmers' special endurance development level, and on this basis to establish the various components of fitness.
2. The proposed exercises make it possible to implement reserves for improving the weakest components of special endurance, as well as improving the balance of special endurance component development for each athlete individually.

3. The time required to improve the weakest components of endurance depends on the swimmers' individual characteristics.

Discussion: Testing over three sessions allowed recovery of the athletes giving more accurate test results and deeper knowledge and insight into their overall fitness. Upon repeating these tests, athletes and coaches should be aiming to reduce pulse rate and lactate measurements.

To use these test sets beneficially for each swimmer, individualization of each athletes work out is essential. To stay within the correct load, coaches must use an individual swimmer's test results to find the correct pace the athlete should working at. With deviation from that pace, the swimmer will enter an alternate load working a different system. For swimmers not meeting required times, rest periods should be increased to increase the load capacity and allow athletes to achieve the desired (individualized swimming time) outcomes.

Abstract

Clusters are viewed as a subject worth attention paid by scholars and politicians for they are able to add to regional economy development through various outcomes of their performance. Valuable observations are made on how the clusters performance could be estimated. Scientific literature suggests that innovation, knowledge transfer, social networks, collaboration, regional/ national proximity, competitiveness, research and development (R&D) is an integral part of cluster studies. The aim of this study is to suggest a tool, which would allow evaluating the efficiency of clusters performance in terms of knowledge transfer, understood in the most general way. There are various aspects of cluster performance emphasized by different researchers. We offer a system of indicators, which could be used for cluster performance description where transfer of knowledge is the key phenomenon taken into account. It is offered to include 44 indicators into the system used for cluster performance evaluation. The indicators are attributed into three groups according to different facets that they represent. The groups are named as Resources, Activities and Processes. Transfer of knowledge is viewed as a very important part of cluster performance and is ascribed to activities, which are difficult to measure. For integration of the indicators included into the system we employ one of multi-criteria methods, specifically, SAW method. The results suggest that clusters, which show good results with processes, stay in high positions, while clusters, which are keeping behind with processes, show worse results in cluster performance. This system of indicators could be used in further research to detect if these three groups of indicators should be rated the same for clusters belonging to different sectors.

Introduction

It is notable that the interest in clusters and their role in sustainable regional development are increasing as scholars often review this topic (Tvaronavičienė 2017a, 2017b; Razminienė, Tvaronavičienė, 2017; Monni et al., 2017). Valuable observations are made on how the clusters should be researched in order to improve their performance which would result in economic growth both in regional and national scale. Scientific literature suggests that innovation, knowledge sharing, social networks, collaboration, regional/ national proximity, competitiveness, research and development (R&D) is an integral part of cluster studies (Zemlickienė et al. 2017; Rezk et al. 2015; Fuschi and Tvaronavičienė 2016; Tvaronavičienė 2016; Razminienė et al. 2016; Dobrovolskienė et al. 2017; Tvaronavičienė 2017; Panfiluk and Szymańska 2017; Prause and Atari 2017; Tetsman et al. 2017; Oganisjana et al., 2017). These phenomena are of high importance when talking about the performance of the clusters for the results depends on how they are managed and evaluated. Different authors agree that geographic proximity is worth the attention that it gets for it enables collaboration, innovation (Letaifa and Rabeau 2013; Boschma et al. 2013; Castellani et al. 2013; D'Este et al. 2013; Maskell 2014) and knowledge sharing (Crespo et al. 2014; D'Angelo et al. 2013; Sokół, Figurska, 2017). In addition, social networks are analysed to understand their relationship with innovations (Casanueva 2013; Letaifa and Rabeau 2013), production (Carswell 2013) and knowledge sharing (Lorenzen and Mudambi 2013). The scholars suggest that industry clustering has positive effect on innovation performance and knowledge (Lai et al. 2014; Tavassoli and Tavassoli 2014; Bouncken and Kraus 2013; Morrison et al. 2013; Feldman 2014). Literature study, data collection and analysis allow making a conclusion that profit making or capital accumulation can differ depending on companies upgrade (Tokatli 2013) or path dependence (Dobusch and Schussler 2013). D'Agostino (2013) studies the relationship between a region's home and foreign investments in R&D that affects home's regional knowledge production. Recent researches on competitiveness and clusters for regions and regional

policy show that policies are mostly focussed on strengthening existing agglomerations rather than establishing new ones (Ketels 2013). The concept of creating shared value which is emphasized by scholars in cluster studies also receives critique for several reasons, such as not being original, ignoring tension between social and economic goals, being naïve about the challenges of business compliance and having basis of shallow conception of the corporation's role on society. On the other hand, this concept has strengths for successfully appealing to practitioners and scholars, elevating social goals to strategic level, articulating a clear role for governments in responsible behaviour, adding rigor to ideas of “conscious capitalism” and providing an umbrella construct loosely connected concepts (Crane *et al.* 2014).

Authors view knowledge transfer from different angles. Bouncken and Kraus (2013) emphasize that damaging or encouraging effects for firms in clusters depend on three types of innovation performance: sharing knowledge with the partner, learning from the partner and technological uncertainty. The study resolves that positive results of co-opetition are achieved on revolutionary innovation when SMEs integrate their partners' knowledge or even if a greater technological uncertainty prevails. Hence, negative influence on revolutionary innovation is discovered when SMEs are sharing knowledge with their partners. Casanueva *et al.* (2013) analysed a wide range of ties in order to understand how they impact the transition of tacit and explicit knowledge. The results show that a central position is significant in product innovation while the role of structural holes is weaker. The study of Corredoira and McDermott (2014) shows that suppliers benefit from multinational corporation subsidiaries in cases when they collaborate with non-market institutions and are able to recombine experiential knowledge with standards gained from the subsidiaries. Crespo *et al.* (2014) claim that an evolutionary framework is presented in their work, where regional resilience is accounted by emphasising local knowledge sharing. A paper presents simple statistical measures, which characterize the structure of cluster which allows studying such properties as degree distribution and degree correlation of regional knowledge networks. Feldman (2014) provides a literature analysis that observes the mechanisms and institutions that promotes the creation of useful knowledge. Lai *et al.* (2014) suggest that industry clustering has positive effect on corporate innovation performance and corporate knowledge. Stanko and Olleros (2013) investigate knowledge spill-over mechanisms' effects on industry innovativeness and profit and their changes in industry growth. The findings suggest that the outsourcing negatively affects innovativeness but benefits profitability. Despite the attempts to detect the links among these phenomena and indicate their influence on each or several factors that are analysed by scholars, it is still complicated to evaluate the performance of the clusters. Different methods are applied in order to analyse qualitative and quantitative data, such as correlation and regression analysis (Casanueva *et al.* 2013; Lai *et al.* 2014; Tavassoli, Carbonara 2014; Crespo *et al.* 2014; D'Angelo *et al.* 2013), gravitation model (Castellani *et al.* 2013), case analysis (Ben Lafeita and Rabeu 2013; Boschma *et al.* 2013; Bouncken and Kraus 2013; Carswell 2013; Lorenzen, Mudambi 2013; Tokatli 2013; Dobusch and Schussler 2013; Morrison *et al.* 2013) or literature analysis (Crane *et al.* 2014; D'Agostino *et al.* 2013; Maskell 2014; Feldman 2014; D'Este *et al.* 2013; Ketels 2013). The problem of providing the most effective way to evaluate the data of different phenomena which are mentioned in clusters' studies could be by performing quantitative evaluation of clusters' performance (Ginevičius, A. 2007; Rutkauskas, Ginevičius 2011). The aim of this study is to suggest a tool, which would allow evaluating the efficiency of clusters performance in terms of knowledge transfer, understood in the most general way. Clusters' performance is complicated to evaluate for the measures of the aspects that must be calculated differ and the most appropriate solution to formalize these aspects should be found. There are many methodologies used in decision making sharing common characteristics of conflicting criteria, incomparable units, and difficulties in selection of alternatives. The alternatives are not predetermined but instead a set of objective functions is optimized subject to a set of constraints (Pohekar and Ramachandran 2004). Different multi-criteria evaluation methods are suggested by scholars for quantitative evaluation of the performance of a certain phenomenon (Simanaviciene and Ustinovichius 2010; Chen 2012; Ginevičius *et al.* 2013). Ginevičius *et al.* (2013) emphasize the importance of the development of a set of criteria as a stage of multi-criteria evaluation of a complex phenomenon. A single level set of criteria can be provided for experts to determine the weight of each criterion if their number is small and possible to conceive. On the other hand, if there are more criteria which makes it difficult to separate the most important ones from the less important, their number must be

reduced by forming a hierarchical structure where each hierarchical level is evaluated starting with the lowest one. Hence, the criteria in each hierarchical level must have the weight determined. The study is structured as follows. Part 1 provides the theoretical information of multi-criteria methods in quantitative evaluation. Part 2 gives the design of research and the methods of data evaluation. Part 3 presents the clusters that are considered in the study and illustrates the results of the evaluation of cluster performance. Conclusive remarks are incorporated in the final section of the study.

The methodology of quantitative evaluation of cluster performance

Multi-criteria Decision Making is a well-known branch of decision making. It deals with decision problems which involve a number of decision criteria. Multi-criteria Decision making as a discipline is rather young for the models and techniques of modern multi-criteria decision making were started to develop since 1950s and 1960s when many scholars were proposing their new models and techniques of multi-criteria decision making. The interest in this field is growing for the number of researches and development are continuously growing in the past decades (Zavadskas *et al.* 2014; Pohekar, Ramachandran 2004). Multi-criteria decision making, as described by Vincke (1992), is the most directly characterised by a set of multiple criteria method. The methods that were developed since 1950s differ in the required quality and quantity of additional information, the methodology used, the simplicity, the sensitivity tools used, and the mathematical properties they verify (Zavadskas *et al.* 2014). The main features that are shared by different methodologies are conflict among criteria, incomparable units, difficulties in selection of alternatives. The alternatives are not predetermined in multi-criteria decision making, a set of objective functions is optimized regarding to a set of constraints. The best solution is sought by evaluating a small number of alternatives against a set of criteria which are often hard to quantify. The alternatives are sought by making comparisons between the alternatives with respect to each criterion. Multi-criteria decision making methods can be used in solving both theoretical and practical problems. They are universal for their potential to quantitatively evaluate any complicated object described by a set of criteria (Ginevičius 2008). Quantitative multi-criteria evaluation methods may be different regarding their concept, various types of data normalization may be used, data and the weights of criteria may be combined in different ways, the range of the criteria values may vary and the importance of data can be viewed accordingly. The important point is that it is possible to make decisions based on the results of multi-criteria analysis, compare them, and analyse the reasons of some alternatives which are leading or staying behind. The influence of particular criterion and its weight can be detected and decision made respectively (Ginevičius, Podvezko 2008b). In order to apply multi-criteria evaluation methods, these procedures should be followed in such order: development of a set of criteria describing the considered object; determination of the weights and significances of criteria; choosing of an appropriate multi-criteria evaluation method (Ginevičius *et al.* 2008). The purpose of quantitative evaluation of cluster performance is the effective management of the cluster after the targeted criteria are examined and all the possibilities of improving them are considered and applied. Multi-criteria analysis should perfectly serve this purpose and allow making valuable observations in cluster performance improvement after the evaluation is made. A hierarchical structure must be considered to be made for cluster performance evaluation and simple additive weighting method applied to calculate the results. A socioeconomic system is large and complicated, therefore, the main goal is grouping the criteria describing its performance according to some particular characteristics, rather than searching for their interrelations (Ginevičius, R. 2007). The criteria that allow cluster performance evaluation are suggested by Klasterių studija (2012). 44 criteria are selected for further examination. Before providing the criteria for evaluation of the experts, a hierarchical structure must be created with different hierarchical levels for experts cannot cope with numerous criteria. The number of criteria must not exceed 12 (Ginevičius, R. 2011). For this reason a hierarchical structure must be divided into hierarchical levels depending on the connecting theme of the criteria. The later step includes the weights assigned by the experts. Their given weights must be reasonable and coincide to a certain degree. Since the weights of criteria are evaluated by experts, the consistency of their estimates should be checked. It is usually performed by using the concordance coefficient W and Pearson correlation coefficient χ^2 (Kendall 1970; Podvezko 2007). Further processing of the results must include multi-criteria evaluation of the performance of the cluster. Multi-criteria methods are used for both theoretical and practical tasks since they are universal and

enable to carry out a quantitative study for any complex phenomenon with many indices (Ginevičius, Podvezko 2008a; Jakimavičius and Burinskienė 2007; Žvirblis and Zinkevičiūtė 2008; Jakimavičius and Burinskienė 2009; Shevchenko *et al.* 2008; Wu *et al.* 2009; Žvirblis and Buračas 2010; Ginevičius *et al.* 2010; Podvezko 2011). It is important to formalize various aspects, which is developing and integrating the criteria into one generalized quantity, while evaluating cluster's performance. The problem arises for the criteria may be multidimensional and oppositely directed, which indicate the increasing value of some criteria show that the situation is getting better, while some cases indicate vice versa – the increasing of some criteria show the situation is getting worse. These problems may be solved by applying multi-criteria methods for performance of certain phenomenon evaluation (Ginevičius *et al.* 2013; Tvaronavičienė *et al.* 2015b). The multi-criteria SAW (Simple Additive Weighting) method was applied to process the results. SAW method was developed in 1968 and applied for multi-criteria decision making in various fields, which contain multi-criteria decision making problems, group decision making, contractors ranking, performance assessment model in a sector, evaluation of certain zones, analysis and ranking (Zavadskas *et al.* 2010). This method is one of the simplest methods and most often used in multi-criteria decision making technique (Malczewski 1997; Janssen 1992; Eastman 1993). The method is based on the weighted average. An evaluation score is calculated for each alternative by multiplying the scaled value given to the alternative of that attribute with the weights of relative importance directly assigned by decision maker followed by summing of the products for all criteria (Şener *et al.* 2006).

The evaluation of selected clusters' performance

This study continues and complements the previous study where four clusters were evaluated by a certain set of criteria (see more Tvaronavičienė *et al.* 2015b, Razminienė *et al.* 2016). This study involves three more clusters with different characteristics, described in Table 1.

Table 1. Successful clusters (source: author's compilation)

Cluster	Name	Establishment year	Number		
			of members	Specialization	Sector
A	Vilnius Cluster	Film2011	22	Cinema and advertising	Services, changing client's physical or mental qualities
B	Wellness Cluster iVita	2011	11	Health promotion	Services, changing client's physical or mental qualities
C	Laser Engineering Technologies Cluster (LITEK)	and2011	13	Lasers and components	laserElectronics industry
D	Baltic Automotive Components Cluster (BACC)	2013	17	Engineering industry (manufacturing of machinery and devices)	metal machinery and manufacturing industry
E	Latvian Added Value and Healthy Food Cluster (LHAVHFC)	High2010	31	Food Processing Manufacturing	Food and beverage industry
F	Smart Cluster	Food2013	18	Food Processing Manufacturing	Food and beverage industry
G	Užupis Cluster	Creative2010	9	Information communication technologies;	andServices, changing client's physical or mental qualities creative industries

A hierarchical structure was composed according to the common themes for experts would be able to evaluate the importance of each criterion (Figure2) (see Appendices). The main purpose is to provide an adequate number of criteria in one group which should not exceed 12 criteria. In this case, the maximum number is 10 for it is still possible to process this number of criteria and they were divided into groups according to the theme that they are connected. The main components are resources, activities and processes in cluster performance and the criteria that are singled out allow giving the measures for these components. European Secretariat for Cluster Analysis (ESCA) suggests cluster benchmarking indicators, grouped according certain features. They include structure of the cluster, cluster management and governance / strategy of the cluster organization, financing of the cluster management, services provided by the cluster organization (spectrum and intensity), contacts and interaction with relevant players, achievements and recognition of the cluster organization. These indicators can serve as very relevant guidelines in cluster performance evaluation and some of them are used in this research but the groups are modified according to the measures that indicators should be valued and the certain features they present. The indicators of cluster performance are put into three major groups: resources, activities and processes, which were found to be important after literature analysis. Resources include indicators which can be evaluated in numbers, both in terms of money and units (Table 2). This group represents the characteristics of a cluster, cluster's profile with the official information and statistics. The second group represents activities which cannot be measured in units or this kind of evaluation would be inaccurate; hence, activities were asked to be measured according to their importance, ascribing points from 1 to 10, where 1 means low importance, 10 means high importance. According to scholars, one layer of indicators in the hierarchical system should involve 10 – 12 criteria at most.

Table 2. Cluster performance indicators: resources

Resources
Number of cluster coordinating members
Number of cluster members - companies, R&D subjects, supporting organizations
Number of R&D personnel
University graduates working at cluster companies
Common cluster projects in two years
Financed common cluster projects in two years with cluster initiatives co-financing
External financing for cluster initiatives in two years
Total sum of cluster members' investments for cluster initiatives in two years

Activities naturally split into market activities and communication activities (Table 3, Table 4), following this rule of criteria for one group. Market activities reflect features, such as supply, orders, distribution, tenders for clients, as well as advertisement, exhibitions and fairs, internet site, cluster's imagine. Communication activities involve internal communication of cluster members. These are all necessary events of clear communication that is very important for firms in cluster to share all information with cluster members. The idea is to evaluate if meetings, integration events, communication platform, publications, co-operation, training, data base satisfy the needs of cluster members so that communication can work precisely. These features cannot be measured easily by exact numbers, as mentioned above, so special scale of evaluation was suggested.

Table 3. Cluster performance indicators: market activities

Market activities
Common supply and order scheme
Common distribution channels
Common cluster members' tenders for external clients
Exchange of common market information between cluster members
Cluster advertisement (leaflets, media)
Common participation in exhibitions and fairs
Lobbying
Common internet site
Visual identification (common logo, brand)
Contacts and image of cluster in mass media

Table 4. Cluster performance indicators: market activities

Communication activities
Regular meetings of cluster members
Cluster integration events
Common communication platform
Common cluster publications (booklets, newsletters, etc.)
Co-operation while creating new products or technologies
Co-operation while creating innovations (organizational, marketing, etc.)
Common training, workshops, conferences, internships
Common data base
Informal sharing of knowledge and experience
Transference of technologies

The last group is processes, which is divided into processes of human resources management (HRM processes) and international processes (Table 5, Table 6). HRM processes involve not only changes in human resources and their training but also R&D projects and expenses, EU SF projects. This information needs to be provided in per cent or units for objective evaluation in further calculations. International processes involve more diverse informational about products or goods, new members, start-ups, foreign markets, export, agreements, international exhibitions and sales offices that are connected to sales or foreign markets and R&D. These factors also need to be evaluated in per cent or units.

Table 5. Cluster performance indicators: HRM processes

HRM Processes
Increase of cluster members' employees in two years
Number of internal cluster training participants in two years
Number of cluster organized common training in two years
Number of qualification upgraded employees in two years
Increase of direct employment in cluster innovative activities
Part of R&D expenses in common expenses in two years
Number of common submitted/funded EU SF projects in two years
Number of common international R&D projects, funded not from EU SF, in two years

Table 6. Cluster performance indicators: activities

International Processes
Products/goods of cluster, sold in internal market
Products/goods of cluster, sold in external market
New cluster members in two years
Start-up in cluster
Foreign markets where members of cluster works
Part of export in total cluster sales
Number of official co-operation agreements with foreign entities
Participation in international exhibitions and sales offices in two years

The indicators were given in the questionnaire survey which was submitted in clusters and the indicators were supposed to be evaluated in different ways. Resources require providing exact figures for they can be measured in units or Euros so the questions asked to provide these figures accordingly. Processes include information about expenses, change in a number of different indicators, exact numbers of indicators which also need to be correct. While activities and processes can be expressed in exact figures, activities needed a different kind of evaluation. Hence, clusters were asked to rate activities from 1 to 10 according to the performance of the cluster. Communication activities and Marketing activities took the same weight in total Activities for they are of the same importance as well as International processes together with HRM processes had the same weights ascribed in total Processes. Literature analysis, where several scientific papers were viewed from the point of methodology used in cluster study (also see Tvaronavičienė *et al.*, 2015a), reveals that scholars are pointing out the same features characteristic to clusters which are also included in these three groups of indicators.

Innovativeness, knowledge sharing, common distribution channels, qualified human resources and initiatives can be seen as characteristic features that indicate cluster performance. Processes and activities include these indicators expressed in different measures, where processes provide exact numbers, while activities reflect the degree of fulfilment that relies more on personal opinion than numbers. Razminienė *et al.* (2016) emphasize that processes in comparison to activities should get more prominence in final cluster efficiency evaluation. According to the conclusions that were made after the literature analysis, processes were given the weight of 0,7 while activities and resources share equal weight of 0,15. The proportion was chosen as universal for all the clusters in different industries, so there is an assumption that it may be altered in further researches depending on the industry and the profile of the cluster. In this study it is considered to be adequate as it enables discussion for further application and development of the calculation of the final results.

Table 7. The results of multi-criteria evaluation of clusters' performance (Source: author's compilation)

Cluster	Resources	Activities	Processes	Total
A	0,07	0,18	0,16	0,15
B	0,11	0,10	0,25	0,21
C	0,04	0,13	0,05	0,06
D	0,25	0,11	0,14	0,15
E	0,16	0,11	0,10	0,11
F	0,14	0,17	0,12	0,13
G	0,24	0,19	0,17	0,18

Table7 provides the results of the multi-criteria analysis where the total weights determined the results. The study took several phases with different criteria which were provided for experts to evaluate and give the weights. Hierarchical structure was composed to limit the number of criteria which needed to be valued for experts are able to cover only a limited number of criteria (in this case, the number was limited 8-10 criteria). The later stage took literature analysis which helped to determine the weights of the main components in clusters' performance evaluation. The literature analysis has shown that the processes are the most important in clusters' performance and should be given a greater weight than recourses and activities. Hence, the resources and activities should share the equal values. The results in Table 7 can be used for further case study in deeper analysis of clusters and their performance. Benchmarking could be employed to compare the criteria and to make observations of what can be done in order to achieve better results and to create value. The study is still open and more research must be made paying attention to the different nature of clusters as they specialize in different industries and their concentration on every criterion may differ. It may be helpful for companies in clusters for comparison can identify their strengths and weaknesses and indicate the possibilities of performance improvement.

Findings

The interest in clusters is growing in the last century. Access to foreign markets, sources of foreign investments, and global knowledge networks are essential ingredients to the growth and development prospects of low and middle-income countries. These are the main issues that companies in clusters aim at. Clusters represent a complex form of organization, in which social ties (the community), productive networks of local firms, and the web of local institutions and collective agents form a co- operative and competitive density. Clusters are a characteristic phenomenon in local or regional markets, but their function is to build a competitive advantage for cluster members on a larger scale – not only national but international. Companies today experience many challenges as well as meet the opportunities because of continuing technological revolution. The aim of companies is to enhance competencies and create competitive advantages in global competition and this can be achieved through pulling from a common and accessible pool of resources, information and demand for innovation which means that companies can profit from belonging to a cluster. Cluster studies can be a useful pool of information for policy makers as well as company managers in helping companies to gain a competitive advantage and get great success in markets. Here, one of multi-criteria methods is used for the integration of indicators included into the system. SAW method is used after the system was created, including 44 indicators out of which three main groups were formed.

Results, Conclusions and Recommendations

The results suggest that knowledge sharing, innovativeness, common distribution channels, qualified human resources and initiatives may be referred to as the most important indicators of cluster performance. These main indicators are included in processes and activities. Here, processes are evaluated in exact numbers whereas activities reflect the degree of fulfilment expressed through rating. Hence, the evaluation system is suggested, which implies that processes are the most important in cluster performance evaluation, while processes and activities share the same value. Transfer of knowledge is viewed as a very important part of cluster performance and is ascribed to activities, which are difficult to measure. Hence, activities reflect the degree of fulfilment expressed through rating, which suggests more personal opinion than exact figures. As the literature analysis implies, the most important indicators are ascribed to processes for during the research the weights given for these three groups were changed and clusters which show good results with processes, stay in high positions, and while clusters which are keeping behind with processes, show even worse results in cluster performance. This system of indicators could be used in further research to detect if these three groups of indicators should be rated the same for clusters belonging to different sectors.

Abstract

This study compared targeted and non-targeted drag flick field hockey shooting techniques in the penalty corner area, using a three-dimensional kinematic analysis. Eleven male field hockey players (mean age 19,82±1,40 years) participated voluntarily. Seven high-speed cameras (Oqus 7+) with 120Hz refresh rates were used. Field calibration was completed via the wand method. The data was evaluated in two phases: starting and finishing. Players undertook three drag flick shots to the box using targeted and non-targeted techniques. The angular kinematics and stroke force applied to the stick were analyzed using the Qualisys Track Manager Program V2.12, and ball velocity statistics were gathered with the SPSS 18.0 program. To make an accurate target shot the players attempted to maximize their targeted shooting rates, particularly by decreasing the speed of their lower extremities.

Key Words: Penalty Corner, Drag Flick, Kinematic, Ball Velocity.

Introduction

Field hockey is a high-intensity sport due to its multi-dimensional nature and has quite long-standing background (Sharma et al., 2012). It requires physical fitness, psychological skills, techniques, and strategies (Anders and Myers, 2008). There are various shooting techniques used in this sport. The drag flick shooting technique examined in this study is known as the highest-scoring technique in field hockey and the mechanics of each phase of the technique is significant in terms of performance (Bari et al., 2014b). This shooting technique is the most common offensive technique in both outdoor and indoor field hockey and is preferred for goal shooting. One of the most important scoring plays is the penalty corner technique (Laird and Sutherland, 2003; Pineiro, 2008), and success depends on three main technical applications: pusher, stopper, and drag flicker (Lees, 2002). During a penalty corner, the drag flick is much more effective than the hits or pushes and is used more by male players than female players (Bari et al., 2014b). According to hockey rules (FIH 2009), there is no stipulation regarding the maximum and minimum height of the ball when the first shot at scoring a goal is a push or a drag flick (Bari et al., 2014a; Yusoff et al., 2008).

There is a need for biomechanical studies to develop well-targeted shooting techniques for drag flick shots made at the penalty corner. Most sports techniques were discovered in order to increase the performance or via trial and error in order to meet the needs of changing equipment or rules (Carr, 1997).

Biomechanical analysis is essential to find the key mechanical factors of physical performance (Gómez et al., 2012). Various biomechanical studies have been conducted on field hockey. Some researchers focused on shooting techniques (Chivers and Elliot, 1987; Kerr and Ness, 2006; Brétigny et al., 2008) and reviewed the biomechanical model of the drag flick in search of the best performance. In several studies, the kinematic data was provided about the drag flick and players of different levels (McLaughlin, 1997; Yusoff et al., 2008; López de Subijana et al., 2010).

All the angular movements of the joints must be evaluated correctly for the players to develop better performance in competitions and improve their current performance. As field hockey is a target-oriented sport, the criterion for evaluating performance is the ball reaching the goal post at the end. Ball velocity becomes significant at this point, because a high-speed ball gives a goalkeeper less time to save. Decreasing the speed of the joints is another method for targeting points the goalie will have difficulty meeting, thus increasing the goal rate.

The aim of this study was to compare the biomechanical characteristics of targeted and non-targeted drag flick shots made at the penalty corner. The secondary aim of the study was to understand the training strategies and methods.

Method

Eleven (N=11) male field hockey players (mean age \pm SD 19,82 \pm 1,40 years; mean height \pm SD 174,88 \pm 5,63 cm; mean weight \pm SD 70,10 \pm 8,01 kg) who represented Turkey's Men's National Hockey Team and Bolu Highway Hockey Club participated in this study voluntarily and were all informed about the study. No players had significant musculoskeletal injuries according to their recent medical histories. This study was approved by the Human Ethics Committee, University of Kocaeli, with the protocol code KOÜ KAEK 2015/173 and was conducted in a manner consistent with the recommendations of the declaration of Helsinki.

This study was experimental, so a 3D videography kinematic method was used for data collection.

All players had approximately 20 minutes to warm-up, including running and dynamic exercises. Players used their own sticks (91cm long and 600gm average weight) and a white, rigid field hockey ball that weighed approximately 156-163gm.

12.5cm diameter reflector markers were attached to the players' joints: olecranon on the elbows; medial styloid on the wrists; acromion on the shoulders; trochanter major on the hips; patellar lateral condyle on the knees; lateral malleolus on the ankles; and also to the stick. The hockey ball was also covered by a reflective material for tracking.

The measurements were made with Qualisys Motion Analysis System software and seven high-speed 120 Hz video cameras (Oqus 7+) were used for recording the performance of the players (Figure 1). After placing the video cameras in the field, the calibration was carried out dynamically via the wand calibration method, using a 60.3cm long T-shaped calibration stick. A Sports Radar Gun (km.h⁻¹), Astro Products, CA was used to measure the velocity of the ball.

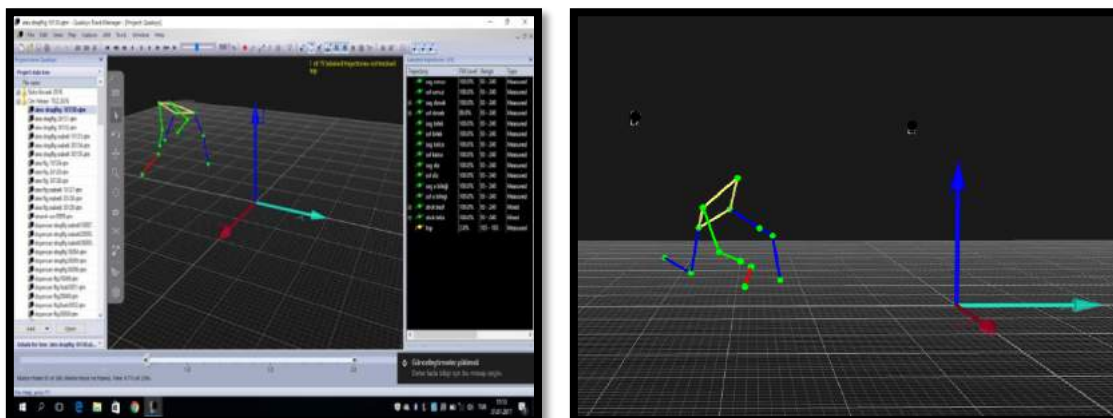

Figure 1. A capture from Qualisys Track Manager software.

The players performed six drag flick shots at a distance of 9.15m from the goal post. Three were targeted (at a 40x40 cm size, iron-framed panel attached in the middle of the crossbar) and three were non-targeted. Kinematic data figures obtained in the study used the moment when the left, supporting foot stepped on the ground as the starting phase and the moment the ball left the stick as the finishing phase. The hockey stick angles were taken on a YZ plane and the force variable was calculated with the formula $F=m \times a$ (force applied to the stick = weight of the stick \times the acceleration of the stick at the finish).

Statistical Analysis

The descriptive statistics of the anthropometric parameters and the angular kinematic parameters were obtained by using SPSS 18.0 (SPSS Inc., Chicago, IL, USA) software program. The comparison between the targeted and non-targeted shots of the drag flick shooting techniques, t-test was applied. Besides, at the identification of the relation between the angular kinematic parameters and both the force applied on the stick and the ball velocity; Pearson Correlation test was applied on the data. The significance level was accepted as $p \leq 0.05$.

Findings

The kinematic figures derived from the 3D motion analysis of the players and the statistical definitions and comparisons of these figures, the results of the shooting force to the stick, and the ball velocity are presented as tables.

Table 1. Comparison of the angular kinematic values in the starting and finishing phases of the non-targeted and targeted drag flick shots (t test)

	Non-Targeted Drag Flick - Targeted Drag Flick		t	p
	Mean±SD	Mean±SD		
Starting				
Right Shoulder				
Angular Velocity (°/s)	-238,22±145,97	-104,74±231,48	-3,300	,003*
Right Hip				
Angular Acceleration (°/s ²)	5155,49±3273,36	1238,64±5990,57	3,492	,002*
Left Knee				
Angular Velocity (°/s)	-240,38±213,26	-159,2±263,91	-2,090	,047*
Finishing				
Rihgt Hip				
Angular Acceleration (°/s ²)	-809,97±4489,09	-3014,65±3810,88	2,421	,024*

* $p \leq 0.05$

When Table 1 was examined, the verifications were: a negative decrease rate of %55 in the mean angular velocity of the right shoulder at the starting phase of the drag flick shots of the players (non-targeted shot: $-238,22 \pm 145,97$ %/s; targeted shot: $-104,74 \pm 231,48$ %/s) and a %34 decrease in the mean angular velocity of the left knee (non-targeted shot: $-238,22 \pm 145,97$ %/s; targeted shot: $-104,74 \pm 231,48$ %/s) and a positive decrease rate of %76 in the mean angular acceleration of the right hip (non-targeted shot: $5155,49 \pm 3273,36$ %/s²; targeted shot: $1238,64 \pm 5990,57$ %/s²). There were statistically significant differences found in the results ($p \leq 0.05$). As for the finishing phase of the drag flick shots, a negative increase at the mean angular acceleration of the right hip and a statistically meaningful difference were found.

Table 2. Ball velocity figures measured by radar regarding the non-targeted and targeted drag flick shots

Ball Velocity	Non-Targeted Drag Flick - Targeted Drag Flick							
	Min-Max	X	SD	Min-Max	X	SD	z	p
km.h ⁻¹	11-58	41,12	12,87	10-51	35,91	13,68	-2,606 ^a	,009*
m.s ^{-1**}	3,06-16,11	11,42	3,58	2,78-14,17	9,97	3,80		

* $p \leq 0.05$

When Table 2 was examined, a %13 decrease was identified between the means of non-targeted (mean \pm SD $11,42 \pm 3,58$ m.s⁻¹) and targeted (mean \pm SD $9,97 \pm 3,80$ m.s⁻¹) drag flick shots in the ball velocity data. There was a statistically significant difference ($p \leq 0.05$).

Table 3. Comparison of the force applied on the stick at non-targeted and targeted drag flick shots

Force Applied on the Stick (N)	Non-Targeted Drag Flick - Targeted Drag Flick					
	X	SD	X	SD	z	p
	135,56	123,32	131,64	107,34	-1,193 ^a	,233

* $p \leq 0.05$

When Table 3 was examined, there was no statistically significant difference found in the force applied to the stick between the mean of the targeted and non-targeted drag flick shots ($p > 0.05$).

At the review of the correlation results in the study, a meaningful relationship was found between some of the variants at the angular kinematics and the ball velocity values. Accordingly, the ball velocity was affected by the angular velocity of the right elbow ($r = ,445$) and the left hip ($r = ,449$) and the angular acceleration of the right hip ($r = -,452$) and the trunk ($r = -,506$) at the starting phase of the players' non-targeted drag flick shots. During the finishing phase, the angular acceleration of the right hip ($r = ,399$), the left hip ($r = ,399$), and the trunk angle ($r = ,404$) affected the ball velocity ($p \leq 0.05$). During the starting phase of targeted drag flick shots, the angular velocity of the right hip ($r = ,401$) and the trunk angle ($r = ,485$) were found to affect the ball velocity ($p \leq 0.05$). No relationship was found between the ball velocity values and the other angular kinematics at the starting and finishing phases of the non-targeted and targeted drag flick shots ($p \leq 0.05$).

Furthermore, a meaningful relationship was found between some variations of the angular kinematics and the force applied to the stick. Accordingly, the kinematics affecting the force applied to the stick at the starting phase of non-targeted drag flick shots were: the angles of the right shoulder ($r = ,415$), the right hip ($r = -,427$), the stick (YZ) ($r = ,556$), the angular velocity of the right knee ($r = ,381$), the left knee ($r = ,499$), the right shoulder ($r = -,403$), the angular acceleration of the right elbow ($r = ,418$) and the stick (YZ) ($r = -,393$). As for the finishing phase, the angles of the right shoulder ($r = ,455$), the left knee ($r = ,387$) and the left hip ($r = -,376$), the angular acceleration of the right shoulder ($r = -,392$), and the angular velocity of the trunk ($r = ,390$) and the stick (YZ) ($r = ,495$) were verified as affecting the force on the stick ($p \leq 0.05$). As with the targeted drag flick shots, the force on the stick was affected by the left knee ($r = ,521$), the right hip ($r = -,557$) and stick (YZ) ($r = ,566$) angles, the right knee ($r = ,694$), the right shoulder ($r = -,515$) and the trunk ($r = -,436$) angular acceleration, the left hip ($r = ,474$), the left

knee ($r=,746$) and the trunk ($r=-,571$) angular velocity during the starting phase. At the finishing phase it was affected by the right shoulder ($r=,680$), the left hip ($r=,460$) and right knee ($r=,603$) angles, the right knee ($r=-,714$) and trunk ($r=-,434$) angular acceleration, and the left hip ($r=-,455$) and stick (YZ) ($r=,724$) angular velocity ($p\leq 0.05$). No relation was identified between the force applied to the stick and the other angular kinematics at the starting and finishing phases of the non-targeted and targeted drag flick shots ($p\leq 0.05$).

Discussion

The purpose of this study was to compare the kinetic (force on the stick) and kinematic (angle, angular velocity, angular acceleration, and ball velocity) variations of targeted and non-targeted shots performed by elite hockey players, using 3D kinematic analysis of the field hockey drag flick shooting technique. A significant difference was found between the ball velocity of the non-targeted drag flick shots ($11,42 \text{ m}\cdot\text{s}^{-1}$) and the targeted drag flick shots ($9,97 \text{ m}\cdot\text{s}^{-1}$) ($p\leq 0.05$). A significant %13 decrease in ball velocity was observed during targeted drag flick shots ($p\leq 0.05$), and this decrease increased the target rates.

In McLaughlin's 1997 study, he compared the values of fourteen male field hockey players to the values achieved by Australian field hockey national team member Greg Corbett. During the drag flick shot, the mean ball velocity ($19.1 \pm 1.84 \text{ m/s}$) when released from the stick surface is $15.2\text{-}21.8 \text{ m/s}$, while Corbett exhibited a ball velocity of 21.9 m/s at release. It was observed that, as the ball velocity decreased, the angular velocity of the shoulder increased and that of the hip decreased. The angular velocity of the hip and the shoulder affected the ball velocity.

Baker et al. (2009) measured the ball velocity values by radar and found ball velocity was $30.5 \text{ m}\cdot\text{s}^{-1}$. Hussain et al. (2012) found ball velocity values during the drag flick shots of $31.85\pm 0.86 \text{ m/s}$ for college-level players and $30.99\pm 4.33 \text{ m/s}$ for those playing at the state level. There was no significant difference between the two groups ($p>0.05$). It was suggested that these insignificant ball velocity differences between the groups resulted from the increasing movement of the shoulder compared to the hip during oscillation. In a different study, Hussain et al. (2011) found that the ball velocity of players assessed in a body position of 45° and 90° during the execution of penalty shots on the upper right and left corners and in the right and left corner areas was between $25.42 \text{ m}\cdot\text{s}^{-1}$ – $33.57 \text{ m}\cdot\text{s}^{-1}$. Different levels of training affected the ball velocity.

Even though some researchers state there is no significant difference between successful and unsuccessful drag flick shots (Bari et al., 2014b), the study results suggested that the highest ball velocity ever reached made an important contribution to "scoring a goal" (Bari et al., 2014a). More velocity results in less time for the goalkeeper to save.

The conclusions of the study reported meaningful differences between targeted and non-targeted ball velocity values, and decreases in the ball velocity resulting in an increased target rate, reflecting the results of our own study (Karadenizli, 2006). In Satti's 2004 study, conducted via kinematic analysis of targeted and non-targeted shots in basketball, air resistance and ball rotation had a slight effect and the angle and the velocity had to be in an appropriate combination vertically and horizontally (Gürol and Yılmaz, 2016). Ratko et al. (2006) found that the angle of the elbow movement is important for targeted and non-targeted shots. Miller and Barlett's 1996 demonstrated that the elbow extensors significantly contributed to ball velocity during the shot (Gürol and Yılmaz, 2016). Speed and accuracy are inversely correlated according to Fitt's Law; the faster the ball moves, the less accurate the shots are. Another factor affecting accuracy is the difficulty of the shot. In other words, the smaller an area the well-defended target has, the longer a distance it has. Thus, it can be concluded that speed and accuracy do not correlate and other strategies may be required while carrying out the motor tasks. Furthermore, as the target width decreases the necessary time for the motion increases (Karadenizli et al., 2014).

Jennings et al. (2010) reviewed the forces between the stick, the ball on the stick, and the position of the ball. It was verified that the normal force between the ball and the stick decreased while the ball was moving towards the stick head during the shots. During a drag flick shot, the force applied and the position of the ball was significant in controlling the drag flick shot.

According to our evaluation results, there were significant differences between the angular velocity of the right shoulder, the left knee, and the right hip at the starting phase of targeted and non-targeted shots. At the finishing phase, this difference was only present in the angular acceleration of the right hip ($p < 0.05$).

Although significant differences were not encountered in the value of the left knee angle (non-targeted: 145° ; targeted: 144°), the right knee angle (non-targeted: 116° ; targeted: 114°) at the starting phase of the drag flick shots and at the finishing phase ($p > 0.05$) showed similarities with those of Chivers and Elliott (1987) (150°) and López de Subijana et al. (2010) (male group: 156° - 114°). Thus, the players moved with similar knee joint angles during the drag flicks.

Ibrahim et al. (2017) found that body axial rotation and lateral rotation towards the target, right wrist flexion, and left wrist extension are the main contributors to the speed of the stick head. They advised coaches to emphasize trunk rotations and wrist flexion and extension movements to maximizing stick head speed.

Initially, there is a backward oscillation of the arm during the low shots. During this oscillation, the shoulder rotates externally with abduction, in a position of humerus level with the shoulder. The flexor and internal rotator muscles that stretch during this movement pull the humerus down towards the front of the body. To perform an ideal drag flick shot from this body position, the players in our study demonstrated a decrease in angular velocity at %55 in their right shoulder flexors at the start of the drag flick shot and a decrease in the angular velocity at %34 in the left knee while making a knee flexion in addition to external rotation at the flexion position ($p \leq 0.05$). At the start of the drag flick shot, a decrease of %76 at their angular acceleration of the right hip and an increase at the angular acceleration of the left hip was reported for the finishing phase ($p \leq 0.05$). Consequently, an effective and targeted drag flick shot required a decrease in the angular acceleration of the right hip by placing it in an external rotation position as horizontal as possible at the start of the low shot. At the finish, there was a need for increased angular acceleration via the hip rotation and placing the left foot in a position vertical to the shooting line.

Recommendations

By incorporating more target-oriented exercises in their training and repeating them frequently, coaches will be able to prevent their players' speeds decreasing during targeted shots. This will increase the players' skills and improve performance during high-accuracy shots. Furthermore, identification of the shooting dynamic variances and discovery of the key kinematic elements affecting the shooting dynamics contributes a great deal to sports scientists and coaches in terms of comprehending shooting dynamics.

Conclusion

In order to execute accurately-targeted shots during the application of the drag flick shooting technique, the players in this study tried to maximize their performance by decreasing their speed both in their lower extremities and in their ball velocity.

Art and Creativity as a Chance in The Perspective of Developing The Principles of Education

Liutauras DEGESYS

Prof., Lithuanian University of Educational Sciences, Faculty of Educational Sciences, Department of Educational Sciences

Email: liutaurasd@gmail.com

Abstract

The aim of this paper is to look at the problem of possibility to implement the art and creativity into the teaching curriculum as the chance to develop the principles of education. In this paper an attempt is made to work out the methodology for comparative analysis of principles of education. The basic hypothesis is that the art may be successfully implemented into the school curriculum seeking at least three base targets of education: 1. Art may foster a culture of self-education giving knowledge and understanding of diverse societies. 2. Art may develop skills of inquiry, approach and participation advancing questioning and understanding and empathy. 3. Art would help in developing and verifying attitudes. The art is the search for meaning that consists of uncovering or creating connections and relationships of various kinds. That is why the art and creativity may be concerned as a call for attention to underlying beliefs, attitudes and values enables individuals to examine the foundations upon their views rest and develop the stronger sense of themselves as the persons. The art and creativity in education may be treated as a personal inquiry that is based on permanent questioning of assumptions and self-correction. That makes an art a strategy, protecting from lapsing into the dogmatism and enabling people to respond positively to the opportunities and challenges of the rapidly changing world. And finally, the art may serve as a toolkit developing the skills of good questioning and helping to avoid the indoctrination and ideological impact. Art may help in developing skills of participation and responsible action. We have not underestimate the role of art in social changes and integration of cultures as the challenge to active and responsible participation: the art while proposing linguistic and non-linguistic activities, such as drawing, drama, happenings, games, simulations and so on, may help students to learn from the very beginning self-confidence and socially and morally responsible behavior. As far as the art provokes questions, these questions may lead to inquiry and gives us the possibility to communicate, to discuss, to meditate, to think, to reflect upon what we do and who we are and where are we going. That is why the art may enable us to elaborate questioning, analyze and criticize the concepts that are taken for granted.

Keywords: Art, creativity, development, principles of education.

Introduction

In the classical situation of education where there is one educator and others are learners, there is a prevailing passive attitude of observance. One can easily imagine a certain state of expectancy, as the learner passively lets him/herself “be taught, educated”. He/she transfers all the competences of the subject to the “real” educator, a kind of demiurge, organizer or planner. This passive state does not require any subjectivity, responsibility, or initiative. In the classical conception of the education process the responsibility is simply passed on to the one who takes it in order to get out of the learner an expected social product. In the classical conception of the education there seems to be no question about the *personalization* of the education process: in the objective process of objective knowledge transference knowledge is considered a thing to be transmitted from a material collection of knowledge pieces into the no less material head of the learner who is ready to receive it.

