Title: Synthesis, Characterization and Quantum Chemical Calculations of Substituted 1,2,4-Triazole Derivatives.

Author: Rebaz Anwar OMER

Submission Date: 14 April 2022

Defense Date: 23 May 2022

THESIS APPROVAL

This thesis, which was prepared according to the thesis writing rules of the Graduate School of Natural and Applied Sciences, Firat University, was evaluated by the committee members who have signed the following signatures and was unanimously approved after the defense exam made open to the academic audience.

Supervisor:	Prof. Dr. Metin KOPARIR Firat University, Faculty of Science	<i>Signature</i> Approved
Chair:	Prof. Dr. Mustafa KARATEPE Firat University, Faculty of Science	Approved
Member:	Prof. Dr. Niyazi BULUT Firat University, Faculty of Science	Approved
Member:	Prof. Dr. Ahmet ÇETİN Bingol University, Faculty of Science and Literature	Approved
Member:	Assist. Prof. Dr. Kamuran SARAÇ Bitlis Eren University, Faculty of Science	Approved

DECLARATION

I hereby declare that I wrote this Doctoral Thesis titled “Synthesis, Characterization and Quantum Chemical Calculations of Substituted 1,2,4-Triazole Derivatives.” in consistent with the thesis writing guide of the Graduate School of Natural and Applied Sciences, Firat University. I also declare that all information in it is correct, that I acted according to scientific ethics in producing and presenting the findings, cited all the references I used, express all institutions or organizations or persons who supported the thesis financially. I have never used the data and information I provide here in order to get a degree in any way.

23 May 2022

Rebaz Anwar OMER

PREFACE

First, my deepest gratitude to God for all his mercy and blessings, and for giving me the strength and ability to complete this search in these difficult times.

I would like to express my sincere gratitude and thanks to my Principal Supervisor Professor Dr. Metin Koparir for providing me the opportunity to work under his supervision on this Project, for his continuous support and excellent supervision during my PhD study, for his patience, and for always having time for discussion, for insightful comments, and objective reviews of papers.

I would like to take this opportunity to say warm thanks to all my beloved friends, who have been so supportive along the way of doing my thesis.

I would like to express my sincere thanks to Dr. Ibrahim Nazem Qader for his guidance and help during my work.

Thanks to my parents for always paving the way for progress and for being the strength of my heart. Also, thanks to my brothers and sisters that are happy with my success. Besides, my wife, Lana Omer AHMED, and my Daughter ROVA, tolerated me and supported me for a long time.

ABSTRACT

Synthesis, Characterization and Quantum Chemical Calculations of Substituted 1,2,4-Triazole Derivatives.

Rebaz Anwar OMER

Doctoral Thesis

FIRAT UNIVERSITY
Graduate School of Natural and Applied Sciences

Department of Chemistry

May 2022, Page: iv + 130

This thesis are planned in two main stages experimental and theoretical studies.

Stage 1: Synthesis and characterization of structures to be studied in the thesis

In this step, N-phenyl-2- (thiophene-2-carbonyl) hydrazine-1-carbothioamide and N-ethyl-2- (thiophene-2-carbonyl) hydrazine-1-carbothioamide were obtained by the reaction of thiophene-2-carbohydrazide with phenyl isothiocyanate and ethyl isothiocyanate respectively in the presence of ethyl alcohol. The obtained N-phenyl-2-(thiophene-2-carbonyl) hydrazine-1-carbothioamide and N-ethyl-2-(thiophene-2-carbonyl) hydrazine-1-carbothioamide was added base (KOH) to give the ring closure reaction. result of the ring closure reaction is obtained the 4-phenyl-5- (2-thiophene) -2,4-dihydro-3H-1,2,4-triazole-3-thione and 4-ethyl-5-(2-thiophene)-2,4-dihydro-3H-1,2,4-triazole-3-thione. The 4-phenyl-5- (2-thiophene) -2,4-dihydro-3H-1,2,4-triazole-3-thione compound obtained in the second step was converted to compound 1- (3-methyl-3-mesityl) -cyclobutyl-2 - {[5- (thiophen-2-yl) -4-phenyl-4H- 1,2,4-triazol-3- yl] sulfanyl}-ethanone by reaction with 2-chloro-1- (3-methyl-3-mesityl-cyclobutyl) -ethanone in dry acetone containing potassium carbonate.

Also 4-ethyl-5-(2-thiophene)-2,4-dihydro-3H-1,2,4-triazole-3-thione which was prepared in a second step is reacted with four different coumarin compounds to obtain compounds containing coumarin, 3,4,5-trisubstituted 3,4,5-trisubstituted 1,2,4-triazole sulfonyl compounds. Organic compounds prepared by us have been experimentally characterized by spectroscopic methods such as FT-IR, ¹H-NMR, and ¹³C-NMR after being purified by appropriate purification methods.

Stage 2: Theoretical characterization of the substances to be synthesized in the thesis:

In addition to the characterization studies of the experimentally obtained compounds, theoretical calculations were made at the cc-PVDZ basis set level by using the Gaussian 09W and GaussView 5.1 packages of molecules and the Density Functional Theory (DFT) method. As a result of the studies, it was seen that experimental and calculated values were in good agreement.

The molecular electrostatic potential (MEP), charge distribution on the atoms, and thermodynamic parameters for all compounds were evaluated. Different parameters were calculated for all compounds using B3LYP/cc-Pvdz, those parameters are including energy of the highest occupied molecular orbital (E_{HOMO}), energy of the lowest unoccupied molecular orbital (E_{LUMO}), energy bandgap ($\Delta E = E_{LUMO} - E_{HOMO}$), dipole moment (μ), hardness (η), softness (σ), electronegativity (χ), electrophilicity index (ω), nucleophilicity (ϵ) index and The fraction of transferred electrons (ΔN) which is related to transfer electron between the inhibitor and metal surface.

Keywords: 1,2,4-triazole, Thiophene, Sulfanyl, Cyclobutane, Coumarin, B3LYP/cc-Pvdz, Inhibitor.

ÖZET

Sübstitüe 1,2,4-Triazol Türevlerinin Sentez, Karakterizasyon ve Kuantum Kimyasal Hesaplamaları

Doktora Tezi

FIRAT ÜNİVERSİTESİ

Fen Bilimleri Enstitüsü

Kimya Anabilim Dalı

Mayıs 2022, Sayfa: iv + 130

Bu tez deneysel ve teorik çalışmalar olmak üzere iki ana aşamada planlanmıştır.

Aşama 1: Tezde çalışılan yapıların sentezi ve karakterizasyonu

Bu aşamada, N-fenil-2-(tiyofen-2-karbonil)hidrazin-1-karbotioamid ve N-etil-2-(tiyofen-2-karbonil)hidrazin-1-karbotioamid, etil alkol varlığında sırasıyla etil izotiyosiyanat ve fenil izotiyosiyanat ile tiyofen-2-karbohidrazidin reaksiyonundan elde edilir. Elde edilen N-fenil-2-(tiyofen-2-karbonil) hidrazin-1-karbotioamid ve N-etil-2-(tiyofen-2-karbonil) hidrazin-1-karbotioamid, halka kapanmasını vermek üzere baz (KOH) ilave edildi. Halka kapanma reaksiyonunun sonucu, 4-fenil-5-(2-tiofen)-2,4-dihidro-3H-1,2,4-triazol-3-tiyon ve 4-etil-5-(2-tiyofen)-2,4-dihidro-3H-1,2,4-triazol-3-tiyon elde edildi.

İkinci aşamada elde edilen 4-fenil-5-(2-tiyofen) -2,4-dihidro-3H-1,2,4-triazol-3-tiyon bileşiği, bileşik 1-(3-metil-3)'e dönüştürüldü. -mesitil) -siklobütül-2 - {[5-(tiofen-2-il)-4-fenil-4H-1,2,4-triazol-3-il]sülfanil} -etanon, 2-kloro-1 ile reaksiyona sokularak - (3-metil-3-mesitil-siklobütül) -etanon, potasyum karbonat içeren kuru aseton içinde. 2-kloro-1-(3-metil-3-mesitil-siklobütül)-etanon sentezi, literatür talimatına göre sentezlendi. Ayrıca ikinci aşamada hazırlanan 4-etil-5-(2-tiyofen)-2,4-dihidro-3H-1,2,4-triazol-3-tiyon dört farklı kumarin bileşiği ile reaksiyona sokularak elde edilen bileşikler aşağıdakileri içerir: kumarin, 3,4,5-tri-ikameli 3,4,5-tri-ikameli 1,2,4-triazol sülfonil bileşikler. Tarafımızdan hazırlanan organik bileşikler, uygun saflaştırma yöntemleriyle saflaştırıldıktan sonra deneysel olarak FT-IR, ¹H-NMR ve ¹³C-NMR gibi spektroskopik yöntemler ile karakterize edilmiştir.

Aşama 2: Tezde sentezlenen maddelerin teorik karakterizasyonu:

Ayrıca deneysel olarak elde edilen bileşiklerin karakterizasyon çalışmalarının yanı sıra, moleküler Gaussian 09W ve GaussWiew 5.1 paket programları ve Yoğunluk Fonksiyonel Teorisi (DFT) metodu kullanılarak cc-PVDZ temel seti seviyesinde teorik olarak da hesaplamalar yapıldı. Yapılan çalışmalar sonucunda deneysel ve hesaplanan değerlerin uyum içerisinde oldukları görülmüştür.

Tüm bileşikler için moleküler elektrostatik potansiyel (MEP), atomlar üzerindeki yük dağılımı ve termodinamik parametreler değerlendirildi. B3LYP/cc-Pvdz kullanılan tüm bileşikler farklı parametreler hesaplandı. Bu parametreler arasında en yüksek dolu moleküler orbitalin enerjisi (E_{HOMO}), en düşük boş moleküler orbitalin enerjisi (E_{LUMO}), enerji bant aralığı ($\Delta E = E_{LUMO} - E_{HOMO}$), dipol moment (μ), sertlik (η), yumuşaklık (σ), elektronegatiflik (χ), elektrofiliklik indeksi (ω), nükleofilisite (ε) indeksi ve inhibitör ve metal yüzey arasında elektron transfer etmek ile ilgili olan Aktarılan elektronların oranı (ΔN) bulunur.

Anahtar Kelimeler: 1,2,4-triazol, Tiyofen, Sülfanil, Siklobütan, Kumarin, B3LYP/cc-Pvdz, İnhibitör.

1. INTRODUCTION

Triazole compounds have become a highly attractive field of research because of their available application such as drug substances, agricultural drugs, artificial acceptors, multimolecular ligands, etc. [1-3]. The triazole ring is, which is aromatic with three nitrogen atoms, a five-member heterocyclic compound, and is an electronically rich system [4]. These compounds have a wide range of biological effects because triazole derivatives can easily bind to various enzymes and receptors in the biological system via weak interaction such as coordination bond, ion-dipole, cation- π , π - π , van der Waals forces, the hydrophobic effect [5-8]. Triazole compounds have the ability to create multimolecular structures, which is a unique characteristic [9, 10]. In this way, special importance is placed on triazole compounds especially in the development of new molecules drug [2, 11, 12]. Furthermore, the triazole ring can be employed as an appealing linker to unite several pharmacophores to create bifunctional medicinal compounds. Thus, it provides a convenient and efficient way to develop biologically active and functional various molecules. In the construction of novel therapeutic molecules, the triazole ring is also an essential isostere of substances such as imidazole, oxazole, pyrazole, and thiazole.

Some triazole-based compounds have been widely produced and explored for their biological activity in the study and development of novel medications. In particular, triazole compounds as antifungal drugs are an important role in clinical treatment and it is the first choice for the treatment of fungal infections. Many triazole derivatives are being used as clinical drugs due to their potent pharmacological activity, low toxicity, low side effects, high bioconjugation, good pharmacokinetic properties, drug targeting, drug delivery diversity, broad-spectrum and better healing, or become candidates for the treatment of various diseases.

The biological activity of the sulphonyl derivatives of 1,2,4-triazoles is diverse. As example to these can display diuretics, neuroleptics [13], antituberculosis [14, 15], antimicrobials [16-18] antiphlogistics [19], antimycotics[20], anti-HIV [21]. In addition, substitute sulphonyl-1,2,4-triazoles can be used in agriculture and industry [13, 22] as complexing agents having the ability to coordinate metal ions with various donor centers [13, 23, 24] and as precursors in organic synthesis [25].

