## INTRODUCTION

Medicinal plants can be important sources of unknown chemical substances with potential therapeutic effects. Besides, the World Health Organization has estimated that over 75% of the world's population still relies on plant-derived medicines, usually obtained from traditional healers, for basic health-care needs (Farnsworth et al., 1985).

Herbal medicines are currently in demand and their popularity is increasing day by day. The use of herbal medicine is becoming popular due to toxicity and adverse effects of allopathic drugs. This led to sudden increase in the number of herbal drug manufactures (Verma and Singh, 2008).

Drug-induced diuresis is beneficial in many lifethreatening disease conditions such as congestive heart failure, nephrotic syndrome, cirrhosis, renal failure, hypertension, and pregnancy toxaemia (Agunu et al., 2005).

Diuretics play an important role in situations of fluid overload, like acute and chronic renal failure, hypercalciuria, cirrhosis of liver, and also as an antihypertensive agent. Diuretics relieve pulmonary congestion and peripheral edema. These agents are useful in reducing the syndrome of volume overload, including orthopnea and paroxysmal nocturnal dyspnoea. They decrease plasma volume and subsequently venous return to the heart (preload). This decreases cardiac workload, oxygen demand and plasma volume, thus decreasing blood pressure (Hoeland et al., 2000).

One of the earliest strategies for the management of hypertension was to alter Na + balance by restriction of salt in the diet. Recent studies suggested a complex set of interrelationships exists among the cardiovascular system, the kidneys, the central nervous system (Na+, appetite, thirst regulation) and the tissue capillary beds (distribution of extracellular fluid volume), so that perturbation at one of these sites can affect all the remaining sites. A primary law of the kidneys is that Na + excretion is a steep function of mean arterial blood pressure (MABP) such that small increase in MABP cause marked increase in Na + excretion (Guyton, 1991).

A number of diuretics like mannitol, thiazides, furosemide, and ethacrinic acid are used in practice (Singh et al., 1991). Most diuretic drugs have the adverse effect on quality of life including impotence, fatigue, and weakness.

Still there is a need for more effective and less toxic diuretic. Many indigenous drugs have been claimed to **Plant diuretics** 

have diuretic effect in traditional medicine but they were not properly investigated. Naturally occurring diuretics include caffeine in coffee, tea, and cola, which inhibit Na + reabsorption and alcohol in beer, wine and mixed drinks, which inhibit secretion of ADH (Agus and Goldberg, 1971; Stookey, 1999). Several plant derived chemical entities have proved to be more efficacious and safe. Following is the list of different experimental and clinical studies in the same which will be beneficial for further studies and trials.

S. No.	Plant	Plant Part used	Extract studied	Model	References
1	Abutilon indicum	Seed	Aqueous	Rat	Balamurugan et al. (2010)

79	Wrightia tinctoria	Leaves	Aqueous & Alcoholic	Rat	Sathianarayanan et al. (2011)

### CONCLUSION

Diuretics are used to treat a number of cardiovascular and renal related disorders. Allopathic medicines do not have a safe role in this regard. Many indigenous drugs have been claimed to have diuretic effect in traditional medicine but they were not properly investigated. Naturally occurring diuretics are more safe and efficacious. Several plant derived chemical entities have proved to be more efficacious and safe. It remains for the modern scientists to give scientific validation for the herbs claimed for therapeutic activity to make use of herbal potential in a more productive way. In the above review paper, validation of these herbs most of them have been mentioned in classical literature as diuretic, and further, they are economically feasible, safe and efficacious and will be beneficial for further studies and clinical trials.