Then knowledge, if detached from the reality as a process, produces a set of theories of teaching and learning, with their sets of formalized and finite knowledge, and recipes (methods) for transmission, theories that are absolutely detached from the real social life and its needs. Such metaphysical material thinking makes the *education process a special activity detached from the reality.*

Speaking about the modern education we should stress the resemblance of dialogical nature of inquiry and dialogical nature of Art. Any modern theory of education is the scientific inquiry and as such as much as the art itself is the search for meaning that consists of uncovering or creating connections and relationships of various kinds. The education theories should look for underlying beliefs, attitudes and values of individuals to examine the foundations upon their views rest and develop the stronger sense of themselves as the persons. Any

educational theory should be treated as a strategy, protecting from lapsing into the dogmatism and enabling people to respond positively to the opportunities and challenges of the rapidly changing world.

The same with art: it may be a toolkit developing the skills of good questioning and helping students to avoid the political indoctrination and ideological impact.

Competencies of the modern education and the role of art

The principles and standards of so called objective or traditional pedagogy are determined by the theoretical preconditions of scientific thinking that emerge from the theoretical reconstruction of the reality by exact sciences. If reality exists irrespective of our analysis and of ourselves then scrutinizing and analyzing “scientific” glance does not change the reality at the time of investigation and we may see the reality “as it really is”. This enables us to look at the reality “objectively” – free of any interest or subjectivity. When a scientist seeks for the truth he eliminates himself as a subject from the process of cognition in favour of objective attitude, the objective truth, in favour of the possibility to see the world what it really is rather what it looks like to him. The principle of “eliminating” the subject may also result from the standard (metaphysical, mechanical) construction of a cognitive subject-object opposition when the subject as though stood in front of an objectively, “naturally” existing reality and because of this position the subject seeks to get the objective knowledge of the reality that opposes him. Quite opposite is in the case of reflecting the piece of art: it is impossible to create such a mental construction of “self-renunciation” or desubjectifying the subject. The *traditional concept of education* is based on the idea of the classical disjunction between the subject and object of learning understood as teaching or educating. “Here, on the one hand there are “educators” who are the subjects or actors, or “those who” organize the process by setting goals, select the tools, and take the responsibilities for the results; on the other, there are the learners or objects – things, or “those to whom” the process is meant as receivers, that is those who within a given frame or education model are modeled, formed and changed (they are taught). The implications of this disjunction of subject and object of the learning process as applied in this education model are such that the subject (“agent”, “actor”) is the teacher, the learner therefore becoming an object” (Baranova, Degeysys, 2015). In the case of reflecting the piece of art the processes are declared to be the greatest and independent value and the goals of human activity are the activity and the process itself, but not the results. The reflecting of the art leaves the rooms for creativity or originality, but this is not all. What is even more, implementing of the art in the school curriculum implies the demand of individuality, subjectivity and personal commitment for the results and sense of education.

In the classical education, the knowledge is treated as the sufficient amount of information about reality with a purpose to change and transform this reality. Knowledge is understood as a tool or as a tool-kit for operating on reality; knowledge was considered to give the beholder a power to react to reality and get the desirable results. Thus, the extracting, categorization, storage and transmission of knowledge became the main worries of education. This means that as an object of the process, the learner is, a mere passive and indifferent element with no responsibility for the process of education. The implementing of art may turn him into a subject, an active manager of process of education that is responsible for everything.

Modern education is inevitably based on the *competence for independent thinking*. So, does the art. Self-correction and self-education need an ability to decide independently, the ability to test their own theories and verify assumptions, falsify own attitudes and ideas. This is the reason why in the teaching and learning process a specially introduced, visible, controlled and intentional *distance* is so important: the same as in the process of reflection of the piece of art. The process of education and the process of reflecting of the art needs and offers the possibility of continual reflection of the situation under analysis with the introduction of a constant complimentary point of meta-analysis, when one not only observes and discusses what and how it is going on, but also raises the question about the meaning of this specific situation, and about the meaning of the analysis of this question, about the effectiveness of the methods and methodologies used.

As much as the education the reflection of art supposes the idea of the creativity and inevitable presence of the principles of dialog, interactivity and communication. Uniqueness of the art may help students to get the unique experience.

The art in the school curriculum:

1. Gives the sense of identity through knowledge and understanding of the spiritual, moral, social and cultural heritages of diverse societies.
2. Gives the knowledge and understanding necessary for the interpreting of local, national, European, commonwealth and global dimensions of students' lives.
3. Reflects the enduring values that contribute to the social justice, respecting differences and human rights.
4. Challenges stereotypical images of other places and cultures.
5. Develops skills that will help students to combat prejudices and prejudgements.

Of a great importance in modern education are "unpractical", meta-practical, theoretical, especially meta-theoretical disciplines, that provide not only with specific, "pedagogical" knowledge, but also turn the subject of learning towards itself, disciplines that teach not only knowledge, but teach the ways of acquiring new knowledge, teach, how to learn discipline and how to teach oneself. "Whatever the theory, it must be one based on the concept of self-possession, it has to consist of a self-development principle and as any theory, and it has to contain methods, a methodology, an organizational structure, criteria and principles of analysis of their effectiveness, all of which should match this original principle of self-education" (Degesys, L., 2011).

If we are interested in social changes and integration of cultures the art may act as the challenge to active and responsible participation:

1. Implementing of the art in the school curriculum may help to conceive of students as active actors and make their experience of learning very personal and active.
2. The art while *proposing linguistic and non-linguistic activities*, such as drawing, drama, happenings, games, simulations and so on, may help students to learn from the very beginning self-confidence and socially and morally responsible behavior.
3. The art may enable students to elaborate questioning, analyze and criticize the concepts that are taken for granted.
4. The art provokes questions, the questions lead to inquiry and gives us the possibility to communicate, to discuss, to meditate, to think, to reflect upon what we do and who we are and where are we going..

The art enables every student to get the meaning of his personal experience, which is so often underestimated in the teaching process because it is considered insignificant as it is subjective, disorganized and not systematic (Dewey, 1973). It is necessary to declare that a person is precisely the one who possesses himself, he/she is the **subject** (will, intellect and soul) who sets his/her own goals, chooses the means, decides, rules, and commands. And at the same he/she is also the **object** (body, thing, person) whom he rules, directs, encourages, and the one he can possess of with absolute autonomy. There is a need for a **competence for life-long-learning**. *The self-teaching actor should be ready to learn from experience, should be ready to learn all the time and assume that learning is a never-ending process*. Therefore, he/she is the one, **who** educates and changes and perfects himself/herself, as well as the one **whom** he/she can change, perfect and educate. Evidently, these assumptions presuppose permanent, inevitable reflection and a meta-relationship with oneself. When reflecting, the individual observes him/herself as the object under analysis and then he/she determines what he/she could and would like to do with him/herself and by him/herself. So, anybody may be a person, giving the examples of different experiments of living, having different opinions and even proving practically by his life and his works that it is worth to be individual. The education as much as the art may teach that people should not copy each other, they should be different and original and thus the examples of originality should be given by themselves (Degesys L., 2011, p.52-53). The process of education itself should be revealed and explained by the very principles of social communication: as the process of permanent interpretation and re-interpretation of social reality, the reflection of what is going on and assessment of changes that should be relevant to the changeable

social reality. Thus, in the process of education the teaching and learning transforms into self-teaching and meta-learning. The process of education should be analyzed as a whole set of very effective and modern methods and principles of education,

such as the methods of mental experiment, self-analysis and self-reflection, logical alternative calculation, logical analysis and critical thinking and should be based on such thinking and ethical strategies as empathy, decentering from the self and moral imagination. „The self-learning teacher should know how to teach himself and apart the professional competencies he needs very general competencies – **competences of critical thinking**“ (Degeys, L., 2011, p.52). It becomes very important to develop the possibility to raise questions and doubts, and not the necessity to find and provide univocal answers. This possibility can be realized through a meta-relationship - one’s own relationship with oneself and with others. Evidently, these assumptions presuppose permanent, inevitable reflection and a meta-relationship with oneself. When reflecting, the individual observes him/herself as the object under analysis and then he/she determines what he/she could and would like to do with him/herself and by him/herself.

If we agree that life is a permanent construction and re-construction, programming and re-programming, then deconstruction is a method of vision and interpretation the world, as well as a way of living. It always implies a certain re-construction with the two meanings of this concept: the re-creation of constructions based on reality and the application of these constructions to the recycling of reality, based on the principles of reality. In the contact with culture and art the individual constantly finds him/herself in situations of uncertainty, where rationality may not help, because in the cultural context most processes cannot be just simply foreseen, planned and rationalized. “(Degeys, L., 2005). No one may be prepared to the future problems only by the knowledge, just because it is impossible to know future knowledge. Unpredictability of the future - together with the unpredictability of the past -needs the competence for tolerance to unpredictability. This **tolerance to unpredictability** or the **competence** of this kind of tolerance is the ability to act and to fit in unexpected circumstances and unforeseen coincidence.

Looking to the Greek ideal of a person we may find those: Latin - individuum or Greek athomos - undividable, unique, original - that concepts based on the principle of self-development. The principle of any member of any society may be: **Educate Yourself**. Develop your individuality and you will diversify, furnish, strengthen all the society. Individuality and originality of the member of society is valuable to himself but it is valuable to the society. It is said that public opinion rules the world. But there is very dangerous power of the "right majority" that is based on the public opinion or pretends to represent this opinion as the only right. When public opinion become a dominant power in the society it is dangerous to the freedom and even more dangerous than eccentricity of the member. The art may teach us to be eccentric – that means to be not at the center, to be aside of the collective mediocrity, of public opinion, of the “right majority”.

The main dangers of education and some chances to escape

The development and change of the society is based on the recognition of freedom. The **danger comes from the unification and assimilation** (Mill. J.S). People in the contemporary society get the same things - the same ideas, they read the same things, watch the same television programmes, go to the same places to watch the same bars, romes, paris. They get the same truths and eat the same things. Even the democracy proposes the same rights and liberties. The same education principles unify them. Thanks to the global trading, business and manufacture they get and consume the same products. Thanks to the mass media they consume the same ideas and are obsessed by the same standards of living and making love. The only different experiences may produce the cultural growth. Only the different narratives, different paradigms of thinking may produce the new European identity. We as members of European society can find our place only as an original and different thinkers and if only assume that the richness of Europe is in differences, in pluralism, in the possibility to exchange the different experiences - even if they seem unsuitable, and eccentric.

The traditions and customs, the laws and moral principles are the reflections of the experience of the reality. The experience has taught us the right modes of living and right interpretations. But an experience may be unsuitable if there is no reality this experience was based on. Traditional way of living, thinking and writing

may be correct but based on the experience of the vanished reality so unsuitable to the present reality. The mental and moral exercises may train our spiritual forces like the muscular powers may be only trained by the everyday physical exercises. All the members of society have a power not only train the beliefs, skills of critical thinking, change the attitudes of "traditional thinking and living", but train the desires, feelings and emotions - showing the practical prove of the worth of sensual life. Any member of society may prove it by the experiment of his personal life and show to the others that this model of life as an experiment fits to try it. Or - show the nonsense of the quite opposite experiment - the experiment of non-doing that leads to the crucial results.

Unification of opinion, the opinion of majority is the real danger for any society and its individuals. The mankind is imperfect and this imperfection is very useful. There is no absolute truth, all the truths are half-truths, at least because of permanent change of reality (Mill. J.S). Even if you have gotten some eternal truth via some mystical way - this truth inevitably becomes not true, because the reality changes permanently. After this change becomes obvious that your real truth speaks about non-existent reality, reality that has changed, moved and vanished. So, all the truths are imperfect, because reality is not finished. That's why we should have different opinions about reality, do not pretending to have final, absolute truth. How much resistant against the pressure of society is the member of society. How much disobedience should have somebody to be a member of this society and at the same time not become a frog. A society gives him these froggy kisses during and via the education, during the supervising care of society institutions such as school, family and government. The liberty of individual is limited by common sense and the standards of social progress. Any society kissing every member by the concepts of "true, real life and real truth", asking him to be a "true member", "a citizen", pretends to make him a frog. And afterwards – any member who became a frog, starts to kiss other members pretending to make them the same or at least – similar – frogs, teaching "the real truths and proposing their own models of "real lives".

Results, Conclusions and Recommendations

Any modern theory of education is the scientific inquiry and as such as much as the art itself is the search for meaning that consists of uncovering or creating connections and relationships of various kinds. The implementing of the art in the school curriculum may help students to reflect the enduring values that contribute to the social justice, respecting differences and human rights. The art may challenge stereotypical images of other places and cultures and develop the skills that will help students to combat prejudices and prejudgements. The art shows the student a need to get the meaning of his personal experience, which is so often underestimated in the teaching process because it is considered insignificant as it is subjective, disorganized and not systematic. It helps to conceive of students as active actors and make their experience of learning very personal and active. The art provokes questions, the questions lead to inquiry and gives us the possibility to communicate, to discuss, to meditate, to think, to reflect upon the social reality. The art while proposing linguistic and non-linguistic activities, such as drawing, drama, happenings, games, simulations and so on, may help students to learn from the very beginning self-confidence and socially and morally responsible behavior. It shows a need in the general and non-specific competencies such as: competence for independent and critical thinking, competence for life-long-learning, the competence for tolerance to unpredictability. The art may enable students to elaborate questioning, analyze and criticize the concepts that are taken for granted. The art may forewarn us against the dangers of classical education such as unification of opinion, the danger of "opinion of the right majority" and assimilation of the culture. The implementation of the art into the school curriculum may help to develop and introduce the modern principles of education.

Abstract

Globalization process, effects of demographic changes and changes in workforce markets have caused compulsory education and formal education to fall short of meeting the need for training qualified workforce required by the economy in recent years. This situation has brought about the need for diversifying post-compulsory educational policies and services and lifelong education has started to become widespread via being supported as a social policy tool. While, on the one hand, thanks to life-long education, alternative works are carried out for those who have a disadvantageous position in the involvement in the compulsory education process or those who have a negative educational background, on the other hand, works are done to have people acquire professional qualities and skills. To achieve social integration and economic growth, the coverage of life-long education programs can be versatile ranging from basic education based on read-and-write, professional education, general education, general culture education to trainings developed with the aim of evaluating free times. Women's low education levels and low participation rates in the workforce as an employee and employer have led to an increase in the number of programs aiming at women in these trainings. In the education process, various programs have been developed especially for women who could not complete their educations for various reasons or for those whose educations do not fit the requirements of the day. The purpose of this study is to examine the role and importance of local governments by examining non-formal education programs for women in the case of Bursa.

Keywords: Woman Education, Life-Long Education

Introduction

Globalization process, effects of demographic changes and change in labour markets have caused to fail recent compulsory and formal education providing qualified labour the economy needs. This situation revealed to need for diversification of education, policy and services after compulsory education. Life-long education as a social policy tool began to be popularized by supported. On the one hand with life-long education, alternative works are performed for ones who have over a barrel on joining compulsory education or ones who have negative educational history, on the other hand works to gain professional qualifications and skills are performed. Equality between individuals is the most important goal that governments provide to their citizens as the indication of contemporaneity. But individuals who need to have same rights can have disadvantages either there are obstacles to access their rights or obstructive elements of accessing or using their rights. Mayer explained disadvantageousness notion that concentrated on the thought 'being obstructed from self-sufficient tools' and classified as obstacles that individuals face, absence of resources, inaccessibility of resources, social perspective, goverment policies, corporate applications, in-group conditions (Yıldırım, 2011, 5).

In other words, classification of individuals' self-sufficiency with various reasons. United Nations Development Program explained the reasons of general obstacles caused disadvantageousness as economical obstacles, insufficient social services, legal and institutional discrimination, insufficient support for alternative tools, limited communication, lack of consciousness or insensitivity for specific needs, lack of trust in goverment agencies, lack of physical access (UNDP, 2005, 156).

In the other words, disadvantageousness directly relates to obstacles in front of tools providing individuals' self-sufficiency and every disadvantageous group or person cannot reach tools like health, knowledge, employment, education, capital, self-confidence and social support. Prejudices, discrimination, opportunity inequality, gender inequality and exclusions caused by individual and social attitude besides, applied government policies, the failure of equal opportunities by government, poverty and difficulties in accessing resources etc. create social obstacles. Groups with social and individual disadvantages have fewer opportunities to access resources such as education, health, employment, social and financial resources, professional careers (Yıldırım, 2011, 8).

Among the disadvantaged groups, women are one of the largest groups. Women can fall into disadvantaged positions from a wide variety of angles, and in some cases they can have multiple disadvantages. These disadvantages of women who have serious disadvantages in important areas of life, such as education, health and employment, are usually caused by social point of view, discrimination, lack of state policies, deficiency or nonexistence.

The lack of sustainable programs and policies for women, not supporting to participate in decision-making processes, the low level of participation in the labour market, the exposure to violence and discrimination are the most important problems in contemporary life. This situation plays an important role in the disadvantaged situation of women in contemporary life. As a matter of fact, the rights given in many countries at the legal level do not really make any sense. In this context, it is stated that education is still a problem as in many other regions of the world, women are less benefited from education opportunities than men, and social gender-based inequalities are going on (Turkish Republic Prime Ministry Directorate General on the Status of Women, 2008, 5). Thus traditional life style that protects its existence from urban centers to rural areas, from west to east and gender inequalities continue to constitute an obstacle to access to educational services about women's access to educational services also in Turkey. Women are not in a position to decide on benefiting from educational services, especially in rural areas and slum areas, due to the low social status and lack of economic independence. As a result, women face many obstacles in terms of education, health and employment due to reasons such as social point of view, inequalities in opportunities, discriminatory attitudes and inadequacy of government policies, which cause women to continue their disadvantaged positions in social life.

Life-long Learning Policy

Formal education is carried out by the Ministry of National Education in Turkey as it is in all countries. But life-long education is provided not only by all possible official and private institutions and organizations together with the Ministry of National Education but also non-governmental organizations to participate in the education. However, all non-formal education activities have to comply with the general objectives and basic principles of national education under the supervision of the Ministry of National Education (Article 17 of National Education Basic Law No. 1739) (Yıldırım, 1996, 57). On the other hand, the Ministry of National Education published the life-long learning strategy document in 2009 (Ministry of National Education, 2009). The document mainly sets out national priorities and duties and responsibilities for all stakeholders. In order to ensure coordination at the national level by the end of 2010, a steering committee composed of the related parties was established and its priorities were determined.

Causes Requiring Life-long Education

The rapid change created by the developments in the world in today's conditions is not able to adapt to changing labour market conditions with existing information as new demands arise. On the other hand, widespread education is needed to meet the needs of those who have left the formal education for a variety of reasons, those who did not have a vocational or artistic education in their education process, and those who have life-long learning desires. As a matter of fact, while the structure of the professions has changed over time, some professions have lost their validity and new professions have emerged. This situation causes insufficient knowledge and skills. It is possible to reduce unemployment, increase efficiency and productivity by means of

non-formal education by acquiring the professional knowledge and skills required by the labour market. In this way:

- * Reducing unemployment,
- * To make individuals have job and profession,
- * Developing and evaluating human power,
- * To complete the basic knowledge acquired through school education,
- * To develop cultural and artistic skills,
- * Helping the unemployed or employees that work on unwilling job to earn income-generating and wealth-enhancing skills is among the main economic reasons for life-long education (Bahat,2013,18). Supporting the adaptation of individuals to the development and change of the communities they live in should be among the main objectives of life-long education. The turmoil, loneliness, incompatibility, gap between generations, migrations created by social change cause social policy makers to give more importance to the planning and implementation of life-long education. Providing social harmony within the society through education is also among the targets (Bahat,2013,20). In this way:

- * To gain consciousness of collective life, helping each other, cooperative working and to adopt habits,
- * To reduce the problem of social cohesion caused by internal and external migration,
- * Protecting public health, family planning, consumer education, environment, maternal education, religious culture and morality increasing social welfare by providing productive assessment of current time is among the main social reasons of life-long education.

From another point of view, it plays an active role on learning people's literacy with life-long education, completing the integration in the cultural dimension within society, participating in artistic events to evaluate leisure time, learning the educational technology and techniques that will lead them to knowledge and manpower resources in changing conditions.

Social Policy Notion

The main objective of social policies is to provide prosperity and peace together in society (Serdar,2017,1). The most general approach in the literature is that social policy covers all social problems(Ersöz, 2006, 2). This basic approach to change causes social policies to deal with the problems of special groups outside the working relationship, on the one hand, by solving social problems existing in the society, by increasing the welfare level of the people by trying to prevent new problems and by turning to all sectors of the society. These groups are women, children with disabilities, the elderly, the poor, the unemployed, immigrants and other disadvantaged groups and policies directed at them. Especially in the recent period, social policy has become an field where all classes in need of social support in society deal with problems such as education, health, security, tax, justice, employment and claiming to produce solutions. The effective role of determining and implementing social policies belongs to the government. The state is regulating this role by producing policies in all matters covered by social policy, preparing legislation and acting on related institutions and organizations (Koyunoglu, 2002: 20).

Social Policy Practices and Lifelong Education

In the implementation of social policies, central and local administrations as well as voluntary organizations, foundations, associations, trade unions and social partnerships are involved in the private sector. As the state determines the changes that must be made nationwide for the identification and implementation of social policies, the responsibility of providing social policies is increasingly being applied by central government and democratic institutions (Ersöz, 2006, 2). In this context, local governments have also been active in recent years. The local governments provide various exhibitions, demonstrations, fairs, panels, seminars, meetings and conferences, in-service and vocational qualification training, which are organized as a whole between adult education services provided by provincial special administrations, local municipalities, development agencies,

NGOs and neighborhood mukhtar activities and these activities are seen mainly in practices regulated by local governments (Toprak-Erdoğan, 2012, 86; Köksal,2017,35).

Local Governments as Social Policy Practitioners

Local governments are organizations that are part of the public administration and are responsible for fulfilling the local (regional) quality of services that can be benefited by the people living within the local borders (Ersöz, 2004, 51, Kaya, 2006, 3). It is important that local governments, whose aim is to meet the common needs at the local level, fulfill these needs in accordance with the wishes and expectations of the people and the benefit of society. As a matter of fact, this situation is expressed in the Municipal Law No. 5393 (Article 3) as "Represents a public legal entity with administrative and financial autonomy, established to meet the local collective needs of local residents and elected by the decision-making body of voters." The Municipal Law No. 5393, which was enacted on 03.07.2005 within the framework of the social state principle, which the 1982 Constitution regards as the basic qualifications of the state, has become one of the basic principles of local municipalities. Thus, long-term policies such as education and health are required by the central government, while services such as food, clothing, housing, as well as support for addressing the short-term needs that need to be met quickly are given to the responsibility of local governments (Beki, 2009, 1-2). In this context, local administrations have been given responsibility for solving social problems besides other activities (Toprak and Şata, 2009,15). If a comprehensive description is made, all social, cultural, artistic, educational and sports activities as well as social assistance and social services which will raise the living standards of the people living within the municipal boundaries can be evaluated within the scope of social municipalities (Beki, 2009). Within the scope of social municipalities, these services are carried out under the headings of public education services, cultural, artistic and sportive activities, protective services under the Municipal Law No. 5393 and Metropolitan Municipality Law No. 5216, which are intended to enable municipalities to become active in social life. They fulfill the services people need in order to meet the social expectations. For this reason, the scope and quality of these services differ according to time, space and needs, and in this case, the services provided by local governments prevent comparison with each other. The efficiency and productivity of the services can therefore be assessed, mostly directly or indirectly, in terms of their satisfaction with the service areas, their level of utilization and their contribution to the sustainability of the service's benefits.

Services Provided to Women in the Scope of Social Municipality

According to Article 14 of the Municipal Law No. 5393, metropolitan municipality with municipalities having a population exceeding 100.000 have established protection and shelter for children and women. Works related to domestic violence have started, and women's guesthouses are providing services such as accommodation, education, psycho-social support and rehabilitation. Apart from this, it is seen that the municipalities constitute sports fields, which they organize vocational and skills training courses (Pekşen, 2014,31). In particular, the metropolitan municipalities play an important role in the economic, social and cultural development of the people in order to adopt urban culture, to meet the needs of culture and arts, to solve employment problems and to provide education services in various fields and levels (Ersöz, 2007, p.44).

Women and life-long education

Gender equality within the sustainable development goals set out by the United Nations on the basis of the "2030 Agenda for Sustainable Development" adopted on 25 September 2015 and the provision of full and productive employment and equal pay for all women and men are among the targets (Memişoğlu vd., 2016,1075). It is emphasized that the objectives set are aimed at achieving human rights and gender equality for all, and that this perspective is an integral part of the economic, social and environmental dimensions of sustainable development (United Nations General Assembly,2015). While the main reason behind this important decision is long-term economic crises, unemployment and gender inequality are on the Earth as well as Turkey's main problems. Male

employment in Turkey is close to nearly double the level of female employment. In 2015, the female employment rate in the world was 46%, while male employment was 72%. Moreover, when the unemployment rates are examined, it is observed that the rate is higher in women. Within the framework of the National Employment Strategy, it is targeted that the labour force participation rate of women will be increased to 41% in 2023 (Memişoğlu vd.,2016,1079).

The most advanced statistics on employment in Turkey are obtained as a result of the Household Labour Force Surveys of the Turkish Statistical Institute.

Table 1. Advanced statistics on employment in Turkey(TUIK,2017)

	Total		Man		Woman

Non-agricultural unemployment rate	11,3	12,2	9,8	10,1	15,0	17,3
Young population(15-24 years)	17,4	19,8	15,8	17,0	20,3	25,0
Unemployment rate	17,4	19,8	15,8	17,0	20,3	25,0
(1)Neither in employment nor in education rate	21,6	22,0	12,1	12,4	31,1	31,8

The figures on the table may not yield because of rounding

(1)It is the ratio of young people who are not working and who are not educated (formal and non-formal) in total young population.

According to the figures of May 2016 and May 2017; It is observed that unemployment rates in women are higher than that of men and that of employment rates is about half. The determination of gender and the level of education in terms of women's participation in the labour and the problems they are facing is known to be the reason why women's problems they encounter while working are also preventing them from participating in the labour at the same time. Factors that impede women's participation in the labour are mainly examined under two headings as economic and social factors. Women in the working age sacrifice their education from triangle of education, marriage, child. That causes woman labour working on less qualified works with less price. On the other hand, the wage to be paid to the woman must also meet the family duties she undertakes during her absence. The woman uses her choice not to work unless she finds a job at a pay level that will cover expenses incurred from the household for housework, elderly and child care. The total value of the services the woman produces at home is called "reservation fee" . When the woman wants to enter the labour market, her wage is compared with the wage that is due to the income work, ie the reservation fee. In this case, it makes it even harder for women to work again in low-skilled jobs. On the other hand, low level of education of female labour, socio-cultural obstacles in the society and in the family and rural-urban migration negatively affect the labour participation of women. However, although legal arrangements have been introduced into working life and

discrimination prevention regulations, even the calculation of the pre-pregnancy periods has been a barrier to start to work in front of the female labour.

Women to take a more active role in their working lives can be possible through the creation and implementation of active employment policies. Active employment policies and the global changes, transformations and developments in the global world need to be leaded up. For this purpose, firstly policies should be made to create new job opportunities for the female labour. For this, it is necessary to take incentives and measures to open new investment areas. In addition to the industrial sector, the opening up of the development in the service sector, the arrangement of credit and incentive support for those who want to establish or develop a business can be done in this context. In particular, prioritization of women labour is needed to increase women's employment and important steps about that have been taken recently in Turkey. However, since it is not possible for a woman to start a new activity without a certain knowledge, the introduction of vocational and entrepreneurship education will be the starting point of the work.

However, each investment has to be at a certain level of productivity and the goods and services produced must be demandable. In this case, the main subject to be aware of is quality and efficiency works. It is obligatory to increase productivity because of competition with today's market conditions. On the other hand, quality of produced goods and service is prerequisite to compete in the market. To do so, it is necessary to provide consultancy services for businesses, information technology and technology transfer, and to provide quality education for enterprises to establish and maintain quality systems. Another key issue for businesses is technology leadership. Kör et al. (2016) argue that technology leadership is directly proportional to seniority and age in research conducted by educational managers on technology leadership, so young managers and senior executives must come together at various events, and technology leadership can be widespread.

Due to the change in the current globalization process, there is a lack of qualified labour. In order for the female labour to remain in the labour market for a long period of time, vocational education and renewal education should be given as well as vocational training. For this purpose, increasing the number of practical education, the disappearance of some professions and the emergence of new occupational groups in the face of rapidly advancing technology and the changing of the forms of production in the existing professions caused the knowledge and skills that individuals possess are lost and reeducating of people gained necessity. For these reasons, "life-long education" is the most important educational policy of our day.

All these precautions can be taken on the one hand by directing legislation and policies towards the labour market and on the other hand by actively taking part in the work of all the actors in the country in order to spread the applications. In particular, the main objective of the social municipality, which is enforced in accordance with the Municipal Law No. 5393 and the Metropolitan Municipality Law No. 5216 and other laws is not to give every request and demand but to rescue the residents of the town from needing help and to decrease the value-behavior difference emerged in individuals and groups by interfering with social tissue. That is to provide rehabilitation of social touch. The concept of social municipalities in this framework allows women to be stakeholders who will play an active role in entering the labour market as an entrepreneur or as an employee. As a matter of fact, in recent years, many municipalities throughout the country have been cooperating with public education centers, KOSGEB and Turkish Employment Organization, institutions and organizations in their life-long education activities.

In this study, only municipalities, especially the Metropolitan Municipality in Bursa, were examined and a generalization was not made. The main reason for the lack of generalization is the fact that the work carried out by the municipalities is shaped by the needs of the local elements and the possibility of being active only in this condition is high.

Vocational Education Courses organized by local governments in Bursa

Education programs organized by local governments in the context of lifelong education are usually provided by the metropolitan municipalities, but the municipal municipalities also open courses. Especially in recent years, although the numbers have increased, it is observed that this ratio is far behind the European countries.

Source: The Ministry of Labour and Social Security, which transfers from Eurostat,2015,24.

In recent years, the number of social municipalities has rapidly increased with the work of "National Employment Strategy 2014-2023 and Action Plans 2014-2016". Bursa Metropolitan Municipality has been continuing its education for 12 years since it started with BMMAVEC (Bursa Metropolitan Municipality Arts and Vocational Education Courses) and Local Agenda 21.

With life-long education:

* BURSA ART AND PROFESSIONAL EDUCATION INSTRUCTIONS (BMMAVEC) A total of 25,000 courses a year in 220 branches, in 34 different venues (including 26 courses, 4 cultural centers, 3 sales offices and 1 management center),

*BURSA MOBILE EDUCATION PROJECT (BMEP) in 10 districts by 10 education vehicles going around the neighborhood with educated and experienced in their own branches, all women for 16 years old and over,

*BURSA UNOBSTRUCTED MOBILE EDUCATION PROJECT(BUMEP) Private computer classroom, the designs are spacious and useful, in two education vehicles, with educated and experienced educators in their own branch, free of charge for disabled citizens "Graphic Design and Computerized Accounting Basic Educations" in 7 districts, free education services are provided in 3 different structures. One of these education groups is open only to the disabled, one of them is open only to women and the other is open to everyone, mostly women.

Giving Education in the places that the disabled and women can easily reach has increased the attendance and demand rates of education.

BMMAVEC's 2 missions that is explained is " sustainable education" and "qualified non-formal education".For this purpose;

* To develop professional arts and skills and to increase personal accumulation,

* Helping them to become producers from being consumers,

* Strengthening local development with a structure that increases employability and contributing to the realization of public welfare are expressions in it's vision (BUSMEK,2016,3-4).

In this context, 166.222 people have been educated in the courses opened since 2005 and 108.450 people have certified their professional knowledge in different fields. Courses that continue their activities depending on Bursa Metropolitan Municipality Department of Social Services Directorate of Social Affairs and Education Services Department act in cooperation with the Ministry of National Education and Public Education Directorates. Besides Turkish Employment Organization and KOSGEB, employment-guaranteed courses can be opened in cooperation with non-governmental organizations. Horticulture, computer technology, office management and secretarial services, child development and education, handicrafts and clothing technology, sick and elderly care services, machinery technology, food and beverage services are courses for direct regional needs and mainly occupational areas preferred by women. Only the educations of industrial kitchen groups opened a

way to acquire a profession for 1506 persons in 8 different branches in 2014-2016 period, such as preparation of home meals, pastry apprenticeship, making macaroni and sauces. 13 groups gave education and 375 people have obtained certificates and 111 of them opened their own business in KOSGEB-supported entrepreneurship educations. Education and production activities for the production of silk carpets and fabrics started with the women sitting in the mountain regions under the guidance of Bursa Koza Agriculture Sales Coop. Communities by placing 115 carpets, 26 fabric weaving looms. Coverage of life education programs can be versatile as basic education based on reading and writing, vocational education, general education, general culture education and educations developed to evaluate leisure time with the education programs BMMAVEC has prepared for ensuring social integration and economic growth. The low participation rates of women, both in terms of education levels and in the labour as employees and employers caused an increase in women's special programs in these educations. Special programs were developed for women who did not completed education especially for a variety of reasons or whose education did not comply with the requirements of the day. While these programs were being developed, the city's labour supply as well as responding to the demands of the labour were included in the mission.

Conclusions and Recommendations

Beside the classical municipality as of the 21st century; Social services and aids as well as cultural and artistic and educational services continue in line with the understanding of social municipalities. The goal in social municipalities is not to give aid, but to relieve from needing help and providing social touch rehabilitation. In this way, correcting the disadvantageous position of people resulting from various reasons is the main goal. That makes it possible for people to get a healthy grip on demand and expectations from the city administration, to prevent social explosions, to provide urban integrity, to facilitate the adaptation of city life and social life especially in cities such as Bursa that have intensive internal and external migration. However, special attention should be paid to not over-specializing in vocational education. It is necessary to give importance to occupational development, vocational renewal education as well as vocational education especially in areas such as Bursa that are rapidly developing and have a high chance of competing in global markets. The annual average of 25,000 people getting education is relatively small in the city with a population of 2.5 million. Although vocational education courses are organized by the municipal municipalities, the coordination between these courses and the provision of job sharing will increase the effectiveness of the courses. Providing boarding education opportunities for young women can provide positive contributions in terms of the productivity of education especially in mountain regions where transportation is difficult. Good monitoring of the relationship between life-long education and employability, diversification of education in line with the changing needs of the market and maintenance of the flexible management model in which differentiation can be made are the key to increasing productivity. Life-long employability is that someone is productive throughout his working life. Continuously changing knowledge and skill need educations need to be provided for people who are not only for the first time in the labour market, but also who need to renew their professional knowledge and skills and that should not be ignored.

Social Media In Higher Education For Marketing

Sabahattin ÇELİK

Ph.D., Vocational School of Social Sciences, Istanbul University

Email: sabahattin.celik@gmail.com

Abstract

Internet marketing is to reach the existing and potential customers, to sell and advertise the products and services via the internet networks. Social media which has emerged along with the development of the internet technologies and effective social communication methods on the internet is a new way of marketing activities. Marketing activities which are committed via the internet networks can also be called social media marketing. In Turkey, as well as in the world, colleges and universities are beginning to embrace the social media, to realize the potential power of it and to use it as a component of their overall marketing mix. This paper will review the existing literature available in this subject area by introducing some popular social media tools such as Facebook, MySpace, YouTube, Flickr, Twitter and Instagram, express what the advantages and disadvantages of using social media in advertising and promotion activities of universities and colleges and suggest some ideas about these implements by giving advice for the marketers. Keywords: Internet, Education, Social Media Marketing

Keywords: Internet, Education, Social Media Marketing

Introduction

Social media consists of activities that involve socializing through words, pictures and videos, and creating an online network. Social media redefines how we relate to each other as people and how we relate to organizations serving us as people. Social media is concerned with the dialogues that comprise of bilateral discussions bringing people together to explore and share knowledge (Solis, 2008).

Jason Falls, one of the founders of the Social Media Clubs, has asked Twitter followers to explain social media with two words or less, and has found that they have the terms "relationship", "interaction" and "community" (Falls, 2008) in common. "Social networking is an umbrella term that refers to web-based software and services that allow users to come together online, communicate, discuss, exchange, and engage in any form of social interaction" (Ryan & Jones, 2009:152).

Social media marketing aims to develop brand awareness, define opinion leaders, analyze consumer behavior and external sources of crowded communities, develop ideas for new marketing strategies, direct the traffic to the company's website, spread specific messages as viral, enhance site visibility, extend brand exposure, (through organic links), support the brand's reputation and image enhancement and internalization, increase product sales, achieve marketing objectives effectively and initiate and maintain mutual talks (Weinberg, 2009: 6).

Until recently, instruments such as newspapers, magazines, radio, television and billboards have come to the fore as the means by which marketers can promote their products and services on the market. However, the emerging Web 2.0 technology and the advantages offered by it have made the marketers slip into this new media. Social media is made up of online networks based on a very comprehensive and bi-directional interaction including blogs, company discussion boards, chat rooms, e-mails between consumers, consumer product and service assessment websites, internet discussion boards and forums (Mangold ve Faulds, 2009: 358). Although some studies show that social media and Web 2.0 are used in the same sense, the most important difference between them is that Web 2.0 symbolizes the technological dimension of change in information and communication technologies while social media symbolizes the social dimension and usage (Akar, 2010: 17).

Nowadays, experienced marketers have realized that things that have been functioning in the past are not currently functioning accurately or properly. There has been a need for a new approach (Weber, 2009: 9-10). Developing marketing requires marketers to focus on social networking and other new techniques. The New World offers new media, new channels and new markets. Social media marketing can be defined as using social media sites to increase visibility on the internet and to promote goods and services. Social media sites provide the exchange of ideas and information by creating social networks (Akar, 2010: 33-52).

Weinberg (2009: 3) defines social media marketing as a process that empowers individuals to promote their websites, products or services through online social channels and to communicate and connect with a wide range of communities that are not possible with traditional advertising channels. In another definition, social media marketing is expressed as an online advertising form in which social communities, including social networks, virtual worlds, social news sites, and social opinion sharing sites, are used in cultural context to fulfill branding and communication purposes (Tuten, 2008: 19). Social networks are a dimension of social media in which people share their ideas and interests or they meet with other people who have the common ideas or benefits. The two most popular social networking communities are Facebook and MySpace currently. This study will focus on the use of Facebook, MySpace, YouTube, Flickr, blogs, Twitter in higher education marketing. According to the Pew Center research on online social networks among American teenagers, 55% of all young people online use social networks like MySpace or Facebook, and 64% of children in the 15-17 age group are creating online profiles on these networks (Noel-Levitz, 2007). In this section, the social media tools that make up the subject of work and their forms of use in higher education will be examined.

Social Media Tools and Their Use In Higher Education

Facebook is a social service that connects people with their friends and with other people in the place where they work or live. People use Facebook to take care of their friends, upload an unlimited number of photos, share links and videos, and learn more about the people they meet. Facebook consists of six main components: personal profiles, status updates, networks (geographical regions, schools, companies), groups, applications and fan pages. When Facebook launched the concept of fan pages in November 2007, many universities immediately took the advantage of the opportunity to create a formal Facebook presence for themselves. By January 2008, there were 420 universities that made use of this new feature (Cheater, 2008). Fan pages are similar to personal profiles but they can be used by businesses also. These pages include wallpapers, discussion boards, photos, videos, and more. Users viewing the page can choose to be "fans" of your organization, which is shown on their personal profile pages for their friends to see. This creates a viral marketing effect, those who see that one of their friends is a "fan" of another organization that is also interesting for them will be the "fan" of that page. Facebook pages also provide organizations with the ability to communicate with their "fans" through targeted and direct messages (such as "fans" in a particular network or age group) and view "content" with detailed statistics about the use of the organization page.

MySpace is an online community that allows you to meet your friends' friends, share photos, magazines, and interests. Because of the way Facebook is started, MySpace has developed an "exclusive" image and it is more attractive for colleges and universities to express themselves through MySpace. The numbers also support this attraction, 85% of students in 4-year universities have a Facebook profile, and in areas such as higher education and discretionary income, Facebook users' demographic information is often higher than that of MySpace (Qualman, 2007). In April 2008, Facebook passed MySpace as the world's most popular social network (Stevens 2008). This can lead to the formation of unprofessional, amateur-looking pages which, if not done well, can damage the image of a company. Other organizations with poor-looking pages affect the overall perception of a person about MySpace, which negatively affects this "not so exclusive" image. Unlike Facebook, MySpace allows users to fully customize their profiles by changing the appearance, background, and format of their pages (Solis, 2008).

YouTube is a leader in online video and a first-rate goal to share original videos worldwide on the web. YouTube makes it easy for people to upload and share video clips via the Internet sites, mobile devices, blogs, and email. Universities have been making videos for more than 20 years to help recruitment efforts. YouTube has provided them with a platform that will easily distribute these videos to a wider audience and not cost to write to CD / DVD or mail to a smaller audience. For example, Dove spent two and a half million dollars on a 30-second ad at the 2006 Super Bowl. Later, the famous "Evolution" video was only broadcast on YouTube, which led to an increase in the flow of web sites without any expense (Li and Bernoff, 2008).

Flickr is an online photo site where users upload photos that can be edited with sets and collections. Public photos can be seen and commented on by others (Consortium, 2007). Universities see Flickr as a perfect tool for easily sharing photos with students, alumni, faculty, and staff. It is the perfect tool for uploading photos, adding titles and tags, and converting organized collections with slide shows without any manual web code.

Blogs are an form of online journal. They can have a single author or several. Most blogs allow readers to write comments in order to promote conversation in response to an article or a post (Consortium, 2007). The most popular use of blogs for marketing in higher education is having currently enrolled students blog about their lives on campus as a recruiting initiative in conjunction with admissions. One quarter of all college admissions offices use blogs by students or campus personnel (Noel-Levitz, 2007). Karen Sines Rudolph wrote a thesis on the topic of using official admission blogs to recruit millennials, from a public relations perspective. In this research, she found it was key that the selected bloggers represented a full spectrum of interests and status, and they have a clear understanding of the purpose of recruitment through their blog posts. She also found it important that the institution's brand practitioners stay involved with the project, actively guiding bloggers so their posts can meet established goals, namely to provide prospective students with the clearest picture of life at the institution (Rudolph, 2007). Blogs are also being used by some colleges to post news articles in order to facilitate conversation. Faculty blog about their teaching, travel and research. Admissions counselors blog about their travel and recruitment cycle.

Twitter is a mix of instant messages and blog posting that allows users to send short (140 character) updates. Users can also keep track of their friends' updates, send direct messages to them, reply publicly to their friends, or send comments to their current status (Consortium, 2007). Anyone who is suspicious of Twitter and its benefits should read a comprehensive list of fifteen reasons to use Twitter (Puiu, 2008). These include reasons such as awareness and creating brand awareness, content promotion, quick feedback, new audience finding and marketing, and higher education marketers should show great interest in all these areas. Some have suggested it can be used in conjunction with other social media tools, such as student bloggers also having Twitter accounts they update more often than their blogs, to serve as another tool to promote their new blog entries. Others have suggested it can be used in emergency situations, such as the shootings that happened at Virginia Tech (Swartzfager, 2007), or using it in place of a live chat service for recruitment (Wilburn, 2008).

With **Instagram** becoming increasingly popular and the infographic and visual use increasing in marketing applications in social gatherings, brands have begun to show interest in Instagram. It has been proven by investigations that people forget the objects that they have seen later and brands have begun to concentrate on visual-based posts rather than writing-based posts. From this perspective, Instagram, which has a great advantage in marketing the goods and services through visual elements, has become an important channel with many potentials for marketing higher education institutions when it is supported by special campaigns and a multichannel communication work is carried out with other social media accounts of the brand. According to social media theories, communication is bidirectional because they attach importance to consumers' thoughts and opinions while creating brand values of businesses. The Instagram users find this value in the content and

inspiration shared by the brand and do not need to enter into too many dialogues through this channel. They are marketing their content that they see worth talking about through tags first and then by communicating with their relatives through word of mouth communication (Wallsbeck & Johansson, 2014: 65).

Conclusions and Recommendations

The social media economy is the fastest growing and changing phenomenon of our time. The reason for this is undoubtedly the rapid increase in the usage of internet and social networks by individuals. Social networks require participation of these entrepreneurial enterprises in these networks. Today, social networks provide opportunities for small businesses as well as large businesses. Social media is much easier to use for businesses because it does not require large budgets, such as in traditional media, in promoting products and services. But what is important here is that businesses can bring out original and creative ideas that they can draw attention to in social media.

Research has shown that visual messages are more noteworthy than written messages in social networks. It has not taken long for businesses and marketers to realize this. The visual content used in social networks is carefully prepared and aims to transmit the desired message directly. Currently, Facebook, Twitter and LinkedIn are the most widely used social networks around the world. The marketers are not indifferent to Instagram and use this visual based network with social networks like Facebook and Twitter. The campaigns that are being prepared are planned to cover all social networks used.

The power of social media has not reached the desired depths. Many people think that the transition of the use of social media into higher education is controversial. For example, what if we had lectures for student reviews on our site? New students would also be able to see assessments of the courses, especially as they tried to make choices for general education courses. Courses that have good grades would probably be chosen at a higher rate without paying any additional fees. Administrators would be worried about the courses that received negative evaluations, however, whether this feature exists or not, these conversations would occur elsewhere.

Social media offers excellent opportunities to stay in touch with alumni later on. Facebook is one of the popular tools for it. Alumni or individuals who are in more contact with their schools are those who are more likely to donate more to their colleges in the future. Noel-Levitz stated that the social network could be an excellent resource for recruitment efforts and that your program could be very useful. Noel-Levitz stated that the social network could be an excellent resource for recruitment efforts and that your program could be very useful. Nevertheless, it is still believed that the vast majority of target audience should strengthen the experience perspective (Noel-Levitz, 2007).