Wang and colleagues reported a novel sulphonyl triazole see Figure 1.1, as a non-nucleoside HIV-1 reverse transcriptase inhibitor in their study [26].

Figure 1.1. sulphonyl triazole

Kaplancyk and colleagues have synthesized 3-alkylsulphonyl-1,2,4-triazole derivatives [27] and investigated antituberculosis activity. Tests performed in the presence of in vitro have shown that these compounds act as anti-tuberculosis agents at a significant level see Figure 1.2.

Figure 1.2. 3-alkylsulphonyl-1,2,4-triazole derivatives

Nahworld and colleagues have synthesized sulphonyl-1,2,4-triazole derivatives see Figure 1.3 [28], which have potent antiviral activity against efavirenz and nevirapine resistant viruses.

Figure 1.3. sulphonyl-1,2,4-triazole derivatives

It is known that 3-substituted cyclobutane carboxylic acid derivatives exhibit anti-inflammatory, antidepressant [29] activity. In addition, the cyclobutane ring in the structure of some polymers imparts different properties to these polymers. Such polymers have liquid crystal properties and they form a class of biopolymers suitable for photodegradation [30, 31].

Zhu and colleagues have synthesized 3-(phenylcyclobutyl)-1,2,4-triazole derivatives [32] in their study they measured values of inhibition against 11β -hydroxysteroid dehydrogenase enzyme in the presence of both in vitro and in vivo. As a result of the measurements, 1,2,4-triazole compounds containing the fluoro substituted cyclobutyl group see Figure 1.4, reported very good inhibition.

Figure 1.4. 1,2,4-triazole compounds containing the fluoro substituted cyclobutyl group

Ahmedzade and colleagues in a study in 2003 have synthesized thiazole derivatives containing 1,1,3-trisubstituted cyclobutane ring see Figure 1.5 [33], they have investigated antimicrobial activities against fungi and yeast. As a result of the antibacterial and antifungal

studies carried out, they reported that these substances showed high activity especially against *Escherichia coli*, *Rhodotorula rubrum* and *Kluyveromyces fragilis* species.

Figure 1.5. synthesized thiazole derivatives containing 1,1,3-trisubstituted cyclobutane ring

2. 1,2,4-TRIAZOLES

Three nitrogen atoms are arranged in a five-membered ring in this arrangement known as "triazacyclopentadiene" or simply triazole look Figure 2.1. There are two different isomer groups according to the relative position of the three nitrogen atoms. Each of these isomers has two different tautomers than the nitrogen atom to which hydrogen is attached.

Figure 2.1. Simple triazole derivatives

In these aromatic rings, the state of electronic of the nitrogen atoms carrying hydrogen is the same as the electronic state of the nitrogen atom in the pyrrole. The electronic state of other nitrogen atoms is like the state of nitrogen atoms that do not carry hydrogen in diazoles [34, 35].

2.1. Synthesis 1,2,4-triazole derivatives

The first studies on the triazole ring started in 1885 by Bladin and Pelizzari when hydrazine reacted with formamide to synthesize the main ring [36] The formation reaction is shown in Figure 2.2 and the mechanism shown in Figure 2.3.

Figure 2.2. 1,2,4-Triazole ring formation reaction.

Figure 2.3. Mechanism of pellizzari reaction.

In this reaction, different methods have been tried for the synthesis of 1,2,4-triazole, as the yield is low and variable. In 1914, chemist Karl Brunner successfully synthesized substituted 1,2,4-triazole derivatives by reacting to various imides and hydrazines. This reaction is known as the Einhorn-Brunner reaction [37-41] The formation reaction is shown in Figure 2.4 and the mechanism is shown in Figure 2.5.

Figure 2.4. Formation of 1,2,4-triazole by Einhorn-Brunner reaction.

Figure 2.5. Einhorn-Brunner reaction mechanism

2.2. Other methods

In 1974, Conde et al. the mixture of cyano compound and aluminum chloride in dry *o*-dichlorobenzene were mixed then added with phenyl benzohydrazidoyl chloride heated for 20 minutes at 120-130 °C. This mixture is then basic with chilled dilute sodium hydroxide then extracted with ethyl acetate. Dilute organic part 1,2,4-triazole compound was obtained by washing with hydrochloric acid and water [42]. The related reaction is in Figure 2.6.

Figure 2.6. Hand reaction of 1,3-diphenyl-5-alkyl-1H-1,2,4-triazole.

The reaction of hydrazone and aliphatic amines under aerobic oxidative conditions. It gives 1,3,5-trisubstituted 1,2,4-triazole compounds. The reaction is given in Figure 2.7. and the mechanism in Figure 2.8.

R: Ar, alkyl
R1: Ar, alkyl, Br

Figure 2.7. Formation recreation of 1,3,5-trisubstituted 1,2,4-triazole compounds as a result of the reaction of hydrazone and aliphatic amines.

The reaction occurs by the interaction of hydrazone and amine at 90°C under the catalyst of iodide and tert-butyl hydroperoxide (TBHP). The yield varies between 34% and 92% depending on the type of hydrazone and amine used.

Figure 2.8. The formation mechanism of 1,3,5-trisubstituted 1,2,4-triazole compounds as a result of the reaction of hydrazone and aliphatic amines (SET = single-electron-transfer).

Castenedo et al. In a study published in 2010, succeeded in obtaining 1,3,5-trisubstituted-1,2,4-triazole derivatives as a result of the reaction of carboxylic acid, pyramid amidine, and monosubstituted hydrazines [43]. The reaction is as in Figure 2.9.

Figure 2.9. The reaction of 1,3,5-trisubstituted-1,2,4-triazole derivatives from carboxylic acid, primary amidine, and monosubstituted hydrazines.

2.3. Synthesis 1,2,4-Triazole-5-thions

2.3.1. From thiosemicarbazide and its derivatives

In 1896, 1,2,4-Triazol-5-thion (Figure 2.10) was first obtained by Freund by heating 1-formyl-3-thiosemicarbazide to 190 °C then dried [44].

Figure 2.10. 1,2,4-Triazol-5-thion

One of the most widely used methods for the synthesis of 1,2,4-Triazole-5-thions by cyclization of 1-acyl-4-substituted-3-thiosemicarbazides with acylhydrazines substituted isocyanates see Figure 2.11 [45-47].

Figure 2.11. 1,2,4-Triazole-5-thions derivatives

4-Substituted-3-thiosemicarbazide derivatives acylation with carboxylic acid chlorides to obtained 4,5-disubstituted-1,2,4-triazole-3-thiones look Figure 2.12 [48-50].

Figure 2.12. 4,5-disubstituted-1,2,4-triazole-3-thiones

2.3.2. Dithiocarbazic Acid Salts

Acylhydrazines with carbon-sulfur in alcohol at room temperature at the basic environment, as a result of the reaction, is dithiocarbazate salt which is a reaction with hydrazine the 4-amino-5-alkyl-1,2,4-triazole-3-thion was formed [51] look the Figure 2.13.

Figure 2.13. Synthesis of 4-amino-5-alkyl-1,2,4-triazole-3thion from dithiocarbazic acid salts.

In the study of Reid and Heindel, 3-aryldithiocarbazate was reacted with hydrazine hydrate to formed 4-amino-5-phenyl-2,4-dihydro-3H-1,2,4-triazole-3-thion. It is reacted with methyl bromoacetate, acid chloride, methylene iodide, and chloroacetonitrile, to synthesized 4-amino-5-phenyl-1,2,4-triazole derivatives in 60-70% yields Figure 2.14 [52-54].

Figure 2.14. Synthesis of 4-amino-5-phenyl-1,2,4-triazole derivatives from 3-aryldithiocarbazic acid salts.

According to the Reid and Heindel procedure, carboxylic acid hydrazides in ethanolic KOH, then react with CS_2 and give high-efficiency potassium 3-aryldithiocarbazate salts. This salt, which is formed, forms a 5-aryl-2-mercapto-1,3,4-oxadiazole compound by ring closure with pyridine or anhydrous KOH. 4-amino-5-alkyl-3-mercapto-4H-1,2,4-triazole were formed when reacted with excess NH_2NH_2 in Figure 2.15 [55].

However, after the 3-aryldithiocarbazate salt is activated with methyl iodide, if the dithiocarbazate formed is reacted with hydrazine, the result of the ring-closing reaction gives 4-amino-5-alkyl-3-mercapto-4H-1,2,4-triazole.

Figure 2.15. Reid and Heindel procedure, for synthesized 4-amino-5-alkyl-3-mercapto-4H-1,2,4-triazole

2.4. Properties of Triazoles

2.4.1. Acidity and basicity

Although 1,2,4-Triazole compounds show weak acid properties ($pK_a = 10.04$ for protonation), they are more basic than 1,2,3-triazoles ($pK_a = 2.45$ for proton removal). The basic feature of 1,2,4-triazole is that the imidazolium-type cation is stabilized mesmerically in Figure 2.16.

Figure 2.16. 1,2,4-Triazoles proton intake and proton administration

2.4.2. Reactivity

1,2,4-triazoles are similar to 1,2,3-triazoles in their aromatic properties and stability. Oxidizers are oxidized the side chain, cannot break the ring. Triazoles, $KMnO_4$, CrO_3 , etc. They are usually resistant to oxidants but are sensitive to reducers. Hydrogen in the nitrogen atom is replaced with metals.

Hydrogen at position 1 in triazoles is alkylated with alkali halides or diazomethane in an alkaline medium see Figure 2.17.

Figure 2.17. 1,2,4-Triazole derivative

On the other hand, 3,4-disubstituted-1,2,4-triazoles are numbered five with alkyl halides. While alkylating from their positions, they are acylated with acyl chloride, see Figure 2.18.

Figure 2.18. 3,4,5-Trisubstituted-1,2,4-triazoles

Preparation of 3- and 5-Substituted Derivatives from the positions of the ring is also possible. Triazoles can be easily halogenated, N-Cl or halogenated products, N-Br, and N-I-1,2,4-triazole derivatives are interesting. Because the connection between nitrogen and halogen can be easily broken and give a displacement reaction.

In 1,2,4-triazoles, nitration, sulfonation, and Friedel-Crafts alkylation and acylation do not give electrophilic substitution reactions that require acidic conditions. But they form 3-hydroxymethyl-1,2,4-triazoles with formaldehyde at 130 ° C.

3. THIOPHENE

Thiophene Figure 3.1 is a heterocyclic compound consist of a five-member ring with one heteroatomic Sulphur and the formula is C_4H_4S . Thiophene and derivative are found in petroleum and col. The structure of thiophene may be present in many natural products and is used in many pharmacologically activities. The thiophene derivatives were very well known for their therapeutic applications in medicinal chemistry. Simple thiophene is Liquid and stable compounds like benzene in boiling point and small [56, 57]. Thiophene was found as a benzene contaminant [58]

Figure 3.1. Thiophene

3.1. Synthesis of Thiophene

The major thiophene synthesis including Paal Knorr synthesis, aminothiophene (Gewald), Fiesselmann synthesis, and Hinsberg thiophene synthesis.

3.1.1. Paal Knorr Synthesis

From the reaction of 1, 4-Dicarbonyl with the source of sulfur to give thiophene [59, 60], Figure 3.2.

Figure 3.2. Paal Synthesis of Thiophene

The reaction of diketone with P_2O_5 under the condition of Paal synthesis was produced a higher yield of thiophene see Figure 3.3.

Figure 3.3. The reaction of diketone with P₂O₅ under the condition of Paal synthesis

According to the above reaction the proposed mechanism Figure 3.4 to formation the initial thione (X= S or O) which is tracked by cyclization and tautomerizations [61].

Figure 3.4. Mechanism reaction for Paal synthesis

3.1.2. Aminothiophene (Gewald)

In 1966 Gewald has reported this method [62]. This method was consisting the condensation reaction between Ketones has methyl group with β -ketonitrile under base condition and sulfur element, the cyclization was formed, see Figure 3.5.

Figure 3.5. Condensation reaction between Ketones with β -ketonitrile and sulfur element, the cyclization was formed

3.1.3. Fiesselmann Synthesis

Fiesselmann synthesis of thiophene by condensation of thioglycolic and α , β -acetylenic esters to formed 3-hydroxyl-2-thiophene carboxylic acid [63]. According to the following reaction (Figure 3.6).