Social media offers the opportunity to humanize the stories of students and graduates who are committed and can gain future jobs. Those who are willing to "participate in the conversation" and social media in a way should create strong and effective policies for its use and provide specific monitoring and contribution functions to the staff members. Sites and tools should be created for the employees that they can really devote themselves to (Solis, 2008).

Abstract

For teacher who is seeking to implement modern education goals, it is important to create prosperity educational and learning environments, which were not relevant to the traditional paradigm. The learning environment is one of the most important factors influencing the successful formation of adolescent self-esteem, their self-expression and creative autonomy. The concept of learning environment includes – the schools tradition, domestic regulations, pupil and teacher relationship, the psychological climate, school management and teacher's work style. It is typical for the autocratic teacher work style to stereotype and depersonalise the pupils, this weakens the adolescent self-esteem. Meanwhile, democratic procedure, learner's participation in decision making, respectful relationship, honesty and self-discipline promotes learners self-confidence and enhances self-esteem. Well organized learning environment is a good atmosphere to motivate pupils and encourages them to become a proactive, independent and responsible persons.

Keywords: Adolescent, Self-esteem, Educational process

1. Introduction

The issues of self-evaluation and the construct of self-esteem have been thoroughly discussed in psychology. The psychologists Rogers (1994), Baummeister (1999), Maslow (2011), Mruk (2006) emphasized that self-esteem is one of the fundamental human needs, essentially significant for the individual's development, the individual's psychic and physical welfare and behaviour. James (1991), Lemme (2003) defined self-esteem as the relationship between the ideal 'I' and the actual 'I'. The afore-mentioned authors treat self-esteem as the individual's self-concept comprising a system of self-knowledge as well as the knowledge about other individuals and the surrounding world; and this system enables the individual to identify own needs and abilities, and to foresee ways for self-realization. Lemme (2003) defines self-esteem as a multi-layered construct, in which individuals may perceive their self-esteem as being of lower or higher degree in different areas of activity. Lemme (2003), Atchley (1991) share the view that the degree of self-esteem depends on how individuals value their achievements in the area of activity that is vitally important to them.

The psychologists and educationalists, who studied the construct of self-esteem, agree on the opinion that the individual's self-esteem can be enhanced on condition that certain conditions are provided. O'Dea, Abraham (2000), Wild, Flisher, Bhana, Lombard (2008), who studied the peculiarities of building self-esteem at different age groups, assert that self-esteem, as a personality trait, can be modified by certain factors. Zuffiano, Alessandri, Luengo, Kanacari, Pastorelli, Milioni (2008), who studied the relationship between low self-esteem and unsocial behavior, established that self-esteem can be modified on the basis of the observation how the changing degree of self-esteem leads to behavioural changes. Pepi, Faria, Alesi (2006) claim that learning motivation is closely related to the learner's self-esteem, which, in turn, adds self-confidence and self-actualisation and leads to better academic proficiency. In the opinion of the afore-mentioned authors, the learners with higher self-esteem are more outgoing, they are ready to make independent decisions, have more belief in successful outcomes of activity, and do not suffer that much in case of failure. Mruk (2006), who acknowledges the significance of introspection, also points out the importance of social factors in building individual's self-esteem and claims that, on the basis of mutual interaction and feedback, the individual is able to carry out comparative self-evaluation within the framework of social relationships network. Psychologists emphasize that high self-esteem is influenced by positive evaluations, especially when they come from the people whose opinion the individual appreciates and respects. Bednar, Wells, Peterson (1989) point out that self-esteem of an individual to a large degree is pre-conditioned by the evaluations given by the surrounding people; the

researchers maintain that self-esteem is the feedback to the individual about whether their behavior is adequate or not. Myers, Willse, Villalba (2011) studied the impact of self-esteem on adolescent psychic condition, and they found that higher self-esteem helps in overcoming stress, despair, anxiety. The researchers believe that self-esteem provides emotional and spiritual resilience, on the basis of own self-perception and acknowledgement of the individual's worthiness, coming from other individuals.

Carlo, Hausmann, Christiansen, Randall (2003) studied the significance of prosocial behavior in enhancing self-esteem. The authors defined prosocial behavior as volunteer help and support of other individuals. In the researchers' opinion, a high degree of self-esteem is essentially significant in displaying altruism and trust. Adolescents that demonstrate prosocial behavior tend to be more considerate and good-wishing; they tend to follow higher moral standards, have a stronger sense of responsibility, are more independent, which, in turn, has positive effect on their self-esteem. Allison, Schultz (1994), on the basis of research findings, claim that it is of utmost importance to insistently encourage learners' self-esteem. The researchers assert that self-esteem facilitates the processes of becoming a community member. Allison, Schultz (1994) made an attempt to compare the understanding of self-esteem as displayed by adolescents and adults. In their answers, adults tended to focus on how self-esteem can increase the opportunities of employment, facilitate decision-making on the job, allows to better respect other individuals' rights. In the opinion of adolescents, self-esteem is decisive in handling difficult situations, in becoming an independent and responsible person; it provides the individual with positive self-concept and support, helps to feel psychologically secure, including stress-related situations.

USA National Centre for Self-esteem carried out research in 2001, the findings of which speak for the fact that, with years, the child's self-esteem tends to diminish. Purkey (1970), Amundson (1991) found that at the age when children start school their self-concept is already shaped, mainly due to the family influence. Stipek (1984) investigated learning motivation in children, and noticed the tendency for fairly high self-esteem in primary learners as the learners at primary level are more interested in the learning process itself, not in the learning outcomes. But in later years at school, learners become more concerned about their academic performance and that results in a lot of negative emotions. According to Stipek, because of the growing importance of academic achievement and different social roles that learners have to accept, students face the necessity of re-evaluating their knowledge and skills, and they do that on the comparative basis, in respect to their peers, as they feel obliged to justify their parents' and teachers' expectations. Stipek asserts that the students' self-esteem is continuously affected by the school environment, peers, and family members. West, Fish, Stevens (1980) point out the family is the decisive factor in enhancing the child's self-esteem although the role of school should by no means be underestimated. In the opinion of Hoge, Smit, Hanson (cit. Scott, Murray, Mertens, Dustin (2005)), the key factors in enhancing school students' self-esteem are school, family, and inborn cognitive abilities. The researchers Cai, Wu, Luo, Yang (2014), Swinson (2008), on the grounds of research findings about the degree of self-esteem in learners of different age groups, assert that the degree of adolescent self-esteem, when compared to primary learner self-esteem, diminishes considerably. Myers, Willse, Villalba (2011) tend to relate the lower or higher adolescent self-esteem to the immediate environment, in which the adolescent goes through the processes of maturing. A number of psychological studies have been carried out (Hasagi, Okada, Fuji, Noguchi, Watanabe, 2012) on the immediate constituents of the structure of self-esteem, with implicit or explicit manifestation of self-esteem revealed, as well mechanisms for enhancing self-esteem identified, and major decisive factors described, with academic achievement, physical appearance, family relations, and social everyday contacts within and outside school dominant among some others.

Having surveyed the major issues in enhancing self-esteem, it is legitimate to assert that the very idea of enhancing self-esteem that originated at the end of 20th century has not lost its relevance. The movement for learner self-esteem that sprang in the USA several decades ago in protest at autocratic forms of discipline and unconditional obedience at school was meant to fight against the teaching practices that involved learner embarrassment and humiliation means. As a result of the movement, a number of theories have been developed

that focused on the role that self-esteem plays in the learner's well-being; alongside, research has been carried out about ways of building learner self-esteem, and programmes have been devised and put into practice on how to enhance learner self-esteem at school. There has been research done on the assessment of exclusively self-esteem-focused programme effectiveness. (Helping Children to Build Self-esteem; Enhancing Self-esteem in the Classroom, Life Routes, etc.). The data of the research revealed the main shortcomings of those programmes, namely, their fragmentary character, inconsistency, lack of continuity. The researchers (Babu, 2005; Allison, Schultz, 1994) established that the self-esteem-focused programmes embraced merely superficial activities which, to a large extent, were individual teacher initiative-driven. Babu (2005), Allison, Schultz (1994) point out the need for long-term impact on self-esteem enhancement, constituted by purposeful and consistent activities, directed towards systemic self-esteem building.

It could be stated with certainty that researchers who investigated the construct of self-esteem have emphasised the significance of self-esteem for the individual's personal development, psychic condition, learning motivation and interpersonal relationships. However, the research focused on the analysis of adolescent self-esteem building within the schooling system is very scarce. More research is needed to disclose the impact of factors like educator personality, teaching methods and styles, the role of assessment and self-assessment as well as of overall learning environment on enhancing adolescent self-esteem.

The following problem statements are addressed in the present study with the aim of establishing factors in adolescent self-esteem building at school of general education:

- What factors of the educational process, in adolescents' view, act as enhancing their self-esteem and what factors lower adolescents' self-esteem?
- What are specific emotional reactions and forms of behaviour that adolescents refer to while responding to the factors that either increase or diminish their self-esteem?
- What factors, in teachers' view, add up to both enhancement and diminishing of adolescent self-esteem?

The afore-mentioned questions lie at the basis of the research problem that requires a consistent study, which has been carried out in the present work. The object of the research is the investigation of factors that enhance and diminish adolescent self-esteem in the natural process of education. The aim of the research is to identify the factors of the process of education, which both enhance and diminish adolescent self-esteem.

2. Methods

The questionnaire served as an instrument to empirically prove the forms of manifestation of adolescent self-esteem enhancing factors, also to identify groups of individuals related to adolescent self-esteem enhancement or diminishing, and to highlight the qualities of teacher personality that precondition positive and professional interaction of the teacher with the learner.

The partially-structured interview was used to reveal the in-depth experiences of the two major agents of education, teachers and learners, with the focus on teenagers' experiences that can disclose their self-esteem enhancing or diminishing factors in the process of education, and also revealing teachers' attitudes towards specific factors that increase or lower teenagers' self-esteem in the process of education.

Methods of data analysis of the research

Statistical methods of the research data processing were the methods for quantitative data processing, namely, the SPSS (Statistical Package for the Social Sciences) with the help of Programme 17.0 for Windows. Descriptive statistical methods were also employed (for calculating frequency in percentage). The reliability of frequency difference in respondent answers was checked by applying the non-parametric chi (χ^2) criterion,

applicable to numerical categorical (both nominal and rank-type) variables that are used to verify the responses of the whole sample section (Bitinas, 2006). The χ^2 compatibility criterion was used to verify the hypotheses about the section of the variable within the population. The χ^2 criterion reveals whether the difference between the empirical and theoretical sections is significant, i.e., whether the selected empirical section is compatible with the theoretical model (Čeka navičius, Murauskas, 2001). Correlative analysis was done by applying Spearman coefficient since it is generally applied to bigger samples and also to analyse variables that are measured according to the ranking scale. *Factorial analysis* helped to explain the mutual correlations of a big number of variables by the influence of certain common factors. The transition from variables to factors makes the information more condensed, and it is easier to handle it, thus the aim of factorial analysis is, with minimal losses of information, to replace the unlimited number of indicators of the phenomenon under investigation by a selected group of a few factors (Čekanavičius, Murauskas, 2001). The factorial analysis provides meaningful interpretations of statistically significant results, and the identified factors characterised essential qualities of teacher personality. The factorial analysis was used in the present research to condense the initial variables of the study by joining them around factors. The data applicability to factorial analysis was verified by using the measurement Kaiser-Meyer-Olkin (KMO).

The accumulated qualitative data were analysed by applying the method of *content analysis*, based on multiple readings of the text and dividing it into sections directly related to the object of study. Statements of closely related meanings were grouped into categories and subcategories. Subcategories were established with the help of heuristic approach, namely, “while reading the answer of the respondent, its abstracted informational content was identified and placed under a certain subcategory” <...> different subcategories were united under the same category when there could be recognized a unifying common idea, worded in the category; several categories made up a common topic group“(Bubnys, Žydžiūnaitė, 2012, 31). While grouping the statements that illustrate separate subcategories, the most typical and originally-sounding statements of the respondents were selected.

The basis of the empirical research and its sample

In the quantitative research, the representational characteristics of the sample was guaranteed by the nest-based sampling. The respondents, both teachers and learners, that took part in the questionnaire, were from schools in Vilnius, Panevėžys, Šiauliai, and Ukmergė. With the aim of getting a multilayered character of the research, both teacher and learner groups of respondents were selected: the general line of the respondents was made up from learners in forms 6 to 9 of schools of general education and of teachers – of different age groups and subjects taught, of different job experience and professional qualification. The overall sample involved 299 learners and 140 teachers from schools of general education in Lithuania. The answers from 439 respondents were received in the process of the research.

The sampling of respondents for the qualitative research was preconditioned by the aim of the study, namely, to investigate the immediately relevant phenomenon in the broad perspective and rather intensive but not extensive way. The informativeness of the respondents in terms of the aim of the study preconditioned their selection. It is not generally indicated in research literature how the sufficient sample of the qualitative research should be selected. In the process of study, it is usually relied on the concept of saturation (the number of ‘saturated opinions’), which states that the sample is big enough if the information obtained from respondents starts repeating itself, and the additionally received opinions of the respondents do not influence the results of the study (Punch, 2000). In the process of qualitative research, the sample of learners was modified, i.e., the study was limited to the respondents from forms 7 to 9, and the participants from form 6 were left out. The decision to limit the population of respondents to forms 7 to 9 was based on the assumption that adolescents of this particular age group best represent their age group-specific characteristics, with the greatest number of physical and psychic changes taking place exactly at this period. The overall sample was made up of 136 learners in forms 7 to 9 and 86 teachers.

3. Findings, Results and Conclusions

On the grounds of the analysed research literature, it is possible to assert that self-esteem is one of the most important personality constructs, preconditioning positive development of individual, providing coherent social integration, and guaranteeing quality of living. The need for self-esteem gets actualized in the early stages of personal development when the individual is able to perceive the meaning of 'self'. Self-esteem is decided by the degree of adequacy between self-perception and the ideal 'self'; in the case of incongruity, inadequacy results in low self-esteem. One of the ways of enhancing one's self-esteem is to find a realistic match between one's aspirations and possibilities, between one's desires and the real state of things, and to set one's aims in realistic proportion to one's abilities and possibilities. *Another option is to strive for self-discovery, to uncover and develop one's abilities, and to widen the spectrum by pushing the boundaries.*

The findings of the quantitative study make it possible to state that nearly half of all teenagers treat their teachers as the most important people in terms of enhancing their self-esteem at school, and so do two fifths of teenagers with reference to their peers; in turn, nearly one third of teenagers indicated teachers and two thirds of teenagers mentioned their peers as related to diminishing their self-esteem at school. In teenagers' opinion, certain personal qualities of teachers are important in enhancing adolescent self-esteem, and those qualities can be grouped into categories under three latent factors: positive and professional interaction with learners (learner support, consideration of learner opinions, fairness of judgement, etc.), teacher professional qualities (sincerity, optimism, creativity, etc.), responsiveness and empathy (friendliness, sensitivity to learners and mutually-built relationships, frankness, etc.).

The qualitative study allowed to establish that adolescent self-esteem enhancing and diminishing experiences at school are related to two most significant factors: positive or negative relationships with teachers and peers. Other factors did not have such a significant impact on adolescent self-esteem enhancing or diminishing. The teacher's supportive behaviour, encouraging the learner to treat oneself as a worthy person, (teacher-demonstrated trust, respect, approval, public appreciation, acknowledgement of learner's abilities) – all these act as adolescent self-esteem enhancing factors. Teenagers' experiences of teacher's power-dominant relationships (ignoring, public humiliation, 'sticking labels') diminish learner self-esteem. A sense of comradeship among learners, leadership, cooperative self-realisation, independent decision-making, responsibility for oneself and others (a sense of belonging to the same group of peers, leadership, realising one's ideas in jointly-carried out activities, providing support for others) enhance adolescent self-esteem. Teenagers' experiences of exclusion, lack of trustworthy relationships, cases of bullying (ignoring on the part of peers, rejection of ideas, blaming, bullying for reasons of physical appearance, or academic failure, or cultural differences) all act as diminishing adolescent self-esteem.

Teenagers' emotional reactions to self-esteem enhancing factors are in principle positive – learners feel value-oriented, emotional and cognitive enabling (they are proud of themselves, feel upgraded, encouraged, worthy, important, responsible, independent, clever). Teenagers' emotional reactions to self-esteem diminishing factors are in principle negative -- only a small part of teenagers manage, with their power of will, to restrict oneself from self-esteem diminishing factors, other teenagers experience heavy feelings (a sense of being unaccepted, of guilt, shame, humiliation, hatred, disappointment in oneself, sadness), they feel confused, embarrassed, and even think of dying. When teenagers experience the overall diminishing of their self-esteem and not a specifically-focused reaction, directed to a particular act of behaviour, they go through a number of negative emotions and do not consider themselves worthy people. Teenagers' self-esteem grows when they receive positive responses from their teachers and peers, when they are guaranteed respect, unconditional acceptance, and can feel their significance. Teenagers' self-esteem is affected more severely by demonstrated disrespect towards them, by distrust, intolerance, non-constructive and offensive criticism spoken out in public than by academic failure, lack of abilities, communication problems or physical appearance. If the conditions to experience positive self-esteem

are absent, a sense of unworthiness develops, and there is a risk of encountering serious psychological and social problems hindering coherent cognitive, psychological, and social development in the period of adolescence. Teenagers' behavioural reactions to their self-esteem enhancing factors in essence are constructive, their major forms of expression being increased motivation to learn, more effort invested in studying, better attendance of school, seeking higher academic achievement; also greater general activity and resolution to demonstrate one's abilities, to speak up one's mind, willingness to communicate and help other people; improved behaviour (they became friendlier, more polite, and more respectful towards others). Teenagers' behavioural reactions to self-esteem diminishing factors is non-constructive by its essence – in the majority of cases, the teenagers' reactions were passive (they did not try hard to study, did not care to behave well, their motivation to learn was weak), they closed inside, ignored other people, doubted their abilities, experienced heavy feelings; part of the teenagers displayed hostile reactions, became more aggressive (got angry with their peers, were planning revenge). Only a small part of teenagers pointed out that their wish to achieve higher academic results increased, that they became more active (they tried to defend their point of view), sought help.

The teachers who took part in the research distinguished four factors as having significant effect on adolescent self-esteem in the process of education:

- qualities of teacher personality;
- methods and techniques of teaching;
- assessment and self-assessment of the progress made by the learner;
- support provided for learners with low self-esteem and for those suffering from bullying.

The teachers acknowledged as enhancing adolescent self-esteem the qualities that facilitate establishing partnership-based interaction with learners (respect, sincerity, trust, tolerance, support); the teachers pointed out as self-esteem diminishing qualities the ones that make the interaction a mere formality, that allow the teacher to dominate, to demonstrate destruction and stereotyped thinking. The teachers' responses give sufficient grounds to assert that the efficiency of study methods depends on the roles of the teacher and learners and on the type of activity. The teachers acknowledged the following methods as adolescent self-esteem enhancing factors: learner-centred teaching, ways and techniques of activating learner self-realization, independence, responsibility, cooperation, encouraging creativity; similarly, the methods of assessment favoured by the teachers were the ones that can reveal the learner's potential strengths and abilities. The methods pointed out by the teachers as the ones that diminish adolescent self-esteem were constant control, refusal to admit individual learner differences, distrust, focus on learner mistakes and cases of failure. Adolescent self-esteem enhancement can take place in the environment, which encourages self-discovery and adequate self-evaluation, which fosters self-realisation, develops independence and responsibility.

On the grounds of the teachers' responses in the qualitative study, it is legitimate to assert that the problem of bullying must be viewed as a problem of school and class community and not as a problem of an individual; a teenager with low self-esteem and suffering from bullying can be best helped by activities educating a sense of responsibility within school and class community (by educating empathy, tolerance, paying appropriate attention to human rights, by creating the atmosphere of discontent to the culture of bullying, by organising self-and-peer-support groups), also, the learner support should be built upon the personal responsibility of all professionals who communicate with teenagers having low self-esteem and suffering from bullying (form tutor, social pedagogue, school psychologist, etc.).

4. Recommendations

To teachers at institutions of higher education, to educational programme developers:

Research in the identification of factors in self-esteem enhancement and diminishing at school of general education should not be limited exclusively to the middle period of adolescence. With the aim of achieving long-term, purposeful and systemic process of building self-esteem at school of general education, it is of utmost

importance to study the peculiarities of self-esteem formation in different school age periods. Further research of factors preconditioning learner self-esteem building would reveal general tendencies and would provide more in-depth conceptual information about self-esteem enhancing and diminishing factors at school of general education.

The subject of *Pedagogical Ethics* is recommended to be included into programmes of educational science, with focus on the issues of value-oriented, moral, and self-esteem building aspects and strategies in the study modules of the teaching profession.

To head-teachers and other pedagogues at schools of general education:

Learner self-esteem building strategies should be included into long-term planning at schools of general education. Practical realization of self-esteem enhancing factors in the process of education could serve as an efficient means in solving problems of adolescent poor attendance, low academic achievement/underachievement, destructive behaviour, bullying. Appropriate attention to learner self-esteem enhancing factors could facilitate in creating the kind of school environment that is favourable for teacher and learner self-realisation, readily-establishing the organizational culture and upgrading the teaching profession.

Specific-focus seminars for teachers on the issues of self-esteem building would enable teachers to better perceive the significance of self-esteem building processes for the positive development of teenage personality, for the learner welfare, academic achievement and behaviour. Teacher newly-obtained knowledge about learner self-esteem building factors would expand the possibilities of putting into practice self-esteem building strategies and would enable to guarantee forms of support for learners with low self-esteem and for those suffering from bullying.

It is essential to establish a closer cooperation between family and school while initiating jointly-organized events for teachers, social pedagogues, school psychologists and parents to unite their effort in fighting teenager low self-esteem. Close contacts between school and family add better understanding of teenagers and their needs which, in turn, allows to apply self-esteem building strategies at school more successfully.

Teenager self-esteem is enhanced by different forms of participation in non-formal activities, in art and sport hobby groups and competitions. School should find ways of providing more opportunities to learners to get involved in varied activities and to gain useful life skills, including volunteer activities that encourage prosocial behavior and generates a feeling of self-pride.

Teachers should give learners an opportunity to experience a sense of active partnership in building interpersonal relationships at school, and to become full-right participants in establishing standards of behavior. Active personal involvement and participation of every teacher and learner in creating the respectful atmosphere for communication and cooperation helps to guarantee safe and friendly environment that motivates to learn. School standards of behavior should clearly demonstrate school values and principles, what kind of behavior is favoured and what kind of behavior is unacceptable as it violates the agreed upon norms.

Abstract.

Authors raise a question about possibility to measure of clusters' performance. The research is performed within a framework of EU project 'Cluster Development Med' (Horizon 2020). Authors suggest a model, which allows to make comparisons of clusters and to identify the better performing ones. The model embraces three dimensions of cluster activity, i.e. "Resources, Activities, and Processes". The dimensions are suggested by the Lithuanian association "Knowledge Economy Forum", in their work "Cluster Analysis". Authors in their turn collect data and employ one of multi-criteria method to integrate indicators employed into one composite indicator for each cluster. Data for practical evaluation purposes were obtained, an interview on site with the coordinators of the Lithuanian clusters. Then Simple Additive Weighting method was used to estimate the efficiency of the clusters' performance. The results were compared through suggested benchmarking. Suggested model can be used for evaluation of wide range aspects of cluster performance.

Introduction

According to Nuur (2005) clusters have long been part of the industrial framework, with geographic agglomerations of business and enterprises in specific industries existing since centuries. Agglomeration economies had been first developed by Marshall (1920) and further by Arrow (1962), Romer (1986) and many other scholars (OECD, 2007). Over the last decades, cluster policy has been widely analyzed by Porter (1990, 1998), who claims that clusters are composed by firms and industries linked through vertical (buyer/supplier) and/or horizontal (common customers, technology, etc.) relationships with the main players located in a single nation/state. This definition was further analyzed by several scholars (Rosenthal and Strange, 2004; Delgado, Porter, and Stern, 2014; Ellison and Glaeser, 1997; Kerr and Kominers, 2015; Krugman, 1991).

Several governments and industry organizations all over the world have made use of this concept in recent years as a mean to encourage urban and rural economic growth. As a result, a high level of cluster initiative organizations started during the 1990s, and the trend continues (Bevilacqua, 2011). An analysis of cluster initiatives around the globe, covered more than 1400 cluster initiative organizations, was carried out in the "Cluster Initiative Greenbook" published by Orjan Solvell, Christian Ketels and Goran Lindqvist, with a foreword by Michael Porter (Andersson, 2004). The attempt of the work is to use benchmarking to measure the cluster performance of the clusters. Benchmarking is a good practice in business among organizations to improve performance and competitiveness, but it is rarely used to check cluster parameters in Lithuania (Tvaronaviciene, 2015). Some scholars as Rodriguez-Pose (2017) claim about cluster performance that firms in small regions may suffer because of shortages of skills and limited externalities. These limitations can be partially overcome by potentially higher levels of social capital and interpersonal trust (Maskell and Malmberg, 1999), although greater collaboration and embeddedness may both facilitate the generation and transformation of skills and knowledge into industrial performance (Fitjar and Rodríguez-Pose, 2017) or, conversely, lead to lock-in and stifle the capacity of local firms to remain competitive and productive (Boschma, 2005; Rodríguez-Pose and Crescenzi, 2008).

Approaches towards cluster perception. Clusters and their literature to study them are various and multidimensional. They require a wide variety of tools to be deeply understood and appreciated. Even though there are several studies carried out in different countries, there is not a common compromise of the cluster concept has

not been generally accepted yet. “Clusters are geographic concentrations of interconnected companies and institutions in a particular field. Clusters encompass an array of linked industries and other entities important to competition. They include, for example, suppliers of specialized inputs such as components, machinery, and services, and providers of specialized infrastructure” (Porter, 1998, pp.11). One of the main characteristics of clusters is to support the economic growth of enterprises in specific working sectors or create new businesses in larger industries of a geographic area. Industrial clusters perform as instruments in strengthening the innovative capabilities of firms, industries and even nations. “The phenomenon of cluster appears as an evolution of the traditional industrial districts. It reveals factors in common such as cultural approach, knowledge transfer, social capital and institutions” (Monni and Spaventa, 2007, pp.175). According to Porter, “clusters also often extend downstream to channels and customers and laterally to manufacturers of complementary products and to companies in industries related by skills, technologies, or common inputs” (Porter, 1998, pp.78). Moreover, most of the clusters embrace governmental and other institution supporting for specialized training, education, technical aid, research and information. Clusters involve a disposition of interconnected industries and other entities important to competition (Porter, 1998). However, talking about clusters does not concern only geographic and physical relation, but it specially focus on the social and human relation between a wide array of members such as institutions, universities, research centers and enterprises, where the synergy gets even more importance between public and private sector (Monni and Spaventa 2007, 2009; Zemlickiene et al. 2017; Fuschi, Tvatonavičienė 2016; Ahmed et al. 2017; Razminienė et al. 2016).

We aim at claiming that clusters develop and therefore strengthen their competitiveness, through the “combination of inter-firm rivalry and collaboration (so called “co-opetition”), innovation and the rapid transmission and adoption of ideas, and the generation of important local externalities, such as a skilled labour pool, the availability of specialized inputs” (FAO, 2010, pp.3). Cluster are in continuous evolution, facing the challenge of the stakeholders and the only solution is the cooperation between companies within and between clusters. Reduced input costs of the manufacturers, development of common suppliers, training of professional labor and a technical knowledge spillover effect can be achieved through the formation of clustering (Hsu, 2014; Morrison et al., 2013; Prause, Atari 2017; Hilkevics, Hilkevics, 2017).

The strategic role of Small and Medium Enterprises. According to Karaev (2007), clusters are identifiable as an essential mean for improving SMEs productivity, innovativeness and overall competitiveness through overcoming their size limitations (Kljucnikov and Popesko, 2017). The knowledge of clusters represents an opportunity for small and medium enterprises to improve their market position. The purpose is to encourage the cooperation as well the competition between them, in such a way to accelerate the processes of innovation. “Numerous examples, in both industrialized and developing countries, demonstrate that SME cluster have established themselves as important and dynamic players within the international market responding to global competition challenges by capitalizing on local opportunities and collective competitive advantage” (UNIDO Programme, 2001, pp. 10).

Cluster competitiveness aims at enhancing SMEs’ size, performance, innovation and employment; therefore it is used to assessing their outcomes in terms of capital invested and equity returns. The findings from a difference-in-differences analysis reveal that sales, employment, R&D investments, and value added all increase in relative terms, but financial returns exhibit significant relative decreases for the smallest companies, whereas larger firms record strong increases (Broekel et al., 2015; Kozubikova et al., 2017). The ineptitude of the least modest SMEs to take advantage from their cluster membership should be more discussed for both companies and policy-makers (Braune et al., 2016).

“It is characteristic to clusters to sustain productivity growth of firms in specific regions or create new businesses in larger sectors of a particular nation. Industrial clusters perform as instruments in strengthening the innovative capabilities of firms, industries and even nations. The main feature of the cluster, which exposes itself in the long run is that companies within cluster increase their competence of an organization and achieve a competitive

advantage in global markets” (Tvaronavičienė et al., 2015b pp.120). Therefore, identifying the dominant problem groups facing the company can enable an estimate of the level of knowledge available in the enterprise. Classifying micro, small and medium enterprises (M-SME) based on their available levels of knowledge, specific problems that dominate a company’s operations are considered. “About half of the M-SME shows a lower level of available knowledge, and only 10% are categorized with the highest level. There should be not wide differences between the size and the level of available knowledge of the company. Thus, employment and sales’ level of M-SMEs is not followed as a logical consequence by an accumulation of knowledge which firms can benefit to improve their operations” (Lopez-Ortega et al., 2016, pp 1). SMEs have an essential role in the cluster framework. By funds they get, they can invest in R&D, enhance knowledge, increase innovation and improve quality of life (Rodríguez-Pose and Crescenzi, 2008). Here it is also aimed at examining “how technology transfer is being approached in the latest scientific literature, and whether interrelations of technology transfer and sustainable development are being elaborated. Clusters in this context are perceived as networks (not necessarily proximate in geographic terms), which serve as technology transmitters” (Tvaronavičienė, 2015b, pp. 87).

ClusDevMed: a Horizon 2020 project for cluster The ‘Cluster Development Med’ (ClusdevMED) is a project funded by the European Union, MarieSkłodowska-Curie Actions under the Research and Innovation Staff Exchange scheme (RISE) -Horizon 2020 Programme. ClusdevMed Project’s areas of interest are those that concern the implementation of research and innovation about the sustainable development field: e-learning, educational technology, green technology, affordable and healthy food, energy efficiency and renewable energy, water reuse and wastewater treatment. It aims at improving the sustainable development through the secure access to food and energy worldwide, relying on win-win share of sectoral use of constrained natural resources, such as land and water, taking also in account the crucial role of ecosystems and their services (Karabulut, 2017).

The project lies within priority research and innovation topics in EU cooperation, as highlighted in several past projects and policies recommendations, i.e. within the MOCO - Monitoring Committee for European Cooperation in RTD. International Cluster Cooperation offers opportunities to scale up research and technological potential, enhance competitiveness, support the regional socio-economic development and reinforce the market placement of new, innovative products. These cooperation approaches often fail due to constraints on resources, capabilities, instruments and funding. On the other hand, over two-thousands clusters only in the European Union covering all sectors and able to realize an inter-sectoral framework, as well as related clusters and networks in the southern Mediterranean countries, form a great potential for transnational clustering (European Commission, 2014)

Method

Below we provide object, approach to data collection and methods used, what is embraced by methodology of research. Object. Concerning the research and innovation about the sustainable development field for the ClusDevMed project, it is interesting to focus on the Baltic regions’ experience and to analyze in depth the Lithuanian case. Recently there are less than fifty clusters initiatives in Lithuania. Some of them are still at the initial formation, or is a group of companies that gathered together seeking only for EU SF aid. From all the identified clusters in Lithuania only a fourth is formed naturally, by common work aiming at bigger part of market and increasing competitiveness of cluster companies, in a long-term co-operation perspective to develop of new products or services (Tvaronavičienė, 2015b). Seven successful clusters have been selected according to the following criteria: “they have been operating for longer than two years, receive funding either from EU funds or private institutions and the results of cluster activity are satisfactory” (Tvaronavičienė, 2015a, 122). Because of the strong partnership and trade connections, of the similar characteristics showed and, specially, because of the same working business area, that is food and agriculture, it was decided to include even the cluster from Latvia (Food Products Quality Cluster), also for the reason why it produces a wide contribution to the analysis. The research concerns different fields of cluster: the aim is to compare clusters through every kind of field and then focus on cluster of the Lithuanian agricultural sector. The following clusters are the one being interviewed: the Latvian ‘Food Products Quality Cluster’ (Cluster A), of which the main target is to promote cooperation between

Latvian food enterprises and increase their export potential; the ‘Smart Food Cluster’ (Cluster B) aims at helping companies from Lithuanian Food Exporters Association to increase competitiveness in foreign markets by uniting the capabilities, expertise and contacts; the ‘Uzupis Creative Cluster’ (Cluster C), that wants to establish and build a strong, international simulation game development community, to develop educational simulation games cluster, which in the design of products and competence would be able to compete in international markets, create and implement innovative new technologies and solutions in the field of educational simulation games, combining and developing the potential of Lithuania; the ‘iVita Wellness Cluster’ (Cluster D) purpose is to develop high quality and added value wellness products and services which increase people’s safety, their performance efficiency, contribute to prevention, education of society and development of healthy lifestyle habits; the ‘Vilnius Film Cluster’ (Cluster E) not only provides top-quality services, but also actively cooperates with Lithuanian and foreign partners, supports young creators, organizes professional development events and mastery courses for film industry specialists; the ‘Baltic Automotive Components Cluster’ (Cluster F), aims at uniting the Lithuanian (Baltic) companies involved in the manufacturing of automotive and farm equipment; the ‘Laser and Engineering Technology Cluster’ (Cluster G), of which the first goal is to create a dynamic activity center with a fully integrated supply chain of suppliers, manufacturers, and sellers, which would enhance the international competitive ability of the sector of laser and related technologies as well as knowledge and material well-being of its individual members¹.

Clusters’ performance in Lithuania: approach to data collection. Studies related to performance of clusters are widely discussed in scientific literature: scholars debate such aspects as measuring of innovations (Rezk at al. 2015), approaches and methods (Maffioli, Pietrobelli, Stucchi, 2016) of cluster analysis, technology transfer processes and driving forces; composition and governance specifics; participation of start-ups. Hence, spectrum of questions related to clustering phenomena is wide (Razminiene, 2016). At the initial stage an interview with the coordinators of the seven clusters selected in Lithuania was arranged. The main aim of the meeting was to get information from a person who has been participating in the life of cluster from the beginning of it about the successful clusters in Lithuania. “As it is complicated to measure how successful cluster is some features were named as obligatory which characterize cluster and show how good it is at accomplishing goals, if the companies are working together for a common purpose. Measurements such as cluster activity, resources and processes must be taken into account” (Tvaronaviciene, 2015a). Successively, the managers were asked to give evaluations for indicators of cluster efficiency according to their importance so that a multi-criteria analysis could be carried out. A multi-criteria analysis was chosen for it serves in making a comparative assessment among heterogeneous measures. At the last stage the data was structured and a multi-criteria analysis carried out to prove the efficiency of the clusters. The results were compared through benchmarking.

Multicriteria SAW method. Multi-criteria methods are used for both theoretical and practical tasks since they are universal and enable to carry out a quantitative study for any complex phenomenon with many indices (Ginevičius, 2008). The multicriteria SAW (Simple Additive Weighting) method was applied to process the results. The adopted model embraces three dimensions of cluster activity, so called, “Resources, Activities, Processes” (Ziniu Ekonomikos Forumas, 2012). The work suggests an approach for cluster performance assessment, based on the multi-evaluation, which covers a wide range of indicators. We assume, that cluster effectiveness should be evaluated according to the suggested indicators. Let us explain the steps through which it was possible to get these values. First, as mentioned above, a questionnaire survey was delivered to clusters’ managers that decided to participate at the analysis. The questionnaire has been developed in collaboration with the ‘Science, Innovation and Technology Agency’ (MITA) of the Lithuanian Government. It is composed by two principal parts: in the first one, the managers were asked to give some data (for each indicator of Resources and Processes dimension) and an evaluation from 1 to 10 (for each indicator of Activities); while in the second one they were asked to attribute

¹ For further information about the clusters analysed, please refer to the European Cluster Collaboration Platform webpage, <https://www.clustercollaboration.eu/cluster-list>

a number of Importance to these indicators, still from 1 to 10 (Ziniu Ekonomikos Forumas, 2012). The next step was to sum the seven different evaluations up (since the interviewed managers were seven) of each indicator of the first part (Table 1).

Table 1. Data and respective Sum

	cluster A	cluster B	cluster C	cluster D	cluster E	cluster F	cluster G	Sum
units	1	1	1	3	2	1	10	19

Source: Authors' elaboration

Later on, we passed to the normalization: it was obtained dividing each number of the evaluations by the value of the indicator that refers to the evaluation. These values are included between 0 and 1 (Table 2).

Table 2. Normalization

	cluster A	cluster B	cluster C	cluster D	cluster E	cluster F	cluster G
units	0.052632	0.052632	0.052632	0.157895	0.105263	0.052632	0.526316

Source: Authors' elaboration

Then, the same process was carried out for the second part: first, the levels of satisfaction (from one to ten) attributed by the managers (still seven, because of the seven different managers) of the same indicators were summed. Therefore, to get the final weight, each of these numbers (numbers of importance) was divided by the respective sum that refers to the indicator (Table 3).

Table 3. Level of satisfaction and respective weight

cluster A	cluster B	cluster C	cluster D	cluster E	cluster F	cluster G	Sum	Weight
7	8	8	8	7	7	7	52	0.138298

7	6	7	7	6	7	7	47	0.125
6	6	7	7	7	5	7	45	0.119681
7	7	8	8	7	7	7	51	0.135638
							376	1

Source: Authors' elaboration

Finally, the last step was to multiply this weight by the respective final value (always seven final values for each indicator) obtained in the first part (Table 4). The values that refer to each cluster, obtained by this last multiplication, were summed up to get seven final results of each category (Table 5).

Table 4. Results of each indicator

Benchmarking was chosen as the most reasonable method of data analysis to serve the purpose of this article. As a process benchmarking, this method serves to compare the three main dimensions which reveal cluster efficiency: activity, resources and processes (Carpinetti, 2008). Based on this methodology, there must be a continuous monitoring performance of clusters. These indicators must be assessed at least once every two years, to verify the collection of relevant data clusters and interview survey methods. In order to increase cluster performance, it should be based on cluster performance assessment results, establishing appropriate incentive measures to ensure the changes in values and simultaneously ensuring the efficiency of the whole cluster.

Findings

Looking at 'Final results' table (Table 5), it is possible to compare clusters between them. Concerning the 'Resources' dimension, Cluster C and G perform high values specially for the reason why they have been receiving lots of financings and making wide investments. As it concerns 'Activities' dimension, Cluster C stands out again because it shows a clear satisfaction in the organization and logistic of the cluster. Then, with reference to the 'Processes' dimension, Cluster E demonstrates the highest value because it especially invests in training for developing the personnel. The aim of the research is to focus on Cluster B, Smart Food Cluster. We aim at analyzing Smart Food Cluster because it takes place in the agribusiness and agricultural sector and it is the most relevant to the ClusdevMed topic that is Sustainable Development. It is positioned in the middle cluster group with the E and G ones. By taking a look at each value of B, it is still in the middle level for 'Resources' and 'Processes', while it gets a relative higher value for Activities, taking part to the top of performance cluster ranking. What does it need to do to improve its performance? For instance, to develop the resources, it has to increase the skilled personnel (having a highest education) and raise the financing level, while to improve the activities it needs

to focus on the visual identification (i.e. logo, brand, image) and specially on the cooperation and technology transfer; then to show a better performance in processes, there must be an increase of the expenses in Research and Development and of the level of internalization of the cluster, that means a launch to import and export business. Cluster resources include all assets, capabilities, organizational processes, firm attributes, information, knowledge, etc. controlled by a firm that enable the firm to conceive of and implement strategies that improve its efficiency and effectiveness. Thus, in the language of traditional strategic analysis firm resources are strengths that firms can use to conceive of and implement their strategies. Here resources regard human resources and know-how, financial resources, infrastructure resources (Barney, 1991). Cluster activities regard the value chain that a firm operating in a specific industry performs in order to deliver a valuable product or service for the market. The idea of the value chain is based on the process view of organizations, the idea of seeing a manufacturing (or service) organization as a system, made up of subsystems each with inputs, transformation processes and outputs. Inputs, transformation processes, and outputs involve the acquisition and consumption of resources – money, labour, materials, equipment, buildings, land, administration and management. How value chain activities are carried out determines costs and affects profits human resources development, Cluster competitive situation changes, cluster innovation changes, Cluster internationality level (Jurevicius, 2013). Cluster processes are a collection of related, structured activities or tasks that produce a specific service or product (serve a particular goal) for a particular customer or customers. It may often be visualized as a flowchart of a sequence of activities with interleaving decision points or as a process matrix of a sequence of activities with relevance rules based on data in the process. They include Market activity, Marketing and public relations communications, internal communication, External communication (Competitiveness and Innovation Framework Programme, 2011). The clusters were selected paying attention to their performance regardless of the industry sector as for generic benchmarking. “As to agree with the principles for benchmarking (Carpinetti 2008), some restrictions were applied to this article”. In order to verify legal aspects of the study, statistical data are given in the normalized. All the benchmarking partners will receive the same type of information for perceiving mutual benefits. Benchmarking data will be communicated outside for study purpose as it was prior agreed with benchmarking partners. To sum up, after comprising all the steps that have been taken moving towards the results of this study, generic benchmarking process has been followed. At first cluster efficiency was determined as a subject of this benchmarking study. Then a coordinator of cluster development in Lithuania as a consultant for choosing the partners was approached. Later seven clusters were identified as the partners of the study four of which participated in the process of benchmarking. Further step was to collect and analyze data using questionnaire survey and multi-criteria analysis methods to serve the purpose. Finally, the results were implemented and monitored.

Results, Conclusions and Recommendations

This article aims at comparing the most successful clusters, in the given conditions, in Lithuania. After comprising all the steps that have been taken moving towards the results of this study, generic process has been followed. Cooperation and competition are factors that encourage the growth of clusters, both within and between them. Thus, Smart Food Cluster, that regards ‘Agriculture products’ and ‘Processed Food’, mainly arises in the Activities category where it has one of the highest values while in the Resources category shows medium-high values. By analyzing the cluster framework, we can say most of the clusters could perform better learning from some areas such as the Agriculture and Food one. They can adopt the same strategies or start a collaboration with it. For instance, they can improve in Resources on hiring more graduated people or increasing investments for cluster initiatives. While for Activities, they can show a better performance focusing on the image of the cluster in mass media or, even, sharing more knowledge and experience. On the other hand, Smart Food Cluster and the respective Agriculture and Food sector needs to improve in the Processes category: their values are between the medium-lowest of the analysis, for instance they can increase the R&D expense or the number of official agreements with foreign entities.

Abstract

The aim of this study was to understand how practical activities combined with exploration of digital simulators would allow the construction of basic concepts of electricity. By developing these concepts with children, we also wanted to potentiate the problem solving on this matter and contribute to lifelong learning. The qualitative research was developed in a fourth year class, with the participation of 16 students, aged between 9 and 10 years. Was organized in the following stages: initial assessment of knowledge, application of the teaching sequence and final evaluation. The data analysis revealed a significant improvement in students' understanding of the concepts. The use of the simulator allowed the students to test their ideas, and the actual assembly of the circuit with laboratory material allowed real verification of the hypotheses, creating new problematic situations. Besides, developing problem solving skills in learning, related to real contexts, enhances predisposition to lifelong learning.

Keywords: electricity, education, lifelong learning, technology

Introduction

According to Jaakola and Nurmi (2008), computer simulators and laboratory material have been used as substitutes, or as competing methods, in science teaching. The authors refer to studies carried out over the last 30 years, which have shown that students hold informal conceptions that sometimes differ from those scientifically accepted. More specifically, in the field of electricity, before any formal education takes place, students have difficulties and misconceptions regarding electricity and electrical circuit concepts at all levels of schooling (ibid.). This idea is also defended by Silva (1999, p.9): "In addition, electricity is a domain that many students consider difficult and in which often intuitive and scientifically inadequate ideas persist."

Also Arnold & Millar (1987), who developed and applied electrical circuit classes based on a constructivist model of curricular teaching and development, argue that it is generally accepted by teachers that electricity is a difficult topic to teach in the early years of teaching, because the concepts correspond to properties that can not be observed directly and sometimes the equipment used can break the visual correspondence to the design of the circuit. They also point out that the students construct their learning from the ideas they already have on the subject and as such, it is important to think about the lessons taking into account what the children already know. According to Jaakola & Nurmi (2008), concepts of electricity often require conceptual change, and as such, the school must cause students to experience the phenomenon, as this can help them to organize the conflict between knowledge and new concepts. The main purpose of laboratory activities is to provide students tools to investigate the phenomenon using material to be manipulated. Although the use of laboratory material has a long history and an important role in science teaching, some authors have questioned the efficiency of laboratory material work, such as (Hofstein & Lunetta 1982, 2004, Kirschner & Huisman 1998, cit. Jaakola & Nurmi, 2008). They argued that understanding complex phenomena such as electricity through the manipulation of laboratory materials can be problematic because in some cases students can only see what happens on a superficial level and do not perceive the invisible mechanisms that are essential for understanding some concepts. Resnick (1998, cit. In Jaakola & Nurmi, 2008) argues that the most important is "active manipulation," rather than the manipulation of palpable things. This may indicate that the laboratory equipment can be replaced by the virtual one. The use of virtual simulators in physics teaching can make the content more understandable.

With the simulator, students can experiment by constructing different circuits, changing circuit variables and observing the consequences of what they do. In addition, the simulator can be a "cleaned-up idealized version of the complex messy real word" (ibid. p.272). This makes the simulator to be seen as a promising tool for

conceptual change. Also Lima & Takahashi, developed and applied a teaching methodology for students of the 4th elementary school year with the objective of starting the construction of some concepts of electricity through the use of a virtual simulator. The analysis and development of students conceptions, during the activities carried out, showed that virtual experimentation allowed the development of some cognitive abilities and showed signs of formation of concepts at the formal level. (2013, p.1).

However, according to Jaakola & Nurmi (2008), students learn in a completely different environment from the scientists environment, that can simplify complex systems too. Students do not always believe that the principles used in virtual simulation will work in real life. In this case, simulations are not enough and as such more concrete experiments are needed. As a solution, combining activities with virtual simulator with laboratory material can improve learning. And it is for these reasons that we should not see simulator activities and the use of laboratory material as competing or substitutable activities, but rather as complementary. In the study developed by these authors, the results highlight the benefits of using the simulator with the laboratory material to promote students understanding of electricity concepts. The simulator helps students in understanding the theoretical principles of electricity, however, to promote conceptual evolution, it is necessary to challenge students to apply conceptions using laboratory material.

Problem statement: the main problem issue that arises in this study was to understand how practical activities combined with the exploration of digital simulators allow the construction of basic concepts of electricity, namely: the nature of electricity, the notion of electric circuit and the conductivity of materials.

Method

The research was developed in a fourth year class of elementary school, with the participation of 16 students, aged between 9 and 10 years. As Almeida & Freire (2008, p. 24) point out, "The complexity of psychological and educational phenomena is much greater than the phenomena, which are regular and transposable to the laboratory, which we find in the natural sciences. In fact, observe and understand the process of construction of the concepts is a complex process, dependent on multiple variables (environmental, psychological, social, emotional) that can not be isolated from one another in the real context. Moreover, it's not the aim of this study to prove the effectiveness of the approach or to measure any of its variables, but rather to try to describe and understand the processes, considering and assuming the complexity that characterizes them. So, this is a qualitative research, Bodgan & Bilken (1994, p.16) says that we use the term qualitative research as a generic term that groups several research strategies that share certain characteristics. The data collected are referred to qualitatively, meaning rich in descriptive details about people, places and conversations, and complex statistical treatment.

Throughout the investigation, a number of methods of data collection were used, namely the application of questionnaires of knowledge verification and the direct observation. De Ketele & Roegiers (1999, pp. 22-23) define observation as "a process that includes voluntary attention and intelligence, driven by an ultimate or organizing goal and directed towards an object to gather information about it." In this sense, it is vital for the researcher to embark on research with a clear idea of the object, modes and purposes of observation.

Table 1 summarizes the data collection methods and instruments used at each stage of the study.

Table 1. Research steps and data collection

Research steps	Method of data collection	Instruments of data collection
Prior knowledge assessment Application (lessons)	Knowledge verification questionnaire Observation of the children's interactions with each other, with the teachers and with the materials available	Pre-test Audio recordings of teacher-student interactions; field notes;
Final assessment	Knowledge verification questionnaire	Post-test

Pre-test: The first step of the study corresponded to the application of a pre-test to the students in order to evaluate their prior knowledge. This test had the dual objective of establishing the initial state of the conceptions of the children and of allowing the collection of data necessary for planning the lessons in order to adjust the teaching-learning process to the context. The questionnaire was validated by three specialists, after that it was applied a pilot test with 4 children of the same age. The final version, applied individually to each participant, was organized into 3 questions corresponding to different levels of complexity.

The first question aimed, through the placement of a problem, to verify if the students were able to point out possible causes of failure of an electric circuit. The second question aimed to understand which concept of nature of electricity the students have. In the third question they were asked to draw the electric circuit of a lamp and name its components. The main objective of this question was to understand the concept of electrical circuit that students have. This question was divided into three parts: identification of materials, concept of electrical circuit and function of the components.

The answers obtained through the application of these questionnaires were the subject of a content analysis, for which the analysis categories described in table 2 were created.

Table 2. Detailed category analysis

	Identification of materials	Code
able	Correctly identifies the materials of the components, including the internal components.	30
almost able	Correctly identifies the external materials of the components.	21
has difficulty	Correctly identifies the internal materials of the components.	22
	Correctly identifies some component materials, including some internal component materials.	11
	Correctly identifies some external materials of the components.	12
not able	Correctly identifies some internal components materials.	13
	Does not identify any of the component materials.	0
Concept of electrical circuit		
able	Correctly represents all the components, connects in the correct order and represents all the conductors.	20
almost able	Correctly represents all the components, connects in the correct order, representing only the electric cable.	11
	Correctly represents all the components, connecting them in the wrong order.	12
	Correctly represents all the components, except the switch, connects in the correct order and represents all the conductors.	13
not able	Correctly represents all the components, except the switch, connects in the correct order, representing only the electric cable.	14
	Only represents a few components.	0
Function of components		
able	Correctly identifies the function of all components.	20
almost able	Correctly identifies the function of some components.	10
not able	Does not identify the function of any of the components.	0

Application: It was divided into two sessions of 120' each. In the first session the students were challenge to turn a shoebox into a classroom exit light. Some teachers use a "traffic light" as an instrument for regulating the trips to the bathroom, which, when indicating the exit of a student, signals to others that they should wait for their return to go as well. The device the students were challenge to create intended to perform a similar function because in the classroom where the research was done it can only leave the room, one student at a time.

The whole class discussed what they would need to make the classroom exit light: how can we build it? what do we need? In the next moment, the students worked in groups (of 4 elements), to respond to the proposed challenge. In order to plan the construction of the simulator they had a script, in which they designed, drawing, how they could transform the shoe into the classroom exit light, also schematizing the electrical circuit of the equipment. During the group work the students contacted with some electrical material (lamp, wires, battery) to familiarize themselves with them. When they had already planned and schematized the circuit the groups the groups tested the hypothesis created using a virtual simulator (<https://phet.colorado.edu/en/simulation/legacy/circuit-construction-kit-dc-virtual-lab>). The exploration of the simulator allowed to create and test different circuits. Through the exploration of the tool resources, they could also experiment the behavior of materials with different levels of conductivity. After testing their ideas through the virtual simulator, the groups were able to make adjustments to what they had designed and make the list of materials they would need at the next session. In the second session, the students, organized in the same groups, received the kits with the laboratory material to begin the construction of the circuit, according to what they had requested. All groups would have at least one lamp, one lamp holder, one 9v battery connector, power cords, and a switch. The groups were supported during the circuit construction, since the handling of the materials could be difficult for some students.

Post-test: The post-test was applied one week after the described activities. A questionnaire survey of similar structure and questions that corresponded to the same cognitive levels were made, in the same way as the pre-test, although they were different from the latter in the context.

Findings

In the pre-test, in the first question, most of the students pointed out as reason for the lamp not to work the lack of electricity, with answers such as: lack of light, the wire is not plugged in, electricity is not working, three students said that the lamp was fused, only one pointed to a problem with the wire and two others pointed out other reasons (the lamp does not turn on because it is not pressing the right button; it is damaged).

In the second question, most students (11) said that the knot would have influence on the workings of the lamp, which leads one to think that most students could see electricity as a fluid and that the knot blocks the passage, with answers As "the node can ignite the lamp", "with the knot the electricity does not pass" and "the knot holds the connection". Only four students reported that the knot had no influence, one of these students justified his answer with an experience lived in the daily "I already had a knot in my lamp and it was working" and a student gave another reason: "No, the lamp may be in bad contact, so the lamp does not turn on".

In the third question (identification of the materials), four were able to identify the external materials of the components and the others did not identify any material. Regarding the configuration of the circuit, only one correctly represented all the components, connecting them to each other in the correct order, two represented all the components except the switch, two represented all the components except the switch representing only the electrical cable and 11 could not represent the electrical circuit, representing only some of the components.

Concerning, the function of the components, only three students correctly indicated the function of some components, even though they themselves were drawing them. It is possible that the lack of answers in this item is due to forgetfulness or deficient understanding of the statement of the question, Since it is unlikely that the vast majority of pupils would not be able to identify, for example, the lamp they drew, so it would be prudent not to draw conclusions from the results.

In the first session of the application, when students were challenged to turn a shoebox into a classroom exit sign, some students said that it was not going to be possible because the box did not connect to the electricity.

teacher: Could we use this box to make a classroom exit light?

student: No ... because there is no electricity.

The teacher told the students that they were not going to have only the box and questioned them about other materials that could be useful for building the classroom exit light. They said they needed a lamp and wires and were asked about the type of wires to choose. They said that the wires could be plastic, external material of the electrical wires they have contact with. Another student said that the charger of his mobile phone had already been damaged and inside the wires were not plastic. Teacher showed the electrical wires he took with him.

teacher: you see, on the outside this is a plastic but inside ...

student: it's wire

student: my mobile phone charger has cut a bit and inside it is like this

teacher: so they can not be any cables, right?

student: yes, they have to be metal.

The teacher also questioned the students about the function of the cables and, following the discussion, the students ended up thinking about the battery as a power source, coming at a notion of circuit.

teacher: we already have, a lamp, wires ... but how many wires?

students: 2,3...

teacher: why 2? Why 3? What are the wires going to do?

students: connect the electricity to the lamp

teacher: so the electricity has to come from somewhere... for our classroom exit light, where could electricity come from?

students: from the electrical switchboard or the jack.

teacher: what if we wanted portable electricity? Is there any device that works without being connected?

student: computer...when it has battery.

teacher: So what could we have in our classroom exit light to give energy?

students: a battery!

teacher: so we already have: a battery, a lamp, wires...

Then, they began to work in groups of 4 students, each group has at least one student that, by the results of the pre-test, had shown a good notion of electric circuit. The constitution of heterogeneous groups was a deliberate strategy to stimulate peer learning.

In this session, the groups planned to construct the classroom exit light using a script. The teacher circulated with the material (a lamp, two wires and a pile) by the groups so that they had contact with the material. All groups were able to make light up the lamp. Some students reported being afraid of working on electricity.

teacher: to try we can only pull the wires to the lamp.

students: and if I put the finger there, does it shock?

teacher: No ... we always have to be careful but there is no problem here.

teacher: Here, do you have any idea to build the classroom exit light?

students: yes! we'll need two lamps. And we have to have a button or we take the wires off the plug

Also in this session, the groups experimented with the virtual simulator, tested the circuit hypothesis they had built and did other tests, using the simulator tools. For example, they tried to connect the two wires to the same lamp pole and questioned whether the actual battery would actually burn, as it did in the simulator. They realized the need to put the switch on and did a test to see where they could put it. The exploration of the possibilities of the simulator also allowed to test the levels of conductivity of different materials, making important conclusions from this observation:

teacher: We can experiment with other things ... instead of a thread we can connect...

student: a pencil! An eraser ... can we experiment with the pencil?

students: the pencil did not turn on the light...

teacher: want to try something else?

students: yes, the note... but it will not work.

students: let's try the coin!

teacher: the coin is made of a material that conducts electricity well.

student: so the clip also works.

student: because the clip is made of metal is almost like a wire.

It quickly became apparent that the enthusiasm of each discovery encouraged them to test more ideas. The same students who were just afraid to touch the wires were now experiencing ideas freely without fear of possible consequences (after all it was just simulation). One group said two switches were required: one to turn on and one to turn off. They also wanted to test with more than one battery and as the lamp gave more light, they wanted to order more batteries for the classroom exit light. Two groups wanted to use two lamps and explored the simulator to see how they could do it.

teacher Now let's build the circuit you design!

students: Ok. So we want two lamps and one battery maybe if we put two batteries was easier.

student: Is it possible that a battery can connect the two lamps? Let's try.

students: we connect the battery and the wires to the lamp

students: And the other lamp? It's next to the other lamp.

students: It Works... but it has low light...

students: and is missing the switch!

teacher: And where are we going to put it?

students: we have to connect to a wire...

After the activities with the simulator, the groups had time to design again the circuit and to make the list of materials that they would need for the construction of the circuit.

The second session began with a brief review of what had been done in the first one, since there were students who had not been present at the first moment. The other students of the groups in which they were working also endeavored to help them to understand, when working in the groups, which corresponded to the expectations they had created when creating heterogeneous groups.

Then the groups received the kit with the material they requested. Two groups received, in addition to a screwdriver, a lamp, electrical wires, switch, battery connector and the other two received two lamps, electrical wires, switch, battery connector and a screwdriver. During this session the teacher followed each group because they needed a lot of support in handling the materials. The screws of the lamp holder and the switch and make the connections were very meticulous. Concerning the construction of the circuit, there was little doubt when confronted with the selected materials, since some issues had arisen in the first session during the design of the circuit. However, the doubts that arose were related to the placement of the switch in the circuit.

The real assembly of the circuit implies, to a certain extent, a reconfiguration of the same. Although the topology is maintained, the arrangement of the components and, consequently, the spatial relationships between them is changed. It is not a transposition of the scheme into the circuit, it stimulates the students to mobilize in the task the thought built up during the previous session. Moreover, the appearance of small problems such as a poorly stripped wire that does not let the circuit work, again requires the ability to mobilize the concepts at a higher cognitive level to create and test hypotheses for resolution.

teacher: Something is badly connected, it should not be making contact

students: what a fright! (the light came on)

teacher: Don't worry, press the switch! Why was it not working at first?

students: Because it was touching the plastic and not the screw and so the electricity doesn't flow.

teacher: well done!

All groups were able, at about the same time, to reach the end of the session with their built-in classroom exit light. Although the circuits were identical, the exit lights were a construction of each group and as such the class had 4 different end products that will be used in the class for weeks. In one week, one group, the next week another group, and so on.

After the application of the post-test, the answers were categorized and compared with the analysis of the pre-test answers. Regarding the first question, figure 1, shows that the number of valid answers increased between the application of the two tests. In the post-test, no student provided an incorrect answer to the operation of the circuit, which seems to indicate that the strategy applied improved the understanding of circuit operation.

Figure 1. Data analysis of question 1

In question 2, figure 2 also shows a very marked evolution, with only three of the answers still showing some misunderstanding of the concept. It may be said that the fact that the students had had the experience of knotting and the current flows, made them understand this question.

Figure 2. Data analysis of question 2

Concerning question 3, identification of the materials, (graph 4) 6 correctly identified some component materials, including those of which they are internally constituted, 7 correctly identified some external materials of the components and 3 did not identify any of the components materials. Here, it is possible to also verify a large difference between the pre-test and the post-test, in pre-test 12 they did not identify any material and 4 identified only some external materials.

code 0: Does not identify any of the component materials.

code 11: Correctly identifies some component materials, including some internal component materials.

code 12: Correctly identifies some external materials of the components.

Figure 3. Data analysis of question 3 – identification of the materials

In relation to the concept of electrical circuit, it is possible to observe in graph 5 a transfer of the number of responses in the lower levels of performance to the highest ones, evidencing clearly an evolution in the capacity to idealize and represent the electric circuit. The number of students who correctly represented all components connecting them to each other in the correct order (code 20 + code 12) increased from 2 in the pre-test to 11 in the post-test.

code 0: Only represents a few components.

code 12: Correctly represents all the components, connecting them in the wrong order.

code 13: Correctly represents all the components, except the switch, connects in the correct order and represents all the conductors.

code 14: Correctly represents all the components, except the switch, connects in the correct order, representing only the electric cable.

code 20: Correctly represents all the components, connects in the correct order and represents all the conductors.

Figure 4. Data analysis of question 3 – Concept of electrical circuit

Conclusions

1. Overall, the comparison of pre and post-test results reveals a significant improvement in students' understanding of the concepts analyzed.
2. The observation of the learning process has highlighted some of the advantages of this intervention methodology, namely:
 - a. The use of the simulator allowed the students to test their ideas, as well as different types of materials in a simpler way than using the laboratory material and without fear of manipulation;
 - b. The possibility of rapid testing (and immediate feedback) and no risk on the simulator encouraged students to experiment beyond what they had initially been asked for;
 - c- The real assembly of the circuit with laboratory material allowed the real verification of the hypotheses and created new problematic situations that required the mobilization of the previously constructed concepts, in real situations.

The data presented allow us to consider that day-to-day problem solving by children, in context, is essential for the development of scientific skills and enhances predisposition to lifelong learning.

Abstract

This study is focused on the analysis of the subjective and objective values of the teachers who extend their formal education in the process of lifelong learning in the Czech Republic. Formal education of the teachers is mostly organized by the Lifelong Learning Centers as parts of the Universities, that react on the current norms and laws issued by the Ministry of Education, Youth and Sports of the Czech Republic. Objective values of the teachers who attempt to extend their formal education in the Lifelong Learning Centers are actually discussed in the form of the norms, laws and other legislative documents. The educational system of the Czech Republic opens an issue of a new career system and a standard of a teacher, that would in a close future legalize the universal (objective) perception of the teacher's role and status. The new career system is expected to support the teachers' motivation, which would increase the quality of the educational process of the whole society. Moreover, we cannot miss the fact, that the new career system pushes the teachers to continue in their own formal education, which might cause the devaluation of the values that are natural to the teachers work. The vision of the financial stability seems to motivate the individual in the short-term, but at the expense of this value the implemented change in the expected career system loses its added value, i.e. historically embedded concept of teaching as a mission, not only an exhaustible resource based on the short-term financial motivation of an individual at the expense of the society. Subjective value orientation refers to the intrapersonal value system of the teachers extending their formal education and to their perception of values in connection to their future career. Sub aim analyses the teachers' specific limitations, which they usually have during the process of their formal education and preparation for their future career of the teachers. The most common limitations of the teachers are reflected by the qualitative research results of the students in the formal educational process and describe the typical obstacles which are connected with their study. The methodological part is focused on the presentation of the research results and the obtained data. The questionnaire includes the questions regarding the perception of the general values in the society, the values closely related to the teacher's profession and the factors influencing the perception of the individual. The results of the research reflect the current personal (subjective) values of the teachers in the process of formal education in comparison with the legislation of the new Education Act as the objective value system regulated by the state. The recommendations reflect the ways how to solve the implementation of these attitudes into the Czech school system with its close connection to the teachers' comments on the career system as the main methodological support of the novelization of the future formal educational system.

Keywords: Formal education, Attitudes, Values, Career system, Limitations

Introduction

The current situation of a teacher in the Czech Republic is an open and widely discussed issue because of the forthcoming application of a new career system to practice, which should result in a motivation increase of the current and future teachers not only from the standpoint of existential conception of social status, which is today quite devalued. The teachers feel overlooked by the society and many of them lose basic human values due to the increasing pressure of the contemporary society of the 21st century. The teachers are irreplaceable among the advocates of positive values in a moral context. According to Lind (2003), moral values can be seen as an inherent part of the educational process. We recognize a variety of values in the society where we can rank the most acceptable and traditional values, such as solidarity, legal recognition and love. (Honneth, 1996: 34). These values are conceptually based on social pressures and are passed on from generation to generation and can be considered as a key in the initial value education because we transfer them from family circles to the next phases

of our lives. Material values have been a measure of luxury and prestige from the beginning of mankind. Traditional values have been oppressed and leave teachers in opposition to the situation of current society. The teachers are consequently forced to become the erudite experts on ethical factors and work with the value based components of teaching that are conditioned by the subjectivity of each of us.

The support for teaching is organized in the Czech Republic by the institutions of the Ministry of Education, Youth and Sports and National Institute for Further Education, which are the creators of all legislation with the participation of the professional public and academic consultants. Currently, the support for teaching and teachers is anchored by the concept of the Education Policy Strategy for 2020 which broadly defines the bases of lifelong learning necessary for the curricular concept of all the pedagogical workers who are currently forced into further professional development. The situation gradually led to a forming of a more sophisticated form of the implementation of the application of the career system. This document was approved by the government at the beginning of the year 2017, but its validity is still in a state of uncertainty as the implementation date of this document has been postponed indefinitely. Basically, the situation is currently in a vicious circle, and teachers are the victims of this step. The career system is also linked to the need for change in teaching for the future teacher's generations. These changes are necessary to be conceptually elaborated not only from the cognitive perspective, but they also need to internally prepare for the affective teaching components that are required in the teaching position. This radical change will not only be faced by primary or secondary teachers but also by the university teachers because they will have to be able to react more flexibly to the legislative big bang, which will affect settled systems of values in already quite demanding teacher's profession.

The universities are strongly aware of the fact that an unprepared system that only supports career growth motivation would not be suitable to those teachers who even now respect the essence and necessity of the continuous improvement of work with pupils. This new system can fundamentally influence the inner attitude towards the teacher's profession and might push the essence of the teacher professional growth on the blind track. (Janík et al., 2014).

The current system of further teachers' education and its legal support

The OECD report on the key data on teachers in Europe (2013) shows that most countries consider further professional development as a professional duty of teachers. In addition, in some countries, participation in the further professional development is a necessary part of the career and financial growth. In many European countries, schools have a duty to provide employees with a further career development plan, but less than one third of the countries require teachers to have their own educational plans.

The area of further teachers' education (DVPP) is defined in the Czech Republic by several legal regulations. Among the most important are Act No. 563/2004 Coll., On Further Education of Pedagogical Staff and Implementing Decree of the Ministry of Education, Youth and Sports and the Act No. 317/2005 Coll., On Further Education of Pedagogical Staff, the Accreditation Commission and the Career System of Teachers.

Act No. 563/2004 Coll., On Further Education of Pedagogical Staff regulates the prerequisites for the activity performance of the pedagogical worker, performance prerequisites for the function of the school headmaster and establishes a system of further teachers' education including the general principles of their career system. The Amendment to the Act on Pedagogical Staff introduces changes in the acquisition of professional qualifications and proposes a solution of the unskilled teachers problem.

According to the Program Declaration of the Government, the Ministry of Education, Youth and Sports prepared a draft amendment to Act No. 563/2004 Coll., which supplements the existing career system of teachers by the new career path - the path of the development of professional competencies. Until now, teachers can only choose career paths to perform specialized activities at school (e.g. specialization of school prevention methodist, educational counselor, etc.) or to go for the leading position in the school.

The Decree of the Ministry of Education, Youth and Sports of the Czech Republic no. **317/2005 Coll.**, On Further Education of Pedagogical Staff, the Accreditation Commission and the Career System of Teachers provides a comprehensive overview and division of the individual types of further education and subsequently sets out the brief characteristics of the training. An important part includes a framework definition of the content of individual types of further teachers' education (DVPP), resp. setting of their minimum duration in the number of lessons. The specific conditions for the content of individual study programs to obtain accreditation under DVPP are mentioned in so-called Standards of Further Education.

Lifelong learning providers are very diverse institutions, which include universities, technical institutes, secondary schools, primary schools, private institutions, non-profit organizations and others. In general, an applicant for accreditation of an educational institution providing DVPP may be any individual or legal person fulfilling the conditions set in paragraphs 1 to 3 of § 26 of Act No. 563/2004 Coll. In simple terms, it is an institution that applies for accreditation of an educational institution. Beside others, institution must also prove its level and guarantee the quality of the provided education services (e.g. authorization to provide training, overview of the applicant's personal, material and technical equipment, overview of the applicant's current activities in education, references, etc.).

List of all accredited institutions and programs is reported by the Ministry of Education, Youth and Sports through, and published at the beginning of the school year in the Ministry Bulletin and on the Ministry's website. The accreditation of the institution and the DVPP programs is granted by the Ministry on the recommendation of the Accreditation Commission, which is established as its advisory body.

Among the major institutions providing teachers' further education is the National Institute for Further Education (NIFE), which prepares and offers lectures, courses and seminars for the further education of teaching staff. NIFE has a national competence and focuses primarily on those topics in the education of pedagogical staff, which need to be addressed flexibly and on a nation-wide basis. At present, NIFE priorities include, for example, curriculum reform education, school management education, or language learning, the need of which is linked to the increasing demands on language skills of teachers. In addition to the practical preparation and implementation of educational programs, the NIFE also focuses on the analysis of needs in the further education of teachers and its concept formation.

An important institute for the further teachers' education of is also the Faculty of Education of the Palacký University in Olomouc, which, through its department "Lifelong Learning Center", satisfies the educational needs for approximately 1500 applicants per year.

Proposed career system Concept for the Czech Republic in relation to the teachers' value orientation

The realization of a comprehensive concept of teacher and career guidance was launched in March 2012 under the auspices of the National Institute for Further Education within the framework of the *Career Regulation* project in cooperation with the working groups of the Accreditation Commission, the Association of the Teaching Profession, deans of faculties of education, etc. The aim was to develop a career system that promotes the teachers' lifelong professional development and links it with a remuneration system.

The core of a new teachers' career system is supposed to be a three-level teacher's standard, which should support teachers' professional competencies and increase the quality of their work. The standard is designed as a tool for achieving, maintaining and enhancing the quality of the teacher's work, and also affects the extent of the teacher's work at school.

The proposed standard has three areas:

- the area of personal professional development (formerly the Teacher and his/her Professional Self)
- the area of teachers' pedagogical activity (formerly the Teacher and his pupils)
- the area of cooperation and participation in the school development (formerly Teacher and his/her Surroundings)

Part of the development of teachers' professional competencies is also an adaptation period for a novice teacher. The incoming teacher would be supported by his/her employer for two years of mentoring (MŠMT, 2017).

According to project organizers, the introduction of a career system should increase the quality of the teaching profession and of teaching as a whole. The teachers' career system aims to increase the quality of schools, to change the priorities of their management, to improve the work of teachers and ultimately to improve pupils' results.

In spite of some critical responses, the new concept of the teachers' career system reinforces the value of motivation for further education, as well as supporting the professional prestige confidence and legal framing of the image of a teacher in the form of an objective standard. The reinforced values cannot be understood individually or separately as they are interrelated. The personal hierarchy of values and goals may change over time, for example, with age or in lifelong learning process. The personal hierarchy of values is often consistent with the system of values and goals of the society in which the individual lives.

According to Horák (1996, p. 12), *"The value system is defined by some authors as a set of values that the individual recognizes and value orientation as a complementary process, which is a condition for the formation of human individuality. It is a process of mutual conditioning and intermingling of the values and value orientation. Therefore, we can define the value orientation as the individual selective focus on the creation and use of values. The value system and value orientation are complex systems of different kinds of beliefs and attitudes that the individual takes in relation to the reality."*

O'Connor (2008) develops the concept of identity that can influence the individual value orientation. He argues that differentiating one person from another is linked to how the person is individually perceived by other people. In this case, the (professional) identity is defined by how the personality is perceived by its environment. In Czech conditions, teaching is still considered to be a prestigious profession and, according to sociological research, it occupies immediately after the doctors the highest places on the prestigious professional rankings (Vašutová, 2011). However, Vašutová (2011) further notes that the teachers themselves evaluate their professions far lower than it is evaluated by the general public in comparison with other professions.

Problem statement and sub-problems (hypotheses)

The core research problem was the hypothesis whether teachers attending formal education at Faculty of Education of Palacký University perceive values in a comprehensive approach to the current pressures of planned conceptual changes and society. The partial aim was to identify the most frequent limitations and factors faced by teachers in the process of further formal education.

Methodology

The research (March, 2017 – Kropáč, Koribská: Research on Value Orientation of Teachers in Formal Education Process) was quantitatively focused on the objectivity of the survey. The data collection tool was a questionnaire focusing on values and their subjective reflection in relation to the teacher's profession. The questionnaire contained open and closed questions, the Likert type scale.

The research sample consisted of formal education participants in combined study at Faculty of Education, Olomouc. A total of 700 respondents (deliberately selected for the purposes of this research) participated in the survey. The research sample included teachers who were subsequently categorized into age groups according to the range from 22 to 37 years and 38 years old teachers and more. The age range is also connected with the length of the professional practice, which was selected on a scale of 1 to 7 years. The workers, who are not qualified teachers, but belong to the legislative framing of a pedagogical worker without direct pedagogical activity according to the Education Act of the Ministry of Education.

The research question was how the teachers in formal education process perceive the values needed for the teacher's work and whether the traditional values disappear from the present school replaced by material values

in relation to financial resources and other commodities. The partial objective was to identify the most frequent factors that represent limitations in achieving the goal during the formal education. Another partial objective was to identify the needs of formal education in the context of the current formal education courses offer following the current amendment of the career system.

Findings

The formal offer of the educational programs in the framework of lifelong learning is considered by more than 81% of respondents to be sufficient, 74% of the surveyed respondents were satisfied with the offer of given branches. In relation to the career system, it is necessary for the organizers of the educational programs to respond flexibly enough to the needs of the educational offer covering all the aspects of the individual development. If the offer is not sufficient enough, it would not make sense for participants in lifelong learning to complete these courses.

The next part of the research was focused on the perception of the value concept of the pedagogical workers. In a reflection of the measured values, 98% of respondents perceive values as a necessity for carrying out their pedagogical mission. The perception of values in today's society is not a matter of course, so we also asked the respondents about the most frequent values from the interpersonal perspective. Respondents most often chose the value of life as the primary element for mental transcendence and the reflection of their own values towards the others in the society. Furthermore, the respondent chose sociologically-oriented characteristics of values, such as cultural, ethical and religious roots that significantly shapes the image of the teacher. In the next part of our findings, we investigated the transformation of mental values towards the demands of today's socially stratified phenomena and the views of the teaching profession. Here we talk about the economic values and values that reflect the current state of affairs. Over 75% of respondents do not find values as something that can be measured in our globalized society. The value of money is only an indicator of well-being, not the ultimate value of a participant in lifelong learning and the aim of the further education. The career system primarily motivates teachers to improve the economic situation and more than 65% of respondents perceive their motivation as sufficient and fulfilled at the moment. The most frequent reasons for motivation include professional beliefs, religious reasons, and fulfillment of life's mission, meaning of life and the pressure from the employer.

Last but not least, it is necessary to mention the perceived limitations experienced by the teachers in the process of the further formal education. As a key limit, 80% of respondents see the formal education as time-consuming and perceive this phenomenon as a main obstruction. It is also necessary to take into account the catchment area / availability of the area in which these courses for pedagogical staff are located. Last but not least, it is necessary to highlight the budget limitations on the part of the educational participants and their employers, who partly pay the costs. Many respondents state that budget limitation forms a great barrier between a satisfactory and high quality offer of formal education offerings, which results in giving preference to low-cost education offers.

Figure 1. The Survey Answers on Limitation During Formal Education

Among the most frequent limitations, the teachers in the process of further formal education rank time demands, location availability, economic burdens and legislative barriers from the perspective of the dynamic change of the curriculum documents. Other limitations include employer obstructions, personal and family barriers and health problems.

Results, Conclusions and Recommendations

Traditional formal concepts of values in the pedagogical practice of the teacher have not disappeared, they only have shifted from secondary values to the primary values. If teachers see the economic values and financial values of motivation as a secondary factors of their value system, this is only good. Primary values embedded in culture, which under the pressure of legislative amendments disappear from the teacher's main content, can now be regarded as an anachronism. The system of values that the teacher forms, does not persist in the short term for reasons of legislative amendments but on the basis of his/her own conviction and self-efficacy. If the educational offer for teachers sufficiently extends these attributes of educational values that are primarily focused on the benefits of society, not in relation to the egoistic concept of an individual, the future of the concept of formal education can be considered to be value-based. However, it is necessary to remember the constant anti-valuation (counter-value) pressure, which brings only parasitism on the current system without reflecting the present values that make us what we are - people and teachers.

Possibilities of Leadership and Tactical Training Evaluation

Jaroslav KOZUBEK¹

¹*Head of Department, University of Defence in Brno, Faculty of Military Leadership, Department of Tactics Email: jaroslav.kozubek@unob.cz*

Abstract

The article is focused on description of outputs of experimental exercise utilizing the tactical virtual simulator Virtual Battle Space (VBS) as the suitable tool for evaluation of cadets' (military students) leadership skills, which were divided into three areas. This experimental exercise was organized as the part of Visegrad Fund research project "Better cooperation for better operation of the future Visegrad EU Battle Group". Furthermore the article is focused on possible proposals to use virtual simulation technology as experimental tools for evaluation of cadets' leadership and tactical training including part of theory, indoor (lab) exercise; computer aided (assisted) exercise and finished by field exercise and the seminar at the end of training cycles.

Keywords: Leadership, Skills, Simulation, Evaluation, Experiment

1 Visegrad Group Scientific Project

The education of new officers should comply with the intellectual development of a professional who is deployable in contemporary multinational operations. Thus, the educational integrating element should become a commonly accepted standard of knowledge and competence that would allow cooperation within the international staff/unit environment. (Pikner, Galatik 2016: 419).

The Czech Republic as the Visegrad Group (also called the Visegrad Four, or V4) member participated in international scientific project "Better cooperation for better operation of the future Visegrad EU Battle Group" granted by Visegrad Fund. The project was oriented in research area of Security and Defence. The lead nation of the project was Poland. Each V4 country contributed in the project by team of academic workers from military academies and universities. The Czech Republic was represented by University of Defence in Brno, Poland by The General Tadeusz Kosciuszko Military Academy of Land Forces in Wroclaw, Hungary by National University of Public Service in Budapest and Slovakia by Armed forces Academy of The General Milan Rastislav Štefánik in Liptovsky Mikulas.

1.1 Project introduction

The aim of the project was to compare the systems of V4 countries officers' education and to present recommendations in the context of V4 Battle Group formed in close future. The project outcomes were oriented to enhance cooperation among officers of V4 countries in the future peace support and crisis response operations and to provide valuable cognitive knowledge for improving and enhance the actual study programs in order to prepare cadets as future officers for operating within multinational military structures.

The project working group decided to:

- Divide project into three phases:
 - a) **Workshop** in order to establish all necessary conditions for experiment;
 - b) **Experiment** in order to check cadets' skills and get relevant outputs;
 - c) **Conference** in order to present project outputs and recommendations.

- Create Observer and rating team:
 - two academic workers from each institution,
 - well experienced in area of planning process and NATO Peace Support Operations,
 - in rank of higher officers.

- Select appropriate group of cadets for evaluation:
 - four cadets from each institution,
 - cadets has to finish second year of study,
 - English language proficiency at minimum level of STANAG 6001 SLP2222,
 - Field of study has to be similar and focused on leadership.

- Write up and issue Study book;
- Create Evaluation report working group;
- Elaborate financial calculation to cover all costs.

The most significant and crucial part of the project was computer based experiment which was organized as the experimental exercise (EXPEX). Article will describe the EXPEX as the method of research work.

1.2 Experimental exercise

In military point of view the EXPEX was designed as the category of Computer Assisted Exercise (CAX) and the training method was considered as the Synthetic Exercise (SYNEX) where the enemy and selected friendly forces were generated, displayed and moved on virtual simulator by both artificial intelligent and administrator commands. The cadets who were verified could operate their own forces directly by commands via keyboard and mouse or remotely by verbal orders via simulated tactical radio networks (Combat Net Radio, CNR).

EXPEX was designed to create as similar as possible operation conditions to adequately verify/evaluate cadets in three categories of knowledge and skills which are essential for their future officer's career. The chosen categories of knowledge and skills allow Observer and rating team to evaluate cadets during both planning process and leading assigned tactical missions in multinational environment. Tactically there were executed most often tactical missions within the scope of NATO Peace Support Operation (PSO).

1.2.1 Simulation tool for experimental exercise

As the most appropriate simulation tool for EXPEX was chosen tactical virtual simulator Virtual Battlespace (VBS). The VBS is fully interactive, three-dimensional, game-based platform designed for tactical training, mission rehearsal, experimentation, visualization, and much more. As the virtual simulation tool provides great level of scenarios development, modification of initial and running conditions and operator and players interaction.

VBS is capable of simulating a wide range of situations at lower tactical level. It can be connected with other HLA compliant simulations to meet specific training outcomes, for example connecting the dismounted infantry in VBS with a high fidelity combat vehicle simulator, or simulating a Fire support team conducting a Call For Fire mission while the overall campaign is controlled by a higher level constructive simulation.

The main benefit of VBS is its capability to model and simulate such a whole military tactical activities within the spectrum of conflict spans from stable peace through unstable peace, insurgency to general war. The spectrum of conflict is the backdrop for army operations. It places levels of violence on an ascending scale marked by graduated steps.

The modeling criteria of tactical activities can be seen as a set of factors, which will take into account the master unit in the planning and implementation of the specified task (combat task). It will be about a wide range of factors, while in individual cases will be this or that the criteria be given more weight than criteria, significance. In the preparation and implementation of another task may be the criteria laid down in a different order to the individual criteria will be given a different priority (Kozúbek, Flasar 2012: 232).

For the purpose of fulfilling the determined tasks (missions) an advanced artificial intelligence (AI) could be used fully accepting basic and enhanced military methods and procedures. VBS may be launched on almost any

Commercial off-the-shelf (COTS) PC or power notebook which is connected to data network through either intranet or internet. It is possible to connect along about 256 trainees (human participants) in one networked scenario which represent more than company level forces. Depending on scenario and organization of roles even battalion task force or similar battle task force can be trained.

1.2.2 Evaluation criteria

Throughout the entire exercise the Observer and Rating team evaluated participants according to set objectives of the experiment using evaluation sheets. The achieved evaluation results were compared with the assumed results. This procedure was base for the evaluation report and the effects of the experiment are presented at the following of part of this article.

The evaluation was performed according to the evaluation sheet prepared during the workshop (project's first event). It was agreed that each knowledge, skill, and competence would be graded according to five-point-scale, where 1 is the highest grade - the level of presented skill is the strongest, and 5 the lowest grade - the level of presented skill is the weakest (Kozubek, Bielewicz 2013: 75).

As it was mentioned in 1.2 there were created following three categories of knowledge and skills which was considered as evaluation criteria:

1. **Communication Skills:**

- Language proficiency,
- Knows and applies proper radio procedure,
- Team worker,
- Accepts suggestions from peers and subordinates,
- Openly discussed his doubts and ideas,
- Uses well thought arguments in discussion,
- During discussions or negotiations is ready for compromise (consensus),
- Is willing to learn new skills and absorb new knowledge (if the lacks them).

2. **Leadership Skills:**

- Feels confident while issuing orders,
- Takes initiative during operation,
- Makes timely decision,
- Is ready to take calculated risk (personal courage) to achieve aim of operation,
- Treats his subordinates with respect,
- Respects humanitarian law and International Law of Armed Conflicts.

3. **Decision Making Skills:**

- Knows and applies Troops Leading Procedures (TLP's),
- Properly manage time given to him and his subordinates,
- Takes under consideration available data while preparing plan for operation (Operation Order),
- Supports his subordinates in their operation preparation phase,
- Clearly and understandably formulates orders and tasks,
- Checks understanding of the orders and tasks by his subordinates,
- Ensure situational awareness among his subordinates (information dissemination among subordinates and reporting to superiors),
- Is able to manage and allocate available resources.

The objectives were stated clearly and precisely, describing actions that was observed and measured. Using the SMART system ensured that objectives were:

- **Simple.**
- **Measurable.**
- **Achievable.**
- **Realistic.**
- **Task-oriented.**

Each evaluation sheet contains all factors for the collection of data, including objectives and points of review, checklists or other evaluation forms, and observation techniques.

1.2.3 Organization of evaluated cadets and experiment

Each participating institution chose four cadets; altogether there were sixteen cadets for evaluation. The cadets were positioned only for command positions of each platoon. The individual members of subordinated squads were not generated.

The highest level of unit was task organized motorized company which was commanded by officer from University of Defense in Brno. There were four motorized platoons within task organized company. During each lap of EXPEX each platoon was led by cadet from different institution, and each squad of platoon (there were three squads in platoon) was again led by cadets from different institutions. Therefore, each exercising platoon consisted of one cadet from each partner institution.

During the planning part of each lap of EXPEX there four cadets act as a platoon leader and twelve cadets act as a squad leader. Totally there were organized and run four laps of EXPEC scenarios to evaluate each cadet in position as platoon leaders and three times as squad leaders.

During the running scenario there was evaluated only one platoon with one platoon leader and three squad leaders. According to purpose of each assigned mission other cadets were positioned to special roles as the top gunner, driver, machine gunner, antitank specialist or sniper.

During the each mission there were generated and controlled entities representing own supporting forces (operator of Unmanned Aerial Vehicles), coalition forces and local governmental forces (army and police units), enemy (groups of insurgents) and civilian population,.

The EXPEX in the whole range was divided into four parts:

- I. Part: Intro briefing in order to put cadets into situation
- II. Part: Basic training to operate VBS in order to get skills to operate entities
- III. Part: Practical part – Evaluation
- IV. Part: After action review

The practical part of EXPEX was organized as the permanent 36 hours exercise. The aim of this exercise length was to get cadets into a state of fatigue and exhaustion similar to working in real battle conditions.

There were executed four missions during the evaluation:

- VIP Escort,
- Convoy Logistics Supplies Force Protection,
- Foot Patrolling,
- Cordon and Search Operation.

To evaluate all requested criteria each mission was divided into two parts. The first part was focused on evaluation of planning process which could be expressed as the Troops Leading Procedure (TLP) and the second part was focused on evaluation of execution of assigned mission which could be expressed as the control of subordinated units. Each part took about 3 to 4 hours.

At the beginning of each mission the company commander issued Operation Order (OPORD) in order to assign each subordinated platoon leader their specific mission. The cadets in role of platoon leaders received their mission statement and start own planning process. During the planning process was allowed joint work of platoon leader and his subordinated three squad leaders. So there was created conditions for cooperation where **the main communication language was English**. Main purpose of planning process was to find optimal solution of assigned mission and elaborate Combat Order for assignment of specific mission for each subordinated squad. At the end of planning process each platoon leader issue his Combat Order in front of whole auditorium.

1.2.4 Experimental exercise outputs

Throughout EXPEX the Observer and rating team evaluated participants according to set of objectives. The achieved evaluation results were compared with the assumed results (see Figure 1.,2. and 3.) In the rating, the significant differences were not registered, and therefore were globally acceptable and applicable to the final assessment.

According to all grades, there were small differences among the whole group of cadets. There is different way of leadership and cadets played a good example for that. All of them were highly motivated, excited, focused and most importantly they improved themselves time after time. Cadets have learned from their former mistakes, and they worked together and not against each other.

As could be seen from the results of the evaluation sheets, each participating country have reached different average values of the evaluated areas although not particularly significant, suggesting different levels of experience, knowledge and skills of cadets.

Every cadet should be able to receive and deliver orders, plan, organize, manage and evaluate activities on platoon level, to be able to work in teams and manage their work, demonstrate critical thinking and therefore must have a professional, tactical and leadership skills and knowledge for the performance for the platoon leader.

Figure 1. Results of cadets' Communication skills evaluation

Figure 2. Results of cadets' Leadership skills evaluation

Figure 3. Results of cadets’ Decision making process skills evaluation

The overall result of the cadets’ evaluation shows (see Figure 4.) that the Communication skills were graded highest and Leadership skills the lowest. It is mostly logical that to gain Leaderships skills is much harder and more complicated because it depends primarily on the personality (character) of each person.

Average result below 2 points, considering the five-point-scale, gives the impression that the cadets from all Visegrad Group countries may be well prepared for future challenges created by international operations conducted by multinational military or civil-military structures. It might prove true, but the observations made during exercise and various international events by this paper authors, presents a different picture. An important lesson learned for the team of researchers is to select randomly participants. Although, it was not a competition or test, the each institutions chose their best cadets.

Figure 4. Overall evaluation of the cadet’s skills assessed during entire exercise/experiment

One of many important observations outputs was that the more experience with multinational environment, the more confident cadets were. Therefore it is paramount for all military academies and universities decision makers to enable their cadets to participate in international cooperation and training as soon as possible, and as many times as possible during their study.

On the other hand, the cadets' self-confidence was hampered by language barrier. When they had realized that communication skill is based more on the willing to understand each other than on language proficiency and weaker vocabulary, they performed better in the operations. They were focused more on the task, than on the grammar. It needs training and experience, thus more opportunities in this regard must be created for cadets.

1.3 Final statement

The general knowledge and level of training of participants' cadets from 4 countries was not so much different.

The representatives of all participating institutions received agreement to continue in mutual cooperation with education of young officers.

The Faculty of Military Leadership of the University of Defence in Brno took seriously the results of the research and from academic year 2014/2015 accredited new study program significantly oriented to leadership. Primarily in military sector, the preparation of the future leading officers has to be oriented in to leadership which is vital part of complex officer's preparation.

2 Usage of simulation tools for research, education and tactical training

In years 2011 – 2012 the Faculty of Military Leadership built up special laboratory with virtual simulation tools. The laboratory is named as SIMLab (Simulation Laboratory).

There were three reasons to build up the SIMLab:

- to support the Faculty of Military Leadership Research Programme,
- to enhancement and qualify education of Military Master Degree Study Programme,
- to provide support the Army of the Czech Republic commanders for preparation of their combat and combat support units to abroad missions and for full spectrum of operations.

To fulfill all intended goals the SIMLab is equipped by two tactical virtual simulators. The more extensively is used simulator Virtual Battlespace (VBS). The second one and newly purchased is Steel Beast (StBt).

Description of VBS

Simulator VBS can be described:

- as tool for tactical training and mission rehearsal up to the combat team level (up to company) and closely integrated with constructive simulation,
- can provide a generic simulation of all weapon platforms for combined arms training,
- is based on a first person computer game, to provide extremely high fidelity virtual environments (important for immersion),
- includes immersive communications system (VBS Radio) which enables radio and direct voice communications between users in exercises and filterable voice playback for After Action Review,
- has open architecture to allow extension by the customer or the contractor, supporting military formats whenever possible for rapid import of terrain and 3D content.