Figure 3.6. Fiesselmann synthesis

3.1.4. Hinsberg thiophene synthesis.

The Hinsberg synthesis (Figure 3.7) is the condensation between 1,2-dicarbonyl compounds with diethyl thiodiacetate to produce thiophene [64]. The product is ester acids by stop mechanism, but the reactions always happened through hydrolysis to isolate di-acids.

Figure 3.7. Hinsberg synthesis

3.1.5. Synthesis thiophene from industrial

On an industrial scale, thiophene can be synthesized by the high-temperature reaction between n-butane and sulfur see Figure 3.8.

Figure 3.8. Synthesized thiophene from the reaction between n-butane and sulfur with high-temperature

The commercial method used for the synthesis of thiophene in industrial is a mixture of acetylene with hydrogen sulfide through a tube contain alumina at a higher temperature of 400 °C, see Figure 3.9.

Figure 3.9. Synthesis of thiophene in industrial

Thiophene can also be synthesis by the reaction of phosphorous trisulphide and sodium succinate with heating see Figure 3.10 [65].

Figure 3.10. Synthesis thiophene by the reaction of phosphorous trisulphide and sodium succinate with heating

3.2. Properties of thiophene

3.2.1. Physical properties

Thiophene is a colorless liquid at room temperature, with a Slightly good smell reminiscent of benzenes, which thiophene shares certain similarities with it. The basis way for separation thiophene and benzenes is sulphonation reaction, due to the reactivity of thiophene with sulphonation. Due to their close boiling points (4 °C) between thiophene and benzene, which are difficult to distinguish by distillation at ambient pressure. Thiophene is classified as aromatic, while theoretical results indicate less aromatic compared with benzene. Thiophene is a toxic and flammable compound. Thiophene is water-insoluble but soluble in organic solvents like ether and alcohols. Thiophene melting points -38 °C, and the boiling point is 84 °C.

Thiophene's critical temperature was calculated by the sealed-tube method and equal to 579.4 K. A resonance energy equal to 20 Kcal/mol for thiophene was determined from the heat combustion and the thermochemical bond energies (Figure 3.11). The electron pairs on sulfur in the pi-electron system are greatly delocalized [66, 67]. Thiophene has a degree of stabilization higher than the equivalent furan, because sulfur has a larger bending radius and Consequently, sulfur could better tolerate a positive charge as a result of inductive sulfur pull.

Figure 3.11. Thiophene resonance

3.2.2. Chemical properties of thiophene

Thiophene is a stable and readily available compound, the chemistry of the derivatives of thiophene matter has constant investigation. The sulfide of thiophene does not normally undertake the oxidations. Thiophene is subjected to electrophilic substitution: sulphonation reaction, nitration, the addition of halogen, Friedel-Crafts acylation reactions, etc. Thiophene even undergoes the Remer Tiemann reactions to the formation of diazonium salt [68, 69].

The reaction of thiophene, Nucleophilic reaction of thiophene (Figure 3.12) faster than the counterpart of benzenoid, this due to delocalization charge on the sulfur atom [60].

Figure 3.12. Nucleophilic reaction of thiophene

Thiophene Friedel Craft acylation reaction gave higher yield with controlling condition, see Figure 3.13 [70].

Figure 3.13. Thiophene Friedel Craft acylation reaction

Thiophene sulphonation see Figure 3.14, with sulphuric acids, the results is thiophene-2-sulfonic acid[71].

Figure 3.14. Thiophene sulphonation

Thiophene nitration see Figure 3.15, should occur in the absence of nitrous acid because it can result in an explosive reaction. To avoid this, nitronium tetrafluoroborate or acetyl nitrate were used [72, 73].

Figure 3.15. Thiophene nitration

Halogenation of thiophene see Figure 3.16, was very fast at room temperature even lower at zero degrees in a dark place, however the halogenation of thiophene 10⁸ times faster than benzene [74].

Figure 3.16. Halogenation of thiophene

4. CYCLOBUTANE AND DERIVATIVES

Cyclobutane is an alicyclic compound with the formula $(C_2H_4)_2$ closed since it is a polar molecule only has Van der Waals interactions. Although it is a colorless and flammable gas at room temperature, it is insoluble in water. The boiling point is 12 and the Melting point is $-80\text{ }^\circ\text{C}$. Cyclobutane itself has no commercial or biological significance, but its more complex derivatives are very important in biology and biotechnology. The four carbon atoms in the cyclobutane are not on the same plane, the ring is typically in a folded or creased conformation. Each of the carbon atoms makes an angle of 25° with the plane formed by the other three carbon atoms. Thus, the driving force caused by each carbon atom is minimized. This conformation is also known as the "butterfly" Figure 4.1.

Figure 4.1. Butterfly conformations of the cyclobutane molecule.

4.1. Stereoisomerism in cyclobutane

In cyclobutane, the carbons are prevented from rotating around their axis due to the ring. As a result, a geometric isomer has formed. For the geometric isomer to form in the cyclobutane, there must be at least two groups. In this case, mostly-isomers of cyclobutane are formed Figure 4.2, when three groups are attached to the cyclobutane asymmetric carbon atom is formed and its optical isomer is seen.

Figure 4.2. possible constitutional isomer for di-substituted

4.2. Reactions of Cyclobutane

The most suitable way to obtain cyclobutane is the Wurtz method with 1,4-dihalobutane. This method is possible to obtain cyclobutane derivatives as in Figure 4.3. The yield in Wurtz method is lower, using dilute hexane or pentane solutions can be increased the yield [75].

Figure 4.3. Cyclobutane production from 1,4 dihalobutans by Wurtz method.

Cyclobutane is formed by catalytic hydrogenation of cyclobutene. The first of the reaction hydrogen gas is sent to the nickel in the phase and H-H sigma bond opening under the effect of metal metal-H bond is formed. In the next stage, cyclobutene is sent to metal, and pi bonds are formed by interacting with the metal and cyclobutene. Figure 4.4. The formed cyclobutane moves away from the metal surface. The reaction takes place at 180 °C.

Figure 4.4. Preparation Cyclobutane from cyclobutene by catalytic hydrogenation.

Cycloaddition reactions are a kind of Diels-Alder reaction, with a light effect. cyclobutane may occur [76]. The reaction occurred in Figure 4.5.

Figure 4.5. Formation of cyclobutane [2 + 2] by photochemical reaction.

Cyclobutane gives a radical halogenation reaction like straight-chain alkanes. It is opened to the public as a result of the impact of hydrogen on cyclobutane in palladium catalysis. Cyclobutane is resistant to HI and KMnO₄ in the cold, and it's not a fragmentation reaction.

4.3. Spectroscopic Properties of Cyclobutane

In 1,3-substituted cyclobutane derivatives -the dihedral angle in the case of the cis-trans state is smaller. While the dihedral angle is 30° in the Cis, this angle is 140° in the case of -trans. If the dihedral angle is small in the -cis position, the atoms will generate a strong repulsion force between the electron clouds, and these will cause the protons to appear in the higher area or lower ppm values in the $^1\text{H-NMR}$ spectrum. Cyclobutane $^1\text{H-NMR}$ peaks are in the range of 2-3 ppm, depending on the change of groups and structure. In the FT-IR spectrum, the peaks of these protons appear at $2980\text{-}2900\text{ cm}^{-1}$ as C-H strain vibrations. At 1325 cm^{-1} , the C-H bending peak appears [77].

4.4. The Importance of Cyclobutane Derivatives in the Literature

The first example that can be given to cyclobutane derivatives is cyclobutane carboxylic acid. In 1887, William Perkin succeeded in obtaining cyclobutane carboxylic acid as shown below as a result of a series of reactions. Figure 4.6.

Figure 4.6. Synthesis of cyclobutane carboxylic acid from malon ester and 1,5-dibromopropane.

This reaction is a two-step reaction. It is an intramolecular reaction in the second stage. Malonic acid ester turns into malonic acid when hydrolyzed. In general, dicarboxylic acids are not stable at high temperatures. They lose 1 mol of CO_2 at $150\text{-}200\text{ }^\circ\text{C}$ and turn into monocarboxylic acid [78].

Akhmedov (1991) et al. Unsaturated derivatives of epichlorohydrin with aromatic hydrocarbons along with Lewis acids for the synthesized chlorine hydrinos containing 1,1,3-tri-substituted cyclobutane ring with high efficiency, see Figure 4.7 [79].

Figure 4.7. 1,1,3-tri-substituted cyclobutane ring

Akhmedov (1991) et al. Benzene allyl-substituted 2-(2-propenyl)-3-chloromethyloxirane and the formation of the following products from reactions next to AlCl_3 were determined. (Ar (Benzene, toluene) see Figure 4.8).

Figure 4.8. Synthesis of oxirane compounds

There are two important features in the synthesis of cyclobutane derivatives in the literature. The first is the use of malon esters as the starting material in general, and the second is the synthesis of cyclobutane carboxylic acid derivatives as the cyclobutane derivative.

5. COUMARIN

Coumarin and derivatives of coumarin are natural products that are found from different parts including fruit, leaves, seeds and roots [80-82]. Coumarins are benzopyrone compounds that naturally occur [83]. Coumarin has antibacterial, antioxidant, anti-inflammatory, and anti-cancer because it had makes a bond such as a hydrogen, hydrophobic, coordination, and van der Waals bonds with proteins and enzymes [84, 85]. Coumarins also play an essential part in the food, and industries (soap and perfume) [86, 87]. Furthermore, coumarin is used in electronic requests such as Optical improvement, dye and fluorophores. Coumarin was synthesized by different methods like Pechmann reaction [88] and Perkin reaction [89] and Knoevenagel reaction [90]. Pechmann reaction is synthesis coumarins from phenol and β -ketoester in a 4-substituted group.

5.1. Synthesis coumarin derivatives

6-ethoxy-4-methylcoumarin (Figure 5.1) was synthesized from 4-ethoxyphenol and ethyl acetoacetate in present sulfuric acid [80].

Figure 5.1. Synthesized 6-ethoxy-4-methylcoumarin

Synthesis 4-(Chloromethyl)-7-methylcoumarin (Figure 5.2) from 3-methylphenol and ethyl 4-chloro-3-oxobutanoate in present sulfuric acid as a catalyst [91].

Figure 5.2. Synthesized 4-(Chloromethyl)-7-methylcoumarin

Synthesized 8-*t*-buthyl-4-methyl-2H-chromen-2-one (Figure 5.3) from 2-(*tert*-butyl) phenol with ethyl acetoacetate [83].

Figure 5.3. Synthesized 8-*t*-buthyl-4-methyl-2H-chromen-2-one

Synthesized 2-oxo-2H-chromen-4-yl 4-nitrobenzoate (Figure 5.4) from 4-hydroxy-2H-chromen-2-one with 4-nitrobenzoyl chloride [92].

Figure 5.4. Synthesized 2-oxo-2H-chromen-4-yl 4-nitrobenzoate

Shuguang et al was synthesized novel coumarin derivatives see Figure 5.5:

Figure 5.5. Novel coumarin derivatives

Figure 5.6. Synthesis phenyl coumarin

6. MATERIAL AND METHODS

6.1. Equipment and Tools Were Used

- As glass material; a round bottom flask of various sizes, dropping funnels, separating funnels, funnels, beakers, glass rod, burettes, capillary tubes, and test tubes.
- Electronic Balance for weighing: Chyo J.L.180.
- Perkin Elmer Spectrum One FTIR spectrophotometer for IR spectra.
- Bruker 400 MHz NMR spectrometer for receiving ¹H-NMR spectra.
- Bruker 400 MHz NMR spectrometer for receiving ¹³C-NMR spectra.
- Memmert M50 model oven for the drying process.
- Melting point determination device (Gallenkamp).
- Magnetic and mechanical mixers.
- Thermometers of 100 and 360 °C.
- Automatic pipettes.
- Desiccator.

6.2. Chemical Substances Were Used

6.2.1. Reagents

Thiophene-2-carbohydrazide, 4-(chloromethyl)-7-methyl-2H-chromen-2-one, 4-(chloromethyl)-6,8-dimethyl-2H-chromen-2-one, 4-(chloromethyl)-6,7-dimethyl-2H-chromen-2-one, potassium carbonate, 4-(chloromethyl)-7,8-dimethyl-2H-chromen-2-one, potassium hydroxide, ethyl isothiocyanate, phenyl isothiocyanate, Sodium dichromate, calcium chloride over anhydrous, 2-chloro-1-(3-methyl-3-(2,4,6-trimethyl cyclohexyl)cyclobutyl) ethan-1-ol.