The simulator StBt is similar to simulator VBS but it is not so much oriented at small tactical units as teams and squads but it enhances capability to train forces up to battalion level within complex tactical scenarios.

Using of VBS to support faculty activities

For supporting the faculty research programme the VBS is used to:

- verify propounded methodology of various tactical activities carried out in both contemporary and future operations,
- generate as real as possible operational conditions to both verify and modify the actual battle drills applied by small tactics unit leaders,
- conduct the Synthetic exercises (SYNEX) for our combat tactical units to gain relevant inputs for our research – immersive using of the After Action Review capabilities,
- evaluate cadets skills in many areas of intent by organizing EXPEXs'.

For supporting the faculty educational process the VBS is used to:

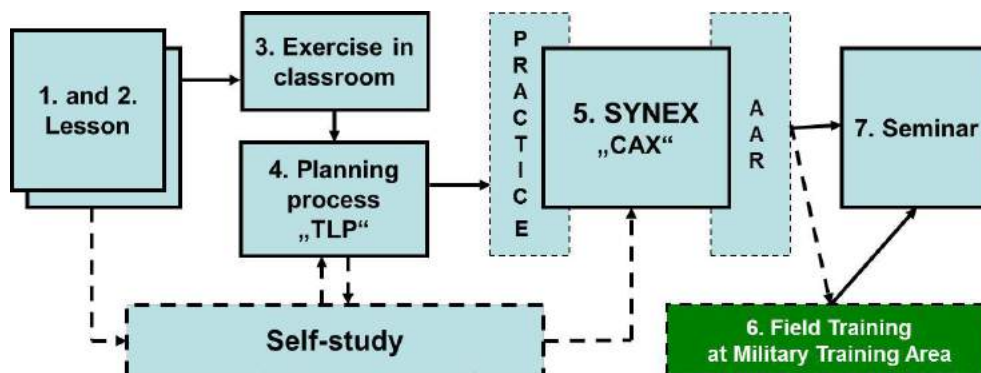

- strengthen student's acquired knowledge and develop their experience and skills,
- support the education by implementation of Synthetic Exercise (SYNEX) directly into chosen subjects,
- implicate cadets for programming VBS in order to enhance VBS capabilities and to adapt VBS to meet our needs by:
 - working out Master Degree Thesis oriented to generate and set 3D world real terrain (e.g. the real military training areas, future abroad operational areas etc.),
 - working out SYNEX guidelines for planning, organizing and mentoring (leading) exercises,
 - verification of actual battle drills (IED, SAF, CPX, VIP FP, MEDEVAC, etc.) and preparation the new possible drill schemes.

There was designed new methodical scheme to efficiently educate and train cadets to gain knowledge, skills and competences requested by the Army of the Czech Republic General Staff. The methodical scheme is part of subject teaching content.

There is example for one selected theme of subject teaching content e.g. „Mechanized platoon in Attack“ (see Figure 5):

1. Lesson (theory by interactive PPT presentation)	90' (length in minutes)
2. Lesson and Preview (training films, YouTube battle videos)	90'
3. Exercise in classroom (test and work with maps)	90'
4. Planning process – mission analysis (Preparation for SYNEX)	90'
5. SYNEX (Computer Assisted Exercise using VBS)	270'
6. Field Training (Training with real equipment in terrain)	270'
7. Seminar (bilateral discussion, evaluation of SYNEX outputs)	90'

Figure 5. Methodological scheme of education utilizing virtual simulator VBS

For supporting the Army of the Czech Republic commander the VBS is used to:

- strengthen cooperation and mutual understanding between university teachers and battle forces commanders,
- directly involve university teachers (academic workers) as HICON and students as OPFOR into SYNEXs',
- collect of suitable data as the results of the SYNEX with trained soldiers and commanders – valuable inputs for comparing analysis in research work,
- ensure the database of knowledge (Lessons Learned) from After Action Reviews to improve the quality of education and to teach in accordance with General Staff requirements,

For this purpose the simulator VBS is installed on the COTS power notebooks to be whole system portable and there is temporarily established so called “Mobile Simulation Training Team” (MSTT).

Recommendations for VBS utilization

VBS has to be the backbone university platform to use simulation and modeling capabilities for student education and practical training.

Planning, organizing, and conducting of combined SYNEX with cadets according to their specialization e.g. Mechanized Infantry, Armor, Reconnaissance, Engineers, Artillery, Air Defence, Pilots, Logistics, etc.

Preparation and conducting of distributed SYNEX with our partners within NATO and PfP (e.g. with Military Academy of the Land Forces in Wroclaw, National University of Public Service in Budapest and others).

Abstract

This paper aims to evaluate the courses and art education activities during the lifelong learning process organized by the Municipality of Istanbul for adults. Turkey's Ministry of National Education, local governances and private establishments work on and develop projects for the lifelong learning process, which was added to objectives of the Bologna Process intended to create a European Higher Education Area. The projects are generally in parallel with the needs of the society and organizations. Two million six hundred people have benefited from the Istanbul Art and Vocation Training Courses (ISMEK) provided by the Metropolitan Municipality of Istanbul between the years of 1996 and 2017. Courses were offered in 540 branches of 35 main branches in 1714 classrooms in 235 course centers of the Metropolitan Municipality of Istanbul. This paper analyzes documents in a qualitative research pattern. In conclusion, the Metropolitan Municipality of Istanbul performs an important function in adult education.

Keywords: ISMEK, Lifelong Learning, Fine Arts Education, Proficiency in Art.

Introduction

It is impossible to provide all the information, skills and customs people need in their lifetime through formal education alone. Therefore, according to Article 18 of Turkey's Basic Law of National Education (1973), which aims at lifelong learning, the system of education was built on two main categories: *formal and non-formal education*. Formal education covers preschool education, elementary, secondary and higher education institutions. Non-formal education includes all educational activities organized along with or outside of formal education (The Ministry of National Education [MEB], 1973).

Article 4 of the MEB's Non-formal Education Institutions Regulation published in the Official Gazette in 2010 designates "*execution of non-formal education activities in coherence according to the Constitution, general objectives and basic principles of Turkish national education and Atatürk's principles and reforms in conformity with universal law, democracy and human rights.*" It also aims at "*facilitating scientific, enterprising, technological, financial, social and cultural development of individuals, accustoming individuals to use their free time productively and provide them with the means to develop their talents through non-formal education*" (MEB, 2010). Legally, the General Directorate of Apprenticeship and Non-formal Education of the Ministry of National Education organizes the adult education activities in Turkey. A rapidly urbanizing country, Turkey needs various educational activities to adapt to city life, at which stage ISMEK gains importance. As the closest basic governance unit to public, municipalities are in direct contact with the public in terms of education and culture and they offer individual and social benefits (Geray, 2007).

Modular Program of the Art Education in Painting, prepared by the MEB's General Directorate of Apprenticeship and Non-formal Education, states, "*The current process of change in branches of art, which are developing into a more complex structure, makes it necessary to base proficiency in art on a broad foundation of information, skills and attitudes and design educational programs accordingly*" (MEB, 2011). Non-formal education stands for on-the-job training, pre-service training, in-service training, human resources development, skills training and nonconventional education (Akcabol, 2006). Educational institutions that provide adult education are Nation's Schools, Community Centers and Chambers, Evening Art Schools, Public Education

Centers, Maturity Institutes, Evening High Schools, Apprenticeship Training Centers as well as nongovernmental organizations like associations and foundations, universities and municipality courses (Celik, 2011).

Lifelong learning includes formal education and all types of non-formal education, and contributes to the development of knowledge and skills of individuals, making it easier for them to find a place for themselves in the information society (Selcuk and Uzunboylu, 2016: 273-319). In this context, lifelong learning can be defined as all activities of lifelong development of personal information, skills and proficiencies (Gunuc, Odabasi and Kuzu, 2012). Lifelong learning targets cooperation in all education and learning fields, establish awareness of constant learning among individuals, supporting citizens in renewing and developing themselves and training active, participating individuals (Guler, 2004). Although this concept is commonly associated with educational activities outside of formal education, there is no consensus on its meaning and content. Even EU member countries have discrepancies (Beycioglu, Konan, 2008). Lifelong learning was first introduced in a conference organized by UNESCO in 1960. Soon afterwards, the concept was discussed one more time and developed by the UNESCO Education Institute in Hamburg. Many researches performed theoretical and practical studies on lifelong learning in the 1970s and 1980s (Óhidy, 2008; ad quoted by: Gunuc et al., 2012; UNESCO, 2009). Society develops with lifelong learning perception, attitude and customs of individuals and offers lifelong learning opportunities (Odabasi and Kuzu, 2012). Lifelong learning and education projects a general plan in order to restructure and realize the potential in people outside the existing system of education. According to this plan, men and women are the agents of their own education, through continual interaction between their thoughts and actions (UNESCO, 2009).

The EU Commission aims to help all young people to improve their basic skills to a reasonable level in elementary education and learning and offer fundamental tools for business life in more advanced stages of lifelong learning. There are also recommendations in lifelong learning for countries to integrate young people into society if they cannot fulfill their educational potential due to personal, social, cultural or financial disadvantages. However, employment policies, social policies, cultural policies, innovation and other policies that involve young people must be developed in order to establish consistency in adult education and learning services (EU Commission, 2006). To that end, in compliance with the recommendations of the EU Commission, it was decided in the 17th National Education Council to support, develop and popularize lifelong learning and assist nongovernmental organizations in designing national education policies. Main objectives also include harmonize formal and non-formal education programs with international standards and employ mass media to raise awareness among individuals (Celebi, 2006: 129-181). Countries face the problem of educating people as societies tend to adapt to the process of change rapidly and want to keep up with science and technology. Therefore, all countries have acknowledged the importance and necessity of education in training qualified human resources (Cetin, 1999). Even though lifelong learning is associated with adult education, it is involved in every moment of life as it encompasses non-formal education, including in daily life. It requires constant access to learning, enhancement of information and proficiency level, new skills as well as updating of information and skills (Ayaz and Unal, 2016).

Art education

Art education in formal and non-formal education can be defined as "all educational activities intended to develop aesthetic sense in order for the individual to be able to express emotions, thoughts and impressions and exhibit talents and creativity." Therefore, creative people are highly motivated to succeed and sensitive to their environment. Creativity is to have qualities that encourage compliance to rules, a sense of duty and independent adaptability (Marion, 2012). Essentially, creativity is the skill of finding different and fast solutions to problems. The behavior of finding authentic responses to problems is creativity (Celebierol, 2016). Therefore, the goal of art education is not to train artists but guide each student towards creativity and provide for the student's informational, cognitive and emotional education needs. Art education endeavors to educate creative power and

potential, and organize aesthetic thinking and conscious. It develops handcraft and helps the individual synthesize (Artut, 2004, p. 91). Theoretical studies that examine all arts and their interrelation on an intellectual level in terms of the artist, the audience, the society, culture and education are called "Fine Arts Education." The goal of art education in painting is to help individuals gain the skills to paint by making preparations for patterns, implementing techniques and using colors. Visual arts constitute a broad domain that covers painting, sculpting, architecture, graphic arts, industrial design, applied arts, cinematography, photography, textile, fashion design, ceramics and computer art. Theoretical and applied studies in art education and training in each of these branches, starting from preschool education to higher education, is called "Visual Arts Education" or, more plainly, "Art Education." Education and training activities in music, literature, ballet, theater and opera are defined as music education, ballet education, etc. (Guler, B., 2004: 2). Contemporary art education essentially intends to sensitize individuals and the society to their environment and meet their aesthetic needs through artistic activities. It aims at revealing creativity in individuals, help them create products and add meaning to their lives, and integrating constructive, creative and productive people into the society (Aral, 1999; Buyurgan and Buyurgan, 2002). The Art and Education certification program includes goals of Painting and Art Education, proficiencies, course periods for each module, implementation of practices in the modules, rules of evaluation and employment fields (MEB, 2011). As is seen, Painting Education has its own place in the lifelong learning framework of the Ministry of National Education. Considering the schooling rate and the number of illiterate people in our country, the importance of non-formal education is evident in the need for general and vocational technical education programs and educational activities for various purposes (Aslangiray, 2016).

Lifelong learning activities in Turkey

Lifelong learning activities in our country are coordinated by the state, provincial and county municipalities and the national agency. A municipality is "the best organized unit of the local governance and the closest to individuals of the society." Upon the development of "social municipalism" in our country, local governances focused on training services after mid-1990s, and organized various activities (Erol, 2007, p. 70). Lifelong learning activities organized by municipalities include various lifelong learning centers like Istanbul Metropolitan Municipality Art and Vocation Training Courses (ISMEK), Ankara Metropolitan Municipality Training Courses (BELTEK and BELMEK), Bursa Art and Vocation Training Courses (BUSMEK), Kocaeli Vocation and Art Training Courses (KOMEK), Kayseri Vocational Courses (KAYMEK), Antalya Vocational Courses (ASMEK), Gaziantep Vocational Courses (GAMEK), and Eskisehir Art and Vocation Training Courses (ESMEK).

Metropolitan Municipalities of Istanbul and Ankara were the first to open art and vocation training courses. Art, vocation and skill courses of these two municipalities have institutional identities. Other metropolitan municipalities are putting effort into institutionalizing their courses (Cetin, 1999). The Metropolitan Municipality of Istanbul pioneered the courses with non-formal education organization ISMEK, which was founded in 1996. Qualified instructors commissioned in course centers are selected in special talent tests of ISMEK and instructors with academic education are assigned to the courses. ISMEK does not charge fees from trainees in exchange for the service it provides. This paper reports the courses organized for adults as part of the lifelong learning process and the art education activities within the courses.

Method

This descriptive study is based on theoretical analytical research and examines documents. The study was done in late May 2017, when the courses ended, and interviews with trainees or surveys could not be employed. The data used in the study was obtained from the Metropolitan Municipality of Istanbul.

Studies on the Metropolitan Municipality of Istanbul

ISMEK is a non-formal education organization, supplementary to formal education, founded with the purposes of improving Istanbul residents, enhancing their vocational and artistic knowledge, instructing residents on urban culture and living in a metropolis, assisting residents in generating income, increasing their employability, etc.

274,979 trainees participated in the ISMEK courses organized in the academic year of 2016-2017. 2829 instructors are employed in the courses. 86% of the public has knowledge of ISMEK. 2,605,992 people have participated in the courses since 1996. Along with adult education courses, ISMEK organizes summer training programs for children at the age of 9 and above. Children's summer programs include 33 branches, including music, painting, handcrafts and diction. Summer courses were initiated in 2015 and are gaining popularity. 32 thousand children participated in the courses in the academic year of 2016-2017. Courses for children in the age group of 12-16 were introduced in 2016 in branches of information technologies, child development, music and performance arts, art and design, ceramics, glasswork, sports, foreign languages, and food-beverages. Adult course periods vary between 70 hours and 900 hours, depending on the branch. The longest courses are: wood painting and varnishing (480 hours), wood shaping (536 hours), model ship making (520 hours), authentic printing (engraving, screen printing, calligraphy, painting-art education (368 hours), painting-art theory (256 hours), artistic mosaic-1 (438 hours), artistic mosaic-2 (512 hours), illuminated manuscript (640 hours), oil painting (384 hours), miniature (784 hours), assistant cook (896 hours) (ISMEK, 2017, www.ismek.ist).

A research conducted by the Public Relations Directorate of the Metropolitan Municipality of Istanbul revealed that 86% of trainees are satisfied with the courses and the majority of the trainees are between the ages of 26 and 40. The majority of research participants regards ISMEK as a "Public University" and finds the training sufficient and beneficial (ISMEK, May 2017). Trainees are presented with certificates approved by the Ministry of National Education at the end of each course. However, trainees do not obtain a certificate if they have been absent from the courses for one fifth of the course duration.

The tables below show the most popular branches, Istanbul Regional Employment Centers, Specialist Schools, Course Fields and Branches, Painting and Art Education Centers and branches.

Table 1. Course centers opened by ISMEK and their branches numbers

Course Centers	Number of Branches	Course Centers	Number of Branches
Atasehir- Ornek District	79	Kagithane-Hurriyet	77
Atasehir- Kucuk Bakkalkoy	78	Kagithane-Sultanselim	109
Bahcelievler	77	Kartal -Kordonboyu	87
Bakirkoy-Cevizli	99	K.cekmece-Sefakoy	119
Basaksehir 5.Etap	104	K.cekmece Yesilova	106
Basaksehir- Bahcesehir	89	Maltepe Altaycesme	126
Besiktas-Dikilitas	90	Maltepe Cevizli	77
Besiktas Ortakoy	114	Pendik- Yenimahalle	88
Besiktas Dikilitas	90	Silivri	90
Beykoz Gumussuyu	82	Tuzla-Yayla	79
Beykoz-Kavacik	75	Ümraniye Atatürk Mahal.	89
Beylikduzu Semerkant	82	Umraniye Mithatpasa	83
Buyukcekmece- Fatih	74	Uskudar Aziz Mahmut	81
Esenyurt	113	Uskudar - Cengelkoy	82
Eyup	94	Zeytinburnu Gokalp District	83

Gaziosmanpasa -500 Evler	132	Zeytinburnu Seyyid Nizam	95
Gaziosmanpasa - Kucukkoy	79	Zeytinburnu Telsizler	91
Kadikoy Rasim Pasa	110	Beylikduzu-Beykent	78
Kagithane-Hurriyet	77		

Table 1 shows courses held in 235 centers in 38 counties of Istanbul. The table includes centers that organize courses in 75 or more branches. Centers that organize courses in more than 100 branches are Basaksehir 5. Etap (104), Besiktas Ortakoy (114), Kagithane (109), Gaziosmanpasa (132), Kucukcekmece- Sefakoy (106), Maltepe-Altaycesme (126), Esenyurt (113), and Kadikoy-Rasim Pasa (110). Most of these centers are located in developing, immigrant-receiving areas of Istanbul (ismek.ist/tr/branslar3.aspx).

Among women trained at ISMEK (1996) until 2017, 473,462 are university graduates, 685,409 are high school graduates, 658,270 are elementary education graduates, and 25,301 are literate. Among 234 thousand graduates, 6,884 have master's degree and 600 have doctoral degree. In the academic year of 2016-2017, 4,619 master's degree graduates and 422 doctoral degree graduates enrolled in ISMEK. The most popular branches among these trainees are personal growth, sports, handicraft technology, foreign languages and music. Twenty years after its establishment, ISMEK offers training in 317 vocations as part of International Standard Classification of Occupations (ISCO 08). Groups from Nigeria, Afghanistan, the UK and Ukraine were briefed. The Nigerian group was trained in wood painting, wood decoration, jewelry design and jewelry making, furnishing, cosmetics, hair care and clothing (ISMEK Haber, 2017). No significant difference was observed in terms of gender among participants. We do not have data on the subject. Officials state women are more interested in the courses than men. The study by Ayaz and Unal shows that there is no significant difference in the lifelong learning tendencies of genders. This finding appears consistent with results of several studies (Ayaz and Unal, 2016).

Regional Employment Offices of the Metropolitan Municipality of Istanbul are located in 20 centers: Sultangazi, Bahcelievler, Bakirkoy, Besiktas, Beykoz, Buyukcekmece, Bagcilar, Esenler, Esenyurt, Eyup, Fatih, Kadikoy, Kartal, Kucukcekmece, Pendik, Sancaktepe, Sisli, Tuzla, Umraniye and Uskudar. ISMEK cooperates with the Ministry of National Education, the Small and Medium Enterprises Development Organization (KOSGEB), the Turkish Employment Agency, Istanbul Chamber of Trade (ITO), Istanbul Chamber of Industry (ISO), the Union of All Kind of Metallic Goods Craftsmen of Istanbul (IMESOB), the Union of Istanbul Chambers of Tradesmen and Artisans (ISTESOB) and the Association of Turkish Travel Agencies (TURSAB). The project aims at training young people between the ages of 19 and 30 without a job or occupation that reside in Istanbul and provide them with jobs. The Employment Guidance department functions as a bridge between jobseekers and companies that need personnel, and cooperates with a large number of firms in various sectors. ISMEK trains personnel for industries and directly contribute to employment (ISMEK, 2017).

Table 2. ISMEK Specialist Schools

Regional Employment Centers	Number of Branches	Regional Employment Centers	District
Bahcelievler/Culinary Arts School	17 Branches, 3 Classrooms	Kadikoy Music and Performance Arts School	70 Branches, 9 Classrooms
Bahcelievler Yenibosna Graphic Design School	40 Branches, 14 Classrooms	ISMEK Colpan Ilhan Fashion School	46 Branches, 9 Classrooms
Bahcelievler Yenibosna Accounting and Finance	16 Branches, 5 Classrooms	Retail School	21 Branches, 6 Classrooms
	Bahcelievler		Sisli

School			
Culinary Arts School / Bahcelievler	17 Branches, 3 Classrooms	Sisli - Mecidiyekoy Child Development School	17 Branches, 5 Classrooms
Bakirkoy Hair Care and Services School	28 Branches, 6 Classrooms	Sisli - Mecidiyekoy Personal Development School	26 Branches, 5 Classrooms
Bakery and Pastry School	23 Branches, 6 Classrooms	Culinary Arts School	11 Branches, 4 Classrooms
Fatih Language School	51 Branches, 15 Classrooms	Baglarbasi Turkish-Islamic Arts Postgraduate School	17 Branches, 24 Classrooms
Fatih Music and Performance Arts School	64 Branches, 10 Classrooms		Uskudar

Table 3 shows branches with the largest participation in the 15 Specialist Schools opened by ISMEK: Bahcelievler Yenibosna Graphic Design School (40 branches), Fatih Language School (51 branches), Fatih Music and Performance Arts School (64 branches), Kadikoy Music and Performance Arts School (74 branches), and ISMEK Colpan Ilhan Fashion School (46 branches). The number of classrooms in training centers is inadequate. Trainees of these specialist schools either set up their own business or are employed by private companies. Schools like the Retail School, the Bakery and Pastry School, the Culinary Arts School train the personnel in demand in various sectors. Moreover, the works of ISMEK trainees are on sale in the Sanat Sokagi Street in Sultanahmet, Istanbul. Apart from these schools, ISMEK also has Sports Training Centers (19), Education Centers for People with Disabilities (3), and Social Life Centers (2). Every year, ISMEK organizes exhibitions and festivals, stages plays, provides aid in poor areas and training for professional agencies (such as hygiene training).

Table 3. Distribution of trainees in ISMEK education fields and branches in courses with 800 or more participants

Main Fields	Branches	Number of Trainees
Sciences of Family and Consumer	Consumer Rights	4447
Gardening	Beekeeping	837
	Garden Maintenance	876
	Office Software Usage	1715
Information Technologies	Computer Operator	8207
	Web Design	1537
	Advanced Office Programs	764
	4-6 Age Child Education and Activities	851
Child Growth and Training	Activities for children aged 4-6	1829
	Leadership	1911

Table 3 lists course fields and branches. The most popular branches are Consumer Rights (4447), Reading Quran (Tajweed) (3262), Reading Quran (Elifba) (3359), Communication in Business Life (3936), Fitness (Women) (11594), Fitness (Men) (11117), Pilates (9943), Aerobics (8684), English Level A1 (11432), English Level A2 (6935), Arabic Level A1 (4810), Sewing Woman Clothing (83733), and Cupcake-Muffin Making (3475).

Painting and Art Education Centers:

16 centers in Avcilar, Bakirkoy, Besiktas, Beykoz, Beylikduzu, Kucukcekmece, Kadikoy, Merdivenkoy, Rasimpaşa, Buyukcekmece, Kadikoy, Sahrayicedid, Kartal, Kucukcekmece, Pendik and Uskudar organize painting and art education courses.

Table 4. Main fields and branches of fine arts education in courses with 800 or more participants in the academic year of 2016-2017

Fields	Branches	Number of Trainees
Handicraft Technology	Wedding candy embroidering	1858
	Dowry preparation	1888
	Lacework	6111
	Decorative wood painting	1470
	Dowry preparation	1888
	Handmade ribbon work	2343
	Wire wrapping	997
	Knitting needle for cardigan	1469
	Accessories	1864
	Decorative cover and case sewing	965
	Lace anglaise	1056
	Bedcloth sewing	1696
	Bed linen sewing	2238
	Making flowers by needle lace stitch	965
	Doll making	800
	Photo shooting	3118
	Graphic Photography	Computer supported advertisement and designing
Art and Design	Charcoal drawing 1	1171
	Painting in gouache	2571
	Calligraphy	1014
	Illumination	884
	Marbling	1182
Music-Performance Arts	Bağlama training (irregular method) Level 1	1204
	Bağlama training (Bağlama method) Level 1	1112
	Classical guitar level 1	1640

Table 5 lists main fields and branches of Fine Arts. However, not all branches of main fields were listed as only courses with 750 or more trainees were included for brevity. In the academic year of 2016-2017, training programs were offered in 278 branches, including Wood Technology (4), Handicrafts (57), Handicraft Technologies (100), Graphics and Photography (18), Art and Design (24), Ceramics and Glass (5), and Music and Performance Arts (70) (ISMEK document, www.ismek.com).

Results, Conclusions and Recommendations

This paper examines adult education activities of the Metropolitan Municipality of Istanbul Art and Vocation Training Courses (ISMEK) as part of the non-formal education project in Turkey. Currently, the Municipality of Istanbul organizes courses in 540 branches within 35 main fields in 235 training centers. These centers offer training in fields like information technologies, clothing and textile technologies, personal growth, food technologies, and food and beverage services. Painting and art education courses are organized in main fields including art and design, wood technology, handicraft technologies, ceramics and glass, graphic and photography, music and performance arts, and textile technologies.

According to study results, the Metropolitan Municipality of Istanbul has opened a large number of courses for people at and above the age of 12 as part of the lifelong learning process to help people improve their skills, find employment in certain fields and utilize their spare time. 86% of participants are satisfied with the training. The training courses provide vocational and artistic training for residents of Istanbul and also serve as a type of rehabilitation center for urban dwellers (Topbas, 2017). The selection of courses depends on requirements of training center locations. Course centers that receive the highest level of participation are Bahcesehir, Besiktas, Kagithane, Kucukcekmece, Esenyurt, Kadikoy and Maltepe centers. Regional Employment centers of ISMEK operate in 20 areas, including developing areas like Sultangazi, Fatih, Bakirkoy, Esenyurt, Kucukcekmece and Umraniye. ISMEK also has 20 sports centers, 15 specialist schools, 3 centers for persons with disabilities, and 2 social life centers. However, the number of course centers and classrooms is inadequate. Several centers lack the classrooms they need.

Celik's (2011) study on ISMEK shows that instructors and trainees are accepted regardless of their religion, language, race and political opinions. However, it is stated that the art education offered by ISMEK incomparable with academic art education. It is argued in the study that the education does not have the characteristics of true art education but it is sufficient for individuals to have a good time and take up a hobby (Celik, 2011).

ISMEK organizes monthly art events (art talks, exhibitions, contests, etc.) and publishes a magazine and a newsletter. Materials required in the courses are mostly procured by instructors and trainees. As there is a large number of course centers across the city and courses are organized in several other branches than art, ISMEK does not contribute in this aspect. A study has revealed that the painting training offered by ISMEK fails to achieve its goals, classrooms and workshops are not adequate for art education, art education is not in conformity with the rules, adults only enroll in the courses as a recreational activity or a hobby, and the art and vocation training courses for adults does not provide a vocation for individuals or train artists (Celik 2011). Efforts must be given to establish cooperation between the courses and universities for higher quality education. In-service education programs must be initiated for instructors in human relations, adult psychology, teaching principles and methods. Art education courses must be designed to give the necessary information and develop the necessary skills for proficiency in art.

Abstract

This work examines applications of physics in economics that document the gradual rise of physical economics in the Czech Republic beginning in the early 1970s. The established facts show a direct connection between basic economic research in the Czech Republic and current research abroad in the field of physical economics.

Keywords: Cyberspace, Physical economics, Space economics, Space geodesy, Space weather

Introduction

The term space weather refers to various phenomena that physically involve the transfer of mass, momentum, jerk, energy and charge in heliospheric magnetized plasma that interacts with the geosphere and its sub-spheres. In addition to phenomena involving transfers between individual parts of the geosphere, space weather also affects technological systems found both in the heliosphere and below the Kármán line, as well as technological systems on the ground. At any given time, the immediate position of the Kármán line with respect to the Earth's surface depends primarily on the space-time distribution of the Earth's mass density, the meteorological processes of the given season, as well as solar and geomagnetic activity. As the boundary of outer space (or simply space) changes over time relative to the Earth's surface, to simplify matters professor Kármán defined the boundary of outer space to be a distance of 100 km from the Earth's surface (Kármán, 1967).

By analyzing the analytical structures of microeconomic and macroeconomic systems and comparing these to the analytical structures of theoretical physics, we have established a principle of correspondence between classical non-relativistic mechanics and new economic variables that were derived from the theory of immediate commodity price. (Zeithamer, 2013, 2014 a, 2014 b, 2015 a, 2015 b), (Zeithamer & Pospíšil, 2015, 2016 a, 2016 b). The newly introduced economic variables describing future price development over space and time are as follows: price jerk ↔ third derivative of path over time, price jounce (price shake) ↔ fourth derivative of path over time and price crackle ↔ fifth derivative of path over time (here ↔ means "corresponds to"). Methods for forecasting space weather also employ the principle of correspondence between applications of classical relativistic mechanics of continuum in meteorology and applications of classical relativistic magnetohydrodynamics in solar physics, physics of magnetized plasma in interplanetary space, and physics of the Earth's magnetosphere.

Quantifying future states of magnetized heliospheric plasma sub-systems in space weather is analogous to developing methods for meteorological forecasts (Siscoe, 2007). One approach to quantifying the size of storm systems in terrestrial meteorology is to classify them into three basic categories in descending order based on the extent of the Earth's surface that is affected: extratropic cyclones, hurricanes and tornadoes. Storms in cosmic weather can also be classified in descending order into three basic sizes: M-region storm, coronal mass ejection,

super auroral electrojet. The correspondence principle for forecasting space weather and terrestrial weather can be formulated as follows: extratropical cyclone ↔ M-region storm; hurricane ↔ coronal mass ejection; tornado ↔ super auroral electrojet (Siscoe, 2007).

The principle of correspondence that for two different scientific fields may also be called the binary principle of correspondence is a simple representation that assigns quantifiable variables from one scientific field to a quantifiable variable of a second scientific field based on the same qualitative importance of mechanisms of transfer of mass, momentum, jerk, energy and charge describing the development of systems states in two different scientific fields. Finding a principle of correspondence requires a high degree of understanding of the two different scientific fields. If a principle of correspondence is derived between n scientific fields, then this principle of correspondence is called the n – ary principle of correspondence.

Similar to meteorology, economics and other scientific fields, phenomena and processes of space weather are transformed into cybernetic space and transmitted at a speed less than or equal to the speed of electromagnetic signals in the universe, which numerically is $c = 299,792.758 \text{ km.s}^{-1} \doteq 300,000 \text{ km.s}^{-1}$. In this work, cyberspace is a physical environment through which electromagnetic and gravitational signals are transmitted at the speed of light in a vacuum or a speed slower than the speed of light in a vacuum but close to $299,792.758 \text{ km.s}^{-1}$.

To this definition of cyberspace we must add that at the current stage of development of physics and biophysics, the transmission of a gravitational signal is detected by terrestrial detectors that transform it to an electromagnetic signal, and the generation of this electromagnetic signal is recorded as evidence of the passage of a gravitational signal through cybernetic space. In many cases, the detector (located on planet Earth or in its direct proximity) records an electromagnetic signal that was generated directly in the area of space where the gravitational signal was generated.

Cyberspace defined as a physical environment also affords the opportunity to compare and transfer to this environment knowledge from other scientific fields, in particular physical economics, biophysics, cybernetics, informatics, physiology, neuroeconomics, sociology, psychology, criminology and criminal justice, theoretical politics including international relations, national security policy, law, economics and other sciences. The speed of transmission of electromagnetic and gravitational signals in cyberspace is finite and equal or less than the speed of light in a vacuum. Then it is possible to define the position of a point and distances between points in cyberspace.

But what time intervals are necessary for an electromagnetic signal and a fast solar wind proton moving at a speed of 800 km.h^{-1} to travel a distance equal to 1 AU? Electromagnetic and gravitational signals require approximately 8.5 minutes to travel a distance of 1 AU while a fast solar wind proton approaching the Earth at a speed of 800 km.h^{-1} takes approximately 2.2 days to travel 1 AU. A cosmic ray proton with 10^{20} eV of energy ($1 \text{ eV} = 1,602 \cdot 10^{-19} \text{ J}$) will travel 1AU in 9.2 minutes. To travel a distance equal to the length of the Earth's equator, modelled on a sphere 12,742 km in diameter, an electromagnetic signal will need only 0.13 s.

Methods and results of physical economics

Introductory notes

The Lausanne School of Economics and the Cambridge School of Economics were among the first schools of economics to systematically describe and analyze economic processes using methods and models of non-relativistic theoretical physics, especially those of mechanics and thermodynamics (Marshall, 1890), (Jaffé,

1965), (Walras, 2003), (Holman, 2005), (Zeithamer 2012, a), (Zeithamer 2012, b). Both of these schools of economics laid the foundations for a new field of science that incorporates the current state of knowledge of basic research in the areas of physics, economics, sociology, neurophysiology and biophysics and is known as physical economics. The term physical economics is used in the book title “Econophysics and Physical Economics”, authored by Peter Richmond, Jürgen Mimkes and Stefan Hutzler (Richmond, Mimkes & Hutzler, 2013).

Another significant cornerstone of physical economics was laid in the late 1930s in the United States with the discovery of the empirical law of retail gravitation, formulated by prof. John William Reilly and inspired by Newton’s law of gravity (Reilly, 1929), (Reilly, 1931). In conjunction with the law of retail gravitation, we should note that it was also used in a heuristic manner to formulate the law of demographic gravitation (Zipf 1946), (Zipf 1949), (Stewart, 1948).

A major milestone in the historical development of physical economics is econophysics, the first theses of which were based on the physics of the early twentieth century. At the turn of the millennium, this research crystallized into a comprehensive set of applications of statistical physics in economics, laying the foundation for the new scientific field, i.e. econophysics (Mantegna & Stanley, 1999), (Zeithamer, 2012 a), (Zeithamer, 2012 b), (Stanley, 2013).

The latter twentieth and early twenty-first centuries are periods in which several Czech economists made significant contributions to the advancement of physical economics. This group of authors includes, for example, prof. Pavel Hrubý and Ing. Jaromír Kálal (Hrubý & Kálal, 1974) and prof. František Drozen (Drozen, 2008).

Axiomatic theory of a stationary field of retail gravitation

Reilly’s discovery of the phenomenon of retail gravitation at the turn of thirties and forties poses a fundamental question for physics: Is it possible to theoretically derive the law of retail gravitation from Newton’s law of gravitation? An affirmative answer to this question is given in references (Zeithamer, 2015 b) and (Zeithamer, 2016 a), (Zeithamer, 2016 b). This response not only demonstrates the importance of Reilly’s discovery for economics and physics, but also with respect to consilience.

This work assumes that preferences exhibit the characteristics given by the following axioms:

- I. 1. Axiom of reflexivity;
- I. 2. Axiom of completeness;
- I. 3. Axiom of transitivity;
- I. 4. Axiom of continuity;
- I. 5. Axiom of convexity;
- II. 1. Axiom of non-satiation (Never Get Enough).

This work uses an ECEF Cartesian frame of reference Σ , the origin of which is located at the gravitational center of the Earth with axes fixed to the geoid (Earth-Centered, Earth-Fixed frame of reference). For the description of retail gravitation this coordinate system is a sufficiently accurate approximation of the inertial coordinate system (see references (Votruba, 1977), (Kuchař, 1968), (Burša & Kostecký, 1999), (Leick, 2004)).

Let A be a city on the geoid with population P_a . Because retail flows are realized in three-dimensional space and time, we define the stationary potential of retail gravitation of city A by the relation

$$\varphi(x, y, z) = \varphi(D_a) = \varphi(A, E_A) \frac{N_a}{D_a}, \quad (1)$$

where D_a is the distance of the observation point from city A measured along the geoid. If the distance measured along the geoid is such that the geoid curvature can be neglected, then the distance of the observation point from city A is given by the relation $D_a = \sqrt{(x-x_A)^2 + (y-y_A)^2 + (z-z_A)^2}$, where x, y, z are the coordinates of the observation point and x_A, y_A, z_A are the coordinates of city A;

$\vec{r} = (x-x_A)\vec{i} + (y-y_A)\vec{j} + (z-z_A)\vec{k}$ is the position vector of the observation point, from which retail trade is attracted along the geoid in the direction of city A, or to mass point A; \vec{i}, \vec{j} and \vec{k} are orthogonal unit vectors. Proportionality constant $K_a(A, E_A)$ is expressed in units $\frac{c.u. \cdot pers.}{m^2}$, where $c.u.$ = currency unit, m^2 = square meter, $pers.$ = person; A is mass point with coordinates x_A, y_A and z_A , i.e. mass point A depicts city A; E_A – is an economic facility of city A; N_a – is the number of long-term economically active adult inhabitants in city A at time t . Vector field K_a of the intensity of retail gravitation is determined by the negative gradient of potential of retail gravitation Φ_a , i.e. $K_a = -\text{grad} \Phi_a$. This means that the magnitude $|K_a|$ of the intensity vector of retail gravitation is given by the relation $|K_a| = \left| \frac{d\Phi_a}{da} \right| = K_a(A, E_A) \frac{N_a}{D_a^2}$.

For the intensity vector of retail gravitation the following relations apply

$$\text{div} K_a = 0, \tag{2}$$

$$\text{rot} K_a = 0, \tag{3}$$

and the potential of retail gravitation is obtained by solving the Laplace homogeneous partial differential equation

$$\Delta \Phi_a = 0. \tag{4}$$

Any vector field of retail gravitation \vec{M}_a can be considered the superposition of two fields, one of which is

determined by scalar potential while the second is determined by vector potential A . Let us designate the field of retail gravitation determined by scalar potential Φ_a as K_a and the field of retail gravitation determined by vector potential A as L_a , then

$$\vec{M}_a = K_a + L_a, \tag{5}$$

this means that the vector of retail gravitation at the observation point is expressed by the relation

$$\vec{M}_a = -g \frac{d\Phi_a}{da} \vec{r} + \vec{L}_a$$

rot

$$\vec{A} . \quad (6)$$

The first summand in relation (6) determines the amount of retail trade that can be attracted to city \vec{A} by a single inhabitant who is at the observation point. The second summand in relation (6) determines the amount of retail trade that can be relocated from city \vec{A} to the observation point per single inhabitant found at the observation point. The presented theory of a stationary field of retail gravitation implicitly contains axiom III: 1, which concerns the continuity of the field of retail gravitation, i.e. the scalar and vector stationary potentials are continuous functions of spatial coordinates.

Binary principle of correspondence

A comparison of the analytical structure of economics and the analytical structure of non-relativistic theoretical mechanics has led to the following conclusion: path s traveled by a body over time t corresponds with price n of the commodity at time t , i.e. $n(t) \leftrightarrow s(t)$ for $t \in [0, \infty)$. There is a fundamental difference between the real functions of real variable t “commodity price” $n(t)$ and “the path traveled by the body” $s(t)$. The path traveled by the body is a non-decreasing real function of time, but the commodity price may over certain time intervals increase or decrease as a function of time. The first derivative of path s according to time t , i.e. $\frac{ds}{dt}(t)$, is the path traveled by the body over a unit of time, called the instantaneous magnitude of velocity of the body. A change in commodity price over a unit of time is the first derivative of commodity price n over time t , i.e. $\frac{dn}{dt}(t)$. For the time being in this work, a change in commodity price over a unit of time is called the “tempo of commodity price change” or “price tempo”. The change in commodity price over a unit of time may be positive, zero or negative, while a change in the path per unit of time is nonnegative (positive or zero). The second derivative of the path of the body over time means the first derivative of the velocity of the body is a change in the velocity of the body over a unit of time, called the acceleration of the body. The second derivative of commodity price over time means the first derivative of price tempo over time and in this work is called “acceleration of commodity price”, or price acceleration, or “velocity of price tempo”. The third derivative of the path of the body over time, i.e. the first derivative of the acceleration of the body over time is the instantaneous magnitude of jerk of the body (body jerk). The third derivative of the commodity price over time means the first derivative of the price acceleration, or price jerk (Zeithamer, 2015 a). The economic significance of price jerk is the change of price acceleration over a unit of time. The fourth derivative of the path of the body over time is, from a physical perspective, the change in magnitude of jerk of the body over a unit of time (i.e. also the speed with which body jerk changes). There is no established Czech term for this, but in electrical engineering the fourth derivative of a signal is often called the signal vibration. The fourth derivative of commodity price over time, $\frac{d^4n}{dt^4}(t)$, that

expresses the change in commodity price jerk over a unit of time is the tempo of price jerk, or price vibration (quake) or commodity pricequake. The fifth derivative of the path of the body over time means the physical change in speed of body jerk over a unit of time, or the acceleration of the body jerk. The fifth derivative of commodity price over time is the economic change in tempo of commodity price jerk over a unit of time, or price crackle.

In this section of the work it is necessary to mention the following notes:

- 1) In theoretical physics and applied physics the physical quantities of speed, acceleration and jerk are vector quantities. This pertains to railway engineering, construction of machinery, civil engineering and aviation engineering.
- 2) This work uses the scalar meaning of price. An article devoted to the vector meaning of price is being prepared for publication.
- 3) Two of the first physicists to introduce the term jerk into Czech professional terminology were professors Šindelář and Smrž (Šindelář, Smrž & Beřák, 1977).

Conclusion

Basic Czech research into the principle of correspondence between physics and economics began in the early 1970s. Pioneers of this basic research in the Czech school of economics included prof. Dr. Ing. Pavel Hrubý and his co-worker Ing. Jaromír Kálal. With periodic breaks of varying length, the research have continued to the present day and is steadily incorporating current findings obtained in the field of Sun-Earth relations. The experimental work has resulting in numerous studies, the most important of which are cited in this work;

study authors are prof. Dr. Ing. Pavel Hrubý, Ing. Jaromír Kálal doc. Ing. František Drozen, CSc. (VŠE in Prague), prof. Ing. Jiří Pospíšil, CSc. (ČVUT in Prague), Ing. Tomáš Zeithamer, Ph.D. (VŠE in Prague). (Hrubý & Kálal, 1974), (Drozen, 2008), (Pospíšil, 2013), (Zeithamer, 1986, 1988, 1990, 2012 a, 2012 b, 2013, 2014 a, 2014 b, 2015 a, 2015 b, 2016 a, 2016 b), (Zeithamer & Pospíšil, 2015, 2016 a, 2016 b).

The transfer of mass, momentum, jerk, energy and charge in Sun-Earth relations is the fundamental process that affects the majority of communication technologies we encounter on dynamically changing markets. Therefore, it is essential for the scientific community to understand the axioms of market dynamics in its basic research, and based on this understanding play an active and independent role in the changing business environment.

Acknowledgements

The authors are grateful to Mrs. Pavla Jará, Mrs. Věra Hrabovská, Mrs. Hana Košťáková, Bc. Petr Nouza, Mgr. Pavlína Tvrdá, Ms. Renáta Řeháková and the National Library of Technology for their great effort and excellent work, which was indispensable in the completion of a large portion of this work. Authors thank for technical assistance to Managing Director Mr. Jiří Břichnáč and to the firm Tomados Ltd. without their contribution would not be possible to finish the article. This paper is dedicated to Mrs. Věra Ruml Zeithamer, Mr. Josef Ruml Zeithamer, Mrs. Anna Ruml, Mr. František Ruml and Ing. Milan Pospíšil.

Abstract

The advanced technological age, marketing and society of the abundance in which we live, have a strong influence on the consumption and eating habits of the children. Every day in schools, these little human beings make autonomous choices and their parents, despite seeking to control and know their actions, cannot do it entirely for many reasons. The study was carried out in a group of the fifth grade and their results were subjected to a descriptive and inferential analysis, in which the purpose was to study the relation of some of the variables in question. The conclusions point for example to the parents' lack of knowledge in what concerns the type of consumption and on how their students spend their money. So it can be said that the role of the school in raising responsible citizens in managing their money is a necessary and continuous learning throughout the school life.

Key words: citizenship, consumption, money, health.

Introduction

The development of educational programs for citizenship can prevent phenomena that may have a negative impact on society. It is expected that learning and education for citizenship become a priority. The Charter on Education for Democratic Citizenship and Human Rights Education (2010) points out objectives and guiding lines to the member states in formulating their policies, legislation and practices. In this document it is stated that "every person living on their territory should have access to education for citizenship" (p. 3) and also that "the effectiveness of this learning involves mobilizing numerous agents, including those responsible for policy development, educational professionals, learners, parents, educational institutions, educational authorities, officials, youth organizations, media and communities" (p. 3).

The Somosaguas Institute for Educational Studies refers to education for citizenship as "the need to significantly intervene in the socialization process of children and adolescents to enable the development of their ability to perceive, understand, interpret, and act in society" (Aguilar et al., 2002, p. 12). Afonso (2005) also states that "school must be an organization and a space where you build and live daily citizenship" (p. 16).

At school, students are challenged to discover new skills, new experiences, to overcome limits and to confront risks. Physical, mental and social well-being can only be ensured with proper education. Machado (2015) emphasizes the importance of education of young students as:

a shared responsibility that requires the effort of the whole society represented by those who live with him in the family, at school and in the community and should be seen as an investment in the physical, cognitive and socioemotional of young people and in the future of the country (p. 61).

This author believes that although the basic responsibility is the family, this also applies to school and teachers that, in specific circumstances, may even play a leading role in this.

There is no single way to operationalize it together young people, but there is one aspect in which most theorists and researchers agree: it is needed and more than being a trend or novelty, it is a priority of education. In this study we wanted to cover three dimensions of citizenship: consumer education, financial education and health education.

We are all citizens. We are all consumers and school, as a citizenship space, is also a place of consumption. Associated with consumption comes money. Contemporary societies show a high degree of monetization as satisfying a large part of our needs involves the use of a monetary system and access to money. Santos (2015) states that:

life is influenced by money (or by the lack of money). And, as stated in the popular saying that suggests that 'if you cannot beat it ... join it, it is not possible to escape it. It's better to learn to live with (and without) it (p. 16).

The European Central Bank (ECB) (2009) in a publication about money stated that "money is what money does" (p. 17). That is, money is not what is but what it does. Money is therefore defined by what it does, not by what intrinsically it can be. At school students manage their money becoming themselves economic agents. Regardless of whether or not they have access to the School Social Action (socio-educational support measures for students in households with an unfavorable economic situation), the way students manage their money can have a direct interference with their health. At school they acquire goods and services in most cases without the supervision of an adult.

In the Ottawa Charter (1986) it is stated that "health is built when we simultaneous care for ourselves and for the others, having the ability to make decisions and have control over the circumstances of life itself" (p. 4). We believe that having knowledgeable and economically enlightened students, they are more sensitive to the issue of healthy consumption, and this should be the ultimate goal of all countries. We cannot forget that in our country

the major health problems, in terms of population and public health, are related to inadequate habits and lifestyles, and its prevention or correction depends on changing attitudes and behaviors. We can only achieve this goal if we negotiate and present alternatives, and create habits and options for healthy lifestyles, which are an added value and promote an ethical and socially correct attitude (Cordeiro, 2015, p. 100).

Researching on what young people (children and teenagers) know about money and what they do with it is clearly important, as they have an increasing purchasing power. Furnham and Argyle (2000) report that at this level "schools also play a key role in directly educating and shaping economic behavior" (p. 174) so that young people are informed consumers and responsible users of money.

Method

This study combines quantitative and qualitative techniques. The participating class consisted of 14 students of the 5th grade (nine females and five males). Ten students in the class had School Social

Action (ASE) benefit: six with level A benefit (higher financial support) and four with level B benefit. They all used the schools' card that allows them to enter and exit the school gate and to purchase products in the cafeteria, stationery and reprographics. Throughout the school year, we developed 19 awareness sessions with these students, each lasting 50 minutes. In these sessions we held a set of nine tasks. Data collection in this study was made in the school context and it was based on direct observation of sessions and respective tasks performed in class, as well as other classroom documents. At the beginning and at the end of the investigation, a detailed and quantitative data collection was made regarding all the students' individual expenses. These data were imported from GIAE program (School Administration Integrated Management). For all the materials that were made, and so that we could distinguish them, we've created an identification for each student (ID) that consisted of the letter "s" followed by the number that corresponded to the student's position in the class list, for example a1 is the first student in the class list. There were no s9, s11 and s16.

Findings

From the data collected, it was possible to perceive some of the students' trends in terms of money expenditures and parental monitoring that were fundamental to the preparation of the awareness sessions. Thus, with respect to the money spent by the students, we found that most of the money spent by the class was at the school bar, followed by the cafeteria, stationery and reprography (see Figure 1).

Figure 1. Distribution of student expenditures by sectors

At the school bar, the snack choices that students make are not very healthy and water consumption is low. In Figure 2 are represented the foods consumed by a student over the first term (September to December – 13 weeks) by color. With red color are entirely unhealthy foods (stuffed croissants, cakes, chocolates, sweets, ice cream), with yellow color are less healthy foods (croissant with cheese, butter, ham or mixed, snacks, juices) and with green color are healthy foods (ham and cheese sandwich, milk, yogurt and plain bread, with butter, cheese or ham). The color blue represents the water consumed. This representation has 13 lines, corresponding to the 13 weeks of the first term. Thus the first line corresponds to week 1, the second to week 2 and so on, from the top down to the last line to which week 13 corresponds. As we can see in the picture, this student in the second week (second line) consumed 24 foods. Of these, 11 were entirely unhealthy, seven were less healthy and five were healthy. There is only record of one bottle of water consumed during this week. By the thirteenth week, he had only consumed five foods. In a total of 198 foods consumed, 102 were entirely unhealthy (51.51%), 57 were less healthy (28.79%), 21 were healthy (10.61%) and 18 bottles of water (9.09%) were consumed. The red and yellow colors occupy approximately 80% of the students' consumption, which is a worrying result.

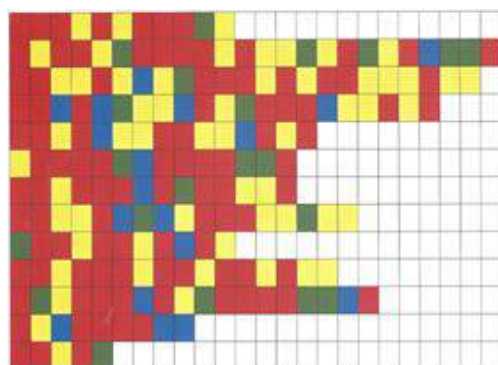

Figure 2. Representation of the foods consumed by a student of the class at the school bar

Another interesting fact that could be observed was the absence of a positive correlation between the financial possibilities of the students' families and their money management. It was expected that students with more financial possibilities would have more expenses, which was not the case. In Figure 3 we present a more detailed analysis of the expenditure performed at the school bar, through which we wanted to understand if there was any relationship between the ASE benefit and the consumption made at the bar. By analyzing the Figure 3 box plot regarding the expenditures of families with or without ASE benefit at the bar, we can see that: (1) the minimum spending values of students with level A benefit are higher than those of students without any ASE benefit, as also the maximum spending values are much higher than those who have level B benefit or no ASE benefit; (2) 25% of students with a level A benefit spends on average more than 25% compared to students without ASE benefit; and (3) 25% of students with level A benefit spend more than any of the students with level B benefit or no ASE benefit.

Given that the ASE benefit is assigned to students from deprived households, it was expected a reduction in terms of spending by these students, but the mismanagement of money is also undoubtedly a matter of family culture.

Figure 3. Analysis of students' expenses with and without ASE benefit

After analyzing the data collected with the students, the development of this project was started. The students accepted the challenge of reflecting on their consumption, recognizing the benefits that it would bring them: more health and less expenses. As it can be seen in Figure 4, from the moment the project

began at week 9, the consumption of the class began to decrease. This decrease was more abrupt between week 9 and week 10 than in the following ones, involving a rate of decrease of about 20€ in the first week mentioned and of 11€ in the following ones.

Figure 4. Money spent weekly by the class

In fact students began to consume less and better and also to spend less. Table 1 shows the percentages of foods consumed of each of the colours: red (Red), yellow (Ye), green (Gr) and Blue (Bl), by students in the first term of the school year (named with a 0, for example, Red0 is food with a red colour in the first term) and then third term (named with a 1, for example, Red1 is food with a red colour in the third term). The students are identified by s1, s2, ... For example by observing the first line of the Table 1, we found that the student s1 consumed too much unhealthy foods (45%) in the first term (Red0) but in the third term (Red1) the consumption of the same kind of food dropped significantly rising to 11%.

Table 1. Type of food consumed

ID	% Red0	% Red1	% Ye0	% Ye1	% Gr0	% Gr1	% Bl0	% Bl1
s1	45	11	31	52	16	22	8	15
s2	15	15	18	15	58	60	10	10
s3	11	0	10	10	73	90	6	0
s4	14	34	23	21	58	28	5	17
s5	23	25	29	25	44	25	5	25
s6	38	0	38	33	5	67	19	0
s7	35	25	9	0	33	50	23	25
s8	21	14	34	71	38	14	8	0
s10	39	0	32	20	19	60	10	20
s12	22	0	13	0	35	60	31	40
s13	43	11	46	33	8	56	3	0
s14	52	44	29	28	11	17	9	11
s15	24	7	29	20	30	67	17	7
s17	33	6	20	6	36	81	11	6
Average	29	14	26	24	33	50	12	13

In average the consumption of unhealthy foods by the students decreased 16% (Red) and the consumption of less healthy foods (Yellow) also decreased by 2%. The consumption of healthy food (Green) increased from 33% to 50% and water consumption (Blue) increased by 1%.

In what concerns the students' average daily expenses, Figure 5 shows the variation of the same ones during the school year: on the first term (september to december), second term (january to april) and third term (may and june). As we can see, all the students spent less on the second term comparing to the first term, excepting one student (s2) who increased his daily expenses and another student (s5) that maintained the same expenses. Comparing the second and the third term, we noticed a slight rise within five students, one of them maintained the same expenses, and eight of the students kept spending even less money. The five students who increased their expenses, three of them (s7, s10, s14), kept their expenses lower regarding the first term, one of the students equaled the average spending of the first term (s15) and only the student s1 who, in the second term, had managed to reduce expenses, in the third term spent more money with an average higher value comparing the first term. In general, we considered these results to be very satisfactory and they reflect the positive effect of the tasks developed among the students throughout the school year.

Figure 5. Students' average daily expenses

Regarding the loading of students' cards¹, we tried to understand if there was any relation between the money the students had on the card and their expenses, that is, if towards any of the types of loading categorized, the students showed a better money management. We named by category 1, all the loadings less than 5€; Category 2 the loadings with the exact amount of 5€; Category 3 for loadings of values higher than 5€ and less than 10€; Category 4 exact amounts of 10€ and lastly category 5 for loadings higher than 10€. Table 2 shows the average amount of money spent by days in each category.

Table 2. Average amount of money spent by categories

	<i>Categories</i>				
	<i>1</i>	<i>2</i>	<i>3</i>	<i>4</i>	<i>5</i>
Average €/d	0.61	1.01	2.46	1.44	1.46

The most efficient loading category, until week 13, for the students, that is the week in which they spent less, was the first week showing amounts below 5€. In this category the students spent an average of 0.61€ per day (see Table 2). Category 1 follows category 2 and then category 4. Finally, in this order

¹ In school students have a student card that is like a bank card with money for purchases in school.

comes category 5 with loadings higher than € 10 and category 3, with loadings between 5€ and 10€ with a daily average of 2.46€.

Conclusions and Recommendations

In view of the characteristics and mainly all the weaknesses presented, we conclude that all the concerns about citizenship education made in the literature review are justified. Education for consumption, health and the use of money by pupils in schools is required. Younger people need to learn to use money, to possess it, to spend it and to spare it.

In this regard educators should promote awareness and reflection on the use of money with their students. These are able to change students' behavior and attitudes towards consumption, saving money and health. Knowing how to think about your consumption, your health, your expenses, knowing the reasons for them and getting them to know your needs and those of others, it's crucial.

It is recommended that children do not have a lot of money on virtual cards to avoid getting accustomed to spending it unreasonably. When they have more than they need, they easily spend it on superfluous consumptions.

It is good to get the student to plan and to know what they eat and what they spend in school. Knowing how to choose what they need, what is healthier. Teach them to take care of their health, to prepare for the future, for life.

Helping them to live with daily self-discipline is essential.

The capacity for self-control allows the human being to own himself, but in order to achieve it he has to train, to learn in the most ordinary things of daily-life, including his expenses in school.

It is imperative that parents, guardians (primary caregivers) develop criteria to support their learners to use money properly and to save it.

Getting children to think about why they spend and getting them to know their real needs is critical for the younger ones. Students have to learn how to manage the small amounts they receive. Knowledge implies practice. If we want the younger ones to know how to manage money, they have to practice it, this knowledge has to be taught through experience.

It is advisable to take every opportunity so that the student understands the value of money, what is the money for, how much it costs parents and caregivers to earn it.

Thus, from an early age, parents have to involve their children in the family budget and request their collaboration in their management. Money does not fall from the sky, and realizing that your gain implies effort and work is critical for the young. At school, students should not have too much money to avoid getting used to wasting it. It is vital to save the money that parents give them.

Abstract

The use of games with a serious purpose, also called gamification, is a new approach to employee training and adult education. This paper explores gamification as a modern approach to adult education which can increase engagement in training process and thus ensure better learning. The research reveals a relationship between the usage of gamification as employee training tool and the performance results as well as employee engagement in training and organisation simultaneously looking at components of effective games. This research is based on case study strategy and is based on data from participants survey and sales results before and after the training. The results show that sales results are not related to gamified training, however, use of gamification elements significantly increase employee engagement in both - training and organisation. The most effective game components for sales training games are the exchange of experiences, possibility to earn points and feedback.

Keywords: Adult education, Gamification, Employee engagement

Introduction

In the light of technological progress, globalisation and generational shift, when people account for much of differences in performance among firms (Mollick, 2012), companies are looking for new solutions to engage employees and ensure that they work with greater enthusiasm and contribute to the achievement of business goals. Human capital is widely recognised as a potential source of competitive advantage (Campbell, et al., 2012), therefore employee training and development seem to be one of the keys to improve the performance of the firms. Recently, more and more companies are using different gaming technologies, thereby involving both customers and employees and changing their behaviour (Roberts, 2014). The use of games with a serious purpose is a new approach to training and development which can be used to generate learning and new insights in adult education.

Why gaming and game elements are so popular nowadays? Video games have gained enormous popularity all over the world. Video game industry revenue has surpassed the Hollywood. Looking at the statistics, the average age of the player is 37 years, 42% of players are women (Brownhill, 2013). According to 2013, "State of Online Gaming Report" data, the number of people playing games on computers reaches 1.2 billion, which is approximately 17% of all the people of the world. Also surprising are facts related to time people spend playing video or computer games: more than half a billion people play at least 1 hours a day. While in the US, 5 million people are spending more than 40 hours a week playing games that can be likened to a full-time working week (Kim, 2015). We live in a society which is becoming increasingly obsessed with games. To attract new audience and engage employees, business is thinking about new reward system, positive reinforcement and feedback received through mechanisms such as points, badges, levels, and in the creation of competition and challenge (Zichermann & Cunningham, 2011). The game industry has found a way to make the game a commodity and variety of platforms and channels are made available (Egenfeldt-Nielsen, et al., 2011). Data shows that there is a significant relationship between the following: the more people play games outside of working hours, the greater the likelihood that they engage in games and while work (Mollick & Rothbard, 2014). Furthermore, Millennium

generation has entered the labour market and this generation is used to spend part of their free time playing digital football or participating in battles (Kastner, 2013), so it can be expected that gamification will engage them in their working life as well as in education.

Several authors mention employee training and adult education as area where gamification can be successfully implemented (Huckabee & Bissette, 2014; DuVernet & Popp, 2014). American Society for Training & Development research showed that 23% of organisations use gamification in employee training and 99% of them are confident about the effectiveness of the method (Oakes, 2014). The number of organisations using gamification in the training of employees is increasing. For example, use of gamification in sales training has increased from ~ 8% in 2012 to ~ 18% in 2013 (DuVernet & Popp, 2014).

Negative aspects of gamification as training and education tool should be considered as well. Side effects can occur due to simplified game design, unattractiveness of rewards, un-relatedness with organisation's aims and poor execution of the training project (Callan, et al., 2015; Kastner, 2013). Despite growing popularity and application, the research on effects of gamification are still scarce, moreover, it is not clear which components of serious games have impact on training and learning process and end results. What is the impact of the use of gamification as an employee training tool on performance differentials and employee engagement? How impactful games should be designed? What should be the components of serious games? The aim of this research is threefold. First it aims to reveal relationship between the usage of gamification as employee training tool and performance results, second it assesses the impact on employees' engagement in organisation and training process. Finally, the components of sales game as training tool are assessed and the most important ones identified.

The paper is designed as follows. First theoretical background of this research is presented and three hypotheses and one research question formulated. Then methodology is described and results presented, followed by conclusions and recommendations.

Employee training– gamification as a new tendency

One of the most important keys to organisational success are competent, knowledgeable and developmental employees. One of the main objectives of human resource management is to ensure that the organisation have the necessary talent, with the appropriate skills and knowledge (Armstrong & Taylor, 2013). The process of staff training is a critical aspect of successful HR management and the main task is to ensure the efficiency and effectiveness of staff (SHRM, 2013). Harrison claim that the main objective of learning and development is to help achieve common progress and to promote the learning and knowledge that helps the organisation to realize its business goals through developing the potential of the individuals (Harrison, 2009).

Harward (2015) mentions the following hot tendencies for training and development: story building – the use of improvisation skills helps participants to play roles and prepare them to face job situations; use of data – to analyse the data as part of training programmes; use of Games to reinforce the learning experience; smaller size of the training groups to make them available for various ages and generations of participants (Harward, 2015). Burton among 2016. actual trends mention elasticity, e-learning, and diversity of elements (Burton, 2016). Similarly, Whyte suggest that organisations should look for new trends to ensure training effectiveness and among future tendencies mention the following: small group size, e-learning and mobile learning, and gamification (Whyte, 2016). All the above-mentioned authors mention gamification among emerging trends available for organisations in employee training and development.

The most important challenge for trainers and organisations is to ensure that the new knowledge and skills are put in use in work situations. Dale (1946) states that the best effect from learning occurs when several methods are combined and participants have possibility to obtain real experience and use the skills immediately. Collins

(2016) mentions emotional involvement as one of the most useful tools. In emotionally safe environment training participants will experience the positive feelings, which will create the memories, and will help to learn the lessons better (McGinty, et al., 2013). Several studies have been conducted that suggests that playing fosters the flexibility of mind leading to revealing several potential solutions to achieve the desired results.

For the first time, the concept of “*gamification*” was used only in 2002, but in 2010 it became widely popular. There are several similarities with gamification and games, but this is not the same. Gamification is about transformation of game related elements, such as aims, rules, competition and feedback system, and voluntary participation, to organisational environment. Kim (2015) explains that games create imaginary world which is different from real one, however, gamification add imaginary element to real world. Gamification is more than a game, it is application of game design elements in unrelated to the game context (Brownhill, 2013). Gamification means using such elements as challenge, excitement, competition and rewards to make ordinary events more interesting (Sarangi & Shan, 2015). According to Kapp (2014), gamification is a process of using game elements, mechanisms and thinking to motivate people and to promote learning or problem solving.

Gamification is used in many different human resource management areas, including talent management, training and development process and performance management (Sarangi & Shan, 2015). Meister (2015) suggests that gamification is 75% psychology and 25% technology and can be applied to real processes in organisations like selection, learning and development (Meister, 2015). Brownhill see future of gamification as more related to development of soft skills and behaviour (Brownhill, 2013). Gamification is widely applied in education to create inspiration (Holmes & Gee, 2016). Gamification can be used in any person related process to involve and improve experience (Callan, et al., 2015). Still research on effectiveness of gamified training and learning sessions is contradictory and there is a need for more research related to the assessment of use of gamification in training programmes. Therefore, further the methods traditionally used for the assessment of training programmes are described.

Assessment of training and development programmes

Assessment of training and development programmes can be done through observation or translated to numbers (Armstrong & Taylor, 2013). The assessment can be performed in four levels: employee reaction - did they like the training; knowledge - did they acquired the necessary knowledge, usually done through tests; behaviour - did they change their behaviour, it is recommended to measure before and after the training; and result - the impact on employee performance and organisational performance (Kirkpatrick & Kirkpatrick, 2006). Brinkerhoff recommend measuring number of employees who apply the gained knowledge either fully, partly or not at all (Brinkerhoff, 2006). Several researchers come to conclusion that there is no direct link between employee feedback on training and after training job results. Moreover, Willyerd and Leone observed that training environment and afterwards working environment impact the results more (Willyerd, et al., 2014; Leone, 2015). This was supported by Brinkerhoff and Mooney who found that such environmental aspects as management support, daily routine, and organisational culture has significant impact on applicability of training results (Brinkerhoff & Mooney, 2008).

However, measuring the impact of training on employee performance is still one of the most frequently used assessment methods for training programmes. Thus, the first hypothesis is formulated as follows:

Hypothesis 1: Use of gamification in sales employee training programme is positively related to sales results.

Still it should be noted that training is not a remedy for all performance problems, for employees who already have the necessary skills, but are not motivated to apply them in full, training is not a solution (Mager, 2008). Alongside with direct impact on performance results, other gains from good training programmes include increased engagement and changing behaviour.

Gamification and employee engagement

According to Kapp (2014), the main fundamental principle of the game is to increase engagement and motivation of the participants. No doubt that employee engagement is desired outcome of any training and development programme, since engagement has significant impact on organisational results (Harter, et al., 2013). Engaged employees exhibit positive behaviour and attitude towards work, they remain loyal to the organisation and work effectively for it (Harter, et al., 2002). Engaged employees feel part of work and organisation, as well as are motivated to achieve high results of the work (Armstrong & Taylor, 2013). Similarly, Reilly suggest that engaged employees are working with passion and feel closely linked to the company, they are the ones that generate innovation and drive organizations forward (Reilly, 2014).

A challenge for businesses today is to find innovative and effective ways to engage employees. Gamification has drawn attention due to a different approach. It helps to create and maintain relationships with employees, as well as interest and enhance learning. Gamification helps workers to be inspired and maintain confidence that the results achieved and the performance is their own merit and responsibility. Innovative and well implemented gamification process may reduce the burn-out syndrome and to promote work engagement (Sarangi & Shan, 2015). From a psychological point of view, the involvement of participants in gamification is achieved through internal motivation and goal-setting and mutual competition (DuVernet & Popp, 2014). When participants are involved in training and the sharing of experience, they feel good and, if trainers respects the ability to think and to share their thoughts, as well as let employees to apply the experience, players are full of energy, they have fun and they are at the same time involved (Pike, 2008). Given arguments lead to the second and third hypotheses:

Hypothesis 2: Use of gamification in employee training programme is positively related to employee` engagement in training.

Hypothesis 3: Use of gamification in employee training programme is positively related to employee work engagement.

Elements of the effective game

In relation to employee training and development, “game” means structured and specially developed training methodology which is designed to help participants to change their behaviour (Hughes & Mccoy, 2015). Story, feedback, mystique are game elements which help to capture attention, remember and foster application of knowledge (Kapp, 2014). Gamification can help to avoid routine and foster creativity and ability to look at complicated problems from different angle (Oravec, 2015). Jensen (2012) consider that there can be no unified form of a good game, but there are several common characteristics: feedback motivate players to make informed decisions; focus on cooperation in setting common objectives of the game; rituals; sound games shall consider the difficulties the players face and challenge, when players are ready; user friendly; all good Games give rewards, however only some include fun (Jensen, 2012).

Collins (2014) pinpoint that six basic principles ensure effectiveness of gamification in training and development: *mission, environment, challenge, choice, consequences and competition*. The motivation to learn new skills in the full amount is based on the condition that it will be useful for the fulfilment of the mission. Game environment shall be so filled that participants can learn by doing. Participants learn new skills due to experiencing the results of their actions. New skills are acquired because of overcoming various challenges. These challenges must be proportionated with increasing difficulty, not getting bored to participants. In any good play, participants learn from mistakes, so it is important learning environments include numerous false choices. The analysis of the consequences enables the participants to create knowledge how to do better and why the choice didn't work. Competition is important as participants feel proud about received awards and points, it is increasing motivation to build new skills (Collins, 2014).

Brownhil (2013) in turn found four game components which help to strengthen the involvement of the employees: 1) continuous feedback and progress assessment; 2) clear success criteria, award and even public

recognition, which is achieved using the badges and points of remuneration; 3) permission to make mistakes, which is the traditional taboo in corporate culture, but allowed in the context of game; 4) the opportunity to collect and analyse performance data (Brownhill, 2013).

Jensen (2012) see gamification as the next “big hope”, however, warns that too often it is used only to serve the system without any value for employee engagement. To truly engage, the participants’ experience should be in the first place, achievements must be personally significant (Jensen, 2012).

Thus, the following Research Question is proposed: *Which game components are better associated with engagement into training process and work engagement?*

A confirmation of the first three hypotheses would favour the application of gamification as strategic HR tool for employee training and development. Whereas, the answer to the research question would provide useful insights for game design.

Method

To achieve the aims of this research a case study strategy and mixed methodology was chosen. Organisation form banking sector in Latvia which implement gamification in sales employee training since final quarter of 2014 was selected. Total amount of sales people employed in the organisation is 500. Since introduction of gamification until March 2016 the gamified training sessions were delivered to 441 employees.

Quantitative data include secondary data on sales results months before and two months after the training. Complete data were available on 25 groups which included 332 employees. Primary data were gathered through observations and survey in two rounds.

The first round was immediate feedback and took place between February 2015 and April 2016 - after each training session participants are sent out a questionnaire to receive immediate feedback and possible suggestions for improvement of training. According to Kirkpatrick, it is important to measure the immediate result including how participants liked the training programme or trainer (Kirkpatrick & Kirkpatrick, 2006). The feedback questionnaire included questions measuring participants’ assessment of training atmosphere, trainer and personal gain. The responses were measured in 6-point scale where 1 means very poor, and 6 – excellent. In addition, open ended questions about positive and negative experience during the training session were included, which provided qualitative data.

The second round and aimed to explore the relationships of game elements with engagement in the training and organisation. The second questionnaire was sent to all 332 employees in March 2016, however only 181 completed responses were returned. The questionnaire was designed to measure the employee engagement in job and organisation, engagement in the training and evaluation of different game components, and the clarity of the rules, aims and processes of the game. The questionnaire was developed in 4 sections: demographic questions, components of the gamified training, clarity of game rules and procedures, and engagement.

Demographic provided control variables for analysis and part included questions related to gender, age, and tenure. Gender has a long history of being examined as control variable. Research by Spires and Lester (2016) shows that there are no statistically significant differences between gender in perception of knowledge through gamification. Taking into consideration that younger employees, millennials for example, might be more involved in games (Kastner, 2013), age was added as control variable. Tenure was measured as number of years employed in the organisation and was added as control as it also may influence the perception of training.

Second section of the questionnaire measure the respondents’ attitude towards the value and contribution of the game elements in knowledge acquisition and training result. The game elements were chosen according to Kapp (2014), Collins (2014) and Brownhill (2013) and the following seven components were assed: winner selection,

additional choice options, competition, exchange of experiences, role play, collection of points, and feedback. Evaluation was based on 6-point Likert scale, where 1 was very poor and 6 was excellent.

The third section included three statements measuring clarity of the game including aims, rules and point accumulation system. Sample statement is “The rules of the game were clear”. The final section of the questionnaire measured employee engagement with 4 statements. The sample statement is “After the training I performed my duties with higher level of enthusiasm”. The internal consistency reliability of the scale was assessed with Cronbach’s Alpha coefficient - .81 proved good reliability of the scale.

In addition, one statement was designed to find out whether the training method (game) contributed to the involvement of participants in the training process. Questionnaire included the statement “The method (training as a game) contributed to my involvement in training”. All the statement in section three and four were measured in 6-point Likert scale where 1 is completely disagree and 6 – completely agree.

Quantitative data were analysed with SPSS software using OLS regression and Friedman test. Qualitative content analysis was used to analyse open ended questions and

Findings and Results

To test the first hypothesis, the sales results 1 month before and 2 months after the training sessions were analysed.

Sales results were measured as number of products sold. Respondents were divided into 25 groups according to the date of their training. To test for differences between groups before and after training Friedman test was used which is nonparametric method for testing differences in related samples. Only four groups out of 25 indicated statistically significant differences in sales results. For 21 group Chi-Square values were in range between .04 – 5.73; $p > .5$. Two of four groups indicated statistically significant increase in sales results (Chi-Square 7.75 and 9.77; $p < .05$), however, two groups showed decrease in sales results (7.54 and 9.25; $p < .05$).

Thus, the first hypothesis should be rejected. This is in line with other researches which concluded that sales results can be influenced by complex variables and there are several adjacent variables, which this study did not consider, but, with reference to the theory can affect employees’ behaviour after training. Leone (2015), Brinkerhoff and Mooney (2008) concluded that environment in which trainee is put after the training has the most significant effect.

The second round of the survey resulted in 181 completed responses and respondents included 90% females and 10% males what is representative for this job category in the organisation. This data was used to test the hypotheses No2 and No3. Table 1 reports the results of ordinary least squares regression analysis for testing hypotheses two and three and answering the research question.

Hypothesis two predicted a positive effect of gamification on employee` engagement in training process. Hypothesis three predicted a positive effect of gamification on employee` work engagement. Positive and statistically significant relationship was found in respect to both, thus both hypotheses should be accepted.

Table 1. Descriptive statistics and OLS regression results

	Descriptive statistics		Hypothesis 2 (DV Engagement in training)		Hypothesis 3 (DV work engagement)	
	Mean	Standard Deviation	B Coefficient	SE	B Coefficient	SE
Elements of the game:						
winner selection,	5.17	1.05	-.037	.053	.109	.074
additional choice	5.04	1.18	.076*	.042	.062	.059

* p < 0.10; ** p < 0.05; ***p < 0.01

Research question was developed to identify the most effective game components. Exchange of experiences appeared to be better associated with engagement into training process ($b = .18$, $p < .05$) and work engagement (b

$= .16$, $p < .1$). This result is in line with Goldsmith (2014) who found that exchange of experiences as one of important components of adult education, and Pike (2008) linked exchange of experiences with overall atmosphere of the training, since it creates energy and joyful atmosphere. Clarity of game rules and aims appeared to have positive and significant effect on engagement in the training ($b = .15$, $p < .01$; $b = .05$, $p < .01$). Collection of points and feedback showed positive and significant effect on work engagement. This result is in line with Brownhill (2013) who connected engagement with the following elements: feedback, clear success criteria for the award, and the opportunity to see the performance. DuVernet and Popp (2014) mutual competition mentioned as one of the factors leading to participant engagement, however, this research did not support this finding since the effect of competition is not significant.

In addition to the results from quantitative analysis, content analysis of qualitative data from open-ended questions was performed. As positive experience of the respondents, participants mentioned game as a method (mentioned

63 times), for example “during the game it was easier to perceive the information than it is during the lecture”; “learning during the game lead to change in my behaviour sooner than learning during the lecture”. The second was atmosphere of the training session (mentioned 60 times), as example, “positive and friendly environment which facilitated exchange of experiences”, “game encouraged me to be open and do not to be afraid of taking risks”. As the most important component of an effective game was mentioned exchange of experience (65 times). Employees stated the following: “exchange of experiences during the game was more valuable than a seminar” and “fantastic opportunity to exchange experiences”. Thus, the results from qualitative data appeared to be in line with the results of quantitative analysis.

Conclusions and Recommendations

This study tested the use of gamification as training method in training and development of sales employees in banking sector organisation. Significant effect of gamified sales training on performance results was not identified, however, the positive effect on employee engagement in training and work was significant. The results are in line with previous research by Brinkerhoff and Mooney (2008), Leone (2015), Willyerd and colleagues (2014), Radovan and Makovec (2015), and Pike (2008). Thus, gamification can be recommended as method for training and development of sales staff.

As the most effective game components for training of sales staff exchange of experiences, collection of points and feedback were identified. For managers who want to implement gamification in organisational training and development the following can be advised. Ensure the clarity of game rules – for example, main rules should be placed on the walls so that participants can recall them any time they need. Trainer`s support explaining the rules is essential. Training aims should be introduced before the training session, for example, by e-mail, so that employees see the link between their job aims and the aims of the training.

When designing or choosing the game for training session, it is important to ensure that the participants have the opportunity to exchange of experiences. For example, during the game when employees play role plays, they should be encouraged to exchange experiences. Feedback should be provided not only at the end of the training, but also during it. For example, after each round, the winners should be announced and then final winner at the end of the game.

It should be acknowledged that this research has certain limitations. In relation to the finding that Gamification did not have significant relationship with performance, there are several variables which were not considered in this research. For example, when analysing the impact of gamified training on performance results, such possible causes of performance deviations as sick leaves, seasonality, sales promotions, market conditions and economic situation, cultural differences between branches were not accounted for. To address this limitation future research should add more variables to the model and/or choose samples for comparison with identical side effects. The generalisability of the results is limited since the research is done in banking sector organisation and related to sales training. Future research should look at different sectors and different training needs, since the components of effective games could be context specific. Different employee training and development aims could be related to different game components. However, the finding reported here could spur future researches to identify the components of effective games in different settings and test their effect on performance outcomes and engagement.

Local and Global Career Building Challenges in Lifelong Learning: Possibilities and Risks of Youth Self-realization

Arturs MEDVECKIS

Dr. paed., researcher, Liepaja University, Sociological Research Center
Email: arturs.medveckis@liepu.lv

Abstract

One of the values of democratic society is free career choices for youth. Looking from economic, social and cultural perspective there are also other actors besides youth interested in youth career choices: state and community representatives, employers, family members and others. Youth self-realization possibilities are actual topic. These possibilities are determined by competitive education at corresponding educational level in order to continue the process of education and to achieve set goals of self-development. Study was carried out in 2011 and 2017, and it is focusing on career possibilities of youth, lower secondary school and secondary school students in Kurzeme region (Latvia), and it is based on a comparative analysis of the quantitative and qualitative research data of self-assessments. Aim of this article is to analyze such resources necessary for youth career building as key competences of lifelong learning, health, social tension, which are based in understanding of values related to career and reflect youth self-assessment dynamics in correlation with future plans, identifying possibilities and risks of youth self-realization.

Keywords: Youth, Career, Key Competences, Self-assessment, Self-realization

Introduction

Prerequisite for development of any territory is its inhabitants: number and content according to age, education, professional training, health etc. Education that meets long-term market requirements is very important. It is stressed out in development strategy of Liepaja (the biggest city in Kurzeme region), taking into consideration the importance of Liepaja at local, national and regional scale. Strategy was developed for period from 2008 till 2014, and it was relevant at 2011 when study was carried out. Development strategy stipulated that sustainable development, competitiveness of city, its European integration will be provided, as well as diversified economic development will be promoted, thus creating healthy and favorable work and living environment for all inhabitants of Liepaja area and Kurzeme region (Liepaja City social economic development program 2008 – 2014, 2007). In addition to set priorities of increased welfare and life quality of each inhabitant of Liepaja and its area accessibility of qualitative education was also stressed out.

Hypothetical assumption of 2011 study shall be updated in 2017: *If priority stressed out in strategy about development of favorable living and work environment in Liepaja (which is possible with active involvement of whole society) will fulfill, it will increase the possibility that after graduation youth will take advantage of possibilities for education and work available in Liepaja and region. Therefore study on student success at school, skills, health, professional orientation, life values, and opinion may give additional information about possible changes of number of inhabitants, and possible supplement of work resources as precondition for development of city and its area of influence* (Markausa et al., 2011, 5).

Updating of said assumption is important also in 2017, as mentioned in latest Liepaja city development strategy (Liepaja City Council. Liepaja 2030. Liepaja City sustainable development strategy 2030, 2015), which is coordinated with strategic development documents of Kurzeme Planning Region, National development plan of Latvia and European Union strategic development.

In Liepaja long-term development strategy “Liepaja 2030” it is declared: *Liepaja is the centre of education, science and research! Liepaja higher education institutions provide competitive, internationally recognized study programs, promote innovative research, and represent important knowledge economy cornerstone. Thus Liepaja professional education institutions provide highly qualified specialists for modern industrial companies*

in Latvia. Young people educated in Liepaja are competitive and creative in labor market; they are demanded specialists and active employers (Liepaja City Council. Liepaja 2030. Liepaja City sustainable development strategy 2030, 2015). Realization of strategy is possible, if appropriate program of action has been developed, where interests and possibilities for self-realization of school graduates has been taken into consideration, and school graduates are able to develop and improve knowledge and competence necessary for personal growth, in order to be competitive in ever changing social, economic and cultural conditions and open to challenges of chosen career.

Understanding of career has changed over the times due to social, political and ideological conditions. For instance, soviet ideology marked person with career goals and “careerist” and this title was used disdainfully, while in Western culture this term was used for intentional rising at work or in different field, which was directed towards success accompanied by fame and popularity, or it is related with individual work, self-expression and leisure time, that has socially important role. Explanation of term “career” in Psychology is analyzed as, for instance, profession with possibilities for individual growth that has positive impact on organization and society as whole (Shepard, 1984). In Sociology career is understood both as relationship between individual and social groups and as social mobility that provide possibilities for growth or transition to another status, linking it to improvement of life quality: *Function of mobility is to provide access to education, work, social contacts, healthcare, culture ect. resources, that are essential for well-being* (Šūmane 2010, 347). In Economy career of individual is being related to employment, which is viewed as readiness of human capital to react on market demands (Becker, 1975) Mentioned and also other career defining aspects as continuity cycle in relationship between individual – career development subject and external factors that influence career development process, can be viewed within system theoretical aspect. System theory approach allows questions related to career to view through interconnection of several theories and sciences, while respecting competence, talents and choices of individual. Defining career as education, interaction between work and private life within one’s life time (Education Law, 2017), student understanding about future perspectives is based on conclusions, that have developed within social experience. In socialization process family, school and circle of agents involved in interaction are very significant. For instance, virtual environment mass culture information sources become significant shapers of opinion and values. It means that possibilities of self-realization related with further career choices depend on not only the self-evaluation of own possibilities, but also on many factors that can essentially impact young person’s life.

As significant risk factor can be considered personal growth that depends on personal life-style. Personal growth can be affected by obtained education, competences, healthy life-style habits etc. However external factors are significant, too, since they don’t depend on persons will, for instance, professions, that cease to exist or transform into new quality during person’s life-time. Therefore, profession, that seems to be acquired for life-time, can vanish and transform dynamically. Youth integration in society and marginalization risks related, among others, with unemployment, which is based on both lack of necessary human capital (Bourdieu, 1986), and structural unemployment, which is related with professions demanded in economy and other forms of youth education, that is acquired according to ones interests and abilities, or insufficient education (Goldmanis, Mierina, 2009). Therefore education process must be continuous, aligning with 21st century education structure that consists of 4 dimensions:

- knowledge, emphasizing interdisciplinary, traditional, modern and thematic;
- skill, emphasizing creativity, critical thinking, communication and cooperation;
- character, emphasizing confidentiality, curiosity, courage, steadiness, ethicalness and leadership;
- meta-learning, emphasizing growth thinking and meta cognitive abilities (Fadel et al., 2017).

In the context of educational content reform in Latvia, when competence based education is being introduced in secondary education, emphasis is on such competences as readiness of individual to perform in ever changing world, ability to make use of knowledge, skills and to express the attitude, solve problems in changing real life

situations, ability to use appropriately learning results in defined context (education, work, personal or social political) (Catlaks, 2015). Emphasis is also being put on character education, which is much more effective student success progress factor in further education, productive work and successful career (Poropat, 2014; Tough, 2013), and meta learning that promotes social responsibility, growth mindset, ability to improve knowledge, and use of skills and character outside direct context (Schraw, Moshman, 1995), in order to successfully overcome 21st century global challenges in solving environment problems, as well as to diminish corruption, terrorisms and income inequality (Glenn et al., 2007).

Aim of study is to analyze in comparative study the self-realization possibilities and risks of last class students of lower secondary school and secondary school in Kurzeme region, as well as career plans and possible influence of different factors on realization of plans for future.

Method

Parallel nested mixed methods design was chosen for this study (Mārtinsone et al., 2016, 199-200). Within this design during data collection stage quantitative and qualitative data is being collected simultaneously, where questionnaire is used for collection of priority data – questioning students of 9th and 12th grades.

Study was carried out in two stages. At the first stage data was collected during 2008/2009 school year and summarization and analysis of data was carried out in 2011, which was the third phase of longitudinal study: Future plans and their realization possibilities of Kurzeme and Liepaja youth. Study on reproduction of population in Kurzeme and Liepaja (Markausa et. al., 2011). During the first stage of study, using nested selection principle, schools from towns in Kurzeme region where chosen randomly. In these schools questioning of students of 9th and 12th grades were carried out proportionally to their numbers, therefore selection with total number of respondents (N 337) was created. This number was acquired after dismissing invalid questionnaires. 179 respondents at 9th grade make part of the selection, where 158 respondents at 12th grade make other part. At the second stage data was collected during 2016/2017 school year according to analogy, using the same data collection methods as during 2011 study, which provides believable data comparing possibilities, providing appropriate representation of respondents at particular age groups (N 169), proportionally to number of students at schools chosen in previous study – 103 students in 9th grade, 66 students in 12th grade. This time there were no questionnaires carried out in parallel classes, instead 2 focus group interviews with 9 informants in each were carried out in order to provide strong and reliable data.

In this study according to rating classification students self-evaluation is being used and analyzed on Likert scale as effective evaluation learning strategy (McNamee, Jie-Qi, 2005; Burns, 2005; Thawabieh, 2017), evaluation of personal performance and identification of personal strong and weak sides for the improvement of learning results and for conferment of value to learning experience (Klenowski, 1995; Wegner, Beumann, 2017).

To process primary data in order to acquire secondary data cross tabulation and Chi-Square test relationship was used for defining statistic significance between criteria depending on respondent profile within SPSS quantitative data processing program, but secondary qualitative data was acquired with content analysis.

Findings

According to 2011 study data most of the 9th grade and 12th grade students plan to continue their professional and academic education. In 9th grade respondent group one third of students plan to obtain higher professional education, and 2017 study shows similar tendency, where interest in higher professional education increase by 3%. In 12th grade respondent group plans to acquire higher professional education dominate both in the first and in the second phase, 38,6% in 2011 and 39,0% in 2017, respectively. 19% plan to obtain masters degree in 2011,

and there is a downward trend in this position with only 17,9% in 2017. Similar decrease is related also with doctoral studies: 8,2% during first phase, and 6% during second phase of study.

Most of the students plan to continue their education after graduation, however both 2011 and 2017 study show that at 9th grade part of the students consider working during studies; 12th grade students have similar understanding about their future. In 2011 27,4% 9th grade students plan working while studying in higher educational establishment, and 65,6% of 12th grade respondents, respectively. Similar tendency is visible in 2017 where 30% on 9th grade students and 66,0% of respondents in 12th grade plan working while studying.

Prospective mobility of Kurzeme region, including Liepaja youth after graduation from secondary school shows that big part of students plan to study in higher educational institutions in capital city of Latvia – Riga. 39,9% of all respondents gave such answer, while 27,2% respondents plan their future studies in Liepaja. 10,1% see study possibilities in other European higher educational institutions outside Latvia. In 2017 desire to study abroad increased by 1,5%. In 85% of cases students plan to work in profession they plan to acquire.

In 2011 both 9th grade and 12th grade students consider good salary and publicly recognized profession as prestigious. In 2017 growth possibilities dominate, but also good salary and demand for profession are considered as important. In 2011 students consider doctor, pharmacist, teacher and builder as demanded professions; in 2017 next to doctor proportion of engineering sciences has increased, including computer science engineer, IT specialist, programmer, which can be explained with purposeful dissemination of information about labor market demand and offer, using mass media and promoting state supported study programs.

In 2011 in 9th grade student group profession choices were influenced mainly by salary (20,1%), interesting profession (15,1%), self-evaluation of personal talents (10,1%), career possibilities (8,4%). In 12th grade well paid profession dominates (16,3%), interesting profession (14,8%), demanded in labor market (14,5%). In 2017 motives of profession choices are similar, however both in 9th and 12th grade demand in labor market ranks as the first. Significance of salary is better visible at 9th grade.

In 2011 students show more interest in doctor/pharmacist and economist profession. Part of respondents at 9th grade show practical orientation, they choose builder (9,5%), as well as lawyer/notary and economist (8,4%) and engineer (7,3%), followed by mechanic and other professions with practical orientation. But in secondary school economist take the first place (9,5%), doctor/pharmacist (8,9%), lawyer/notary (8%), engineer (7,4%). 2017 study shows that students tend to choose IT, however other science capacious professions, doctors and engineers, keep their positions.

In 2011 both 9th and 12th grade students hold the view that work must be interesting. As very important this aspect is recognized among 32,4% of 9th grade students and 43,0% of 12th grade students; as quite important: 52,0% at 9th grade and 45,4% at 12th grade. In 2017 study tendency in 9th grade group stays the same; however in 12th grade student group almost 60% of respondents consider that work must be interesting. 2011 study data show that 48,6% of 9th grade respondents, as well as 50,6% of 12th grade students prefer interesting but not that well paid work, and with small differences 46,4% of 9th graders and 46,2% of 12th graders prefer well paid but not interesting job. In 2017 study the results are vice versa – there is a small tendency in favor to well paid, but not that interesting job. This tendency can be explained with possible value shift in favor to processes in market economy and transformation of ethical believes.

In 2011 in more than 70% cases both 9th graders and 12th graders evaluate their health as good and very good, however 23,5% at 9th grade and 25,2% at 12th grade students evaluate their health as satisfactory which is alarming result, since it may impose difficulties in labor market and on career choices. In 2017 study self-evaluation of health in both groups is similar.

In 2011 study answers of respondent show symptoms of depression in both groups, which match with tiredness in the end of semester or school year. In 2017 study there are no significant differences in physical well-beings, however there is an increase by few percent points of those students who note depression and tiredness in their psychological health self-evaluation, that rise significantly during final exams in 12th grade (by 5,0%). Besides physical tiredness that is promoted by physical and mental load, as well as physiological changes in human body and other factors, also excessive stress causing irritants and misbalanced study load during school year are important factors that influence well-being.

In 2011 as most important obstacles for reaching life goals students pointed out bad health, lack of money, insufficient knowledge and laziness. More concerned about their laziness are students at 12th grade (one third). Also lack of initiative, parental rejection, weak character, also too wide interests were pointed out. On average 8,6% of students see no obstacles (10,6% at 9th grade and 6,3% at 12th grade). 2017 study data show that lack of money and knowledge are considered as main obstacles for reaching life goals. 35,0% of 9th grade students and 56% of 12th grade students emphasized the lack of money. Laziness factor keeps the significance and is similar to 2011 study data, where one fourth of students at both groups pointed it out as significant obstacle.

More important for students are values related with family, education, work, material wealth, health, friends; they consider less significant everything that is related with activities outside work and family.