6.2.2. Solvents

Ethyl alcohol, diethyl ether, acetone, methanol, hydrochloric acid, Sulfuric acid, and DMSO-d₆ for NMR spectra.

6.3. Experimental Part

6.3.1. 4-phenyl-5-(thiophen-2-yl)-2,4-dihydro-3H-1,2,4-triazole-3-thione (1)

To prepared the reaction needed reflux, a round bottle flask (two nicks), magnetic bar, and thermometer. The reaction flask was filled with 10 mmol thiophene-2-carbohydrazide and 50 ml absolute ethyl alcohol. 10 mmol phenyl isothiocyanate was added once the reflux process began. Solid thiosemicarbazide began to form in the reaction flask after about 4 hours. Dissolution began after 15 mmol KOH was added to the material. The reaction was stopped after 6 hours, and the precipitate was generated in ice water with HCl at a pH of 3-4. The solid precipitate was filtered, rinsed with ice water, then crystallized in a combination of alcohol and water. FT-IR, ¹H-NMR, and ¹³C-NMR techniques were used to illuminate the structure of the product. Figure 6.1 depicts the general reaction of the product.

Yield 70%. Melting point: 163-164 °C; FT-IR (KBr, cm⁻¹): 3039-3105 (νAr-H), 1611, 1478, 1415(νC-N, νC=N, νC-N-C in triazole) respectively, 1573 (νC = N), 1259 (νC = S), 681 (νC-S-C); ¹H NMR (400 MHz, DMSO-d₆, ppm): 6.64-7.72 (8H, Ar-H), 13.98 (s, 1H, SH); ¹³C NMR (100 MHz, DMSO-d₆, ppm): 117.34, 126.82, 128.70, 129.35, 130.22, 132.03, 146.64, 168.18. Molecular Weight (C₁₂H₉N₃S₂) 259g/mol.

Figure 6.1.Reaction for synthesis 4-phenyl-5-(thiophen-2-yl)-4H-1,2,4-triazole-3-thiol (1)

6.3.2. 4-ethyl-5-(thiophen-2-yl)-2,4-dihydro-3H-1,2,4-triazole-3-thione (2)

To prepared the reaction needed reflux, a round bottle flask (two nicks), magnetic bar, and thermometer. The reaction flask was filled with 10 mmol thiophene-2-carbohydrazide and 50 ml absolute ethyl alcohol. 10 mmol ethyl isothiocyanate was added once the reflux process began. Solid thiosemicarbazide began to form in the reaction flask after about 4 hours. Dissolution began

after 15 mmol KOH was added to the material. The reaction was stopped after 6 hours, and the precipitate was generated in ice water with HCl at a pH of 3-4. The solid precipitate was filtered, rinsed with ice water, then crystallized in a combination of alcohol and water. FT-IR, ¹H-NMR, and ¹³C-NMR techniques were used to illuminate the structure of the product. Figure 6.2 depicts the general reaction of the product.

Yield 84%. Melting point: 187-188 °C; FT-IR (KBr, cm⁻¹, ν): 3072-3107(ν Thiophen group) 2870-2960 (νC-H), 1570 (νC=N), 1260 (νC=S), 715 (νC-S-C); ¹H NMR (400 MHz, DMSO-d₆, δ, ppm): 1.23 t (3H, N-CH₂-CH₃), 4.22 q (2H, -N-CH₂-CH₃), 7.27 dd (1H, Thio-H), 7.68 d (1H, Thio-H) 7.86 d (1H, Thio-H), 13.98 s (1H, SH); ¹³C-NMR (100 MHz, DMSO-d₆, δ, ppm): 13.7, 39.7, 126.8, 128.9, 129.3, 130.3, 146.3, 168.5. Molecular Weight (C₈H₉N₃S₂): 211g/mol.

Figure 6.2. Reaction for synthesis 4-ethyl-5-(thiophen-2-yl)-4H-1,2,4-triazole-3-thiol (2)

6.3.3. 2-chloro-1- (3-methyl-3-mesityl-cyclobutyl) –ethanone (5)

The synthesis of 2-(chloromethyl)-3-(2-methylallyl)oxirane (3) that we used in our study was prepared as follows by the method of the literature [79].

By dissolving 300 ml of acrolein in 300 ml of CCl₄, a 4-neck 2-liter reaction flask was attached to the mechanical stirrer. On the other hand, the reaction temperature is kept constant in a liquid nitrogen environment at 20-22 °C. Also, 300 g of KMnO₄ was added periodically to the 3-spouted reaction flask and chlorine gas was obtained with HCl dropwise. Chlorine gas was dried in the H₂SO₄ trap and chlorine gas was introduced into the reaction medium for 7-8 hours. Chlorine gas was continued to be given until the alcohol turned green. It is stirred overnight at room temperature. CCl₄ was removed in the rotary evaporator and distilled at 20 mm Hg and 55-60 °C. The distillery trap was recognized with 40-50% base solution, see Figure 6.3.

on the rotary evaporator. 183 g of epoxide was removed by vacuum distillation at 20 mm Hg and 83-90 °C. Yield 76%, look Figure 6.5.

Figure 6.5. Synthesis of 2-(chloromethyl)-3-(2-methylallyl)oxirane

A dropping funnel, thermometer and calcium chloride tube were attached to the 4-mouthed reaction flask and placed in a mechanical mixer. 1500 ml of mesitylene, 167 g of anhydrous AlCl_3 were added and 183 g of epoxide was given dropwise at (11-12) °C. It was stirred for 2 hours and the mixture was decomposed with 15% HCl. It was neutralized with 5% NaOH. Ether-Water extraction was done. It was dried with MgSO_4 and the solvent was removed on the rotary evaporator. Distillation in vacuum obtained 247 g of product at 2 mm Hg, 185-187 °C. Efficiency 71%, see Figure 6.6.

Figure 6.6. Synthesis of 2-chloro-1-(3-mesityl-3-methylcyclobutyl)ethan-1-ol

Four-neck conical flask 1000ml fitted with a thermometer, funnel, stirrer and condenser, added Sodium dichromate (0.29 mol), 2-chloro-1-(3-methyl-3-(2,4,6 trimethyl cyclohexyl)cyclobutyl) ethan-1-ol (0.52 mol) which is prepared according to the literature [79] then added water (50 ml). from the neck of the funnel added H_2SO_4 (75 ml) (68% v/v) during 7-8h at room temperature. At the same temperature, the reaction was agitated for 18 hours. The solid product was formed and filtered, to remove all diethyl ether used CaCl_2 over anhydrous, then recrystallized with ethyl alcohol. FT-IR, $^1\text{H-NMR}$, and $^{13}\text{C-NMR}$ techniques were used to illuminate the final product. Figure 6.7 depicts the general reaction of the product.

Yielded, 55%; melting point: 97-98 °C; FT-IR (KBr, cm^{-1} , ν): 3156 ($\nu_{\text{Ar-H}}$), 1745 ($\nu_{\text{C=O}}$), 1650 and 1612 ($\nu_{\text{C=C}}$ in ring); $^1\text{H-NMR}$ (400 MHz, DMSO-d_6 , δ , ppm): 1.50 (s, 3H, $-\text{CH}_3$ - (cyclobutane), 2.41 (s, 9H, $-\text{CH}_3$ (mesitylene), 2.36-2.52 (m, 4H, $-\text{CH}_2$ - (cyclobutane), 3.48 (p, 1H, $-\text{CH}$ - (cyclobutane), 4.55 (s, 2H, $\text{CH}_2\text{-Cl}$), 6.75 (s, 2H, Ar-H); $^{13}\text{C-NMR}$ (100 MHz, DMSO-d_6 , δ , ppm): (5 peaks for CH_3 and CH_2 s), (20.45, 20.75, 25.24, 37.68, 130.29); (7 pieces of CH and aprotic carbons), 39.77, 40.21, 48.42, 130.29, 134.06, 143.94, 203.90. Molecular Weight ($\text{C}_{16}\text{H}_{21}\text{OCl}$): 246.5g/mol.

Figure 6.7. Reaction for synthesis 2-chloro-1-(3-methyl-3-mesityl-cyclobutyl)-ethanone (5)

6.3.4. 1-(3-methyl-3-mesityl)-cyclobutyl-2-[[5-(thiophen-2-yl)-4-phenyl-4H-1,2,4-triazol-3-yl] sulfanyl]-ethanone (6)

At room conditions, 2 mmol (0.276 g) K_2CO_3 dissolved in 30 ml dry acetone. To this solution, 2 mmol (0.530 g) of 2-chloro-1-(3-methyl-3-mesityl cyclobutyl) ethanone added to the solution at room conditions. Then, 2 mmol (0.423 g) 4-phenyl-5-(thiophen-2-yl)-2,4-dihydro-3H-1,2,4-triazole-3-thione dissolved in 10 ml of dry acetone was added dropwise to this solution, 6 hours stirred at room conditions with a magnetic stirrer. After removing the excess solvent from the environment with the evaporator under low pressure, the solid formed was washed with ice water and filtered and dried. The obtained substance was purified by crystallization in ethyl alcohol. FT-IR, $^1\text{H-NMR}$, and $^{13}\text{C-NMR}$ techniques were used to illuminate the structure of the product. Figure 6.8 depicts the general reaction of the product.

Yield is 55%; melting point: 102-104 °C; FT-IR (KBr, cm^{-1} , ν): 2955-3059 ($\nu_{\text{Ar-H}}$), 2866-2910 ($\nu_{\text{C-H}}$), 1697 ($\nu_{\text{C=O}}$), 1498 ($\nu_{\text{C=N}}$), 1131 ($\nu_{\text{N-N}}$), 1045 ($\nu_{\text{C-S}}$), 774 (C-S-C); $^1\text{H NMR}$ (400 MHz, DMSO-d_6 , δ , ppm): 1.50 (s, 3H, $-\text{CH}_3$ (cyclobutane), 2.14 (s, 9H, $-\text{CH}_3$ (mesitylene), 2.47-2.50 (m, 4H, $-\text{CH}_2$ - (cyclobutane), 3.56 (p, 1H, $-\text{CH}$ - (cyclobutane), 4.23 (s, 2H, S- CH_2 -), 6.69-6.70 (m, 3H, Ar-H), 6.99 (m, 1H, Ar-H), 7.50-7.51 (m, 2H, Ar-H), 7.64-7.68 (m, 4H, Ar-H) $^{13}\text{C NMR}$ (100 MHz, DMSO-d_6 , δ , ppm): 20.5, 21.4, 25.2, 39.0, 40.9, 127.5, 128.2, 128.5, 129.3, 130.5, 130.7, 131.3, 133.7, 134.9, 143.7, 150.4, 151.8, 205.3. Molecular Weight ($\text{C}_{28}\text{H}_{29}\text{N}_3\text{OS}_2$): 487.6g/mol.

Figure 6.8. Reaction of synthesis 1- (3-methyl-3-mesityl) -cyclobutyl-2-[[5- (thiophen-2-yl)-4-phenyl-4H-1,2,4-triazol-3-yl] sulfanyl]-ethanone (6)

6.3.5. 4-(((4-ethyl-5-(thiophen-2-yl)-4H-1,2,4-triazol-3-yl)thio)methyl)-7-methyl-2H-chromen-2-one (7)

In 30 ml of dry acetone, the potassium carbonate (K_2CO_3) (0.02 mol) was dissolved, added 4-(chloromethyl)-7-methyl-2H-chromen-2-one (0.02 mol). At room temperature, 4-Ethyl-5-(thiophene-2-yl)-4H-1,2,4-triazole-3-thiol (0.02 mol) dropwise was added to this solution for 6 hours. The solid product was filtrated and dried with recrystallized by ethyl alcohol. FT-IR, 1H -NMR, and ^{13}C -NMR techniques were used to illuminate the structure of the product. Figure 6.9 depicts the reaction of the product.