Data obtained in 2011 study is noteworthy for career consultants; they show that in 9th grade mothers standpoint is dominant (29,6%), followed by student's own choice (21,8%), fathers standpoint (19,0%), and smaller that others is teachers influence only 5,6%. In 12th grade group students own choice dominate – 36,1%. In 2017 study there is an increase of importance of student's own choice.

In order to promote skills and competences students in both groups pointed out the importance of foreign language skills: 19,2% at 9th grade and 17,1% at 12th grade.

In 2011 study 48,0% of 9th grade respondents believe that it is very important to acquire and to improve one's knowledge during a life time, 45,8% consider this to be quite important; similar situation at 12th grade group: 48,1% as very important, 48,7% as quite important. In 2017 study respondents in both groups consider this to be very important: 53,1% in 9th grade and 54,3% in 12th grade, respectively. Option not important wasn't pointed out at all, but in 9th grade 3,4% of cases option insignificant shows up.

Knowledge classification model fit in many theory systems; there are four dimensions emphasized in these models: interdisciplinary, traditional, modern, thematic.

Interdisciplinary knowledge has integrative character. Problem of interdisciplinary comes in the foreground in knowledge dimension. In Latvian context, when decline of good results at mathematics exam can be observed in whole country by comparing the results of centralized exams of 2016 and 2017, it was set in this study the self-evaluation of mathematics knowledge to be analyzed in the group of traditional knowledge. Data summarized in 2011 study show that more than a half of 9th graders (54,2%) and more than a half of 12th graders (53,8%) evaluate their knowledge at mathematics as average. 12th graders are even more critical – statistically significant differences were established ($p=0.000$) in self-evaluation of mathematics knowledge depending on respondent group – at 12th grade more students (25,3%) evaluate their knowledge as bad, while at 9th grade only 14,0% respondents make the same evaluation. Whereas more students at 9th grade (22,3%) evaluate their mathematics knowledge as good, comparing to 12th grade, where only 14,6 % give the same evaluation. Data of 2017 study show that there is a decline of number of respondents who consider their mathematics knowledge good: at 9th grade there are 19,5%, but at 12th grade – 12,3%. Similarly, number of respondents at 9th grade and 12th grade, who evaluate their mathematics knowledge as bad, have grown: 16,3 % and 27,2% respectively. Traditional learning approach and mathematics knowledge does become worse within time in all respondent groups; the

dynamics of their evaluation is negative. Descending progress tendency might be influenced by offered possibility to choose school subjects and final exams, which significantly lowered the desire of graduates to take final exams at exact science school subjects.

In modern science group self-evaluation of student's entrepreneurship knowledge was analyzed. 2011 study data shows that more than half of respondents (51,9%) recognize their entrepreneurship knowledge as good. Statistically significant differences were established ($p=0.000$) in self-evaluation of entrepreneurship knowledge depending on respondent profile – at 9th grade more respondents evaluate these knowledge as average (41,9%), but at 12th grade group there are only 29,8% respondents who evaluate their entrepreneurship knowledge as average. Whereas at 12th grade respondent group students more often evaluate their entrepreneurship knowledge as good (59,5%), while only 45,3 % at 9th grade make the same evaluation. In 2017 study the tendency of self-evaluation of entrepreneurship knowledge is similar. Student self-evaluation of entrepreneurship knowledge is probably related to lack of entrepreneurship experience at upper secondary school, as well as to lack of purposeful and systematic approach to career education.

In thematic knowledge group students self-evaluation at global literacy knowledge was tested. Global literacy is open communication channels with ability to use several languages to get to know other cultures and to critically overcome stereotypes in global community taken from perspectives of different cultures. In 2011 study big part of students both at 9th grade (61,6%) and 12th grade (72,7%) evaluate their global literacy knowledge as good or very good. In 2017 questionnaire positive changes were established. At 9th grade 85,6% students recognized their global literacy knowledge as good or very good, and 89,3% of 12th grade students made the same evaluation. Student global literacy knowledge has been promoted by student involvement in international mobility, and balanced learning of foreign language reading, speaking, listening and writing skills in school programs.

Skill dimension is related with transfer of knowledge. Knowledge alone without link to skills is short-term. This notion should be placed at the basis of process of improvement of future learning environment and learning process. In order to eliminate the gap between knowledge necessary in real life and application, it is necessary in 21st century to have creativity, critical thinking, communication skills and ability to collaborate.

Believe that creativity is related only with artistic innovation should be reconsidered. It is undeniable that it is so, but stereotypes and artisanal imitation at professional level exist also in arts. Creativity begins where new extraordinary way for usual activities or reproduction of knowledge has been found. It can be achieved with promotion of way of thinking that is problem solving oriented, with search for innovative solutions, with approach where memorizing model is replaced with creativity model – knowledge that is acquired in one field is being integrated in other fields and ability to generate new ideas, as well as to use acquired knowledge for problem solving or to achieve set goals. In 21st century creativity has become an important component of guidance quality. 2011 study concludes that both 9th and 12th grade students most often evaluate their creativity as average: 35,5% at 9th grade, but 42,0% at 12th grade. 38,4% 9th grade students evaluate their creativity as very good and good, but at 12th grade creativity potential is even smaller – 32,0% respondents evaluate their creativity as very good and good. 2017 study shows decrease of creativity self-evaluation in both groups. At 9th grade 31,5% students consider their creativity as very good or good, and 26,8% 12th grade students evaluate their creativity as very good or good.

Direct transfer of knowledge to students has become non-productive, and one of the reasons is this: information flow of 21st century offers new ideas and in emotionally effective way creates attitude towards various different values in social environment. In order for everyone to be able to orientate oneself in information flow, to distinguish objectivity of offered information and to be able to find the necessary information, critical thinking must be developed. Critical thinking is the ability to evaluate facts in reasoned manner, ability to separate facts from opinions, beliefs and self-evident mind habits. It can develop through interaction with different perspectives of one phenomenon; it means that sometimes one shall face different opinions on one issue.

Benefits of critical thinking – ability to analytically evaluate processes and phenomenon outside context where specific knowledge was acquired. According to indicative data of 2011 study it was established that big part of 9th grade students evaluate their critical thinking as average (56,0%); also at 12th grade 45,0% students evaluate it as average. However in secondary school compared with 9th grade bigger number of students evaluate critical thinking as good: 22,4% at 12th grade and 11,1% at 9th grade. In 2017 study it was established that there has been small increase of self-evaluation of critical thinking at 9th grade. 22,9% 9th grade students evaluate critical thinking as good and very good, therefore lower evaluation has decreased in this group. Changes in 12th grade group are smaller, however with positive tendency: 24,8 % respondents evaluate their critical thinking as good and very good. Therefore there is a small decrease in negative evaluations in this group.

Communication skills are necessary not only for those professions where everyday work is related with customer or patient service, or for employees in communication and media environment, but also for any profession. Interactive learning is becoming more and more significant in 21st century, as well as necessity for collaboration, in a result of which feedback of one's competence is obtained. There is an increase of knowledge obtained in the result of interaction, which is not the one-way transfer of knowledge, rather exchange of knowledge with possibility to evaluate offered knowledge critically. In 2011 study 27,4% of 9th graders evaluate their communication skills as very good, 48,0% as good; 19,2% of 12th graders evaluate as very good and 43,6% as good. In 2017 study 25,6% of 9th grade students evaluate their communication skills as very good, 52,4% as good; 12th grade students and more critical than 9th graders: 20,2 % consider their communication skills as very good, 57,0% as good.

In 21st century to solve topical tasks wide and deep knowledge in several fields is necessary, which is not provided by amount of knowledge, skills and competences one person possess. Thus several persons with different competences must collaborate to achieve common goals putting collaboration in foreground. In 2017 study it was established that integral part of learning process is couple and group work, as well as project work. During such collaboration each members abilities are revealed and character expressed, persons with leadership talent become visible; such persons can motivate and organize work to achieve common goals. In 2011 study 9th grade students evaluated their collaboration skills as very good (23,5%) and good (60,9%); 12th grade students evaluated their social skills similarly: 23,4% as very good and 60,8 % as good. 2017 study shows that there is no significant change in self-evaluation of collaboration skills. Evaluation “very good” has increased by few percentage points in both groups, and evaluation “average” has decreased respectively.

In 2011 study respondent evaluate their learning to learn skills as good and average: 55,3% of 9th grade students consider them as good, 25,1% as average; evaluation among 12th grader is similar: 59,5% consider them as good, but 26,6% as average. In 2017 study learning how to learn self-evaluation is similar: answers given to analogous questions at 9th grade show that 49,3 % respondents evaluate their learning to learn skills as good, but 26,6 % as average; 56,3% of 12th grade students evaluate their learning to learn skills as good, but 23,4% as average. Low evaluation of learning to learn skills can be explained by change of paradigm from training, which was expected from teachers during the previous decades, to student's personal responsibility within learning process and in collaboration with pedagogues, which is inherent to 21st century. In 21st century it is important to learn how to learn. It has been established in many studies that while preparing for tests students put different level of effort into their work, however not always results depend on amount of work invested. Without reviewing other factors it was established that success depends also on learning strategies. More successful are those who take into consideration the effectiveness of their learning. It is connected also with self-control and with reasoning about improvement of one's skills. Meta cognitive skills are not based only on knowledge; they depend on character development abilities and mental process management. The lowest level of mental process management can be seen as obvious verbalization, verbalization of non-verbal processes and observations and ability to see structures in verbalized text are attributable to other processes.

Character education can relieve decision making that is based in universal values, at the same time being careful to nature, resources, environment, people, in order to conclude that welfare is based not only on quantitative consumption of resources, but also on modesty. It is not the glorification of poverty, but creation of understanding that is based on moral and cultural values.

Leadership is a significant edge of character. Sometimes energetic, charismatic persons are considered to be leaders, but not always silent guidance leaders are being noticed; they oversee the processes and involve other participants in proactive activities, which leads to wrong conclusion that positive changes happened by themselves. Very often everyone forgets that silent leaders have motivated, have stimulated to solve problems with cooperation, to move towards success, thus giving the meaning to cooperation and transferring this notion to the consciousness of each involved individual.

In 2011 study only 8,9% 9th graders recognized very good leadership skills in themselves; more often they evaluated leadership skills as good (35,3%) and average (30,7%). 8,2% 12th graders recognized their leadership skills as very good, good – 59,1%, and average – 24,5%. In 2017 study small changes can be observed – leadership evaluation as good increases at 9th grade (47,3%), while evaluation as average and excellent decrease. In 12th grade there is a rise of evaluation as very good (9,4%) and good (60,2%), while evaluation as average decrease, respectively.

Quantitative data of study are confirmed by qualitative data, based on the claims acquired during focus group interviews:

- *I have been thinking about successful career in connection with doctor's profession that I have chosen. I know that I will have to study a lot. That is why I take advantage of Shadow day when I can get familiar with my future profession. I learn hard not just at school but also with private teachers;*
- *I think career is very important. It can be considered successful if you don't stay at lowest level at work. Possibilities for growth and related salary is necessary;*
- *If there was no good salary, I would like that it is interesting at work. But it would be better if job was both interesting and well paid. For some time I could travel to see World, and earn money at not that interesting job. I'm not sure that I would like to have the same job all the time. I would like to try myself in different jobs.*

Results, Conclusions and Recommendations

Student's career choices is a dynamic process, influenced by student's own preferences, evaluating their abilities and knowledge in relationship with economic, social and cultural processes and factors that influence them.

Every moment, new discoveries piling up and new knowledge accumulating outside the ability of individual to master them within one lifetime, we face several problems - artificial intellect, storage of information and means of its transfer, thus creating potential danger to privacy. Economic and social problems create the raise of proportion of sciences capacic technology and decline of number of providers of work functions or involved persons. Demographic changes, for instance, rise of number of global inhabitants is faster than possibility to educate them all according to demands of 21st century. Also solutions of problems of ethical character that were once acceptable among one narrow social group, facing the increased international migration, longer life spans etc. demand the necessity of new solutions. Moving towards rise of amount of knowledge in traditionally separated school subject system high information density has been reached in 21st century. However school programs do not provide place for meta learning.

In comparative studies with time distance skill dimension of 9th grade ad 12th grade students is not developed enough in all directions: social skills and communication skills are relatively good developed, but they do not provide critical thinking by themselves; creativity does not compensate lack of knowledge.

Meta learning strategies improve behavior, because during this process self-effectiveness evaluation is activated, performance is increased, feedback on self-evaluation is obtained, which, if necessary, promotes corrective activities without learning model imposed by grown-ups. It is necessary in order for person itself to realize the importance of lifelong learning in career building and to get involved in this process.

Positive tendencies at leadership self-evaluation and transition from authoritarian leadership to democratic can be explained with more frequent student involvement both in activities of student councils and with growth of proportion of interactive activities in lessons and in education as whole.

In order to provide successful career educational basis must be such where person is able to learn to adapt to ever changing circumstances of 21st century, thus acquiring satisfaction with quality of life and fulfillment of life.

Mathematics, entrepreneurship and global literacy education process without the acquisition of basic knowledge must be rebuilt as meta knowledge system.

Lack of connection between knowledge dimension and gap between the necessity for new competences and education systems offer for acquisition of knowledge bring forward new challenges and tasks for education politicians and pedagogues. They are related with the evaluation of old education content and study topics, in order to provide possibilities for personality growth, orientation of intelligent understanding, which is based in competences. If practical aspect of knowledge dominates in education, its usability, then it can be projected that after some time, for instance, some knowledge can become unusable due to development of technologies, as well as cognitive process can be slowed down and emotional alienation may occur.

Acquisition of different knowledge at all education levels must be motivating and understandable for students; it must have clear message about the necessity of knowledge and possibilities of its usability.

In learning process with the aim of high level knowledge basic knowledge must be strengthened. Every component of educational process must be subjected to student self-evaluation and to analytic evaluation in collaboration with pedagogues.

Student perception of their skills are with relatively high self-evaluation, however high self-evaluation of skills partially contrast with achieved performance, which is displayed by learning results. Meta learning strategies should be improved. If brought forward the approach based in meta learning strategies, ways of progress check-ups and content must change as well.

Leadership must be developed in educational processes by changing social roles among students. Aspiring to development of non-authoritarian leadership, it must be achieved that relationships between students and teachers are based on collaboration with common goal and that these relationships are based in mutually agreed ethical principles that are obtainable with active involvement of all interested parties, hearing of all opinions and reasoned discussions.

Abstract

Currently, under the protection of Organic Law 8/2013, of 9 December for the improvement of educational quality (LOMCE), are being developed from the academic year 2014/2015 what has been called "Basic Professional Training" (FPB), are still having difficulties in achieving the objectives and competencies established by the compulsory secondary stage. This research intends to make a brief normative and pedagogical revision not only of the current Basic Professional Formation, but also of the previous laws to this one, to clarify differences and similarities as well as to evaluate the evolution of the objectives that have been marked throughout this years. Therefore, it is concluded that the new FPB establishes a greater catalogue of educational actions aimed at avoiding premature school leaving, among which the proximity and communication with the family or the acquisition of labor competences, giving students greater opportunities for social and labour insertion.

Keywords: Basic Vocational Training (FPI), Initial Professional Qualification Programs (PCPI), Social Guarantee Programs (PGS)

Introduction

Spain is one of the countries of the European Union that continues having a high number of students who do not successfully complete compulsory secondary education. According to data published in April 2017 by Eurostat - EU statistical office of the European Union - Spain is the second country with the highest dropout rate (19%), only surpassed by Malta.

For this reason, the Ministry of Education of the Government of Spain has taken various legislative measures that favor the achievement of basic skills to avoid the early leaving of these adolescents. This research carries out a detailed analysis of the similarities and differences of the last three laws that deal with this issue to obtain a series of results that promote proposals for improvements.

Method

The methodology that has been used in this research is qualitative, through the comparative and descriptive method. We think as Sartori (1984) when in one of his books he claims that comparative studies intend to search for the differences and similarities through a rigorous and systematic work of that which can be compared. What is analyzed in this research are the last three regulations that regulate professional training in Spain, to identify dissimilarities and similarities that enrich and facilitate the perception and information of researchers in the field of education. Once it has been analyzed each of the three regulations, it is proceeded to the categorization to observe the aspects to be compared. In the following table you can consult these categories:

Table 1. Categories of research.

Name of the categories	Description of the categories
Program	Name of the educational program analysed. In this research, the comparison of the following programs has been carried out: Social Guarantee Program, Basic Professional Qualification Program and Initial Training Program.
Law	Law that regulates and protects each of the educational programs studied.
Aim	Aim of each of the programs.
Students	Profile of the students who can make access these studies.
Organization	How the educational modules are structured in academic courses.
Length	Estimated time in hours of training received.
Titles and other certifications	Degree obtained after the training.

Results

The data obtained from the comparative and descriptive analysis between the last three educational laws on vocational training in Spain are numerous and numerous. This document presents the most significant results. In the first place, the basic aspects of each of the regulations analyzed from a descriptive approach are presented.

Social Guarantee Programs (PGS)

The ORDER of January 12, 1993 was chosen to regulate what was called at the time, "Social Guarantee Programs" (PGS) under the protection of Organic Law 1/1 990, October 3, General Ordinance of the Educational System (LOGSE). The purpose of these programs is to provide students who have left the stage of compulsory secondary education without achieving the corresponding objectives, basic and professional training that allows them to join the active life or continue their studies in Specific Vocational Training of Middle Degree.

This educational measure was designed for those students over the age of sixteen who, according to the order, find themselves with learning difficulties or with personal circumstances of different nature that prevent them from reaching the objectives of that stage.

This law meant to be a solution for a large number of young people with the following characteristics:

- A) Out-of-school youngsters over the age of sixteen and under twenty-one.
- B) They left the education system without a minimum professional qualification.
- C) Incomplete basic general training not having obtained the degree.
- D) Unemployed at the same time and with difficulties of labor insertion due to their lack of education and vocational training.

The Social Guarantee Programs aimed three fundamental objectives with this student body:

That they acquire the contents of basic education.

The students would receive training in jobs and occupations according to their personal capacities and expectations.

In addition, teachers would facilitate the acquisition of personal skills so that the student becomes a responsible worker and citizen.

The didactic organization of the contents was structured in five areas: specific vocational training area, training area and work orientation, basic training area, complementary activities and tutoring.

Initial Professional Qualification Programs (PCPI)

The following important change in educational legislation in Spain takes place in the ORDER of June 24, 2008, which regulates the initial professional qualification programs (PCPI), under the protection of Organic Law 2/2006, of May 3 Of Education (LOE).

The PCPI training programs were intended to be a measure of attention to diversity that avoids premature leaving and failure to obtain the title of Compulsory Secondary Education. One aim was to generate "new expectations of training giving access to a qualified working life to those young people who are out of school who are at a social-labour and educational disadvantage" (ORDER June 24, 2008).

The objectives of these were as follows:

- A) Expand the basic competences of the students to continue studies in the different teachings.
- B) Allow the students to reach the professional competences of a level 1 qualification of the current National Catalog of Professional Qualifications (CNCP).
- C) Provide students with real possibilities for a successful social-labor insertion.

Chapter 10 of Article III specifies the modules that these programs will have, dividing them into mandatory and voluntary ones:

Mandatory modules

- A) Specific modules
- B) General training modules:
 - 1.º Module of entrepreneurial project
 - 2.º Module of participation and citizenship
 - 3.º free configuration module.

Voluntary Modules

- A) Communication module.
- B) Social module.
- C) Scientific-technological module.

Those who could access such programs had to be in a series of circumstances such as being under 21 and over 16 and not having the title of ESO. In the case of students with special educational needs, this order contemplates the option to extend the studies one more year, until the 22nd and expresses another exception with those youngsters of 15 years of age who have completed 2º of ESO and have repeated once in the stage.

Basic Vocational Training.

With Organic Law 8/2013 of December 9 for the improvement of educational quality (LOMCE) another significant change is produced again, establishing the current Basic Vocational Training (FPB) programs. Preamble XIII highlights the creation of a new title of Basic Formation, making its access to the Middle Degree more flexible and from this to the Superior, and focused on expanding the competences in this Basic Vocational Training.

Article 30 of the LOMCE speaks of the proposal for access to Basic Vocational Training, which will be proposed by the teaching team to parents, or legal guardians and as long as the student does not reach the degree of acquisition of the skills that As advised, as well as in the requirements established in article 41.1 of this law and which are as follows:

- A) Be at least fifteen years old, or reach that age during the natural year, and not exceed seventeen years of age at the time of access or during the current natural year.

- B) Have completed the first cycle of compulsory secondary education or, exceptionally, have completed the second year of compulsory secondary education.
- C) The teaching team has been proposed to parents or legal guardians the incorporation of the student or student to a cycle of Basic Vocational Training, in accordance with the provisions of article 30.

The objectives on which Basic Vocational Training programs are organized are the following:

- A) Acquire or complete the competences of lifelong learning.
- B) Provide students with possibilities for socio-labour insertion.

The organizational structure would be established according to these three blocks:

Professional modules associated to units of competence of the National Catalog of Professional Qualifications (CNCP).

Professional modules associated with the Common Communication and Society and Applied Sciences blocks. These professional modules will be compulsory in the first and second courses. Communication and Society includes the subjects of Spanish Language, Foreign Language and Social Sciences, and the Applied Sciences includes Mathematics and Applied Sciences to the personal context and learning of a professional field.

Professional module of Training in work centers.

Therefore, the student who passes a Basic Professional Training cycle will obtain the Basic Professional title with academic and professional value throughout the national territory and will allow to make access to the medium-level training cycles.

Differences and similarities of the last educational programs aimed at preventing early school leaving.

After the descriptive analysis of the last three Spanish regulations about vocational training, it was decided to perform a comparative analysis. The main similarity is that the three programs are intended to avoid school leaving without the acquisition of basic skills necessary for professional and personal life.

As for the differences are more numerous and can be clearly seen in the following comparative table:

Table 2. Differences and similarities of the PGS, PCPI and FPB programs

Programs	Law	Aim	Students	Organization	Length	Titles and other certifications
Social Guarantee Programs (PGS)	LOGSE	Provide students who have left ESO with basic and vocational training for job placement or continue with the studies of medium-level training cycles.	Under 21 years Over 16 years old	Area of Specific Professional Training, Training and Labor Orientation, Basic Training, Complementary Activities and Tutoring.	Length between 720 and 1800 hours	Certificate showing the total number of hours taken and the grades obtained.

Initial Professional Qualification Programs (PCPI)	LOE	Avoid premature school leaving and failure to obtain the title of Compulsory Secondary Education	Under 21 years Over 16 years old	Mandatory modules Voluntary Modules	Minimum length of 1800 hours	Graduate Degree in Compulsory Secondary Education, or an academic certificate but has passed the voluntary modules.
Basic Vocational Training (FPB)	LOMCE	Acquire or complete the competences of lifelong learning and equip students with possibilities for social and labour insertion.	Under 17 years Over 15 years old	Professional modules associated to units of competence of the CNCP. Professional modules associated to the common blocks of Communication and Society and Applied Sciences. Professional module of Training in work centers.	Length of 2000 hours	Basic Professional Degree corresponding to the lessons taught with access to the middle degree. They can obtain the title of Graduate in Compulsory Secondary Education.

Conclusions

Academic achievement as an apex closely linked to cases of school success or failure is, at the same time, influenced by a multitude of cultural, economic and social factors, and generally suffers oscillations during the school years (Corchuelo & Cejudo, 2013).

Such variations respond to the demands of an educational system that has been forced to transform itself in parallel form with society. In this research, the following conclusions have been reached:

- A) Preventing early school leaving continues being a challenge for the public administration and the Spanish education system.
- B) The new program of Basic Vocational Training decreases the age of incorporation into this program at age 15 to prevent from dropping out of studies at this early age. Another difference with respect to the two previous legislations, is that the maximum age of access is 17 years, while in the PGS and PCPI it was 21 years. This is due to the fact that the same LOMCE contemplates special educational measures for the adults with little training like the Secondary Education for Adults (ESA).
- C) The organization and structure of the current FPB differ from its predecessors and contemplates greater diversity and intensity in the different modules.
- D) The length of training in the current legislation is also greater -2,000 hours compared to 1,800 hours of the previous laws - which guarantees the time necessary for the acquisition of professional and personal skills necessary for adult life.
- E) Obtaining an official and valid degree for the entire national territory with access to medium-level vocational training.
- F) Wider repertoire of educational activities aimed at avoiding premature abandonment, among which the proximity and communication with the family, the training demand depending on the context.

Abstract

Our paper demonstrates how lifelong learning might increase the economic and business potential of the urban centers of both developed and less-developed countries and contributed to sustainable economic development. Rapidly growing cities (especially, but not exclusively, located in the Third World) are marked by social fragmentation and economic divisions have the potential to become learning cities that engage urban dwellers in learning activities aimed at addressing social divisions and creating opportunities for all citizens. Nevertheless, the question is whether the cities and urban hubs offer opportunities for lifelong learning to the most marginalized city dwellers and what services these might be. Lifelong learning becomes an answer to that that offers formal and non-formal educational activities. Where communities learn to engage with the realities of social exclusion, political alienation, and economic marginalization - through both public policy and private initiatives. Educational initiatives across the cities in less-developed countries might include including public policy in the slums and developed metropolises alike aimed at stabilizing communities and establishing cooperation and integration, non-formal educational initiatives to reduce marginalization, or expansion of the formal school system aimed at raising aspirations.

Keywords: lifelong learning, education, sustainable development, labour market

Introduction

Lifelong learning can be broadly described as learning which is pursued throughout the course of one's lifetime. It represents learning which is diverse, flexible and accessible at different places and times. Lifelong learning crosses sectors, enhancing learning beyond traditional education and all through adult life. The definition is founded on four pillars of learning for the future as described by International Commission on Education for the Twenty-First Century and Delors (1996): learning to know – the need to master learning tools instead of acquiring structured knowledge; learning to do – preparing individuals for the forms of work required currently and in the future such as innovation and adapting learning to future work settings; learning to stay together and with other people – peaceful resolution of conflict, discovery of other persons and their cultures, boosting community capability, personal capacity and competence, social inclusion and economic resilience; and learning to be – learning contributing to an individual's whole growth: spirituality, aesthetic appreciation, sensitivity, intelligence, body and mind.

Lifelong learning is very crucial both for the young and old: in fact, both categories might be influenced by it and both can profit from acquiring new skills and knowledge that might prove to be crucial for securing and maintaining their position on the turbulent labor market (Voogt et al., 2013). New technologies that are starting to emerge and dominate the world markets require constantly adapting and enhancing one's skills and qualifications (Giessen, 2015, Strielkowski, 2017; Čirjevskis, 2017). Sequent process of acquiring of new skills serves as precondition of sustainable economic development therefore has to be fostered by all available means, such as e.g. universities (Matetskaya, 2015; Branten, Purju, 2015; Khanagha et al., 2017) and various kinds of networks (Fuschi, Tvaronavičienė, 2016, Prause, Atari, 2017; Monni et al., 2017; Oganisjana et al., 2017), which are enablers of knowledge transfer (Tvaronavičienė, Černevičiūtė, 2015; Hilkevics, Hilkevics, 2017; Zemlickiene et al., 2017).

Lifelong learning might impart responsiveness, initiative, and creativity in people, thus facilitating them to demonstrate adaptability in post-industrial society by fostering skills for managing uncertainty, communicating within and across cultures, sub-cultures, communities and families, and negotiating conflicts. A report by Aspin and Chapman (2001) stated that lifelong learning provides a holistic outlook on the purpose of education in an individual's life cycle. It upholds that education, as a continuous life process, plays an important role in allowing people to adapt to, and address new challenges and shifts in their lives and the environments they live. Lifelong learning, taking on all kinds of educational as well as learning experiences, aids people in engaging in meaningful interactions with their society through developing their skills, knowledge and critical thinking capabilities. Implicit in the lifelong learning idea is the life wide learning concept. Despite the fact lifelong learning puts emphasis on the continuity of learning all through the human life cycle, life wide learning recognizes that individuals find it essential to engage in several learning activities at the same time, through different modalities and in diverse settings.

The goal of lifelong learning is to allow people to turn out to be active social agents – persons who have the capability of acting, reflecting, and responding properly to the developmental, social and cultural changes which they encounter both as individuals and as societal members (Aspin and Chapman, 2001). Life wide learning, therefore, relates to the parallel and multiple roles of an individual in the society, as an additional aspect of lifelong learning. Overall, in today's world in human life cycle, the traditional focus on creating the basis of basic knowledge as well as competencies and acquirement of the technical and intellectual tools of learning in the first life quarter has to be accompanied by lifelong learning in a learning society in which all take part in and contribute to education all through life.

Literature overview

One of the approaches to the conceptualization of lifelong learning is the promotion of skills and competencies required for the development of general capabilities as well as specific performance in work settings. Competencies and skills developed through policies and programs of lifelong learning would be very important for workers performance in their dealing with precise job responsibilities and the ways they could adapt their particular and general competencies and knowledge to new jobs. Therefore, a more vastly skilled and workforce in slums or third world cities would contribute to a more competitive and advanced economy in Third World countries (Auerbach, 2015). There is also a spillover effect in the form of migration of the young and skilled agents to the markets in the more developed markets where their skills might be in higher demand (Glazar and Strielkowski, 2010; Stojanov et al., 2011; Fraser, 2011).

The same, of course, applies to the developed countries of the West. As the population is aging, more and more stress is put on the “gig economy” where users have to be highly-skilled and intellectual agents that can easily adapt the working environment and to reveal their preferences for goods and services (Jenkins et al., 2003; Janda et al., 2013; Chiabai et al., 2014; Strielkowski et al., 2017).

The United Nations Educational, Scientific and Cultural Organization (UNESCO) defines the lifelong learning along the following lines: *“Lifelong learning is less about the teaching or training of certain things or specific skills, much more a way of describing a process of empowerment and mechanisms through which local communities are exposed to varied learning opportunities that helps to prepare them for anticipating the unknown and tackling the political and social uncertainties of tomorrow. In a word, it is that that prepares them for sustainable futures”* (UNESCO, 2015).

People, especially those in the Third World nations may have their outlook of the world and ability for rational choice constantly expanded and changed through the educational experiences as well as cognitive achievements provided by lifelong learning. Besides, along with the provision of lifelong opportunities offered through traditional agencies and institutions, there is a trend for providing opportunities for lifelong learning by creating and expanding various community initiatives (Biesta, 2006). Such form of the community as an institution and

platform for lifelong learning thrives in the realization that the people who engage in lifelong learning would enjoy an array of alternatives, from which they could construct an enriching and satisfying life-enhancing activities pattern.

Moreover, according to UNESCO (2015), “*a learning city provides lifelong learning for all’ and that ‘lifelong learning lays the foundation for sustainable social, economic and environmental development’ on all of the four levels (international, regional, local and citizen)”*. Lifelong learning would offer slum dwellers the opportunity of updating their knowledge of tasks which they had formerly laid aside or all through wished to attempt but were unable; to attempt pursuits and activities which they were previously made-believe were beyond their competence or time; or to work towards the extension of their intellectual horizons through pursuing to understand and become proficient at some of the present cognitive advances, which have transformed other parts of the world (Lee and Morris, 2016). Nevertheless, lifelong learning is not constrained to those above the education age in institutional or informal settings. Expanding cognitive repertoire and the growth of competencies and skills may continue all the way through life, as a critical part of persons’ growth and development as humans and as residents in a participative social equality, as well as being productive representatives in economic development. Community and individual wellbeing is promoted and protected through making such activities, and the resources for supporting them, accessible to the broadest range of populations. Lifelong learning is a public good – it benefits the society as a whole, and individuals also.

According to Aspin and Chapman (2001), the accessibility of learning opportunities over the entire lifespan of people is a pre-requisite for effective and informed involvement in a democratic society. People might only develop as autonomous agents with the ability of entirely taking part in society when they are adequately informed, pre-disposed and prepared; if they are well-fed and healthy; when they have the minimum domestic conditions for the perpetuation of existence; and when they could involve themselves in communication with their correspondents, enjoying similar autonomy as they have themselves, and with the people they can converse with, consider and plan for mutually beneficial means of action.

Methods

The concept of learning as a public good as well as a responsibility shared by all for the mutual benefit of all societal members are central to this form of the requirement for lifelong learning for all, particularly in developing countries. Participation in lifelong education is an essential prerequisite to an ongoing part of engagement in the organizations of democracy (Ahmed, 2014). Safeguarding the future of all citizens in slums and third world cities is secured through assuring them access to every field and form of human knowledge, understanding and collaborating in a high-quality, dynamic and comprehensive curriculum in multiple institutions committed to the learning and education of the present and future generations. Such a program offers individuals with one of the key ways of personal empowerment, clear understanding and informed decisions in performing day-to-day activities and participating in the growth of the economy of the slums or third world cities and the country as a whole.

According to Ahmed (2014), lifelong learning is critical as it helps in developing the autonomy along with a sense of responsibility of communities and people, in reinforcing the ability to tackle the transformations occurring in the society, culture and economy, and in promoting tolerance, coexistence and the creative and informed engagement of people in their communities. If communities, corporations and governments accept lifelong

learning principle it indicates that people could expect support in their attempts of acquiring and updating the latest skills and knowledge which is vital to their daily work lives, wherever and whenever they require them. Such enables the personal development of the residents, and improves their employability, social capacity and mobility to be effective in involving themselves in activities aimed at improving the quality of life in the cities (Power and Maclean, 2011).

Our paper uses an analysis of the data from Eurostat (2017) on participation rate in education and training in the age group from 18 to 64 years across the EU Member States. We analyze the adult learning patterns for males and females, as well as for all groups together. Moreover, we compare the patterns that is visible across various groups of EU Member States and two other countries that can be found in the EU proximity and have great importance for the economic and social growth of the EU, namely the Former Yugoslav Republic of Macedonia (FYROM) and Turkey.

Our methodology involves the cross-country comparison using the available data as well as graphical data visualization that portrays most common trends and shows the patterns.

Findings

As one can see from Table 1, the European Union (EU) set up an ambitious goal for itself that envisages an average of at least 15 % of adults aged 25 to 64 years old should participate in lifelong learning by 2020. Currently, the participation rate is at 10.8%.

Table 1. Education and training in the age group from 18 to 64 in the EU Member States, FYROM and Turkey (2007 and 2016), males and females (in %)

States	2007		2017	
	Males	Females	Males	Females
EU 28	14.3	16.4	15.6	17.6
EU 27	14.4	16.5	15.7	17.6
EU 15	15	17.4	17.2	19.3
FYROM	9.2	10.2	8.7	10.2
Turkey	6.8	4.7	12.2	10.8

It becomes apparent from Table 1 that the participation in lifelong learning in the EU countries is greater than in its immediate neighbours, FYROM and Turkey. However, one can see that over the past 10 years, Turkey has achieved a growth from 6.8% to 8.7% for males and from 4.7% to 10.8% for females which is similar in its dynamics to the EU countries, while FYROM recorded a slowing rate for males and did not report any increase for females.

Chart 1. Dynamics of adult learning in the EU and neighboring countries (2007-2017), in %

Chart 1 above shows the graphical analysis of the data using the chart form for the EU and neighbouring countries regardless of the gender. It becomes clear that the adult learning in some EU countries is greater than in the other. Moreover, one can see that Netherlands, France, Luxembourg and Estonia were the only other Member States where the participation rate in 2016 already exceeded the 15 % benchmark. By contrast, Romania, Bulgaria, Slovakia, Croatia, Poland and Greece reported adult learning rates of 4.0 % or less (Eurostat, 2017). Overall, it appears that lifelong learning differs in countries with regard to such factors as economic growth, rate of learning, labour market characteristics, social and economic specifics and a plethora of other factors. However, one thing is clear: lifelong learning represents an enormous potential that has to be exploited by the relevant stakeholders and policy-makers. It becomes clear that more dynamic countries or countries aspiring at fostering their economic growth and well-being are keener on investing into lifelong learning and related issues thus promoting sustainable economic growth and development, including, far and foremost, urban development in both slums of the Third World and modern-day smart cities.

Results, Conclusions and Recommendations

Overall, to sum up our discussions and findings, one can agree that in the advent of the global challenges facing the world, lifelong learning has developed to be among the main ways of enhancing the quality of life during the 21st century. Today, it is insufficient to have an all-encompassing initial education – one should continue acquiring new skills and knowledge for taking advantage of the new opportunities which advance technological and scientific advancements bring, and to adapt to the hardships of life in the changing world.

Evidently, investing in lifelong learning would be a payoff to both third world nations and their citizens, in terms of productivity, employment, health, income and other benefits. Furthermore, provision of opportunities to learn all through life would become a critical factor in the fight against eradicating poverty and the education of people for sustainable development. Yet, the adoption of the lifelong learning principle would require a new vision, one which will shift the focus from education to learning; one which would move to a more user-friendly and seamless system; one which would recognize the different ways through which skills and knowledge may be acquired in the digital age beyond the formal system. As pointed out by Power and Maclean (2011), particularly, for a progress to be made in the reduction of poverty and guaranteeing of sustainable development in the developing world, the international community and governments will be required to fulfill their responsibilities and take the necessary measures in making lifelong learning for everybody a reality. Lifelong learning might become a facet of economic growth, most notably sustainable economic growth in both developed and developing economies. It can alter the composition and the structure of labour force which, in turn, might lead to shifting the axis of labour and capital ratio for the local economies.

Moreover, it might promote business development through the creation and cultivation of the new business leaders who might invest into further development of the countries in question and their economies. Relevant stakeholders and policy-makers in both the developing and developed countries should think about the exploitation of the potentials of the lifelong learning. Careful and planned implementation and widespread use of lifelong learning, if applied systematically, might lead to unprecedented changes in the economy and help to create the global business leaders of tomorrow.

Abstract:

This text deals with the problems of morality, guilty, ethics and penalty in the context of the World War II. In given regard are following choosen events and processes which characterized this the most extensive conflict in history. At the same time are also following the consenquences, which the World War II brought with an overlap to present. In the condluding part of text is attention paid to educational aspects of given issue – namely the possibilities of application in curriculum of History and Civics (primarily on elementary and secondary schools) from the point of view subject didactics.

Keywords: World War II, Guilty, Morality, Responsibility, Subject didactics, Schools, Teachers, History, Civics

Introduction

In 1946 The Question of German Guilt, a book by Karl Jaspers, was first published in Germany; the book reacted to tormenting experience of just terminated totalitarian régime and the World War II. Despite the significant interval (more than 70 years) since its first edition, the fundamental topic of the book expressed by its title remains still alive and forces those who won and those who were defeated in the war – fortunately without bloodshed and destruction – to fight the war again in their minds and hearts. There is still the question of why is it this way. Bloody conflicts have caused a crisis of moral values in armed participants as well as defenceless victims since time immemorial, but these painful, even though invisible, wounds usually used to be “mercifully” covered with a new war in the collective memory of nations quite quickly. Moreover, those who survived could not afford the “luxury” of thinking of the tragic past due to their everyday existencial struggles, even though the traumatic war experience left a significant trace, e.g. in works of art – an example can be Goya’s fine art cycle of The Disasters of War or the novel Simplicius Simplicissimus by Hans Christoph von Grimmelhausen.

But “the cure of oblivion” is no longer effective. Since 1945, the majority of Europe has been living – for the longest period in its modern history – in peace and relative prosperity. There are repeated returns to the visible and invisible wounds caused by the war and not healed yet, which are the paradoxical penalties for it.

World War II – Guilty and Moral Responsibility

The conflict pulled civil inhabitants into war to an extent not see before. The operations in which they were not directly affected – e.g. the mutual combat of interceptors or the confrontation in the northern African desert – still bear the hallmark of “chivalry” in a “dirty war”. But generally, all commanders-in-chief who planned their battles had to count on the fact that not only the enemy’s or their own soldiers, but also civilians, woluld die during battle. In the fighting parties, moral scruples eroded very quickly and willingness to use more destructive weapons as effectively as possible increased in the interest of achieving the enemy’s defeat. While not large in terms of extent, the aerial bombings of Spanish Guernica or Chinese Shanghai in 1937 cause indignation throughout world public opinion, while the attacks of Germans air forces on London and Coventry in 1940 or the later systematic destruction of German and Japanese cities by carpet bombing were understood and accepted as military dilemma when he ordered the use of nuclear weapons against Hiroshima and Nagasaki with the aim of achieving the capitulation of Japan. German submarines that attacked (i.e. civil) ships unexpectedly and without

warning are often mentioned as a symbol of ruthlessness in the previous conflict – The First World War. During the World War II, however, these types of attacks, in breach of international conventions, were common to all of the states at war (Hrbek, 1999, p. 325).

Many grievous wounds made by the World War II are still (after more than 70 years) covered and waiting to be opened. Therefore, the transfer of German minorities (inhabitants) from the countries of Central Europe (primarily former Czechoslovakia and Poland) could be discussed in these states quite freely – even though with ambiguous results – as late as after the fall of the authoritarian communist regimes. It is a paradox that German society itself – except for the community of transferred people and partially their descendants – “found out” about this topic, to a considerable extent, as late as after the publishing of *Crabwalk*, a novel by Günter Grass, in 2002. The main theme of the literary work is the story of a German ship, the *Wilhelm Gustloff*, into which the rise and fall of the German nation during the Nazi regime is reflected.

The *Wilhelm Gustloff* was constructed in 1930s of the twentieth century as a holiday passenger ship – a symbol of the economic and social growth of Germany in the first years of the Nazi dictatorship. Thousands of working-class Germans got had their first holiday abroad on the ship’s cruises to Scandinavian countries. During the World War II, the ship was used as a transportation and hospital ship in the Baltic Sea, and in January 1945 it was sunk by a Soviet submarine during the evacuation of German inhabitants fleeing Eastern Prussia from the advanced Red Army. At that time, about nine thousand people – six time more than when the *Titanic* was sunk – died in the ice-cold water of the Baltic Sea. When trying to find whom to blame for these people’s death, we face almost unsolvable problem. Was the commander of the Soviet submarine who attacked the non-illuminated ship equipped with anti-aircraft guns (on the board there were, besides civil refugees, over thousand of German submarine sailors) guilty? Or were the port commanders who allowed civil refugees aboard the ship together with military persons the offenders? Although it was against war conventions, this formal scruple lost its relevance when confronting the despair of the refugees.

Discussions on the fate of the *Wilhelm Gustloff* have still not subsided. On the German side, the fate of the German ship has become, to a considerable extent, a symbol of a tragedy of the German nation during the World War II (but also among others, among them neo-Nazis), contrarily e.g. in Poland, there are voices that refuse attempts to put the suffering of the “offenders” on par with the suffering of the “victims” of the war... For example, similar debates accompanied the creation of the Centre against Expulsion, supported by the German government, which can be also perceived as an attempt to denounce Poland and Czechoslovakia for the post-war transfer of German inhabitants (borderlands territories of the Czech Lands and today western parts of Poland).

The attempt to close the disasters of the World War II by judicial proceedings against the offenders, however, did not bring calm either. Instead, they just raised new questions. On the one hand, it was evident that those who committed unimaginable atrocities could not go free without punishment, on the other hand, the trials of German and Japanese war criminals were – and still are – often assessed as victor’s justice, as they, too, committed indefensible acts during war. Such voices cannot be ignored all the more because not only the generally known crimes of the Soviet totalitarian regime, but also the serious faults of the western allies, are concerned. An American officer participating in the Tokyo prosecution of war criminals sighed: “Even though we have defeated our enemies in the battlefield but we let their spirits win in our hearts” (Johnson, 1991, p. 417). Admiral Karl Dönitz, commander of the German war navy, was sentenced to ten years’ imprisonment by the Nuremberg tribunal, particularly for the command to his submarine Captains not to endeavour to save the crews of sunken enemy ships (Hrbek, 1995, p. 146). The problem is that allied commanders had also given similar commands. Heinz-Wilhelm Eck, commander of a German submarine, who ordered the shooting down of survivors from the Greek steamship, *Peleus*, was condemned to death after the war by the British in a war trial. But how to assess

the fact that the U.S. Navy and Air Force proceeded similarly against survivors of Japanese ships sunken in March 1943 near island New Guinea (Johnson, 1991, p. 417).

The laws of total war and escalated hatred required not only the defeat of the enemy, but total destruction. We asked one of the former Czechoslovak fighter pilot participating in the Battle of Britain whether the fighting methods of Czechoslovak and Polish pilots differed from the Englishmen's method of fighting. The answer was that at the beginning, the English pilots tried to adhere to fair-play rules in aerial encounters, which means that for example they did not attack heavily damaged German planes that were retreating from the fight. The Czechoslovaks and Poles, much more intensely involved in war events by their fate and longing for revenge for the degradation of their countries, however, shot down such planes with no hesitation. Nevertheless – as this contemporary witness added – the English also adopted this merciless way of fighting very quickly.

The fact that the Soviet Union (USSR) was on the side of the “just party” meaning the winners, and that it was a totalitarian superpower that committed, during its existence, similar crimes to those of Nazi Germany – contributed to the moral confusion at the end of the war. If the Soviet Union committed such crimes on its own people, it was – and more or less still is – understood as an internal matter in the neighbouring world, by which we can be offended, though it did not affect us. There was a problem when the terror affected places and people also outside the Soviet world. The death of thousands Polish officers who were massacred in Katyn by the Soviet NKVD troops (People's Commissariat for Internal Affairs – de facto secret police) still remains not only a painful point of Russian-Polish relations, but also a Polish internal trauma. In 2007, over 1.5 million of Poles saw Andrzej Wajda's film *Katyn* during the first three weeks after its premiere. The worst thing about the Katyn crime was the fact that it was probably committed somehow involuntarily – as a single item in mass terror ongoing in the Soviet Union at that time. Even those who ordered the massacring of Polish officers did not probably fully realize the importance of their decision. It shows illustratively words of Lavrentij Berija, the People's Commissioner of Soviet Internal Affairs and the main organizer of Stalin's terror, stated later about the fate of the massacred Poles: “We went wrong with them” (“Мы сделали с ними большую ошибку.”) (Kaiser, 2003, p. 98).