Yield is 65%; Melting point: 145-147 $^{\circ}C$; FT-IR (KBr, cm^{-1} , ν): 2937–3081 (ν_{Ar-H}), 1717 ($\nu_{C=O}$), 1439 ($\nu_{C=N}$), 938 and 1266 (ν_{O-C}), 560-740 (ν_{S-C}); 1H -NMR (400 MHz, $DMSO-d_6$, δ , ppm): 1.17 (t, 3H, N- CH_2 - CH_3), 3.39 (s, 3H, Ar- CH_3), 4.09 (q, 2H, N- CH_2 - CH_3), 4.62 (s, 2H, S- CH_2), 6.32 (s, 1H, H-C-C=O), 7.27 (m, 3H, Ar-H + thiophene-H), 7.57 (s, 1H, Ar-H), 7.85 (m, 2H, Ar-H + thiophene-H); ^{13}C -NMR (100 MHz, $DMSO-d_6$, δ , ppm): 15.3, 21.2, 33.8, 40.2, 114.4, 115.6, 117.2, 125.4, 125.9, 128.0, 128.7, 129.6, 143.5, 149.4, 150.3, 151.4, 153.9, 160.1. Molecular Weight ($C_{19}H_{17}N_3O_2S_2$): 383g/mol.

Figure 6.9. Reaction of synthesis 4-(((4-ethyl-5-(thiophen-2-yl)-4H-1,2,4-triazol-3-yl)thio)methyl)-7-methyl-2H-chromen-2-one (7)

6.3.6. 4-(((4-ethyl-5-(thiophen-2-yl)-4H-1,2,4-triazol-3-yl)thio)methyl)-6,8-dimethyl-2H-chromen-2-one (8)

In 30 ml of dry acetone, the potassium carbonate (K_2CO_3) (0.02 mol) was dissolved, added 4-(chloromethyl)-6,8-dimethyl-2H-chromen-2-one (0.02 mol). At room temperature, 4-Ethyl-5-

(thiophene-2-yl)-4H-1,2,4-triazole-3-thiol (0.02 mol) was added dropwise to this solution for 6 hours [94]. The solid product was filtrated and dried with recrystallized by ethyl alcohol. FT-IR, ¹H-NMR, and ¹³C-NMR techniques were used to illuminate the structure of the product. Figure 6.10 depicts the general reaction of the product.

Yield is 70%; Melting point 188-190 °C; FT-IR (KBr, cm⁻¹, ν): 2923–3081 (νAr-H), 1722 (νC=O), 1630-1384 (νC=C), 1346-1477 (νC-O), 751-831 (νC-S); ¹H-NMR (400 MHz, DMSO-d₆, δ, ppm): 1.19 (t, 3H, N-CH₂-CH₃), 2.51 (s, 3H, Ar-CH₃), 3.18 (s, 3H, Ar-CH₃), 4.08 (q, 2H, N-CH₂-CH₃), 4.62 (s, 2H, S-CH₂), 6.42 (s, 1H, H-C-C=O), 7.26 (s, 1H, Ar-H), 7.35 (dd, 1H, thiophene H), 7.52 (d, 1H, thiophene-H), 7.56 (s, 1H, Ar-H), 7.80 (d, 1H, thiophene-H); ¹³C-NMR (100 MHz, DMSO-d₆, δ, ppm): 15.26, 15.64, 20.87, 34.01, 40.57, 115.41, 117.57, 123.15, 125.79, 127.06, 127.01, 128.79, 129.63, 133.50, 134.82, 149.49, 150.31, 150.33, 151.70, 160.07. Molecular Weight (C₂₀H₁₉N₃O₂S₂): 397g/mol.

Figure 6.10. Reaction of synthesis 4-(((4-ethyl-5-(thiophen-2-yl)-4H-1,2,4-triazol-3-yl)thio)methyl)-6,8-dimethyl-2H-chromen-2-one (8)

6.3.7. 4-(((4-ethyl-5-(thiophen-2-yl)-4H-1,2,4-triazol-3-yl)thio)methyl)-6,7-dimethyl-2H-chromen-2-one (9)

In 30 ml of dry acetone, the potassium carbonate (K₂CO₃) (0.02 mol) was dissolved, added 4-(chloromethyl)-6,7-dimethyl-2H-chromen-2-one (0.02 mol). At room temperature, 4-Ethyl-5-(thiophene-2-yl)-4H-1,2,4-triazole-3-thiol (0.02 mol) was added dropwise to this solution for 6 hours. The solid product was filtrated and dried with recrystallized by ethyl alcohol. FT-IR, ¹H-NMR, and ¹³C-NMR techniques were used to illuminate the structure of the product. Figure 6.11 depicts the general reaction of the product.

Yield is 75%; Melting point 165-167 °C; FT-IR (KBr, cm⁻¹, ν): 2922–3108 (νAr-H), 1722 (νC=O), 1621-1382 (νC=C), 1346-1477 (νC-O), 798 (νC-S); ¹H-NMR (400 MHz, DMSO-d₆, δ, ppm): 1.18 (t, 3H, N-CH₂-CH₃), 2.31 (s, 3H, Ar-CH₃), 3.12 (s, 3H, Ar-CH₃), 4.09 (q, 2H, N-CH₂-CH₃), 4.62 (s, 2H, S-CH₂), 6.36 (s, 1H, H-C-C=O), 7.22 (s, 1H, Ar-H), 7.25 (t, 1H, thiophene H), 7.55 (d, 1H, thiophene-H), 7.63 (s, 1H, Ar-H), 7.81 (d, 1H, thiophene-H); ¹³C-NMR (100 MHz,

DMSO-d₆, δ , ppm): 15.29, 19.31, 20.07, 30.85, 40.19, 114.52, 115.69, 117.60, 125.58, 128.05, 128.01, 128.78, 129.61, 133.37, 142.57, 149.51, 150.32, 151.56, 152.23, 160.28. Molecular Weight (C₂₀H₁₉N₃O₂S₂): 397g/mol.

Figure 6.11. Reaction of synthesis 4-(((4-ethyl-5-(thiophen-2-yl)-4H-1,2,4-triazol-3-yl)thio)methyl)-6,7-dimethyl-2H-chromen-2-one (9)

6.3.8. 4-(((4-ethyl-5-(thiophen-2-yl)-4H-1,2,4-triazol-3-yl)thio)methyl)-7,8-dimethyl-2H-chromen-2-one (10)

In 30 ml of dry acetone, the potassium carbonate (K₂CO₃) (0.02 mol) was dissolved, added 4-(chloromethyl)-7,8-dimethyl-2H-chromen-2-one (0.02 mol). At room temperature, 4-Ethyl-5-(thiophene-2-yl)-4H-1,2,4-triazole-3-thiol (0.02 mol) was added dropwise to this solution for 6 hours. The solid product was filtrated and dried with recrystallized by ethyl alcohol. FT-IR, ¹H-NMR, and ¹³C-NMR techniques were used to illuminate the structure of the product. Figure 6.12 depicts the general reaction of the product.

Yield is 75%; Melting point 175-177 °C; FT-IR (KBr, cm⁻¹, ν): 2920–3074 (ν Ar-H), 1723(ν C=O), 1623-1382 (ν C=C), 1346-1474 (ν C-O), 753 (ν C-S); ¹H-NMR (400 MHz, DMSO-d₆, δ , ppm): 1.17 (t, 3H, N-CH₂-CH₃), 2.38 (s, 3H, Ar-CH₃), 3.29 (s, 3H, Ar-CH₃), 4.08 (q, 2H, N-CH₂-CH₃), 4.61 (s, 2H, S-CH₂), 6.35 (s, 1H, H-C-C=O), 7.27 (2H, Ar-H), 7.55 (t, 1H, thiophene H), 7.68 (d, 1H, thiophene-H), 7.81 (d, 1H, thiophene-H); ¹³C-NMR (100 MHz, DMSO-d₆, δ , ppm): 11.71, 15.31, 20.37, 33.83, 40.23, 114.29, 115.79, 122.51, 124.46, 126.07, 128.07, 128.80, 129.60, 142.15, 149.43, 150.32, 151.75, 151.93, 160.16, 160.16. Molecular Weight (C₂₀H₁₉N₃O₂S₂): 397g/mol.

Figure 6.12. Reaction of synthesis 4-(((4-ethyl-5-(thiophen-2-yl)-4H-1,2,4-triazol-3-yl)thio)methyl)-7,8-dimethyl-2H-chromen-2-one (10)

6.4. Computational Study

The Gaussian 09W program's entire quantum chemical calculations at DFT B3LYP levels with a basis set cc-pVDZ were performed on a personal computer [74-76]. B3LYP with a cc-pVDZ [77] basis set is optimized for the molecular structures of the compound in the ground state (in vacuum). From optimization molecular structure founded Vibrational frequencies. On the optimal shape of the molecule, geometric parameters (bond lengths, bond angles, and torsion angles) of the compounds were calculated theoretically.

Because no imaginary frequency modes were obtained in the optimized geometry of the title molecule, a real minimum on the potential surface of energy was discovered. As a result, the measured upscale frequency, reduce mass, constant of power, infrared intensities, Raman operation and depolarization ratio were obtained. To calculate values of the frequency the harmonic was scaled down. The theoretical calculation for ^1H NMR and ^{13}C NMR were approached with GIAO computed. The theoretical NMR calculation of the solvent is greatly affected by it. The solvent DMSO has been used in nuclear magnetic resonance calculations as a solvent. The harmonic vibrational frequencies of the optimized structure were examined, and the theoretically obtained frequency values were scaled to 0.9588 for the theoretically derived frequency values.

The B3LYP/cc-pVDZ level was used for the molecular electrostatic potential (MEP) with the Millikan charge distribution [78-80] calculations for all the compounds. Based on vibrational analyses, using DFT/cc-pVDZ level, the thermodynamic properties of the compounds were determined at 25 $^{\circ}\text{C}$ temperatures. B3LYP is also suited for workstation capability in the Gaussian09W program at the cc-pVDZ basis set.

The Identifiers of electronic structure from all geometry structures the energy of the highest occupied molecular orbital (E_{HOMO}), the energy of the lowest unoccupied molecular orbital (E_{LUMO}), energy bandgap ($\Delta E = E_{LUMO} - E_{HOMO}$), and the dipole moment (μ), hardness (η), softness (σ), electronegativity (χ), electrophilicity (ω) index, nucleophilicity (ϵ) index, chemical potential (Pi)

and the fraction of transferred electrons (ΔN) related with corrosion inhibition activity were calculated [95-98].

7. RESULTS

7.1. 4-phenyl-5-(thiophen-2-yl)-2,4-dihydro-3H-1,2,4-triazole-3-thione (1)

The molecular was experimentally characterized by FT-IR and NMR spectroscopy. The melting point for compound (1) (Figure 7.1) is equal to 163-164 °C which was measured by Thomas Hoover melting point. The Yield is 75% and the color is white.

Figure 7.1. 4-phenyl-5-(thiophen-2-yl)-2,4-dihydro-3H-1,2,4-triazole-3-thione

The molecular structure of the compound (1) was determined using the Density Functional Theory (DFT/B3LYP) method in the ground state with the cc-pVDZ basis sets. Figure 7.2 shows molecular structures drawing by ChemBioDraw and GAUSVIEW. The optimized geometrical parameters (bond lengths, bond angles, and torsion angles) calculated using B3LYP/cc-pVDZ techniques are listed in Table 7.1.

7.3. 2-chloro-1-(3-methyl-3-mesityl-cyclobutyl)-ethanone (5)

The molecular was experimentally characterized by FT-IR and NMR spectroscopy. The melting point for compound (5) (Figure 7.17) is equal to 97-98 °C which was measured by Thomas Hoover melting point. The Yield is 55% and the color are white.

(5)

Figure 7.17. 2-chloro-1-(3-methyl-3-mesityl-cyclobutyl)-ethanone

The molecular structure of the compound (5) was determined using the Density Functional Theory (DFT/B3LYP) method in the ground state with the cc-pVDZ basis sets. Figure 7.18 show

molecular structures drawing by ChemBioDraw and GAUSVIEW. The optimized geometrical parameters (bond lengths, bond angles, and torsion angles) calculated using B3LYP/cc-pVDZ techniques are listed in Table 7.11.

B3LYP/cc-pVDZ was used to find Molecular electrostatic potential (MEP) for compound (5) shown in Figure 7.23. The negative region's red color is often above the atoms of two carbons (C34, C35) and oxygen with a little on the Cl atom, this indicates that the side of the chlorine atom is attached more electrophilic.

Figure 7.23. Molecular electrostatic potential for compound (5)

Mulliken population analysis for compound (5) shown in Figure 7.24 the more negative charges was distributed on the C2, C4, C24, C21, O38 and C11.

Figure 7.24. Millikan charge distribution on the compound (5)

Different parameters which are related to the inhibitor activity calculated for compound (5) used B3LYP/cc-pVDZ. All parameters were shown in Table 7.15 including energy of the highest occupied molecular orbital (E_{HOMO}), energy of the lowest unoccupied molecular orbital (E_{LUMO}),

energy bandgap ($\Delta E = E_{LUMO} - E_{HOMO}$), dipole moment (μ), hardness (η), softness (σ), electronegativity (χ), electrophilicity index (ω), nucleophilicity (ε) index and The fraction of transferred electrons (ΔN) which is related to transfer electron between inhibitor and metal surface.

Table 7.15. Calculation quantum chemical parameters for compound (5)

Parameters	Equations	Results
Total Energy (a.u)		-1157.799
μ (D)		3.7288
E_{LUMO} (eV)		-0.856
E_{HOMO} (eV)		-6.235

B3LYP/cc-pVDZ was used to find Molecular electrostatic potential (MEP) for compound (6) shown in Figure 7.31. The negative region's red color is often above the atoms of two nitrogens (N31, N32) and oxygen.

Figure 7.31. Molecular electrostatic potential for compound (6)

Mulliken population analysis for compound (6) shown in Figure 7.32 the more negative charges were distributed on the C9, C44, N30, N31.

Different parameters which are related to the inhibitor activity calculated for compound (6) used B3LYP/cc-pVDZ. All parameters were shown in Table 7.21 including energy of the highest occupied molecular orbital (E_{HOMO}), energy of the lowest unoccupied molecular orbital (E_{LUMO}), energy bandgap ($\Delta E = E_{LUMO} - E_{HOMO}$), dipole moment (μ), hardness (η), softness (σ), electronegativity (χ), electrophilicity index (ω), nucleophilicity (ε) index and The fraction of transferred electrons (ΔN) which is related to transfer electron between inhibitor and metal surface.

Table 7.21. Calculation quantum chemical parameters for compound (6)

Parameters	Equations	Results
Total Energy (a.u)		-2120.361
μ (D)		2.646
E_{LUMO} (eV)		-1.344
E_{HOMO} (eV)		-5.764
ΔE (eV)		4.419

B3LYP/cc-pVDZ was used to find Molecular electrostatic potential (MEP) for compound (8) shown in Figure 7.47. The negative region's red color is often above the atoms of two nitrogens (N19, N20) and oxygen (O13, O12).

Figure 7.47. Molecular electrostatic potential for compound (8)

Mulliken population analysis for compound (8) shown in Figure 7.48 the more negative charges was distributed on the N19, N20, N21, O12 and O13, C1, C30.

Figure 7.48. Millikan charge distribution on the compound (8)

Different parameters which are related to the inhibitor activity calculated for compound (8) used B3LYP/cc-pVDZ All parameters were shown in Table 7.33 including energy of the highest

occupied molecular orbital (E_{HOMO}), energy of the lowest unoccupied molecular orbital (E_{LUMO}), energy bandgap ($\Delta E = E_{LUMO} - E_{HOMO}$), dipole moment (μ), hardness (η), softness (σ), electronegativity (χ), electrophilicity index (ω), nucleophilicity (ε) index and The fraction of transferred electrons (ΔN) which is related to transfer electron between inhibitor and metal surface

Table 7.33. Calculation quantum chemical parameters for compound (8)

Parameters	Equations	Results
Total Energy (a.u)		-1884.745
μ (D)		3.172
E_{LUMO} (eV)		-1.883
E_{HOMO} (eV)		-5.877
ΔE (eV)		3.993
I	$I = -E_{HOMO}$	5.877
A	$A = -E_{LUMO}$	1.883
χ (eV)	$\chi = (I + A) / 2$	3.880
η (eV)	$\eta = (I - A) / 2$	1.996
σ (eV)	$\sigma = I/\eta$	2.943
Pi (eV)	$Pi = -\chi$	-3.880
ω (eV)	$\omega = Pi^2/2\eta$	3.770
ε (eV)	$\varepsilon = Pi \cdot \eta$	7.749
ΔN	$\Delta N = (\chi_{metal} - \chi_{inhibitor}) / 2 \cdot (\eta_{metal} - \eta_{inhibitor})$	0.781

The Zero-point vibrational energy, Total energy, thermal energy, rotational constants, rotational temperatures and entropy of the molecules (8) were calculated using B3LYP/cc-pVDZ at a pressure of 1.00 atom and 298 K, Table 7.34 shows the results.

Table 7.34. Thermodynamic parameters for compound (8)

Parameters	B3LYP/cc-pVDZ
Zero-point vibrational energy(kcal/mol ⁻¹)	221.842
Total energy (a.u.)	-1884.745
Rotational constants (GHz)	0.373 0.062 0.053
Rotational temperatures (K)	0.0179 0.0029 0.0025

7.7. 4-(((4-ethyl-5-(thiophen-2-yl)-4H-1,2,4-triazol-3-yl)thio)methyl)-6,7-dimethyl-2H-chromen-2-one (9)

The molecular was experimentally characterized by FT-IR and NMR spectroscopy. The melting point for compound (9) (Figure 7.49) is equal to 165-167 °C which was measured by Thomas Hoover melting point. The Yield is 75% and the color is white.

Figure 7.49. 4-(((4-ethyl-5-(thiophen-2-yl)-4H-1,2,4-triazol-3-yl)thio)methyl)-6,7-dimethyl-2H-chromen-2-one

The molecular structure of the compound (9) was determined using the Density Functional Theory (DFT/B3LYP) method in the ground state with the cc-pVDZ basis sets. Figure 7.50 shows molecular structures drawing by ChemBioDraw and GAUSVIEW. The optimized geometrical parameters (bond lengths, bond angles, and torsion angles) calculated using B3LYP/cc-pVDZ techniques are listed in Table 7.35.

Figure 7.50. Structure of the compound (9) A) Drawing by ChemBioDraw Ultra B) Gaussian Optimized by B3LYP/cc-pVDZ

Table 7.35. In the ground state, geometrical optimization for compound (9)

B3LYP/cc-pVDZ was used to find Molecular electrostatic potential (MEP) for compound (9) shown in Figure 7.55. The negative region's red color is often above the atoms of two nitrogens (N18, N19) and oxygen (O11, O12).

Figure 7.55. Molecular electrostatic potential for compound (9)

Mulliken population analysis for compound (9) shown in Figure 7.56 the more negative charges were distributed on the N18, N19, N20, O11, O12, C9, C10 and C28.

Figure 7.56. Millikan charge distribution on the compound (9)

Different parameters which are related to the inhibitor activity calculated for compound (9) used B3LYP/cc-pVDZ All parameters were shown in Table 7.39 including energy of the highest occupied molecular orbital (E_{HOMO}), energy of the lowest unoccupied molecular orbital (E_{LUMO}),

energy bandgap ($\Delta E = E_{LUMO} - E_{HOMO}$), dipole moment (μ), hardness (η), softness (σ), electronegativity (χ), electrophilicity index (ω), nucleophilicity (ε) index and The fraction of transferred electrons (ΔN) which is related to transfer electron between inhibitor and metal surface

Table 7.39. Calculation quantum chemical parameters for compound (9)

Parameters	Equations	Results
Total Energy (a.u)		-1884.744
μ (D)		3.343
E_{LUMO} (eV)		-1.855
E_{HOMO} (eV)		-5.870
ΔE (eV)		4.014
I	$I = -E_{HOMO}$	5.870
A	$A = -E_{LUMO}$	1.855
χ (eV)	$\chi = (I + A) / 2$	3.863
η (eV)	$\eta = (I - A) / 2$	2.007
σ (eV)	$\sigma = I/\eta$	2.924
Pi (eV)	$Pi = -\chi$	-3.863
ω (eV)	$\omega = Pi/2\eta$	3.717
ε (eV)	$\varepsilon = Pi. \eta$	7.755
ΔN	$\Delta N = (\chi_{metal} - \chi_{inhibitor}) / 2. (\eta_{metal} - \eta_{inhibitor})$	0.781

The Zero-point vibrational energy, Total energy, thermal energy, rotational constants, rotational temperatures and entropy of the molecules (9) were calculated using B3LYP/cc-pVDZ at a pressure of 1.00 atom and 298 K, Table 7.40 shows the results.

Table 7.40. Thermodynamic parameters for compound (9)

7.8. 4-(((4-ethyl-5-(thiophen-2-yl)-4H-1,2,4-triazol-3-yl)thio)methyl)-7,8-dimethyl-2H-chromen-2-one (10)

The molecular was experimentally characterized by FT-IR and NMR spectroscopy. The melting point for compound (10) (Figure 7.57) is equal to 175-177 °C which was measured by Thomas Hoover melting point. The Yield is 75% and the color is Brown.

(10)

Figure 7.57. 4-(((4-ethyl-5-(thiophen-2-yl)-4H-1,2,4-triazol-3-yl)thio)methyl)-7,8-dimethyl-2H-chromen-2-one

The molecular structure of the compound (10) was determined using the Density Functional Theory (DFT/B3LYP) method in the ground state with the cc-pVDZ basis sets. Figure 7.58 show molecular structures drawing by ChemBioDraw and GAUSVIEW. The optimized geometrical parameters (bond lengths, bond angles, and torsion angles) calculated using B3LYP/cc-pVDZ techniques are listed in Table 7.41.

8. DISCUSSION

8.1. Reaction Analysis of Synthesized 1,2,4-triazole Compounds

In the first part of the study, two types of thiosemicarbazides were obtained by interacting carboxylic acid hydrazides with two different types of isothiocyanate, adding KOH subsequently to the reaction medium aliphatic and aromatic substituted 1,2,4-triazoles were obtained.

High yield (70-90 %) thiosemicarbazide derivatives were formed from carboxylic acid hydrazide derivatives and isothiocyanates. Figure 8.1 depicts the reaction pathways of 1,2,4-triazole derivatives.

Figure 8.1. Reaction mechanism of synthesis 1,2,4-triazole derivatives.

This 1,2,4-triazole was formed to show the thiol-thione tautomer feature. The tautomer of 1,2,4-triazole formed as a result of the reaction is shown in Figure 8.2.

Figure 8.2. Tautomers of 1,2,4-triazole derivatives

8.2. Reaction Analysis of Sulfonyl Compounds Containing Triazole and Cyclobutane Ring

The 3,4,5-trisubstituted 1,2,4-triazoles obtained in the first step reacted with 2-chloro-1-(3-methyl-3-mesityl-cyclobutyl)-ethanone contain a cyclobutane ring by immersion in dry acetone containing K_2CO_3 . 3,4,5-trisubstituted 1,2,4-triazole has been converted into sulfonyl compounds, see Figure 8.3.

Figure 8.3. Reaction Analysis of Sulfonyl Compounds Containing Triazole and Cyclobutane Ring

3,4,5-trisubstituted 1,2,4-triazoles react with 2-chloro-1-(3-methyl-3-mesityl-cyclobutyl)-ethanone via the SN^2 reaction mechanism in the presence of K_2CO_3 to produce sulfonyl compounds containing triazole and cyclobutane ring, with a yield of 50-65%. The reaction mechanism is given in Figure 8.4.

Figure 8.4. Reaction mechanism for the formation of sulfonyl compounds containing triazole and cyclobutane ring.

8.3. Reaction Analysis of Sulfonyl Compounds Containing Triazole and coumarin Ring

The 3,4,5-trisubstituted 1,2,4-triazoles obtained in the first step reacted with 4-(chloromethyl)-7-methyl coumarin contain a cyclobutane ring by immersion in dry acetone containing K_2CO_3 . 3,4,5-trisubstituted 1,2,4-triazole has been converted into sulfanyl compounds, see Figure 8.5.

Figure 8.5. Reaction Analysis of Sulfonyl Compounds Containing Triazole and coumarin Ring

3,4,5-trisubstituted 1,2,4-triazoles react with 4-(chloromethyl)-7-methyl coumarin contain via the SN^2 reaction mechanism in the presence of K_2CO_3 to produced sulfanyl compounds containing triazole and coumarin compounds, with a yield of 65-75%. Figure 8.6 show the reaction mechanism.

Figure 8.6. Reaction mechanism for the formation of sulfonyl compounds containing triazole and coumarin compounds.