Czech society had its wounds from the period of Nazi occupation and the World War II, as well. At the first sight, it could seem that they were not as serious compared to those of the other warring nations and countries. Human losses – except for holocaust victims – did not reach to such high numbers and the territory of the Czech Lands became the direct battlefield only at very end of the war. The overall situation in the occupied Czech Lands – the Protectorate Bohemia and Moravia – externally seemed tranquil for the vast majority of the Nazi occupation, but still this period left deep internal marks on the Czech society.

The liberal environment of the First Czechoslovak Republic (between the years 1918–1938) was replaced by a totalitarian regime that liquidated all resistance by repressions. By targeted terror aimed especially at the Czech intelligence and by many gradual Germanizing measures of the Nazi occupational apparatus, preconditions for a post-war so called “final solution of the Czech question” within the sense of Germanization of the “Czech Area” had to be created. In this regard, the World War II was also a fight for the maintenance of the Czech nation and logically, in the Czech environment, it was understood not only as a collision with the Nazi totalitarian regime and its allies, but also as a culmination of the Czech-German national conflict, which thereby became violent and implacable in character (Cingelová, 2016, pp. 57–59). That is why from the Czech point of view the post-war transfer of the German minority seemed (and in the majority still seems) as a just and natural solution without any meaningful alternative.

This radical, but unfortunately in the context of world events logical and justified, end to the hundred-year-long Czech-German coexistence had, at the time, the general support of Czech Republic. The few critical voices that emerged in contemporary Czech society were against the violence committed during the expulsion, not against

its principle as such. The threat to which Nazis exposed Czech nation is still perceived so strongly in Czech historical memory that it reliably prevents any radical reassessment of the opinion of Czech society's majority concerning the expulsion.

The World War II significantly influenced Czech society in other directions, too. Facing the failure of the western allies during the Munich Conference (the end of September 1938) and endangerment of the Czech nation's existence by Nazi rule, the attraction of Soviet Union as a wartime and post-war supporter of Czechoslovak politics significantly increased and the concerns about the change of the political situation in the Czechoslovakia in accordance with Soviet example disappeared. General Bedřich Homola, commander one of the anti-Nazi resistance organization called "Defense of the Nation", who originally participated in the fights of the Czechoslovak Legion against Bolsheviks in Russia between the years 1918–1920, stated clearly: "Moscow will take neither our language nor land from us but Berlin would take both of them. The form of government will change, there will be no communism 30 to 50 years later, however, there will be a nation, while under the governance of Germans, the nation would be destroyed during 20 years." (Benčík, Kural, 1991, p. 8)

The stormy public discussion that practically always accompanies the anniversaries connected with Nazi occupation convincingly shows that the World War II is not only a page in a history textbooks.

Application of theme in subject didactics of History and Civics

The above-mentioned topic – The World War II, its causes and consequences in the context of moral responsibility, ethics, guilty and war crimes issues – are the subject of contemporary history teaching. There is a displacement in some cases of natural controversies that can lead (mostly unknowingly and unintentionally) to the creation of the myths and stereotypes (Krákora, Kopeček, Cingelová, Vaničková, 2016, pp. 9–13). They can be caused by the unilateral interpretation and evaluation by the history teacher, lifting the events out of the broader context or by overtaking the mind templates without any critical interpretation attempt. The aforementioned approach is, of course, negatively reflected in relation to the pupil – in the extreme form it may result in the ignorance, often accompanied by the lack of interest in the understanding of specific historical processes projected to the present and, last but not least, the pupil's easier manipulation by the media or various extremist groups (Labischová, 2013, pp. 171–173).

It is necessary to respect the fact that both the teaching of contemporary history and controversial themes always meet with the present and more or less influence the contemporary society, its form, political order, values, medial background and other aspects (economics, cultural and artistic sphere ...).

Therefore, the fundamental question in relation to the current curriculum is how to adapt these ethically complex and problematic themes for the purposes of the history education (Hubálek, 2016, pp. 120–121). The answer can be hidden in multiple perspective, i.e. the interpretation of historical phenomena from different points of view, which is currently widely used in history teaching, not only within the Czech Republic. Most historical phenomena can be interpreted and reconstructed from the different perspectives that reflect the information and individual interests of those who interpret and reconstruct them.

It is necessary to overcome the traditional approach to historical teaching, which emphasizes only the transfer of knowledge and political history. This approach, in the case of ethically problematic issues, is viewed as insufficient by both the teacher and the pupil (Marešová, 2016, pp. 15–17).

In the past, the teaching of national history was too tied to the largest national group history that dominates in a particular community. The answer to these constraints is "a new history", which leads to finding the balance between history learning of pupils and giving them the opportunity to think about the epoch from the historical perspective without rejecting the importance of chronology and historical knowledge.

The result should be pupils' ability to analyze, interpret and synthesize historical information. Recent development has clearly led to the research of the social groups history that has previously been ignored, e.g. women, poor people, ethnic minorities, children, etc. (Stradling, 2004, p. 7).

At the conclusion, it can be stated that it is always on the teacher (whatever the level of the educational system), his/her qualifications, abilities and skills to use the above-mentioned means and possibilities in relation to the contemporary history and its controversial themes – moral guilt, responsibility and punishment including the context of the World War II, too. These aspects influence the extent of contemporary history teaching and its effectiveness, the ability to engage the pupils and develop and shape their historical consciousness including wider context of civic education (Nováková, 2016, pp. 49–53).

Paradigm, Key-Concept Of Educational Theory and Practice

Ionut VLADESCU

University Alma Mater of Sibiu, Strada Somesului Nr. 57, Sibiu, Romania
Email: ionut772002@yahoo.com

Abstract

Paradigm is a sign of the maturity of a scientific field. The paradigm dimensions determine the conceptual and framework of the educational process (theoretical and practical ones). The meaning of the educational paradigm has advanced depending on the context of pre-modern, modern and postmodern. Currently there is a tendency to attribute pedagogy a post-paradigmatic state, but most researchers demonstrate exchanging of the defining aspects of educational paradigm focused on: openness, flexibility, diversity of the patterns. This attempt to explain paradigm and model in post-modernism, we reach the conclusion that education science is one of the models due to the determinative role of ruling order and laws. If we treat the diversity of theoretical approaches and educational methods, the model is not deducted anymore and doesn't express the major notes of a dominant theory. It is the situation when reasons for post-paradigm pedagogy appear. As a key concept, it gets a traditional role based on the normative model but with a different connotation.

Keywords: postmodern education, curriculum, paradigm, educational methods, concept.

Introduction - Paradigm, major point in education

According to Cezar Birzea, any science is mature and able to solve scientific problems of a subject when it is able to operate with paradigms (Barzea C.,1998).

Because of the complexity, an approach to educational enquiry emerged, one that treated educational theory as factual, as referring to how things are rather than to how they should be. This interpretation of theory derives in large part from the influence of natural science as a model of education.

There is a plurality of interpretations and theory *paradigm* tends to be seen as a example, a model of thinking that explains the occurrence of particular types of event in particular types of circumstance – for example, by identifying the mechanisms involved where ideas, by Platon, should never be separated from the examples that support them.

In an epistemological meaning, paradigm is an instrument of scientific knowledge, and viewed by T. Kuhn, sciences do not operate with theories but with paradigms (Barzea C.,1998).The philosophical meaning is on a second plan and the dominant theories are the paradigms used by science at a certain moment.

- The scientific community adopts referential works for a domain. These works are true theoretical basis for further education.
- Each dominant theory has its own “method” accepted, together with all the applications by the scientific community and these theories are repeated in time.
- The dominant theory becomes a system of exclusion. It collects the coherent concepts of a community but rejects other explanatory cases, paradigm becoming therefore a normative action.
- Paradigm solves in a typical way typical problems.
- Theories changes more frequent but paradigms have stability and conceptual scientific agreement.
- Associating theory and practice in certain projects, paradigms could become an autonomous program of formation.
- Sciences can produce and use their own paradigms if:
 - √ define a referential axiomatic;
 - √ define in a precise way the object to be studied;
 - √ use scientific knowledge to find specific solutions in a domain;
 - √ define the criteria for a paradigm change (Barzea C.,1998).

The paradigmatic approach is of real help because it works with the relation object-subject and on a problematic field. Thus pedagogy can be named “normal” and “mature” able to find scientific solutions in a vast and complex domain- education.

Speaking about education in a functional-structural context, we can determine the role of the models in this activity. In a poly-semantic way, the determined normative meaning of the word model is:

- attitude to imitate due to its value and significance;
- person, fact, object with special qualities, representative for a whole category;
- perfect state, aspiration for something, accomplished in approximate ways;

A scientific meaning could be used, too:

- assemble of elements and variables compounding a symbolic or social system;
- logic representation of a theory (theoretical model),(Barzea C.,1998).

Pedagogy uses both definitions, but the normative one prevails as this is a normative science.

S. Cristea thinks that norms in pedagogy have to be related to the norms in socio-humanistic sciences. In a very general philosophical system, norms are associated to laws, referring to a set of values existing between the absolute ideal and an average of personal successes, expressed in various principles and operational rules (Cristea S.,2010).

The normative relation between the teacher and the student implies standards and social expectations generating and ruling the pedagogic interaction and communication (Cristea S.,2009) . The laws/norms in communication make necessary bridges among the proposed finalities, the extended project, the transmitted message, the common constructive plan and the feed back internally and externally evaluated.

The active laws in educational policy are normative laws, too, and their existence depends on the conscious will or practice of a single or a group of rational agents.

The relation paradigm –model in education has to be interpreted in a functional-structural context.

According to these statements, it is possible to determine the report between paradigm and the real historic period characterizing the dimensions of a paradigm, different from one period to another, from pre-modern, modern to post-modern years.

In pre-modern period, paradigm was defined /determined in the basic works in the domain, which become a dominant theory, a model to follow in education and practical education. The modern period keeps the relation paradigm –model, emphasizing mutual interdependence and inter-determination. “Without having a well-defined, epistemological identity, a studied domain is only a complex of contradictory processes, in search of the best methods to be used in educational theory and practice”(Cristea S.,2003). These searches follow two tendencies: psycho-centrism and socio-centrism.

The openness to other sciences makes possible the extending of the limits of traditional pedagogy, work with empiric researches, indefinite connection between a profession and scientific discipline, between education and pedagogy, the incapacity to theoretically (re)construct the domain (Cristea S.,2010).

Modern period develops in time and the diversity of theories “uses different paradigmatic circuits”, which will give particular values to the parameters to follow when defining education: marking influences, setting the connection teacher-student-educational context-methods of education, giving strictness to the model. According to the “center” of the education (which establish priorities), Y. Bertrand classifies paradigms designing three basic “centers”: person, society, content, interrelation leading to the forth “center” – interconnection.

Fig.1. Four components of educational theories

Post-modernism differs from most approaches to learning, according to the conceptual/theoretic dichotomy between psycho-centrism and socio-centrism. S. Cristea evolution is done in two fundamental ways. (Cristea S.,2010).

- The first is that rationality and logic are not important to attaining knowledge.
- The second is that knowledge can be contradictory. Because of the contextual nature of knowledge, individuals can hold two completely incongruent views of one subject at the same time, intra-, inter- and trans-disciplinary views (Cristea S.,2010).

Connotation is different now and we cannot speak about referential work and about a dominant theory. A question appears: is pedagogy, as theory and practice in education, a sector of the models?

The model preserves its utility to satisfy the functional-structural and contextual dimensions of education.

The teleological character of education imposes the necessity of a model to give dynamism and show the importance of educative activity. “Education at all stages (system, process, real activity) gets the capacity to anticipate long term, medium or short term results in a determined space and time”(Cristea S.,2006).

A model is a conceptual need too, in point of its systemic, historic and national character and education is to be found in the determinative aspect. The resulting quality, educability, is thee capacity to develop personality, defining education as a human virtue to continually grow in life, to get experienced, to try to have perfect abilities all these features being evaluated according to the model.

This attempt to explain paradigm and model in post-modernism, we reach the conclusion that education science is one of the models due to the determinative role of ruling order and laws. If we treat the diversity of theoretical approaches and educational methods, the model is not deducted anymore and doesn't express the major notes of a dominant theory. It is the situation when reasons for post-paradigm pedagogy appear. As a key concept, it gets a traditional role based on the normative model but with a different connotation.

The openness of education sciences using trans-disciplinary approach tries to put foundations for a conceptual educational process using a synthetic, adapted model resulting from the structural elements corresponding to various theoretical approaches and designed to give future perspective on education.

Paradigm and change

In a period of openness, diversity and changes, theory and practice in education have the same functions but in an increased complexity context. The definition/design of paradigm is based on the relation object-subject, a determinative factor for the other constitutive elements of education, as a system and a process. The teacher is specialized in human behavior and has to make extraordinary complex changes in a material, extraordinary complicated. Child's flexibility always acted pro and against education, a phenomenon more accelerate these days. The present education paradigm focuses on the object of education but doesn't leave the student to learn

independently. The tendency to make the object a “subjective” notion must use the fashionable “defensive doctrine”(Cristea S.,2009).

The teacher, as manager of changes, must be familiarized to the laws and demands of the transformations, to understand the substance of the present paradigm in education in case of:

- various theoretical approaches;
- many pedagogic trends to be accepted;
- conceptual incoherence among the elements of educational strategy, of initial formation (and continuous, too), accepted practices to be applied in real contexts;
- discrepancy between paradigmatic dimensions and the resources involved to accomplish them (human materials).

This is the moment when the teacher must be considered an agent of change, in a humanistic theory of education, with old empiric ideas, scientific manipulation of attitudes, with numerous limits but permanently working on the methodology.

Without neglecting the intentional, guiding, organized character of education, we notice the terms of spontaneous change, as result of the influence models have, that becomes more important, an organized change. Another conceptual principle is to put into value all types of education.

Curriculum, paradigm of post-modern pedagogy

As S. Cristea thinks, postmodernism, as cultural model, offers a new method to understand the relation between knowledge and experience, between theory and practice in human actions. This implies a permanent reevaluation of the processes in their educative action and their individualized development in very different contexts and psycho-social situations (Cristea S.,2006).

To be functional, this paradigm imposes two basic conditions:

- √ a historic positioning of pedagogic theory in post-modern cultural context;
- √ an axiomatic synthesis of a referential system.

The curriculum paradigm, introduced by R.W.Tyler, helps to generally (referring to all educational contents) treat the learner (no matter the age) in an open, proper way (using all methodological resources)(Cristea S.,2003).

Globalization and standardization of individual tasks and performances influence the form a paradigm is created. Its substance is focused on finalities to respond both psychological and social demands.

Nevertheless, paradigm was approached in many different ways when documents of educational policy, contents and finalities were taken into account. This is not a completed process and E. Soare, citing W. Pinar (Soare E.,2010), says that “paradigm is a very symbolic concept, representing what the mature generations want to transmit to the younger ones. Therefore, curriculum has a historical, politic, racial, gender, phenomenological, autobiographic, aesthetic, theological and international character”.

The conceptual evolution of curriculum is to be noticed in the introduction of some phrases such as: “apparent curriculum”, “hidden curriculum”, “written curriculum”, “school decision curriculum”, “teaching curriculum”, “learned curriculum” etc.

S. Cristea notices the following tendencies in the evolution of curriculum:

- extension of the concept from defining the educational objectives, projecting contents, selecting models to teach-learn-evaluate, to life experiences, useful for personal evolution;
- considering the concept as a sum of efficient contents and learning situations, following a progressive sequence determined by pedagogic aims;
- managerial approach of the concept;
- integrated approach of the intra-, inter- and trans-disciplinary activity.(Cristea S.,2006).

Conclusion

Curriculum paradigm accepts and promotes a multitude of various aspects. It includes, at a global scale, all structural and functional facets of educational reality projected and existing in an open social environment and in continuous transformation. It also covers the structural finalities of the social system which deeply influence the content, teaching methodology and evaluation situations (Soare E.,2010).

Curriculum analysis has the importance of a paradigm because of its features defining the post-modern reality:

- openness;
- capacity to offer models for various educational situations;
- flexibility, permitting an “inside” evolution;
- search for the key element(landmark) of conception- the education finality is to use both formative values of the process and the functional performance of the result.

As a conclusion, it is obvious the predetermined and prospective character of the curriculum paradigm which ensure the pedagogical optimism to the process of education.

Abstract

In the Romanian education system the four pedagogical steps of integrating ecological education (component of the "new education") have been recognized, and they have already been institutionalized: the infusion step, which refers to infusing traditional disciplines with educational messages that include informational contents specific to ecological education; the modular/disciplinary step, which refers to developing specific educational modules, as well as special chapters within the traditional disciplines; the disciplinary step, which means that ecological education is included as a distinct discipline in the education plan, with institutionalized pedagogical objectives at the level of school curriculum; the transdisciplinary step engages ecological education within the "new education" at the level of scientific syntheses proposed by teams of teachers on a quarterly or annual basis. The paper presents the conclusions of administering a questionnaire on the place and role of ecological education in the Romanian education system to teachers from Bihor county, Romania.

Keywords: ecological consciousness, ecological culture, ecological education, pedagogical step.

Introduction

Being informed and trained for passing on knowledge about ecological education, for developing lasting skills, convictions and behavior connected with the protection of the Biosphere is a fundamental condition required for this noble work called "education". Becoming familiar with the objectives of ecological education is a need, and maintaining a healthy living environment is, after all, the major duty and task of each inhabitant of the World.

The main goal of environmental education is to develop an ecological consciousness and behavior, which begins in the family, continues at school, university and through various forms of continued, lifelong training. Enriching their ecological culture should become a major concern of modern humans.

The four, already institutionalized, pedagogical steps of integrating ecological education (component of the "new education") are the following:

A. The infusion step, which refers to infusing traditional disciplines (Biology, Chemistry, Physics, Geography) with educational message that include informational contents specific to ecological education, but also at the level of intellectual, moral, technological, aesthetic education.

This step raised 2 methodological aspects of maximum pedagogical and social importance (Bălăsoiu, 2014: 88):
– the need to integrate the information coming from the level of ecological education in the structure of the curriculum, and doing that not by merely juxtaposing it as an addendum at the end of a chapter or a book;
– the need to actually achieve a curricular synthesis between the two informational types and trajectories.

B. The modular step. For instance, ecological education is included as a module within Biology in upper secondary education, with objectives specific to the dimension of intellectual education. This type of step raises the issue of correlation between the various modules included within certain educational disciplines. It also raises the issue of a possible unilateralism of the specific objectives within the same dimension of education.

C. The disciplinary step. For instance, ecological education is included as a distinct discipline in the education plan, with institutionalized pedagogical objectives at the level of curriculum.

D. The transdisciplinary step is probably the most interesting, most promising type of step, but also one that is hard to put into practice, which addresses topics included in the content of new education, and which reflects the ideological and psycho-social tensions of the problems faced in the contemporary world: protection of the natural environment, making the most of free time; relationships between generations; the ratio between national and international in the political life etc (Frumos, 2008, Blândul, 2017).

The methodological difficulties inherent to this type of step engage the social sensitivity and responsibility of teachers, their capacities for a global approach (intellectual, moral, technological, aesthetic, physical) to personality development, their open attitude towards the aspects of permanent training, their desire for continued professional self-improvement.

Daniel Goleman is the one who used for the first time the concept of ecological intelligence in the literature (2009, p. 41). Becoming aware of how things and nature work includes the recognition and understanding of the countless ways in which systems created by humans interact with natural ones, that is what Daniel Goleman calls ecological intelligence. Only an all-embracing sensitivity can make us see the connections between our actions and their hidden effects on the planet, on our health and on our social systems. Ecological intelligence combines these cognitive abilities with the empathy for any form of life.

Attitude towards mother-nature is a matter of education, culture, civilization and civic duty, but protecting nature represents the duty of each Earth citizen (Oltean, 2016: 78).

Preoccupations of professors regarding the implementation of ecological education are presented in the journal *Human Education Today For Tomorrow's World*, de ex. „Ornithological data from Bihor county (Romania)” (Ilie, 2016: 113-115), „*Drosera rotundifolia* – a miracle of nature. Reservation and repopulation of the round-leaved sundew's in the swamp of Iaz, Sălaj counties” (Kovács et al, 2016: 116-117), „Young generation relationship with environment in curricular and extracurricular activities” (Oltean, 2016: 78-88).

Methods

The sample consisted of teachers from Bihor county – Romania, both from urban and rural areas. The number of teachers who filled in the questionnaire was 150 (80 from urban areas and 70 from rural areas).

The data were collected between 12 January-19 June 2017.

The main objective was to assess the situation existing at the level of educational reality concerning the place and role of ecological education in the Romanian education system. We consider that such an endeavor is absolutely necessary, as the results obtained in this way represent an essential support for the organization and implementation of future researches.

The purpose was to:

- assess the place and role of ecological education in the pre-university education of Bihor county;
- gather opinions on attitude and responsibility towards the environment;
- collect the teachers' proposals and suggestions for organizing and implementing ecological education.

The system of data collection methods

- a. The survey method, which will contribute to data and information collection so that the issue is understood as thoroughly as possible. Being an interactive method, the information exchange with the subjects assumes collecting data on: knowledge, actions, educational needs, behavior, desires, aspirations etc. The specific instrument used is the questionnaire. A presurvey was conducted beforehand.
- b.

The questionnaires were applied in four stages and the number of items is 35. The items are grouped based on the aspects below:

- attitude towards environment protection;
- responsibility towards environment protection;
- ecological actions: examples;
- place and role of ecological education.

At each stage, the administered questionnaires included 5 to 15 items, the time allowed was one hour. The reason why these items predominate is to obtain open answers and offer the freedom of expression in the process of studying aspects of the place and role of ecological education in the preuniversity education of our county.

b. The interview method is also an interactive method, but a qualitative one, and it will complete some data and information on the subjects of the research. Both group and focus group interviews will be applied.

Findings

The processing of the information collected in the third stage are presented, as this was the stage concerning the place and role of ecological education in the preuniversity education.

In the case of the first item, the statistic situation is as follows: ecological education content is taught in the following disciplines: Biology (27%) and Geography (25%), followed by the Homeroom class (12%) and Health Literacy classes (8%). 8% is also taken by modern languages/mother tongue (Romanian language/Hungarian language in the case of some schools). 5% by Physics, Chemistry, Mathematics. The other answers fall within the 15%.

Figure 1. Subjects which cover ecological education

In the case of the second item, which refers to the implementation of ecological education through extracurricular activities, the respondents mention excursions, trips, field visits, didactic visits, where the percentage is 80%; special days (Earth Day - 22 April, Environment Day, Water Day etc.): 5%; activities such as school camps, "School in Nature", thematic weeks, thematic groups, meetings with ecologists, geologists, geographers, journalists – 12%; other answers – 3%. The other answers category includes didactic ecological games, TV/radio programmes, cleaning the environment etc.

Figure 2. Extracurricular activities which cover ecological education

Items 3 and 5, ideationally linked, have clear answers. Biology, Geography, Homeroom teachers are seriously concerned with the environment, with providing ecological education, with developing the children's attitude towards the environment. In the case of item 3, ecological education is done weekly (22%) and a few times per semester (23%), monthly - 15%, a few times per year – 10%; never – 2%. The remaining 28% belongs to the other answers category.

Figure 3. Frequency of ecological education teaching

Ecological education is not done only by teachers who teach disciplines closely related to this field, namely, Biology and Geography teachers (72%), but also by parents (8%), Homeroom teachers and other teachers (6%), civil organizations (8%), mass media (6%).

Figure 4. Persons who teach ecological education

The answers given to item 4 are very interesting. The wide range of answers shows that ecological education is a continuous process, where the activities are carefully chosen, they are highly topical and also attractive. Ecological education is the foundation of civilisation and human progress. Today's children, the generation of tomorrow, have a duty to preserve, to correct, to make amendments to what has been destroyed by previous generations (Marinescu, 2010: 169; Dulamă, 2010: 78).

The attitude towards nature is a matter of culture and education, of civilization and a civic duty, and the protection of nature is a duty of each inhabitant of the World. Preserving a healthy living environment is in fact the major duty and task of each member of society. "A healthy mind, in a healthy body, in a healthy world, with a healthy environment" are the words of Academician A.T. Bogdan. We look at it as a challenge which encourages us to perform reflection and self-reflection.

Dominant-relevant skills, such as knowledge, intelligence, and expertise, are an essential component that affects individuals with creative potential (Titrek et al, 2015: 6).

Results, conclusions and recommendations

The numerous implications of ecological education with the dynamics of the contemporary society face educators with two fundamental problems:

- the place of ecological education alongside the modernization of the education content;
- the continuous improvement of the teachers' didactic activity through:
 - modernization of teaching-learning by applying interdisciplinarity / transdisciplinarity;
 - transformation of school learning into a process which truly supports young people's active and competent integration into the private, the professional and the public lives.

- increasing interest in the local problems of communities (preserving and taking care of green spaces, planting trees and bushes, hygienization, building nests for birds etc.) and in problems beyond those of communities (protection of nature reserves, participations in fundraising for actions at national level etc.);
- developing of an ecological culture, of an ecological consciousness.

It is impossible to discover the secrets of nature only by watching TV programs or reading newspaper articles. Ecological education does not begin only with love for mother nature, with observing and admiring the environment, with understanding the relations between organism and the environment, but it assumes developing the required competences and attitudes.

At school level, ecological education tends to become a transdisciplinary value included in the pedagogical design. The particularity of ecological education comes from the emergence of social contents reflected by the two complex notions – ecology and environment –, which should not be mixed up or overlapped, but interpreted and exploited from a pedagogical point of view.

The issue of environmental conservation is not only the experts' issue, but also an issue of each inhabitant of the World, because we all are “the children of nature”. Due to its interdisciplinary character, ecological education has an essential role in developing and shaping the human personality. But we should not forget its role in the training for respecting the values of nature and of the environment we live in. The life quality of a nation is also determined by the quality of the environment.

Abstract

This paper presents a study about the ageing of people under detention, based on the analysis of a prison located in the north of Portugal. Scarce studies were developed with this population and statistical data indicates the increasing number of elderly inmates in the Portuguese prison context. This paper intends to explore the perceptions of the inmates who are over 60 years old, as well as other professionals who interact daily with this population. The research is a case study with a qualitative approach. Data collection includes semi-structured interviews to prisoners, the prison director, guards, health professionals, reeducation professionals, etc. For the purpose of this paper, only results from interviews to prisoners will be analyzed (n=11). Ethical issues and procedures were carefully considered during all phases of the research plan. The results intend to contribute to a greater comprehension of the ageing phenomena behind bars and the imprisonment experiences lived by elderly prisoners, including adaptation to prison as well as resocialization issues, pointed out as of great importance by the Portuguese legal system frameworks. Results of this exploratory paper show a description of the social representations of elderly inmates, regarding perspectives of life trajectory without imprisonment, reasons for the crime practice and its interpretation, representation of prison admission, adaptation to prison, representation of the relationship with professionals, social representation of prison population and resocialization and age.

Keywords: ageing, elderly inmates, social reintegration, Portuguese context.

Introduction

In 2015, Portugal was the 4th country within the European Union with the biggest percentage of elderly people, with 20.5% (source: PORDATA). It can be designated as a “hyper-aged society”, considering that in 2050 numbers will increase to over 30%. The prison context is not an exception. There are more and more elderly people in the prisons and statistical data shows that the numbers are increasing every year (see figure 1). A newspaper headline published on a national Portuguese newspaper, on the 3rd of May 2017, calls the attention to this phenomena: “Number of elderly prisoners duplicated in seven years”. This matter has become an issue of great concern and challenge for the Portuguese Prison Services. Statistics from the General Board of Prison Services (DGSP - *Direção Geral dos Serviços Prisionais*) indicate that in 2010, there were 372 inmates aged 60 or more years old in the Portuguese prisons. In the following year (2011), the number increased to 432 (see figure 2). And the number never stopped increasing since then. At the end of the year of 2016, there were 755 elderly prisoners. Of these, 707 were male and 48 female.

Adding to this fact, several of these people were arrested when they were already over 60 years old. With the advance of the age, multiple health problems, the lack of hope and the possible loss of social-affective attachment, are some of the main difficulties faced by these people. The challenges of social reintegration are enormous and Prison Services have a complex task in occupying and monitoring these people.

Portuguese Prison System – some features and regulations

The Portuguese legislation concerning the Prison Establishments includes two important legal frameworks which support and guide the organization of all Prison Establishments. These are the Decree Law nº115/2009 of October 12, which refers to the *Code of Execution of Sentences and Deprivation of Liberty* and the Decree Law nº 51/2011 of April 11, which sets the *General Regulation of the Prison Establishments*. These Diplomas are the legal support that legitimizes all the work carried out by professionals (including the Re-education Professional) working in the prison context who, in an organized and cooperative manner, deal with the re-socialization of the prisoner, since the moment of his/her entrance until the moment of his/her exit. After the admission of the prisoner, his/her clinical evaluation, the contact with the surveillance and security services and other steps that are necessary to guarantee the specific needs of each person, a specific individual plan is elaborated by the Re-education Professional, who accompanies the prisoner during the entire duration of his/her detention. Special attention and consideration is given to the problem of elderly people, aged over 65, as well as youths and pregnant women. In the case of elderly inmates, the article 4º of the Decree Law nº115/2009 of October 12, referring to Special Guiding Principles, mentions on the 2nd point, the following: “*the execution of sentences and deprivation of liberty for persons over 65 years of age must respect their specific needs and their state of health and autonomy, in particular by guaranteeing them the necessary assistance in the activities of daily living and by providing them with accommodation, safety, activities and programs*”. This is, however, the only specific orientation found in the legislation which refers, in a clear and straight way, to the elderly population.

Besides this, the Individual Plan of Rehabilitation (PIR – *Plano Individual de Reabilitação*) takes into consideration specific needs of groups and population. According to the article 69º of the Decree-Law nº51/2011 of 11 of April, each inmate has an Individual Plan of Rehabilitation. The plan is compulsory for all prisoners sentenced to more than one year in prison. This plan sets out the objectives to be achieved by the inmate, the activities to be developed, the different stages of implementation and actions needed to be taken by the prison establishment to ensure the support and control of the accomplishment of these activities, based on the following areas: a) education and vocational training; b) occupational work and activities; c) programs; d) social and cultural activities; e) health; f) contacts with the outside; g) strategies for preparation for freedom. It is the responsibility of the Re-education Professional to formalize the Individual Readjustment Plan, which is approved by the director of the prison establishment. After homologation and approval, the Individual Readjustment Plan is reissued to the Court of Execution of Sentences. The Individual Plan of Rehabilitation should be carried out by

the departments responsible for supervising the execution of the sentence in cooperation with all the other prison services. During the execution of the Plan, the inmate is given priority to express himself /herself about the plan. In this sense, the inmate can present ideas, programs that may be part of his individual plan. It should be noted that the intervention plan should not be restricted to prisoners, but should involve the other prison actors, such as guards, Re-education professionals, directors, among others. It is a treatment that includes a multidisciplinary intervention. This plan must be reassessed after 60 days of inmate's admission to prison. As Ramos (2011) points out, the plan is carried out and made by the Re-education Professional assuming a fundamental role in the performance of his work in order to occupy the time of imprisonment in the most pro-active way, providing the inmate with the opportunity to acquire new skills or strengthen existing ones, so as to fit him in the overall environment. About the relevance and implementation of the Individual Plan of Rehabilitation, Pontes (2015) developed a study aimed to analyse its complexity and the difficulties found in its practical use by the professionals in the prison context. Based on the empirical study, the author concluded that the Individual Plan of Rehabilitation was considered relatively well structured, in spite of being too complex and, therefore, difficult to accomplish in terms of practical utility. Also, a significant proportion of the individuals surveyed in the study proposed a wider involvement of others sectors and services, mainly the reintegration services, as well as greater specificity and individualization of the plan's objectives. The reformulation of the Individual Plan of Rehabilitation and its greater connection with the Evaluation, to better define the objectives of the inmates' reintegration, are also an important conclusion of this study. To conclude, based on this short description of the main characteristics of the Portuguese prison context, its features and regulations, several issues and challenges must be considered in the analysis and study of this complex phenomena of ageing in the prison context. The role of the social reintegration teams that work with the prison establishments are of great importance also to establish the articulation with the families of the inmates and with the communities of origin, when the flexibility of the sentences is considered: jurisdictional exits, proposals for placement in the open regime in the interior or abroad and appreciations for a possible probation and other situations like the use of the electronic bracelet.

Method

This study is part of a broader research project carried out within a Masters Dissertation on Education Sciences at the Portucalense University, in Porto, Portugal. The study aims to analyze and understand the ageing phenomena of people who are under detention, mostly those who are over 60 years old, crossing their perspectives with the perspectives of the professionals who work daily with them. The following research questions were defined to orient the study:

- How do elderly inmates and professionals working in the prison context see and understand the ageing phenomena of inmates?
- What are the psychological and social processes that can lead to successful or unsuccessful individual adjustment of elderly inmates?
- What are the strategies and practices implemented for the by the Portuguese Prison System to support the adaptation to prison by elderly inmates?
- How do elderly inmates describe their imprisonment experiences?
- What are the perceptions of the elderly inmates and professionals who work daily with them (guards, health professionals, reeducation professionals, prison director) about social reinsertion?

To attain these objectives, a case study (Yin, 2003) was carried out at a prison context located in the north of Portugal . The research design is based on a qualitative approach and data collection includes open interviews to prisoners and semi-structured interviews to other professionals, such as the prison director, guards, health professionals, reeducation professionals, etc. For the purpose of this paper, only qualitative data from the open interviews carried out with prisoners (N=11) over 60 years old will be analyzed.

• Procedures

Ethical issues and procedures were carefully considered during all phases of the research plan. A letter was sent to the General Board of Prison Services and Reinsertion (*Direção Geral de Reinserção dos Serviços Prisionais - DGRSP*), presenting the Research Protocol and the authorization request to develop the study in the selected

prison context. Once the confirmation of the authorization of the study was obtained, the data collection phase was initiated and carried out for a period of two weeks, starting the first interview at the midterm of the month of July. The elderly inmates were selected from a list of 46 prisoners aged 60 and over. Due to the short period available to keep up with the paper publication deadline, only 11 inmates were interviewed in the first phase of data collection. Inmates were informed about the purpose of the investigation as well as the authorization of informed consent. During a period of two weeks, the interviewees were randomly called by the guards and directed to the interview rooms. Previously, the researcher had access to the individual reports and cases of each inmate, in order to get to know him better prior to the interview, for example: age; crime; years of pity; recidivism; among others. The previous dialogue established with the guards became crucial to help the researcher become aware of certain characteristics of the inmates. In this way, it was easier for the researcher to adapt her behavior and discourse to each case.

• **Participants**

Participants in the study included a sample of 11 male inmates, selected by a sample convenience. They all have Portuguese nationality and place of residence was located in the north of Portugal. The following table summarizes the characterization of the participants in the study.

Table 1. Characterization of Participants

#	Sex	Age	Civil Status	Number sons/daughters	Qualifications	Detention period	Cause(s) of Detention
P1	Male	66	Single	1	2 th grade	7years	Robbery
P2	Male	69	Single	0	9 th grade	6 Years and four months	Sexual abuse of minors
P3	Male	72	Married	3	4 th grade	7 years	Sexual abuse of minors
P4	Male	75	Widow	0	Ceramic course	6 Years	Sexual abuse of minors
P5	Male	65	Married	3	2 th grade	6 Years	Sexual abuse of minors
P6	Male	76	Married	2	4 th grade	7 years	Tax fraud
P7	Male	69	Divorced	5	4 th grade	8 years	Attempted murder
P8	Male	66	Married	3	4 th grade	3 years	Tax fraud
P9	Male	64	Married	1	4 th grade	3 years and 9 months	Road accident
P10	Male	63	Divorced	2	3 th grade	3 years and 4 months	Domestic violence
P11	Male	60	Married	2	7 th grade	6 years	Drug dealing

• **Data Collection**

Data collection was based on open interviews carried out with prisoners over 60 years old. The interview was seen as the best research method to attain the research goals, although several constraints and limitations that are strongly related to the use of this method were also carefully considered, such as social desirability, nonverbal communication, the characteristics of the interviewer, the audio recording, etc. (Bryman, 2004; Kvale, 1996).

The script of the interview was organized according to the following guidelines (see table 2), systematized in four major dimensions: a) life before imprisonment; b) adaptation to prison; c) life imprisoned; and, finally, d) life after imprisonment.

Table 2. Interview Script and Guidelines

Dimension / Topic	Objectives
Ethical Procedures	<ul style="list-style-type: none"> • Inform about the interview and its objectives • Request permission to record the interview • Create a positive atmosphere of trust
Life before imprisonment	<ul style="list-style-type: none"> • Understand the professional trajectory of the inmate before the prison entry • Identify the inmate's view of family • Identify personal goals and interests prior to the imprisonment
Adaptation to prison	<ul style="list-style-type: none"> • Describe the process of adaptation to prison • Identify successful or unsuccessful strategies of adjustment to prison
Life imprisoned	<ul style="list-style-type: none"> • Understand how inmates spend their time in prison • Identify positive and negative aspects of prison life

	<ul style="list-style-type: none"> • Analyse the relationships between inmates and the professionals who daily work in the prison • Analyze aspects related to ageing • Analyse the participation in activities and programs that favor inmates' reintegration • Compare the past with the future and the motivations for social reinsertion
Life after imprisonment	<ul style="list-style-type: none"> • Analyse possible regrets and expectations after imprisonment • Understand whether aging is a factor of demotivation

• **Data Analysis**

For data analysis, a content analysis was carried out and data from the interviews was organized in different themes (Bardin, 2009). Results will not follow the previous four themes identified in the interview guidelines, as a variety of themes emerged from the data analyzed in the interviews. In the interpretation of the data, we also followed a recent paper from Santos and Nogueira (2015), which refers to the same theme and that was an important reference in the organization of the results, considering that there is scarce literature regarding this theme. Results should be interpreted as the result of a small sample of inmates, that was not possible to extend due to the timeline. Also it is relevant to present that no theoretical saturation was obtained by this data, so they must be considered as exploratory. Also, in this type of population social desirability is very common so the data must be interpreted and observed within this framework (Gonçalves & Gonçalves, 2012).

In the next section, findings will be presented and discussed, according to the data analysis and the review of literature in this field.

Results and Discussion

The first theme “*perspectives of life trajectory without imprisonment*” showed similar responses among all participants. Very low qualifications were reported, with some inmates almost without knowing how to read. Also professional careers with no defined purpose, or a specific qualification are reported. In this theme, we found an idealization of the life courses reported by the interviewees. All inmates reported a professional life with a defined occupation, and showed the intention of maintaining that profession when they get out. They present an idealized “positive perspective” also reported by Santos and Nogueira (2015), referring that when they got out they will continue to work on the same tasks, or even open a new business. We found this idealization also associated with their role on the family. The inmates mainly were silent when asked for life goals.

The second theme is “*reasons for the crime practice and its interpretation*”. Surprisingly, this sample does not present any inmate who shows regret and guilty, which shows that these prisoners, according to Gonçalves (2002), are not prepared for re-entry into society, since they did not assume the crime nor demonstrate understanding of punishment and accountability. The emerged category “*victimization by others*”, was reported by subjects who tend to channel the guilt of the crime committed in people or circumstances that are external to them and “impossible” to control (Santos & Nogueira, 2015, 47), including for instances the victim who refers that “I’m here because of her”.

The third theme is “*representation of prison admission*”. It gathers two categories that associate subjective and reported interpretations regarding institutionalization. The first category is the “*surprise associated with the deprivation of freedom*”. The second category is “*sadness*” as most of inmates state this emotional state as part of their admission to prison.

The fourth theme is “*adaptation to prison*”. The main category reported is “*tendency of isolation for personal safety precaution*”. Also, as reported by Santos and Nogueira (2015), “*age*” is the second category and relevant indicator in this dimension as older inmates did not identify with the remaining age groups, so they tend to isolate themselves. The third category is “*relationships out of prison: support and contact with family and friends*” which focuses on the contacts with family and friends, either through letters, phone calls or visits. Family is the center. All, except one, declared family visits and phone calls as a great moment of anxiety, joy and excitement. As Gonçalves & Gonçalves (2012, p.556) argue “... the maintenance of family contacts during the period of incarceration may be a factor in the prevention of break-ups, which in turn lead to recidivism”.

Surprisingly, we have a sample that does not work in prison. We did not find the importance of labor and training practice as an inclusion strategy, confirming the isolation of the interviewed inmates and their rigidity in not adapting to the prison system. For instances, the "precarious exits" granted for good behavior and work allows prisoners to visit family and friends during imprisonment. The fourth category is "**tendency of isolation and victimization of others**". The majority of participants reported that they do not work in prison, however one does and another is in a resocialization program. They report a tendency to isolation associated with exploitation of other prisoners, that clean their cells and personal clothing.

The fifth theme is "**representation of the relationship with professionals**". The prison staff plays a key role in adapting and reintegrating the inmate. Inmates reported difficulties in accessing a social resocialization professional or doctors. This set of participants demonstrated high satisfaction with the relationship established with nurses and the guards. The time of relationship established between these two professional groups, nurses and guards, with the inmates (more than the doctors or reeducation professionals) may allow the development of a closer relationship. It is also known prison's financial difficulties in Portugal, in hiring professionals, so consequently the lack of human resources for the high number of inmates, that is reported by these interviewees. Also, an interesting information is pointed out by Gonçalves (2002), referring that guards tend to protect inmates who are detained for sexual offenses, against other inmates. In this sample, there is a high prevalence of interviewees arrested for this crime, who express appreciation for the guards, as expressed in by the former author. According to Decree-Law no. 3/2014, of January 9, "it is the responsibility of ensuring the security and order of prisons, observance of the law and prison regulations (...) and participate in the re-socialization of prisoners". In Portugal, guards go through a training program with specific re-socialization dimensions, that are part of the training program. We think that some small positive results are emerging from these training programs that can be seen in these exploratory and initial results.

The sixth theme is "**social representation of prison population and resocialization**". In this theme three categories are relevant. The first is "the **stigma**" where they present feelings of shame towards the general population and do not want to be associated with a resocialization program considering this association with the prison stigma. Another category is "**lack of knowledge towards reintegration programs**". Participants in the study refer that some other inmates, not themselves (once again these participants show high social desirability or lack of personal self-evaluation) probably would benefit from these programs. One refers that the programs should have an income associated, other states that he already has gone through one, and other says that he probably would enter in the city library in one of these programs. To sum up, they all show lack of knowledge about these programs and some inmates are not sure about their existence, or how they have access to them. The third category is "**disbelief in prison's regenerative capacity**". As found in Nogueira and Santos (2015), these interviewees discredit the effectiveness of the prison's objectives.

The final theme is "**age**". Considering Santos and Nogueira (2015) research, we can observe a negative perception of elderly inmates regarding their ageing processes. In the interviewed inmates, there was a great diversity of responses, suggesting that elderly inmates do not reflect on ageing in general and on their ageing personally. Faced with this question, there was silence, there was no immediate response. Inmates assume that there is sadness associated, and psychological problems. Based on these interviews, it was not clear if these inmates acknowledge ageing. If they have a real perception of age and the impact of ageing and the life cycle in their life. Nogueira and Santos (2015) describe a resistance to ageing, fighting a constant battle against ageing, not even recognizing it. They also express, as reported by previous authors, a reported association of ageing with illness and disability. Also, they present an external control perception in behaviors that they are able to control. Participants lay down the responsibility of doing physical exercise, even with little intensity as walking, in the prison establishment. Several groups of inmates perform physical exercises in prison, but these inmates, as reported in Santos and Nogueira (2015), present more characteristics of isolation and external accountability for their own behavior. Therefore, there is a lack of personal responsibility in the practice of physical exercise required. Gonçalves (2002) refers that age is a fundamental dimension that differentiates inmates, as younger subjects would be more prone to develop adaptive problems in prison, as they have a more strict and limited repertoire of coping skills. To sum up, in this sample, results, that are initial and exploratory, seem to

acknowledge these elderly inmates as well-adapted to prison (Gonçalves & Gonçalves, 2012). Well-adapted as Gonçalves and Gonçalves (2012) refer do not usually have criminal records, are detained for occasional crimes, although violent, such as those in our sample, composed of several sexual offenders, are over 30 years of age, have conventional values and do not engage in disciplinary proceedings. In Gonçalves (2002), sexual offenders are reported as the best adapted to prison and this is relevant to understand our results as we have many participants detained by these crimes, or crimes against people, that are better adapted to prison than offenders with crimes against property.

Conclusions

This study presents a relevant and innovative design. Lorito, Völlm and Dening (2017) wrote a systematic review of the existing literature on ageing prisoners. They found that literature tends to focus on diagnosis and physical health. Lorito et al (2017) results show that the experience of imprisonment from the perspective of inmates has received much lesser attention. This study is, therefore, relevant and updated. Presented results do not intend to establish a difference between elderly and younger inmates. This was an exploratory and initial study that intends to see if ageing was relevant in offenders' self-representation. As in Santos and Nogueira (2002) it seems that they are ignoring or rejecting ageing, and results can be a direct sum of other reported dimensions, for instances the crime that they executed and for which they were detained. So, no relevant differences were found between these elderly inmates and the literature that did not focused on ageing (Gonçalves, 1999). This is an important finding to acknowledge, as future developments of this study need to deeper explore ageing in prison, possibly through more specific and detailed scripts regarding age. This study presents relevant advances in understanding ageing in prisons, exploring and describing perspectives of life trajectory without imprisonment, reasons for the crime practice and its interpretation, representation of prison admission, adaptation to prison, representation of the relationship with professionals, social representation of prison population and resocialization and age.