8.4. FT-IR Analysis of Synthesized Compounds

When the FT-IR spectra of the synthesized 3,4,5-trisubstituted 1,2,4-triazoles were examined, it was observed that the C=O tension vibration between $1650-1690\text{ cm}^{-1}$ in carboxylic acid hydrazine derivatives disappeared. It was observed that instead of this peak, N=C=S peaks at $1584, 1265, 1085$ and 980 cm^{-1} and C-N-C tension peak around 1180 cm^{-1} . Figure 8.7 shows the position of the C=O peak in the FT-IR spectrum of Benzoyl hydrazine [99]. N=C=S and C-N-C vibration frequencies of 4-Ethyl-5-(thiophene-2-yl)-4H-1,2,4-triazole-3-thiol are shown in Figure 8.8. In addition to these characteristic peaks, aromatic and allylic CH between $3025-3150\text{ cm}^{-1}$, aliphatic CH between $2850-2965\text{ cm}^{-1}$, C=N around 1550 cm^{-1} , C=S tension peaks around 1270 cm^{-1} and CH peaks was observed between $850-964\text{ cm}^{-1}$ are seen in 3,4,5-trisubstituted 1,2,4-triazole derivatives.

Figure 8.7. Representation of the peak of C = O stretch vibration in the FT-IR spectrum of Benzoyl hydrazine

Figure 8.8. N-C = S and C-N-C vibration frequencies of 4-Ethyl-5-(thiophene-2-yl)-4H-1,2,4-triazole-3-thiol

The most characteristic peak in the 3,4,5-trisubstituted 1,2,4-triazole sulfonyl compound containing cyclobutane ring obtained in this study is the C=O peak. C=O stretch vibration occurs in 1697 cm^{-1} in the synthesized compounds. The C-S-C stretch peak, which is also peculiar to the structure, is approximately 774 cm^{-1} . In addition to these peaks, Ar-H around $2955\text{-}3059\text{ cm}^{-1}$, aliphatic C-H around $2866\text{-}2910\text{ cm}^{-1}$, C-C stress peaks of the cyclobutane ring 1165 cm^{-1} and C=C stress peaks of mesityl ring around 1550 cm^{-1} . The characteristic peaks of the structure are shown in Figure 8.9.

Figure 8.9. Representation of structure-specific characteristic peaks in the FTIR spectrum belonging to 1-(3-methyl-3-mesityl)-cyclobutyl-2-[[5-(thiophen-2-yl)-4-phenyl-4H-1,2,4-triazol-3-yl]sulfonyl]-ethanone

In the third step of this study prepared four different 1,2,4-triazole sulfonyl compounds containing coumarin (ETMC) compound which is different in the number of methyl groups and the position of the methyl groups. S–C, O–C, and C=O vibrations have the most distinct peaks in ETMC. The most S–C was vibrated at a range of 710-750 cm^{-1} and the computed results were show that at 750-780 cm^{-1} , this results was closed with the literature [100, 101]. At 1216-1262 and 1050-1150 cm^{-1} , O–C vibrations were detected. According to the literature previously the O-C vibration pack was observed at 1250-850 cm^{-1} [102, 103]. At 1720-1750 cm^{-1} was the frequency value for C=O, while at 1850 cm^{-1} appears as computed frequency value. Other notable peaks in ETMC include aromatic C–H, aliphatic C–H, and C=N. At 3000–3100 cm^{-1} is the range of aromatic C–H frequency values according to the reference [104, 105]. C–H aromatic frequency theoretical values are in the range of 3050–3150 cm^{-1} , while experimental values are in the range of 3050–3100 cm^{-1} . C–H aliphatic Experimental vibrated at 2920–2985 cm^{-1} and aliphatic C–H frequency values are computed at 3006–3026 cm^{-1} . The C=N vibrational frequency value was observed at 1605 cm^{-1} , while computed value was obtained at 1595 cm^{-1} , see Figure 8.10.

Figure 8.10. Representation of structure-specific characteristic peaks in the FTIR spectrum belonging to 4-(((4-ethyl-5-(thiophen-2-yl)-4H-1,2,4-triazol-3-yl)thio)methyl)-7,8-dimethyl-2H-chromen-2-one

8.5. NMR Analysis of Synthesized Compounds

The most characteristic peak of the synthesized 3,4,5-trisubstituted 1,2,4-triazoles is the SH/NH peak seen as a singlet in the range of 13.98-14.21ppm. This peak in the ¹H-NMR spectrum can be seen in Figure 8.11.

Figure 8.11. Representation of the SH/NH peak in the ¹H-NMR spectrum of the 4-ethyl-5-(thiophen-2-yl)-2,4-dihydro-3H-1,2,4-triazole-3-thione molecule

Besides this characteristic peak of SH/NH, there are some characteristic peaks in the substituents attached to the 1,2,4-triazole ring. The first example of these substituents is the ethyl fragment. It has been observed that the -CH₂- protons of N-CH₂-CH₃ in the 4- position give quartet

peaks between 4.05 and 4.45 ppm. The interaction constant of these quartet peaks is approximately 7.1 Hz. Likewise, $-\text{CH}_3$ - peaks were observed to give triplet peaks in the range of 1.09-1.24 ppm. The interaction constants of these triplet peaks are approximately 7.1 Hz. The places of the carbons belonging to the ethyl group in the ^{13}C -NMR spectrum are approximately 13.77 for CH_3 and 39.77 ppm for CH_2 . The reason for the carbon and hydrogen being close to the nitrogen atom to come out in the low area is the high electronegativity of the nitrogen atom. Thus, the electron charge density shifted towards the nitrogen atom in these atoms and caused these atoms to resonate in a lower electric field. ^{13}C -NMR peaks of the ethyl group are shown in Figure 8.12.

Figure 8.12. Representation of the ^{13}C -NMR spectrum of the 4-ethyl-5-(thiophen-2-yl)-2,4-dihydro-3H-1,2,4-triazole-3-thione molecule

In the protons of the phenyl group, those in the -orto and -meta positions have given two signals peak in the range of 7.0 and 6.6 ppm respectively. The representation of the signals belonging to the phenyl group of 4-phenyl-5-(thiophen-2-yl)-2,4-dihydro-3H-1,2,4-triazole-3-thione is given in Figure 8.13.

Figure 8.13. Representation of the phenyl peak in the $^1\text{H-NMR}$ spectrum of the 4-phenyl-5-(thiophen-2-yl)-2,4-dihydro-3H-1,2,4-triazole-3-thione molecule

The experimental and theoretical NMR calculation was founded for compound 5 (2-chloro-1-(3-methyl-3-mesityl-cyclobutyl)-ethanone), for experimental calculation used DMSO as a solvent and for the theoretical using B3LYP/ccpVDZ in a gas state.

For $^1\text{H-NMR}$ the clear peak was appear for two hydrogens on the benzene ring at 6.75ppm and the computed analysis was the show at 7.94ppm. The peaks for the two methyl groups in a benzene ring has appeared at 2.36ppm experimentally while computing show at 3.1ppm. Experimentally two hydrogen peaks for CH_2 attached to chlorine atom were shifted to higher ppm lower filed (4.55ppm), the theoretical analysis show at 5.6ppm. Figure 8.14 was show the experiential $^1\text{H-NMR}$ peaks.

Figure 8.14. Experimental $^1\text{H-NMR}$ spectrum for 2-chloro-1-(3-methyl-3-mesityl-cyclobutyl)-ethanone in DMSO- d_6

The ^{13}C -NMR spectrum for 2-chloro-1-(3-methyl-3-mesityl-cyclobutyl)-ethanone was analyzed in DMSO. The ^{13}C -NMR for three methyl groups on the benzene ring was found at 20.75, 20.75, 20.45ppm, the same carbon was determined theoretically at 30.47, 30.28, and 28.91ppm. The peak for C=O was found at 203.90 experimentally while computed founded at 211.06ppm. The experimental aromatic carbone for benzene ring appeared 143.94ppm and the theoretically show at 143.41ppm. The CH₂ was attached to the chlorine atom and the carbonyl group shifted lower filed higher ppm (48.42) for experimental and for theoretical equal to 64.38ppm. The two-carbon of cyclobutane ring (C, CH₂) was found in the solvent peaks (39.77 and 40.21ppm) experimentally and theoretically founded at 49.08 and 54.66ppm look in figure 8.15.

Figure 8.15. Experimental ^{13}C -NMR spectrum for 2-chloro-1-(3-methyl-3-mesityl-cyclobutyl)-ethanone in DMSO-d₆

When the ^1H -NMR and ^{13}C -NMR were examined for coumarin compound 4-(((4-ethyl-5-(thiophen-2-yl)-4H-1,2,4-triazole-3-yl)thio) methyl)-6,7-dimethyl-2H-chromen-2-one we founded some peaks are representative for synthesis compounds. The proton peaks for CH₂ which was attached to N-CH₂-CH₃ have observed quartet peaks at 4.09ppm experimentally, while theoretically was observed at range 4.84-4.28ppm. The CH₃ peaks for the methyl group were observed at 1.18ppm this is the triplet peaks, also the computed result for the same peaks has appeared at range 2.22 - 1.73ppm.

For ^{13}C -NMR, the experimental peaks for each CH₃ and CH₂ (methyl group) were founded at 15.29 and 30.85ppm respectively, while theoretically found at 23.41 and 48.15ppm. According to electronegativity, the carbon and hydrogen atoms are closed to the atoms with the higher electronegativity was going to downfield and higher ppm. The ^{13}C -NMR for CH₂-S peaks was mixt

in DMSO solvent. Look to the Figure 8.16 and 8.17 has H-NMR and C-NMR for coumarin compound (9).

Figure 8.16. Experimental $^1\text{H-NMR}$ spectrum for 4-(((4-ethyl-5-(thiophen-2-yl)-4H-1,2,4-triazol-3-yl)thio)methyl)-6,7-dimethyl-2H-chromen-2-one in DMSO- d_6

Figure 8.17. The experimental $^{13}\text{C-NMR}$ spectrum for 4-(((4-ethyl-5-(thiophen-2-yl)-4H-1,2,4-triazol-3-yl)thio)methyl)-6,7-dimethyl-2H-chromen-2-one in DMSO- d_6

8.6. Investigation of Synthesized Molecules with Theoretical Calculations

Some theoretical calculations were made to elucidate the structures of some synthesized molecules in more detail. Within the scope of these studies, the three-dimensional geometry of the molecule, vibration frequencies, and ^{13}C - ^1H NMR spectra graphs were calculated using the Gaussian package program and DFT method with B3LYP/cc-pVDZ base set. It has been seen that the experimental and theoretical findings obtained as a result of all these calculations are in harmony. In Figures 8.18, and 8.19 given below, correlation graphs are drawn to show the compatibility of NMR spectrums.

Figure 8.18. The ^{13}C -NMR correlation between experimental and theoretical calculation for 4-(((4-ethyl-5-(thiophen-2-yl)-4H-1,2,4-triazol-3-yl)thio)methyl)-6,8-dimethyl-2H-chromen-2-one

Figure 8.19. The ¹H-NMR correlation between experimental and theoretical calculation for 4-(((4-ethyl-5-(thiophen-2-yl)-4H-1,2,4-triazol-3-yl)thio)methyl)-7,8-dimethyl-2H-chromen-2-one

8.7. Study the molecular structure (geometrical structure)

The investigation of the molecular structure for our compounds to found the bond length, bond angle and dihedral angle, which are more important to determine the crystal structure. However, in the geometrical structure, we also found the globular all site reactivity of the molecule with dipole moment and energy of the molecule [106-108]. Also in the geometrical structure show the sit for capability and interaction for a large molecule like enzymes. Look Figure 8.20 was the geometrical structure for compound (10).

Figure 8.20. The geometrical structure for compound (10) and the summary of the calculation

8.8. Theoretical inhibitors parameters used to determine the activity of compounds

Determined the electronic structure for all molecules which are called electronic identified, including the following with the equations:

HOMO energy level is found from the output file of Gaussian (1)

LUMO energy level is found from the output file of Gaussian (2)

Dipolmoment (μ) is found from output file of Gaussian (3)

Electronic affinity ($I = -E_{HOMO}$) [109, 110] (4)

Ionization potential ($A = -E_{LUMO}$) [110] (5)

Energy bandgap ($\Delta E = E_{HOMO} - E_{LUMO}$) [111] (6)

Hardness ($\eta = (I - A)/2$) [112] (7)

Softness ($\sigma = 1/\eta$) [113] (8)

Electronegativity ($\chi = (I + A)/2$) [114] (9)

Chemical potential ($\mu = -\chi$) [115] (10)

Electrophilicity ($\omega = \mu^2/2\eta$) [116] (11)

Nucleophilicity ($\epsilon = \mu \cdot \eta$) [117] (12)

$\Delta N = \frac{(\chi_{\text{metal}} - \chi_{\text{inhibitor}})}{2(\eta_{\text{metal}} - \eta_{\text{inhibitor}})}$ [115] (13)

The HOMO and LUMO energy level for the molecule has described the reactivity and stability of the molecule [118]. Electrophilicity ω is defined as the depletion of the energy because the electron is moved from transmitter to receiver [116]. The new molecular analysis is the nucleophilicity index looking at the equation (12). For determination ΔN equation (13) which is related to electrons relocated between inhibitor molecule and metal surface need calculations for each electronegativity and hardness [115]. The χ (electronegativity) and η (hardness) for our molecular inhibitor were calculated theoretically by DFT method with B3LYP/cc-pVDZ base set, while for metals (Fe bulk) equal to $\chi = 7$ and $\eta = \text{zero}$ was founded from the literature [115, 117, 119].

HOMO is the capacity of the donating electronic in a molecule inhibitor. It's key in corrosion research in a theoretical study. It said that by increasing the value of the HOMO the inhibitor of the molecule was increasing. The is working on the absorption charge on the metal surface [120, 121]. From my study compound (C1) was a higher value for HOMO, while compound 5 was the lower

value see Figure 8.21. Looking at the order of the reactivity according to the HOMO value from Higher to lower degree.

LUMO defines as a molecule that has ability to electron-accepting. The lower value of the LUMO means the inhibitor compound is adding a more negative charge on the metal surface. The higher value of the HOMO and LUMO the molecule reactivity for the inhibitor will be higher. For this reason, compound (C1) will be higher reactivity and compound (C7) was the lower reactivity using as an inhibitor. The order of the value of the LUMO from higher to lower is

Figure 8.21. HOMO and LUMO energy level with ΔE for compounds 5 and 7.

The HOMO and LUMO energy bandgap were more important for the determination of inhibitor activity of the organic molecule, also the large significance in the molecular static reactivity. The order of the inhibitors for our molecule is as follows, based on the value of the energy band gaps from lower to a higher value.

The energy band gaps were determined the reactivity of the molecule by compared the ΔE . The lower energy band gaps were inducted the molecule was more reactive. The value of the ΔE is

more related to the energy of the HOMO rather than LUMO, by increasing the energy of the HOMO the ΔE was decreased, it is good anti corrosion activity [120]. From the above sequence of the resulting compound 7 (C7) was lower energy band gap (ΔE), also it has more energy of HOMO, for this reason, it is good anti corrosion activity.

The used Mulliken charge distribution on the atoms in a molecule is one of the wide methods was using for determined the inhibitor activity [122]. With the presence of the negative charge on the heteroatoms, the inhibitor activity was increased due to the absorption on the metal surface this is maintained in the many kinds of literature [123]. Looking at the chart for charge distribution of the compound (7, 8, 9, 10) has a higher negative charge on the heteroatoms compared with another molecule (1, 2, 5, 6). The molecular electrostatic map potential (MEP) was clear shows the distribution of the charge on the atoms. The red color in MEP was representative of the negative charge and the red color going to the blue color illustrative the positive charge. Looking Figure 8.22 as an example for compound 9. The more negative charge was distributed on the heteroatoms like O, N, S, C.

Figure 8.22. MEP for compound 10, show clear charge distribution on the atoms.

The other parameters chose for the inhibitor activity of an inhibitor and stable compound are η (eV) and σ (eV). The good corrosion inhibitors those compounds have soft and more lewis base [124, 125]. In this study the order of compounds from more soft to more hardness are the following:

$$\sigma > \eta \quad C7 > C8 > C10 > C9 > C6 > C1 > C5 > C2$$

Compound 7 has higher energy of the HOMO and lower ΔE , it had more soft and lower hardness compared with other compounds. The compound 7 inhibitor has the most efficient inhibitory effect.

Two other parameters that have determined the inhibitor activities are electronegativity (χ) and chemical potential (P_i) which are inverse to each other. The following is the order of (χ) from higher value to lower value:

$$\chi \quad C7>C8>C10>C9>C6>C5>C2>C1$$

The degree of the electronegativity inhibitor determined how the coordination covalent bonds are formed between the inhibitor compounds and metal surface. In this study, our compound was examined on the iron surface as a theoretical calculation. The theoretical χ value for inhibitor compounds was calculated, looking at Table 8.1. It has shown the χ inhibitor was less than iron metal, in this resonance the iron metal has formed a bond with the inhibitor by taking an electron. The chemical potential (P_i) for molecules was used as an inhibitor is more important, by increasing the (P_i) the anti-corrosion activity increase [126]. The calculation of chemical potential was sequenced as the following:

$$P_i \quad C7>C8>C10>C9>C6>C5>C2>C1$$

Table 8.1 shows the result of ΔN which was obtained from the iron metal surface and inhibitor compounds. Generally, it is seen coumarin compounds (1>10>9=8>7) have more ΔN values than others (6>2>5). The higher value of ΔN means the compounds more electrons transfer to the metal surface [115].

Dipole moment (μ) is the other parameters that were found from the output file of the Gaussian calculation look Table 8.1. It has been not clear for many researchers to discuss the dipole moment change with inhibitor property. The same researcher said by increasing dipole moment the inhibitor property was increased the other researcher said with increasing dipole moment in a molecule the reactivity for inhibitor is decreasing. The coumarin compounds have a large value of the dipole moment compared with other compounds. This agrees with that researcher said by increasing the dipole moment the inhibitor activity is increasing.

The important parameters which are determined the corrosion inhibitors are the electrophilicity index (ω), nucleophilicity (ϵ) index. The ω for inhibitor molecule is represented for electron acceptance [116], while ϵ represents electron-donating [127]. The sequence of the molecule according to ω and ϵ from higher to lower value is a following:

$$\omega \quad C6>C7>C8>C10>C9>C2>C1>C5$$

$$\epsilon \quad C10>C8>C7>C9>C1>C6>C2>C5$$

The inhibitor activity is increased with increasing ϵ value or decreasing value ω . Looking at the sequence study, compound 7 had higher inhibitor activity.

Table 8.1. Different parameters used for determination theoretical inhibitor activity

Parameters	Equations	Compound 1	Compound 2	Compound 5	Compound 6	Compound 7	Compound 8	Compound 9	Compound 10
Total Energy (a.u)		-1423.372	-1270.937	-1157.799	-2120.361	-1845.426	-1884.745	-1884.744	-1884.743

9. CONCLUSION

In this thesis, eight organic compounds were synthesized. Experimentally the IR and NMR showed our compound was fully synthesized. Used B3LYP/cc-PVDZ for theoretical calculation, determined IR and NMR it is a good correlation with experimental characterization. Geometrical structure, molecular electrostatic map potential and thermodynamic was showing the properties of our compounds. Quantum chemical parameters show the inhibitor activity for the compounds. The HOMO and LUMO energy level was good coloration with inhibitor activity, by increasing the value of the HOMO and decreasing the value of the LUMO the inhibitor activity increased. This is because the increasing energy of HOMO is the tendency of the molecule to donating an electron on the metal surface (Fe bulk), while decreasing the energy value of LUMO indicates the molecule's ability to accept an electron. According to the energy of the HOMO and LUMO coumarin compounds has good anti-corrosion activity. The inhibition effectiveness of examined inhibitors is connected with the ΔE , which is a function of reactivity. As ΔE reduces, the inhibitor's reactivity on the iron surface was increased, this is clearly shown on the coumarins molecule. The softness and the hardness of the were linked to the ionization potential, the good softness compounds have good inhibitors, compound C7 has a higher softness value among all compounds. The parameters such as dipole moment (μ), electronegativity (χ), electrophilicity index (ω), nucleophilicity (ϵ) index and the fraction of transferred electrons (ΔN) which is related to transfer electron between inhibitor and metal surface supported that the coumarin compounds had more inhibitor activity. The lower value of electronegativity (χ) compared with the metal indicated the ΔN value was higher. The increasing value of ΔN the anti-corrosion was increased.

APPENDICES

APPENDIX- 1:

Figure A. 1. Synthesis 4-phenyl-5-(thiophen-2-yl)-4H-1,2,4-triazole-3-thiol

Figure A. 2. Synthesis 4-ethyl-5-(thiophen-2-yl)-4H-1,2,4-triazole-3-thiol

Figure A. 3. The powder of 4-phenyl-5-(thiophen-2-yl)-4H-1,2,4-triazole-3-thiol

Figure A. 4. Recrystallization of 4-phenyl-5-(thiophen-2-yl)-4H-1,2,4-triazole-3-thiol

Figure A. 5. Perkin Elmer 1600 FT-IR spectrophotometer

Figure A. 6. Bruker advance III 400 MHz NMR spectrophotometer

CURRICULUM VITAE

Rebaz OMER

PERSONAL INFORMATION

Birth of Place : Iraq- Erbil- Koya
Birth of Date : 23/9/1983
Nationality : Iraqi
Address : Iraq-Erbil-koya-Koya university
E-mail : rebaz.anwar@koyauniversity.org
Languages : Turkish (B1), English (B2), Arabic (B2)

RESEARCHER INFORMATION

Student Orcid ID : 0000-0002-3774-6071
Advisor Orcid ID : 0000-0003-1031-783X

EDUCATION

Master Degree : "Synthesis Hydrogels from dextran and soybean oil by UV photo-polymerization"
Bangor University, Environmental Graduate School, Department of Chemistry, 2012
Supervisor: Dr. Hongyun Tai

Bachelor : Koya University, Faculty of health and Science, Department of Chemistry, 2008

High School : High School for Boy, Koya, 2004

RESEARCH EXPERIENCES

- ✓ FT-IR, NMR, TGA, and XRF
- ✓ Computer programs (Microsoft Office Word, Excel, PowerPoint, EndNote, Origin Lab, Gaussian, ChemBioDraw Ultra, and ChemBio3D Ultra)
- ✓

WORK EXPERIENCE

2008 – 2009 : Worked in Laboratory as assistant chemistry/ koya University/ chemistry department.

2013 – 2016 : Assistant Lecturer at Koya University \ Faculty of Science and Health \ Chemistry Dept.
Teaching polymer Chemistry for 4th year students (Theoretical and practical).
Teaching analytical and organic chemistry for Biology and petroleum (Theoretical and practical) engineering department.

2016 - 2017 : Lecture at koya university/ Faculty of Science and Health/ Teaching organic for 3rd year student (Theoretical).

ACADEMIC ACTIVITIES

Paper:

1. Koparir, P., Parlak, A.E., Karatepe, A., and Omar, R.A. (2022). Elucidation of Potential Anticancer, Antioxidant and Antimicrobial Properties of Some New Triazole Compounds Bearing Pyridine-4-yl Moiety and Cyclobutane Ring, *Arabian Journal of Chemistry*, C Vol. 15 (27), pp: 103957.

2. Ahmed, L.O., Omer, R.A., Qader, I.N., Koparir, P., (2022). Theoretical Analysis of the Reactivity of Carmustine and Lomustine Drugs. *Journal of Physical Chemistry and Functional Materials*, Volume 5, Issue 1 (2022) 84-96.
3. Omar, R.A., Ahmed, L.O., Hama ,J.R., Koparir, P., (2022). Structural Analysis of Epinephrine by Combination of Density Functional Theory and Hartree-Fock Methods. *El-Cezerî Journal of Science and Engineering*, Vol: 9, No: 2.
4. Omer, R.A., Ahmed, L.O., Koparir, P., Hama, J.R., (2022). Impact of Solvent Polarity on the Molecular Properties of Dimetridazole. *El-Cezerî Journal of Science and Engineering*, (9), No: 2.
5. Koparir, P, Omer, R.A., Karatepe, A., Ahmed, L.O., (2022). Theoretical determination of corrosion inhibitor activities of 4-allyl-5-(pyridin-4-yl)-4H-1, 2, 4-triazole-3-thiol-thione tautomerism. *Indian Journal of Chemical Technology*, Vol. 29, January, pp. 75-81.
6. Omer, R.A., Koparir, P., Qader, I.N., Ahmed, L.O, (2022). Theoretical Determination of Corrosion Inhibitor Activities of Naphthalene and Tetralin. *Gazi University Journal of Science*, 35 (2), 434-444
